Although using a set of measures instead of a single test may be time-consuming to administer and to score, using the test batteries solves the problem of unidimensionality of individual tests. Using multiple tests also provides a range of scores that allows teachers, administrators, and speech professionals to understand the language of the child more fully and more objectively than a single score would allow. The drawback of such test batteries is that these tests do not tap into the knowledge of culture and appropriate cultural use of language, an essential element of dominance.

Change in Direction

Policymakers and practitioners soon realized that the concept they chose to emphasize as a focus in deciding the way to offer instruction was problematic. These tests pointed out that the concept of dominance is much more elusive for even a battery of tests to figure out because it consists of a great many aspects such as pronunciation, lexicon, and grammar as well

as cultural awareness and use of language in appropriate cultural situations. This led to the realization that no matter what tests are used, the scores produced are not necessarily indicative of one's true language dominance even in a single context of use, as in classroom language. Moreover, some argued that a person does not have to be dominant in a language to receive instruction in it; it is enough to be comfortable learning in English. These arguments and the realization that the costly tests were not doing their jobs prompted researchers and practitioners to seek an alternative way of looking to what constitutes language knowledge and at what point a person is ready to receive instruction in English.

In the late 1980s and early 1990s, there was a national movement to set academic content standards for what students should learn and be able to do. This reform resulted in creating a set of criteria, or subject-matter benchmarks, to measure academic achievement for students. The goal of English as a Second Language (ESL) instruction, according to the ESL standards, was to lead students to eventual English proficiency. This effectively changed the focus of educators and policymakers from the notion of language dominance to the notion of language proficiency.

Although the notion of proficiency is related to that of language dominance, they are not identical. The general view among researchers is that one does not have to be dominant in a language to be a proficient user of that language. The four areas of proficiency as defined for the purpose of standards-based education, were speaking, reading, writing, and listening.

In 2001, the reauthorization of the Elementary and Secondary School Act, better known as the No Child Left Behind Act, mandated that the assessments used for the purposes of identifying English language learners must be based on national educational standards. As a part of the identification procedure, students must be assessed in all four areas mentioned previously to understand their proficiency levels in English.

Implications for Future Policy Directions

Determining which language is dominant is important in education because it helps determine the language of instruction that would be most beneficial for the child. The use of dominance and proficiency measures may be different in education settings because educators are trying to understand what children are capable

of in any language(s) they might speak at a given moment. This is done so that instruction is tailored to ensure learning. Two approaches are usually taken in education settings to understand where a child is in relation to the language knowledge, ability, and proficiency of his/her peers.

One approach is cross-linguistic. A child is asked to complete a variety of language tasks in each of the two languages, and then the results are compared. Another approach is to compare the performance of a bilingual child, on a variety of tasks, with the performance of a monolingual child on the same tasks. The advantage of such tests is that they are usually quick and easy to administer and do not take long to score. However, these tests are only a one-time measurement of what children can do with either of their languages, and such abilities can and do change quickly. Educators must keep in mind that a contrary assumption underlies this approach—that dominance is stable and does not change with time and across various contexts.

Regardless of the approach taken to assess language dominance and proficiency, children's language is still developing at the time of assessment, and children's development of both languages is an ongoing process. Thus, although children might have significant abilities in both languages, the tests might not recognize this because they are often designed to measure only the sort of language used in academic or laboratory settings.

Educators must also remember that knowing one language can be helpful when learning another because we draw on our language experience to understand how another language works. Thus, in the situations where a child is acquiring a second language that is the language of schooling, it is often important not to shun the native language but, rather, to use it as an aide in learning.

Finally, educators should remember that being dominant in a language does not necessarily mean that a person is proficient in using the language in all aspects of language use. The language of instruction is often dominant in instructional settings only, and for certain periods. It may not necessarily reflect the language used at home, with peers, and in the community at large. Ultimately, achieving proficiency in both languages is the ideal eventual outcome.

LANGUAGE EDUCATION POLICY IN GLOBAL PERSPECTIVE

Bilingual education, even in the United States, has developed as a result of explicit and implicit language policies that are carried out sometimes by nation-states, other times by ethnolinguistic groups and families, and yet other times by educators themselves. Sometimes the language education policy has to do with enrichment, or the *addition* of a second language, as in elite forms of bilingual education for majority children. Other language policies have to do with the *maintenance* of a minority language or even the *revitalization* of a language that has been lost, as in the case of the Māori Kōhanga Reo “language nest” programs for preschoolers. At yet other times, the language

education policy is about ensuring that language minority children *shift* as quickly as possible to a dominant language. This is the case with transitional bilingual education programs in the United States for immigrant children and in many African countries for children speaking languages other than those used in the educational system.

Scholars such as Robert Kaplan and Richard Baldauf distinguish between “language planning,” which is about activities to promote linguistic change including beliefs, practices, and laws and regulations, and “language policy,” which consists of the laws and regulations themselves. But Bernard Spolsky uses the term *language policy* for the entire enterprise, distinguishing between practices, beliefs, or ideology, and what he calls management (the laws and regulations, which for others is planning). This entry uses this broader definition of language policy, referring then to the field, as Sue Wright and Thomas Ricento have done before, as *language policy and language planning* (LPLP).

Bilingual education is perhaps the most important instrument of LPLP. It is directly related to what has been called *acquisition planning* because the implementation of bilingual education programs creates new language learners and new users of a language. Also, by giving a language a prestigious domain in which to function such as the school, bilingual education is also a means of *status planning*, that is, modifying the prestige of a language. Finally, because of the school’s emphasis on literacy, bilingual education is an important means of *corpus planning*, standardizing the language forms, and developing new terms for academic functions.

Three stages of their geopolitical climate, epistemological paradigms (concerning the nature of knowledge), and research paradigms are identified and described later. These three stages have influenced the views of language held, the models of LPLP pursued, and the corresponding bilingual education models developed throughout the world. Although this discussion has been simplified by referring to stages in practice and as dependent on societal circumstance, the views of language, models of LPLP used, and bilingual education models extend throughout time. Thus, language ideologies, LPLP activities, and bilingual education practices that were prevalent in the early 1970s are equally valuable today in some contexts, although not all. This entry explains the different models of bilingual education that have resulted

from different views of language and different LPLP models in global contexts.

Stage I

After World War II, the newly independent countries in Asia and Africa pursued social cohesion as stepping-stones to statehood. Modernization theory posited that the development of an independent and modern nation-state depends on urbanization, secularization, and the citizens' transformation from a traditional to a "modern" disposition. The emergence of LPLP as an academic discipline was an attempt to engineer social change through linguistic means. In its infancy, the research surrounding LPLP was driven by the imperative to solve what was perceived as the emergent states' "language problem," their multilingualism, with bilingual education seen as a possible means to alleviate what was perceived to be a threat to social cohesion. Bilingual and multilingual education became instruments, in some cases, of improving the teaching of the language chosen for modernization, and in others, of linguistically assimilating all people in the shared space that aspired to nationhood.

In 1953, the United Nations Educational, Scientific and Cultural Organization (UNESCO), responding to the educational failure of children in colonial situations, issued an important resolution declaring that it was axiomatic that a child be taught to read in the home language. The resolution stated that the use of the native language should be extended as much as possible; it advised for students to begin academic instruction through their native language. Because this is the language children understand best, this practice was thought to help bridge the gap between the home and school contexts.

Efforts to use the children's language in education, especially in the early grades, gained strength, leading to the first uses of what has since been termed *transitional bilingual education*, that is, the use of the child's heritage language in the early grades and *only* until the child is fluent in the majority or politically dominant language. In the United States, this period corresponded to the awakening of ethnic sentiment and the era of civil rights. The Bilingual Education Act of 1968 and its ensuing amendments was, in some measure, an example of language education policy and planning, endorsing in 1974 the transitional bilingual education model to ensure the children's shift to English. The development of contemporary bilingual

education within a civil rights ideology meant that, especially at first, Chicano and Puerto Rican activists develop many *maintenance* bilingual education programs that used both English and Spanish in instruction throughout the children's education, asserting a bicultural identity and dreams of self-determination.

In the Canadian province of Québec, where French is the numerically majority language and was increasingly coming into power, some Anglophone parents, considered the powerful majority, demanded a way of making their children fully bilingual through school. Immersion bilingual education came into being, planned by scholars from McGill University, notably Wallace Lambert. In these programs, children are taught initially in the language they are learning, and by the second or third year, half of the instruction is through their home language and the other half through the language of immersion.

Stage II

The worldwide economic downturn in the 1970s and the ensuing widening of social inequities led to the questioning of bilingual education policies in transforming citizens and societies, espoused by theories of modernization. The role of sociohistorical processes in shaping particular forms of bilingual education, and in particular the role of class, ethnicity, race, language and gender in such shaping, was given increased attention. Specific forms of bilingual education, especially transitional bilingual education, were increasingly criticized, as indigenous peoples and autochthonous minorities claimed their language rights in education. They sought to develop their own forms of bilingual education, with language development goals they could support as communities with shared interests.

Developmental bilingual education programs—that is, programs that use the children's home language in addition to a second language throughout the child's education—spread throughout the world. In the United States, these developmental bilingual education programs are also known as late-exit bilingual education. The goal of these programs is to develop two languages, one being the majority language, the other being the language of autochthonous minorities or indigenous peoples. This was the case, for example, of the bilingual education programs in Wales in the rural Welsh heartland. In these traditional or "natural" bilingual schools, children

are taught in Welsh initially, and from the age of 7, they study English, with both languages used as media of instruction throughout primary years. There are also designated schools (*immersion programs* for Anglophone children).

Some peoples, especially indigenous ones, have experienced such devastating language loss that they have had to develop bilingual education programs for their children in an effort to revitalize their languages. For example, after passage of the Māori Language Act of 1987, New Zealanders started a type of immersion revitalization bilingual education as a desperate attempt to get elderly grandparents to pass on the language to their grandchildren. The *Kōhanga Reo* programs, or “language nest” as they were called, involved preschool children under the age of 5 in centers where the *whanau*, extended family, impart Māori spiritual values, language, and culture. In Hawai‘i the ‘Aha Pūnana Leo preschools were modeled after those of Māoris in New Zealand to revitalize the Hawaiian language. In the United States, Navajo and other Native American groups attempted similar programs with varying degrees of success.

Stage III

The end of the cold war, the collapse of the former Soviet Union, pandemic globalization, and the increasing role of international organizations have accelerated the movement of peoples and challenged the sovereignty of the state in the 21st century. With increasing awareness of other languages and the dominance especially of English, but also of Chinese, Spanish, and Arabic throughout the world, bilingual education has taken yet another turn; this time, growing often without the direct intervention of the state, and including forms that respond to a much more dynamic language use. The newer forms of bilingual education, based on a more ecological approach, prepare language communities to balance their own linguistic ecologies, enabling them to go back and forth freely in their overlapping languages and literacies.

Nowhere is this more visible than in the European Union’s newly designed educational programs, where a second language is used to teach nonlinguistic content matter. Called *Content and language integrated learning/Enseignement d’une matière intégrée à une langue étrangère* (or CLIL/EMILE), these programs take on varied forms. However, their goal is to develop plurilingualism. Plurilingualism is defined by the

Language Policy Division of the Council of Europe as having proficiency, of varying degrees, in several languages and experience of several cultures.

In the United States, the effort to develop two-way bilingual education programs for language majority and language minority children can also be considered a shift in ideological orientation. Although these programs have been around at least since the Coral Way School in the early 1960s, these programs gained popularity in the past decade, as bilingualism has been accepted as a resource by some parents. Yet increasingly, the U.S. official bilingual education policies have swung the other way, often even resisting the transitional bilingual education model of the 1970s. For example, transitional bilingual education was abolished in California in 1998, in Arizona in 2000, and in Massachusetts in 2002. Only immersion in English, and only for a year, is legal in those states.

Although some bilingual education policies are explicit, others are implicit. For example, in Spain’s Basque Autonomous Region, there are three models of bilingual instruction and parents have a choice—Model A in which instruction is carried out in Spanish, and Euskara (Basque) is taught as a subject; Model B, in which instruction is 50% in Spanish and 50% in Euskara; and Model D, in which instruction is in Euskara and Spanish is taught as a subject. In the United States, however, there is no mandate for bilingual education per se. Even Title VII of the Elementary and Secondary Education Act, which became known as the Bilingual Education Act, was only a funding source for different kinds of bilingual programs. Its substitute as of 2002, Title III of No Child Left Behind (NCLB), Public Law 107–110, is also not as explicit regarding a bilingual or even nonbilingual education stance. Although it substitutes the “Language Instruction for Limited English Proficient and Immigrant Students” for the older “Bilingual Education Act,” thus silencing the word *bilingual*, it offers no explicit language education policy. However, it outlines an explicit assessment policy, requiring the annual testing of all English language learners, and focuses on standard written English as the only valid measure of knowledge. It can then be said that this assessment policy is in itself a language education policy, privileging monolingual education over bilingual education in the United States. The consequence of Title III of the NCLB, that is, monolingualism, exists in tension with the spirit of the worldwide ecological model of

LPLP, which celebrates linguistic diversity and asserts bilingualism as a resource.

LANGUAGE EXPERIENCE APPROACH TO READING

It is Friday morning in the village of Supai in Havasu Canyon, a branch of the Grand Canyon. Supai is the home of the Havasupai people, one of more than 30 American Indian nations in the state of Arizona. A popular tourist destination, Supai is home to several hundred Havasupai, and an elementary school serves the children of the village from kindergarten through eighth grade. On Thursday evenings, the cafeteria in the elementary school becomes a theater, as the community gathers for movies. The movie this Thursday has been a horror show, and the children in the primary grade classroom are full of conversation about it.

After opening exercises, a teacher gathers the young children around her and asks them about the movie that they saw: What was the movie about? What did they think about it? She calls on individual children to share their opinions and feelings. Then she brings out a sheet of chart paper and tells the children that together they are going to create a story about the movie they saw. She asks the children to think carefully about what they want to say, and she tells them that she will call on them one by one and write down what they say. She calls on one child who

says, “Last night we seed a movie.” The teacher repeats the sentence and then pronounces each word slowly as she writes, “Last night we seed a movie.” The teacher then asks for another child to volunteer a sentence. A young girl says, “It was about a monster.” The teacher repeats the sentence and then writes it out word by word, articulating each word as she writes. This procedure continues until the group generates a story that reads

Last night we seed a movie.

It was about a monster.

He was scary.

And kill people.

He die.

I like it.

After the teacher has written the children’s sentences, she asks the children to listen carefully as she reads the story one more time. The teacher repeats what is on the chart, running her hand under the words in each sentence as she reads them. The teacher asks the children to read the story along with her, and she leads them in a choral reading of what they have created. The teacher then returns to the beginning of the story and asks if there is an individual child who wants to read one of the sentences. Individuals volunteer to read each sentence, after which the group rereads the entire story. The teacher announces that she is going to place the story in a particular place in the classroom, and during the day, when children have free time, they can walk over to the chart and read it for themselves.

Over the next several days, the teacher will use this chart to focus on particular aspects of written language. For example, she may use the words *movie* and *monster* to focus on the sound that the letter *m* makes, writing *movie* and *monster* on the board, asking the children to read the words with her, and then asking the children to share other words that begin with “mmmm” as do *movie* and *monster*. She may point out that the word *was* occurs two times in this story and in other stories as well. *Was* is a word that we use frequently when we talk, read, and write. She may point out that each sentence in the story begins with a word whose first letter is a capital letter, and each sentence in this story ends with a period. In these ways, the teacher moves from the whole experience of the story

to parts of the language, such as high-frequency words and sound-letter correspondences that students will need to use as they become independent readers and writers.

Foundations

The vignette you have just read exemplifies one way of engaging young children in reading, which is described in this entry. It has been termed the *language experience approach* (LEA) to reading, and it is based in the idea that experiences that children have become the basis for charts created through dictations to the teacher. These experience charts then form reading materials for the learners. Denise Nessel and Margaret Jones describe the basic steps in the creation of a language experience chart as the following:

Step 1: Teacher and children converse about the topic for the dictation.

Step 2: The children dictate an account to the teacher, and the teacher records their statements.

Step 3: Teacher and children read the story several times, until the story becomes familiar to the children.

Step 4: The teacher designs activities to help the children attend to individual words and other aspects of reading such as sounds and letters and punctuation.

Step 5: Students move from reading their own dictation to reading material written by other authors as they develop confidence and skill as readers.

In 1943, Lillian Lamoreaux and Dorris Lee first detailed the use of language experience charts in their book *Learning to Read Through Experience*. In 1963, Lee collaborated with Roach Van Allen to produce the second edition of this book. Allen, who began his career in the San Diego County public schools, became linked closely with this way of teaching young children to read, and he is credited with relating the language experience approach to young children's development of critical understandings regarding print. In particular, Allen asserted that using experience charts would facilitate children's coming to understand that

Anything a child thinks about can be talked about.

What a child talks about can be expressed in writing (or in painting or in some other expressive form).

What a child writes can be read.

Children can read what they write and what others write as well.

Allen went on to explain that, through the experience of creating charts and through teachers' subsequent use of these charts to focus on particular aspects of written language, children come to understand concepts such as written words, high-frequency words in texts, letters and sounds and how they are related, spacing between words, and punctuation. Most importantly, children come to understand reading as a process of developing meaning from patterns of symbols and meaning as coming from the individual experiences of the reader.

Group Charts

The creation of class experience charts, such as the one whose development is described previously, forms one of the central features of the language experience approach to reading. But other instructional engagements are important as well. One of these is the use of a wide variety of classroom charts that serve multiple purposes. For example, classrooms may display classroom rules and jobs, attendance counts, and lunch menus and counts on charts. Teacher and children may create the News of the Day, or the Child of the Week. Other charts may be related to content under study. Before beginning a unit of study on insects, for example, using a KWL chart format, the children may share what they already know about insects (K) and what they want to learn (W). As the unit progresses, they will dictate what they have learned (L). Charts may be used to outline procedures that learners have followed as they engaged with content; charts may be kept to keep a record of favorite songs or books that have been read aloud or sung. All of these provide demonstrations of a variety of purposes for writing and reading, and all of the charts provide opportunities for the teacher to work with the children on particular features of written language.

Key Words

A second engagement advocated by many LEA educators is that of key words or key vocabulary. Key word use is a strategy developed in the 1940s and 1950s by New Zealand educator Sylvia Ashton-Warner, when she worked with Māori children. The

Māori are a Polynesian people who arrived in what is now New Zealand about a thousand years ago. They were well established in what they called Aotearoa when European explorers and later British settlers came to their land. The young Māori children that Ashton-Warner taught spoke the Māori language and a dialect of English called Māori English. The language of the schools was English, but because Ashton-Warner had learned to speak Māori, she used Māori as well as English in her classroom.

Ashton-Warner became critical of the readers provided to her to teach her young students to read because the readers did not reflect the life experiences and the culture of the Māori children. She believed that children's first reading needed to be with words and stories that held intense meaning for them. So she devoted instructional time each day to asking her students what words were most important to them, what words they most wanted to have written down for them on the tag board, so that they could share these words with others. In her book, *Teacher*, she shares details of her teaching practice. The words the children chose were ones that held power for them, words such as *kiss*, *ghost*, *jet*, *bomb*, or *tigers*. Each time that Ashton-Warner wrote a word on a tag board card, she gave the word to the child, with instructions that the child take the word home to read it to his or her family. The children also read their words to each other in the classroom. Over several months, each child accumulated a pile of key words, words that could be read by the individual and shown to others.

Ashton-Warner also selected a word each day from the children's key words and used that word to invite the children to converse. One day, for example, she picked the word *frightened*. When she read that word to the children, they began immediately to talk about what frightened them. These conversations both expanded the children's oral language and provided the basis for experience stories. The publication of *Teacher* in the United States in 1963 influenced many who had been advocates of experience charts to expand their understanding of language experience to include key vocabulary.

Personal Charts

A third strategy in the language experience approach involves the creation of personal rather than group or class experience charts. Most often, this engagement begins with child-created artwork followed by

individual dictation to the teacher. Thus, for example, if the class is studying insects, children might be asked to draw an insect of particular interest to them and to decide what they want to share about the insect chosen. As they complete their pictures, the teacher circulates, converses with each child about his or her picture, and elicits and writes one or two sentences on each child's creation. The individual charts are then shared with the class. All of these strategies focus on using children's own lives, in and out of school, as a source for some of their reading experiences, and all of them serve as demonstrations of the connections between spoken and written language.

LEA and Bilingual Education

The earliest proponents of the language experience approach to reading did not address specifically using this way of teaching with bilingual children or children in second-language situations. However, the classroom examples provided earlier in this entry make it clear that educators working in bilingual and second-language contexts found the approach compelling, and began to use it and advocate for it. LEA has resonated among literacy educators working in bilingual education because it creates a place for children's lives, cultures, and language(s) in the classroom. As Ashton-Warner and many others since have pointed out, commercial textbooks created to teach reading often do not reflect the lives and realities, the cultural and experiential frameworks, of the schoolchildren who use them. Language experience charts do reflect these realities because it is the children's lives and happenings that are especially meaningful to them that become the content of the stories. Additionally, community and individual language patterns, ways of using both a native and additional languages, often do not appear in commercial reading materials. In contrast, in language experience charts, teachers write down children's contributions to a narration in the language that they actually use. Thus, learners see their own cultures and language varieties in the stories that they read. LEA instructional strategies also are powerful because teachers provide demonstrations of taking ideas from spoken to written form. This demonstration of writing can help second-language learners who are reluctant to write to understand that their early writing experiences can be based in talk that is written down.

One concern for many teachers of English as a Second Language (ESL) is the provision of quality

reading experiences for learners at varying English proficiency levels. Because LEA integrates the language processes of listening, speaking, reading, and writing, the creation of key word banks and experience charts may be based on oral language and content units of study that are a part of the school curriculum. Teachers may adapt LEA strategies according to the language abilities and needs of the learners. Beginning level ESL students involved in a study of insects, for example, may be able to participate in key vocabulary engagements by sharing the name of an insect they want to have in writing. If learners are not able to articulate complete sentences, the teacher may choose to use pattern sentences such as “Butterflies have ____” and ask individual children to fill in the last word to create an experience chart such as

Butterflies have wings.

Butterflies have a head.

Butterflies have eyes.

Butterflies have feelers.

When learners become more comfortable in speaking English, their narrations, whether done individually or with others, will be more extensive. Some ESL educators suggest using wordless picture books (picture books whose illustrations are particularly clear in a story sequence) for learners of intermediate and more advanced oral language. Learners are able to create stories using the pictures. At any level of English development, comprehension is not an issue because the narrations come from the learners.

A concern often expressed by ESL teachers who are using language experience dictation is the acceptance of English sentences that are not grammatically correct according to adult, native-English-speaking standards (in the first example earlier, children used the word “seed” instead of “saw”). Teachers worry about reinforcing incorrect habits and that students will never learn correct grammar if they are allowed to read sentences that do not reflect standard usage. This fear is not well founded, according to experts in LEA. Internationally known ESL educator Pat Rigg argues that it is important to accept and write out whatever language the learners use (as we saw in the Havasupai story) to validate what the learners are able to articulate. She notes that a generation of research in second-language learning has made it clear that

language learning is not a process of habit formation and stimulus-response learning. Rather learners, over time, construct the language they are learning, making mistakes as they do so, and gradually coming ever closer to what could be called the standard. Thus, their ways of expressing themselves at a given time do not remain static. Rather than the teacher correcting the students’ grammar, Rigg suggests saving language experience charts from earlier in a school year, and returning to them later in the year for editing, to reflect students’ growing command of English. She has demonstrated that when the teacher rereads a chart and asks the learners if they want to make any changes, frequently the students are able to comment on how they expressed themselves earlier and make corrections. Additionally, the teacher may be able to call students’ attention to particular issues of usage.

More than 60 years have passed since Lamoreaux and Lee proposed that teachers use language experience charts as a central feature of reading instruction for young children. Since its introduction, LEA has been used in elementary, secondary, and even adult education classrooms. Recently, educators (for example, Linda Labbo, Jonathan Eakle, and Kristiina Montero) have adapted LEA into literacy instruction that uses technological innovations such as computers and digital cameras. For numerous learners around the world, experience charts scribed by a teacher have provided learners the support and demonstrations they need to begin to see themselves as readers and writers.

LANGUAGE LEARNING IN CHILDREN AND ADULTS

Bilingualism has always been a part of the human experience. Many groups of people worldwide need to be proficient in more than one language to carry out the tasks they have to perform in their daily lives. Moreover, the interconnected world we live in through the Internet and the migrations of many peoples have made it increasingly important to communicate in more than one language. In linguistic communities such as Switzerland or South Africa, children acquire more than one language concurrently; in other linguistic environments, children learn the second language sequentially, when they already have established their first language. Many people choose to, or have to, learn a second language during adulthood.

Acquiring language is an experience so close to all human beings that we all have opinions about how and when we best acquire it. One popular belief is that whereas children acquire languages quickly, easily, and effortlessly, adults need more time and effort to learn a second language. There is a widely held belief that regardless of their commitment and interest, adults cannot attain the level of mastery of a second language that children achieve so readily and almost without fail. Paradoxically, another popular assumption is that it is problematic to have young children learn more than one language at a time because they may get confused and be unable to master either of the two languages well. These assumptions are probably based on observations

of children and adults learning languages, but they do not consider the complexity of languages, the different ways children and adults learn languages, and variations in the linguistic input learners receive. Not surprisingly, these popular viewpoints raise many questions and are far from being accepted by experts and language researchers, who see language acquisition as an extremely complex phenomenon that still requires much investigation to be understood.

Evaluating these popular beliefs requires answers to several questions that researchers have been struggling with for years. These questions include the following: How do human beings acquire their first language? How do we acquire second or additional languages? Are there differences in the way children and adults learn a second language? If differences exist, at what age do they become apparent? What level of proficiency is required for an individual to be considered bilingual? This entry reviews some of the current knowledge on the differences between children and adult ways of learning language.

Language Components and Language Acquisition

Acquiring language involves mastering the following interrelated components of language: *phonology*, the sounds or phonological structure of the language; *morphology*, the way sound units are organized into words; *syntax*, the order of the words in sentences; and *semantics*, the meaning of the words. The main goal of mastering a language is being able to use the language (pragmatics) to communicate. However, communicating effectively necessitates linguistic knowledge and knowledge of the socially established rules of interaction followed in specific places and by specific linguistic groups. Regardless of the daunting task of attaining mastery of a given language, almost all children follow a certain order in acquiring certain aspects of a specific language, have a tendency to make the same mistakes, and by 5 years of age are confident and competent speakers of their first language.

How do children accomplish this complicated task of integrating all the aspects of learning a language, or even more than one language? No one universal theory explains how and why human beings are able to acquire language; many theories end up only partially explaining how languages are acquired in childhood. All theories acknowledge the importance of the learner, the environment, and the linguistic principles to explain

language development, and bilingualism in particular. Ellen Bialystok, in her book *Bilingualism in Development: Language, Literacy, & Cognition*, considered simultaneous and sequential bilingualism in childhood in light of two different sets of theories that addressed the issues outlined.

Formal Theory

For formal theorists such as Noam Chomsky and Steven Pinker, the most important ingredient in explaining language acquisition is the human being's innate capacity to learn language. This language ability is separate from other cognitive abilities, and it manifests itself in abstract linguistic rules. For the formal theorists, the linguistic input provided in social and communicative contexts is needed, but is less important than the innate ability. According to this theory, there are no qualitative differences between learning one or two languages either simultaneously or sequentially. The innate language ability will activate regardless of the number of languages once the child is in contact with more than one language.

Some followers of this theory, however, stress the importance of age in learning language. Eric Lenneberg affirms that the innate linguistic ability activates during a specific time in life, known as a critical period, in which language is easily acquired. Depending on the experts, the critical period is between 2 and 9 or 2 and 12 years of age. Eric Lenneberg argued that there is a biological reason for the child to be able to acquire language easily in a specific age range: Before age 2 the child's brain is not yet prepared, and after age 9 or 12, the human brain loses the plasticity needed to learn language. This claim is supported because children speak the language or languages they learn without accent, from exposure to the language in the environment, but many adults never lose the accent they form in their second or other languages and need formal instruction in the language.

Functional Theory

For functional theorists, including Charles Fillmore and Robert Van Valin, the language ability of human beings is part of a more general human cognitive ability and the determinant factor in acquiring language is the linguistic input provided in a specific social context that allows the learner to infer the linguistic rules. Learning one or more languages simultaneously or

sequentially is qualitatively different for these theorists. They claim that knowing a language certainly influences the cognitive structures of the learner. Furthermore, the linguistic input provided—for example in who, when, and for what purposes language is used to communicate—is different for monolingual and bilingual children and therefore qualitatively affects the learning process.

Other Theories and Recent Research

Bialystok points out that each of these theories explains the role of some of the components of language in language development—the formalists focus on syntax and phonology and the functional theorists on semantics and pragmatics—but no theory explains how all the interdependent components of language work together. Moreover, although all experts agree that certain abilities that the learner brings to the task, as well as to the environment, have an important role in acquiring a language, no theory fully explains the role of each. According to Bialystok, the research available is not conclusive regarding the existence of a critical period to learn language; it may be that a critical period exists for certain components of language (e.g., phonology) but not for others.

The controversial questions regarding the existence of qualitative differences in the way children and adults learn a second language are well presented in Barry McLaughlin's two volumes on *Second Language Acquisition in Childhood*; however, the research available is inconclusive. Experts such as Lenneberg and Michael Long claim the existence of a critical period during which it is easier to learn language, and therefore, qualitative differences exist in the way children and adults learn language. According to these theorists, children and adults process language differently: Children bring to the learning process a linguistic ability distinctively available to process language, whereas adults process language through a more general cognitive ability. Furthermore, Hans Stern claimed that learning a language creates cognitive and linguistic structures that interfere or assist in learning a second language, depending on how similar or different the first and second languages are, making the paths to bilingualism for young children and adults necessarily different.

In contrast, Susan Ervin-Tripp and Kenji Hakuta argue that learning a second language in childhood or adulthood involves the same cognitive processes. To

understand the apparent differences in the ways children and adults learn a second language, these researchers focus on the cognitive characteristics of the learners, affective factors, and the linguistic and sociocultural contexts as well. The idea that children attain bilingualism fast and easily may arise because the demands on a bilingual child and a bilingual adult are different in the vocabulary and the length and structure of sentences expected of each. In several studies cited by Yugo Butler and Hakuta, adults outperformed children; in another study, 12- to 15-year-olds and adults (in that order) do better than children in rate of acquisition when controls for the amount of linguistic input are used.

Learning language is a difficult task for children and adults alike. Children and adults learn language only after intensive and extensive exposure to the language or languages. In the case of young children, they may learn the second language by being immersed in a natural and playful linguistic environment with other children, or by watching television, which make us think of the experience as effort-free. Adults, on the other hand, may not get the necessary linguistic input from being immersed in a natural environment and need to be formally taught the second language. Older children, however, may also receive formal support in learning the second language in school.

Research on second-language acquisition in adults conducted by Robert Gardner and Wallace Lambert highlights the role of affective factors such as attitude toward the language, motivation, anxiety, and self-confidence in accounting for the variation in outcomes in acquiring the second language. These factors may influence the success of children as well. In general, children are motivated to interact with their peers to be able to play; adults may be motivated for economic reasons, to communicate with other adults, or to be part of the new culture. Adults, however, may fear losing the identity they convey through their first language and are often afraid of making mistakes and feeling ridiculous, which can prevent them from practicing the new language.

These affective factors cannot be understood without analyzing the specific linguistic and sociocultural contexts in which they develop. The following factors contribute both to creating positive or negative attitudes and motivation toward a second language and to the success in acquiring it: (a) the prestige of the second language relative to the native language, (b) the

possibility of acquiring a new language without risking the loss of the first language, (c) the socioeconomic status of the learner, (d) the quality of the linguistic input, and (e) the nature of the learning situation.

Conclusion

The research available addressing language learning in children and adults is inconclusive. Although some experts, such as Long, affirm that learning a second language in childhood involves different processes than does learning it in adulthood, others, including Hakuta and Stephen Krashen, claim that there are differences only in the style that children and adults use to learn a second language. Most researchers agree, however, that acquiring more than one language in childhood does not necessarily negatively affect the proficiency attained in both languages. To sum up the dilemma, the difficulty in understanding how human beings acquire one or more languages stems from the complexity of the linguistic experience, which necessarily involves individuals with different educational, cognitive, and affective characteristics (such as attitude and motivation), living in different linguistic and sociocultural contexts—all variables that affect language acquisition.

LANGUAGE LOYALTY

To be loyal to one's language is generally evidenced by a desire to retain an identity that is articulated through the use of that language, and to adhere to cultural practices associated with that language. Language loyalty leads people to work toward maintaining the language in question even under adverse conditions. Language maintenance consists of strategies that groups use to keep the language to which they are loyal alive; language persistence is the result. Through religious and educational institutions, social organizations, the popular press, and the political process, persons loyal to their language work to maintain the language by using it to worship, educating their young in it so that the next generation uses it, and using it in interaction with one another socially and through print and broadcast media and the political process.

This entry reviews what is known about the complex phenomenon of language loyalty, exploring the following questions: Under what circumstances does a person or group demonstrate loyalty to one's language? Is being loyal to a language something that all people do, or is it particular to certain groups of people or circumstances? Are some more loyal to their language than others? What are the motivations for language loyalty? Is it possible to be loyal to more than one language?

Types of Language Loyalty in U.S. History

Joshua A. Fishman, who wrote the first major work on language loyalty in the United States, asserts that various types of language loyalty played a major role during the last five centuries of European history. Each of these loyalty types is related in different ways to nationhood. The earliest immigrants came to North America from Europe because they were disconnected from the nation building process by virtue of their peasant status and had no stake in staying in Europe. Another group came because of a concern that the European nation was corrupting the language and culture and the belief the New World provided for the preservation of their language and culture. A third group came out of fear that the language and culture were being obliterated by outside political forces in their nation, and the New World provided the place to be at liberty to live the language and culture of the Old Country.

In the colonial era and early national U.S. history, language loyalty was associated with a tension between nation building and ethnic identity. Though language loyalty was important to the nation building that was an outgrowth of the Renaissance, early immigrants arrived in the U.S. colonies and the newly established nation having meager familiarity with European events and movements to which language loyalty was related. The early immigrants were not among the European intelligentsia, middle class, and working class who stayed behind in Europe. Those who remained in Europe considered language loyalty and the maintenance of ethnic languages and cultures important to the building of European nations. Generally, those who ventured forth to the American colonies did not consider language loyalty an important factor in nation building in the New World.

Thus, as Fishman states, though the United States was born during a period when European nationalism

was extremely important, and though the United States was a reaction to that nationalism, millions of immigrant people to the United States paid little attention to language loyalty as a nationalistic concern. What was more important to successive waves of immigrants throughout U.S. history appears to have been ethnicity of a traditional, particularistic, and nonideological character. Ethnicity, with its associated language and perhaps religion, has been the general rule among immigrants rather than language as a symbol of nationalism. Languages spoken and to which immigrants have been loyal in early U.S. history were related more to everyday life than to causes or ideologies.

Though immigrants may leave their homelands without much thought about their language and ethnicity, it is generally accepted that only after arrival in the new country does loyalty to one's language become a conscious concern. Fishman asserts that in some instances, many immigrants only became aware of their *groupness* in America—their common origin, their common past, and problems shared with their group related to their current situation. Thus, we can assume, for purposes of this analysis, that only after immigration does language loyalty become a conscious concern among newcomers to any country, including the United States because it is in the comfort zone of shared language as an everyday, particularistic, and nonideological nature that group members can celebrate their common origin and understand their common past. In this same zone, they can also work together to solve problems and learn to live according to the customs in the new country.

After arrival in the new country and as their old ways of life appeared to fade, successive immigrant groups to the United States have turned to their language to protect the way of life that they came with. They have established voluntary organizations, schools, and communications media unheard of in the Old Country. These tools were expressions of their language loyalty; they were also shaped by people who would have had little prior experience in building these mechanisms had they remained in the homeland. The organizations, schools, and media worked both to preserve people's loyalty to the language, ethnic costumes, foods, and celebrations and to facilitate group members' entry into new customs of their newly adopted country. In this respect, language loyalty comes to play in a context of social change where immigrants simultaneously grasp for continuity and extend themselves into new ways of living.

A second type of language loyalty came with later immigrants who came with the express purpose of preserving a language and culture that they feared was not possible in newly established European nations. Fishman reported that many immigrants, including those in the early German sects in the United States, considered themselves as saviors of their respective languages and cultures. They came to the New World with a language loyalty for the purpose of preserving what they feared was being lost in the nationalistic European context in the 17th, 18th, and 19th centuries and could only be preserved by relocating to the New World. At times, members of these groups practiced separatist and non-participatory philosophies. In others, intellectualized concepts of nationalism and pluralistic rationales were evident. In these instances, language loyalty was expressed via political groups, schools, children's camps, choral groups, and literary and scholarly associations. Members of these groups published at an appreciably higher level than did the mass immigrant press or the mass English language press. These social and political institutions were an expression of language loyalty. Their purpose was to maintain their language and ethnic culture. Though members of this type of group have been more numerous and more influential since World War II, the preservationists have been among the many waves of immigrant groups to U.S. shores throughout U.S. history.

A third type of language loyalty is reflected in more recent waves of European immigrants, especially those from Eastern Europe who arrived following World War II—asylum-seekers who came seeking a place to preserve their language and culture threatened by outside forces. These immigrants are distinguished by their formal education in their mother tongue. More of these than those of earlier immigrant groups came with a knowledge of the national history of their homeland, and they were more likely to have what Fishman calls a diaspora consciousness that carries with it a language loyalistic and retentivistic orientation. These immigrants left homelands that were under antireligious and antinationalistic control. Upon arrival in the United States, they considered themselves the only ones who could preserve their language and culture during a period of domination by outside control in their homelands.

Examples of Language Loyalty in U.S. History

Throughout U.S. history, immigrant speakers of languages other than English have demonstrated versions

of these types of loyalty to their languages of origin. Until the mid-20th century, most newcomers were loyal to European languages. Some European immigrant languages were of higher status than others. The three of longest standing and perhaps of highest status are French, German, and Spanish.

French immigrants from Canada settled first in New England in the 19th century. They came for economic reasons to textile mill towns, and they sent remittances to their families who remained in Québec. For this group, language loyalty was intimately intertwined with their religious heritage in the Roman Catholic Church. In this tradition, language was the bond among all, regardless of social or economic station in life. Loss of language meant loss of faith, and loss of faith meant loss of eternity. Language maintenance efforts expressive of this loyalty included French-language worship, French-language parochial schools, French societies, and a French-language press that reported on French parochial schools and the need for French-speaking clergy.

Language loyalty among Franco-Americans was a family affair. Societies supported the Church, the school, and the family in remaining loyal to French and maintaining the language. Perhaps because of the egalitarian and closed nature of Franco-American community and families and their limitations in identifying loyalist leaders, the preservation of French in New England was limited because no one was available to transform concepts to concrete language maintenance efforts that would keep the French language alive in future generations. Franco-Americans hinged their language loyalty and maintenance hopes on an amorphous elite interested in French language and ethnic values. As the younger generation failed to take on leadership in preserving the language and culture, over time there was no French language to which to be loyal in the community. Today, with the exception of northern Maine, the daily use of French in New England is rare.

Immigrant speakers of German, especially those in Pennsylvania, arrived as early as the late 1600s, and came in the largest numbers in the 1800s. German immigrants considered themselves partners and equals to others in establishing the new republic. Like the French, their language loyalty was expressed in church and in elementary school. Unlike the French, language loyalty leadership was not as markedly egalitarian an enterprise within the group. Fishman reports that although 95% came for economic reasons, their

outlook was shaped by a better-educated 5% who came for ideological reasons, be they religious or political. These 5% were represented in four categories: Roman Catholics, Orthodox Lutherans, other Protestants, and Liberals.

For the most part, rural Germans were *Kirchen-deutsche* (Church Germans) of the first three categories; and urbanites were *Vereinsdeutsche* (Club Germans) of the fourth category. The main dividing line among them was between Roman Catholics and Orthodox Lutherans on the one hand, and other Protestants and Liberals on the other. As the public schools started offering German as a subject, other Protestants and Liberals abandoned their German-language schools. Because Roman Catholics and Orthodox Lutherans had always stressed bilingualism, they remained loyal to the German language and continued and expanded their language maintenance efforts through German-language schools.

Some of the German immigrants who arrived between the two world wars in the 20th century were ambivalent about the German language. They arrived at a time when nativist tendencies made language loyalty of any kind, but especially German, an unpopular enterprise among German immigrants in the United States. This ambivalence drove many Germans to dampen their urge to preserve the language among their children and to ease their acceptance into the society by allowing them to become monolingual English speakers.

The Case of Spanish

Immigrants loyal to the Spanish language also have a long history in the United States. What sets them apart from the French and Germans is that most came not from Europe, but from Latin America, primarily Mexico and the Caribbean. Also confounding our understanding of language loyalty among Spanish-speaking people in the United States is that many of them are technically not immigrants at all. Many have lived in the U.S. Southwest for generations and were already there when the territory belonged to Spain and subsequently to Mexico. The border moved as a result of political struggles between Mexico and the early United States that culminated in the Gadsden Purchase and the Treaty of Guadalupe Hidalgo in the 1800s. U.S. citizenship was conferred on those who remained in the territory. However, some argue that equal treatment did not necessarily follow.

Other Spanish speakers came to many East Coast cities, including Philadelphia and New York, from the Commonwealth of Puerto Rico. They came with a history of attempts by the United States—beginning in 1898—to colonize their homeland and to impose the English language on its inhabitants. A third major Spanish-speaking group came to the United States, primarily to Miami, Florida, from Cuba following the 1959 revolution there. A second wave of Cuban immigrants arrived in 1980 in the *Mariel* boatlift. Unlike the earlier German immigrant waves in Pennsylvania, the first Cuban arrivals to the United States were among Cuba's intelligentsia. The later wave was less educated. As with their predecessors, church, school, societies, and the political process were incubators of loyalty to the Spanish language wherever Spanish speakers from Mexico, Puerto Rico, and Cuba settled. Also similar were the struggles between Spanish-speakers whose loyalty to the Spanish language and culture prompted them to educate their children to carry on the language and culture through bilingualism in church, school, social organizations, and the press. In recent decades, these early Hispanic Americans have been augmented by hundreds of thousands of immigrants from Central and South America and the Dominican Republic. Because these groups have moved into communities that are already predominantly Latino, they have not experienced great difficulty maintaining their Spanish, at least as long as they live in those communities.

The case of Spanish is perhaps the best context in which to remind the reader that loyalty to one language does not preclude loyalty to English, the lingua franca of the nation. All of the research with respect to this topic reveals that this is the case with Spanish speakers.

Conclusion

The experiences of French, German, and Spanish speakers have been repeated as many times as the number of languages represented by newcomers to the United States who speak languages other than English. However, the most recent newcomers are coming not only from the European continent. Many emigrate from Asia and Latin America, along with refugees from a number of African nations. All bring with them a particular language and culture to which they are loyal to varying degrees and for different reasons. As with their predecessors throughout U.S.

history, language loyalty offers both continuity between old and new and community with others who share the same language, culture, and problems adapting to their new environment.

U.S. history and current sociological studies seem to suggest that it is inevitable that as those loyal to the home language grow older and the next generations mature, the language of the Old Country gives way to the language of the new, English. Appearances can deceive, because what may have been expedient for immigrants throughout the past in the United States may not be the best option for the future. Appearances can also deceive because the history may have been told in the past through an American ethnocentric lens. Perhaps today's immigrants' present experience, as we understand it, is closer to the truth of previous waves of immigrants than the history books describe. Perhaps we are all still too close to the present experience to see the similarity between these groups' loyalties to their languages and those of previous newcomers. Time will tell.

What is also not clear but worthy of continued study is the degree to which it is possible to have multiple language loyalties and consequently become multilingual in a global economy where nationalism is giving way to transnationalism and where proficiency in more than one language places one at an advantage socially, economically, politically. Also worthy of clarification is the possibility that additional reasons exist for language loyalty than those explained by Fishman some 40 years ago because global sociopolitical and geopolitical circumstances have changed since then. New patterns of relationships between language communities have emerged throughout the world. The definitive study on language loyalty for the 21st century may tell a different story from that of the 20th century.

LANGUAGE PERSISTENCE

This entry addresses the issue of language persistence, the ability of a language to survive and thrive in a society. Language persistence depends on a number of ambient conditions and other influential factors. Issues that influence language persistence include the historical period or era in question, those who use the language, the reasons that the language is used, and the importance of that language. All of these factors determine the degree to which the overall societal environment is accepting of that language. In most cases, it is not the mere existence of a single condition—such as a large base of timeless literature—that allows a language to exist but the intersection of internal and external pressures that have the greatest effect and influence on whether the language persistence will be supported or rejected. Because each of these factors is constantly changing, the conditions faced by any given language are always in flux, as is the language's likelihood to persist.

Historical Influences

A language will persist depending on conditions during the era and how that period intersects with issues that produce favorable conditions for that language. Conditions can be a product of an era's level of encouragement for language diversity and intolerance for language extinction and can be contingent on other factors, such as the place where the language exists, the language's linguistic characteristics, and the language's use. Indigenous languages in the United States present a good example of languages that are either extinct or in decline. Following the Civil War, the

U.S. government began a process of systematic forced assimilation by removing Native American children from their families and tribes. The ultimate objective of this assimilation was to "improve" their way of life and make them more American. This included eliminating their home language and teaching them English. These strategies played a part in the eradication or near extinction of many indigenous languages. Today, public sentiment will not tolerate the open and willful eradication of native languages in this way. The knowledge that these languages are endangered has allowed public and private funding to help indigenous people revive their languages. This interest, in some cases, has helped reverse the decline, and several native languages are now experiencing a promising revitalization. The critical difference is the historical period in which one or the other outcome could be expected to gain traction.

The era can largely determine the modes of communication used in a specific area; for example, how the language is able to adapt to those communicative uses determines the language's likelihood to survive. Period-specific modes of communication such as the printed press, Internet, and television have had, and continue to have, a profound effect on languages. These technologies illustrate the importance a historical era or period will have on languages. We can imagine then, that in the future, most languages in existence will continue because of interpretive technology, but that would be overly simplistic. We also know that other factors will be at play. Nevertheless, the time window for gaining a foothold on the Internet era is closing. And a language without an active Internet presence, and the existence of numerous Web sites, risks a lack of persistence into the 22nd century. European linguists believe that the Czech language is a good example of conditions that affect language. With only 10 million active speakers, a shrinking population, and young people actively surfing the Web in English, it is difficult to imagine the emergence of Czech as one of the dominant languages of Europe. Similar fears have been expressed about the Italian language because it exists in an area populated by older people and in a society that lags behind other nations with respect to technology.

Where the Language Exists

A language's chance to persist partly depends on where it exists. The coexistence of other languages in

the location where a language exists, for example, can reduce or enhance a language's chance to persist, depending on the language's standing among other languages spoken in the same region. Other factors that affect a language's survival include the area's proximity to or association with political entities where that language is prevalent or predominates, the stability of the area where the language exists, and the perceived level of threat or existing power structures posed by persons who use the language. Each of these factors can reduce or enhance a language's chance to persist depending on the relationship with other factors that produce conditions favorable to the language. A language's standing can be measured in several ways, among these the total number of speakers; number of speakers from the political, social, or economic elite; and benefits of speaking the language such as economic returns or fending off social or economic control by outside forces.

The former Yugoslavia is a textbook example of how the place where a language exists affects a language's chance to persist. In Yugoslavia, the place-where-the-language-exists factor interconnected greatly with the historical-era factor to create different environments for the multiple languages of the region. For instance, during the rule of Josip Broz Tito from 1953 until his death in 1980, language pluralism dominated Yugoslavia. Language maintenance, bilingualism, and language variety were widely and strongly supported during the Tito regime and languages enjoyed powerful legal protections. Pluralism was tied to the ideologies of national unity and linguistic equality. The likelihood that languages in the region would persist was good.

Following Tito's death and until Slovenia declared independence in 1990, the Serbs, who constituted the largest nationality group in Yugoslavia, imposed Serbian-based centralist policy and did away with pluralism. Chances that several languages in the region would persist alongside a dominant Serbian language now seem relatively weak. Interestingly, with the breakup of Yugoslavia, the likelihood that languages of the region would persist again turned promising. Slovenia, for example, adopted pluralism and protected the minority languages of Italian and Hungarian in its new constitution. Language was given human rights protection along with such characteristics as race, sex, and religion.

In an unexpected turn of events, Slovenia's openness to other languages and its stronger ties to Western

Europe have worked against the Slovene language, which has suffered losses to English and German languages in important domains. As a result, the Slovene language's chance to persist has diminished.

Speakers of the Language

A language's speakers do much for the conditions faced by a language. Increases in the number of speakers, for example through a high birth rate or through immigration, affect its likelihood of persisting, although not always positively depending on the intersection with other factors. Increases in the number of low-status immigrants who speak a different language or dialect have been met with backlash when persons and institutions of power over sociocultural, religious, and economic entities feel that their power is threatened by a surge of speakers entering "their" society.

Illustrations of backlash toward non-English speakers can be seen in the United States. Large increases in the number of Spanish speakers in several states has spurred the emergence of language restrictionist measures in those states aimed at curbing the use of Spanish and raising fears among the general public about its effect on the society. In Arizona, the Spanish-speaking population grew from 14% in 1990 to 20% in 2000. Concurrently, a drive against bilingual education led to a voter initiative to eliminate bilingual education in the public schools. The voter initiative against bilingual education was not coincidental. Other propositions followed to restrict Spanish-language use in the state, including a restriction against the use of Spanish by public employees in the exercise of their duties. Policy changes ending the practice of providing drivers' license examinations in other languages have taken effect in several states. Hence, the persistence of Spanish in an otherwise positive environment of growth has been stymied by negative public policies rooted in the same conditions. In this instance, the factor of political power made a difference. Although the Hispanic population grew rapidly, its political power did not. Rapid population growth without a parallel increase in political power led to retaliatory public policies against the language.

A backlash can also occur with increases in the social status of a language's speakers. Increased social status is generally thought to increase a language's likelihood to persist, but increased social status of the language's speakers can also lead to

retaliation against a language or languages depending on the intersection with other factors. Press reports in California showed that more persons who speak Asian languages were getting into medical schools than before and were subsequently increasing the proportion of Asian medical doctors in the state. This led to calls to raise English language proficiency requirements for admission to medical school. The long-term effect of these dynamics is likely to be a decision by many Asian families to reduce the use of Asian languages in the home and focus on English as the family language of choice.

Unless they are driven by strong nationalistic sentiment, most humans are practical when it comes to language. They often take the well-worn course of least resistance. Speakers of a language must see the benefits and advantages of a given language's persistence if they are to join in supporting the effort. Such benefits may be tied to identity, culture, economics, tradition, relationships, or other such contexts. But benefits will generally trump disadvantages when it comes to language use. Clearly observable benefits are among the strongest factors that contribute to conditions for language persistence. Language often becomes an identity marker within a given historical period. Often, it is not a difficult choice for young people to seek to identify with the persons with the more positive identity and to move away from those who are in some way stigmatized as speakers of a less prestigious language.

Language Use and Persistence

A language's use has a significant influence on its persistence. If a language is one used by educational institutions and education increases the chances to succeed, then persons will value that language provided they have access to educational institutions that use that language. But the reverse can also be true. If use of the language by educational institutions serves the function of limiting access to educational services, then the quality of educational services that accrue to this population will be poor, and the language involved may not persist within that population. The case of Arizona is once again illustrative, specifically the state's policy intended to curb the use of Spanish. Although there is little proof of the policy's effect on the use of Spanish in Arizona, the effect on access to quality education for the state's Spanish speakers has been documented. Language

policy can become, whether by design or not, the interests of the state, the media, or a multitude of other players, a gatekeeping mechanism to deny or grant access to services in education.

Whereas changes can be slow and unremarkable, what constitutes a particular language is constantly changing even when the language is mature and somewhat standardized. For example, words may be added or dropped, borrowed from other languages, or mutate in meaning. Although limited flexibility to accommodate its users helps a language's survival, excessive tolerance for change does not ensure that the language will persist. If a language mutates rapidly to the point of becoming unrecognizable in a few generations, it ceases to be classified as that language and runs the risk of being lost or becoming a low status dialect. The combined factors of ease of accommodation and speed of acceptance of foreign elements act against its persistence. English, for example, holds on to an arcane system of spelling that could benefit from simplification. But there is no movement to simplify the spelling of English words. The reasons for this are probably complex, but one factor contributing to that is fear that it would subsequently appear to be less whole, more childlike, or that it may lose its literary history and prestige. How the linguistic characteristics of a language intersect with other factors that affect persistence can determine, at least in part, the language's chances for survival—for example, how a language intersects with current modes of communication and how the language is positioned on multiple scales in a given area. Among these are degrees of prestige, prevalence, and prominence. All of these affect the language's chance for survival.

LANGUAGE POLICY AND SOCIAL CONTROL

Language policy refers to official or quasi-official efforts to manage or regulate the use or form of a language within a community. Language policy encompasses the range of decisions that people make about language. The decision to make English the official language of India offers one example of language policy, and another is a decision for instruction to be in Tagalog at a local elementary school in the Philippines. The use of one language rather than others within a community establishes and maintains the high status of that language and its speakers, positioning others lower in the hierarchy, and contributing to the loss or maintenance of a language.

Language policy is directly linked to social control and the privileging of one group of people over others

using language as a vehicle to do so. Though the loss of a language from the world's linguistic landscape is typically seen as a natural, evolutionary process over time, it is often a direct result of choices that people in power have made. The reality is that language policies are often concerted, politically motivated efforts to assert the power of one group of speakers over another.

Knowledge of the high-status language offers certain advantages to the people who speak it, such as easier access to school curricula or more lucrative jobs. History offers countless examples of the use of language policies to assert power and dominance, most obviously by governments in their efforts to create and enforce a national identity, as this entry describes.

Language Policies in Conquest, Colonization, and Nationalism

Throughout time, language has played a central role in conquest, colonization, and the formation of nations, as speakers of different languages are brought into contact amid power struggles, usually resulting in language spread. The spread of Latin during the Roman Empire, Arabic during Islamic expansion, and French during the 17th century offer instances of groups using language to promote their economic, political, or religious missions. Language has often been used to advance the goals of colonial leadership and, as a result, English has been promoted in East Africa, Russian in the former Soviet Union, and Japanese in Korea. Newly democratized or independent nations such as South Africa, Estonia, and Bangladesh have also relied on language policy to symbolize a reenvisioned national identity.

The colonization of the African continent offers many illustrations of the central role of language policy in wide-scale efforts to gain social control. French colonization in West Africa was characterized by efforts to assimilate Africans into French culture and thereby “civilize” them, and by a belief in the superiority of the French language. The exclusive use of standard French was formalized in the Brazzaville Conference of 1944, when a recommendation was made to designate it as the exclusive language of schools, and any use of local languages was forbidden. As a result, many local languages were lost.

Under apartheid, the official languages of South Africa were English and Afrikaans. In 1974, the government issued a decree that made Afrikaans, seen as the language of the oppressors, as a medium

of instruction for 50% of subjects from the last year of primary school to the last year of high school. The enforcement of this policy spawned the student uprising of 1976 in Soweto, to which the government responded violently. To reverse exclusive apartheid policies after the end of apartheid, a new constitution was formally adopted in 1996 that recognized 9 local languages in addition to English and Afrikaans. This has created a unique context in South Africa, which now has 11 official languages.

Not all new nations adopt multilingual policies, however, and most follow the one-nation, one-language ideology that took root in the early nationalist period. In the case of Israel, Zionist ideology actively and effectively promoted Hebrew monolingualism, upholding the symbolic, political connection between Hebrew and national identity. Historically, it was expected that immigrants to Israel would quickly learn Hebrew because it was necessary for their everyday lives and for their absorption and assimilation into Zionist culture. Normalization of Hebrew that revitalized the language from a primarily religious, written form into a modern, spoken language was essentially completed by 1914. By the time the state of Israel declared independence in 1948, 80% of the Jewish population claimed to know Hebrew, and more than 50% claimed to use it as their sole language. This language revitalization and subsequent shift to Hebrew took place within 50 years. With regard to social control, though this monolingual policy was viewed as essential for the state's unification, it has resulted in the marginalization of Arabic, as well as the loss of minority Jewish languages such as Yiddish and Ladino.

There have been other examples and evidence of the connection between language policy and social control; the 1976 Soweto uprising was not the only time that language policy has been a touch point for violence and resistance to domination. When Pakistan gained independence in 1947, and the national government established Urdu as the national language, Bangla speakers in the eastern part of the country resisted. The police responded violently to a strike in 1952, killing several students. This led to greater resistance and, ultimately, when the first constitution of Pakistan came into effect in 1956, it recognized Bangla as a state language. Bangladesh became independent from Pakistan in 1973 and declared Bangla its official language.

The struggles described previously are about far more than just language. They are also about how

society manages diversity, culture, power, identity, and mainly, how it treats the people who are the speakers of different languages.

Language Policy and Gatekeeping

The power of language policy as a mechanism for social control stems from the fact that language policy often functions as gatekeeper, giving access to some and denying others, in arenas such as civic participation, economic mobility, and educational opportunity. In civic affairs, language choices can be used to constrain the ability of people who do not speak the dominant language(s) to take part in elections and political discourse in general, and in some places, citizenship is only granted to speakers of the dominant language. For example, Estonia gained independence in 1991 after 50 years of Soviet rule, and established Estonian as the official language. In a backlash against the preceding "Russification" period and Russian speakers who had entered the country during that time, a law passed in 1992 requires knowledge of Estonian to gain citizenship.

In the United States, English literacy testing has historically provided a legal means for discrimination in civic participation and citizenship. Although it has been illegal since 1870 to prohibit male citizens over the age of 21 from voting, southern states adopted literacy tests as a way to bar Blacks from participation. This practice was ongoing until the passage of the Voting Rights Act of 1965. Although this law banned literacy tests for voting, literacy testing has remained a requirement for naturalization as a U.S. citizen since 1917.

Although the government initially accepted literacy in any language for citizenship, this changed in 1950 when federal law established literacy in English as a condition of naturalization. Language policies such as these bar certain groups from civic participation and citizenship, illustrating how language policies and practices can be used for social control.

With regard to economic mobility, knowledge of high-status languages is directly correlated with income and socioeconomic status. Most jobs require knowledge of the dominant language, and in some workplaces, speaking a minority language is even forbidden. In an example of a workplace language policy, Rose Associates, a building company in New York City, sent out a memo in 2007 forbidding building workers from speaking languages other than

English in all public areas as well as on the radio as a company policy and common courtesy. This policy demotes languages other than English to lesser status and curtails the opportunities for workers with limited knowledge of English to advance professionally.

In Pakistan, English provides access to jobs within the government bureaucracy and the major industrial and business sectors. However, only students of the elite private and public schools have the opportunity to learn English. Likewise, in Israel, both Hebrew and English proficiency are directly correlated with socioeconomic status. For example, knowledge of both is necessary to pass the Bagrut, a higher education matriculation exam, and for most White-collar employment. This disadvantages Arabic speakers, who speak Hebrew as a second language and English as a third language after Hebrew. Results of the national achievement exams consistently show that Jewish students outperform students in the Arab sector in English. Given that both Hebrew and English are necessary for higher education and extremely beneficial in the job market, Arab students are being systematically denied equal access to opportunity.

As evident from these examples, education has historically been a primary way that powers around the world have implemented their language policies. In schools, language policies can contribute to minority language loss or, correspondingly, academic disparities because of language; in this way, schools often participate in the marginalization of minority language speakers. The Chinese government requires Han Chinese culture and language in Tibetan schools as a form of domination, which places Tibetan students at a disadvantage and limits their ability to access the curriculum. In Kazakhstan, Soviet language education policy led to dramatic language loss, and the “Russification” of schools under Soviet rule created the situation in the mid-1980s whereby 40% of Kazakh youth were unable to read their native language. New language policy is reversing that trend by strongly emphasizing the Kazakh language in education; however, now this new language policy poses an equal threat to Russian in today’s Kazakhstan.

As a result of the imposition of English-only policies in public schools in the United States, the languages of immigrant families are typically lost by the second or third generation and replaced with English. Decisions to impose English as the only language of instruction have reflected popular attitudes toward particular ethnic groups and the relationship between

the United States and the students’ country of origin, as in the case of Japanese Americans just after World War II or the treatment of Puerto Rican Americans. The extreme losses of Hawaiian and Native American languages in the United States resulted from intentional education policies, which actively sought to replace these minority languages with English as part of wider efforts to Americanize and control these groups. Perhaps the most egregious language policy in the United States was a state law in Louisiana that made it illegal for slaves to use their native languages while they worked. The same law also forbade the teaching of English to slaves.

Although nations typically use language policies to promote one language at the expense of others, as evident in these examples, many countries now have policies designed to protect and promote regional and ethnic languages, which will preserve the vitality of these languages over time. South Africa exemplifies this—by raising nine local languages to official status in its new constitution, the government contributes to maintaining these languages. Language policies can be adopted that conserve minority languages and offer opportunities to the people who speak them. As postapartheid South Africa shows, linguistic diversity need not be viewed as a threat to national identity, but can instead be seen as a national resource. Likewise, more accepting language policies can enable and encourage civic participation and can contribute to equalizing economic and educational opportunities for all people. For this reason, language policy research in recent years has primarily advocated the adoption of language policies that create opportunities and are inclusive rather than exclusive.

LANGUAGE REGISTERS

Users of most languages alter the way they address others according to social backgrounds, intentions, geography, gender, and age. Other factors, such as occupation, may also influence register. When we speak, we sometimes shift registers to communicate effectively and appropriately with others. When we speak of *language registers*, we are generally referring to the variations that speakers or writers use in their language when addressing interlocutors other than in the expected mode or level of formality. Register shifts may be horizontal or vertical. *Horizontal shift* implies language variations used within the same group as the speaker's. *Vertical shift* relates to the degree of formality, ranging from frozen to intimate. Register is a broad concept; it may imply variations in all aspects of language, including phonology, morphology, semantics, syntax, and pragmatics. Shifts may involve both verbal and nonverbal elements. This entry describes why people shift language registers, theories of language registers, variations in language use, and implications for second-language users.

Why We Shift Language Registers

When we use language, we must consider a number of factors: who we are, who we are speaking to, the relationship between us and the other person or people, the context we find ourselves in, the purpose of our communication, and the rules for communication in that specific context. Based on our analysis of these, and other factors, we make choices relative to vocabulary, pronunciation, intonation, velocity of speech, gestures and posture, syntax, proximity, and eye contact. We consider whether to tell a joke and even how we should appear physically—type of clothing and accessories, perfumes or colognes, makeup, or hairstyle.

In short, we shift language registers in appropriate ways to follow the social rules, relate to others in some way, and make sure that we accomplish our purpose as communicators. We may want to get a job, invite someone out on a date, share a secret with a friend, explain a lesson to a group of students, write a short story, show that we are part of a group, share findings of a research project at a conference, give a guided scripted tour at a local park, or write a polite letter of complaint to a service provider. If we do not communicate in the right way, our message may not come across correctly, we may offend the person or people we are addressing, or we may detract from our message because the listener focuses attention on our inappropriateness. When language users do not know how and when to shift, they will face communication difficulties that could, in turn, lead to other types of problems—issues with relationships, work-related problems, or poor grades, among other things.

Theories of Language Registers

As with most language phenomena, *language register* is defined in different ways by different people. Thomas Bertram Reid, in 1956, is credited with the first use of the term, which then became more commonly used in the 1960s by linguists who wanted to speak or write about variations in language according to user and related to the interaction of different variables. Michael Halliday has written about user selection of language variations according to the setting. He defines three variables that influence the variation selected: field (subject matter), tenor (relationships), and mode (type of communication being spoken or written). Rodney Quirk and colleagues distribute register shifts across a formality scale that includes very

formal and frozen, formal, neutral, informal and casual or familiar. Martin Joos speaks of five styles: frozen, formal, consultative, casual, and intimate (a commonly used model).

Register shifts can be placed on a continuum. It would be difficult to place language usage neatly into one particular style at any time because users tend to overlap in their style usage, or there are modes in between, for example, intimate and casual or frozen and formal. As language users, we each operate with our own *idiolect*, a personal way of speaking and writing that lets others recognize us, and within dialects (according to age, occupation, gender, or region). Each of these adds another variable when considering register shifts. Each language user has a particular style and way of operating within the registers. People who are adept at “reading” interlocutors sometimes shift between or among registers during an initial conversation. These people observe the effect that each register type has on the other person and quickly move to whatever register seems to work best given the purpose of the exchange. Users also have varying degrees of experience within registers, which will influence how and when they use that variation. For example, a user may have little experience with frozen registers (a young child, for example) or with casual registers (someone who has few contacts with others and is mostly in a professional or formal setting). Registers also change with time. Expressions or gestures, for example, that are “in” one day may be “out” the next day, therefore marking a change in the casual register. Failure to keep up with widespread register changes can have the result of labeling the speaker as outdated or old fashioned. Individuals change and so do the times, and with these changes, language adapts and appropriateness is redefined.

Variations in Language Use

Language register may imply shifts in phonology, morphology, syntax, semantics, pragmatics, and paralinguistics. Examples of phonology shifts would be the use of abbreviated or reduced forms, like “did’ja,” or “could’ja” in casual settings. A language user in a more formal setting would use “did you” or “could you” and avoid reduced forms. In an informal mode involving mother and baby, a mother might say “wab-bit” instead of “rabbit” when playing with her child, as a strategy of endearment or imitation. In terms of morphology, depending on social class or geographical

region, a speaker might violate rules—for example, using “sheeps” or “oxes” to represent the plural instead of “sheep” and “oxen,” although language evolves with time, and usage patterns produce changes such as the acceptance of “fishes” instead of “fish” for the plural form because of common usage. An example of syntax shifting could be, “Are you interested in reading the report?” rather than “Wanna read the report?” In the case of semantics, the examples are many. Perhaps the area that has most adjustments in register shifting is that of word choice. In a more formal setting, for example, we might call a gathering of people to talk a “planning session” or a “roundtable discussion” but in casual terms, we might call it a “jam session” or a session to “chew the fat.” A problem might more formally be called “an incident,” “an inconvenience,” or “an area of opportunity,” but in more casual terms, it might be “a pain in the neck,” “a glitch,” or “a mess-up.” Pragmatically, we shift to follow social rules, to modify our style to fit the purpose. This might relate to how much information we give or how we represent an issue. For example, a politician or spokesperson at the White House might give telegraphic, nondescript information about an international incident, but a reporter would spill all the details she had available to her editor to facilitate a decision by the editor concerning the same story. In an interview, should the interviewee ask questions or challenge the interviewers? Is it all right to ask the panel to repeat or paraphrase the question?

Paralinguistically, people make decisions on issues such as clothing, jewelry, scents, makeup, body language, and gestures. When going for a job interview, should a woman wear a suit (pants or a skirt, what color, what style?) or a dress (is the look too feminine, not “power-oriented”)? Should she use jewelry or avoid it? Perhaps, if the interview is for a teaching position, the look might be a bit more conservative, as a possible partner in a law firm would look more “business oriented,” but if the position is for a cosmetic salesperson, a feminine use of clothing and makeup might be key. Should the interviewee shake everyone’s hand, sit down before being asked to sit, or hand out materials that he has brought even though they were not requested by the interviewers? When a language user opens his mouth to speak or sits down at the computer and starts to write, he makes important decisions about how he will deliver his message. What will he say and not say, and how will he say it within that particular setting? Written and spoken language

have variations between them. Commonly, young students write the way they speak, very informally, even in their own language. They do not perceive the difference between the two. In writing, just as in speaking, the user will need to decide which register or style to use. The selection of style depends on the function of the document and how we will judge the relative success of the communication. A friendly letter, a memo, a technical report, a poem, a contract, a television script, a short story that includes regional dialogues, a prayer, and a speech are all different and require different types of language.

Implications for Second-Language Learners

To function successfully in a society as a language user, English language learners (ELLs) must be able to effectively maneuver through the maze of decisions associated with register, to ensure that they are getting their messages across in a way that is appropriate according to the context in which they find themselves. A second-language learner who finds himself or herself in an English-speaking country with the task of learning how to use English appropriately must deal with many linguistic and cultural issues. Usually learners, by definition, do not dominate the language 100%, nor do they know the cultural or social rules completely. They have a competing set of linguistic and cultural rules that they have operated with all of their lives. These rules may be similar to or different from the rules in their new location, even when the language is the same. Under these circumstances, ELLs are faced with a completely new palette of words, expressions, gestures, and social relationships. Perhaps in a given country, one does not sit until invited to do so, women do not speak directly to men, children are not involved in adult conversations, certain subjects are taboo in business settings, or one must deal with social niceties before getting down to business. The learner does not know whether certain words are formal or informal and, hence, cannot judge whether they are appropriate. Should titles be used? Who can take the lead in a conversation? Should the person who approached first be the leader? All of these questions relate to facility in the selection and use of appropriate registers.

In second-language learning situations, the issue of register, especially in the case of teenagers and adults—and maybe even more so when dealing with

English for special purposes—must be dealt with concretely. Learners should be familiar with the concept of register shifting and should be able to move across registers as needed when they interact with others. This familiarity and practice can occur through role plays, reading, talking about films, or interacting in real-life situations of various types. Language learners need to have experience with observing and acting upon different types of social contexts. A demonstrated ability to maneuver within registers will facilitate entrée into, and success within, the English-speaking world. Uncertainty in handling register changes may come across as an uncertainty concerning the purpose of the exchange or the sincerity of the speaker.

LANGUAGE RESTRICTIONISM

In the context of U.S. bilingual education, *language restrictionism* is defined as systematic efforts to stop a linguistic or ethnic group of people from speaking, learning, or maintaining their native or home language. In the United States, language restrictionism has been justified under the banner of promoting national unity, ensuring the homogeneity of the citizenry, or as a means of “Americanizing” immigrants or native peoples. Learning and using the English language is usually considered the defining characteristic of “Americanism.”

Many scholars agree that a restrictive period of language policy lasted from the 1880s through the 1960s. James Crawford, in his book *Educating English Learners*, provides what may be the most comprehensive overview of the history of language restrictionism in the United States, as expressed in attitudes and policies restricting bilingual education. This entry draws from his work and that of others who have looked into this peculiarly American idea.

Although the founding fathers never selected an official language for the new nation, restricting the use of languages in public places, especially in schooling, is documented as early as the mid-17th century. Benjamin Franklin was perhaps the most notable personality who promoted language restrictionism. He opened an English-only parochial school for native German-speaking children in the 1750s. When parents realized that the school's emphasis was imposing a language shift away from German, they removed their children and withdrew political support for Franklin. In 1780, John Adams also proposed opening an English-only school, but his request was ignored by the Continental Congress, probably because the support of German-speaking colonists was vital to the nation-building effort that lay ahead.

Terrence Wiley, in a book chapter titled "Accessing Language Rights in Education," provides a history of educational language policy in the United States. In it, he identifies the groups against whom language restrictionism has been aimed historically: immigrants, including refugees, enslaved peoples, and indigenous peoples. He and others have argued that language restrictions targeting minority populations are directly and indirectly associated with social, political, economic, and educational policy debates. Further, presumed social hostility against certain populations resonates in the degree of restrictiveness against a language and the impact of restrictions on that population.

Enslaved Peoples

Often language restrictionism results in the emergence of new or altered languages as speakers resist restrictions on their native languages, chiefly the inability to study the conventional form of their languages in school. Language restrictionism, on the one hand, and powerlessness on the other are part of the explanation for how plantation owners exerted dominance over large slave populations in places where

African slaves outnumbered Whites. Linguists such as John Baugh have presented the theory that African American Vernacular English (AAVE, sometimes called "Black English" or Ebonics) emerged because (a) slaves from different language backgrounds were forced to find means of communication, and (b) educational apartheid in the United States denied access to English language and literacy development for African Americans. In the case of language restrictionism aimed at African American slaves, compulsory ignorance laws barred access to literacy until 1865. *Compulsory ignorance* refers to the practice whereby slaves were prevented from speaking their own tongues, but also prevented from learning English. In some slaveholding states, Whites were punished if they were found teaching slaves to read and write. Even after the last laws against compulsory ignorance were voided in 1918, however, equal access to education for African Americans was not provided. In 1896, *Plessy v. Ferguson* upheld the "separate but equal" doctrine that further restricted access to schooling and to the language of schooling for 50 years, until it was overturned by *Brown v. Board of Education* in 1954. Baugh and others have documented anecdotal recollections that point to the gatekeeping structures that limit access to native speakers.

Indigenous Peoples

Evidence of attempts by White Americans to restrict the use of indigenous languages appears as early as 1674, as noted by Richard Bailey in his book chapter "American English: Its Origins and History." He reports the Superintendent of the Indians in Massachusetts writing a proposal to stop attempts at teaching indigenous literacy and replacing them with how to speak, read, and write English. Beyond this early example, little documentation of language restriction exists until much later. In 1819, the Civilization Fund Act was passed to advance English education and practical skills for Native Americans, including English and Anglo values, thus restricting the maintenance of indigenous language and culture.

By the mid-19th century, language restrictionism expanded in scope tremendously and was aimed at "civilizing" Native Americans. Directly after his election as president in 1830, Andrew Jackson pushed a law through Congress called the Indian Removal Act, which required indigenous peoples to move west of the Mississippi River. This occurred largely through

coercion and force. The best-known result of the Removal Act is the historical event referred to as the Trail of Tears. Cherokees who refused to leave their land were forced westward by U.S. troops; en route, nearly 4,000 died of cold, hunger, and disease. Once resettled, tribes instituted bilingual and Cherokee medium of instruction schools, resulting in the spread of native language and literacy (an oral language, it was assigned a syllabic writing system by Sequoyah and adopted by the Cherokee nation in 1821). Ultimately, the Cherokee achieved 90% literacy levels among their people, far beyond that of White Americans of the time. One governmental response was an attack on indigenous peoples' language and culture. Crawford notes that in 1868 the Indian Peace Commission stated, "In the difference of language to-day lies two thirds of our trouble. . . . Schools should be established, which children should be required to attend; their barbarous dialects should be blotted out and the English language substituted" (p. 48). To enforce this concept, off-reservation boarding schools were created where Native American children were forcibly Anglicized and Americanized. In 1877, Congress began appropriating funding for Native American schooling, appropriating \$20,000 the first year. Restricting indigenous language use was a key objective in the new program initiatives. The superintendent of Indian Schools announced in 1887 that a native's "inability to speak another language than his own renders his companionship with civilized man impossible," and J. D. C. Atkins, Commissioner of Indian Affairs, lauded English in arguing, "This language, which is good enough for a White man and a Black man, ought to be good enough for the red man" (p. 51). In his book *Language Loyalties*, Crawford refers to the following excerpt taken from Atkins's annual report on Indian Affairs:

The object of greatest solicitude should be to break down the prejudices of tribe among the Indians; to blot the boundary lines which divide them into distinct nations, and fuse them into one homogeneous mass. Uniformity of language will do this—nothing else will. (p. 48)

In response to these calls, a "No Indian" rule was instated at boarding schools in 1890, meaning students were never permitted to speak their native languages—all communication was to be in English. In implementing this policy, most schools punished

children for speaking native languages. Adult Navajos have reported having been assigned chores, having hands slapped with rulers, and mouths washed out with soap for disobeying the English-only rules while in dormitory living spaces. Among the most successful boarding schools at teaching English was Carlisle Academy in Pennsylvania, where some teachers claimed students could attain oracy and literacy in English as quickly as in 6 to 9 weeks. Indian boarding schools exist today in a different light, as settings for students to revitalize native language and culture, but the older model of boarding schools lasted through the mid-20th century along with language restrictionism.

Immigrants

The most obvious and persistent efforts toward language restrictionism in the United States have been the promotion of a single language for immigrants. This was among the purposes of Noah Webster's dictionary. Webster intended to craft a language that reflected American culture and values and distinguished American English from British English. As noted by its publisher in 1806, Webster's was "A Compendious Dictionary of the English Language," the only truly American dictionary of its time. It was the first to document uniquely American words. Often, he changed the spelling of words so that they would reflect a distinctly American usage.

Although Webster's work may reflect early and well-meaning civic contributions to the society, often language restrictionism itself is covert, or hidden, by claims of promoting a unifying national language—English—over the languages of smaller groups that are deemed less important. Language restriction can also be overt, however, as was the case when in 1812, Thomas Jefferson considered an English-only law following the acquisition of lands from the Louisiana Purchase and Louisiana's entry into the Union. He ultimately conceded to the French-speaking majority because of near-rebellion from New Orleans residents. As noted by Crawford, from 1790 to 1830, fewer immigrants to the United States resulted in the weakening of languages other than English, until a great wave of immigrants from Germany arrived, causing German and German-English bilingual schools to gain strongholds in certain areas of the country. Bilingual schooling in German-English and other languages was widely accepted until the 1880s, when a second wave of immigration from southern and eastern Europe

(Russia, Poland, Hungary, Slovenia, Lithuania, and Italy) spread, causing renewed anti-immigrant sentiment across the country. These “new immigrants” were from a variety of different countries and their linguistic, ethnic, religious, and cultural backgrounds were less familiar to Americans than were those of their predecessors from Northern Europe (Germany, England, Scandinavia, and Ireland).

In 1889, English-only schooling laws aimed at German Catholics were passed in Illinois (Edward Law) and Wisconsin (Bennett Law). Although both were repealed in 1893, these legislative efforts reflect resistance against and distrust of languages other than English. Several years later, in 1906, Congress passed a law requiring English proficiency for naturalization.

Attempts at assimilating these new immigrants by defining or redefining American identity partly as English speakers meant promoting the idea that immigrants’ native language use should occur only in the home. According to historian Ezri Atzmon, the Bureau of Naturalization of the Immigration and Naturalization Service adopted the goal of implementing English language and citizenship classes for immigrants across the country between 1914 and 1920. In 1916, the agency invited more than 200,000 naturalization applicants to join such classes. This sort of “social support” reflected a move away from the acceptance and integration of the languages and cultures brought by immigrants to the United States and a new emphasis on “Americanization” through the imposition of English.

After the United States entered World War I in 1917, the move for Americanizing “the other” gained even more momentum as xenophobia set in, particularly against the substantial number of German immigrants who had arrived in the United States in earlier decades. As noted by Bernard Spolsky, a massive reaction against anything resembling Germany took hold, especially regarding language, an obvious marker. Thirty states passed laws requiring nonnative English speakers to attend English language classes, and 34 states passed English-only schooling laws. According to Aneta Pavlenko, a Nebraska Congressman’s words illustrate popularly held notions of anti-immigrant and anti-immigrant’s language, “If these people are Americans, let them speak our language. If they don’t know it, let them learn it. If they don’t like it, let them move” (p. 178). Restrictions against the use of German were widespread, and those heard speaking German were perceived as unpatriotic and as suspect. Wiley notes that in Jefferson County, Nebraska, local council members

ordered telephone operators to cut off those who publicly spoke German over open lines. Movie theaters were closed, bans on German music ensued, German Americans were encouraged to cancel subscriptions to materials printed in German, and ultimately instruction in foreign languages was deemed un-American. Pavlenko identifies two discourses that were adopted in pursuit of language restrictionism: (1) the positive cognitive and linguistic influences of learning English, and (2) devaluing multilingualism, foreign-language teaching, and native-language maintenance among immigrant populations. In 1919, Theodore Roosevelt, addressing the American Defense Society, called for restrictions on languages other than English, stating, “We have room for but one language here, and that is the English language, for we intend to see that the crucible turns our people out as Americans, of American nationality, and not as dwellers in a polyglot boarding house; and we have room for but one sole loyalty, and that is the loyalty to the American people.” Americanization efforts, largely manifested as language restrictionism in the form of antibilingual education and antiforeign-language instruction continued through the 1920s, and in 1924, the National Origins Act identified quotas based on immigrants’ national origins, which reduced incoming immigration until the 1960s.

Despite this period of restrictiveness, there were advocates for German Americans and supporters of rights to native language use and maintenance. These attitudes, although shared by far fewer Americans, are evident in such cases as *Meyer v. Nebraska* in 1923, which overturned an earlier case that prohibited German-language instruction, and *Farrington v. Tokushige* in 1927, in which the Supreme Court ordered that a ban on heritage language instruction in Japanese, Korean, and Chinese offered outside of public schooling was unconstitutional. The restrictions on language of this period were eventually overturned in policies that grew out of the civil rights movements of the 1960s but have since been reinstated, evidenced, for example, by English-only medium of instruction laws enacted in Arizona, California, and Massachusetts. This last wave of restrictionism has been specifically aimed against bilingual education and is the greatest single policy threat at the moment. As of this writing, there has been no move to reverse them.

LANGUAGE REVIVAL AND RENEWAL

Half of the 6,000 to 7,000 languages worldwide are considered “endangered,” as parental transmission loses out to other influences and power languages take

over the task of global communications. Of these, more than 500 are considered “moribund” or nearly extinct, with only a few elderly speakers still living, according to the language resource *Ethnologue*. In the United States, 68 indigenous languages are in this category. The process by which languages become extinct is known as language loss, language obsolescence, language death, or extinction. On the other side of the language coin, efforts to instill vitality in a language that is either extinct or in the process of becoming so are referred to as *language maintenance*, *language revival*, *language renewal*, and more generally, as *language revitalization*. This entry discusses those efforts.

Languages and the sociocultural contexts in which they function have never been static, and language loss is not a new phenomenon. The nature, scale, and scope of the current pattern of linguistic change is unprecedented and distinct from what occurred before the colonial projects starting in the 16th century and the formation of large nation-states in the 18th and 19th centuries. Since then, languages have been lost at an unprecedented pace. This replacement of thousands of languages by a few languages represents a loss of cultural and intellectual diversity to the world. From an individual perspective, language loss represents a shift in identity; from a community perspective, it represents the loss of cultural values, beliefs, traditions, and knowledge that are closely tied to the languages in question. Many scholars, including Joshua A. Fishman, David Crystal, and Leanne Hinton, agree that cultures cannot long survive without the languages that are used to express their more nuanced feelings, emotions, and ideas.

Besides the loss of important linguistic resources to the world, maintaining a community language is nowadays considered a basic linguistic human right to be protected. Around the world, local and indigenous communities have become aware of this problem and are taking action to reverse the course of language loss. Patterns of language loss and extinction are nearly always tied to political, military, or economic takeover or decline. They may be either slow and steady or abrupt, happening within a single generation. In the 20th century, developments in communication and universal education contributed to the decrease in the domains in which local and indigenous language may be used. Today, the phenomenon of globalization is also contributing to the decline in use of local and indigenous languages. Languages of wider communication, such as English, Spanish, and Chinese, are

considered instrumental in conducting business and communicating on a global scale. According to the Endangered Language Fund, if the current patterns of language shift and language loss continue, half of the current languages in the world will be extinct by the year 2100.

Language revival and *renewal* are two of the terms applied in the literature to efforts by communities and advocates to maintain local and indigenous languages in use and halt the process of language loss and extinction. These terms, together with the more general *language revitalization*, are not always defined consistently; although some authors make clear distinctions among them, others choose to use them interchangeably. *Language revival*, in its most strict definition, applies to efforts to revive a language that is no longer in use by any native speakers. In a broader sense, this refers to the process by which members of a speech community try to revive fluency, strengthen existing competence, and expand the language's uses by adding new domains of use. *Language renewal* is referred to as efforts by adult community members to ensure that at least some of them will continue to use and promote a traditional language that has experienced decline in use. An example of this is the Master-Apprentice Language Program in California, in which elderly speakers of native languages act as mentors to adult members of the community, teaching them the language so they in turn help the community in revitalizing the language.

A related term, *language revitalization*, is used to refer to efforts to impart vigor and restore vitality to a language that is experiencing a decline in use. Reinstatement of the transmission of a language across generations may not necessarily be the primary or essential goal of these efforts; they involve increasing the number of users and promoting new uses of the language, by expanding its domains and instituting learning programs. The goals of these efforts usually depend on the particular situation of a language and the community that speaks it. Although the process of language loss and extinction is seldom planned, language revival and renewal efforts usually require deliberate actions by the community, known as language planning.

Factors in Language Revival and Renewal

Endangered languages may still be spoken by all age groups in a community, but there may be a decline in

the proportion of children learning the language at home or a decline in the domains in which the language is used. There may be cases where a language is no longer being learned by children in the homes, with either the parent or grandparent generation as the last fluent speakers of the language. A language may have only a few individuals, or elders, who still know the language and may or may not have a chance to speak it. Or, a language may have lost all its speakers. The United Nations Educational, Scientific and Cultural Organization (UNESCO) the expert group on endangered languages identifies nine factors for assessing the vitality of a language, including the following: (1) intergenerational language transmission, or whether the language is still in use by all generations, (2) absolute number of speakers, (3) proportion of speakers within the total population, (4) trends in existing language domains, or whether the language is used in all domains and for all functions, (5) response to new domains and the media, (6) availability and promotion of materials for language education and literacy, (7) governmental and institutional language attitudes and policies including official status and use, ranging from equal support to prohibition, (8) community members' attitudes toward their own language, ranging from all members valuing and supporting the language to no one caring if the language is lost, and (9) amount and quality of documentation, ranging from comprehensive to inadequate.

Although language communities are complex and diverse and a single factor is not sufficient to determine the need for documentation for a particular language, these guidelines taken together may be useful in assessing a language's situation in a society, and helping determine what types of efforts are necessary in the maintenance, revitalization, revival, or renewal of the language.

Another set of factors that may contribute to revival and renewal efforts are offered by David Crystal, in his book *Language Death*. He argues that languages may improve their chances of being maintained if their speakers (a) increase their prestige within the dominant community, (b) increase their wealth, (c) increase their legitimate power in the eyes of the dominant community, (d) have a strong presence in the education system, (e) can write the language down, and (f) can make use of electronic technology. The role of literacy and the media in language revival and renewal is controversial, and one that has been extensively argued. Although some consider literacy as an important, even crucial

factor in the revival efforts of a language, others see it as detrimental to a community's oral tradition. The role of the media is also controversial because it exposes formerly isolated communities to the influence of a globalized economy and the pressures to acquire dominant languages. At the same time, the media can function as a powerful tool in aiding the efforts of communities to maintain their community connected and the language in use. The Internet in particular has been reported as useful in both documenting languages and connecting communities and their languages.

Stage-Based Approaches to Language Revival and Renewal

In an effort to conceptualize a course of action to reinstate intergenerational transmission, Joshua Fishman offers a typology and rationale for Reversing Language Shift (RLS) in eight sequential stages through which this can be accomplished, referred to as the Graded Intergenerational Disruption Scale (GIDS). This scale consists of a continuum of eight stages of language loss in which eight is closest to extinction and one closest to dynamic continued use. Fishman proposes GIDS as an assessment tool to establish the language's situation and, at the same time, as guidelines to determine what course of action is needed to restore the language to the vitality needed for intergenerational transmission. *Stage eight* refers to "nearly extinct" languages with only a few isolated elders who speak the language. At this stage, possible courses of action include documentation through recordings and transcription, master-apprentice programs in which adults learn from the elders, and getting elders connected via telephone and digital media. *Stage seven* happens when only adults beyond childbearing age speak the language. Possible courses of action at this stage include grandparents teaching their grandchildren the language, and the establishment of immersion preschools or "language nests" where these speakers team up with teachers to expose young children to the language. *Stage six* refers to the reappearance of intergenerational oral transmission of the language. Fishman notes that this is a difficult and crucial stage because most languages survive at this level without the need to go to subsequent stages. Courses of action at this stage include developing places in the community where the language is promoted and used, and encouraging families to speak the language at home with and around their children.

Stage five includes the use of literacy in home, school, and community, but without necessarily being present in formal institutions. Courses of action at this stage might include promoting literacy in the language through voluntary programs in schools and other institutions to increase prestige and use. *Stage four* involves the required use of the language in elementary education. At this stage, courses of action include the improvement of instructional methods, developing dual-language programs where children outside the community learn the language, and developing textbooks and literature in the language for content and literacy instruction. This is the first step that may require regular contact and cooperation outside the speech community. *Stage three* involves the use of the language outside the community in places of business and some work environments. Actions that may be taken at this stage are the promotion of the language as the language of work throughout the community and developing vocabulary so that the language can be used in all work environments. *Stage two* is achieved when the language is used by local government and local mass media. Actions at this stage include promoting the use of the written form in government and business, as well as promoting periodicals, radio, and television in the language. *Stage one* refers to the use of the language in higher education, government, and the media (without political independence). Fishman cautions that achieving this stage does not mean the end of problems despite the advantage of reaching this level; rather, problems become more politicized and aggravated. Actions at this stage include teaching a variety of subjects in the language in higher education, promoting publication of literature and public performances (i.e., theater, concerts) in the language, as well as creating awards to promote these efforts. Fishman's model has been adopted and adapted extensively; however, the situation of endangered languages is usually complex, involving several of the stages at the same time, which makes the linear application of his model either difficult or impossible. Further, in some instances, achieving intergenerational transmission is no longer possible but maintaining the language in different domains is.

Leanne Hinton, in the introduction to *The Green Book of Language Revitalization in Practice*, offers an adaptation of Fishman's model that provides steps toward language revitalization. She notes that these steps may happen simultaneously and may begin even before the language planning first step takes place. In Hinton's model, *step one* involves language assessment

and planning. *Step two* involves reconstruction of the language in cases where there are no speakers left, and *step three* involves documentation when only a few elder speakers remain. *Step four* involves developing second-language learning programs for adults who will become instrumental in later steps. *Step five* involves redeveloping and enhancing cultural practices that promote the use of the endangered language at home and in public. *Step six* involves an intensive language-learning program for children, and *step seven* involves the use of the language in the homes as the primary means of communication. *Step eight* involves expanding the use of the language to different domains within the community, and *step nine* involves doing the same outside the community. Hinton stresses that some of these steps may be outside the desired goals of small communities, though some of the early steps may not be necessary for some communities.

Hinton also describes different approaches used in language revitalization efforts, which include (a) school-based programs, (b) children's programs outside of school, (c) adult language programs, (d) documentation and materials development, and (e) home-based programs. School-based programs include the teaching of the endangered language as a subject, bilingual education, immersion schools and classrooms, and culture programs. Children's programs outside of school include after-school programs and summer intensive language and culture camps. Adult programs include evening classes for adults and their families, community recreation programs, and master-apprentice programs. Documentation efforts are particularly important in the case of seriously endangered languages and they must be carried in conjunction with other measures. Some languages are better documented than others, and having more documentation is always better. Modern audiovisual and digital technology may prove valuable in carrying out these efforts, especially in relation to how people actually use the language. Home-based programs are aimed at establishing transmission across generations, and involve both the parent and the grandparent generations carrying out daily tasks as well as traditional activities in the language. Depending on the language community, some of these efforts will take precedence over others, but all scholars and advocates in this field agree that a combination of measures is most effective in revitalizing a language.

The most famous case of language revival is that of Hebrew, which went from being a liturgical language to a spoken vernacular with the advent of the state of

Israel. Other known cases of language revival and renewal around the world include Catalan and Basque in Spain, Irish in Ireland, Māori in New Zealand, Sami in Norway, Quechua in the Andean countries, and Hawaiian in the United States. Official status granted to many of these languages was one of the measures taken, but this alone is not enough as a combination of official governmental measures and community-driven actions are often necessary to achieve the goals of revitalizing a language. This is especially important given the social nature of language that needs its speakers more than official documents. In many instances, efforts to revitalize these languages achieved no more than halting the decline in the number of speakers, or adding new domains to the language. However, had these measures not been taken, the state of these languages might be different today.

LANGUAGE RIGHTS IN EDUCATION

In dealing with educational language rights in the United States, it is useful to make a distinction between the *right to access* education and the *right to an education in one's mother tongue(s)*. For language minority students, both rights are important for participation in the broader society and staying connected with their home/community language. According to Reynaldo Macías, two basic rights exist: (1) the right to freedom from discrimination on the basis of language, and (2) the right to use one's language in the activities of communal life. There is no legally protected right to choice of language except as it flows from these two rights in combination with other rights, such as due process, equal enforcement of the laws, and so on.

In the United States and other Western countries, rights are usually located in the individual rather than in groups, explains Macías. In international law, all the existing rights are individual rights and freedoms, although their manifestations may involve more than one individual, according to Fernand de Varennes. The idea of language rights generally means something different than freedom of speech. Language rights around the world frequently are ignored in the formulation of educational policies. Unfortunately, even though organizations such as the United Nations have passed resolutions supporting the right of children to instruction in their native languages, member nations, including the United States, do not act on them because these resolutions are not binding, clarifies Tove Skutnabb-Kangas.

In the United States, language rights are largely derived from their association with other constitutional protections, which are also linked to race, religion, and national origin. Bill Piatt argues that some accommodations for the use of minority languages have been made in some legal cases dealing with educational, economic, and political access; the recognition of language rights generally and linguistic accommodations, therefore are on a tenuous legal foundation. This entry describes the orientations and implications of language policies, their historical context, and key court decisions relating to educational language policies.

Policy Orientations and Their Implications

Language policies have a direct effect on language rights. In considering policies, it is useful to note their

functions in either promoting or restricting rights. Traditionally, many scholars—such as Heinz Kloss, for example—limited their analyses to formal policies, or explicit language laws. Language rights in practice are also shaped by *implicit/covert* policies as well as by *informal* practices that can have the same or even greater force than official policies. *Implicit* policies include those that overtly start out to be language policies but have the effect of policy. Arnold Leibowitz explains that *covert* policies, as the word implies, are more menacing because they use English language or literacy requirements as a means of barring someone from social, political, educational, or economic participation.

Promotion-oriented policies are those that use the resources of the government to advance a language. Historically, by the 1920s, English had been officially designated as the language of schooling in the majority of states. Even before the official designation of English, most language resources have flowed primarily into English instruction. The federal and state governments have rarely tried to promote languages other than English in education, except for purposes of strategic national self-interest or defense. A recent exception has been the Native American Languages Preservation Act of 2006 (H. R. 4766, 109th Congress), which has authorized funds for the promotion of threatened languages. More typically, governmental educational policies of the past several decades only have sought to assist in communicating with non-English-speaking populations through *expediency-oriented accommodations*. These are also used when, as Kloss notes, the government/state sees a need to communicate with speakers of minority languages to provide a bridge between minority populations.

Historical Context

In the United States, much of the focus on language rights and schooling has centered on immigrant language minorities. Immigration certainly has been an important source of language diversity. Nevertheless, other sources are also important. Historically, the major types of language minorities have been *immigrants*; *refugees*; *enslaved peoples*, who were forcibly brought here; and *indigenous peoples*. Meyer Weinberg explains that enslaved Africans were among the early recipients of attention and experienced the brunt of early restrictions on their language rights and educational rights, and Native Americans were targeted during the latter

19th century with policies designed to eradicate their languages.

Leibowitz reports that in 1790, approximately 23,000 Spanish-speaking people inhabited areas on the North American continent that would later become part of the southwestern United States. Macías has argued that the notion of indigenous peoples should be extended to include (a) those Spanish-speaking peoples who inhabited an area that later became part of the United States, before its national expansion into the region they occupied, and (b) groups that have a historical or cultural bond to the Americas before European colonization. A similar case could be made for those who spoke French or Russian at the time of their incorporation. Thus, for many, language shift to English resulted not from the choice to assimilate, but as a result of involuntary immigration and enslavement, or annexation and conquest. Territorial expansion and forced assimilation aside, immigration was the major source of language diversity in the 19th and 20th centuries.

During the first 130-plus years of U.S. history, a *tolerance-orientated* policy climate prevailed toward speakers of most European languages. Although the federal and state governments did not promote these languages, attempts to restrict them were rare. During the early republic, education among European-origin peoples was largely supported through private and sectarian means. During this period of relative tolerance, German Americans provided support for instruction in German or bilingual instruction in German and English. Some states, such as Ohio and Pennsylvania, with large German-origin populations during the 19th century allowed public-supported education in German and German/English. Terrence Wiley reports that nevertheless, for the most part, local and private stakeholders provided support for instruction in languages other than English as well as bilingual education. African-origin peoples, however, had a different experience given that *restrictive* literacy policies appeared in slave codes in the 1740s. Slaveholders saw literacy as a direct threat to their ability to control those enslaved. The last of the *compulsory illiteracy* laws, which made it illegal to teach literacy, remained on the books until 1865. During the 1880s, Native American children were forcibly wrenched away from their families and required to attend military-style boarding schools where only English was permitted, as Weinberg explains. Attitudes and policies toward speakers of European languages began to change during the World War I era, however, as speakers of German, the second most populous linguistic group at that time, suddenly found

themselves stigmatized and forced to use English, alleges Wiley. During the 1920s and 1930s, Chinese and Japanese community-based schools operated, often meeting resistance from territorial authorities in Hawai‘i and state authorities in California.

School-based language requirements and standards have been used covertly as surrogates for racial discrimination. In Hawai‘i during the 1920s, for example, so-called English Standard Schools were implemented. Placement in these schools was determined by performance on Standard English tests. Students were sorted into “standard,” “nonstandard,” and “feebleminded” educational tracks. Michael Hass claims that without resorting to overt racially based segregation, language proficiency became the means by which a system of racially segregated schooling was established wherein English language proficiency generally correlated with race or ethnicity.

Educational Language Policies in Societal Context

A number of scholars contend that educational language policies are best understood in their relationship to broader societal policies, dominant beliefs, and power relationships between groups. In this regard, Leibowitz concluded that language policies have been used as instruments of *social control*. He argued that official language policies in education are related to larger problems in society, and language was one of many responses. He noted, for example, that although English was used as the official language for specific functions (e.g., instruction at school, and voting), its use was paired with limitations for the use of languages other than English. In addition, legislation and practices in other areas were discriminatory in nature toward linguistic minority groups; this included undisclosed humiliations. Leibowitz highlights how these situations did not relate only to language, but rather to broader issues. He contends that English-only policies imposed on German, Japanese, and Chinese immigrants as well as on Native Americans, Mexican Americans, and Puerto Ricans corresponded to the general level of *hostility* of the dominant group toward various language minority groups.

Key Court Decisions

The belief that all children deserve the right to educational opportunity in public education received support only gradually. A legal basis for their language

backgrounds being accommodated is much more recent. During the 19th century, the notion that children have a right to publicly supported education gradually gained favor. Even as it did, however, the right to equal educational opportunity was withheld from many children of color, many of whom were also language minorities, as Joel Spring and Weinberg explain. The 1896 Supreme Court decision *Plessy v. Ferguson* (163 U.S. 537) affirmed the dogma of segregated, *separate but equal* education, which was not overturned until 1954 in *Brown v. Board of Education* (347 U.S. 483). In *Brown*, race was the singular focus, but some language scholars such as Skutnabb-Kangas have made a similar case for the importance of language rights, though this position has found little support in U.S. law.

Meyer v. Nebraska

Following the antirealism of World War I, many states passed laws prohibiting children from studying a foreign language until Grade 6 or Grade 8. Nebraska similarly passed a law prohibiting foreign-language instruction. The intent of these measures was to make foreign languages inaccessible during those ages when children would have the best opportunity for learning and retaining them. By 1923, several appeals challenging these prohibitions had been filed with the Supreme Court, as Piatt explains. The critical case was *Meyer v. Nebraska* (262 U.S. 390 [1923]). Meyer was a parochial schoolteacher who was convicted and fined for breaking the Nebraska law prohibiting foreign-language teaching. He appealed to the Nebraska Supreme Court and lost. The Nebraska court took the position that teaching German to children of immigrants was a threat to national safety and self-interest. However, in 1923, the Supreme Court overturned the Nebraska decision based on the reasoning that in peacetime such an extreme restriction on foreign-language teachers or parents who wanted their children to learn foreign languages. By a 7–2 vote, the Nebraska law was held to be an infringement of the Due Process Clause of the Fourteenth Amendment (as described by I. N. Edwards, Paul Murphy, Piatt, and Wiley).

Murphy explains that although the *Meyer* case ruled that unduly restrictive educational language policies were unconstitutional, it failed to establish little more than a weak precedent for educational rights because the court accepted the view that all citizens of the United States should be required to speak a common

tongue. *Meyer* also affirmed the “power of the state to compel attendance at some school and to make reasonable regulations for all schools. The requirement that they give instruction in English was not questioned . . .” (as cited in Jill Norgren & Serena Nanda, 1988, p. 188). Thus, a major outcome of *Meyer* was to affirm the official status of English language instruction.

Farrington v. Tokushige

A few years after *Meyer*, in a related decision, *Farrington v. Tokushige* (273 U.S. 284 [1927]), the Supreme Court, following *Meyer*, ruled against the territorial governor of Hawai‘i who had attempted to impose restrictions on private or community-based Japanese, Korean, and Chinese foreign-language schools. *Farrington* was important because a large number of such schools had been established in Hawai‘i and in California, as reported by Leibowitz and by Robert Bell. Many of these schools thrived during the 1920s and 1930s, just as similar schools do today. These heritage language schools provided supplemental instruction in native languages to the English-only instruction provided in public schools. During World War II, however, *Farrington* had no impact when the federal government prohibited Japanese instruction in the federal internment camps in which Japanese Americans were imprisoned, as illustrated in U.S. Senate documents from 1943 to 1974.

Lau v. Nichols and Related Cases

The most significant legal case with implications for language minority students’ educational rights since *Meyer* was *Lau v. Nichols*. The case was filed in San Francisco. California, like many other states, had a prior history of discriminating against language minorities. During the late 19th century, segregation of Asian-origin students was legal, and as late as 1943, the California constitution had affirmed legal segregation of schoolchildren of Indian, Chinese, Japanese, or “Mongolian” parentage. This stipulation was not overturned until 1947.

As in many educational discrimination cases, *Lau* was brought as a lawsuit only after failed efforts by parents and community language rights activists to receive appropriate educational programs for language minority children. Li-Ching Wang, a community leader involved in the 4-year litigation, noted that the Chinese American community had held meetings with the San Francisco school administrators

over a 3-year period. They did several studies demonstrating what children who did not speak English needed and developed proposals of several ways to approach these issues and staged demonstrations in protest of district inaction. As a last resort, Chinese American parents and community leaders filed a lawsuit offering as evidence that of 2,856 Chinese-speaking student who needed help, 1,790 of them did not receive any help or special instruction; only 260 of 1,066 of this student population who received special instruction in English had bilingual Chinese-speaking teachers, as Edward De Avila, Edward Steinman, and Wang further explain.

Despite these inequities, the circuit court of appeals sided with the school district concluding,

The discrimination suffered by these children is not the result of laws passed by the state of California, presently or historically, but is the result of deficiencies created by the children themselves in failing to know and learn the English language. (Cited in De Avila, Steinman, & Wang, 1994, p. 16; emphases added)

In 1974, the Supreme Court, however, ruled in favor of the plaintiffs. In writing for the majority, Justice William O. Douglas noted the connections between language and race, ethnicity, and national origin as he concluded,

The failure of the San Francisco school system to provide English language instruction to approximately 1,800 students of Chinese ancestry who do not speak English, or to provide them with other adequate instructional procedures, denies them a meaningful opportunity to participate in the public educational program and thus violates § 601 of the Civil Rights Act of 1964, which bans discrimination based on “the ground of race, color, or national origin,” in “any program or activity receiving financial assistance. . . .” (*Lau v. Nichols*, 414 U.S. 563 [1974])

Focusing on the issue of the importance of language for educational access, Douglas chided the lower court and school district for implying that schools are not “legally or morally obligated to teach English,” as he concluded,

Basic English skills are at the very core of what these public schools teach. Imposition of a requirement

that, *before a child can effectively participate in the educational program, he must already have acquired those basic skills is to make a mockery of public education. We know that those who do not understand English are certain to find their classroom experiences wholly incomprehensible and in no way meaningful. . . . (Lau v. Nichols, 414 U.S. 563 [1974] emphasis added)*

The significance of *Lau* is that it required schools to accommodate children who do not speak English. It did not, however as is sometimes thought, require bilingual education or any other specific educational remedy. Douglas noted, “Teaching English to the students of Chinese ancestry is one choice. Giving instructions to this group in Chinese is another.”

In the mid- to later 1970s, federal authorities did attempt to outline what approaches could be used to accommodate language minority children. These came to be known as the *Lau* Remedies. These were subsequently withdrawn by the Reagan administration (see work by James Crawford). Nevertheless, using *transitional* bilingual education as a remedy was prescribed in several district court cases, the first of which was *Serna v. Portales Municipal Schools* (499 F.2d. 1147, 1154 [10th Cir. 1974]). Other important district court cases that prescribed transitional bilingual education include *United States v. Texas* (506 F. Supp. 405 [E.D. Texas 1981]) and *Ríos v. Reed* (480 F. Supp. 1978). Significantly, however, neither *Lau* nor related cases such as *Serna* addressed the constitutional issue of equal protection under the Fourteenth Amendment. This means that language access in education issues have been largely based on legislative protections against discrimination under the Civil Rights Act of 1964, rather than directly on the Constitution.

According to Martha Jiménez, the question of determining whether the school districts have complied with *Lau* was left to federal courts to resolve. The significant case in addressing this issue was *Castañeda v. Pickard* (648 F.2d 989 [5th Cir. 1981]). The importance of *Castañeda* is that it laid out criteria known as the three-part test by which ““appropriate actions”” by school districts ““to overcome language barriers”” could be assessed. These criteria required that any educational remedy for language minority children must (1) be based on sound educational theory; (2) it must have a reasonable plan for implementation, including the hiring of appropriate

personnel; and (3) it must produce positive educational results.

In returning to the distinction between the right to access education and the right to an education in one's mother tongue(s), court decisions in the United States have upheld the former within the context of accommodating language minorities. This is essentially a right of access. To date, the courts have largely sidestepped the issue of the right to education in one's home or community language through public schools. Language minority parents and communities can, however, do so through private and community-based efforts without restriction based on the *Meyer* and *Farrington* decisions.

LANGUAGES, LEARNED OR ACQUIRED

As this entry describes, a common debate in language teaching and in linguistics centers on the question of whether languages are learned or acquired. Stephen Krashen used the term *learning* to refer to a conscious process of language development that occurs as a result of direct teaching. In contrast, *acquisition* is a subconscious process of language development that occurs as the result of exposure to meaningful messages in a language. Even though some researchers have argued that there is a continuum moving from acquisition to learning rather than a clear distinction, the two terms are widely used in the research literature, and the distinction seems to be a useful one.

Most researchers agree that many aspects of a child's first language are acquired. Children seem to acquire the phonology of a language. Within a fairly short time, they can understand and produce messages in a language their parents or other caregivers use to communicate with them. In addition to the sounds of the language, children acquire the syntax. Experiments with young children brought up by English-speaking parents show that they understand the difference between "Big Bird is washing Cookie Monster" and "Cookie Monster is washing Big Bird." This research demonstrates that the children recognize that there is a link between the order of the words and the meaning, and that in English, the first noun phrase is the subject or actor whereas the second is the object of the sentence.

Although phonology and syntax appear to be acquired rather than learned, other aspects of a first language, such as the vocabulary, may be learned. However, there is more debate about whether additional languages can be acquired. Similarly, some would argue that written language is learned, but others hold that literacy is acquired in the same way that oral language is. The debate is not simply academic

because the position one holds has clear implications for teaching in bilingual classes.

First-Language Acquisition

Support for the claim that first languages are acquired comes from Noam Chomsky's theories of linguistics. Chomsky, the foremost linguist in the United States, developed a theory referred to as *generative linguistics*. Chomsky was interested in describing language as a set of rules that could be applied to generate all the sentences of a particular language. No limit exists on the number of different sentences that can be expressed in any language, so there must be a finite set of rules capable of generating an infinite number of sentences. For this description, to reflect psychological reality, the number of rules must be relatively small. Otherwise, humans couldn't acquire them.

Chomsky's answer to the question of how children acquire language is that children have an innate capacity for language, which he at first called a *language acquisition device*. This language acquisition device is a specialized area of the brain designed for language. According to Chomsky, humans do not simply have a special cognitive capacity for figuring out language. Rather, humans are born with the basic structures of all human languages already present in the brain. Chomsky calls this innate knowledge of language *Universal Grammar*. Children are not born with knowledge of English or Japanese or any other human language. Instead, they are born with knowledge of those elements that are common to all human languages.

As a result, the task facing the child is not to learn how language works, starting from scratch. Instead, because children are born with an implicit knowledge of language in general, and they have to figure out how the particular language (or languages) they hear functions. For example, all languages have something like prepositions, words that show relationships among things (The book is *on* the table). In such languages as English, these words that show position come in front of the noun, so they are called *prepositions*. In other languages, these words follow the noun, so in those languages, a child would encounter sentences with this pattern (e.g., The book is the table *on*). In such languages, these words are called *postpositions* because they come after (post), not before (pre).

Children are born with the built-in knowledge that the language they hear will have a word to show position. What children must figure out is whether the position word precedes the noun or follows it. This is

a much easier task than starting without any knowledge and having to learn that there are some words that show position and having to learn where those words go in the sentence.

If children have a Universal Grammar, this hard-wired knowledge, then it is not surprising that most children acquire the language that surrounds them. Not all of language, however, is innate. Certainly, children have to learn individual words. Vocabulary can't be built in because it is not completely systematic and predictable. There is no regular connection between sounds of words and their meanings. Even though there are patterns within vocabulary that enable children (and adults) to develop vocabulary knowledge fairly rapidly, learning vocabulary is different from acquiring the phonology or syntax of a language. However, Chomsky's claim is that most of language is innate. He and other linguists base this claim on certain facts: (a) Most children acquire a first language rapidly and without formal instruction, (b) they do this with only a limited amount of evidence, and (c) they do it with only limited feedback.

Second and Written Languages

Stephen Krashen bases his theory of second-language acquisition on Chomsky's theory of linguistics. Krashen claims that the same process that enables a child to acquire a first language applies to a child or an adult acquiring a second language or learning to read and write. Evidence for Krashen's position comes from the fact that most students who attempt to learn a second language in school fail to reach high levels of proficiency and quickly lose their ability to speak the language if they do not continue to use it. Conversely, people who live in an environment where communication takes place in a second language seem to be able to pick up the language naturally and to retain it. In this context, the second language is acquired, not learned. In addition to his acquisition/learning hypothesis, Krashen developed several other hypotheses to account for how second languages are acquired. These include the Natural Order Hypothesis, the Monitor Hypothesis, the Input Hypothesis, and the Affective Filter Hypothesis.

The Natural Order Hypothesis

Krashen reviews research that shows that language, both first and second, is acquired in a natural order. Simply put, some aspects of language appear in

the speech of language learners before other features. For example, babies acquiring English first produce sounds with vowels (usually the low, back "ah" sound) and later add consonants beginning with consonants formed with the lips like *p* or *m*. This helps explain why the first word of many infants is something like *mama* or *papa*, much to the delight of a parent. Sounds like *r* come later. That's why young children might say, like Elmer Fudd, *wabbit* instead of *rabbit*. Other parts of language also appear in a natural order. Statements come before questions. Positive statements come before negatives, and so on.

Researchers in second language found the same phenomenon. The natural order of second-language acquisition differs slightly from that of first language, but there is a definite order. Heidi Dulay and Marina Burt studied Spanish and Chinese speakers acquiring English and looked at the order in which certain morphemes appeared. Dulay and Burt noted that the plural *s* in a word such as *toys* showed up in children's speech earlier than the third person *s* of present tense verbs in sentences like "He plays." Whether researchers look at the acquisition of sounds, word parts, or sentence patterns, they find an order of acquisition that is the same even for children whose first languages are different. The order seems to come from the language being acquired, rather than a transfer of features from the first language.

The Monitor Hypothesis

This hypothesis helps explain the role of learning in the process of language acquisition. Acquired language forms the basis for the ability to understand and produce the language. The phonology, morphology, and syntax are acquired. Acquisition is what enables native English speakers to tell what "sounds right" in the language. They may not be able to explain why "He is married to her" sounds better than "He is married with her," but because native speakers have acquired the language, they can make these kinds of judgments.

Learned knowledge also plays a role in language competence. The rules that people learn can be used to monitor spoken or written output. In other words, people can use these rules to check what they say or write. For monitor use to be effective, language users must have time, they must focus on language form, and they must know the rules. Even in the first language, most people monitor their speech in formal situations such as giving a speech to a large group of

people. To use the monitor effectively, one must have learned the rules. Is it *different from* or *different than*? Unless the speaker has learned the right answer, he or she can't monitor the output well.

Spoken language is difficult to monitor using learned rules because if we start focusing on form, we cannot also focus on meaning. However, editing during the writing process represents an ideal situation to apply the monitor because there is time, and one can focus specifically on the correctness of the language, learned knowledge, to be sure that sentences are complete and words are spelled right. On the other hand, when writers are drafting, they may depend more on their acquired knowledge because too much focus on form may interrupt the flow of their ideas.

The Input Hypothesis

How does acquisition take place? According to Krashen, the key is comprehensible input, messages, either oral or written, that students understand. Not all input leads to acquisition. Krashen says that students acquire language when they receive input that is slightly beyond their current level. He refers to this as $i + 1$ (input plus one). If students receive input that is below or at their current level ($i + 0$), there is nothing new to acquire. However, if the input is too much beyond their current level ($i + 10$, for example), it no longer is comprehensible.

Providing comprehensible input is not an exact science. Teachers can't possibly ensure that everything they say or write will be exactly at the $i + 1$ level for every student. The students in a class are all at different levels of proficiency. Nevertheless, as long as students understand most of what they hear or read in a new language, they will acquire the language. Different students will acquire different parts of the language depending on their current level. Krashen is an especially strong advocate of reading for language acquisition. He cites research showing that reading provides excellent comprehensible input and is the source of one's knowledge of vocabulary, grammar, and spelling.

The Affective Filter Hypothesis

How do affective factors such as nervousness, boredom, or anxiety influence language acquisition? If language is acquired when a person receives comprehensible input, that input has to reach the part of the brain that processes language. That part of the brain is

what Chomsky calls the language acquisition device. Boredom or anxiety are affective factors that can serve as a kind of filter to block out incoming messages and prevent them from reaching the language acquisition device. As a result, even though a teacher may present a comprehensible lesson, some students may not acquire the language of the presentation because their affective filter operates to block the input. Students cannot acquire language that never reaches the language acquisition device. On the other hand, when the filter is open, when students are relaxed and engaged in a lesson, even messages that are not easy to comprehend will trigger the acquisition process.

In sum, Krashen argues that both second and written languages are acquired, not learned, and that the process is the same as for first-language acquisition. Acquisition occurs in a natural order when people receive comprehensible input and their affective filter is low. Rules that people learn can be used to monitor the output, either speech or writing. Although other theorists have pointed to the importance of output and interaction in the process of developing a second language or learning to read and write, most researchers agree that all forms of language are largely acquired rather than learned.

LANGUAGES AND POWER

Max Weber, a German sociologist and political economist, defined power as the capability of a person or

group of persons to impose their will on others, even against the wishes of those others. Other scholars have noted that power can be manifested in different ways; it can be exercised physically and forcibly or more subtly to sustain oppression and coercion. In many cases, language plays a role as an instrument and as a symbol of power, dominance, and control. Michel Foucault, a French philosopher and social scientist, explains that language reflects the way in which power relations in the social structure function between institutions and sociocultural groups. He believes that those in power have access to special knowledge, and that they use language policies as a means to remain in power. Paraphrasing Weber, the relationship between language and power can be understood as the ability of a person or group to impose their will on others and against the resistance of others. This can be based on a variety of factors, but one of them is the ability of the more powerful group to establish the uses and status of one or more languages. This entry discusses language and power, particularly relative to bilingual education.

Language and Power in Society

An important distinction exists between the notion of the power of a language and the notion of power relations surrounding a language; the former is related to the communicative function that a language carries, and the latter can be related to the symbolic value that speakers give to a language in a community. In the social structure of the United States, power dynamics are most clearly reflected in the unequal value ascribed to one language above all others. In schools, students of minority groups who speak another language are viewed by members of the mainstream group as deficient, incompetent, and members of a lower class. Members of the majority group, even when they are monolingual, are considered more normative because they speak English, the language of power and influence. Spanish is viewed as inferior and less prestigious, as is African American Vernacular English, also known as Ebonics or Black English. Black English is regarded as a substandard version of mainstream English and an impediment to learning.

In every society, the prestigious languages are those spoken by the mainstream group and are usually used in government, official, religious, and economic functions; these languages are usually learned at school.

Less prestigious languages are commonly used for less formal functions and to communicate with family and friends; these languages are usually learned at home. Language and culture are closely linked. Both are an important part of life and identity. In most societies, one language tends to be used as a sorting mechanism of power. That language determines which individuals will have access to benefits, opportunities, education, and other resources commonly available to speakers of the mainstream language. A language can be used to coerce those who speak another language to oblige them to follow the rules established by the group in power. Historically, there have been cases where the uses of languages other than English have been viewed as a symbol of resistance and lack of patriotism as well as a symbol of lack of interest in assimilation to mainstream culture. In some cases, language interacts with the factor of race to create important hierarchies and to act as screens to equal participation. Arguably, this kind of categorizing and sorting led the country to appoint a German American general to lead the Allied Forces in Europe during World War II, while collecting Japanese Americans in internment camps.

Throughout the history of the United States, social science researchers have applied different approaches to explore the power and status that a language might have in society. A technique that has proven useful for this task is documenting the public's attitudes toward a particular language. John Attinasi and James Bradac have concluded that the attitudes people have toward a language will, if such patterns persist over time, influence the status of a given language. Attitudes and assumptions about language may be expanded to determine how people feel about the social, cultural, political, and economic standing of a certain group or culture; these attitudes have influential implications for language policy.

During the 1950s and before, many schools in Texas and California demanded the acquisition of English for Spanish-speaking students as a mechanism of assimilation; students were not allowed to speak Spanish in the classrooms, at lunchtime, or on playgrounds and were often punished for doing so. The story of Native American languages is another example of the power of one language group to oppress others. In the 1800s, Native American boarding schools engaged in physical force and coercion as disciplinary measures to oblige students to speak English and abandon their ancestral languages.

Language and Power Relations in Bilingual Education

How the speakers of the majority language feel about the value of languages is likely to affect the support or lack of support for programs such as bilingual education for language minority youngsters. In the United States, it is not merely the use of two languages that is disdained; it is the *continued use* of two languages by people who learned the “other language” at home rather than at school. Although it is not strongly encouraged, no stigma is attached to having children of the majority group study languages as school subjects.

Attitudes toward the use of more than one language at school have varied throughout the history of the country. More often than not, the nature of these changes has been related to public attitudes toward immigration and the resultant policies on the subject. Other factors such as commerce, globalization, transnationalism, multicultural awareness, and democratization have become important in recent history.

In much of the world, the use of two or more languages is the norm rather than the exception. Many European countries accept and tolerate cultural and linguistic diversity. In the United States, however, the use of a standard form of English in society and education has become a symbol of an immigrant’s willingness to undergo assimilation. Standard English is understood as the use of a homogenized language—vocabulary, grammar, spelling, and pronunciation—and avoidance of regional “accents.” Standard English is also regarded by many as a symbol of a good and proper education.

Today, all school systems in the United States, whether public or private, demand the acquisition of English as mandatory for the integration and adaptation of students to the school context. This type of policy is not universal. In many countries, families can choose what language to use in the education of their children according to their choice of schools conducted in particular languages. Once again, the issue of power is played out in a practice that has become so ingrained in the country that it is hardly recognized as a matter of social control. Whether or not schools value, respect, and provide opportunities for students to learn through other languages underscores how the society regards diversity. Schools that uniformly deny this aspect of education are, in effect, making decisions about the relative importance of languages in society and in human development. The almost complete absence of schools conducted in other languages

makes linguistic choice impossible. Even in schools that employ bilingual education, especially *transitional* bilingual education, minority students who are learning English can be seen as disadvantaged. Spanish-speaking students who are learning English are more likely to be regarded by the dominant group as having a deficit, but native English speakers who study Spanish as a *foreign language* are not viewed in the same way.

With respect to the study of languages, the future may hold different patterns of student participation. Changing demographics, employment trends, globalization, and transnational ties are encouraging parents from mainstream groups to enroll their children in foreign-language immersion programs. Evidence of this is the creation of Chinese, German, French, and Spanish immersion and dual-language programs across the country. These programs begin as early as kindergarten, and students may learn to read and write in their second language before they learn in English. Their purpose is to help young students develop communicative skills in other modern languages and enable them to compete better in the global marketplace. Although this trend may appear benign, it may not be entirely so from the perspective of power relationships and the question of who benefits from such programs and policies. Some scholars suggest that the emphasis on training native English speakers in foreign-language programs does not empower language minority students. Although there are negative views and negative attitudes toward bilingual minorities, bilingual members of majority groups are viewed in a positive and nondiscriminatory way. Language policy researchers Tove Skutnabb-Kangas and Robert Phillipson are critical of dual-language programs for the mainstream students; their view is that when the students of an English-speaking majority background learn other languages, this group will be favored over other speakers when competing for jobs that require bilingual skills. Other scholars believe it is too early in the history of these programs and efforts to reach a definitive conclusion.

Language, Power, and Public Policy

According to Richard Ruiz, the use of language can be seen from three different perspectives: as a problem, as a right, or as a resource. The definition of what is a problem, a right, or a resource is usually made by those who have the power to enact these ideas into practice. In American society, when language is

viewed as a problem, it is often connected to problems of poverty, underachievement in school, and lack of integration to mainstream culture. When language is viewed as a right, it means that people have the freedom to choose the language they want to use to communicate with others in society. When this view prevails and is supported by those in power, language discrimination may be viewed as analogous to racial or religious discrimination. Language as a resource means that language is used to close the gap that exists among different cultures and groups. In this case, additive approaches to bilingual education are supported because the additional language is viewed as a resource instead of being a problem.

If policies in the United States were to recognize the languages of language minority students as a resource, this could improve the status of those languages and those who speak them. In the United States, current global and transnational trends promote the education of foreign languages among majority groups, but the use of foreign languages within minority groups is devalued. Guadalupe San Miguel, a scholar in the field, considers this orientation to be a major inconsistency and a paradoxical point of view in the United States. Although it may be paradoxical, the views and policies connected with these sentiments underscore the need of those who hold power to maintain it. Hence, the paradox might be explained by some degree of threat that is experienced by members of the cultural and linguistic majority. It appears to be related to issues of immigration control and a felt need to control more effectively who will enter the country and under what conditions. It may also involve fear of the influence that new immigrants may come to exert on other aspects of the society: cultural identity, social economic standing, and access to the resources of the society. In the United States, context language has been used as a tool to create social distinctions between groups. The trepidation of the majority society to support widespread dual-language education may originate in the fear, pure and simple, that the English language may change in unacceptable ways because of heavy immigration. The point has not been lost: The more power, status, and prestige the speakers of a language have, the higher status their language will have in that society.

LANGUAGE SHIFT AND LANGUAGE LOSS

Every year, all over the planet, languages die. Most of us are unaware of this even when it occurs in our own country. This entry reviews and summarizes two important concepts in the study of language survival and disappearance: language shift and language loss. Language death is often the ultimate result of this progression. Because of its obvious meaning, it will be discussed only briefly. Definitions of *language shift* and *language loss* will be followed by more extensive discussion, including efforts to stop or retard language loss.

Language shift can occur in an individual or within a community. For an individual, *language shift* can generally be defined as a loss in language proficiency or a decreasing use of that language for different purposes. This leads, in turn, to a linguistic atrophy caused by the non-use of a language. For a community, the term refers to a change from one language to another (e.g., immigrants in the United States tend to shift from the use of another language to English). As the shift becomes permanent, fluency in and mastery of the first-acquired language—Spanish, Chinese, Korean, or other—usually declines.

Language shift is usually talked about concomitantly with *language loss*, which is the process of losing proficiency—either limited or completely—in a language whether by an individual or a language community. A total and irreversible language loss may be described as language death.

Language death is total language loss—when there are no longer any speakers of that language. When the last native speaker of the language has died or the language is no longer used as a medium of communication, the language is considered “dead.” Language

death generally occurs when the older generation stops passing the language on to its children, the children refuse to speak the ancestral language, or when the speakers shift to using another language. In the United States, language death is usually linked to indigenous language minority communities such as Native Americans and Native Alaskans. In Alaska, of the 20 native languages still spoken, only 2 are being taught to the next generation. Since the arrival of the Europeans, hundreds of Native American languages have disappeared. Linguist Michael Krauss forecast that 45 Native American languages would lose their last native speakers by the year 2000, 125 by 2025, and 155 by 2050.

Many scholars and linguists are working actively to record languages before the languages die, whereas others are trying to revive endangered languages by creating language immersion schools for them, and encouraging parents and grandparents to pass the language onto their children and grandchildren. According to James Crawford, 90% of existing languages worldwide are likely to become extinct in the next century; only 10% of languages (approximately 600 languages) have a secure future. These dire predictions are echoed by the two most important scholars who advocate for language revival and language rights today: Joshua Fishman and Tove Skutnabb-Kangas.

Language Maintenance

Language maintenance also can take place within an individual or a community. Language maintenance occurs when language shift is staved off. It exists when speakers of a language (both adults and children) maintain proficiency in a language and retain the use of the language in various domains. A good sign of language maintenance is when older generations continue passing the language on to their children.

Many factors can influence whether a language is maintained or lost. Colin Baker, an authority on the subject, believes that 10 critical factors explain why some languages are kept and others lost: (1) number and density of speakers, (2) supply and resupply through immigration, (3) proximity to homeland and communication with homeland, (4) attitude toward homeland and rate of return, (5) stability of immigrant community (growth/decay), (6) economic stability of the group, (7) social mobility of the group, (8) economic utility of the mother tongue (native language), (9) level of education in the mother tongue,

and (10) intensity of group identity with the mother tongue in the face of negative forces, such as discrimination or linguistic restrictionism.

Going further, Baker argues that other factors that affect language maintenance or loss of native or heritage languages are the following: (a) the presence or absence of *mother tongue* (MT) institutions (e.g., media, schools, community organizations, leisure activities); (b) the strength of cultural and religious activities in the MT; (c) the extent to which the MT is a recognized language of the homeland; (d) the salience of the MT as a marker of ethnic, family, or community identity; (e) the importance of the MT as a language for instruction; and (f) the degree of acceptance of the majority language in instruction.

Other research on heritage language maintenance has looked at variables such as gender, language attitudes, birth order, and speaker social networks as factors explaining why some maintain their heritage language but others lose it. Most of the important factors, however, are those identified by Baker.

Language Shift in the United States

Given Baker's emphasis on various factors why some languages are kept and others lost and his six factors that affect this process, it is natural to wonder if some immigrant groups are better at maintaining their native or heritage language than others are, or if maintenance is facilitated by the dominant society, for some language groups but not for others.

Based on Baker's list of factors, one might assume that Spanish speakers in the United States are better able to maintain their native or heritage language because there is a large number and density of speakers, a continual supply or resupply of immigrants, and close proximity between Mexico and the United States; this is a different scenario than that of Vietnamese speakers, who are much fewer in number and density of speakers, there is no continual supply or resupply of immigrants from Vietnam, and the distance between Vietnam and the United States is great. Russell Young and MyLuong Tran, researching a Vietnamese American group in California in 1999, found that a three-generation model of language shift holds true, even though an overwhelming majority of the parents surveyed reported that Vietnamese was the only language spoken at home. Although the children communicate with their parents in Vietnamese, a definite shift could be seen. More than half of the parents reported

that the children were using either English only, or a combination of Vietnamese and English in their interactions with their peers.

Interestingly, in 2006, researchers Ruben Rumbaut and Frank Bean at the University of California–Irvine, and Douglas Massey at Princeton University, found that Spanish speakers in southern California also follow the three-generation model of language shift and loss, and that by the third generation, most Hispanics speak English only. The researchers state that this pattern of language shift and loss holds true for other immigrant groups in the United States, such as Europeans and Chinese. Thus, despite the differences in the strength of factors as cited by Baker that may help some groups maintain their languages, the bulk of literature and research suggests that all language minority groups in the United States are continuing to follow a three-generation model language shift and loss process. This suggests that the maintenance of languages other-than-English is not propitiated; instead, cultural pressures actively discourage it. Evidence indicates that language maintenance in the United States is openly discouraged by social and educational policies of linguistic restrictionism.

Calvin Veltman, an American sociologist, demographer, and sociolinguist, asserts that one key misperception by many in the United States is that today's immigrants, unlike immigrants of yesteryear—especially Spanish speakers—are successfully resisting assimilation into American culture, not learning English, and holding onto their native languages. Some have even argued that immigrants are so good at maintaining their native languages that the dominance of the English language is threatened in the United States. This fear may stem from seeing and hearing the use of Spanish on billboards, on television, in automated phone messages, at grocery stores and other establishments, and in government documents (e.g., voter registration, driver's license applications). Veltman argues that no rejection of the English language is involved. Instead, the open use of Spanish does not mean that today's immigrants are better at maintaining their native languages than immigrants of previous generations but, rather, indicates that a large, continuous stream of Spanish-speaking immigrants is coming to the United States.

Overall, the literature regarding heritage language maintenance among immigrant groups reveals a three-generation model, with the first generation being dominant in the heritage language and slowly acquiring

English, the second generation speaking English in the school and other public domains and speaking the heritage language at home with family members, and the third generation becoming dominant in English with little, if any, proficiency in the heritage language. Thus, many grandchildren of immigrants become English monolinguals and are not able to speak with their grandparents who speak only the ancestral language. Many immigrants experience language shift and loss before the third generation, and it is not rare to find that this can happen to some immigrant children within one generation.

Consequences of Language Shift and Loss

That some children can lose their native or heritage language within one generation is particularly noteworthy because some immigrant parents may lose the ability to communicate effectively with their children. In a study by Lily Wong Fillmore and colleagues, more than 1,000 immigrant and American Indian families were interviewed to determine the extent to which family language patterns were affected by their children's early learning of English in preschool programs. The study found that as immigrant children learned English, the patterns of language use changed in their homes and that the younger the children were when they learned English, the greater the effect. An important aspect of this study is that immigrant children who attended Head Start programs became the change agents who determined what language would be spoken at home. The study also found that even though many of the parents were not fluent in English, if the children wanted to speak English at home, the parents would accommodate them by speaking English—even if the parents were not comfortable in that language. Young children, it appears, are powerful actors in the linguistic choices that go on in their communities.

Some public policies have unintended linguistic consequences. Evidence from the Wong Fillmore study suggests that as young children learn English, they lose their heritage languages. Some may argue that the Head Start program has been successful because it achieved its goal of helping the students get a “head start” by teaching them English so that they would not fall behind their peers. Persons concerned with language loss may argue, however, that the Head Start program contributes to the shift and eventual loss of immigrant languages, when it does not include

a language-maintenance component. It is not clear that a government-funded program such as Head Start should be responsible for the language cleavage that develops when children are no longer able to speak to their parents or grandparents. It can certainly be argued strongly that this is a parental prerogative. An interesting aspect of this research is that when parents were asked, “Are you worried about your children losing their heritage language?,” many were not concerned about heritage language loss until after their children had stopped speaking their heritage language. By then, of course, it may have been too late for the families involved.

There are many arguments for language maintenance. One of the benefits of language maintenance is to prevent such consequences of language shift and loss as increased friction and conflict between immigrant parents and their children because parents are no longer able to pass on wisdom because of language and cultural barriers. The relationship between ethnic identity and heritage language learning was studied by Kiyomi Chinen and Richard Tucker. In a sample of Japanese American students, Chinen and Tucker assessed students' perception of their language skills in Japanese and their ethnic identity. The study findings revealed that both variables were strongly related.

Some scholars have used the ecological model argument (the beauty of linguistic diversity), whereas others give more pragmatic reasons such as that we are living in an increasingly global world and that speaking more than one language gives us a competitive edge in business. Others have argued that language maintenance and bilingualism are good because the United States needs people who can speak foreign languages for military purposes, and others argue for bilingualism because of its cognitive benefits.

Currently, immigration has been a hot topic in politics and legislation. Topics such as stricter enforcement of the U.S.–Mexico border, building a wall along the U.S.–Mexico border, and President George W. Bush's proposed guest worker program all have implications for language shift and language loss with respect to Spanish. Given a growing nativism in the United States, it is not surprising that legislation such as California's Proposition 227, Arizona's Proposition 203, and Massachusetts' Question 2 were passed; their effect has been, in essence, to restrict bilingual education programs in these states. By reducing the use of other languages and bilingual education programs, these measures have a powerful effect on the shift and loss of important languages. Indigenous language

groups have not been the targets of this spate of legislation. They have been able to develop their own language immersion programs such as the Navajo Immersion Program at Ft. Defiance Elementary School in Arizona and the Ayaprun Elitnaurviat Immersion School in Alaska.

Some immigrant groups do not depend on the public schools to teach their heritage languages. Instead these groups (e.g., Chinese, Koreans, and Vietnamese) have organized weekend heritage language schools in their local communities to teach both the heritage language and culture. In particular, the Chinese and Korean communities have been particularly effective in creating weekend and after-school heritage language schools for their children. Many of these heritage language schools are organized in conjunction with local churches, temples, and community organizations.

Educators and community leaders now recognize that the phenomena of language shift and language loss are real and dramatically affect the lives of immigrant children and the future of their families. Various groups are attempting to address this need by creating resources such as John Webb and Barbara Miller's book *Teaching Heritage Language Learners: Voices from the Classroom* to help language teachers understand the different needs of heritage language learners, compared with those learning a language as a foreign language. The University of California, Los Angeles, has created the National Heritage Language Resource Center, whose focus is the development of effective pedagogical approaches to teaching heritage language learners by creating a research base and developing curriculum, materials, and teacher education resources. These institutional efforts provide useful resources to address issues of language shift and language loss in the United States. All are fairly recent; it remains to be seen how useful these will be in helping language communities restore their respective languages.

LANGUAGES IN COLONIAL SCHOOLS, EASTERN

In the history of education in the eastern United States, we find a tradition of cultural and linguistic diversity that predated the arrival of English-speaking settlers. Nearly 2,000 languages were spoken in the Western Hemisphere when the first European explorers arrived. Though the English language was

important for participation in community life as part of a family, a congregation, and in the marketplace, other languages, including Dutch, German, Scandinavian languages, and indigenous languages were also common and important. This entry reviews a complex dialectic tension between English and other languages in education in selected Atlantic Coast colonies from the late 1500s to the birth of the nation in the late 1700s.

Virginia and New England

The original purpose of the colonization by English speakers of what is now roughly equivalent to Virginia in the late 1500s was economic gain. Only after work had begun on developing the land and infrastructure and learning how to survive in this new environment did women and tenants follow and families form to create a need for formal education in Roanoke and in a second settlement, Jamestown, also in Virginia. Over time, the purpose shifted from a search for gold to providing food for survival, and there was no clear understanding of a relationship between education and either of these purposes.

In the Virginia colonies, the trappings of community life—including families, government, and religion—contributed to a vision of using education to convert the children of Indians and settlers to the English language and culture. The vision was not realized, but it indicated recognition of an English colonial experience that would depend on self-sufficient agricultural and trading communities, the planting of families, and the development of English institutions that would educate families.

Intent on learning from the failures of the Virginia colonies, John Winthrop set out to establish a Puritan plantation in New England that would be profitable and of service to the church and the commonwealth. The Pilgrims came in 1620 for religious freedom, to preserve their cultural identity, and to convert others to their way of life. Education was conducted by the family and the churches, rather than by a school or college. Both the Puritans and the Pilgrims came to the colony as a community, but the Puritans also brought with them a vision of a community that modeled Christian charity. Within this mission, the education of the sons played an important role in transmitting an English-speaking intellectual heritage and serving as an agency for the pursuit of an English cultural ideal.

New Amsterdam

In 1624, the Dutch established New Amsterdam in what is now Manhattan, the Hudson River Valley northward to what is now Albany, New York, and western Long Island. New Amsterdam was a commercial trading post, and Dutch-speaking inhabitants were apparently more occupied, at least early on, with survival and building thriving businesses than with educating their children. By 1638, the first elementary school was established, and in 1652, the first formal instruction in the classics was introduced. The Dutch were the most numerous but there were speakers of other languages in that colony, including the English, French-speaking Belgians, Swedes, Finns, French, Portuguese, and Africans. Though government, education, architecture, and churches were characteristically Dutch, official communication was normally in more than one language.

Eventually, the English captured New Amsterdam, and the inhabitants continued using their languages and practicing their cultural traditions. Language instruction fell to the church, but in New Amsterdam, language instruction was multilingual. It happened in many different languages. Where there were Dutch schools, instruction continued in Dutch, even after the English conquest in 1674. During the first 30 years of English rule, education was relatively open. Though the colony was governed in English, there was a willingness to permit diversity of belief, worship, instruction, and language.

New Sweden

The Swedes, with Dutch support, founded New Sweden in 1638 as a commercial trading center in the territory where Wilmington, Delaware, southeastern Pennsylvania, and southern New Jersey now are. The project failed after 17 years, and the Dutch took over in 1655, followed by the English a decade later. Although the Swedes attempted to preserve their language and culture under English domination, they gradually took on English language and ways.

Like neighboring Pennsylvania, New Sweden was a colony without an established church. Most young people in New Sweden received their vocational education via apprenticeships. The Bible and the catechism were the only frequently read books, and book learning in Swedish, or any of the other languages represented in the colony, was generally left to the

religious authorities. Young Swedes learned to read the Bible and catechism in Swedish. The language of instruction was Swedish to ensure its preservation in the colony. Instruction and literacy in Swedish was of lower priority, though, than was ensuring enough provisions to survive the winter.

Some assert that respect for education was slow in coming. As the need for education shifted from religious and cultural goals toward commercial ones, the Swedes began to take on the English language ways. Under English domination, older Swedes resisted assimilation into the English way of life. However, younger Swedes grew so accustomed to the English language that they became reluctant to express themselves in Swedish. Israel Acrelius, provost of the Swedish churches in America, saw this language confusion as a symptom of a more basic conflict of culture between the Swedish and the English during the colonial period.

As early as 1654, the Scotch-Irish began to establish themselves in New Sweden. However, their first academies were more noted for their students' enthusiasm than their academic achievement. Later, the academies focused more deeply on reason and theological knowledge based in Presbyterianism. English- and Welsh-speaking Quakers also established schools so that their sons and daughters learned reading, writing, and arithmetic. As the settlers improved their economic conditions, they saw to it that their children received an elementary education. In some cases, teachers were purchased as indentured servants, an arrangement reflecting the low status of people in the teaching profession. Over time, teachers opened their own schools. Vocational education, including professions such as law and medicine, was provided within the family or by apprenticeship. The first Swedish-language school in the colony was opened before 1700 in the Old Swedes' Church. During the last half of the 18th century, the leading educational institution was the Wilmington Academy, which was built in 1765. Before 1791, no provision was made for free schools. In Delaware's state constitution of 1791, provision was made for establishing schools, and in 1796, an act was passed by the legislature applying all moneys received from marriage and tavern licenses to a school fund, paving the way for a public school system.

Pennsylvania

Pennsylvania was founded in 1681 by the English as a holy experiment. English- and Welsh-speaking

Quakers and German Protestants organized their own communities within Pennsylvania in which they preserved their respective languages and cultures. The first German arrivals were predominantly Mennonite and Amish and were joined later by Lutherans and Reformed and other Protestant sects. Presbyterian Scotch-Irish followed in the early 1700s. In 1756, an estimated third of the population was English- or Welsh-speaking Quaker, another third German, and among the rest were speakers of English, Scottish, Scotch-Irish, French, Celtic Irish, Dutch, and Swedish.

In 1683, a Pennsylvania ordinance provided that all children be instructed in reading and writing until age 12. Thereafter, they should be taught a trade or skill so that they become self-sufficient adults. However, this apparently straightforward requirement would be a challenge because of the linguistic diversity of the colony. Of all the immigrant groups, the most challenging to the English in Pennsylvania were the Germans because, of all the non-English-speaking groups, the Germans were the most numerous. Because of a fear that the English would be Germanized instead of the Germans Anglicized, various measures to control Germans were recommended, but not implemented, including the prohibition of German-language publications, the establishment of English language schools, the introduction of an English language literacy requirement, and encouragement of intermarriage of English and Germans. This fear was also instrumental in the establishment of charity schools that provided for the cultural Anglicization of the Germans.

Money to support the establishment of these schools was raised by the English in Holland and Scotland. Some maintain that the most important impact on the Germans of these efforts was the stimulation of their own effort to preserve the German language and culture. Though the Germans maintained separate schools and churches and a college to train their own religious and civic leaders to preserve the German language and culture, they eventually recognized the necessity to read, write, and speak English.

Within Diversity, English Predominates

A number of language and cultural dynamics bear on colonial education. First, education was a family enterprise for which the family looked to the church for assistance. Clergy provided children instruction in the home language, and the Scriptures and catechism

were the primary texts. Second, in some cases, everyone in the colony spoke the same language. In other cases, many different languages were used. Third, the purpose of education was to transmit the language and culture. Its purpose was not to educate for vocation. Fourth, public schools as we know them were not commonplace, and where something like a public school did exist, its purpose was to Anglicize rather than preserve indigenous or other languages and cultures. Fifth, the early settlers did not take financial responsibility for establishing public schools. Sixth, the northern colonists' primary motivation for coming to the New World was to escape religious persecution, and the southern colonists' primary motivation was generally to achieve economic well-being. The middle colonists' motivation reflected varying degrees of both. In Pennsylvania, especially, the English invited oppressed Europeans with the promise of a better life, but there were pressures to live that better life in English. Seventh, although education was considered important in the northern colonies to preserve the English language and religious culture, it was of lesser importance in the middle colonies and of least importance in the southern colonies. In short, although the English speakers were not ardent promoters of their language, they apparently outdid everyone else, who seemed not to notice that their own languages were slowly eroding in favor of English.

Finally, the settlers depended on continuing financial support from their homelands to support educational activities designed to preserve their languages and cultures. The English also relied on the homeland for financial support to Anglicize other settlers. Perhaps the English sources of support were more generous. Rarely was an effort made to learn the language of the indigenous people, though on occasion such attempts were made.

Just as it is important to consider what was today's immigrants' prior history in their countries of origin, it is also important to consider the social context of the early settlers. The English shared a common heritage with the Dutch, the Spanish, the French, and others on the European continent. Notwithstanding the rivalries of royal families, the concept of the nation-state had not yet hardened into the strict lines of demarcation that came about in the 18th and 19th centuries accompanied by nationalistic fervor. Upper-class English read the Bible and the literature of great thinkers from Ancient Greece and Rome, and the peasant class was beginning to enjoy secular pursuits, including

Shakespeare's dramas. The English also embraced the ideas of contemporaries such as Erasmus (a Dutchman) and Montaigne (a Frenchman), among other continental Europeans. Also, the English culture itself was changing. For example, there were struggles between Protestant and Catholic, Anglican and Puritan, scientist and humanist, among others, in England. These struggles played themselves out to a certain extent in the New World as well and merit consideration when pondering language and education policies and practices in the eastern colonies.

Particularly pertinent is the struggle between medieval and Renaissance thinking that was taking place in Europe at the time of the North American explorations. Though Renaissance thinking may have motivated the settlers to make the journey to the New World, medieval thinking still operated strongly in their worldviews. Lawrence Cremin reports that the English, above all in Europe, were the earliest to capitalize on the great information and communications technology of the age: the printing press. The printing press was possibly the most important invention in ushering in the Renaissance era in northern Europe. Though a German invention, there was no German state organized to harness the power of the press. The European English were better organized to produce and use print materials to facilitate the transformation of their citizenry to critical thinkers, learners, and leaders. They were also better organized to support the development of print media to Anglicize others in the New World. An interesting parallel today is the prevalence of English on the Internet where, once again, the technology comes with English thrown in, free of charge.

New situations encountered in the New World required a rethinking of the medieval worldview. Edward Gray and Norman Fiering assert that the prevailing explanation in Europe at that time regarding language diversity involved the Biblical account of the Tower of Babel: With the fall of the Tower of Babel, 72 mutually unintelligible languages arose. When the settlers encountered many more indigenous languages in the New World, they needed new ways to align the Biblical story with the new reality. When they found an abundance of languages and cultures in non-Christian North America, the European settlers interpreted the language diversity that they found as an indication of social decay. European settlers learned Native American languages and with the indigenous people developed pidgins such as Pidgin

Delaware as tools more geared to Anglicization of Native American peoples than to mutual understanding. Another purpose served by learning indigenous languages and pidgins was to satisfy the settlers' real need to know more about their new environment by learning about it from the indigenous peoples who had already experienced it. With this knowledge, they would be better prepared to survive the cold, harsh winters. In neither case was the indigenous peoples' concept of well-being a primary consideration. Learning and using indigenous languages was not a school-based activity. Where it did occur, it usually happened in the harsher environments of the receding frontier as the settlers moved west.

Some might argue that the English used their resourcefulness heavy-handedly in new social and physical situations they encountered in the New World. For instance, in the early days of the new nation, African slaves were denied access to education in any language because of fear that they would be able to read the abolition literature, thus threatening the economic balance in the South. Though linguistic and cultural diversity existed in the colonies, a linguistic and cultural pluralism that placed English and other languages at parity with each other never took root in institutional educational settings. The education historian Joel Spring goes one step further. He argues that educational practices during the colonial period paved the way for using schools to impose English language and culture on others throughout U.S. history.

LANGUAGES IN COLONIAL SCHOOLS, WESTERN

From the arrival of Hernán Cortés in Mexico in 1519 to 1821 when Mexico won independence from colonial rule, Spain actively sought to Christianize and “Castilianize” native populations. The Spanish sought to expand the Spanish empire and culture, including their language, to the farthest reaches of the New World. In this version of colonial education, bilingual instruction in mission schools was used much more than in the English colonies and their Native American neighbors. This entry examines that phenomenon in brief fashion.

To achieve their colonizing goals, the Spaniards brought Catholic missionaries to conduct the work of Christianization. Every military excursion also brought missionaries; the sword and the cross traveled together. Spanish missionaries established chains of missions throughout the Americas that defined colonial life for 300 years. The mission system became the single most powerful vehicle for achieving control of the landscape of New Spain. Language, religion, education, culture, law, social customs, economy, and even clothing all flowed from the missions. Little wonder that they played such a key role in establishing Spanish as the lingua franca in New Spain, and in creating an enduring Mexican presence in the American territories.

With the signing of the Treaty of Guadalupe Hidalgo in 1848, the United States took possession of the southwestern states. Under the new English-speaking nation, *mestizos*—the term used to describe the offspring of Spanish and Indians—experienced a fleeting tolerance for their culture and language for

several decades, but the advent of mandatory school attendance laws ultimately ended non-English languages from the schools. The push for Americanization ushered in deep-seated prejudices. In an ironic twist of fate, the language of the Spanish conquerors would become a primary identity marker for *mestizos*, later known as Mexicans, Hispanics, and Latinos. The Spanish language would serve as the unifying force for the steady influx of other Spanish speakers migrating to the United States. The tenacity of these groups in retaining Spanish would remain a symbol of resistance to total assimilation into the American mainstream.

Background

Spain was among the most powerful nations in the world in the late 15th century. With the expulsion of the Moors and Jews from Spain, it garnered special favor from Pope Alexander I, who granted the Spanish crown authority over the Catholic Church under its domain. In 1493, a year after Columbus's first voyage to the Americas, the pope divided the unexplored territories in the Western Hemisphere, ceding to Spain North America, Central America and a large portion of South America, including the islands of the Caribbean. A steady stream of Spanish explorers fanned out into the New World, laying claim to the new frontier in the name of Spain. Cortés and his men arrived in Mexico City in 1519. In the name of Christianity, they destroyed the indigenous civilization in the valley of Mexico and implanted Spanish colonial control in what would be known as the "New Spain."

Genesis of the Mission Model in Mexico

After settling in Tenochtitlán (the Aztec capital), Cortés petitioned King Carlos V for missionaries, soldiers, masons, carpenters, and other skilled workers to help establish more permanent settlements in Mexico. The Flemish Franciscan Brother Peter Van der Moere of Ghent (known in New Spain as Pedro de Gante) spent the first few years in Texcoco, second largest city after Tenochtitlán, before moving to the latter to establish a school.

Gante found a hostile climate in Tenochtitlán, where Cortés wanted the school. The bloody and violent overthrow of the capital had left the Aztecs distrustful of the conquerors. Despite Spanish power

at his disposal, Pedro de Gante realized that teaching the Aztecs would be a monumental challenge. Further, he understood that changing the culture and customs of an entire nation required a more organic approach. This meant that it was more essential to educate the masses than the privileged classes. Teaching the common man had potential for uplifting cultural values from the ground up and changing the oppressive treatment of women and children. Convinced that his educational plan was sound, he agreed to open a school in 1527.

Eager to make Gante's school endeavor successful, Cortés overreached. He ordered his men to round up all the young boys they could find and hold them within the mission enclosure. Parents objected vehemently, and the boys rebelled in anger. Teaching religion to more than a thousand boys held against their will was an unsatisfying and frustrating situation. Gante was nearly overcome with frustration and was tempted to return to Flanders. His vow of obedience, however, obliged him to ponder his plight carefully.

Fusion of Spanish and Native Cultures

After futile attempts to teach the defiant students and after much reflection, Gante arrived at an important insight: He needed to integrate Aztec culture as a link to the boys' lived experiences to pique their interest in learning. Having lived in the region of Texcoco for 3 years, he had observed Aztec enthusiasm for music, dance, and performance. Wasting little time, he began with singing and dancing lessons. To the boys' surprise and delight, Gante himself participated in the dancing and singing. Demonstrating respect for their culture earned him the boys' trust. As a way to manage the large group, Gante selected 20 of the brightest students to assist with the teaching. They received special instruction before Gante's introduction of the lesson to the whole class. In this way, he was able to manage the large group of students. The student leaders' fluency in Nahuatl, the language of the Aztecs, and their intimate knowledge of Aztec cultural traditions contributed to their own conversion.

Without conceding basic tenets of Catholic doctrine, Gante incorporated culture and art in his instruction, allowing an outlet for creative expression. His approach proved effective in maintaining student interest. Centuries later, in the context of the United States, the idea of adapting instruction to

native cultures would become a prime tenet of bilingual and multicultural pedagogy.

Treatment of Indigenous Languages

Communication with indigenous people was daunting. But, unlike English-speaking settlers in the United States who worked at eradicating Indian languages, Spanish missionaries embraced the native languages of their converts as tools for teaching. For those early clerics, it was self-evident that success in converting the natives required two basic principles: First, learn the native language, and second, use the native language for instruction. Imposing Spanish would have been viewed as a sign of arrogance and disrespect, inciting greater resistance to conversion. Aside from its pedagogical merit, dealing with natives in their mother tongue reflected a sign of good will and served as a method of self-preservation for the friars who worked in hostile surroundings. Gante had studied Nahuatl in Texcoco where he also started recording the Nahuatl sounds using the Latin alphabet. In this way, he developed a written alphabet for Nahuatl that he later used to write a book on Catholic doctrine.

Breadth and Scope of the Missions

The typical mission structure was designed as a quadrangle. It included a church, a private residence for the priests, a mission school, a dormitory on one side for boys, another on the opposite side for girls, a kitchen, infirmary, and several workrooms. In the expansive American frontier, missions also functioned as garrisons, providing shelter, food, and protection for the Christianized Indians against the abuses of soldiers and civilians, warring tribes, and other European settlers. Missions were made possible by royal land grants situated in prime, strategic locations. Spanish monarchs and wealthy lay patrons paid for the creation and operation of the mission schools in an early form of school-community partnerships. Viceroyalty in the various regions of New Spain exercised authority over church and state matters, paying missionary salaries, setting administrative policies, providing military protection, and enforcing colonial law.

Organization of Mission Life

The missionaries' long-term goal was to establish independent Christian towns where property, resources, and

labor served the common good and operated under their absolute control. Although missions were not militarized, nor were natives (with few exceptions) physically forced to convert, but once baptized, converts were required to live in the mission complex. They were forbidden to leave or have contact with outsiders. Mission Indians lived under constant supervision, following a strict monastic-like lifestyle that included prayer, catechism, academic instruction, work, chores, meals, and recreation. Boys were taught agricultural and industrial skills; girls were taught sewing, cooking, quilting, weaving, spinning, and other domestic skills considered essential for marriage. Catholic holidays and liturgical celebrations broke the monotony of everyday life.

Missionaries raised horses, cattle, and other domestic farm animals brought from Spain. Neophytes were taught farming, cattle raising, ranching, and whatever agricultural and industrial skills were needed for the day-to-day operation of the mission complex. Missionaries also planted indigenous crops and myriad European vegetables, herbs, and fruits. In time, the missions became profitable enterprises, raising a substantial number of cattle and producing an abundance of vegetables, grains, and fruit for themselves as well as for sale to the locals.

Academic Curriculum

Along with the practical skills necessary for the operation of the mission, students were taught counting, reading, and writing in Nahuatl. Latin and Spanish as foreign languages were added later. Because of the clergy's strong tradition and talent in music, song, and musical instruments, these fine arts were also incorporated in the early curricula of the mission schools. In effect, each mission became a microcosm of Spanish civilization. This organization of Spanish missions in Mexico proved so successful that elements of it were incorporated into the state laws of California, Texas, New Mexico, Louisiana, Arizona, Florida, Georgia, and the Carolinas. Even today, several of these states retain elements of Spanish law side-by-side with English common law that prevailed on the Atlantic seaboard.

The power and influence of the Franciscan missionaries over the early colonial settlements and emerging towns became a source of envy among the increasing Spanish population and secular clergy that ministered to persons outside the missions. Missionary

priests had a monopoly over the missions. Under pain of excommunication, no one could interfere in their work—not even secular priests charged with the spiritual ministry of civilians. Autonomy over the operation of the missions allowed missionaries to exert great power and influence. As each mission became self-sufficient, colonial authorities petitioned the king for secularization of the missions. Secularization entailed transferring control of the missions to civilian authorities and secular clergy. Lacking the educational background, discipline, organizational skills, goals, and earned respect of the missionary priests, civilians failed to keep the missions prosperous and intact. Ultimately, most of the missions declined and fell into dysfunctional remnants of their former glory.

Duplicating the Mission Model in the United States

As the French and English competed for territories in the American frontier, the Spanish moved quickly to establish missions in those regions as a way to retain the land for Spain. Jesuit and Franciscan missionaries moved into Florida, Georgia, the Carolinas, Texas, New Mexico, Arizona, and California. There, they emulated the mission model they had developed in Mexico and the state of Baja California. Frontier missions, however, were difficult to sustain because they were located in isolated areas and far from Mexico's protection. Missionaries lived in hostile surroundings and suffered extreme hardships trying to make them prosper. Many missions were destroyed or razed, but others, notably those in California, endured and still exist, albeit with different goals. They serve as a reminder of the singular, most powerful vehicle for the transmission of Spanish/Mexican culture.

Florida, Georgia, and the Carolinas

Juan Ponce de León landed in the southeast territory of the United States in April 1513. He named it *la Pascua Florida*, commemorating Easter Sunday, the day of his arrival. The territory of *La Florida* extended from present-day Florida north to the Chesapeake Bay. De León explored the territory up to the Carolinas and attempted to establish a colony in what is now Charlotte Harbor in 1521, but the Calusa Indians attacked his party, seriously wounding him, and forcing him to retreat to Cuba, where he

later died. Jesuit missionaries established a mission in St. Augustine, Florida. From there, they proceeded north, building missions among the Apalachees in Georgia and the Carolinas. Missionary efforts to convert the natives, however, met with limited success because of adverse conditions, Indian resistance, and difficulty in confining Indians to the missions. Positioned on the Atlantic coast, *La Florida* was a dangerous front line because the area served as a primary entry into mainland territory for the steady influx of European explorers. Missions in Florida doubled as forts, providing a modicum of safety for missionaries, their converts, and Spanish civilians against English and French invaders.

In 1573, Franciscan missionaries replaced the Jesuits in Florida, and although, they, too, faced great challenges, they were more successful in establishing enduring missions. They organized a school for the children of the soldiers in the local garrison. As they had done elsewhere, missionaries planted crops and raised livestock, providing essential food staples. Few details exist concerning the inner workings of mission schools in *La Florida*, but recent archeological discoveries of Indian-language Bibles and catechisms written with Spanish phonetics are proof that the missionaries provided Catholic doctrine in at least some of the indigenous languages of the region. Although those languages became extinct, the Indian-language books survived.

More than one hundred Spanish missions were established from 1526 to 1702 in what are now the states of Florida, Georgia, and the Carolinas. At various intervals, however, each mission was abandoned because of inadequate resources, inability to protect themselves, epidemics, Indian resistance, and annihilation of the friars. English colonists wrestling for control of Florida also pillaged and destroyed a number of missions in this area. The English and their Indian allies committed atrocities against the Spanish Apalachees in Georgia and the Carolinas, killing the missionaries and capturing Hispanicized Indians as slaves for the thriving plantations in South Carolina. The city of St. Augustine, founded in 1565, holds the distinction of being the oldest town in the United States. Franciscans maintained a mission at St. Augustine that later evolved into the first school for Whites. This school existed one year before the arrival of the English in Jamestown and operated 30 years before an English language school was established in North America.

New Mexico, Texas, and Louisiana Territories

During this Spanish/Mexican era, New Mexico, Texas, and western Louisiana were part of a sprawling territory that explorer Juan de Oñate called “the Kingdom of Saint Francis of the New Mexico.” In 1540, Francisco Vasquez de Coronado explored the territory north of New Spain in the area now known as West Texas. Eight Franciscan missionaries who accompanied him chose to stay behind to begin the conversion of the natives, but failed to establish permanent settlements in Texas. In 1558, Oñate led another group of Franciscans to New Mexico, where they founded the first permanent settlement, Mission San Gabriel, in what is now San Juan Pueblo. They worked among the Pueblo Indians. For more than a decade, this settlement served as the capital of New Mexico before the capital was moved to Santa Fe. By 1598, Franciscans had operated mission schools for 75 years.

In Taos, Pecos, and Santa Fe, missionaries set up more schools where they taught catechism, reading, writing, and music, including agricultural and industrial arts. Pueblo Indians in Santa Fe and nearby pueblos learned new techniques for their various crafts. It is difficult to determine the exact number of mission schools opened in the territory of New Mexico, but according to archives, there were at least 59 friaries with each friary housing one or more schools.

Franciscans converted and taught a large number of natives in the New Mexican territory, but faced ongoing resistance. Even as the Franciscans reached their “golden era” of mission work, the Indian pueblos rebelled against Spanish colonization, killing 21 Franciscans and 400 civilians and soldiers. As a result, the missionaries moved to Albuquerque, where they established other mission schools. In Albuquerque, the friars introduced horses, cattle, and sheep, teaching the Indians to breed and care for the animals. The friars also introduced Indians to improved methods of spinning and weaving. Hostile Indian tribes eventually destroyed the missions and pushed the Catholic friars to present-day El Paso, Texas. In small towns and villages within the current Texas border, the friars established 26 missions and outposts. The semi-nomadic lives of Texas Indians worked against the cloistered life required of converts. Indians rebelled, and the Spaniards failed to establish enduring settlements throughout the vast territory of Texas, with the exception of El Paso, San Antonio, and the Rio Grande Valley.

Texas missions did not flourish as well as those in California but were instrumental in creating the foundation for the strong presence of Spanish and Mexican culture that exists today. By the late 1700s, a large number of Indians in Texas were fully assimilated into the Spanish and Indian culture of the towns, becoming devout, Spanish-speaking Catholics. With their Spanish names given to them by the missionaries, they were indistinguishable from other mestizos of the region. A testament of Pedro de Gante’s philosophy of education and the staying power of Spanish was evident as late as 1890 to 1898 in the El Paso public schools’ requirement that English-speaking teachers pass a Spanish exam to teach the large number of Spanish speaking students.

California

Father Junípero Serra led a team of Franciscan missionaries into present-day California in 1769. They founded a chain of 21 missions along the west coast of California, from present-day San Diego near the Mexican border to San Francisco. Each mission was located one day’s horseback ride from the other, along a trail named *La Calle Real* (the Royal Highway). In California, as elsewhere, missionaries were not all saintly, equally kind, or above reproach. Those who demonstrated genuine concern for the physical, spiritual, and intellectual welfare of the Indians, however, quickly earned their trust and cooperation. Other missionaries who took more authoritarian approaches, resorting to force and exploitation, faced Indian resistance, retaliation, and revolts.

Teaching took place in various Indian languages, but proved a constant challenge. In some cases, there was a different language every 10 to 15 miles. Records indicate that at Mission San Francisco, the friars taught in five different native languages. For the most part, California mission schools followed a traditional curriculum similar to the one designed in Mexico. As the neophytes became more fluent in Spanish, the missionaries used both the native language and Spanish in their instruction. Indian converts attended schools in the missions where they were confined for the duration of their schooling. Girls were required to reside in the monastery. At night, they were locked inside the *monjerío* (nunnery), which served as their living quarters, and were supervised by a *maestra* (female teacher). A misnomer, the *monjerío* was not a convent. The girls were neither preparing to become

nuns, nor did they remain there for life. Alongside mission schools, colonial towns across the Spanish/Mexican territories had secular clerics and Catholic nuns who ran private Catholic schools for the children of Spaniards and Creoles in the community. Instruction in those schools was in Spanish.

All missions were completely secularized in the late 18th century. Along with secularization, a royal decree required that all schools in the empire abandon the use of native languages and institute Spanish as the official language. Many Franciscan missionaries throughout the Spanish settlements in U.S. territories ignored the new policy and quietly continued using the native languages. Some missionaries in Texas welcomed the new directives, arguing that Hispanization was so complete in some towns that there was little need for Indian languages. California missions were among the largest in the Spanish empire. San Luis Rey Mission, for example, sprawled across 90,000 acres of land. In the mid-1830s, it owned 50,500 head of cattle, approximately 29,000 sheep, 5,000 horses, and an enormous number of pigs, goats, and other domestic animals. Franciscan missionaries wielded so much economic power over the Indians and Catholic laity, and the missions had accumulated so much wealth that those two factors alone intensified the push for total secularization. Most California missions still exist in their original or restored condition, and although they were secularized, many continue to operate as viable Catholic churches. An excellent example of this longevity and continued service is the church at San Luis Rey near present-day San Diego.

Arizona

Franciscan missionaries arrived in Hopi land in 1630. They endeavored to establish the Mexican mission model in there too, beginning with *la doctrina* (Catholic doctrine) and following with basic reading and writing skills. Instruction was reserved for Christian converts; others were not included. Brighter students were taught Latin and Spanish in addition to the basic curriculum. The task of evangelization was not easy; missionaries faced great obstacles. In due time, however, they built a monastery in the center of Hopi territory. The isolation of the missions made them easy targets for Indian raids. Fearing this constant danger, the Franciscans ordered Spanish soldiers to build a garrison for their

protection and the protection of their wards. Hopi Indians objected to their militarized encroachment and stormed the construction site, killing the priests and their converts, and destroying the monastery.

Southern Arizona missions were originally founded by Jesuit missionaries who worked in the northern part of Mexico in the area of present-day Mexican states of Sonora, Durango, Chihuahua, and Sinaloa, but their missions extended into a portion of Arizona. On the Mexican side, the Jesuits founded mission schools and colleges. Indian resistance was generally the rule. Many had witnessed multiple atrocities against their people, so they fought back, ultimately killing all the Jesuit missionaries.

Despite their losses and constant attacks from the Tarahumara and Yaqui Indians, the Jesuits persisted. By 1691, Father Eusebio Francisco Kino stretched the missionary work into the territory of the Pima Indians along the Gila River in Arizona. Father Kino brought another cleric and a team of Sonora Indians to help with the construction of the mission and instruction of the natives in this region. Pleased with the initial response, he took hundreds of head of cattle from Sonora to help support the mission. Father Kino specialized in teaching adult Indians. His genuine affection for Indians was known throughout the territory. In his youth, the Pueblo Indians referred to him affectionately as *El Padre Negro*. Later they nicknamed him *el viejito* (the old one) and sat around for hours listening to his stories and teachings. Kino used visual aids to teach his converts until he mastered their languages. He also organized a children's school. The Jesuits remained in Arizona for 100 years before the pope expelled them from all the territories. Franciscan missionaries took over their work in southern Arizona.

Conclusion

The Spanish established hundreds of missions throughout the vast territories of New Spain. Those missions operated schools and churches that served as effective tools for social reproduction of Spanish culture, solidifying and expanding the Spanish empire, and spreading the Spanish language among indigenous peoples. Many mission settlements became large profitable enterprises, giving missionaries tremendous influence and control over the lives of people within the mission and the surrounding areas. The Spanish were successful in establishing Christian towns and

colonizing millions of indigenous peoples. Mestizos became the majority in Mexico and a large segment of the population in the expanding American colonies. When the U.S. Declaration of Independence was signed in 1776, most people within what is now the United States were probably Spanish speakers—from the Californios on the West Coast to the Spanish-speaking Apalachees in Georgia and the criollos of Florida.

Unlike the English, who intentionally worked at eradicating indigenous languages and cultures, and rejected the notion of mixed racial unions, the Spanish were interested in saving their souls. Catholic doctrine and royal policies dictated that indigenous peoples were human beings with rights, deserving protection by the Spanish crown and its representatives. This dictate was not always obeyed; abuses abounded throughout the empire. Three centuries of mounting resistance from Creoles and Mexican elite against Spanish exploitation erupted in 1810 with Father Miguel Hidalgo's call for independence from Spain. Although mestizos outnumbered the Spanish 10 to one, the bloody battle for independence lasted 11 years, ending in 1821. The new Republic of Mexico, however, was unable to retain possession of the huge expanses of land in what is now the U.S. Southwest. With the signing of the Treaty of Guadalupe Hidalgo in 1848, Mexico lost those territories to the United States. Despite this loss, missions were instrumental in building an enduring Mexican cultural presence. Today, the missions that are still standing are chiefly museums and historical points of interest throughout the Southwest.

In Mexico, secularization also changed the role and function of the missions. Secularization brought with it the end of Indian schooling by the Spanish. The Spanish crown had ordered colonial schools throughout the empire to serve exclusively for Spanish-speaking children. The king's directive was not closely followed in the frontier colonies, but pressure to shift the academic curriculum for Indians to an industrial curriculum began to mount. Often, the deep-seated prejudices of the Spanish and, later, of the Mexican elite began to question whether advanced studies for Indians (and the lower classes) were essential when they were unlikely to use such knowledge. Furthermore, the elites argued that Indians were better suited for agricultural and industrial skills. In many communities, those colonial attitudes are still evident in the public education system in Mexico,

which serves the poor and rural descendants of the early residents of the Spanish missions.

LANGUAGE SOCIALIZATION

Language socialization refers to the process by which individuals acquire the knowledge and practices that enable them to participate effectively in a language community. Based on concepts related to language acquisition and anthropology, language socialization theory is a theory of language learning that argues that one learns language and culture simultaneously. In other words, when someone learns a language, by definition that person is also learning culture. From a language socialization perspective, language and culture are inseparable; that is, one is simultaneously learning language (linguistic knowledge) and acquiring socio-cultural knowledge (how to use language in context).

Language socialization theory differs from other theories of socialization in that it argues that language is the primary symbolic medium through which cultural knowledge is communicated, and therefore

reproduced. Specifically, language socialization theory developed as a response to other theories of first-language acquisition prevalent in the 1960s and 1970s that did not consider the sociocultural context, and instead focused on the internal, cognitive aspects of language learning.

Initially, language socialization theory was developed as an explanation for infants' and young children's development of their first language. Early scholars and the main architects of this theory, Elinor Ochs and Bambi Schieffelin, examined the process of first-language acquisition in a cultural context through detailed ethnographic studies of small, often isolated monolingual societies. From these studies, a view emerged explaining that the process of learning a language is a social activity that relies on the building up of routines of interactions. This early work, although not directly focused on issues of bilingualism and bilingual education, paved the way for other studies that directly addressed the issue of how language socialization in the home could differentially affect the experiences of children when they attend school.

Beginning in the 1990s, a second generation of studies in language socialization broadened the scope of research to look explicitly at the processes of socialization in cultural contexts other than the home environment. These studies focused on understanding the processes of language socialization in bilingual and multilingual contexts. This entry describes the development of language socialization theory.

Roots of Language Socialization Theory

Language socialization theory portrays a developmental process through which children learn how to speak like adults do, and therefore, they learn to become adults. Ochs and Schieffelin, drawing on the work of linguistic anthropologists Dell Hymes and John Gumperz, characterized societies as having a fairly fixed and predetermined set of norms, values, and rules for behavior, which children acquire through their interactions with adults in the process of everyday life. Through participation in everyday social interactions, children engage in and internalize the practices of the society. Over time, through practice in routines and regular activities, children become more and more skilled in the social practices considered appropriate in their communities. For example, through their participation, children learn when it is

appropriate to speak or be silent, when it is appropriate to tell jokes or be serious, and when it is appropriate to talk about certain topics and not others. In addition to "when" children also learned "how" to speak, joke, and be serious. In other words, as young children interact with their caregivers, they simultaneously acquire the necessary social and language skills needed to develop a specific cultural view of the world that shows them how to behave appropriately in their society or community.

Although the initial conceptualization of language socialization theory rested on the analysis of isolated communities, an early work by Shirley Brice Heath showed the importance of language socialization theory for bilingual education in the United States. In her ethnographic study titled *Ways With Words*, Heath compares the language socialization practices in three communities and extends the study of language socialization from the home to the school. In this study, Heath demonstrates the ways in which children in two different working-class communities are socialized into "ways with words," ways of using language that form the heart of what it means to be a competent member of their home communities. Heath then moves on to show how these "ways with words" are incompatible with the sets of expectations of schoolteachers in elementary schools. Particularly, because these expectations derive from schoolteachers' own home "mainstream," middle-class ways of using words to accomplish or carry out social interactions.

This and other works view the concept of "home-school differences" as an important explanation for the lack of success in school by nonmainstream students, including bilingual and English language learners. Associated with the concept of home-school differences was also a clear call for working with teachers, so that they might become aware of the sociocultural differences between children. This knowledge may help teachers change their attitudes toward minority children and adjust their classroom practices to reduce the disadvantages children from different sociocultural backgrounds face when they attend school.

Second-Generation Language Socialization Theory

In more recent years, language socialization research has broadened to encompass studies of second-language socialization and bilingual language socialization,

thus making a more direct link to issues of bilingualism and bilingual education. Some of the insights presented here have emerged through the analysis of bilingual and multilingual communities. This is because communities in which two or more codes (be they languages or language varieties) exist together for whatever reason, they do so inevitably with issues of difference, dominance, or conflict that surround the languages and the speakers of those languages. By examining language socialization in contexts where different social practices come into contact or conflict with one another, these studies highlight the focus on social practice that is the hallmark of language socialization research. A review by Robert Bayley and Sandra Schecter provides an overview of a wide-range study on language socialization in bilingual and multilingual contexts. This work addresses some concerns with the early model of language socialization and offers a variety of extensions.

The first extension of this research, exemplified by Heath, was an extension of the focus of studies on larger, less isolated communities, concerned with studying language socialization practices beyond the scope of the home community, in cases where two or more codes come in contact with one another. This is precisely what happens in the case of language minority children entering language majority schools.

Another extension of the research was to examine the process of socialization not only in childhood, but also as an ongoing process throughout the life span. Adolescence, in this extension, takes on a particular importance because this is when individuals in modern societies find themselves at the intersection between childhood and adulthood. In this period, social identity formation becomes central; hence, extending the scope of socialization beyond childhood entails a shift from seeing socialization as a developmental process to one that sees socialization as practice.

From this perspective, individuals engage in social practices that reflect their identity in age-appropriate ways throughout the life cycle, and in response to the social environment in which they find themselves. In essence, this extension suggests that language socialization is not simply a developmental process leading to adulthood, but rather a component of what it means to be human, namely to be a member of a group. For instance, the practices required to be a “good 5-year-old” are not the same as those required for an adolescent, a young adult, or a senior citizen. The extension suggests that a variety of factors related to identity

help shape what particular behaviors are appropriate for which members of a society. For boys and girls to be considered competent boys and girls, they must behave in quite different ways; likewise, teenagers and senior citizens engage in different behaviors appropriate to their identities and positions in a community. All of those shifts in social practices, in routines of behavior, over time are examples of the language socialization processes. Studies of language socialization also extend to examine the process by which individuals learn the language and the sociocultural practices needed to become competent tool-and-die operators, folk dancers, middle-school students, university professors, meat packers, baseball players, and so on.

An additional extension of recent work in language socialization is the view that cultural norms and practices of communities are far from static or predictable. Rather, communities are indeed always changing to some degree because the individuals who are their members are capable of change. The source of such change can come from broad macrolevel social historical processes at the level of the society and even transnational influences; or it can also come from local level shifts in practices that may permeate a community from the inside. Hence, the process of language socialization is considerably more complex because individuals not only engage in routine practices but must also be aware of how they are changing over time. One example of this research is Don Kulick's *Language Shift and Cultural Reproduction: Socialization, Self and Syncretism in a Papua New Guinean Village*. Kulick examines how macrosociological processes influence language choice, and how the shift to monolingualism in Tok Pisin among children in Papua, New Guinea, occurs.

An additional extension of language socialization research, one drawn particularly from research in bilingual and multilingual settings, shows how the norms and values that dictate and define the language and other social practices also shift over time from one small community to another. *Language as Cultural Practice: Mexicanos en el norte*, by Schecter and Bayley, examines the different ways in which Mexican American families practice and define their culture, and the ways in which both monolingual and bilingual Spanish and English practices form part of that culture. Individuals at different stages of their lives, to be considered members of a community, engage in different practices; along with them, communities change over

time. This social practice view of language socialization allows a more fluid and multifaceted conception of socialization and those social identities associated with it.

Finally, second-language socialization studies have examined cases where language socialization does not occur. These studies employ the same methods for examining social groups, and the same underlying concepts of how it is through social practice that individuals can be in a position to negotiate, challenge, contest, reject, or transform existing social practices in contexts that they find themselves in. Patricia Duff addressed this topic in a research study that is particularly relevant to bilingual and second-language education. Duff examined behaviors of resistance to school-imposed norms and social practices that fail to incorporate or value the language and social practices of language minority youth.

In sum, language socialization theory outlines a view of language learning as embedded in the social practices in which language is used. Through the close examination of everyday routines and practices of individuals in various contexts and communities in which they find themselves, we can learn how and when, in the case of bilingual populations, individuals use the various language codes at their disposal. By extending the scope of research to the broader social processes in which these everyday activities and practices occur, we can also provide explanations for the maintenance and shift of languages in bilingual contexts, as well as the ways in which languages map onto, or construct different social identities, including ethnic and linguistic identities.

LANGUAGE SOCIALIZATION OF INDIGENOUS CHILDREN

The acquisition of language is a universal and fascinating aspect of human development. Language socialization research shows that when acquiring a first language, children are simultaneously acquiring the cultural and social knowledge necessary for becoming competent members of their respective families and communities. From an indigenous perspective, the mother language serves as a basic and fundamental source of identity, sacredness, and strength of an individual, family, and community. This entry begins with a general overview of indigenous peoples, their languages and their cultures, and outlines some of the ways that indigenous children of the United States, Native Americans (also known as American Indians), Alaska Natives, and Native Hawaiians are socialized into their homes and cultures.

Indigenous Peoples, Languages, and Cultures

Indigenous peoples around the world and in the United States differ in a number of striking ways, such as governance, culture (i.e., dress, art, and ceremony), genesis theories, acculturation, and languages. Presently indigenous peoples constitute 4% of the world's population; they also speak an estimated 4,000 to 5,000 of the 6,000 world's languages (as reported by Daniel Nettle and Suzanne Romaine). In the United States, indigenous peoples equal 4.3 million or 1.5% of the total population and represent more than 560 autonomous indigenous nations, including Chippewa, Lakota, Jemez Pueblo (Walatowa), Diné (Navajo Nation), Inuit, Eastern and Western Cherokee, Tohono O'odham, Caddo, Eastern Pequot, Seminole, and Oneida. There are 175 U.S. indigenous languages, which range in various degrees of vitality from a handful of elderly speakers of Pii Paash, a Yuman language, also known as Maricopa (Arizona), to more than 178,000 speakers of Navajo, an Athabaskan language, whose use stretches from the sub-Arctic to the U.S. border with Mexico.

Equally important to understand about indigenous languages is that most of them predominately remain oral languages with cultural knowledge and traditions being orally transmitted among generations; however, language vitality in each community (and family) varies. For most communities that have a written language, mother-tongue literacy is reserved primarily for schools. For example, Zuni is a language isolated in New Mexico, which is spoken by 90% of the 10,000 Zuni members; however, only an estimated 5% of the population is able to read and write the language. Similarly, mother-tongue literacy has existed for nearly 100 years among the Navajo and is currently taught in model language education programs reservation-wide, yet their distinct child socialization practices and patterns remain primarily oral. This is not to say that mother-tongue literacy is not important but, rather, that the socialization of children essentially remains an oral process in indigenous cultures.

Language Socialization Research

Language socialization research is, in general, influenced by the fields of anthropology, sociolinguistics, psychology, and sociology—all of which critically examine human development and human nature, including language acquisition and language and cognitive development. This entry takes a sociolinguistic perspective, strongly influenced by the work of Russian psychologist Lev Vygotsky. In this theoretical view, through various interactions with adults and other cultural experts, young children tacitly, yet actively, absorb social knowledge; they internalize what they acquire from these external activities to make it their own. Vygotsky referred to this sociocognitive process as *internalization*, where an external interaction is transformed into internal mental functioning. In his view, through their verbal and nonverbal sociolinguistic interactions with experts (adults), children come to know who they are in relation to others in their world. In other words, they are acquiring a self-identity in a world of social meaning.

According to Elinor Ochs and Bambi Schieffelin, language socialization research is concerned with how children and other novices are socialized through language and how they learn to use it in their homes and communities. Thus, language socialization research provides insight into the sociolinguistic and cultural world of children before they enter school. This research is critical because it can assist educators who

may be unaware of the language and cultural resources that ethnic and linguistic minority children bring from home, including Native American children. Because these children do not behave linguistically and socially as mainstream English-speaking children do, educators can mistakenly perceive them as having learning difficulties, or may underestimate their abilities to understand when they are actually learning and using language in culturally appropriate ways. Susan Phillips's classic study, for example, illustrated how disparities between the Anglo teacher discourse and the Warm Spring Native students' discourse negatively affected the learning and achievement of culturally and linguistically diverse children. As critical as this sociolinguistic research was, there continues to be a dire need for additional contemporary studies of language socialization of indigenous children.

Language Socialization in Home and Community

Populations around the world have found ways to socialize their children according to their realities and the logic of their languages. Through these socialization practices, a group's youngest members acquire the means to carry this cultural knowledge into the next generation. Experts assume that when children are socialized, they will eventually acquire the home language as well as the beliefs, values, and precepts embedded in it, the means with which to communicate with family members, to function successfully in the world of the home and family first, and eventually the social world of the larger community, including school. What do indigenous socializers (caretakers) believe indigenous children should learn? How do they believe children acquire this "local knowledge?" Do they need to be taught, and if so, who teaches them? People will be able to answer these questions from their own linguistic and cultural experiences and from their perceptions and beliefs about the nature of children, their abilities, and their roles in the cultural world; this is where the discussion now turns.

Beliefs and Perceptions of Children

A renowned native speaker of the Lakota language, Beatrice Medicine, explained that the Lakota word for children, *wakanyeia*, is derived from "wakan," meaning sacred, and reflects the Lakota belief of the sacredness of children. She further explained that

Lakotas socialized in the Lakota language and culture believe that an unborn child is a highly intellectual spiritual being, preparing to enter the physical world and that before being born, the child has preselected his or her parents and caretakers. Simultaneously or respectively, children are considered sacred blessings by parents and family members, and therefore, young children are respected and treated as capable of understanding both the physical and spiritual nature of life. Similar perceptions of children are held by the Pueblo people of New Mexico. A Pueblo grandfather, when asked about his views of children, replied, "Every child is sacred because we don't know what is destined for this child; therefore, we treat every child with equal value" (as reported in research conducted by Mary Eunice Romero-Little). This epistemology of human existence frames the Lakota, the Pueblo, and other indigenous societies and guides them throughout their lives, including how they carry out their "sacred trust" for children. In other words, how they care for, nurture, and value their youngest members.

Becoming Indigenous: Cultural Plans for Socializing Children

Across indigenous cultures and communities, a number of common threads are interwoven to create the cultural plans that guide the socialization of children. One core thread prevalent throughout most indigenous societies is the belief and value of "respect"—respect for the human interconnections with land, water, sky and, one's relations. Respect is reflected in many forms through language and ways of speaking, as indicated by sociolinguist Dell Hymes, and as Leanne Hinton has shown among the Wintu Indians of California:

Many of the verbs that express coercion in our language—such as to take a baby to (the shade), or to change the baby—are formed in a way that they express a cooperative effort instead. For example, the Wintu would say, "I *went with* the baby," instead of, "I *took* the baby." . . . They never say, and in fact they cannot say, as we do, "I have a sister," or a "son" or a "husband." Instead, they say, "I am sistered" or "I live with my sister." To *live with* is the usual way in which they express what we call possession, and they use this term for everything that they respect. (p. 62)

Culture and socialization practices influence the way children behave linguistically and socially, how

they express their feelings and emotions, and how they understand their world. For example, greetings—whether in English or in the native language—are the means for showing respect to others and acknowledging one’s interconnectedness with others. This is illustrated in the following vignette of a young Pueblo girl learning through Keres, the communal language, the important forms of greetings and acknowledgments and the proper way of interacting with others:

A four-year-old girl and her mother enter the house. The mother greets the adults (several women and a couple of men) inside the house. Immediately, at the sight of the youngster, the adults in the house give special attention to her. They greet the young girl with smiles and expressions of verbal delight. The shy young girl does not smile or respond; she clings on to her mother and hides behind her dress. The mother continues to greet the women with her daughter clinging on to her leg. She appears not to mind her clinging child. After greeting each person, the mother sits down on a bench across from several women who are busy rolling out dough for pie-crust bottoms. The mother whispers in her daughter’s ear as one of the women smiles at the young girl and says in Keres, “How are you, my little one? Do you want to help?” The young girl hugs her mother and does not respond. Her mother gives her daughter a little push and instructs her, “Go say hello to your aunt.” The young girl refuses to go or to respond. The mother then takes her daughter by her hand and walks her over to the women working at the table. Together they approach each of the women. The mother models for the daughter the proper verbal greeting and the proper nonverbal gestures (a hug or a handshake). Gradually, with a hesitant smile, the young girl holds out her hand to each of the women and with the assistance of her mother, greets everyone present in the house. The women are delighted and tell the young girl in Keres, “Come help us. Here’s some dough.” (Romero-Little, p. 175)

As this young girl grows older, through guided practice and numerous opportunities for peripheral participation, as characterized in the model proposed by Jean Lave and Etienne Wenger in the home and communal context, she will learn appropriate social and linguistic practices.

For indigenous children, who, from birth—and in some indigenous cultures, *before* birth—grow up with

many familial and community caretakers throughout their lives, special cultural events and daily sociocultural activities (such as illustrated in the previous vignette) collectively contribute to the development of their self and communal identities. Language plays a central role in shaping their perspectives of themselves and kinship (another common thread in the socialization of indigenous children), namely how one is related to others and how to properly acknowledge and interact with them. “Knowing the people” is identified by a young Pueblo parent as being vital to her daughter’s development of a sense of self and communal identity: “I want her to know the people. I want the people to know her. And, of course, I want her to learn the language. But I think that those relationships are really going to help that part out. So, we try and teach her who people are” (as reported in Romero’s study). Likewise, David Sing, Alapa Hunter, and Manu Meyer report that Native Hawaiian children are instilled with the *ohana* (family) and community when they participate in practices in the “Hawaiian way,” such as learning hula, making rope out of *hau* or carving stones for *ulumaika*, chanting, and through storytelling or “talking story”—all of which are embedded with life lessons and traditions.

Through their intrapersonal and interpersonal sociolinguistic interactions with their caretakers, children acquire the knowledge of relationships, in particular the prominent role carried out by the extended family and grandparents. For instance, in the Kiowa society, a Plains Indian nation of Oklahoma, young children learn to use language in ways that acknowledge the various extended relations, especially their connections with elders, which constitute the core (or circle) of their social and cognitive worlds, as illustrated in the following story told by a Kiowa man who was asked who his most important childhood caretakers were:

As a young boy growing up, I became excited and charmed by my grandfather . . . I can remember feeling attached to this powerful man and proud to be part of his family—his circle. My other relatives were also important in my care and upbringing. I can still remember with fondness as my mother or grandparents would introduce me to an older woman at a powwow or church and say, “this is your grandma.” It was not until the eighth grade that I came to the realization I only had one set of biological grandparents. The images and cohesiveness of this extended

circle played a powerful role in my development.
(Rogers, n.d.)

In many indigenous societies, one is related to many individuals in many ways that extend beyond one's blood relations. Children must learn this tapestry of social, cultural, and religious relationships early in their lives.

Patricia García contends that one way that parents socialize a child on the importance of language and other cultural practices is through attitudes toward language and practices that may not be overtly taught; they are often displayed in daily interaction or communication. This is exemplified in the socialization of Alaska Native children, as reported by the Alaska Native Language Center. In Alaska Native villages, daily life and much of the daily learning of both children and adults evolve around essential seasonal subsistence activities such as hunting, fishing, berry picking, and so on. Each summer, for instance, children accompany their families to fish camps for months at a time. While at the fish camps, children are integral contributors to the myriad tasks for preparing fish for the winter food supply. From morning to dusk, the entire family is busy catching, cutting, cleaning, and drying the fish. Young children, if not directly engaged in a task, are silent participants. They listen, observe, and quietly internalize the daily activities of others. In this way, they learn the important things they will need to know when it is their turn to take on these responsibilities and to pass them on to the next generation.

Conclusion

Children, including indigenous children, come to school with well-established ways of communicating, and particular forms of knowing and learning that are framed through their languages, cultures, and socialization experiences. In this socialization process, which is part of a culture and begins well before children enter school, are found methods for imparting what a community truly believes children ought to learn and may not resemble the language and literacy practices of schools. This is not to say that indigenous families do not value and promote the knowledge and skills taught in mainstream schools. Quite the opposite, they value them as much as mainstream families do. As witnessed in this entry, however, what is taught in school is only a small part of what indigenous

children must learn if they are to be successful in and beyond their own community. First, these children must learn how to relate to others in their own cultural world and become skilled at carrying out their duties and responsibilities as members of their cultural community; they must also acquire the cultural literacy to do this. For this reason, indigenous peoples faithfully carry out cultural plans for their children. Thus, in a deep sense, the language socialization process is key to an indigenous people's cultural and linguistic survival. The family and community goals for indigenous children reach far beyond the form of literacy shaped and promoted by formal schooling. Although their early socialization may differ from those of mainstream children, indigenous children are provided with many rich and meaningful opportunities to acquire the cultural symbols and intellectual traditions, which according to Rebecca Benjamin, Regis Pecos, and Romero, are important and vital for the development of their personal and collective identities and, equally important, for ensuring their bilingual and bicultural competence and successes beyond their cultural worlds, in mainstream schools.

20th century at the high school and university levels rose and fell consistently with societal ideologies that affected our collective outlook on cultural and language diversity. Interest in foreign-language study has sometimes coincided with policies associated with national defense. More often, however, opposition to immigration and perceived threats to a national American identity have contributed to devaluing the study of certain foreign languages in schools. The see-saw effects of less-than-decisive policies and public sentiment have had a negative affect on foreign-language study. This entry examines some of these changes during the last half of the 20th century, the period that parallels the contemporary history of bilingual education.

By the end of the 20th century, only 60% of post-secondary institutions had foreign-language requirements for graduation. The United States is one of the few countries in the world, perhaps the only one, where it is possible to receive a university education without any foreign-language requirement. Historical data illustrate the worsening of this situation over time.

Language Enrollments in Schools in the 20th Century

Estimates for foreign-language enrollments from 1900 to 1920 indicate that most students were enrolled in foreign languages, primarily Latin, followed by German, French, and Spanish. Latin was often a requirement for admissions to liberal arts colleges. After World War I, German language enrollment fell dramatically, although it experienced a comeback in the 1930s. During this period, there was also a shift from colleges primarily offering courses in Latin to “modern language instruction” that eventually outpaced the classical languages. From the 1920s to the 1950s, foreign-language instruction overall fell in the United States as the country became more isolated and xenophobic. In addition, an increasing number of students turned to fields of study other than languages.

The launch of the world’s first artificial satellite, *Sputnik*, by the Soviet Union in 1957 resulted in a renewed, albeit short-lived interest in foreign-language studies, especially at the federal level. The National Defense Education Act (NDEA) was passed in 1958 to encourage the advancement of education in science, mathematics, and modern foreign languages. One purpose of NDEA was to encourage the teaching of languages designated as “critical” or “strategic” by

LANGUAGE STUDY TODAY

Although the United States is a nation of diverse languages and populations, foreign-language study has had a checkered history in the nation’s schools and colleges. Foreign-language enrollments during the

government entities and the Modern Language Association (MLA). The immediate purpose, however, was to move the United States ahead of the Soviet Union during the space race through better education. This had a direct impact on foreign-language enrollments, and by 1960, 86% of postsecondary institutions had foreign-language requirements. Although language enrollments continued to rise throughout the 1960s, enrollment fell off in the 1970s as a result of many colleges removing their foreign-language requirements for reasons that are not altogether clear.

In 1978, President Jimmy Carter created the President's Commission on Foreign Language and International Studies to investigate whether the United States was maintaining its commitment to the 1975 Helsinki Accords on foreign-language study and also address the concerns of the State Department and National Security Council regarding the nation's capability in foreign-language training and research. The commission discovered persistent problems at all levels of foreign-language instruction, including inadequate training of teachers, insufficient administrative support, a lack of imaginative curricula, poor coordination, and a lack of sound criteria for measuring progress in these fields. The commission made 65 recommendations; however, by the end of the 20th century, few of those recommendations had been implemented. Despite national reports detailing the need for Americans to be competent in languages and cultures other than their own, only a handful of states had mandated foreign language be taught in schools and only 60% of postsecondary institutions had a foreign-language requirement.

Enrollment Numbers in Universities and High Schools

Since 1958, the MLA has conducted surveys every 4 years to track foreign-language enrollment in postsecondary institutions. The last survey conducted in the 20th century was in 1998. In the 1960s, foreign-language enrollment was at an all time high with 17% of students enrolled in a foreign language (Table 1). The top five languages that accounted for 95% of the foreign-language enrollment were French, Spanish, German, Russian, and Latin (see Table 2). Since the 1960s, the choice of which foreign language to study has shifted significantly. Although French was the most popular foreign language in 1960, its enrollments experienced a steady

Table 1 Modern Foreign-Language (MFL) Enrollments Compared With Higher Education Enrollments, 1960–1998

<i>Year</i>	<i>College Enrollments</i>	<i>MFL Enrollments</i>	<i>%</i>
1960	3,789,000	642,896	17.0
1965	5,920,864	1,034,877	17.5
1968	7,513,091	1,125,594	15.0
1970	8,580,887	1,101,659	12.8
1972	9,214,820	1,002,030	10.9
1977	11,285,787	933,468	8.3
1980	12,096,895	924,372	7.6
1983	12,464,661	966,013	7.8
1986	12,503,511	1,003,234	8.0
1990	13,818,637	1,184,489	8.6

1998	14,507,000	1,194,648	8.2

Source: Draper & Hicks (2002).

decline. German and Russian, along with French, also saw a steady decline in enrollment numbers (Table 3). Although still a popular foreign language, by the end of the 20th century, French was far outpaced by Spanish (see Table 2). In 1998, Spanish accounted for more than half of all foreign-language enrollments. Foreign languages such as Chinese, Japanese, Arabic, and Korean also saw major increases in enrollment (see Table 3). In 1998, Japanese became the fifth most commonly taught language, and Chinese the sixth.

Although the actual number of foreign-language enrollment is currently at an all-time high, the past 40 years have demonstrated the waxing and waning interest in foreign-language study in the United States. Throughout the 1960s, enrollment remained on a steady incline, reaching more than a million students by 1965. Then, during the 1970s, enrollment declined before increasing again in the 1980s and 1990s. This growth in foreign-language enrollment numbers, though, has not been consistent with the total growth of college enrollments. College enrollments have outpaced foreign-language enrollments. Since the mid-1980s, foreign-language enrollments have stayed at approximately 8% of total college enrollments compared with 16% 40 years ago.

Foreign-language study at the high school level also shifted throughout the 20th century. Beginning

in 1958, the MLA began tracking high school foreign-language enrollment. Eventually, the American Council on the Teaching of Foreign Languages, a division of the MLA, assumed data collection. In the early part of the 20th century, foreign-language enrollment was at an all-time high with 83% of students learning Latin, French, German, or Spanish (Table 4). Foreign-language enrollments reached an all-time low after World War II but have increased since then. Although enrollment

numbers steadily declined, during the 1900s and until the middle of the century, Latin was the foreign language of choice. As the popularity of Latin declined, Spanish quickly became the most popular foreign language. Spanish now accounts for almost 70% of all foreign-language classes being taught in high school. In 2000, 43% of students were enrolled in a foreign language. Spanish, French, German, Italian, and Latin account for 96% of all foreign-language enrollments (Table 5).

Language Organizations

Various organizations are dedicated to the study and teaching of modern languages in schools in the United States. These include the MLA, the American Council on the Teaching of Foreign Languages (ACTFL), and the Center for Applied Linguistics (CAL). Throughout the 20th century and continuing in the 21st century, these organizations have been dedicated to the study and promotion of foreign languages and language issues in the United States.

Founded in 1883, the MLA is a scholarly organization that provides opportunities to share findings and teaching experiences as well as discuss trends in the study of languages. The ACTFL was founded in 1967 by the MLA and remains the only national organization dedicated to the improvement and expansion of the teaching and learning of all languages. This organization has been involved in developing proficiency guidelines and national standards for foreign languages. CAL was established in 1959 as a private nonprofit organization working to improve communication through better understanding of language and culture. CAL is also involved in the National K–12 Foreign Language Resource Center. The resource center was established in 1994 as a collaborative effort between CAL and Iowa State University and funded by a grant from the U.S. Department of Education. The center seeks to improve foreign-language education in Grades K–12 through professional development of K–12 foreign-language teachers.

Conclusion

Despite the support of organizations devoted to foreign-language instruction and the rising numbers of enrollments in foreign languages, language study in the United States overall remains inadequate. Research shows immersion programs to be the best method of language learning, yet those programs remain scarce, and most schools only require a minimum of foreign-language study that limits proficiency to beginning levels. Because of the autonomy of schools in choice of instructional program, both at the secondary and postsecondary levels, foreign-language learning is often disjointed and precludes any meaningful competence. The assumption of most language programmers in schools is that languages are best taught in classrooms three to five times a week in the same way as are all other subjects. There is no research to show that this is actually the optimum arrangement for teaching and learning languages. This is coupled with the consistent problems of funding shortages, inadequate in-service training and lack of quality materials for language instruction.

Foreign-language study in schools in the 20th and 21st centuries has been greatly affected by the lack of commitment to language diversity at the local, state, and national levels. Despite the advent of globalization at the end of the 20th century, the United States embraced a monolingual English-only language policy for schools and society.

Current foreign-language enrollments document how many students are enrolled at a particular time.

Although only 8% might be enrolled when the survey is given, it does not mean that only 8% of students have received foreign-language instruction. Currently, 60% of universities have a foreign-language requirement, meaning that at least 60% of students will graduate with some foreign-language study.

LATINO ATTITUDES TOWARD ENGLISH

The U.S. Bureau of the Census reported that, in the last official census, the number of persons who speak Spanish at home rose from 10.2 million in 1980 to 24.7 million in 2000. This growth has sparked concerns among some critics of bilingual education who fear that Spanish has become pervasive and that some proportion of Latino students will not learn English if they are permitted to participate in bilingual education for a protracted time. The assumption of these critics is that bilingual education detracts from the immigrants' desire to learn English, particularly in the case of Latinos, by far the largest of the immigrant groups. Research with

Spanish speakers, however, challenges the myth that Spanish-speaking immigrants, their children, and their grandchildren resist learning English. This entry reviews what is known about Latino attitudes toward English, and possible reasons for beliefs held by some that Latinos in the United States do not want to learn English.

The Importance of Language Attitudes

Attitudes are difficult to measure because unlike other attributes, such as height and weight, they cannot be observed directly. An attitude represents internal thoughts, feelings, and behavioral tendencies that vary with time and context. An attitude can be a predisposing factor, and it can also be an outcome. Those with positive attitudes toward learning a language before they start learning it may succeed in their studies. Also possible is that through language study, language learners will develop a positive attitude toward the language they are learning. Conversely, a learner with a negative attitude about a language may experience more than the usual problems learning that language.

Colin Baker describes various types of language attitudes. According to Baker, some may be loyal to their own language and hold a less generous attitude toward a minority or immigrant language. Others may have favorable attitudes to both their own and another language. They may also have particular attitudes to a language variation, dialect, or speech style. Other attitudinal targets include strategies of language instruction and the notion of learning a new language in itself. These differences color people's identity with respect to the society in which they are situated. Attitudes associated with these differences, have myriad implications for how people of varying language backgrounds, abilities, and motivations accommodate each other when interacting with one another in a given language.

Josiane Hamers and Michael Blanc suggest that attitudes appear to be associated with the speakers' desired future for themselves and their group within a given society. Immigrants who opt for the identity of their adopted homeland may favor quick assimilation. Those who opt for preserving their ethnic identity may favor a cultural pluralism that permits them to maintain their cultural heritage. These differences

have implications for bilingualism. Baker also mentions research indicating that people may also have integrative or instrumental attitudes toward a language other than their own. Those with positive integrative attitudes may want to learn the second language because they want to identify with its speakers, participate in their cultural activities, and form new friendships. Persons with positive instrumental language attitudes may want to learn the second language for utilitarian purposes, such as finding a better job, improving their career prospects, passing exams, performing well on the job, or helping their children with schoolwork. The same person might also have instrumental language attitudes in some circumstances and integrative language attitudes in others.

Baker further emphasizes the importance of situating the study of language attitudes in its parent discipline, the social psychology of attitudes. To neglect to do so would place language attitudinal studies at risk of reaching poorly defined, naïve conclusions, which might place researchers and consumers of research at risk of replicating previous mistakes. To do so could place us in danger of overgeneralizing apparently similar language attitudes experienced by others earlier in history, and applying conclusions that might have been poorly conceived to current situations. One such potentially harmful conclusion is the assumption that Latino people who are loyal to Spanish have poor attitudes toward English.

Research on Latino Attitudes Toward English

Recent research about Latino attitudes toward English using direct means such as attitude questionnaires is limited. Baker asserts that certain attitudinal instruments, such as attitude-to-bilingualism questionnaires, can fail to reveal subconscious or socially undesirable attitudes. Another weakness has been the implicit assumption in some designs that a favorable attitude toward one language excludes the possibility of a simultaneous favorable attitude toward another language.

Given the difficulties associated with using direct means to research attitudes, researchers typically rely on indirect methods. One generally accepted indirect research strategy is the *matched guise technique*, where respondents listen to the same person read the same passage in different languages or with different accents or styles within a language.

Respondents do not know that the same person is reading and are asked to make judgments about the speaker. The matched guise technique has proven useful in identifying listeners' attitudes about the speaker according to three dimensions: the speaker's competence, his or her personal integrity, and his or her social attractiveness.

Another indirect research method is surveys. Despite their weaknesses, surveys can provide insights into community thoughts, beliefs, and preferences about their own and other languages. Especially pertinent research about Latino attitudes toward English are the following survey results: Calvin Veltman's work, published in 1988 by the Hispanic Policy Development Project; the 1991 Gallup Study of Attitudes toward English as the Official Language commissioned by the U.S. English organization; the Southwest Voter Research Institute 1996 *Latino Issues Survey*; and two surveys conducted by the Pew Hispanic Center in 2002 and 2004.

Veltman reported that by the time Latino immigrants have been in the United States for 15 years, three-quarters of them reported using English on a regular basis. His research also pointed out regional differences with respect to the speed of language shift from Spanish to English. In Texas and New Mexico, Latinos "migrated" from Spanish to English more slowly, and in Colorado, Latinos "migrated" more quickly. Age also made a difference. Not surprisingly, immigrants who arrived at an older age migrated to English at slower rates than did younger Latino immigrants.

In the 1991 Gallup study, 42% of Latino respondents responded in favor of making English the official language, but 78% of non-Latino respondents favored this option as well. Only 34% of Latinos reported in favor of limiting bilingual education to the period when children are learning English, but 54% of non-Latinos did. Forty-five percent (45%) of Latino respondents reported a belief that maintaining immigrant languages and cultures should be a private concern, and 71% of non-Latinos reported similarly. Some might conclude from these statistics that Latinos as a group think differently from non-Latinos, but such a conclusion may overgeneralize other factors associated with these statistics, such as the age of the Latino respondents, the length of time of residence in the United States, and citizenship status. Carol Schmid reported that the small sample of Latinos in this study makes it difficult to analyze the data and reach defensible conclusions.

Table 1 Hispanic Attitudes Toward English Language in the United States

	<i>Citizens</i>	<i>Noncitizens</i>
Percentage that support . . .		
Making English the official language of the U.S.	37.1	23.2
Eliminating bilingual education	12.2	7.5
Eliminating ballots in Spanish	10.1	9.2
Eliminating the use of Spanish in government	8.7	5.4
Percentage that will use a ballot in English	83.5	54.7

Source: Schmid, C. (2001). *The politics of language: Conflict, identity and cultural pluralism in comparative perspective*. New York: Oxford University Press.

Schmid also reports that Latino respondents to the *Latino Issues Survey*, though generally in opposition to making English the official language of the United States, did not have unanimous opinions on this matter. When asked if they would use a ballot in Spanish or in English to vote, 83.5% of U.S. citizen Latinos and 54.7% of noncitizen Latinos reported a preference for an English language ballot.

The Pew Hispanic Center surveyed Latino opinion on education and civic engagement and included questions about attitudes toward English. Respondents were asked whether they thought immigrants have to speak English to assert they are part of American society. They were also asked whether teaching English to immigrant children is very important, somewhat important, not too important, or not important at all.

Latino respondents reported that immigrants have to speak English to be a part of American society and that English should be taught to the children of immigrants. The endorsement of the English language, both for immigrants and for their children, was strong among Hispanics of all backgrounds in socioeconomic status, party affiliation, fluency in English, or length of residence in the United States. How long Latinos had been in the United States, however, did make a slight difference in their attitudes. Latino immigrants are slightly more likely to say that immigrants have to learn English than are native-born Latinos. Most Latinos—across socioeconomic status

and levels of education—viewed it essential that immigrants learn English.

Latino and other respondents also reported that it is important that English be taught to children of immigrant families. Latinos held stronger views than either non-Latino Whites or Blacks. This support was equally high regardless of party affiliation, income level, or language ability. Foreign-born Latinos were stronger in their opinion that English be taught to immigrant children than were U.S.-born Hispanics. The Pew survey also reported another telling statistic: Among Latinos, only 2% held the view that teaching English to immigrant children was not important, whereas 27% of non-Latinos held this view.

Evidence from the Pew Hispanic Center’s 2002 survey about civic engagement suggests that Latinos who speak both Spanish and English prefer to use English. Although many native-born Latinos can speak Spanish, few reported strong reading capacities in Spanish. In nearly all job settings, bilingual Latinos use English. Fewer than 10% of all

bilingual Latinos obtained news information solely in Spanish, and fewer than 20% used Spanish exclusively at home. Because the home is considered the ultimate domain for imparting language ability from one generation to the next, it was not clear in 2002 whether English-Spanish bilingualism will remain prevalent in future generations of native-born Latinos. This finding reconfirmed what Veltman reported in 1988.

On a related topic, respondents also commented on the importance of assimilating into a dominant culture. Seventy-three percent of Latinos surveyed reported it somewhat or very important for Latinos to change so that they blend into the larger society, as for example, in the image of the melting pot of cultures. Fifty-five percent reported that an immigrant has to speak English to say they are a part of American society. Fifty-four percent felt that one must be a U.S. citizen, 65% indicated that one must vote in U.S. elections, and 79% reported that one must believe in the U.S. Constitution to demonstrate that they are part of American society. However, among all Latinos, 87% reported it very, or somewhat, important to maintain their distinct cultures, and 93% reported it very,

or somewhat, important that future generations of Latinos living in the United States speak Spanish.

Conclusion

The research suggests positive language attitudes among Latinos toward English. What the evidence does not show are the reasons for these positive attitudes. There are insufficient data to suggest which factors are at play within the Latino community in encouraging these attitudes. The data are also insufficient to suggest which contextual factors outside of the Latino community, such as inaccurate understandings of non-Latino people, influence these attitudes and people's perspectives on them.

Given historical accounts of immigrant speakers of languages other than English in the United States, some may conclude that today's Latino experience follows a different trajectory from that of previous immigrant groups. However, historical accounts about other immigrant groups' experiences in the United States may be incomplete. Accounts of our non-English-speaking European ancestors' struggles with English may have failed to adequately capture the

unobservable and therefore not reportable, which is now so vividly articulated simply through prolonged, immediate contact with today's Latino community in everyday life.

Also absent from historical records are comprehensive studies such as Veltman's and the Pew Hispanic Center's. Perhaps a previously held, implicit expectation that newcomers would learn English and relinquish their native languages precluded surveying immigrant opinion on the matter. Factors such as the nativist attitudes that surfaced at various times in U.S. history among those already in the United States when the newcomers arrived sometimes go unnoticed. Also, many of us grew up in an era when immigration to the United States was at its low point. This era was not the norm that we might tend to believe. Amnesia about these realities may have colored our understanding of the past and its similarity to the present. Today's Latinos' positive attitudes toward English and Spanish remind us that one can have positive attitudes about more than one language, and more accurate recollections of our past might lead us to conclude that our ancestors may have felt the same way although scientific research was not conducted to help us find this out. With this realization, the question becomes less of a question, and the evidence becomes less of a surprise.

LATINO CIVIL RIGHTS MOVEMENT

Historically, much of the civil rights struggle in the United States has concerned the constitutional rights, legal status, and treatment of minority groups that are marked off from the majority by race, religion, or national origin. For the Latino population, civil rights struggles emerged in the mid-1800s over constitutional rights to property, citizenship, treatment, and the very meaning of their community. By the early 1900s, however, a shift began to take place in matters of economic, educational, and political equality. Mexican Americans—the largest group within the Latino population in the United States at the time, with a long history of discrimination, segregation, and second-class citizenship since the end of the Mexican-American War of 1846–1848—led the struggle. To understand and appreciate the struggle for civil rights by Mexicans and other Latinos, one must consider the historical relationship of this community to the majority group in power. Although the term *Latino* is used widely today in conjunction with the civil rights movement, the primary reference group and examples in this article are drawn mainly from the Mexican American community. This entry briefly reviews early struggles by Mexican Americans in education and how these struggles helped pave the way for the Latino civil rights movement of the 1960s and 1970s. Particular attention is given to the relationship between the movement and the emergence of bilingual education. It is important to note, however, that Puerto Ricans, Cuban Americans, and others also played important roles in promoting bilingual instruction.

Historical Antecedents and Early Education Struggles

The Mexican American community gained a more visible legal status in the United States after the Mexican American War ended in 1848. As a result of the war, Mexico ceded more than half of its territory to the United States. The vast territory lost by Mexico to the United States and known in U.S. history books as the “ceded territories” comprises what are now the states of New Mexico, Colorado, Arizona, California, Nevada, and parts of Utah. The Treaty of Guadalupe Hidalgo, which ended the war, made certain assurances to the Mexican population living in the conquered land. The treaty set forth the terms by which the former Mexican citizens and their property would be incorporated into the United States. Former Mexican citizens had as long as a year to choose their preference for citizenship—Mexico or the United States. Staying in the United States meant accepting U.S. nationality and citizenship. Most chose to remain on the land where they had settled and consequently became citizens of the United States. Their property was supposed to be respected as covered in Articles VII and IX of the Treaty, but many violations of these assurances occurred, and property was lost or stolen. Legal battles to recover property continue. Some Chicano scholars argue that the Treaty of Guadalupe Hidalgo, a legal document between two sovereign nations, guaranteed the civil rights, language, and religious freedom of the Mexican population who became United States citizens. The relevance of this argument surfaced in at least one desegregation school case in the 1940s and will be discussed in the next section.

Following the Mexican American War, the integration of Mexican Americans into the U.S. society between 1848 and 1915 has been characterized by political historians as one of a “politics of resistance.” Mexicano struggles throughout the Southwest centered on maintaining control of their property as well as efforts to maintain a cohesive and culturally distinctive communal identity. The tradition of bilingual instruction, prevalent at the time in California and New Mexico, contributed to the maintenance of community. But public sentiment toward bilingual schooling began to turn in the late 1800s. In Texas, for example, arguments for English-only pedagogy emerged, although, as Carlos Kevin Blanton documented, legislation with criminal punishments did not take hold

until after World War I in the context of American nativism fed by the war and increased immigration. Some of the antibilingual sentiment was directed at Mexican Americans. But as hostility increased toward Germany, German became as unpopular as Spanish in state laws and in the public schools.

The first major wave of Mexican immigration that significantly increased the Mexican population in the United States occurred at the turn of the 20th century, pushed by the Mexican Revolution of 1910 and pulled by the economic expansion of the agricultural and industrial sectors in the United States. Children of these immigrants started attending school in large numbers, and by World War II, many of them became soldiers; of these, many fought and died in Europe.

After the enactment of mandatory school attendance laws in the 1920s and 1930s, the public schools emerged as the primary institutions charged with the task of preparing students for productive adult roles in society, including the inculcation of American values and the ability to speak English. Unfortunately, opportunities to pursue long-term schooling were limited for most Mexican students. The predominant policy of segregation and Americanization initiated differential treatment and discrimination based on race, ethnicity, and national origin.

The legal precedent for separate but equal facilities upholding racial segregation was decided by the Supreme Court case *Plessy v. Ferguson* in 1896. The interpretation of this decision was extended to racial segregation in schools and applied to African American, Mexican American, and Native American students. During the first half of the 20th century, Mexican American children were subjected to the practice of segregation into either “Mexican classrooms” or into separate “Mexican schools.” Chicano historian Ruben Donato estimates that by 1930, 85% of Mexican children in the Southwest were attending either separate classrooms or entirely separate schools. Anglo community and education leaders believed that the practice of segregating Mexican children from their White counterparts was best to train them for their expected station in life, Americanize them, and teach them English. Many Mexican parents engaged in struggles protesting segregation and discriminatory educational practices. Among the practices used to discriminate against Mexican American children was punishing them for speaking Spanish on the school grounds at any time and for any reason. As late as 1968, when the U.S. Commission on Civil Rights held

hearings in Texas relative to these practices, one of the witnesses produced a “Spanish Detention Slip,” which he explained was used in his child’s school to document that the child was being punished for speaking Spanish. This was the same year that the Bilingual Education Act was passed in Congress as Title VII of the Elementary and Secondary Education Act (ESEA).

Desegregation Cases in Texas and California

Some political scientists argue that from 1915 to the 1950s, the Mexican American community pursued accommodation as a strategy to integrate into U.S. society. Given the nativist sentiments against German Americans and Mexican Americans deriving from World War I and the Mexican Revolution, many Mexican Americans did seek greater assimilation and cultural integration. This period saw the rise of the (hyphenated) Mexican-American generation and the birth of civic organizations such as the League of United Latin American Citizens (LULAC) and the American GI Forum. Note that at least in the case of these organizations, the word *Mexican* did not appear in their names. The Mexican-American generation sought to integrate by practicing their patriotism, serving in the armed forces, adopting American ideals, acculturating, and working within the system. Working within the political system meant standing up for their civil rights. Examples of these struggles are provided by several desegregation court cases, three of which will be discussed here.

The first milestone case was the 1930 *Independent School District v. Salvatierra* in Del Rio, Texas. A group of Mexican American parents sued the Del Rio Independent School District for illegal racial segregation. Attorneys for LULAC represented the parents in court. School officials reasoned that because Mexican Americans spoke Spanish, it was pedagogically necessary to segregate them, especially in the first three grades to teach them English. The judge hearing the case ruled in favor of the school district, noting that if the existing pedagogical segregation was limited to the first three grades, it was not inherent racial discrimination. In essence, the judge found *de jure* segregation illegal, yet in practice *Salvatierra* maintained pedagogical segregation as a legal loophole for *de facto* racial segregation.

The second historic case—*Alvarez v. Lemon Grove*—took place in California and was also decided in 1931. Mexican parents sued the school district of Lemon Grove for illegal racial segregation. School officials made a similar argument, claiming that it was necessary to segregate Mexican American students to facilitate their English language development and Americanization. In this instance, the court ruled in favor of the Mexican community on the grounds that separate facilities for Mexican American students were not beneficial to Americanization or to their English language development.

The third landmark case, *Méndez v. Westminster School District*, was decided in a California federal court in 1947. The court ruled that the school had illegally segregated Mexican American students from Whites, yet they were not legally classified as separate races. Moreover, the judge who heard the case found no statute or congressional mandate that permitted school boards to segregate Mexican American students and stated that the Fourteenth Amendment and the ratification of the Treaty of Guadalupe Hidalgo had guaranteed Mexican Americans equal rights. The *Méndez* case provided renewed inspiration to terminate segregation, especially in Texas where LULAC and the American GI Forum led the effort challenging the legality of pedagogical segregation. New cases were filed in 1948 (*Delgado v. Bastrop Independent School District*) and 1957 (*Hernandez v. Driscoll*). Attorneys for the NAACP Legal Defense Fund were carefully following these cases because they all contributed in some way to the epic Supreme Court decision in *Brown v. Board of Education*. The Court found the schools guilty of *de jure* segregation in Texas, however, many school districts resisted changing the practice of pedagogical segregation well into the 1960s, arguing that they were justified on pedagogical grounds because of students’ limited English proficiency. The language question did not become a central civil rights issue until the 1960s and 1970s.

Shifting Sentiments Toward Native-Language Instruction

The decade of the 1960s ushered in an important change not only in the methods of teaching non-English-speaking children through use of the native language, but also in the type of leadership emerging from Latino communities, which differed significantly from the accommodationist politics of previous

generations of Mexican Americans. After the enactment of Title VII of ESEA and the successful experiment of refugee Cuban children in bilingual schools in Florida, the Office of Education in the Department of Health, Education and Welfare began to fund programs experimenting with bilingualism and native-language instruction. Other factors that entered into this different mind-set included increased immigration from Asia and Latin America, and a gradual rethinking of assimilation and ethnicity. This political and cultural context influenced some leaders and language scholars to shift their thinking away from an exclusive English-only pedagogy to the emergent technique of English as a Second Language (ESL), which was more sympathetic to native languages. Early experimentation and research with native-language instruction and ESL in New York and Florida illustrated the promise of this new approach. Bilingual education followed close behind and eventually became the program of choice among Mexican American civil rights activists.

New York and other northeastern cities had experienced an influx of Puerto Rican workers and families since the 1930s. Puerto Rican children attending public schools encountered the same English-only pedagogy as did Mexican Americans in the Southwest. This schooling practice contributed to low educational attainment and high drop-out levels among Puerto Rican youth. In the late 1950s, concerned Puerto Rican community leaders and professionals in New York began to organize to address discrimination and push for educational equity. As a result of these efforts, the civic organization ASPIRA was founded in 1961 to address the high drop-out rate and push for the empowerment of the Puerto Rican community. The increased number of Puerto Rican children in New York City schools coupled with the reported failure of English-only instruction, and pressure from ASPIRA prompted school officials to initiate native-language instruction programs. In 1963, the superintendent of schools, Calvin Gross, advocated native-language instruction to help develop the bilingual and bicultural capabilities of Puerto Rican children to the benefit of the city, nation, and a multicultural world.

South Florida provided a different example regarding the incorporation and instruction of Latinos into American society and its educational system. Miami and Dade County Public Schools experienced an influx of Cuban refugees following the 1959 Cuban Revolution. The arrival of thousands of Spanish-speaking Cuban exiles prompted the national and

local government and school officials to act. The state of Florida had no constitutional obligation to provide political refugees with services in education and other areas as it would for its citizens. Yet on political and moral grounds, the state accepted them as a group and provided all or some of the rights they had enjoyed in Cuba, including education in their native language. The sympathetic reception by Florida toward the Cuban refugees combined with the advocacy of Cuban refugee leaders prompted the federal government to provide aid to facilitate their settlement and assimilation. In 1961, the Cuban Refugee Program was established through the U.S. Department of Health, Education and Welfare. Through this program, incoming refugees were registered and a determination made of their eligibility for support and services. Various forms of assistance were provided, among them providing Spanish and English instruction to refugee children in Dade County schools, as well as vocational training to adults. From the start, a concerted effort was made by the school district to train teachers in English language instruction techniques and in developing appropriate materials for teaching English language arts to Spanish-speaking students. In 1963, the Dade County School Board approved the funding and implementation of a bilingual education project to serve both Cuban and American children. Based on the willingness of school administrators and teachers and the support from the Cuban American and Anglo American communities, the bilingual education project grew into a broader concept of two-way bilingual education for both Spanish-speaking and English-speaking students. English-speaking children learned Spanish and Spanish-speaking children learned English. The Mexican American experience with bilingual schooling, however, was different in style and substance.

Emergence of *Movimiento* Leadership

In the 1960s, educational attainment for Mexican Americans in the Southwest ranked among the lowest of all ethnic groups. Moreover, the practice of punishing students for speaking Spanish on school grounds continued. This practice went hand-in-hand with English-only pedagogy and was meant to shame the speaker into speaking English. The prevailing belief among educators in the Southwest was that if students learned English, abandoning their native language and culture, they would assimilate into American society faster and more effectively. The Mexican-American

generation had embraced aspects of this conviction as an avenue to assimilation and social mobility. However, evidence showed that even after having learned English and given up Spanish, Mexican Americans continued to suffer the effects of years of segregation, discrimination, poverty, and powerlessness, without much hope of improvement. Furthermore, leaders saw that African American and other groups were getting more response from the federal government than Mexican Americans were. Inspired by the confrontational politics of the civil rights and antiwar movements, a new generation of Mexican American leaders began to change their politics. The new leadership drew much of its energy from Mexican American students and youth who had grown disenchanted with the traditional Mexican American political groups and organizations that had pursued the politics of accommodation. The leadership of this new Chicano generation espoused a greater sense of ethnic pride and cultural distinctiveness and preferred to self-identify as *Chicano* instead of the hyphenated *Mexican-American*. They also felt that Spanish was integral to their cultural distinctiveness and sought to have it recognized more openly and used more widely in schools. The preferred self-identification term *Chicano* served as a statement of the politics of identity and as a statement of self-affirmation and community empowerment. In rejecting the accommodationist style of their parents' generation, the style of the Chicano generation was more confrontational, grounded in activism and action, and formed the basis of their philosophical outlook, designated by the term *chicanismo*. The philosophy held that to be a Chicano or Chicana meant someone who fought for the rights of the Mexican American community and against Anglo-American bigotry, not merely seeking to integrate themselves into the society as their parents had done. Chicanismo was also concerned with the loss of Spanish and with cultural erosion, the lack of economic and social mobility, discrimination, and lack of educational equity.

In 1966, following a walkout by Chicano leaders from an Equal Employment Opportunity Commission conference in Albuquerque, New Mexico, and a call for more direct intervention, President Lyndon B. Johnson created the Inter-Agency Committee on Opportunities for the Spanish Speaking and named Vicente Ximenez to head the cabinet-level agency. Ximenez coordinated another conference in El Paso in 1967 that focused on Mexican American issues. Mexican Americans presented papers at the conference advocating the

inclusion of Mexican American culture and language in schools on an equal basis with Anglo culture. Some of the young leaders who participated in these events grew disaffected with what they saw as all talk and no action. This group of alienated Chicano leaders organized their own *Raza* (literally meaning "the people") unity conference in El Paso and called for more self-determined efforts. A series of other *Raza* unity conferences were held in Texas and the Southwest, which brought members of different Chicano organizations and regions together to exchange ideas and strategies for addressing the problems facing Mexican Americans.

Among the central concerns discussed at these gatherings were political mobilization, cultural nationalism, the plight of Chicano education, and the need for bilingual education. Chicano leaders sought to gain representation at all levels of political life and called for governmental action on behalf of their group in education, health, housing, and employment. Fearful of the crumbling Hispanic support, the Johnson administration responded to the pressure from the different wings of the civil rights movement with programs under the banner of the Great Society and the War on Poverty. The passage of Title VII, known as the Bilingual Education Act (BEA) of 1968, was a component of the Great Society's antipoverty efforts through education. Although it was poorly funded, initially, supporters of Title VII believed that it was not just a linguistic tool in the education of non-English speakers but also a mechanism of empowerment and integration for language minorities into the mainstream. For Mexican Americans and other Latinos, the passage of the Bilingual Education Act created the potential of "additive" practices of bilingual education, which countered the Americanization and English-only "subtractive" approach extant since the late 1800s. Although the full promise of the Bilingual Education Act did not materialize, bilingual education supported by Title VII was a significant step forward in making possible a more meaningful relationship between schools and Latino communities. This noninstructional aspect of bilingual education has yet to be evaluated.

LAU V. NICHOLS, ENFORCEMENT DOCUMENTS

Lau v. Nichols was a landmark federal court case filed in 1970 by parents of native Chinese-speaking students in San Francisco. The families argued that a lack of special support services for learning English violated their children's rights to an equal educational opportunity. In 1974, the Supreme Court found

unanimously for the plaintiffs, finding that students who do not speak English are entitled to special accommodations under Title VI of the Civil Rights Act of 1964. An important antecedent document in the case was a May 25, 1970, memorandum sent by the Office of Civil Rights (OCR) in the then-Department of Health, Education and Welfare (now the Department of Education) to school districts around the nation. That memorandum anticipated the ruling in *Lau* by several years. It outlined the special responsibilities of public schools toward these students. The "May 25th Memorandum," as it is generally known, was not actually part of the *Lau* decision, but it was given higher visibility and status by that ruling.

The *Lau* decision and its effect on education policy have been much discussed among educators and school policymakers for more than 30 years. Important changes have taken place in the last 20 years, if not to the letter of the law in *Lau*, certainly to the tenor and vigor of enforcement efforts by the federal government. To fully understand the actual and potential impact of the *Lau* decision, it is useful to examine a number of supporting documents that trace the history of enforcement of the *Lau* ruling by the OCR. This entry reviews each of these documents briefly and relates them to the evolving interpretation and enforcement of *Lau*. Readers should be mindful that new rulings of the U.S. Supreme Court or actions by the Congress can affect the status of these policy documents later.

In chronological order, the pertinent documents to be reviewed here are the following:

1. The "Lau Remedies" issued by the OCR in 1975
2. The proposed *Lau* enforcement regulations published in the Federal Register in August 1980, as a Notice of Proposed Rulemaking
3. Guidance and policy memorandum by the director of OCR issued in 1985
4. Policy Update on Schools' Obligations Toward National Origin Minority Students With Limited-English Proficiency, issued in 1991

The *Lau* Remedies, 1975

Following the *Lau v. Nichols* decision, the *Lau* Remedies were published in 1975 under the title "Task-Force Findings Specifying Remedies Available for Eliminating Past Educational Practices Ruled Unlawful Under *Lau v. Nichols*." This document gave

districts guidance regarding how to identify English language learners (ELLs), which types of programs ELLs should be placed in; existing criteria, and standards for teacher qualifications. Moreover, the Remedies stated that when students' civil rights were violated, bilingual education should be implemented (they did not, however, require bilingual education in all cases). The Remedies found three types of programs suitable for ELLs: (1) bilingual/bicultural, (2) multilingual/multicultural, and (3) transitional bilingual education (TBE).

The Remedies are organized into nine sections: (1) Identification of Student's Primary or Home Language, (2) Diagnostic/Prescriptive Approach (identify the nature and extent of each student's educational needs and then prescribe an educational program utilizing the most effective teaching style), (3) Educational Program Selection, (4) Required and Elective Courses (must show that required and elective courses are not designed to have a discriminatory effect), (5) Instructional Personnel Requirements (instructional personnel must be linguistically/culturally familiar with the backgrounds of the students to be affected), (6) Racial/Ethnic Isolation or Identifiability of Schools and Classes (not educationally necessary nor legally permissible to create racially/ethnically identifiable schools to respond to student language characteristics), (7) Notification to Parents of Students Whose Primary or Home Language Is Other Than English (districts have the responsibility to notify parents of students identified as ELLs), (8) Evaluation (plans must include both a product result; and process evaluation-periodic evaluation throughout implementation), and (9) Bilingual/Bicultural Program (a program which utilizes the student's native language and cultural factors in instructing, maintaining, and further developing all the necessary skills in the student's native language and culture while introducing, maintaining, and developing all the necessary skills in the second language, English).

As noted by researcher Kenji Hakuta, the federal government emphasized a policy of implementing transitional bilingual education throughout the 1970s and moved away from English immersion toward the maintenance of native language and culture. The OCR largely used the *Lau* Remedies as a vehicle for this shift in program implementation. During this period, the number of bilingual education programs in the country grew substantially. James Crawford asserts that although schools in Alhambra, California, for instance, had no bilingual programs in 1977, OCR

citations for civil rights violations resulted in the district's implementation of 120 bilingual programs by 1987. These included instruction in Spanish, Vietnamese, Cantonese, and Mandarin at various levels. Although the *Lau* Remedies recommended native-language instruction, these programs had never been regulated by the OCR. Rather, complaints about violations of *Lau* were resolved based on recommendations to schools and districts, rather than requirements.

Notice of Proposed Lau Regulations, 1980

In August 1980, the Department of Education under Education Secretary Shirley Hufstедler published a Notice of Proposed Rulemaking (NPRM) titled "Nondiscrimination Under Programs Receiving Federal Assistance Through the Department of Education, Effectuation of Title VI of the Civil Rights Act of 1964." This would have replaced the *Lau* Remedies with more stringent requirements for schools educating ELLs. The changes would have mandated that all schools serving a certain number of ELLs from the same language background provide bilingual education as the program of choice for such children. When President Ronald Reagan took office, however, these proposed regulations were withdrawn. James Crawford cites Education Secretary Terrel Bell, who called the proposed regulations "harsh, inflexible, burdensome, unworkable, and incredibly costly . . . an intrusion on state and local responsibility." The Reagan administration promised to issue new, less intrusive regulations in the near future, but never published such rules in the Federal Register for public comment.

Since 1981, bilingual education programs have endured considerable scrutiny and opposition in policy making, with several judicial decisions as key exceptions. Today, OCR compliance issues are addressed on a case-by-case basis, although the process for filing complaints and recommendations is still viable and available. The May 25, 1970, Memorandum affirmed in the *Lau* decision and Title VI are still referenced in nearly all investigations decades later.

Guidance and Policy Memo, 1985

A memorandum titled "Policy Regarding the Treatment of National Origin Minority Students Who Are Limited English Proficient," initially published December 3, 1985, by the Assistant Secretary for Civil

Rights updated the May 25, 1970, OCR memorandum mentioned at the beginning of this entry. This document outlines the procedures OCR followed, during the mid 1980s in applying the standards affirmed by the Supreme Court in the *Lau* case, and in Title VI compliance reviews. The memo provides the background information presented in this entry and further reviews OCR's current procedures for conducting compliance investigations. It states that districts may use any method or program that has proven successful for educating language minority students, but that districts are expected to evaluate and modify programs that do not meet expectations. The memo lists two general areas in determining Title VI compliance: (1) whether an alternative program is needed for language minority students, and (2) whether the alternative program is likely to be effective in meeting the needs of language minority students. If English language learners are not able to participate effectively in the instructional program, an alternative should be implemented. The memo references the factors that influence the success of various approaches and pedagogies, including student characteristics, such as age and previous schooling, and school characteristics, such as the number of students from shared language backgrounds. In determining Title VI compliance, the OCR set forth an analytic framework including (a) whether an alternative program is necessary, and (b) whether the alternative program is likely to be effective.

Need for an Alternative

Determining whether students are served by programs may be based on a number of factors. Exiting criteria for placement in programs based on English proficiency levels may permit placement in regular instructional programs, and past academic records may be predictors of the assistance provided in alternative programs. Information for screening may include language assessment instruments, information from parents, or interviews. These methods may vary based on the number of students from shared language backgrounds, ages of students, size of school district, or availability of assessment tools. Districts may show that students placed in regular instructional programs do not need alternative programs for assistance, or that students can be transferred to alternative programs for a portion of the school day if necessary, for additional educational support. Although OCR may find schools that do not provide alternative programs to be

in violation of Title VI, the absence of formal identification, assessment, and a formal program may not constitute violations. For example, schools with low numbers of language minority students or in which a recent influx of ELLs has occurred may not be expected to have formal procedures or programs in place.

Whether the Alternative Is Effective

Within this second portion of the analytic framework, the memo outlines three questions: (1) Is the alternative program based on a sound design? (2) Is the alternative program being carried out in such a way to ensure the effective participation of the language minority students as soon as reasonably possible? and (3) Is the alternative program being evaluated by the district and are modifications made in the program when the district's evaluation indicates they are needed? For the first question, the OCR avoids making educational judgments about decisions made by local educational agencies. Factors that would be considered by OCR in compliance reviews include (a) whether at least some experts deem the program based on sound educational theory (an expert is an individual qualified for judgment based on experience, training, and objectivity), (b) whether there is an explanation for how the program meets the needs of language minority students (including a description of the program's components and activities and a rationale explaining how the program expects to meet students' needs), and (c) whether the district has implemented a plan approved by OCR (previously accepted plans remain valid).

Regarding how the program is being carried out, districts in compliance must have appropriate staff in place (training, qualifications, and experience should be consistent with the program) and adequate resources (timely availability of equipment and instruction material but limited finances do not constitute Title VI violations). Districts faced with such challenges as teacher shortages will not be penalized because the OCR will not place unrealistic expectations on districts. For program evaluation, districts are in compliance with Title VI when students are taught English and mainstreamed into regular instructional settings within a reasonable period. OCR approaches compliance concerns with caution, given the expertise of local education agencies in ensuring the efficacy of alternative programs. There are no regulations for data collection regarding alternative programs for districts. The 1985 memo stated that OCR expects districts to

maintain accurate information about program implementation and effectiveness based on student progress.

In closing, the 1985 memo specifically states that OCR does not require a particular educational approach for compliance with Title VI. Legally, programs are deemed adequate if strategies have worked or promise to work based on the recommendations of experts. This memorandum was reissued without change on April 6, 1990.

Policy Update, 1991

In 1991, the OCR published the “Policy Update on Schools’ Obligations Toward National Origin Minority Students with Limited-English Proficiency” memorandum, which represents the most comprehensive recent formal extension of the *Lau* Remedies. This document cites two equally important memoranda, May 1970 and December 1985; the three of them were “designed for use in conducting *Lau* compliance reviews.” The memo cites *Lau* and the *Lau* Remedies as well as the court cases *Castañeda v. Pickard*, *Keyes v. School District No. 1*, *Teresa P. v. Berkeley Unified School District*, and a handful of less well-known cases in its guidance.

Notably, much of the document references the *Castañeda* case’s standard, which is a three-pronged test for ensuring adequate educational support for language minority students (see below). This test requires that the program meet three standards: (1) It must be based on a sound educational approach, (2) the approach must be implemented effectively, and (3) adequately trained staff must be provided for the program within a reasonable amount of time. For the first prong, the policy update lists the following approaches as acceptable: transitional and developmental bilingual education, bilingual/bicultural education, structured immersion, and English as a Second Language (ESL). Addressing proper implementation (second prong), the document reads, “A recipient must either hire formally qualified teachers for LEP [limited English proficient] students or require that teachers already on staff work toward attaining those formal qualifications.” Minimum qualifications for bilingual staff include ability to speak, read, and write in both languages and instruction in bilingual methods. Teachers in programs other than bilingual must complete training and demonstrate mastery of methods for this program. Districts should “use validated evaluative instruments—that is, tests that have been shown to accurately measure the skills in question.” Also reviewed under implementation

requirements are exit criteria for language minority and LEP students, special education programs, gifted/talented programs, and other specialized programs. For program evaluation (the third prong), the memo again references *Castañeda*, requiring that schools modify programs if they are unsuccessful and that programs are evaluated regularly to ensure student improvement. Formal programs should set achievement goals or demonstrate that students are overcoming language barriers. Further, programs are permitted to segregate ELLs from the mainstream population, but they must do so in the least segregative manner possible. Finally, the document states that the OCR will continue to use the *Castañeda* standard in reviewing complaints against schools’ obligation to ensure educational equity for ELLs.

Educators, families, and researchers in the field have raised concerns regarding the English-only movement given the *Lau* and *Castañeda* cases. In 1998, the OCR published “Questions That May Be Raised by Proposition 227” regarding California’s English-only initiative. This document repeatedly references the *Lau* decision, Title VI of the Civil Rights Act, and the May 25, 1970, Memorandum and states that placing ELLs in mainstream classes without additional assistance is a violation of *Lau*. The list of questions includes whether the Department of Justice or Department of Education will play a role in litigation challenging Proposition 227; the reply ensures that both will continue to monitor the implementation of program models post-227 and “whether children with limited English proficiency are provided realistic opportunities to succeed academically, consistent with federal civil rights requirements.” Citing *Lau*, the document states that districts cannot limit special support for ELLs to one year and that if parents opt out of a program, districts must ensure that students have an equal opportunity to meet their needs relevant to learning English. This clarification notwithstanding, issues of *Lau* compliance in the context of the voter initiatives in Arizona, California, and Massachusetts are far from settled. In the years immediately after passage of the initiatives, OCR has given great latitude to these states to seek forms of compliance that they themselves design and allowed time for these to be tested.

LAU V. NICHOLS, SAN FRANCISCO UNIFIED SCHOOL DISTRICT'S RESPONSE

The January 1974 U.S. Supreme Court decision in *Lau v. Nichols* was instrumental in guaranteeing linguistic minority students an education that is equal in

quality to that of their English-speaking peers and has become synonymous with education rights in the United States. This entry describes the *Lau v. Nichols* case and the manner in which the San Francisco Unified School district (SFUSD), defendant in the case, responded to the legal mandate imposed on it by the U.S. Supreme Court, and subsequently, on remand, by the U.S. District Court in San Francisco.

The *Lau* decision was the outcome of a case brought against the SFUSD by a group of community members and parents of Chinese-speaking children. The parents claimed their children could not gain the same benefit from instruction in English as their native-English-speaking peers, and on this basis took legal action against the SFUSD for its failure to provide those students with an equal access to the district's instructional program. This was a class action suit. That is, parents and community members who brought the suit did so not only on behalf of their own children, but also on behalf of all children who might be suffering the same lack of access for the same reason. The plaintiffs did not seek a specific solution to the problem. Instead, they asked that the Board of Education of the SFUSD be directed to rectify the situation by the best means possible.

The original case, filed in federal district court, relied on the Equal Protection Clause of the Fourteenth Amendment to the U.S. Constitution and the Civil Rights Act of 1974. The latter excludes recipients of aid that discriminate against racial groups from participation in federal financial assistance. The parents claimed that these children, who were attending school in a district that received a significant amount of federal financial assistance, were being denied equal protection under the law because of their national origin. This case demonstrates the complicated and unpredictable nature of the pursuit of language and other rights through the courts.

Although *Lau* is perhaps the most pivotal of all language rights cases, it followed an unusual course through the judicial system and had a somewhat unlikely outcome. The original claims made by the parents (who were the plaintiffs in this case) were rejected by two lower courts. Neither the district court nor the court of appeals found the school district to be in violation of the students' rights. The Supreme Court's seldom-granted agreement to review the court of appeals decision led to the landmark nature of the case.

The court of appeal's argument in denying the parents' claim was that the school district was not responsible for the preexisting condition of lack of knowledge

of English. It reasoned, “Every student brings to the starting line of his educational career different advantages and disadvantages caused in part by social, economic and cultural background, created and continued completely apart from any contribution by the school system” (*Lau v. Nichols*, 1973). The parents bringing this case were not satisfied with this outcome and continued to pursue a solution to the problem. Although a case that is lost in the court of appeals cannot be appealed directly, plaintiffs who lose a case at that level can request that the Supreme Court review the decision by filing a petition for writ of certiorari. This petition presents arguments about why the Court should grant the writ; that is, why it should review the case. These petitions are usually denied. In this case, however, the Court decided to grant the petition because of “the public importance of the question presented” (*Lau v. Nichols*, 1974).

After reviewing the case, the Supreme Court found in favor of the plaintiffs and returned the case to the U.S. District Court for the Northern District of California (a process known as “remand”), directing that court to fashion an appropriate solution, by directing the San Francisco Board of Education to “apply its expertise to the problem and rectify the situation” (*Lau v. Nichols*, 1974). The agreement between the SFUSD and the court, known as the consent decree, was the district’s plan to provide all students access to a meaningful education. It became, and remains, pivotal to how schools provide students who do not speak or understand English with a meaningful education.

To craft an appropriate plan for the education of English language learners, the district contracted with the Center for Applied Linguistics, a group of educators and researchers with significant expertise in the area of English learner education. The Center for Applied Linguistics and a group of parents and community members recruited by the district called the Citizen’s Task Force worked together to develop a “Master Plan for Bilingual-Bicultural Education in the San Francisco Unified School District.” This detailed plan took more than a year to prepare and consisted of four volumes when it was finally submitted to the court in May 1975.

The plan detailed in this consent decree became the blueprint for the education of English language learners not only in the SFUSD but also in much of the United States. Kenji Hakuta points out in a timeline titled *Evolution of Important Events in California* that the California Legislature passed the Chacón-Moscone Bilingual-Bicultural Education Act in 1976,

which was the first state legislative act that mandated school districts provide language minority students with equal educational opportunities, despite their limited proficiency in English. Unlike federal legislation, which left decision making regarding how to ensure equal educational opportunity to district discretion, the California legislature asserted the right of English language learners to bilingual education.

Following is a summary of the plan, developed by the Citizen’s Task Force in collaboration with the Center for Applied Linguistics and described in the consent decree between the plaintiffs and the San Francisco Unified School District.

The Master Plan

The consent decree stipulated that the SFUSD would implement a master plan for bilingual-bicultural education for the major language groups in the district—Chinese, Filipino, and Spanish—and established a formula for defining a “major” language group. The decree also stated that students from all such groups would be provided a bilingual education program to correct the problems identified in the proceedings. The decree further stated that the district would provide English as a Second Language (ESL) and other special programs for students from other language groups and would provide bilingual instruction for students from the less common language groups whenever feasible.

The plan provided detailed descriptions and definitions of the various program aspects, including instructional alternatives and techniques that could be used along with sample schedules and descriptions of how classroom organization and teacher and instructional aide time might be allocated. The plan also included criteria for choosing among different instructional options in different situations and provided a similar level of detail with regard to choosing appropriate instruments for assessing students’ English and primary-language skills and for the preparation and certification of teachers for bilingual-bicultural education.

The master plan included a detailed timeline for implementation of each aspect of the program and specified that information about the progress of this implementation would be submitted to the court. Finally, the consent decree stipulated that the district would gather and report detailed information about the program to the court on an annual basis. This information-gathering and accountability for what the district would do to remedy the situation for linguistic minority students, how it would do this, and the way it would

report progress of implementation of the solution were key aspects of the agreement. The specific information required of the district included the following:

1. Information about program participation and nonparticipation for students who speak a language other than English at home, as well as the numbers of these students and a description of the process for identifying them
2. A detailed description of these programs, how students are recruited for and assigned to them, identification of the school sites that maintain “model bilingual programs” for the major language groups, and those school sites that have other types of bilingual classes described in the master plan
3. Information about language skills and professional preparation of teaching and other staff and about their assignment to bilingual or other types of classes

This information-gathering became the model for data collected by the federal government and by many states. In addition, the consent decree required that the school board appoint a group of individuals from the community, the community council, including parents of both program participant and nonparticipant children, to serve as advisors regarding the plan and to assist in monitoring its implementation. The decree also stipulated that the district would provide assistance to and cooperation with the activities of the community council. Finally, the consent decree established a process for parents and others to express any objections to how the district was implementing the plan, for the district to respond to these objections, and for resolving disagreements between the two.

Conclusion

Although it has been somewhat eroded by recent interpretations of applicable law, the *Lau* case remains a key language-rights decision. With this case, the judicial system debated the question of whether schools must address the unique education needs of children who do not speak or understand English. The Supreme Court was unequivocal in affirming the rights of these children to have these needs addressed and school districts' legal obligation to do so. Moreover, the Court's finding that treating all children the same does not constitute an equal education for students who do not speak or understand English was an important precedent with regard to

educating English language learners in the nation's public schools. At the same time, the case's nonprescriptive approach shifted the policy and political debate about how to address the needs of these students and set a precedent for allowing school districts to determine how they will address this issue at the local level. Agreement by the school district to use chiefly a bilingual education approach further helped establish the preferred instructional modality for serving these children.

LAU V. NICHOLS, THE RULING

Editor's Note: *This entry summarizes the ruling of the U.S. Supreme Court in Lau v. Nichols. This case is multifaceted. For a more complete explanation of the impact and significance of the case, please consult the entries listed under "See Also . . ." and the text of Lau v. Nichols reproduced in Appendix C.*

In 1974, the U.S. Supreme Court handed down a landmark decision in *Lau v. Nichols*. The Court ruled that Chinese-speaking students in San Francisco had a right to a better education than they were currently receiving, that the San Francisco Unified School District was responsible for providing them a more "meaningful" education, and that the Office for Civil Rights (OCR) of the U.S. Department of Education had the authority to compel the San Francisco Unified School District to provide such a program. More than 30 years after this historic decision, it continues to be widely discussed by experts and stakeholders, many of whom believe that the promise of the *Lau* decision has not yet been fulfilled.

The U.S. Supreme Court has dealt only infrequently with issues of language and language policy. In its history, only a handful of cases involving language have been decided by the Court. This is hardly surprising given the overwhelming prevalence of English in U.S. society. With the exception of Spanish, which is spoken by more than 30 million Americans, few languages are likely to have a continuing effect on as many cities and regions of the country during this century. The language group involved in the *Lau* case was a group of Chinese-speaking students attending the San Francisco schools. At the beginning of the 21st century, Chinese is the second-largest language community in the United States, second only to Spanish.

This entry describes fundamental concepts and issues of the ruling, the significance of the case, and recent developments regarding the case.

Fundamental Concepts and Issues

The decision by the Supreme Court to hear *Lau v. Nichols* on appeal from the Ninth Circuit Court in San Francisco was not made to resolve a language policy issue but, rather, a civil rights issue. During its 30-year history, the *Lau* case has come to be viewed as an important statement of equity for millions of public school students who come to school speaking languages

other than English. The case was not intended to be dispositive on the question of whether bilingual education is preferable to English as a Second Language (ESL) or vice versa, even though the case became inextricably embroiled in that debate. The *Lau* case was concerned with civil rights rather than language rights. The ruling made it abundantly clear that school leaders and policy-makers are required to operate school programs with due cognizance of the requirements of Title VI of the Civil Rights Act of 1964, a measure that has now undergone modification by the more conservative justices who were subsequently appointed to that Court.

Several legal concepts are important for a full understanding of the current and future status of *Lau*, Title VI of the Civil Rights Act (CRA) of 1964, and related topics. Among the most important of these are "disparate impact," "private right of action," "coextensiveness," and "intent to discriminate" under the Equal Protection Clause. The future of civil rights protection under *Lau* and Title VI of the CRA will continue to evolve because of the impact of these terms and others. Interested readers are urged to consult legal sources to remain abreast of developments in this area.

Two fundamental issues went before the Supreme Court in *Lau*. The first of these was whether the Department of Health, Education and Welfare (now the U.S. Department of Education) has the authority to regulate the services offered by schools receiving federal assistance with respect to services to non-English-speaking students. Title VII of the Elementary and Secondary Education Act of 1965, as amended in 1968, provided funding for the creation and operation of bilingual education programs based on proposals submitted by school districts. Title VII of Elementary and Secondary Education Act was the proverbial carrot and Title VI of the CRA was the stick. The Court reviewed the legislative history of Section 602 of the 1964 CRA, which imposed on all federal agencies the responsibility for ensuring nondiscrimination in programs and activities involving federal financial assistance. The second and equally important issue was whether the educational program of the San Francisco Unified School District, at the time, violated Section 601 of the 1964 CRA. This issue was also decided in favor of the plaintiffs. Upon reviewing the findings of the lower courts, the Supreme Court reversed the lower court rulings and remanded the case back to the federal district court to fashion an appropriate remedy. The remedy that eventually issued from a citizen's advisory committee was bilingual education.

The San Francisco Unified School District adopted that recommendation.

Significance of the Decision

Perhaps the most important aspect of *Lau* was the ringing endorsement it provided for the idea that children who have language characteristics different from those of the mainstream population must be educated with proper cognizance of those differences. The Supreme Court asserted that it is not enough to provide the same education to children who are different; opportunity for one group may mean a denial of opportunity for another. In much of the litigation brought by African American children against the schools after *Brown v. Board of Education* in 1954, plaintiffs sought access to school programs already available to majority group students. In the main, desegregation cases sought access by Black students to the same curriculum and school activities available to White students. In *Lau*, the opposite was true; a remedy could only be said to exist if differentiated instruction were made available. *Lau v. Nichols* made clear that equality is not synonymous with sameness. What is good for one group of children may be inappropriate for another. In the language of the decision,

There is no equality of treatment merely by providing students with the same facilities, textbooks, teachers, and curriculum; for students who do not understand English are effectively foreclosed from any meaningful education. . . . We know that those who do not understand English are certain to find their classroom experiences wholly incomprehensible and in no way meaningful.

Another important message in *Lau* was that schools have a responsibility to teach those academic skills they require of their students before they can graduate from high school. At the time of *Lau*, high-stakes graduation tests were not as common as they are today. California, however, required that high school students must demonstrate a strong command of the English language to graduate. The Supreme Court did not question California's right to require this:

§ 8573 of the [California] Education Code provides that no pupil shall receive a diploma of graduation from grade 12 who has not met the standards of proficiency in "English," as well as other prescribed

subjects. Moreover, by § 12101 of the Education Code (Supp. 1973) children between the ages of six and 16 years are (with exceptions not material here) subject to compulsory full-time education.

Elsewhere, the opinion stated,

This is a public school system of California, and § 71 of the California Education Code states that "English shall be the basic language of instruction in all schools." That section permits a school district to determine "when and under what circumstances instruction may be given bilingually."

Having noted the available options, the Court went no further. It mandated the district to ensure that schools teach English effectively to students who speak other home languages. The Court was explicit on this point:

Basic English skills are at the very core of what these public schools teach. Imposition of a requirement that, before a child can effectively participate in the educational program, he must already have acquired those basic skills is to make a mockery of public education.

This posture by the Supreme Court supports conceptions of school accountability that have currency today. We can only speculate whether the use of high-stakes testing in English for graduation would be viewed in the same way today by the courts, if that requirement were to be challenged on the grounds that it violated the spirit of *Lau* absent an effective instructional program for teaching English. To our knowledge, no such case has yet been brought. Under the current interpretation of the No Child Left Behind (NCLB) 2001 legislation, the requirement of passing a test in English and other subjects appears to sit squarely on the shoulders of students rather than serve as a test of the viability of the instructional program and its promise to facilitate a good command of English. As the requirements of NCLB continue to evolve, it is possible that a legal challenge of this type could take place. In addition, considerable controversy exists concerning the degree to which children who do not yet have a command of English should be tested only in that language merely to satisfy the testing requirements of NCLB.

Among scholars and long-term observers of the decision who tend to view it in a wider context of

educational change, some are concerned about the focus on English embodied in *Lau*. Richard Ruiz, an expert on language policy and politics, asserts that the emphasis on language barriers and on the primacy of English over all other subjects underscores the widespread popular view concerning the overarching importance of English. Ruiz believes that suggesting that young people are, in some sense, less than complete until and unless they learn English is an ethnocentric and narrow view of education. Furthermore, because the Supreme Court referred to this single aspect of education—teaching the *lingua franca*—and to no other, the decision gives no support to a broad mandate for making schools more sensitive to other needs of language minority children.

On the question of bilingual instruction, *Lau* was not the final word. The Court noted that there may be several ways of meeting the needs of these children:

No specific remedy is urged upon us. Teaching English to the students of Chinese ancestry who do not speak the language is one choice. Giving instructions to this group in Chinese is another. There may be others. Petitioners ask only that the Board of Education be directed to apply its expertise to the problem and rectify the situation.

With respect to what remedy is most appropriate, the Court invoked the well-established principle of judicial restraint: A court should not answer questions that have not been brought to it for adjudication. Having acknowledged that several remedies are available, the Court disposed of the matter by noting that, in this case, “a remedy is not urged upon us.” It reiterated that responsibility for policy remedies rests with the executive branch, in this case with the U.S. Department of Education and its OCR.

Lau recognized the right and legal responsibility of enforcement agencies in the executive branch to clarify, expand, and enforce the judgments of courts in accordance with Title VI of the Civil Rights Act of 1964, the legal basis on which the case rests. By so doing, the Court accepted one of the requirements promulgated by the OCR (of the then-Department of Health, Education and Welfare) in a now-famous memorandum called the May 25, 1970, Memorandum, signed by J. Stanley Pottinger, the then-director of the OCR. By affirming previous enforcement efforts by the OCR, the Supreme Court, in effect, adopted an important provision of the

May 25, 1970, Memorandum: the requirement that in cases where parents do not speak English, communications sent by the school to the home should be in the parents’ language. To our knowledge, that requirement has never been challenged in other litigation, although few schools may be doing it. Many experts and stakeholders believe that because of the Supreme Court’s acknowledgment, the May 25, 1970, Memorandum is entitled to great weight in planning school programs. Even in states that have passed antibilingual education measures, it can be assumed that the mandate for school-home communications in the child’s home language remains valid and enforceable because school-home communications were not a school practice that was abolished by antibilingual initiatives in those states.

Furthermore, the Supreme Court affirmed the responsibility of the OCR to provide operational definitions and interpretations to the schools. As an example, the Court noted the May 25, 1970, Memorandum that had been sent to school districts by OCR. The Supreme Court seemed to approve of that policy and quoted two specific points from the memorandum in its ruling:

1. Where inability to speak and understand the English language excludes national origin-minority group children from effective participation in the educational program offered by a school district, the district must take affirmative steps to rectify the language deficiency to open its instructional program to these students.
2. Any ability grouping or tracking system employed by the school system to deal with the special language skill needs of national origin-minority group children must be designed to meet such language skill needs as soon as possible and must not operate as an educational dead-end or permanent track. (May 25, 1970, Memorandum)

Hence, although the Supreme Court avoided opining on the merits of bilingual instruction, it validated OCR’s prescription on the use of other-than-English languages for communications between school personnel and non-English-speaking families.

The Court went on to reiterate,

Respondent school district contractually agreed to comply with Title VI of the Civil Rights Act of 1964 . . . and all requirements imposed by or pursuant to

the Regulation of DHEW which are “issued pursuant to that title . . .” and also immediately to “take any measures necessary to effectuate this agreement.” The Federal Government has power to fix the terms on which its money allotments to the States shall be disbursed. Whatever the limits of that power, they have not been reached here.

Recent Developments

Powerful and clear as the language of the *Lau* decision was, serious challenges to the continued viability of the decision and its reliance on the CRA have arisen post-*Lau*. The Supreme Court became more conservative after 1980, which has eroded the importance of Title VI of the CRA. The CRA was designed to enhance the Equal Protection Clause of the Fourteenth Amendment of the Constitution. The difference is that the Equal Protection Clause requires that plaintiffs show that the agency in question intended to discriminate against the person or group involved. Under the CRA, plaintiffs did not need to prove intent to discriminate, merely to document the negative impact of the school district’s policies and practices. This difference has been slowly but surely eroded under the theory that Title VI of the CRA, and the Equal Protection Clause are coextensive; in short, that they are parallel laws with the same purpose. Further, that whatever requirement of intent to discriminate attaches to the Equal Protection Clause also applies to suits brought under CRA. This means that if *Lau* were to be tried under today’s interpretation of CRA, the Supreme Court would probably reach different conclusions. Finally, because of another change imposed on Title VI of the CRA in recent years, individuals can no longer bring suits under the CRA. Only a federal agency may use CRA to seek relief against a government entity on behalf of an aggrieved individual. In legal parlance, Title VI no longer allows private right of action. Today, therefore, individuals must rely on another law to bring an action against a public body, the Equal Educational Opportunity Act of 1974, a measure that codified the findings in *Lau* explicitly.

LAU V. NICHOLS AND RELATED DOCUMENTS

See APPENDIX C

LEARNING A LANGUAGE, BEST AGE

A controversial topic among linguists and researchers is the critical period hypothesis (CPH) and research studies that pertain to the best age in which to learn a language. CPH was first proposed by neurologist Wilder Penfield and coauthor Lamar Roberts in 1959. CPH claims that the presentation of adequate stimuli during the first few years of life are critical for individuals to acquire a first language. According to the theory, if language input does not occur during this period, the individual will never achieve a full command of the language—especially the grammatical systems. CPH was popularized in 1967 by Eric H. Lenneberg, with the introduction of his book *Biological Foundations of Language*.

Lenneberg’s theory has extended to include a critical period for second-language acquisition (SLA) and has influenced research in the field, which is evidenced by studies including those supportive and unsupportive of CPH. Generally, researchers in the field of SLA have explored the following questions:

1. Does age affect how fast we can learn or acquire a second language over a reasonable period?
2. Does the type of exposure to the second language relate to age?
3. Does the age at which we begin learning a second language affect how fluent we can become in that language after a long time?
4. Do all these effects hold for all levels or types of linguistic knowledge?

This entry considers studies that have tried to look at both early-stage performance and ultimate attainment of those language learners studied. Results of studies in second-language acquisition indicate researchers are divided in their positions regarding CPH. Some researchers support CPH and insist that a critical period for learning a language does exist. For example, Mark Patkowski conducted a study about the likelihood of a critical period for learning a second language that found that learners younger than age 15 achieved a higher syntactic proficiency than did those who were older than age 15 at the onset of exposure. Among all factors Patkowski examined, age was the factor that had the most significant impact for success in learning a second language.

Results of some studies are mixed. For example, Stephen D. Krashen found in a 1973 study that adult learners proceeded through the early stages of syntactic and morphological development faster than children did, and that older children acquired this growth faster than younger children who were in the early stages of language development. Similarly, Anna K. Fathman and Lois Precup, in their 1983 study of immigrants acquiring English as a second language in the United States, reported that those who had immigrated at a younger age achieved higher levels of phonetic/phonological proficiency than later arrivals. However, an opposing pattern was found in respect to morpho-syntactic proficiency. A similar example is the 1999 study by Ellen Bialystok and Brenda A. Miller; they replicated the 1989 study of Jacqueline Johnson and Elissa Newport, and found differences in the performance on a grammar judgment test between native speakers of Chinese and Spanish acquiring English, before the age of 15. Although the younger Spanish-English bilinguals showed an advantage in performance over the older participants, the same pattern did not apply to Chinese-English bilinguals. They conclude that their results do not provide enough evidence to support the critical period hypothesis when acquiring a second language.

Results in some studies contradict what proponents of CPH claim. For example, Theo Bongaerts, Brigitte Planken, and Erik Schills have provided evidence that the groups of English language learners involved in their 1995 study were indistinguishable from the group of native speakers of English with respect to their pronunciation and thus passed themselves off as native speakers. These findings are contrary to the widely accepted belief proposed by Lenneberg that a

second language is learned only through extensive conscious effort and that an accent cannot be overcome easily. Thus, researchers, in summarizing phonological studies over the years, note that age may be central to ultimate attainment, but that no evidence has as yet been provided for the claim that second-language speech will automatically be accent-free if it is learned before the age of six and that it will definitely be foreign-accented if learned after puberty.

The inconsistency of results from research studies has provoked questions from researchers about whether the difference between young learners and adults must be the result of the critical period. For example, three misconceptions about age and second-language learning were recognized through a study conducted by Stefka H. Marinova-Todd, D. Bradford Marshall, and Catherine Snow in 2000. The first is the misinterpretation of observations of differences between children and adult learners, which may suggest that children are faster and more efficient at picking up a second language. Marinova-Todd, Marshall, and Snow admit that most adult second-language learners do end up with lower-than-native-like levels of proficiency, a failure often caused by a lack of engagement in the task and sufficient motivation. However, hard data make it clear that children learn a new language slowly, and with less speed, and with more effort than do adolescents or adults. The second misconception is the misattribution of conclusions about language proficiency to facts about brain functions. Marinova-Todd, Marshall, and Snow hold that the connection between brain functioning and language performance will no doubt be confirmed, but the exact nature cannot be guessed from the data available on brain function in early versus late bilinguals. The third misconception is based on poor adult learners, and the less emphasis placed on adults who master a second language at native-like levels. Marinova-Todd, Marshall, and Snow point out that sufficient motivation, commitment of time and energy, and support from the environment are the factors that have been overlooked by researchers, thereby seeming to lend support to the myths that children learn more quickly than adults, and that adults are incapable of achieving native-like second-language proficiency.

Researchers such as Bialystok and Kenji Hakuta have examined the role of linguistic and cognitive factors and explored how age might interact with these. Their research found both younger and older learners made more mistakes on items containing grammatical

features that were different between their first and second languages, than on items that were similar in both, a phenomenon that cannot be explained by the linguistic theory of Universal Grammar, proposed by Noam Chomsky. Their study provides evidence that cognitive factors such as different instructional formats, the literacy difference of the learners, the availability of written texts, and the opportunity for instruction may lead to differences in proficiency levels.

David Singleton raised the issue from a different perspective, concerning diverse proposals or variations of CPH. He points out that the variety of ways CPH is understood affects the implications for second-language instruction. For example, Herbert W. Seliger suggests an earlier start of the phonetic/phonological acquisition of language by 12-year-olds is not consistent with that proposed by Lenneberg. Karl C. Diller, on the other hand, asserts that second-language accents can be avoided only if phonetic/phonological acquisition takes place by the ages of 6 to 8. Though Thomas Scovel asserts that the critical period, generally, ends progressively over a number of years beginning around ages 6 or 7; this is then followed by a second maturational phase, from 7 years to puberty. Michael H. Long proposes that a prerequisite for the acquisition of the second-language morphology and syntax to native level should be exposure to the second language before age 15.

The range of the critical period proposed so far extends from 1 year of age to adolescence, and the difference in between casts doubt on the credibility of CPH. This also confirms the well-founded comment made by researchers that the end of CPH for language in humans has proven difficult to find. In addition, the “fuzzy boundaries” used in language acquisition such as early child first language and second language, late child second language, adolescent second language, and adult second language have also caused problems. The divisions, all based on puberty, were not supported because researchers, in their studies of SLA, actually do not evaluate for age or whether a child has reached puberty.

Even though CPH has drawn many controversies and criticisms, its implications for second-language instruction cannot be overlooked. Research topics in the field of SLA also include how and to what extent the CPH concept can be applied to second-language instruction in school settings. For example, the idea of “younger equals better” by Penfield and the neurological evidence were the driving forces of movements

advocating foreign-language education in elementary schools in the 1950s and 1960s. These arguments find support in CPH literature that claims biological and maturational factors constrain language learning beyond a certain age.

The influence of CPH, on the debate over the best age to learn a language, continues in the domain of SLA. Although the complexity of the behavioral systems to CPH concepts, which are applied to young children make it difficult, if not impossible, to identify the boundaries of sensitive periods with great specificity, it is imperative that educators consider all factors that lead to the success of second-language learners other than age alone. For example, linguistic, cognitive, and social factors, most of which have not been considered by previous studies on CPH may all play a part in the learner’s language acquisition.

LINGUISTIC MATURITY THEORY

See LEARNING A LANGUAGE, BEST AGE

LINGUISTICS, AN OVERVIEW

One of the central academic disciplines underlying the collective knowledge base of bilingual education is that of linguistics. *Linguistics* can be defined, in the broadest terms, as the scientific description of human language. Tony Howatt explains in the introduction to the *Linguistics Encyclopedia* (2nd ed.) that serious study of the human capacity for language is presumed to have begun in the first literate human societies (e.g., Mesopotamia, Northern India, China, and Egypt). However, the roots of Western linguistics as a specific

area of scientific study date back to the 19th century. Two central questions have shaped the field since that time: First, what is the nature of human language; and second, what is involved in the study of human language? This entry addresses those two questions by way of providing an overview of the science of linguistics.

Nature of Language

It is difficult to capture, succinctly, the myriad ways in which different traditions of linguistic study conceive of the nature of human language. As discussed later in this entry, there are substantive debates about language that prevent such a brief summary. Ralph Fasold and Jeff Connor-Linton have attempted to provide an overview of certain features that they maintain most linguists would accept as universal to humans' capacity for language.

The first of these features is the *modularity* of language. Language is composed of distinct and discrete units, or modules. Each module has a particular role to play, but they function together in a coordinated way to allow humans to produce and understand language. Related to modularity is the principle of *constituency*. Languages are organized in constituent parts such that more complex constituents may be used to take the place of simpler forms. An example of the principle of constituency might be, “*They* argued heatedly about the new work assignment.” The simple constituent *They* can be replaced by a more complicated one, for example, “*The manager and her employee* argued heatedly about the new work assignment,” or even “*The new manager and her employee who had worked there for many years* argued heatedly about the new work assignment.” The principle of constituency describes how like constituents of varying degrees of complexity may be exchanged for one another. However, this principle does not mean that language is random. On the contrary, “*heatedly and her new employee* argued about the new work assignment” is not a possible construction, because “heatedly” and “they” or “the manager and her employee” are not like constituents.

The principle of constituency is particularly important in that it allows for an infinite number of utterances, even though languages are composed of a finite number of units. This phenomenon of language is known as *recursion*. The ability to construct an infinite number of utterances from a finite number of constituent parts has an enormous impact on our

understanding of language. Above all, it means that humans do not acquire language by memorizing each word in a language. Instead, there must be some other explanation for how humans are able to learn language such that we can produce and understand an infinite number of sentences. We will return to this issue later.

The linguistic property of *discreteness* manifests itself in two particular ways. The first has to do with the sounds that humans are capable of producing. Imagine the sounds a violin makes as its player tunes the instrument. As the string becomes more taut, the pitch rises. In much of Western music, that spectrum of sound has been broken into incremental steps of a scale, the smallest unit of which is a half step between, as an example, C and C sharp. In most cases, those who play and compose Western music have socially agreed to divide the full spectrum of sound in this way. But when we are exposed to music from other parts of the world, we discover various ways in which to divide the spectrum of sound that incorporate discrete units much smaller than a half step. Languages function in much the same way. Within each language community, a social contract of sorts is in effect that agrees about how to distinguish the spectrum of possible sounds into discrete, intelligible units. In English, we differentiate a long i sound, as in *eye*, from a long e sound, as in *bee*. That distinction allows us to know when someone is talking about bites or beats, for example. But not every language brackets sound in the same way. This means that the distinction between long i and long e, which comes naturally to native speakers of English, may be entirely indistinguishable to speakers of languages that do not compartmentalize sound in the same way.

Discreteness in language is shown, as well, in how humans understand the world around them. For example, different languages divide time in different ways. Even languages that share the concepts of year, month, day, hour, and so on often reflect different distinctions in time. English terms such as *morning*, *afternoon*, *evening*, and *night*, for instance, do not fully equate to Spanish terms such as *mañana*, *tarde*, *noche*, and *madrugada*. Thus, natural phenomena experienced by all humans, such as time, are captured in unique ways in each language. Nonetheless, in borderland regions such as that between the United States and Mexico, bilingual speakers often minimize the subtleties and end up equating terms to facilitate communication. This occurs as well in bilingual classrooms. The net

effect is the adaptation of both languages to each other. In those circumstances, a fully fluent bilingual individual can detect the borrowing of grammatical or lexical features from one language to the other.

The principle of *productivity* is demonstrated by every language being capable of creating new words to better understand changes in the world around us. Think of the many words that have emerged in the United States to refer to a car (e.g., hatchback, coupe, SUV, RV, compact, pickup, wagon, etc.). Similarly, all languages are able to create new words in an instance. If this new word fits the sound and word patterns in the language—and if the wider social community of that language accepts and begins to use that word—then it can become part of that language system. A prime example would be the term *Spanglish*. Whatever our opinions may be of the linguistic phenomenon to which the term refers, this term was coined to refer to a language variety that is distinct from standard varieties of English and Spanish. The word follows sound and word patterns in English (but not in Spanish) and has been widely accepted in the greater speech community as a word.

The final three universal aspects of human language are perhaps the most critical. The first of these is the acknowledgment that the words we coin, the sounds we bracket within the spectrum of sound, and so forth, reflect completely arbitrary decisions. The *arbitrariness* of language implies that there is nothing about the sounds /t/-/ej/-/b/-/l/ or its standard English spelling “table” that has any systematic or innate connection to a flat, hard surface (usually) held up by four rods. Instead, it has been socially agreed upon and transmitted across generations that this collection of sounds, and this manner of representing those sounds graphically, will refer to such an object. Likewise, such words as *mesa* or *Tisch* (in Spanish and German, respectively) are not any more connected to this object than “table” is in English. However, the arbitrary nature of the correlation between sound and object does not mean language is random. Instead, how languages combine sounds, words, and phrases is governed by distinct patterns that allow in English for the /b/ and /l/ sounds to combine as they do in the word “table,” but not so in a word like “lbatte.”

Moreover, human language reflects *duality* in its structure. Every language is composed of discrete units that on their own have little or no meaning. The sounds /d/, /l/, and /g/ alone, for example, have no meaning to native speakers of English. Yet, when we

combine these three sounds together, we get a larger unit of language, “dig,” that assumes various meanings in English. Linguistic duality underscores the importance of context in communication; individual units of any language are meaningful only inasmuch as we understand them in relation to other linguistic units. The importance of context can be seen more clearly with larger units of language (e.g., at the word or sentence level). Consider the many English language arts teachers who work tirelessly to help their students know when to write “to,” “too,” or “two.” The problem here stems from the principle of duality. Each word on its own has little meaning. When placed in the context of a phrase or sentence, however, each word takes on specific meaning, and the listener is able to know at once which word is meant.

The final universal property of language is its *variability*. We see this feature in several other properties of language discussed earlier, for example, how different languages divvy up the sound spectrum, or the ability to create new words based on existing sound and word systems. But another aspect of linguistic variability is that humans change their language to reflect who they are, and where and with whom they are interacting. A simple example is how we choose to address a group of people at once. Whether we say “you guys,” “y’all,” “you’s” or “you’s guys,” or just simply “you” says a lot about where we come from, how formal or not the situation is, our age, and so on. The words we choose, the way we pronounce them, what we do not say at all—all of these linguistic moments reflect our identities and our understanding of the social context around us. Another aspect of linguistic variability concerns the varieties of language that emerge when different language systems are in contact; examples of these include Spanglish in the United States or the varieties of English that are native to postcolonial societies such as India or Nigeria.

Linguistic Traditions and Domains of Study

As suggested earlier, the tradition of linguistics in the West dates back to the 19th century. Known then as *philology*, the primary focus of research was the historical and comparative study of language. Howatt outlines the factors that influenced philology. First, linguistic studies found important models for research in the natural sciences. The work of Carl Linnaeus in the 18th century, for example, in classifying the plant

world served as a guide for classifying human languages. Charles Darwin’s development of the theory of evolution also provided an important model to 19th-century philologists in identifying language families that have evolved over time. A second important influence on philology were the projects of nation-building taking place in the Western world at this time. Romantic notions of the nation-state being composed of one people and one language required a history of that people and its language that reached back far into time. Colonialism brought Western philologists into contact with long-standing linguistic traditions, especially that of the ancient Indian language Sanskrit, as they sought to find Western linguistic and national roots in ancient civilizations.

Structuralism

Although he emerged from this intellectual environment, Ferdinand de Saussure fundamentally altered the landscape of linguistic study. His greatest contributions to linguistics were made in a series of lectures published posthumously in 1916 as *Cours de linguistique générale*. In his lectures, Saussure differentiated historical study of language, *diachrony*, from nonhistorical study, *synchrony*. For him, the latter envisions language as a living whole, existing at a particular moment in time. The goal for linguists should be, so Saussure stated, to understand a language in its current state before engaging in a historical study of its development.

Saussure’s most famous contribution to the study of language is his tripartite conception of human language. His notions of *langage*, *langue*, and *parole* would later become the foundation of *structuralism*. Saussure named the overall human capacity for language *langage*. Within this capacity, he distinguished between separate language systems, or *langue*, and the manifestations of those systems as actual speech, or *parole*. He argued that the primary focus of linguistic study should be to better understand the nature of each individual language system, *langue*. For Saussure, *langue* is a social phenomenon, a system that has been socially agreed upon within a linguistic community. Saussure first identified the arbitrary nature of language with his distinction between signifier and signified. Although no inherent connection exists between a given sound (the signifier) and its meaning (the signified), each linguistic community must agree to a convention of matching the two for

communication to occur and be effective. However, signifiers in language systems have meaning only in relation to other signs. For example, the English word “house” has meaning only inasmuch as we contrast it with apartment, cabin, shanty, or mansion to identify various housing structures.

Saussure made an additional distinction about the nature of language that draws from his notion of signifiers and signified. Each language system organizes the signs it employs in two particular ways. Saussure conceived of this as two intersecting axes. The horizontal axis represents a *syntagmatic* organization of signs, in which different signs are linked together into utterances. The vertical axis represents a *paradigmatic* organization of signs, which represents different categories of signs (e.g., things, actions, descriptions) that are more or less constrained by the structure of each language system.

In the United States, the structuralist tradition stems in large part from the field of anthropology. Howatt describes the insights into linguistic study offered by Franz Boas in his *Handbook of American Indian Linguistics*. The first of these, the phoneme principle, establishes that each language has a limited and distinct set of sounds from which to construct utterances. The primary job of linguistics, then, is to describe those sounds as accurately as possible, and from there derive any generalizations about the language. Additionally, Boas further argued that all languages are distinct; that each language must be understood on its own terms, not by projecting a model of one language onto another; and that the basic unit of linguistic study should be the spoken sentence.

Another anthropologist, Edward Sapir, built on Boas’s ideas and formally introduced the concept of specific patterns, or structures, in language in his 1921 work, *Language*. Sapir took a holistic approach to understanding culture, language, and social life as an integrated whole. He is perhaps best known for his notion, developed together with his student and colleague, Benjamin Whorf, of the relationship between the constraints of language systems and cognition, known as the *Sapir-Whorf hypothesis*. Howatt defines the extreme version of this hypothesis, which argues that humans are limited by the structure of their language system as they conceive of, or understand, the world around them. Although such a deterministic view of language and cognition has long been debated, weaker versions of the Sapir-Whorf hypothesis support the notion that different languages capture

different worldviews, making each human language distinct and intrinsically valuable.

Generativism

Generativism, the second major tradition in linguistics, is most closely associated with the work of Noam Chomsky, although his work in transformational-generative grammar is only one trajectory of generativist scholarship. Chomsky’s work represents a break with structuralists’ focus on patterns. For structuralists, the aim of linguistic study was to describe spoken language as accurately as possible, to allow for inductive generalizations about patterns in a given language system. For Chomsky and his notion of transformational grammar, the focus of study was on identifying a series of rules underlying the construction of phrases and sentences. He made a distinction between the *surface structure* of word order, that is, how an actual sentence was ordered, and the *deep structure* that governed its construction. The example he began with was active and passive sentences. Although at the surface level, each type of sentence appears to be different, an underlying grammar is the same in determining how each sentence will be structured.

Whereas Chomsky’s original work focused on word order, a central concern of his scholarship has been to explain how humans acquire language at all. He has posited a series of controversial theories to explain this universal characteristic of humans. Chomsky has argued that humans are genetically endowed with the ability to acquire language. The acquisition process is directed by a *language acquisition device*, a specific area in the brain that enables children to induce and acquire the rules of the particular language system in which they are immersed. Chomsky adds to this the notion of *Universal Grammar*, which acts as a set of parameters for language that all humans are endowed with genetically. Within the parameters set by Universal Grammar, each language system develops its own settings that children acquire naturally.

Stemming from this concept of Universal Grammar is a distinction made by Chomsky that relates in certain ways to Saussure’s differentiation of *langue* and *parole*. Chomsky distinguishes between linguistic competence (i.e., tacit knowledge) of a given language system based in Universal Grammar, and linguistic performance (i.e., how we demonstrate that competence in social communication). Although Saussure’s notion of *langue* is rooted in the language system

unique to a particular linguistic community, competence for Chomsky is rooted in the genetic ability for humans to acquire language. This definition of competence and its focus on cognition has been criticized for relying too much on idealized native speakers and listeners of a given language and their linguistic competence, while disregarding actual speech in real-world social contexts.

Functionalism

The third major tradition in linguistic study, *functionalism*, concerns itself precisely with real-world language use. This perspective on language study focuses on the social functions of language as a system of signs that humans develop to meet complex social, cultural, and communicative needs. The form that a given language takes still matters, but the study of the relationships between various forms (i.e., their function) is particularly important.

Michael Halliday's contributions to functionalist linguistics have been enormous. His conception of language as a social semiotic understands language as a system of signs that humans create to act upon the environment and to interact with one another. He outlined various *metafunctions* of language that allow humans to do this. According to this researcher and theorist, *ideational functions* of language allow individuals to interact with their environment, to understand it, and act upon it. *Interpersonal functions* of language allow groups of individuals to interact with one another in specific social contexts. The central aim of linguistic study should be, then, to engage in systematic analysis of why people make the choices they do within the framework of specific linguistic systems, and the metafunctions at play within them.

Connections to the Study of Bilingualism

In addition to the three theoretical traditions of linguistics, the United States has a rich history of interdisciplinary approaches to language study. It is impossible to name and summarize each approach here, but among the most important is *applied linguistics*. As the name suggests, applied linguistics aims to link theoretical linguistic study with practical questions about language, especially second- and foreign-language learning, language pedagogy, translation studies, language policy and planning, and other educational fields.

Sociolinguistics focuses on the interaction between a language variety and the structure and functioning of the society in which it is located. Finally, *psycholinguistics* concentrates on the impact of specific psychological processes, such as attention and memory, on linguistic behavior. In each case, these fields emerged in the 1960s and have grown, along with many others, to become major traditions of linguistic inquiry in their own right.

Each of the various interdisciplinary approaches has produced important scholarship on the nature of bilingualism. Many foundational concepts in bilingualism and how children acquire second languages have derived from the intersection of psychology and language study. An early example is the work of William Lambert and his distinction between *additive* and *subtractive bilingualism*. Yet another major theoretical insight on the connection between cognition and language acquisition is James Cummins's *Thresholds Theory*. Neither this theory, nor further theoretical developments that grow out of it (e.g., Cummins's distinction between social and academic language) has gone without controversy (see critique by Jeff MacSwan and Kellie Rolstad and by Terrence Wiley). Nevertheless, they remain foundational notions in the development of scholarship on bilingualism and language acquisition.

Stephen Krashen's contributions to the field of bilingualism have also been invaluable, both at the theoretical and advocacy levels. His conception of second-language acquisition is composed of five distinct but related hypotheses. The acquisition-learning hypothesis distinguishes the natural acquisition process, which occurs subconsciously as second-language learners engage in meaningful interaction in the target language, from the conscious knowledge about the second language that results from explicit instruction. His monitor hypothesis speculates about the relationship between acquisition and learning; namely, that learned knowledge about the second language acts as a monitor that edits the utterances produced by acquired knowledge. Krashen's natural order hypothesis posits that elements of the second language are acquired in a predictable order. However, the order of acquisition is language specific and not tied to the language learner's age, first language, or amount of instruction. His input hypothesis focuses on acquisition, rather than learning, of the second language and argues that input in the target language must be comprehensible, that is, at a degree of difficulty

just above what the learner already can understand, for the language to be acquired. Finally, Krashen developed the affective filter hypothesis to account for the role of emotional, motivational, and other related factors in the second-language acquisition process.

The field of sociolinguistics has produced a fundamentally different approach to understanding bilingualism and how people acquire additional languages. Most prominent in this tradition of scholarship is Joshua Fishman. His early work on multilingualism challenged psychological approaches to the study of bilingualism that investigated language learning only at the level of the individual, leading to the idealized notion of the “balanced bilingual.” For Fishman, multilingualism is a social phenomenon that reflects social patterns of rights, obligations, and interactions. His work is driven by what he calls “partisanship” in supporting linguistic minorities and trying to understand language use from their insider perspective. This commitment has led to several decades of groundbreaking scholarship on questions of bilingualism, including the following: refinement of the notions of domain, and diglossia as a way to understand language use within a given community; exhaustive study of language shift among linguistic minorities in the United States; a theory of reversing language shift, including the Graded Intergenerational Disruption Scale as a tool for identifying various stages of language shift or language maintenance; and compelling theories of the relationship between language use and ethnic consciousness.

Major Themes

Despite the great diversity in linguistic inquiry, two major themes have dominated the debates about the nature of language and the most appropriate way to study it. On the one hand is the basic distinction between language systems and language-in-use. This distinction surfaces in various ways, be it Saussure’s *langue/parole*, Chomsky’s *competence/performance*, or the form and function divide in functionalism. Although there are important differences among these traditions, each represents theoretical distinctions that have important consequences for the methodology of linguistic study and for the applications that flow from the knowledge thus acquired. On the other hand are questions about the diversity versus the universality of language. From the descriptivist traditions that recognize the uniqueness of each language, to strong versions of the Sapir-Whorf

hypothesis that state we can only understand the world inasmuch as we have linguistic categories with which to do so, a long tradition exists in linguistics of attempting to understand each language as a unique system. Still, there has also been the recognition that language—a system of sounds and signs that humans employ in creative ways to interact—is a defining characteristic of our species. The recognition of this universality led to the study of the principles at the start of this entry, as well as to notions of genetic endowments and universal systems of grammar that govern language-in-use.

LITERACY AND BILITERACY

Among both lay people and experts, everyone seems to agree that literacy is important. Nevertheless, there has been little consensus regarding what it means to be literate or regarding what all the purported benefits of literacy are to both individuals and to the larger society. Ever since the 1950s in the United States, sensationalist headlines have drawn national attention to an alleged literacy crisis. Implicit within the captions is an assumption that literacy equates to literacy in English. Literacy in other languages is generally ignored. Even a 2006 high-profile report by Diane August and Timothy Shanahan on developing literacy among second-language learners focuses on English literacy almost exclusively. Perhaps because of negative language politics, knowledgeable professionals tend to ignore the fact that bilingual learners are well positioned to acquire some level of literacy in English and another language—that is, to become biliterate. This entry discusses beliefs about literacy, defines *literacy*, compares bilingualism and literacy, and discusses approaches to literacy and limitations of assessments of literacy.

Beliefs About Literacy

Most discussions about the importance of literacy in society tend to reflect several basic metaphors or

beliefs about literacy. Sylvia Scribner identified these as literacy as adaptation, literacy as power, and literacy as a state of grace. Literacy as adaptation sees literacy as essential for social and economic functioning. Certainly literacy is necessary for access to most jobs and for participation in society, so this view has been influential in framing most popular discussions about literacy. Literacy has also been portrayed as power or as a transformative means to empowerment. This position was most notably popularized by Paulo Freire's influential *Pedagogy of the Oppressed*. This work emphasized the importance of using literacy for breaking cultures of silence among those not literate. English literacy has been seen as necessary in the United States, but several adult education specialists, drawing on Freire, have argued that native-language literacy provides the most direct and efficient means for empowering many adult language minority immigrants who have previously lacked opportunities for formal education. Surely, the issue of promoting literacy does not need to be framed as English literacy versus native-language literacy—as some pundits would try to have us believe—because the latter can also facilitate the acquisition of the former.

According to Scribner, the most popular metaphor has been to see literacy as a state of grace, wherein literacy is positioned as a kind of salvation in which literate people are seen to have special virtues; hence, the traditional notion of the literati.

Defining Literacy

Regardless of what beliefs people have about literacy, unless literacy is clearly defined, it cannot be measured and assessed. There is little consensus regarding what it means to be literate; however, the ability to interpret or produce meaning using written text is common to most definitions. One of the reasons literacy has been difficult to define is that expectations regarding what it means to be literate do not remain stable over time. Throughout much of history, given the demands of time and effort needed to produce or gather food, literacy was only accessible to elites who had the leisure time to acquire it. As a result, literacy came to be a powerful tool for the control of specialized knowledge, whether it was in the ability to recite or decipher sacred texts or interpret laws. In many traditions, literacy has involved the ability to read and or write in classical scripts that are not commonly spoken, or that may correspond to common vernaculars.

In these cases, literacy has often involved some degree of bilingualism.

In the United States, it has been common to focus on literacy as discrete individual skills that can be tested. Many scholars, such as Shirley Heath and Brian Street, focus on literacy as socially constructed practices involving print. From this perspective, literacy practices are embedded within social contexts and involve shared knowledge within social networks. Specialized knowledge can be accessed within a network in which all members have equal knowledge or skills, as long as one knows who has the knowledge and ability to access that knowledge.

As Terrence Wiley explained, despite the lack of consensus, the following list tends to be representative of some of the influential definitions of literacy:

Minimal literacy refers to the ability to read or write at any level. Minimal reading ability became one of the requirements for entry into the United States during the World War I era when immigrants were required to read a short passage from the Bible—whether or not they were Christian—in their native language. Interestingly, at that time, for purposes of immigration, literacy in languages other than English was recognized. Subsequently, this requirement has been replaced by an English-only literacy requirement.

Conventional literacy refers to the ability to read, write, and comprehend familiar texts. In many language-minority communities in the United States, familiar texts would include those in their native languages rather than English.

Basic literacy refers to the attainment of literacy that allows for ongoing, self-sustained development. A major debate in the United States has centered on whether language minority children and adults, who have not yet acquired literacy in their native languages, should receive instruction in English or their native languages first. Many bilingual theorists and researchers, Virginia Collier and Wayne Thomas, for example, stress the importance of the latter, even though educational policies have imposed the former in some states.

Functional literacy refers to the ability to use print to achieve personal goals and the demands of society, while effectively being employed and functioning as a consumer, voter, and everyday problem solver. Functional literacy has preoccupied much of the national debate about literacy in the United States. Functional literacy presumes basic literacy and the ability to read, write, and comprehend familiar text, but it extends the definition to include the ability to use reading and

writing to fulfill an economic or social purpose. Although English literacy is often assumed to be necessary to function successfully in this country, many families are able to negotiate the literacy demands of their environments in their native languages to meet their basic needs. They are able to do this without always being literate in English because literacy involves more than just their individual knowledge. It also involves the ability to access a social network, in which others have knowledge that they share within this network.

Restricted literacy refers to literacy activities that are only available to a minority of people without the aid of state-supported school literacy. There have been some language communities where a script has been developed and informally taught outside state and federal policy. Scribner and Michael Cole conducted research with the Vai people in West Africa, who developed a script for their own social and commercial purposes. Restricted literacies tend to be informally taught based on local, practical needs. They do not necessarily compete with dominant societal language of literacy taught through state-supported public schools; nevertheless, they can offer rich possibilities for enhancing communication within local communities.

Vernacular literacies are those that are generated through popular and local practices. They often challenge or conflict with the conventions of standardized or dominant modes of literacy. Vernacular literacies such as those that have developed around rap and hip-hop cultures blur the distinction between oral and literate communication because oral styles may also be represented in writing. These literacies may also involve the use of nonstandard varieties of language.

Elite literacy refers to knowledge and skills certified by academic credentials acquired in school. Degrees, diplomas, and other forms of literacy certification are taken as evidence of mastery without their holders having to continue demonstrating the literacy skills that were needed to attain them. Thus, these skills become markers of literacy status. Although an elite education often includes instruction in languages other than English, reading and writing knowledge of a language other than English does not necessarily count unless one has acquired it through formal education.

Multiliteracies refer to knowledge and skills specifically related to particular types of literacy skills related to, for example, so-called cultural literacy, computer literacy, mathematical literacy or numeracy, or critical literacy. During the 1990s, the National

Adult Literacy Survey (NALS) prepared by Irwin Kirsch, Ann Jungeblut, Lynn Jenkins, and Andrew Kolstad attempted to assess three domains of literacy: document, prose, and quantitative. These were generally conceived as subsets of functional literacy, but only in English.

One common element of these definitions, as applied in the United States, is that they can—but frequently do not—reference literacy in languages other than English because of the ideological dominance of the English language.

Bilingualism Versus Biliteracy

Literacy is often assumed to correspond with spoken languages as speech written down. There are theoretical and technical problems with this view, but the notion persists. From a school perspective, language is typically conceived as four skills: speaking, listening, reading, and writing. The notion of four skills, therefore, presumes literacy. There are, however, approximately 6,000 to 7,000 spoken languages in the world, many of which do have writing systems or systems that are commonly used. As a result, there are fewer languages of literacy than spoken languages, and fewer yet that are languages of literacy used in formal schooling. Thus, bilingualism and multilingualism are not necessarily associated with literacy.

The widespread school's eye view that language involves four skills also leads to the assumption that there can be so-called balanced bilinguals, or people with equal abilities in speaking, listening, reading, and writing of two languages. Increasingly, however, the idea that there can be fully balanced bilinguals has been criticized. Guadalupe Valdés refers to them as “mythological” bilinguals, because, although it is possible in theory, it is not frequent that people obtain the exact same access to both languages in identical contexts or that they use language for the same functions and persons they interact with. Thus, finding fully balanced biliterates is equally unlikely. Nevertheless, many people do achieve a high degree of biliteracy when provided with the opportunity.

In highly multilingual countries such as India, children who have access to schooling are expected to receive education in the national language, Hindi, as well as in English and in the dominant language of their local state. These options may, or may not, however, correspond to the language(s) of their family and community. In the United States, immigrant language

minority students have no inherent right to native language-instruction, and only a small number have access to it. Thus, a potential resource for developing some degree of biliteracy through schooling is underused.

Approaches to Estimating Literacy

Regardless of whether we are interested in English literacy, biliteracy, or native-language literacy in languages other than English, literacy is measured or estimated in only three major ways. These involve direct assessments, literacy surrogates or equivalencies, or self-reports. Direct assessments of literacy involve tests or demonstrations of literacy. If we attempt to determine national literacy rates, direct measures are not feasible for the entire population. Thus, there have been attempts to gather representative samples of the adult population. To date, most attempts at national assessment have been limited to English literacy. Such was the focus of the National Adult Literacy Survey and subsequent surveys that have sought to assess three major types of literacy skills and knowledge, related to texts involving prose, documents, or mathematical computation.

Surrogate indicators of literacy are sometimes used to provide crude measures of literacy when direct measures are not feasible. The most common are based on years of schooling. Six or 8 years of schooling, for example, have been taken as equivalent to basic or functional literacy. Most surveys, such as the U.S. Census, rely on self-reported information; thus, surrogate and self-reported indicators may work in tandem. Direct measures are certainly preferable to either, but even these are subject to scrutiny regarding their authenticity. Testing one's skills in quantitative literacy related to a problem about shopping is not as authentic as actually studying how people manage their money in actual shopping. Despite their limitations, surrogate and self-reported measures of literacy abilities, nevertheless, can provide some useful information, particularly about literacy in languages other than English.

Limitations of Assessments That Focus Only on English

For the past several decades, the United States has seen a major increase in language diversity, largely through immigration; according to Ofelia García, the United States now has the fifth largest Spanish-speaking population in the world. By ignoring literacy in

Spanish and other languages, the literacy picture of the United States is both incomplete and distorted. Failure to account for literacy in languages other than English increases the perception of a “literacy crisis” and stigmatizes those people who are literate in other languages as if they were “illiterate.”

A related problem involves confusing literacy with spoken language abilities. National demographic surveys have tended to place more emphasis on English-speaking ability than on English literacy. Similarly, adult education programs for language minority populations often emphasize the acquisition of oral English or sustained English literacy development.

Other problems have related to biases in sampling. Reynaldo Macías notes that significant problems were found in the 1990 U.S. Census data of specific groups, whose reported figures were lower than what they were supposed to be. Thus, reported data tend to be more accurate in characterizations of the general population than of linguistic minorities. Macías stresses that because most of the surveys had been designed for the assessment of English literacy, the samples might

have excluded those who had limited or no proficiency in English. Macías further cautions that the representation of language diversity in the census samples does not necessarily include those subjects who had a limited ability in the English language from selection or analysis. A final area of concern in national literacy profiles relates to ambiguity in linguistic, ethnic, and racial identification. Macías also warns that there has been extensive indistinctness in how labels are used in studies of literacy wherein ethnic identifiers often are treated as surrogates for language background.

Regardless of how literacy is defined, if literacy in languages other than English is excluded, the perception of a literacy crisis will be inflated. In recent years, there has been a slight improvement in the attempt to gather more information on literacy in languages other than English. Although the 1993 National Adult Literacy Survey, for example, only attempted to directly assess, or test, literacy abilities in English, the survey did include some self-reported data on literacy in other languages. If we focus on literacy among the U.S. Hispanic population, the importance of including a focus on native-language literacy and bilinguality becomes apparent. Based

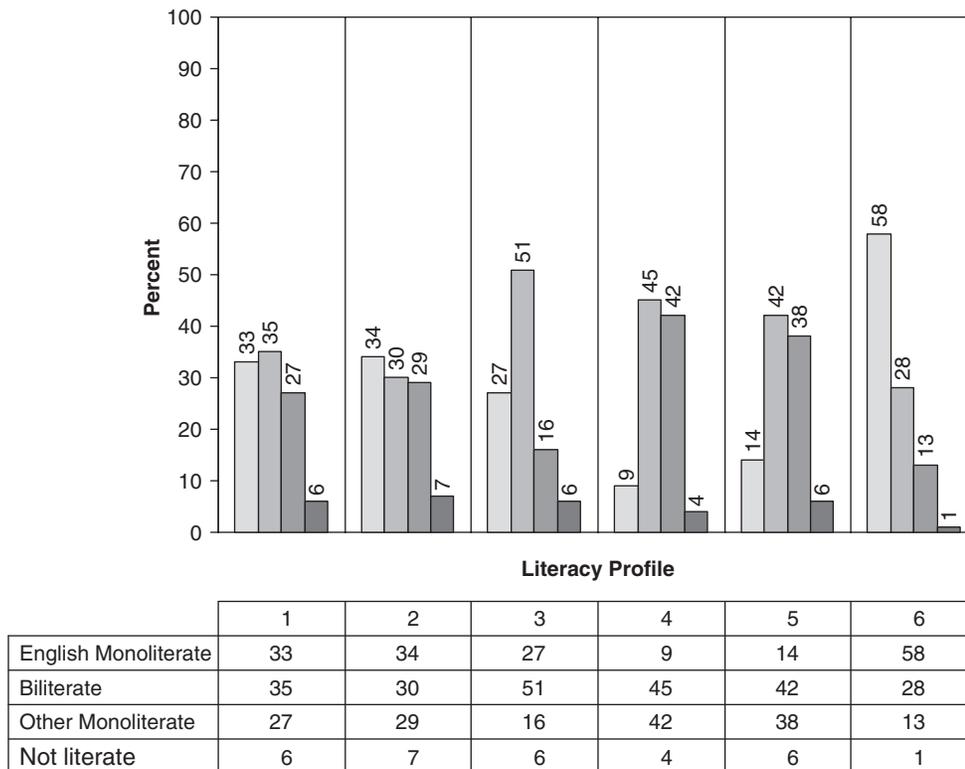

Figure 1 U.S. Hispanic Literacy Profile

Source: Adapted from Greenberg et al. (2001), Table 2.4, p. 32.

on self-reported literacy data, 94% of all adult Hispanics were literate. If literacy and Spanish and other languages were excluded, however, only 68% of the sample would have been considered literate. When Latino subgroups such as Cuban Americans are considered (see Figure 1), only 54% would have been considered literate if Spanish and other languages had been excluded, compared with an overall rate of 96% when they are included. There is also a substantial degree of biliteracy among all Hispanics (35%) and particularly among Puerto Rican Americans (51%).

These data indicate that a focus on only English literacy inflates the perception of the purported “literacy crisis.” Designing national literacy assessments that incorporate estimates of English literacy and literacy in languages other than English will provide a more accurate picture of literacy in the United States. There is equally a need to assess the kinds of literacy needs and interests of the populations being surveyed. This requires more ethnographic study of literacy practices among various linguistic communities.

LITERACY INSTRUCTION, FIRST AND SECOND LANGUAGE

Imagine you have a 5-year-old daughter going off to her first day of kindergarten in a U.S. public school. Your child is fluent in your family’s mother tongue (which, let’s imagine, is not English). Perhaps you have read children’s books to her every night before bed. Perhaps she can recognize some words in environmental print or, depending on the richness of her literacy environment, can read and write some letters or words in her mother tongue. Now, however, on her first day of school, her teacher is speaking to her in a language she does not understand. Your child is not alone. Millions of primary-age children enter U.S. classrooms fluent in a language other than English. If you can imagine this child’s anxiety on her first day in school, in a classroom in which she does not understand anything her teacher says, consider her situation in the next few weeks, as she begins to receive reading instruction in a language she does not speak or comprehend.

On the basis of this scenario, you may recognize intuitively how little sense it makes to teach children how to read in a second language before they can read in their mother tongue. Research is clear on this matter: It is better to help children become literate in their mother tongue before attempting to foster literacy in a second or additional language, a language that they are still acquiring. It is not possible (in some states not even legal), however, to provide literacy instruction to children in their mother tongue (other than English) first in many U.S. classrooms. Our classrooms are growing in diversity such that it is possible to have multiple languages represented in a single classroom. It is not likely that classroom teachers will be literate in all of the languages in their classroom to the extent that they can facilitate literacy in each student's native language. Further, some states, such as California, Arizona, and Massachusetts, have passed legislation that severely limits the accessibility of bilingual classrooms, even in schools that have somewhat homogeneous student populations (e.g., schools with large numbers of Latino students). Therefore, what is theoretically best is not always practically feasible in the classroom. However, classroom teachers can support native-language literacy in classrooms in many ways, even when they are not literate in their students' native languages. This entry describes native-language-literacy research and its effects in and beyond the classroom.

Research on Native-Language Literacy

Research by Steve Krashen, Jim Cummins, Jeff McQuillan, and others shows that children who first learn to read in their native language become literate in a target language faster than if they are expected to learn to read in a second language. Further, several studies (see work by Stephen Krashen) have shown a correlation of ability level in native-language literacy compared with target-language literacy. In other words, the higher the reading ability level in English was, the higher it was in the native language.

Native-language literacy helps support target-language literacy for several reasons. One is that it is easier to learn to read in a language one already speaks. Another is that once someone learns to read in one language, their reading skills may transfer to other languages (especially when those languages share alphabetic similarities, such as Spanish and English).

A slightly more technical look at the reasoning behind supporting native-language literacy first involves the process of reading itself. Reading requires the use of multiple cueing systems so the reader can construct meaning from a text. Readers use schemas (as explained by Richard Anderson, Rand Spiro, and M. C. Anderson), which are existing knowledge structures within each reader, to make meaning as they read. Schemas are both experiential and linguistic. Thus, it is easier for readers to make predictions based on schemas if they have experiences and language in common with the text. The three basic cueing systems are syntactic, semantic, and graphophonic, as Kenneth Goodman explains. *Syntactic cues* refer to grammar and language structure, such as word order. *Semantic cues* are the context cues a reader uses to predict meaning. *Graphophonic cues* are letter-sound correspondences the reader uses to predict specific words. Proficient readers use all three cues simultaneously.

It is easier for readers to use all three cueing systems in a language they already speak. Native speakers of most languages have already acquired the sounds and structures of the language that they need to predict meaning as they read. Take, for example, the following sentence:

I have a *pink* pig.

Native speakers of English already have syntactic knowledge that would allow them to predict the word *pink* because their experience with English would inform them that in English, adjectives generally precede the nouns they modify. Further, these readers would likely have schemas for the word *pink*. It would be easier for native speakers of English to make syntactic and semantic predictions about this sentence because of the linguistic and experiential knowledge that they have in English. The same is true for any native speaker of any language. Once readers have learned how to use schemas, language cues, and reading strategies to construct meaning from text in their native language, they can use the same skills to construct meaning from texts in their second language. Even if the native language is nonalphabetic, or runs from right to left, such as Mandarin (which is character-based) or Farsi, schemas, context, reading strategies, and language cues (other than graphophonic cues, in the case of character-based languages) are involved in constructing meaning from text, and these skills

transfer such that readers can draw from them, as they construct meaning from text in their second language.

Bringing this discussion back to the child in our example, it will be much easier for her to learn to read in the language in which she has already established schemas, including experiences and language structures that will allow her to use prediction skills to construct meaning from text. Her affective experiences will also be much more positive, which will contribute to her sense of confidence as a reader and writer. Confidence is a key component of success in literacy.

Native-Language Literacy in the Classroom

Teachers can support native-language literacy in the classroom in many ways, even if they do not speak the language. Researchers (see for example the work by McQuillan) cite the importance of the availability of native-language materials in the classroom. High-quality children's literature, including predictable books, picture books, or big books, that are in the native language of students are vital to supporting native-language and target-language literacy. Bilingual books as well as books in English that reflect the schemas of students in our classrooms should also be a part of our classroom libraries. Such materials can be found in public libraries, online book ordering companies, and local bookstores, as well as from specialty publishers.

In addition, community members are great resources for native-language literature, including children's books, poetry, and stories passed down by oral tradition. Parents and community members can be invited into the classroom to provide support in workshop settings in which students engage in reading aloud, storytelling, shared readings, and the like.

Children can be allowed to read and write in their native language. Sociopsycholinguistic theories maintain that children learn to read by reading and they learn to write by writing, as explained by Kenneth and Yetta Goodman. Children can be encouraged and supported by well-trained teachers to engage in meaningful literacy experiences in their native language. For example, children can write in their native language—even as emerging writers use scribble writing, pre-phonemic writing, or invented spellings in English, they can do the same in the native language. Journal writing activities, shared writing (in which the teacher and students write a common text, discussing writing decisions explicitly), and write-aloud activities (in

which the teacher or a speaker of the native language from the community think aloud as they are demonstrating writing and the decision making that goes into it), and process writing (taking writing through the process of rough draft, revision, editing, and publishing/sharing) can all use the students' native languages.

The benefits of native-language literacy for target-language literacy have been well documented by scientific research, including that cited previously. Thus, it behooves teachers to find as many means as possible to support native-language literacy. This will require resourcefulness, creativity, and the support of beyond-school communities, but it is worthwhile. Imagine the best-case scenario: Our child walking into a classroom in which a welcoming adult speaks her language—someone who can tell her where to hang her coat, where to find the restroom, where to get a drink of water; someone who, beyond those basic needs, can help her find her way to the world of literacy. Imagine our child finding stories and books that reflect who she is culturally and linguistically. These needs are fundamental, and every child has the right to have them met in the classroom, one way or another.

Native-Language Literacy Beyond the Classroom

Native-language literacy is not only a means to an end, it is also an end in itself. As our growing students expand their knowledge, they also explore their sense of identity. The goal, in short, is biliteracy. Thus empowered, students can continue to read in their native language, to write in their native language, and to become bilingual, biliterate, unique individuals who have access to multiple worlds of literature.

LYONS, JAMES J. (1947–)

James John Lyons was a respected senior adviser and specialist on civil rights for a decade before becoming the executive director and legislative counsel of the National Association for Bilingual Education (NABE). Jim, as he is known to countless bilingual educators across the country, held that highly visible position for 9 years before stepping down in 1998. An attorney father who was committed to helping those in social disfavor and psychologist Kenneth B. Clark, who played a central role in the desegregation of American schools, were major influences in shaping Lyons's personal and professional life. During his tenure at NABE, Lyons gained the support and respect of a broad-based constituency nationwide that admired his tireless championing of bilingual education, his gifts as an orator, and his Capitol Hill savvy, as he led NABE through what were arguably its greatest years as an organization.

Lyons was born and raised in Omaha, Nebraska. While in high school, he earned statewide recognition

for his debating skills. His abilities as a debater earned him a 4-year scholarship to George Washington University (GWU), where he received a BA degree in American thought and civilization in 1969. While attending law school at GWU, he was hired by Clark and his wife Mamie Phipps Clark as a staff member with the Washington, D.C., Office of the Metropolitan Applied Research Center. The Clarks had gained national prominence for their testimony as expert witnesses in *Briggs v. Elliott*, a case that was later merged into *Brown v. Board of Education*, which officially overturned racial segregation in public education. Lyons and Dr. Clark remained friends and colleagues until Clark's death in 2005. Clark, a supporter of bilingual education for all children, had urged Lyons to apply discipline, research, and reason to help society overcome inequality and discrimination. That ideology guided Lyons through the early stages of a newly found passion: bilingual education.

In 1980, Lyons was appointed senior adviser to the assistant secretary for legislation within the newly created U.S. Department of Education. In August of that year, President Jimmy Carter's administration published a Notice of Proposed Rulemaking (NPRM) to clarify the legal responsibilities of school districts serving limited-English-proficient students. The NPRM, although much needed and long overdue, ignited a firestorm of political controversy hotter than even previous conflagrations over "forced busing." As the Carter administration's chief firefighter on Capitol Hill on this issue, Lyons was able to contain the damage. Following the election of Ronald Reagan in November, Lyons was asked by Reagan's new education secretary, Terrel Bell, to stay on to help develop a new *Lau* enforcement program that would protect the rights of language minority students but would not create unnecessary furor. Conservatives within and outside the Reagan administration pushed for a total renunciation of *Lau v. Nichols*; Lyons countered their ideological arguments with cogent legal analysis, and in the end, Secretary Bell promulgated the results-oriented set of *Lau* enforcement guidelines Lyons had developed. Having accomplished the vital objective, Lyons resigned his position in the department and turned his full attention to bilingual education.

After leaving the U.S. Department of Education, Lyons assumed the position of legislative counsel for NABE. His strategy was to increase awareness and knowledge about the value of bilingual education for all students. He accomplished this by building

coalitions with respected organizations that represented American Indian, Latino, and Asian communities. In 1983, congressional representatives Baltasar Corrada (D-PR) and Dale Kildee (D-MI) asked Lyons to rewrite legislation revamping Title VII of the Elementary and Secondary Education Act. Lyons worked closely with Lori Orum of the National Council of La Raza, and they rewrote the existing law and accomplished a significant strengthening of the act. As Lyons later noted, “The legislation recast bilingual education as a vital language enrichment program rather than a remedial teaching program.” In 1984, President Reagan signed that bill into law.

The executive board of NABE asked Lyons in 1989 to become both the executive director and legislative counsel. The challenges he faced were considerable; NABE was in organizational disarray. Working closely with various executive boards, presidents, and staff, he led the effort to transform NABE into a viable and visible organization. As Nancy Zelasko, founding director of the National Clearinghouse for English Language Acquisition and former deputy director of NABE, asserted, Lyons was instrumental in the transformation of the organization regarding its national recognition, stability, and influence.

Lyons resigned from NABE in 1998. Even though he is no longer directly involved with NABE, he is still considered by many in the field as one of the most

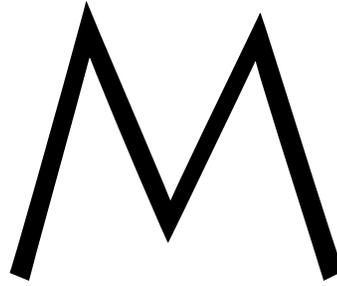

important and influential leaders in the progression of bilingual education in the United States. Bilingual education remains a part of Lyons’s life and, as he recently commented, “If the current generation of our nation’s leaders had received quality bilingual bicultural education, our society would be better and stronger, and our reputation in the world community would be better and safer.”

MAINTENANCE POLICY DENIED

Essay

Editor's Note: The author of this entry was invited to submit an article reflecting a mix of information and expert opinion. We acknowledge that parts of it could be disputed or given an alternative interpretation. In several instances, we found this approach helpful in more realistically portraying the history and current status of bilingual education in the United States.

Forty years after the federal government began supporting bilingual education in the public schools of the United States, the goal of preserving existing language resources other than English remains unfulfilled in many communities. Because of vagaries of public policy, most programs funded by federal government are aimed at developing only English language skills and ignore the potential for continued development of the languages that children bring with them from home. This entry discusses the impact of this policy ambivalence and why many of these programs are bilingual in name only.

At issue is the degree to which parents and communities have a voice in defining the type of education they prefer for their children or whether a single model of instruction should be mandated whether or

not it satisfies the preferences of the families involved. There are a number of related questions: Should the goals and objectives for bilingual education be the same throughout the country: in the Navajo nation, in the Haitian community of Miami, for Arabic speakers in Michigan, and for Spanish speakers in Houston? To what degree should the public schools seek to accommodate community desires to involve their schools in home language maintenance? In a society that values diversity, should the states have the right to prevent the use of other languages in the public schools even when many parents request it? Should children who speak other languages be denied a chance to continue developing their home language in school even as the same school struggles to teach that same language to students who speak only English? Addressing these issues is important to the continued viability of these programs.

To a great extent, the answers to these questions are rooted in the policy history of bilingual education, in the ways the case has been presented to government agencies and the courts, and in the degree to which legislative enactments reflect the interests of minority communities. This is especially true of immigrant communities that may not participate actively in the governance of the public schools. To date, most programs of bilingual education funded by state education agencies and the U.S. Department of Education have not had significant input from the language minority groups they were meant to serve. There are several reasons for this. First, appeals for bilingual instruction directed at state legislatures, to the U.S. Congress, and to the courts have been based largely on arguments for educational equity. To minimize

political opposition, the program has been promoted as a way to equalize educational opportunity for children with limited English language skills by teaching them English more efficiently. Implicit in this is the belief that all children who speak a language other than English—no matter what the language or how well they speak it—benefit equally well from an instructional program that uses the home language as a bridge for a brief period. This belief has been escalated through litigation. Underlying the push for transitional bilingual education is the concept of a legal entitlement to an education that is as good as that received by native-English speaking children; furthermore, in a jump of logic, that the same instructional treatment will serve all language groups equally well.

How did the original idea of bilingual instruction go astray? When Title VII of the Elementary and Secondary Education Act of 1965, as amended, was enacted by Congress in 1968, the legislation limited participation to children whose families were below the poverty level. Other children were not eligible to take part in programs funded by that law. In time, that requirement was lifted but the association between bilingual education and poverty (and the stigma of that association) remained. The reason, of course, was that, in most communities, the clients of bilingual education are usually poor. In the United States and perhaps other countries as well, bilingualism and multilingualism among the poor has been regarded as less valuable for them than it is for the rich, who have more time and resources with which to travel, study languages and the arts, and participate more actively in the political life of their communities. The result is that bilingualism among the poor has tended to be regarded as a liability, but among the affluent, it is regarded as an asset and a birthright.

The type of bilingual education we know today was a creature of its time. It emerged during the administrations of John F. Kennedy and Lyndon Johnson, an era when redress of inequities and injustices was high on the nation's agenda. In education, the most important programs were remedial-compensatory efforts to make up for the gross exclusions of the past. In court pleadings, the central claim was that schools had been erratic or negligent in teaching English to children whose first language was not English. The most important court decision of this type was rendered in 1974 by the U.S. Supreme Court in *Lau v. Nichols*. The pivotal argument in *Lau* was that the public schools have a legal responsibility to ensure

equitable participation by such students in school programs. The Court agreed with this view, stating that if public schools require command of English for graduation, they must find effective ways to teach the language to all children, including those who do not speak it natively. Bilingual education, according to the Court, was one of the ways of reaching that goal, though not the only one. After *Lau*, many bilingual education programs became ESL programs with minimal use of the home language. The goal of continued development of the home language took a back seat in most states. Policy actions by government agencies and legislatures have tended to limit bilingual education to a temporary service, using the home language for a limited time but only as an aid to learning English—hence, the title *transitional bilingual education*.

Although entitlements exist for correcting past educational practices that deny equity, there is no legal entitlement, except in the case of Native Americans, for language minority communities to enlist the public schools in helping to maintain languages other than English or that they have a right to this service because they pay school taxes. A widespread sentiment in U.S. society is that the benefits of diversity do not extend to the promotion of other languages and that the schools have little or nothing to do with that objective. In today's climate, language diversity cannot go far without substantial public support for linguistic diversity in the wider society.

The case of Native American languages and the language situation of more recent immigrants have similarities in the inability of these client groups to make policy changes. Most of the languages of Native American groups in the United States have disappeared entirely or are spoken by relatively small groups of older people. Although efforts to preserve these languages are being made, there is no guarantee that they will prove successful. The powerful hegemony of English in American society works against the rescue of Native American languages. Without purposeful and creative interventions, other languages are in danger of disappearing because native languages have much less utilitarian value compared with English, the language in which most Indian children are now schooled. Furthermore, it is doubtful that schools have the power to keep alive or to restore languages that are not supported strongly in the society at large. In this century, several Native American languages will cease to be viable instruments of communication. They will

become museum languages that exist only in recorded snapshots of a bygone era. While this entry was being prepared, a brief newspaper report noted that the last speaker of an Alaskan native language had died, and with her, the language of her ancestors. There is now nobody left who speaks that language.

The case of immigrant languages is different from that of Native American languages although there are interesting similarities. It takes time for immigrant families to acculturate fully to American society. During that period of becoming American, families often suffer privations and exclusions that prevent the adults from engaging fully in the political life of the communities in which they live. Their children, on the other hand, are busily making friends and learning English under the pressure of schools and peers. Neither group has much time or opportunity to reflect on the future role of their respective native languages. Gradually, the language of parents and grandparents lapses into disuse. By the second generation, according to research, immigrant families switch to English except when communicating with older family members who have less contact with the host society on a continuing basis and learn English more slowly. In many instances, grandparents and grandchildren are no longer able to communicate well with each other because the young members of the family prefer English and older members only speak their ancestral languages.

It is not difficult, therefore, to understand why immigrant families have not been more engaged in efforts to preserve their languages of origin through bilingual education. The delay of political empowerment caused by poverty is well known. It is reinforced by the slow process for acquiring citizenship, by the schools, and by politicians who insist that learning English is the most important task for immigrant families. Because of widespread assumptions connected with languages in daily life, the pressure to abandon immigrant languages is ever present. Immigrants are continuously reminded that most foreign languages are neither necessary nor desirable. Their children, busily learning English and the youth culture of their peers, are rarely urged to use the language of the parents.

These factors, combined with the hegemony of English worldwide, further increase the pressures on native and nonnative people alike to abandon their native languages and embrace English as their only tongue. Little wonder that the clients of bilingual education do not engage the political process in efforts to

keep their languages alive through these programs. Add to this the rhetoric of political leaders who fan anti-immigrant sentiment and the reasons for the limited scope of bilingual education become clearer.

Although it was not the original purpose, bilingual education has had the primary function of teaching English, not helping to teach other languages. The United States is one of a few countries in the world where it is preferable to speak only one language and where the advantages of language preservation are not celebrated. Language restrictionist laws in several states reflect the prevalence of this view. In a few communities, efforts to restore heritage and to promote dual-language programs are underway but these efforts are not large scale and have had minimal impact in broadening the scope of bilingual education.

The loss of language resources in American society has negative consequences. James Lyons, former executive director of the National Association for Bilingual Education, is among those who lament the loss of language capacity suffered by the nation through denying American students an opportunity to participate in maintenance and developmental programs of bilingual education. According to Lyons (1990),

An undergraduate student preparing to be a teacher would receive in four years only 600 hours, at five hours per week, of foreign-language instruction. The average graduate of such a teacher-training program lacks the skills to use properly, much less teach, a foreign language to children. Only rarely would he or she possess foreign-language skills suitable for the imitative capacities of young children. Time could be turned to our advantage, however, if we were to conserve, develop, and capitalize on the language skills of the language-minority students in our schools.

These skills, developed through tens of thousands of hours of mother-tongue instruction, offer both a quick fix and a long-term solution to the problem of American monolingualism. The average language minority child entering kindergarten has a higher level of language mastery than the average graduate of the intensive and expensive 47-week Defense Language Institute program.

A broader role for bilingual education is inhibited by two important factors: first, in policies rooted in ethnocentrism and the view that the nation's children only need one language, English. This narrow view is unlikely to change unless native-English-speaking

parents pressure the schools to teach languages to their own children. The lack of political empowerment of language minority communities is the second factor that limits bilingual education and keeps it from reaching its full potential. As with other educational issues, it will require the voice of an enlightened majority to encourage this change. Until that happens, Native American and immigrant languages will continue to fade out. They will inevitably be lost to future generations.

MEASURING LANGUAGE PROFICIENCY

Assessing students' proficiency in English has been a mainstay of bilingual education programs. It serves as the primary index in distinguishing linguistically and culturally diverse students who are English language learners (ELLs) and qualify for language support from students who are English proficient. Although the notion of what constitutes language proficiency and how we measure it has changed over time, its assessment has remained the bedrock for identification of language minority students eligible for English language assistance and their subsequent redesignation. This entry traces the evolution of the construct of language proficiency and how it has been applied to assessment of ELLs in summative, large-scale, formative, classroom situations.

Defining the Construct

Language proficiency, in the broadest sense, refers to a person's competence or ability to use a language regardless of the circumstances under which it is

acquired. That is, the acquisition process that underlies language proficiency occurs in many different settings and contexts with many different interlocutors, such as family members, teachers, or peers. For students, language processing (through listening and reading) and production (through speaking and writing) occur both inside and outside of school.

Given these circumstances, development of proficiency involves two languages for ELLs. Minimally, these students come to school with oral language proficiency in their native language, and more than likely, continue to be exposed to their first language in their home environment. Depending on their age and prior educational experiences, their oral language development may or may not be complemented by literacy in their native language. Thus, often it is important to ascertain these students' relative language proficiency; that is, their performance in one language in relation to that in another upon their initial entry into school.

Linguists have tended to define language proficiency in one of two ways. The behaviorist school, represented by Charles Fries and Robert Lado in the early 1960s, dissects language into each of its component and subcomponent parts: phonology (the sound system), morphology (the smallest unit of meaning), syntax (grammar or structure), and semantics (meaning at a word, phrase, or discourse level). This approach also sees language proficiency as the accumulation of discrete skills or isolated elements. A communicative approach to language proficiency epitomized by Sandra Savignon in the late 1970s, on the other hand, places emphasis on the message or how language is used in a particular situation rather than on the knowledge of the language per se. Communicative competencies are generally exhibited in real life settings in which natural interaction is encouraged.

James Cummins's work over the past 25 years has influenced how educators envision language proficiency as part of the schooling of linguistically and culturally diverse students. His theoretical framework captures interpersonal communication outside of school, the linguistic demands of school, and underlying cross-lingual proficiencies (the developmental relationships between two languages). In essence, communicative proficiency is conceptualized along two perpendicular continua; one relates the range of contextual support available to access meaning, and the other stipulates the degree of cognitive involvement.

Finally, in recent years, U.S. legislation, in particular the No Child Left Behind Act of 2001, has helped

recast the notion of English language proficiency. ELLs' progress and attainment of English language proficiency are directly tied to schooling and accountability. Moreover, mandated English language proficiency standards, aligned to state academic content standards, are expressions of how language proficiency is operationalized along a developmental continuum. English language proficiency has come to encompass social, intercultural, and academic dimensions, with particular emphases on the language demands of school, such as specialized discourse associated with the content of mathematics, science, or social studies.

Documenting Evidence of Language Proficiency

The abbreviated summary of what constitutes language proficiency serves as the backdrop for deciding what to measure, how to measure it, and how to interpret the results. Measuring and reporting language proficiency can be configured in many different ways. The most common means of examining a student's or group of students' language development through assessment include the following:

1. Overall language performance in one language (generally the second language, English)
2. Relative performance in two languages; second language (L2) in relation to first language (L1) language proficiency
3. Oral language (listening and speaking) in relation to literacy (reading and writing) development
4. Strength in comprehension (listening and reading) relative to production (speaking and writing)
5. Performance in individual language domains: listening, speaking, reading, and writing
6. Performance by language domain or combination of domains (oral language, literacy, and comprehension) in reference to language proficiency standards

Since the mid-1970s, language proficiency assessment has played a major role in the education of linguistically and culturally diverse students. The *Lau v. Nichols* Supreme Court case in 1974, followed by state level litigation, prompted the design and use of large-scale measures. Subsequently, states and school districts have consistently administered one or more

language proficiency instruments for a variety of purposes, including identifying ELLs, monitoring their English language development, determining their attainment of English language proficiency, and even evaluating language education programs.

The measurement of language proficiency, whether in English or in other languages, has reflected the philosophical stance assumed by this early generation of testing. The more behaviorist instruments focused on discrete language skills at the phonological (such as the comparison of minimal pairs), morphological (such as the examination of tense), or syntactic (such as the presence of grammatical strings or patterns) levels. The more communicative instruments involved language use at a discourse level, such as describing a picture or retelling of a story. In either case, these tests tended to measure language proficiency almost exclusively within social contexts.

Since early in the 21st century language proficiency testing has become standards-referenced; that is, English language proficiency standards developed by states or consortia are the anchors for the design of new instrumentation. As English language proficiency standards are to be grounded in state academic content standards, the notion of language proficiency has come to represent the language associated with content that is requisite for success in school. Now, a single English language proficiency measure is selected and used by states within a specified window on an annual basis, for accountability purposes. It is considered high-stakes, as its results affect the status of schools and school districts. Table 1 presents a descriptive comparison between the old and new generation of large-scale language proficiency tests.

Large-scale, summative language proficiency assessment has received much attention at the federal and state levels. However, teachers working with ELLs historically have relied on multiple measures for making instructional decisions and have been able to contextualize results given their students' historical backgrounds and prior educational experiences. Reliable and valid data may also be gathered from standard or common assessment tools used across classrooms, offer diagnostic information on individual students, and provide an overall index of the effectiveness of language education programs.

At the classroom or formative level, performance assessment has played a substantive role in measuring students' language proficiency. That is, ELLs actively engage in hands-on activities, tasks, or projects that are

Table 1 Comparison of Features of Large-Scale English Language Proficiency Tests, Pre- and Post-No Child Left Behind (NCLB)

<i>English Language Proficiency Tests Pre-NCLB</i>	<i>English Language Proficiency Tests Post-NCLB</i>
Norm-referenced on a sample population; not standards-based	Criterion-referenced; anchored in state English language proficiency standards
Multiple purposes: Identification, designation, and redesignation of English language learners	Primary purpose: Accountability for growth and attainment of English language proficiency
Emphasis on social language and everyday interactions	Emphasis on the academic language of school
Generally integrated oral language domains (listening and speaking) coupled with reading and writing	Independent language domains (listening, speaking, reading, and writing)
Different tests designed for each grade-level cluster with no comparability between them	Vertically scaled tests across grade level clusters for comparability of forms
Nonsecure; readily available through publisher	Secure; available through the state that has contracted with a publisher
Low-stakes, with few repercussions from decisions based on results	High-stakes, with potential consequences for students and sanctions for schools and school districts

connected to their lives and curricular content as part of the instructional assessment cycle. In large part, rubrics, or scoring forms, provide criteria for interpreting work samples and providing feedback to students.

Teachers collect, analyze, and report information about students' listening, speaking, reading, and writing as part of language proficiency assessment. As they focus on state language proficiency standards, bilingual or English as a Second Language (ESL) teachers create language objectives that are complemented with content objectives often determined in collaboration with general education teachers. A variety of classroom-centered techniques are used to measure and document students' language proficiency, whether in one language or in two, on an ongoing basis. As instruction, assessment of ELLs has come to be differentiated according to the students' level of language proficiency.

For assessing oral language, teachers may confer with students on a one-to-one basis or observe them: (a) individually, as they follow oral directions by pointing, sequencing pictures, locating information, drawing figures, or constructing models; (b) with

partners, as they dialogue, engage in two-way tasks, or conduct interviews; (c) in small groups, as they participate in book talks, literature circles, debates, or dramatizations; or (d) present in front of a whole group, as they give speeches or make reports.

For assessing literacy, teachers may give feedback, orally, in writing, or through rubrics, as ELLs: (a) categorize, classify, sort, or sequence visually or graphically supported information; (b) draw or match elements in response to written text; (c) answer or ask questions in writing; (d) take notes or outline text; (e) complete graphic organizers; and (f) produce labels, lists, journal entries or learning logs, e-mails, letters, stories, poetry, reports, or research.

At the classroom level, language teachers generally manage language proficiency data of ELLs. This information, whether stored in student portfolios or in traditional grade books, is most useful when shared with other teachers who work with these students. Ultimately, assessment must be approached systematically for ELLs to have continuity of learning experiences and maximize their potential to succeed in school.

Designing an Assessment System

Until recently, there has been little connection between the assessment of language proficiency and academic achievement. As framed by Margo Gottlieb, this paradigmatic shift can be attributed to advances in theory and pedagogy that emphasize the integration of language and content as the instructional backbone for ELLs. The shift has been accelerated by the federal insistence on the alignment of language proficiency and academic state content standards. As a result, assessment of ELLs, as of all students, becomes a driving force in a standards-based educational system.

Student learning or content standards form the core of this system from which assessments are designed and built in conjunction with the planning of curriculum and instruction. Because accountability rests on a double set of standards for ELLs, so too, are there dual assessments: language proficiency and academic achievement. Within the system, then, the developmental nature of acquisition of language proficiency (that is, how ELLs score on state English language proficiency tests) must be considered in explaining student achievement.

As the construct of language proficiency has evolved over time, so too has its role in the schooling of students for whom English is an additional language. This change has become evident in assessment practices carried out in all elementary and secondary public schools throughout the United States. Educators and policymakers alike can now see that measuring language proficiency is vital to understanding the language development process of English language learners as a way to help them succeed in today's content-based classrooms.

MELTING-POT THEORY

The melting-pot theory of acculturation and assimilation has been discussed widely since its introduction by playwright Israel Zangwill in 1909. Zangwill's play, of the same name, is all but forgotten, but the phrase caught on. It gave rise to the image of a super-American purported to blend the best traits of many cultures. In this view, the new American is an amalgam of characteristics that resulted, as if magically, in an archetype persona that found favor with many Americans. It is of some interest that the concept of the *melting pot* arose from popular culture, rather than from the social sciences, although social scientists seemed to accept it just as warmly.

Zangwill wrote,

America is God's crucible, the Melting Pot where all the races of Europe are melting and reforming! Here you stand, good folk, think I when I see them at Ellis Island, here you stand in your fifty groups with your fifty languages and histories, and your fifty hatreds and rivalries, but you won't be long like that, brothers, for these are the fires of God! A fig for your feuds and vendettas! Germans and Frenchmen, Irishmen and Englishmen, Jews and Russians—into the Crucible with you all! God is making the American . . . The real American has not yet arrived.

He is only in the Crucible, I tell you—he will be the fusion of all races, the coming superman.

Zangwill was not creating a viewpoint; he was simply reflecting it. As this excerpt shows, by the beginning of the 20th century, the idea of a distinctly American persona was becoming firmly established. Increasingly, as the nation moved through the Industrial Revolution, efforts at remaining different or maintaining old-country customs, traditions, and languages were regarded with suspicion. Often, they were labeled “un-American.” The fact that the United States is composed of people from all over the world remains undisputed. The issue that was being addressed in the nation’s internal discourse of citizenship was different: How do immigrants become true Americans, and what is the ideal result of the amalgamation of people from different parts of the world? The notion of a melting pot wherein harsh differences were softened and made more tolerable seemed appropriate to many Americans of the time. It bears noting that the melting-pot concept was not about race. Americans of the time had not yet dealt openly with miscegenation, and few people were arguing that all races were endowed with the same attributes. This entry describes the metaphor and ideology behind the melting-pot theory, how schools have viewed assimilation, and criticisms of the theory.

Metaphor and Ideology

The prevailing view of the melting-pot ideology is that the metaphor describes cultural assimilation, through which the major differences between groups are blended away to allow for harmonious coexistence, and cultural pluralism. The ideal, according to this view is a mix of peoples who have largely melted into a new composite but in the process contribute certain attributes that strengthen the whole. The original notion of the melting pot is now portrayed somewhat differently. The revised idea is that there are two competing ideologies rather than one. The first is one of blending into the American fabric of society at the price of losing one’s cultural, ethnic, and linguistic identity, and the other is a more pluralist view where the various groups within the country maintain their own identities and institutions while participating equitably in the benefits of the society. In this interpretation, there is not enough room in the melting pot for both ideologies. Implicitly, the melting pot favors the

first idea rather than the second. The two concepts are incompatible and cannot exist harmoniously within the same idea of becoming American. The melting pot does not address the benefits that particular groups may expect for themselves; rather, it speaks to the benefits that the society and the nation will gain from the various groups it takes into the mix. Minority groups who have not participated equitably in the past are reluctant to continue a conversation in which only their contributions are noted but not their entitlements.

James Banks defines the idea of the melting pot as “Anglo conformity” and links it to an assimilationist ideology. Christine Bennett describes cultural pluralism in its ideal form, as “a process of compromise characterized by mutual appreciation and respect between two or more cultural groups.” Whether they agree with each other or not, theorists and scholars seem to agree that the concept of the melting pot has had something to do with our national character as a nation of immigrants and the accommodations that has made the integration of these groups possible as one nation.

Perhaps the major problem with the melting-pot theory is that it is not an apt metaphor; many people simply did not *melt*. Across the United States, one finds enclaves of ethnic groups living a dual existence. They identify themselves as *American*. However, they also view themselves in part as related to an ethnic group that does not necessarily see life as other Americans see it. Their patterns of interaction with the greater society may at times differ just a little, or at other times quite significantly from the majority culture.

For many European Americans, the melting pot actually may have worked fairly well. If we interpret the melting process as the suppression of ethnic or nationalistic aspects of a group’s identity, many Americans acknowledge that they no longer identify with a culture other than an “American culture.” The combination of factors involving a homeland that was far away and being White like most everyone else of European descent, meant that White Americans could more readily melt and claim to be *more American* than others who held on to their languages and cultures of origin. In short, they resisted the heat of the melting pot. Yet another way of describing this difference is that those who melted and yielded to the pressures of assimilation could never go back to their countries and cultures of origin whereas those who did not melt completely kept that option more or less open. This is important because in the contemporary notion of

immigration, many immigrants do not come with the express desire to stay forever. They come to test life in the United States and will decide later whether to remain or return.

The melting-pot theory is flawed in another important respect. The theory behind the melting pot is that all who came here were entitled to immerse themselves in that process and that no one would be excluded. According to Bennett, more than 45 million immigrants, mostly from European nations, entered the United States between 1820 and 1970. The melting-pot idea assumes that most of these immigrants will willingly give up their native languages and cultures to accept the Anglo-American way of life. But the melting pot is undemocratic in that it appears to deny choice whether to participate in the process or not.

Schools and Assimilation

The American public school was supposed to be the major force in the assimilation exercise. Bennett cites early 20th-century education historian Ellwood P. Cubberley:

Everywhere these people (immigrants) tend to settle in groups or settlements and to set up their own national manners, customs, and observances. Our task is to break up their groups and settlements, to assimilate or amalgamate these people as part of the American race, and to implant in their children, so far as can be done, the Anglo-Saxon conception of righteousness, law, order, and popular government, and to awaken in them reverence for our democratic institutions and for those things which we as a people hold to be of abiding worth.

Pamela Tiedt and Iris Tiedt observed that many immigrants believed in the process of assimilation as the key to success in America. Although they often lived in ethnic neighborhoods and sent their children to private classes for heritage and even language tutoring, the immigrants felt that blending in was part of what was expected in America. This expectation of blending is what Banks refers to as *assimilationist ideology* that he asserts comes directly from the concept of the melting pot and what he labels *Anglo-conformity*. Anglo-conformity, according to Banks, refers specifically to ethnic groups and immigrants giving up their cultures and replacing them with those of the Anglo-Saxon. Peter Kivisto maintains that the ideology of the melting

pot was nothing more than an attempt to justify the *Americanization* efforts demonstrated in the early part of the 20th century. Kivisto states, "These campaigns were intended to eradicate all vestiges of the new arrivals' cultural heritages, while simultaneously instilling in them what were considered to be appropriate American attitudes and behaviors." As an example of this process, Kivisto cites the activities of what was known as Henry Ford's "Sociology Department,"

which ran training schools in his automobile plants for immigrant workers. The purpose of the schools was to teach the English language and to study in preparation for citizenship. Workers enrolled in the program took pledges that they would only speak English, and they proclaimed themselves intent on becoming "100 percent" American. In practical terms, this perspective required a willingness and ability on the part of immigrants to accept and to emulate the hegemonic WASP culture.

Critiques of the Theory

Criticisms of the melting pot have tended to focus on issues of fairness and equity toward the immigrant. According to Bennett, teachers in particular still use the idea of the melting pot in their attempts to educate culturally different students. These beliefs have led many teachers to view students' language and cultural differences as liabilities, deficits, and disadvantages. Teachers who attempt to force children and youth into a predetermined and narrowly defined "American way" often fail both to assimilate and to educate. This, in turn, often has led some schools to diagnose these children as "special-needs children."

M. Lee Manning and Leroy Baruth suggest flatly, "The melting-pot theory is no longer considered a model, much less a means of achieving a just, equal, and accepting society." Although an assimilationist model of schooling was used during and even after the large immigration waves of the 19th and early 20th centuries, education today favors a more multicultural manner of teaching and defining what it means to be American. Bennett maintains that cultural pluralism has emerged as an alternative means of looking at culturally diverse students. In a culturally plural society, individual ethnic groups are allowed to maintain their cultural traditions and customs, including the right to voluntarily discard them at their own pace. This would include language, foods, customs, and religion,

as long as it did not interfere with another group's or person's right to do the same. Pluralism only requires that all groups and individuals agree to abide by a set of institutions that will govern all of the groups as a whole. Examples of these institutions include a system of government or laws and an economic or money system. In his view, the concept of cultural pluralism is a good fit with American values and ideals such as democracy and majority rule with minority rights.

Joshua A. Fishman, a leading American sociolinguist, is a strong critic of the melting pot. As a staunch defender of maintaining minority languages, Fishman believes that language loss inevitably produces loss of culture. He views the loss of language(s) from several perspectives. However, one perspective that he identifies with most ardently is that of culture loss. He writes,

You can also speak from the point of view of the culture lost. The culture has lost its language. What is lost when the culture is so dislocated that it loses the language which is traditionally associated with it? That is a serious issue for Native Americans. We can ask it from the national point of view. What is lost by the country when the country loses its languages? We have had this very haphazard linguistic bookkeeping where you pretend nothing is lost—except the language. It is just a little language. But, after all, a country is just the sum of all of its creative potential. What does the country lose when it loses individuals who are comfortable with themselves, cultures that are authentic to themselves, the capacity to pursue sensitivity, wisdom, and some kind of recognition that one has a purpose in life?

As an advocate of bilingual education and the retention of native languages in the United States, Fishman believes that culture cannot be replaced once it is lost. He likens this loss to a fundamental loss of self. According to Fishman, the most significant manner in which we can lose a culture is through the loss of one's native language because the language contains all of the elements of a culture:

The most important relationship between language and culture that gets to the heart of what is lost when you lose language is that most of the culture is in the language and is expressed in the language. Take it away from the culture, and you take away its greetings, its curses, its praises, its laws, its literature, its songs, its riddles, its proverbs, its cures, its wisdom, its prayers. The culture could not be expressed and

handed on in any other way. What would be left? When you are talking about the language, most of what you are talking about is the culture. That is, you are losing all those things that essentially are the way of life, the way of thought, the way of valuing. . . .

The loss of a culture is difficult to gauge if people feel that they have never had one. In distinction from Fishman's passion, many persons deal with this issue as if it were unimportant. American culture is so intertwined with our identity that we often neglect to understand that one does not have to be ethnically or racially different to feel that one has a distinct culture. There is nothing wrong with an American youth who claims that he is not German, French, Italian, or Swedish; he is simply American. Banks refers to this national culture as the *macroculture*. The other subcultures he refers to as *microcultures*. Gunnar Myrdal identified values that Americans hold strongly as the "American Creed." Examples of these values are justice, equality, and human dignity.

Although other paradigms have been offered as a substitute for the melting pot, none seem to have caught the attention of most citizens in the same way. Other paradigms such as the "salad bowl" or "ethnic stew" have simply not resonated with the American public. This can be seen in the resistance that multicultural education and diversity education programs have met with in public schools. That Americans continue to strive for inclusion in the American mainstream is a point not easily lost on a macroculture that is determined to be "distinctively American."

MÉNDEZ V. WESTMINSTER

Gonzalo Méndez, William Guzmán, Frank Palomino, Thomas Estrada, and Lorenzo Ramírez filed suit against the Westminster, Garden Grove, Santa Ana, and El Modena School Districts in California on March 2, 1945, for not allowing Mexican children to attend Anglo schools because they were “forbidden, barred and excluded from attending any other school in said District or System solely for the reason that

said children or child are of Mexican or Latin descent” (*Méndez v. Westminster School District*, 1946). Attorneys on both sides effectively presented their arguments. To that point, no precedent regarding Mexicans and equal protection law existed. Both parties noted that the case did not involve race discrimination and that European Americans and Mexicans would be considered White. The parties also agreed that the identified school districts all maintained schools that consisted entirely of Mexican students. The central argument and point of contention was the purpose of segregation, as described in this entry.

The Méndez petitioners argued that the school districts intentionally segregated Mexican schoolchildren. For these reasons, they sought relief under the Equal Protection Clause of the Fourteenth Amendment of the U.S. Constitution and argued that the school districts denied them equal protection of the laws, as a class, by forcing them to attend schools solely for children whose ancestry was Mexican. Using the testimony of local community members who had attended the school, David C. Marcus, attorney for the plaintiffs, presented evidence of the segregation policies. Further testimony revealed specific instances of transfer denials for Mexican children and inferior services provided to them. Children who testified at the hearing shared accounts of the segregation and described how it made them feel. More important, Marcus employed social scientists to testify about the strong negative effects of segregation on the educational and social development of the group labeled as “inferior.”

The school districts, on the other hand, argued that although segregation occurred, it was only on the basis of language and not racial discrimination. In other words, the segregation was an instructional matter and therefore a function of language rather than race. This, they argued, was not discriminatory. One common method used to justify the segregation of students was to emphasize the Mexican students' lack of proficiency in the English language. When combined with culturally biased IQ testing, Mexican students supposedly performed poorly, demonstrating that they were not as academically capable as Anglo children and therefore merited separate schools.

Federal District Judge Paul McCormick ruled that segregation on the basis of race or ancestry was a violation of California State law. It was, therefore,

a violation of the student's right to the equal protection of California law under the Fourteenth Amendment:

"The equal protection of the laws" pertaining to the public school system in California is not provided by furnishing in separate schools the same technical facilities, text books and courses of instruction to children of Mexican ancestry that are available to the other public school children regardless of their ancestry. A key requisite in the American system of public education is social equality. It must be open to all children by unified school association regardless of lineage. (*Méndez v. Westminster School District*, 1946)

Judge McCormick responded to the new integrationist educational theory proposed by petitioner's social science and psychological experts in court: "It is also established by the record that the methods of segregation prevalent in the defendant's school districts foster antagonisms in the children and suggest inferiority among them where none exists." The court further stated, "The evidence clearly shows that Spanish-speaking children are retarded in learning English by lack of exposure to its use because of segregation." McCormick pointed out that the only valid reason for segregation of pupils was for special language instruction, but that valid language testing would be required before any segregation could occur. Finally, McCormick ordered the districts to desegregate and required injunctive relief for all students of Mexican descent in Orange County.

During the hearings, Mexican parents in Orange County demonstrated their solidarity by raising money to pay attorney fees while groups of parents visited Los Angeles every day to show support for the Méndez case. Gonzalo Méndez organized a community effort that involved a large number of persons from El Modena and the other three cities in the case. However, the *Orange Daily News* reported only a few days later that the defeated school districts would appeal the case to the Ninth Circuit Court of Appeals in San Francisco and to the Supreme Court if necessary.

In 1946, Alexander Lievanos attempted to enroll his son in the Roosevelt School, but was denied admission. With the assistance of the Latino American Organization (LAO), he filed a petition to hold Trustees Henry Campbell, Joe Irwin, and Jerome Neiger and Superintendent Harold Hammarsten in contempt of the court's orders because no change had been made in the schools following the court's decision.

On September 27, 1946, the same day the petition was filed, Judge McCormick ordered the defendants to appear before the court by October 14, 1946, or face contempt charges. The El Modena Chicanos had formed "The Unity League of El Modena," which later became the Latin American League of El Modena. Lievanos, owner of a small shop in town, was elected chairman and came with other parents before the board to inquire why integration had not begun and why testing to determine proficiency in the English language had not been conducted. The board said had it considered an educational plan to divide the schools by grade level, the lower grades in one school and the upper in another, but there was "a question of budget." The superintendent was belligerent and stated that tests were not given to Mexican students because tests were not necessary to determine that the children could not speak English. School board member Neiger blamed the Mexican parents for the segregation, stating, "If the parents had English as the language spoken in the home, the children would have no trouble when they got to school and would do much better," as reported in the El Modena School District Board Meeting Minutes, from October 9, 1946. The school board was so confident in its decision that on September 13, 1946, the board announced it would not change its educational policies and would continue with a later start time for Mexican students so they could work the walnut harvest, as documented in the *Orange Daily News* of September 16, 1946.

The court, however, did not approve the school board's plan and forced the school board to implement the plan to divide the schools by grades. The Mexican American community at El Modena had become the center of the struggle to ensure an educational opportunity for every student. Mexican American parents directly challenged the school board for the first time as an entire community through a Unity League. They also continued their support of the movement in Orange County and sent their representatives to San Francisco to provide a show of strength at the appellate court.

The appellant school districts were not daunted by the rulings of the district court and made similar arguments as those presented at the district court, but hoping for a different outcome. The appellee schoolchildren's arguments on appeal were joined by several amicus briefs (which are filed by someone who is not a party in the case) that attempted to provide the court with

a broad-based legal and policy argument against segregation. Each brief for the appellee was planned as a piece of a puzzle that would eventually give the court a picture of the wrongs of segregation, both in precedent and in policy. The amicus briefs also provide the most interesting arguments in the case.

In the district court, only the American Civil Liberties Union (ACLU) and the National Lawyer's Guild filed amicus briefs with the trial court, but on appeal, five civil rights groups and the attorney general of California wrote briefs in support of the ruling. The case was monitored by the National Association for the Advancement of Colored People (NAACP) and the ACLU as the test case to strike down "separate but equal." Aside from the obvious attempts to overturn the *Plessy v. Ferguson* case (decided in 1896) directly, the NAACP and the ACLU made overtures to human rights issues that were brought to prominence through the atrocities of World War II. The use of public policy considerations was given new force in the postwar era because of the U.S. role as the advocate of democracy during and after World War II.

Several points are important to understanding the importance of the Méndez case. First, the Mexican schoolchildren were considered "Caucasian" for purposes of the case, and therefore, the trial court found a violation of the schoolchildren's rights not because of racial discrimination grounds, but because of national origin. Second, the appellate court found unequal enforcement of California's educational laws by the school districts as a violation of the children's equal protection rights, implying that if California law had explicitly allowed segregation based on Mexican ancestry, segregation may have been permitted. The Méndez case became an important part of the legal scaffolding leading to the *Brown v. Board of Education* decision just a few years later.

METALINGUISTIC AWARENESS

During the last 30 years of the 20th century, a significant body of research in psychology and psycholinguistics was carried out, relating to the relationship between early bilingualism and cognitive (intellectual) development: specifically on the subject of metalinguistic awareness. Most of this research defined early bilingualism as young children's (ages 4 to 8 years old) ability to speak and repeatedly use two languages. *Metalinguistic awareness* refers to a specific cognitive skill that generally accounts for an expressed ability to contemplate language and to understand and use an array of linguistic constructs, rules, norms, and patterns.

Until the mid-20th century, before studies evaluated metalinguistic awareness specifically, as a differential outcome between bilinguals and monolinguals, much of the work assessing the relationship between early bilingualism and cognition suggested a negative relationship between these two variables—cognition measured as performance on standardized tests of intelligence. This meant that bilingual children were found to score lower than their monolingual peers. These conclusions, however, have now been largely abandoned because the research methods and designs of those initial studies contained serious flaws.

As research designs, methods, assessment tools, and techniques were improved, evidence demonstrated

certain cognitive benefits of bilingualism in young children. Several controlled studies, including a seminal Canadian paper discussed later in this entry, found as early as the 1960s that bilingual children demonstrated favorable outcomes with regard to their developing conceptions of language, referred to as metalinguistic awareness, when compared with monolingual children. This meant that bilingual children were found to demonstrate more developed understandings of linguistic constructs, and thus were able at earlier ages to make letter-sound associations, separate sound from meaning, interpret semantic attributes, develop understandings about vocabulary, and comprehend syntactic structure.

More recently, however, studies assessing whether bilingual children have superior metalinguistic abilities when compared with their monolingual counterparts have produced mixed results. Most of the published research supports an advantage for bilingual children, but other studies show either no difference or a disadvantage for them. Ellen Bialystok, a Canadian psychologist and professor at York University, who has published extensively on the topic, has presented a model to account for the mixed research findings. She describes metalinguistic awareness as a two-prong cognitive process rather than as a cognitive ability. Bialystok concludes that bilingual children are able to outperform monolinguals on some metalinguistic tasks because they demonstrate better control of attention in real time, not because they are necessarily superior on any specified cognitive domain. This entry describes the research on metalinguistic development.

Conceptualizing Difference in Metalinguistic Development

It is perhaps an intuitive or attractive notion that young bilinguals demonstrate metalinguistic benefits over their monolingual counterparts. Because they are able to manage two linguistic systems rather than one, it seems conceptually probable that bilingual children would be more aware of linguistic constructs and processes than would children who speak only one language. This idea echoes the view of Russian psychologist and developmental theorist Lev Vygotsky, who wrote in the early 20th century that expressing the same thought in more than one language enables children to perceive language as one system among many. This process leads to awareness of linguistic operations.

Developing bilingual children, those yet to achieve age-appropriate proficiency in either or both languages, would demonstrate less of a metalinguistic advantage over their monolingual peers than those children who were fully bilingual, proficient in both languages have. This view of cognitive superiority for bilingual children could serve as a logical impetus to expand bilingual education by challenging the belief that schools that incorporate more than one language in the classroom produce confused and culturally disoriented children.

Although the notion of metalinguistic benefits attributable to bilingualism is appealing and somewhat intuitive in theory, research on this topic has left some important questions unanswered. Conceptually, it is not clear whether bilingualism generates enhanced awareness or greater uncertainty regarding linguistic structures because of similarities and differences between languages. Patterns where linguistic systems interact over time to produce advanced metalinguistic awareness throughout early language development have been largely unvisited by theory. Furthermore, the research has lacked a uniform definition of metalinguistic awareness or ability; therefore, researchers have not worked with the construct in consistent ways. No analyses have been attempted to show that children's awareness of letter, word, syntactic, and grammatical functions are necessarily explained by one underlying latent construct.

Early Research

In the 1920s, psychologists began to study the relationship between cognition and bilingualism because of an interest in developing suitable strategies and tests to measure the intelligence of bilingual children. Until the 1950s, most research concluded that bilingual children were linguistically deficient compared with their monolingual counterparts (e.g., they had underdeveloped articulation, lower standards in writing composition, more grammatical errors, and a considerably reduced vocabulary). Several researchers, such as D. J. Saer and Rudolf Pitner, concluded that bilingual children developed language handicaps that damaged their cognitive development and academic performance through their college years.

Subsequent reanalyses of these studies found them to be methodologically flawed, and consequently, not readily generalizable or even interpretable. Several failed to account for the influence of the socioeconomic

differences between bilingual and monolingual samples; others failed to assess the level of linguistic fluency to determine the level of child bilingualism. Therefore, the belief that monolinguals outperformed bilingual children on measures of verbal intelligence could not be supported and was largely abandoned.

After a gradual transition from “behaviorist” to “cognitivist” research approaches in psycholinguistics, a seminal study, conducted in the early 1960s by Elizabeth Peal and Wallace Lambert at McGill University pointed the way to new conclusions. Peal and Lambert selected samples of 10-year-old French-English bilinguals and English monolinguals from the same school system in Montreal and formulated a composite measure to assess children’s language fluencies; those who scored at the extreme ends were excluded from the study. All participants in the study, 75 monolinguals and 89 bilinguals, were then administered intelligence tests. French, English, and nonverbal versions of the tests were given. The study also controlled for socioeconomic status, gender, and age. Contrary to previous findings, this study found that bilinguals performed significantly better than monolinguals did on tasks that measured concept formation, symbolic flexibility, and mental representations of visual stimuli. It was not clear how these cognitive abilities were associated with (or enhanced by) bilingualism *per se*. Nonetheless, through better research methods and by accounting for levels of language proficiency, the study challenged the prevailing view that early bilingualism leads to impoverished cognitive development.

Recent Research

More recently, several studies used controlled research designs to compare bilingual and monolingual child populations on an array of cognitive outcomes. The cognitive construct of metalinguistic awareness was introduced as a benefit of early bilingualism in the 1970s by researchers Anita Ianco-Worrall, who studied English-Afrikaans bilinguals; Sandra Ben-Zeev, who studied Hebrew-English bilinguals; and James Cummins, who looked at English-French bilinguals. These studies began to look at specific linguistic differences between bilingual and monolingual groups. They assessed phonological processing, semantic skills, and vocabulary development. Cummins suggested that bilingual children outperformed monolinguals on a number of linguistic tasks

because they had more developed metalinguistic abilities, and that bilinguals were more likely than monolingual children to look *at* rather than *through* language.

Research on early bilingualism and outcomes of metalinguistic awareness through the 1980s and 1990s were troubled by mixed results. Researchers continued to evaluate differences in metalinguistic abilities between monolingual and bilingual samples of children who spoke English and either French, Spanish, Chinese, Swedish, Hebrew, Italian, Afrikaans, or Indonesian as their other language. Metalinguistic abilities were defined in various ways. Some focused on word-level skills by administering tasks that assessed children’s ability to isolate words in utterances or make associations between words and meaning. Other studies had children perform assorted grammatical tasks to determine differences in syntactic awareness between bilinguals and monolinguals.

Further research evaluated differences in metalinguistic abilities by assessing phonological processing abilities. Researchers Bialystok, Sylvia Galambos, and Jakob Cromdal measured an array of linguistic skills using a variety of tasks to assess differences in metalinguistic awareness. Yet analyses showing that variations of these various linguistic outcomes were actually explainable by one unique construct—metalinguistic awareness—were not produced. Moreover, phonological, word, and syntactic awareness were each measured in different ways in these studies.

Bialystok published a research synthesis on this topic, where she reviewed the empirical evidence on the metalinguistic benefits of early bilingualism, highlighted mixed results, and concluded that inconsistent findings were a function of the tasks researchers used to measure this skill. She noted, for example, that measurement techniques of phonological awareness to determine differences between bilingual and monolingual children’s metalinguistic awareness varied between studies. This was also found to be the case for studies that used syntactic and word-level tasks to assess metalinguistic abilities. The significance of the research results was found to be highly associated with the task researchers implemented in their studies. Bialystok concluded that pointing to metalinguistic awareness as an underlying ability and benefit of early bilingualism is unwise—that the benefits bilinguals demonstrate over monolingual children are associated with tasks used for assessment and based differences in cognitive processing, rather than an intellectual ability, *per se*.

An Explanatory Model

To elucidate her conclusion that the relationship between early bilingualism and metalinguistic awareness is accounted for by differences in cognitive processing between bilingual and monolingual children, Bialystok developed a conceptual model to explain why the research produced inconsistencies. She suggested that tasks used to measure metalinguistic awareness in the research literature vary within a two-dimensional spectrum of cognitive processing demands. The dimensions were presented as (a) analysis of representative structures, and (b) control of selective attention. The first refers to the child's ability to construct detailed and structured mental representations of phenomena, and the second refers to an ability to direct and maintain attention to specific particular aspects of stimuli in real time. She found that studies in which administered tasks demanded high control of attention (e.g., count words in sentences, substitute symbols, use novel names in sentences, segment phoneme), were solved better by bilingual than monolingual children. Those tasks that required little or no control of selective attention (e.g., describe attributes of words, determine ambiguity, explain grammatical errors, phoneme substitution) did not produce a bilingual advantage. No differentiating trend between language groups was found in tasks' level of demand of representative structure analysis.

Bilingual children, therefore, do not appear to have a predictable metalinguistic advantage over their monolingual counterparts. The cognitive benefit of early bilingualism, according to available research, is an increased ability to attend to pertinent information in the presence of irrelevant distractions. This assertion, currently, is the best explanation for why bilingual children are able to outperform monolinguals on certain metalinguistic and cognitive tasks.

MODERN LANGUAGES IN SCHOOLS AND COLLEGES

This entry focuses on modern language study in the United States, which is typically defined as the study of languages other than English by native-English-speaking students but can also include the study of a language other than English by native speakers of other languages. Modern language study aims vary, depending on the length of time devoted to the process and student predisposition for language learning. They range from language and cultural awareness in a second language to near native proficiency or bilingualism. Numerous gradations exist in between.

American students enroll in the study of different languages—including, commonly, French, German, and Spanish—for different reasons. As geopolitical and economic circumstances change globally, so also do enrollment patterns. Currently, there is heightened interest in Chinese among both Asian and non-Asian students, and in the late 20th century, Japanese was a popular language. Where there is a high concentration of people of Italian heritage, the Italian language is popular, sometimes supplanting German or French as second or third most popular after Spanish. This entry reviews modern language enrollments from elementary to graduate school, as reported in the latest available surveys. These surveys are conducted periodically by the Modern Language Association (MLA), the Center for Applied Linguistics (CAL), and the American Council on the Teaching of Foreign Languages (ACTFL).

Elementary and Secondary Education

In a study conducted by the Center for Applied Linguistics (CAL), Nancy Rhodes and Lucinda Branaman report that in 1997, more than 4 million of 27.1 million elementary school students (slightly less than 15%) studied modern languages in U.S. public and private schools. At the secondary level, nearly 12 million young people studied modern languages in 1997. Of 8.2 million middle school/junior high school students, 3 million (36.5%) were enrolled in languages other than English. Of 13.5 million high school students, 7 million (52%) studied a modern language. Another 1.5 million students in combined junior/senior high schools studied a modern language.

Between 1987 and 1997, the incidence of modern language instruction in elementary schools increased nationwide by nearly 10%. In 1987, about one elementary school in five reported teaching a modern language. By 1997, the proportion had increased to nearly one in three. Spanish and French were the more commonly studied languages, though Spanish increased in popularity and French declined somewhat. German, Japanese, Latin, Hebrew, Italian, Sign Language, Native American Languages, Russian, and Greek each represented 5% or fewer of the elementary schools that offered modern language study during that period. Notable among this group of languages is Japanese, which no elementary school offered in 1987, but 3% of elementary schools offering a language offered

Japanese in 1997. Representing less than 1% of schools teaching languages included Chinese, Chinese for Chinese speakers, Hawaiian, Cherokee for Cherokee speakers, French for French speakers, Russian for Russian speakers, Yaqui, Kutenai, Tewa for Tewa speakers, Arabic, Dutch, Filipino, Micronesian, Polish, Swedish, and Korean for Korean speakers. Most of these languages had small enrollments. Spanish was the exception. Between 1987 and 1997, Spanish for Spanish speakers increased from 1 to 8% of elementary schools offering modern language classes.

Modern language study programs in elementary schools are of four different types: foreign-language experience/exploration (FLEX), foreign language in the elementary school (FLES), intensive FLES, and immersion. FLEX aims for exposure over fluency, and part of the program may be taught in English. FLES students acquire listening and speaking skills, gain an understanding of and appreciation for other cultures, and acquire limited reading and writing skills. Intensive FLES students are expected to acquire more extensive reading and writing skills.

Immersion program goals include developing communicative proficiency in the language and culture. At least 50% of the school day is taught in the target language through content areas, such as mathematics, science, social studies, and language arts. Immersion programs may be partial, total, or two-way or dual immersion. In the last instance, half are native speakers of English, and the other half speaks another language, typically Spanish, natively. The students learn each other's language with and from each other. In this survey, FLES and FLEX programs were the most common, constituting approximately 80% of programs reported in elementary schools offering foreign-language instruction. Immersion programs increased in popularity between 1987 and 1997. In 1987, 2% of elementary schools reported offering immersion programs. That percentage rose to 8% in 1997.

Almost all secondary schools with foreign-language programs in 1987 and 1997 offered the standard class, which includes listening, speaking, reading, writing, and culture. During this period, advanced placement classes increased from 12 to 16% of secondary schools with a language program. Language classes for native speakers also increased from 4 to 7%. Program types, in addition to the standard class and language classes for native speakers, included exploratory, advanced placement, honors/accelerated, conversation, and literature classes.

Jamie Draper and June Hicks report in a study conducted by the ACTFL that 42.5% of the public high school enrollment in the United States, or nearly 5.75 million high school students were engaged in modern language and culture study during fall 2000. This percentage was an improvement over the previous survey for 1994 and consistent with an upward trend since 1982, when modern language enrollments were at their low point of 21.3% of all students in U.S. high schools. Before 1982, modern language enrollment had ranged from a high of 35.9% in 1915 to a low of 13.7% in 1948. The earliest recorded percentage was 16.3% in 1890. The first reported Spanish enrollments were in 1910 (6,406 students). Italian and Russian enrollments appeared in 1958 (22,133 and 4,044 students, respectively), and the first enrollments in Japanese were reported in 1990 (24,123 students). Before 1910, French and German were the only modern languages reported, and their enrollments were outnumbered by Latin, which was at least twice as large as French and German combined.

Higher Education

Though the general trend has been increased modern language enrollment between 1960 and 2002 in higher education, the MLA reports several periods of declining enrollment, which included 1970 to 1974 (approximately -16.0%) and 1990 to 1995 (approximately

-3.6%). The most precipitous increase in modern foreign-language enrollments occurred between 1960 and 1965 (approximately 60%). When viewed as a proportion of all higher education enrollments, we see a less rosy picture. In 1960, 16.1% of all college students were studying modern foreign languages. Since that time, the proportion declined to 8.6% of 15,608,000 college students in 2002. The lowest proportion was reported for 1980, when 7.3% of all college students studied a modern language. Though the number of students studying modern languages has increased, their proportion among all students has declined since 1960 and has been hovering between 7.3% and 8.6% since 1977.

In the latest MLA survey of 2006, Nelly Furman, David Goldberg, and Natalia Lusin reported that in fall 2002, 1,397,253 students were studying modern languages in colleges, community colleges, and universities. By fall 2006, the number had increased to 1,577,810, representing a 11.5% increase. The most popular language of study was Spanish, with an enrollment increase of 10.3%. However, other, lower-enrollment languages experienced higher percentage changes: American Sign Language (29.7%), Arabic (126.5%), Chinese (51%), Japanese (27.5%), Korean (37.1%), Italian (22.6%), and Portuguese (22.4%).

In 2006, 22.5% of national higher education modern language enrollments were in the Northeast, 21.7% were in the Midwest, 21.3% were in the South

Atlantic region, 9.8% were in the South Central region, 7.5% were in the Rocky Mountain region, and 17.2% were on the U.S. Pacific Coast. Language learners on the Pacific Coast were most likely of all modern language students to study languages in a community college (36.8%), and undergraduate and graduate language learners were concentrated on the Atlantic Coast and in the Midwest (71.4% of undergraduates; 70.5% of graduates). The smallest number of modern language students in the United States in 2006 was found in the Rocky Mountain states of Arizona, Colorado, Idaho, Montana, New Mexico, Nevada, Utah, and Wyoming (7.1% of all undergraduates, and 7.0% of graduate students).

Conclusion

Relatively few U.S. students appear to take advantage, consistently, of the opportunity to study modern languages in schools and colleges around the country. Though many policymakers profess an interest in modern language and culture studies, there appears to be, as scholars such as Nancy Zelasko have pointed out, a linguistic double standard. Although modern language study is valued, bilingual education is not. Further research needs to be conducted to clarify this apparent contradiction. Among the industrialized nations of the world, U.S. students start modern language study later and continue it for shorter periods of time than do their peers in other nations and, as

a result, are less likely to achieve enough fluency that can be described as bilingualism. Although they are not conducted frequently, ongoing surveys, such as the MLA, CAL, and ACTFL surveys, are important tools to provide longitudinal data to support this research.

MOLL, LUIS (1947–)

As a middle school student in Santurce, Puerto Rico, Luis Moll would have been mystified to learn that he would eventually make education a career. A rebellious youngster, he disliked school, preferring the comradery of friends outside the school building. As an adult scholar, he appreciates the irony of turning that early attention to friendships into a formal study of social networks for learning and teaching. This entry describes his life and career.

Luis Carlos Moll was born on June 28, 1947, in Santurce, Puerto Rico to Carlos Moll Schwartzkopff and Olga Rita del Rosario. Moll entered public first grade and attended several other schools, including an English immersion school. But school had little meaning for the boy. In the seventh grade, he was suspended. Subsequent experiences with schools, he said later, were equally difficult.

In 1962 at the age of 15, Luis moved to Los Angeles, California, with his mother and grandmother; he graduated from high school in Montebello, California, in 1965. The following year, he attended California State Polytechnic University in Pomona, but he was poorly prepared for college and had difficulty negotiating academic requirements. He struggled with a heavy course load and dropped out after one year. Together with several high school friends, Moll joined the army in the summer of 1966. He served for 3 years. His army years included duty in Vietnam, where he was assigned to a medical evacuation unit. He spent 6 months in Vietnam and was released in June 1969 to attend college.

Back in California, he enrolled at the Rio Hondo Community College in Whittier. After a year, he returned to California Polytechnic and graduated with a bachelor's degree in social science in 1972. By then, he was more comfortable with formal education, and he enjoyed increasing academic success. After graduation, he entered the University of Southern California's (USC) masters in psychiatric social work program.

During his studies at USC, Moll worked with Latino families at an East Los Angeles mental health clinic. He enjoyed the work, and upon graduation from USC in 1974, applied to the doctoral program in educational psychology at the University of California at Los Angeles (UCLA). At UCLA, he worked with a professor conducting research on mother-teacher-child interactions with Latino students. This increased his interest in collecting and analyzing data.

While at UCLA, Moll was introduced to the cross-cultural work of Michael Cole and colleagues, in particular their focus on the relationship between culture and cognition. Moll was captivated by this work. This new interest took him to the Laboratory for Comparative Human Development (LCHC) at the Rockefeller University in New York City. There, he worked directly with Cole, director of the Laboratory, among others. At the lab, Moll encountered the work of Lev Vygotsky, a Russian psychologist whose writings from 1924 to 1934 continue to influence contemporary research on children's language and cognitive development. While at LCHC, Moll read a draft of *Mind in Society*, a translated compilation of some of Vygotsky's seminal writings on cultural-historical theory. Vygotsky believed that human thinking was culturally constructed, historical in origin, and social in content. Moll began to read everything he could find on language, culture, and thinking.

Moll completed his dissertation at Rockefeller and returned to UCLA to defend it in 1978. The same year, the laboratory moved from New York to the University of California at San Diego (UCSD), and Moll was invited to join the staff as a research psychologist and lecturer in communication and teacher education. He remained with the lab for several years.

Since 1986, Moll has been a member of the faculty of Language, Reading and Culture, University of Arizona, in Tucson. At the University of Arizona, Moll became one of a group of scholars (including James Greenberg, Carlos Vélez Ibañez, and Norma González, among others) who have theorized the "funds of knowledge" framework that has been highly influential in the way that teachers and researchers perceive Latino household and community knowledge. Combined with the Vygotskian cultural-historical perspective, the funds of knowledge concept provided Moll with a theoretical basis from which to engage research on Latino family households. Household knowledge and social networks for learning and teaching remain his principal focus.

In 2004, Moll became associate dean for academic affairs for the University of Arizona's College of Education. During his tenure at Arizona, he has been the recipient of many awards and honors, among them membership in the National Academy of Education (1989–present); the Sylvia Scribner Award, American Education Research Association (2005); Henry T. Trueba Lifetime Achievement Award, Journal of Latinos and Education (2005); Outstanding Researcher Award, College of Education, University of Arizona (1998); Outstanding Faculty, Office of Mexican American/Hispanic Student Affairs, University of Arizona (1998); the Green Honor's Chair, School of Education, Texas Christian University, April (1999); American Educational Research Association Distinguished Lecture (1999); and the Research Award, National Association for Multicultural Education (1999).

Moll is married to Ana Coralia Escalón. They have two sons, Carlos Ernesto and Eric Luis.

MONITOR MODEL

The monitor model, described in this entry, is a theory that explains second-language acquisition through five major hypotheses. The model covers multiple aspects of language acquisition, ranging from the way people acquire a second language to how a second language develops, depending on how it is acquired and the learner's disposition to the acquisition process. Originally, the model focused on adult language acquisition, but over time, it extended to children and adolescents as well. Stephen Krashen, a linguist, language teacher, and language researcher, developed the monitor model in the 1970s; his ideas can be traced to a series of articles and books written between 1978 and 1985. Early on, Krashen was interested in the differences between how adults formally learned a second language and how they acquired one informally. He was particularly keen on providing empirical support for the claims he made about the effectiveness of the natural approach, developed by Krashen and Tracy Terrell, to teach a second language, a method that reflects how people acquire a second language informally, when understanding and conveying meaning are paramount. This preliminary work lead Krashen to develop a set of hypotheses that attempt to explain the differences between formal and informal language learning and form an argument for the superiority of informal over formal language learning when the goal of instruction is to

enable learners to become conversationally proficient in the new language.

The Five Main Hypotheses of the Monitor Model

The five hypotheses that constitute the monitor model are as follows: (1) the acquisition-learning hypothesis, (2) the monitor hypothesis, (3) the natural order hypothesis, (4) the input hypothesis, and (5) the affective filter hypothesis.

Acquisition-Learning Hypothesis

The acquisition-learning hypothesis speaks to the two distinct and independent ways that learners have for developing proficiency in a second language. One way is through *acquisition*, which for all practical purposes, according to Krashen, is the same process that infants and young children use in acquiring their mother tongue through interaction with caregivers in natural settings, where communication is the goal. In this manner, acquisition happens subconsciously, with learners picking up the new language implicitly by listening to it being used meaningfully, in the here and now, without attention being paid to the form of language.

In contrast to acquisition stands *learning*, any situation where conscious attention is paid to how language is formed and used correctly. From this perspective, learning a second language involves consciously focusing on the formal rules of the language. People learn a second language by having a teacher (or someone who knows) explain the rules and correct any errors made during language production.

A corollary of this first hypothesis is that what people learn about a second language does not become acquired. In other words, learning does not result in acquisition. This corollary takes a non-interface position; namely, that what becomes learned is independent of what one acquires. This corollary casts doubt on the value of spending time on teaching about language by having students focus their attention on language forms.

The Monitor Hypothesis

The monitor hypothesis explains the role of learning in second-language acquisition. Simply put, what people learn about language from conscious attention

to rules and errors feedback can be used to make changes before or after they produce language. Learning enables learners to monitor the quality of their language production by making changes in the form of the language they have acquired. What happens when people learn rules through conscious attention and error feedback is that they mentally develop a type of personal editor that they can access if they have time, if they are focused on form, and if they know the rule that is needed to produce language correctly. Krashen argues that when people are intent on communicating, they are less likely to invoke the monitor. However, the extent to which people monitor their language production depends on how they developed the second language and their goals for using language.

Accordingly, some people over-use their monitor by constantly checking their language production against their conscious knowledge of rules. Because of an over-concern for correctness, these people tend to speak haltingly and take their time to produce correct sentences. Other people under-monitor their language output, even when they have time and know the rules. Under-users of the monitor are more concerned about communicating fluently than producing correct language. Consequently, under-users may be able to converse fluently on a number of topics, but will do so with language that is sprinkled with errors. Optimal monitor-users, according to Krashen, are people who edit their language production when it is appropriate, especially in occasions where they can plan what they need to say or write, but not necessarily for conversational exchanges, where fluency and meaning are more important. Monitor users of this type edit their output according to the social context in which they are using language.

The Natural Order Hypothesis

One of the things that a monitor enables learners to do is to use language correctly even though they have not yet acquired it. According to Krashen, language is acquired in a predictable order, with some rules coming early, and others coming late. In other words, language acquisition has a natural order, independent of any order that is taught to people in formal learning settings. The idea of a natural order of language acquisition is based on studies that examined the order in which English language learners acquired certain grammatical morphemes—noun and verb endings,

articles, auxiliaries, and prepositions, and copulas. These morpheme studies found that children and adults had essentially the same order of acquisition of the grammatical morphemes. Moreover, the order of acquisition was not significantly different even among English learners who speak different first languages (for example, Spanish and Japanese).

In addition to the morpheme studies, Krashen also claimed that there was a natural sequence for questions, negatives, inflections, and the auxiliary system. This is part of Krashen's general claim about language acquisition stages. This claim is that all learners go through stages of language development, ranging from preemergent speech, beginning, and intermediate to advanced proficiency. Within each sequence or level of proficiency, learners will acquire certain grammatical items naturally associated with that sequence, but will need to wait to acquire items that are in a later stage of acquisition. The only way they can use items belonging to a later stage is by consciously monitoring the language they produce to include items that are not yet acquired.

The Input Hypothesis

This hypothesis attempts to explain how people progress through the natural order of acquisition, from one stage to the next. This hypothesis has had the greatest impact on the teaching profession in United States. According to Krashen, people acquire a second language by understanding messages that are addressed to them orally or in written form. For the messages to promote language acquisition, however, they must be slightly beyond the level of the learner's proficiency. Language that is slightly beyond the learner's current proficiency is called *comprehensible input*. For Krashen and his followers, providing learners with continuous comprehensible input is what causes language acquisition. Because the comprehensible input contains the grammar that the learner needs at any point, there is no need to teach particular grammatical items. Learners will acquire the grammar subconsciously as they receive continuous language input that they understand.

If comprehensible input is what enables learners to gain proficiency in a second language, what role does output—speaking and writing—play in promoting acquisition? According to the input hypothesis, output has no direct impact on acquisition; its role is generative. When learners produce language they have

acquired—output—they will receive additional input from others who are likely to adjust their input to levels slightly beyond the learners proficiency levels. In this manner, output generates continuous amounts of comprehensible input, and thus promotes language acquisition. The ability to produce language, which emerges over time, is a function of the extent to which learners continuously receive comprehensible input. For Krashen, speaking (and writing) is a result of language that has been acquired, and neither speaking (nor writing) cause language acquisition.

How do teachers and others make their input to language learners comprehensible? The answer lies mainly in context. For beginning language learners, for example, input can be made comprehensible by focusing on the here and now, making sure that learners use their senses to understand language directed to them. By pointing to and using real objects, teachers can also adjust the language they use and rely on extralinguistic support. As learners become more proficient, teachers can use more sophisticated language, and rely less on realia (real objects), and adjust the extent to which they use extralinguistic support to enhance comprehension.

The Affective Filter Hypothesis

This hypothesis speaks to the role of a learner's affective state for receiving comprehensible input. If the learner has some kind of affective mental block that prevents the input from being processed, then even though the input is comprehensible, it cannot reach the language acquisition device. For example, the learner might be distracted, unmotivated, or overly anxious about failing. Krashen uses an image of a filter, similar to an air filter, to suggest that only when the filter is open can comprehensible input be processed by the language acquisition device and become acquired. If the filter is clogged up, the input will not reach the area in the learner's head responsible for language acquisition. Accordingly, although comprehensible input is a necessary condition for language acquisition, it is not sufficient. The learner must feel safe, confident, and positively inclined to receive comprehensible input.

The affective filter hypothesis explains why some learners may take longer to acquire a second language than others. If learners do not feel comfortable even in a rich language acquisition setting, they will not progress as quickly as will learners who have an open

affective filter and receive the same amounts of comprehensible input. This means that teachers need to pay attention to the affective conditions of their students to ensure they feel safe and are motivated and on task. According to Krashen, to the extent that learners feel safe and comfortable trying out new language, they will receive the comprehensible input they need to gain proficiency and move to higher levels.

Issues with the Monitor Model

Few language acquisition theories have generated more controversy than the monitor model. It is one of those ideas that people who are involved in language acquisition and language teaching either love or hate. Teachers working in K–12 school settings tend to love it; second-language acquisition researchers have little use for it. The monitor model resonates well with teachers of school-aged children who are learning content through a second language because these teachers appreciate the value of providing comprehensible language to learners. Teachers know that when students feel safe and comfortable, they are more likely to understand language and participate in learning activities, which according to the monitor model facilitates language acquisition.

Several of the approaches to teaching English learners in U.S. school settings incorporate hypotheses from the monitor model. For example, thousands of classroom teachers have been trained to use the *Sheltered Instruction Observation Protocol (SIOP)*, an observation system developed by Jana Echevarria, Mary Ellen Vogt, and Deborah Short, and the *Specially Designed Academic Instruction in English (SDAIE)*. Both of these approaches promote comprehensible input, low anxiety environment, error acceptance, and a focus on communication as guiding principles for promoting second-language acquisition in school contexts.

The monitor model has little support within the second-language acquisition research community mainly because it does not meet the requirements of acceptable research. Researcher Barry McLaughlin has declared the monitor model to be completely inadequate because it uses imprecise terms that are poorly defined, and the theory itself is not falsifiable. McLaughlin provides numerous examples of imprecise concepts, and he argues that comprehensible input, the sine qua non of second-language acquisition according to the monitor model, is indefensible because it is not defined in such a way that it can be empirically

measured. Other critics of the monitor model have charged that the model makes sweeping claims that are readily disputed in the research literature.

Although researchers largely reject the monitor model as a viable theory of second-language acquisition, it remains a theory of language acquisition that has endeared itself to thousands of second-language teachers and students of second-language acquisition worldwide, despite its theoretical and researchable limitations and inadequacies.

MULTICULTURAL EDUCATION

The definition of *multicultural education* has evolved since 1973, when James A. Banks wrote *Teaching Ethnic Studies: Concepts and Strategies*, and advocated the inclusion of ethnic studies in the curriculum of public schools. Multicultural education began as a specific part of the curriculum; that is, as African and African American studies geared to African American students about their historical roots and contributions,

which were often left out of the mainstream curriculum. Today, multicultural education has a broader definition, which is that *all* students learn in the mainstream curriculum about the cultures and contributions of the diverse ethnic, racial, and linguistic minority groups that make up America, and provides greater learning opportunities and more equitable opportunities to learn for everyone.

The opportunity for students to learn about America's diverse cultures and backgrounds and become cross-culturally literate—that is, able to interact with diverse others skillfully, meaningfully, and with respect—has become more important in an economically and politically interdependent world. For some, such as Noel Epstein, multicultural education is unacceptable because they see diversity eroding the unity of Anglo-American mainstream culture. As Joel Spring writes, the multicultural education movement runs parallel to the development of the civil rights movement. From voting rights being reserved only for White male landowners in the 1700s, to the Emancipation Proclamation of 1863 that ended slavery, to the struggle for women's suffrage in 1920, to the Civil Rights Act of 1964, when Black men and women won the right to vote, the definition of *representative democracy* has broadened. But not without struggle: Just as there was a power struggle over extending the definition of who could vote, there has been a power struggle over who should participate in defining the canon that shapes the curriculum, from elementary through high school and higher education. The overarching question is this: Whose cultures should be included in the curriculum as part of the bigger picture that is the national culture. This entry traces some of the dynamics connected with the emergence and diversification of the concept of multicultural education, a concept that, in some ways subsumes bilingual education.

History of Multicultural Education

Banks has written that multicultural education evolved through four phases. The first, in the 1970s was that of ethnic studies, when African American scholars such as Banks, Gwendolyn Baker, Geneva Gay, and Carl Grant sought to integrate information, concepts, and theories from ethnic studies into school curricula and teacher education programs. Multiethnic education followed ethnic studies as the second phase because educators realized that integrating ethnic studies content into

school and teacher education curricula was necessary but insufficient. Systemic changes and structural changes, in the whole school, such as de-tracking students, employing a diverse teaching faculty, and diverse parent involvement in shaping school policy, were needed to increase educational equity for all students, to develop more democratic attitudes, and to reduce prejudice and racism. Banks credits scholars of other ethnic groups as playing important roles in the evolution of multicultural education, including Carlos Cortes, who wrote about Mexican Americans; Sonia Nieto, a Puerto Rican who wrote case studies of students from multiple ethnic groups; Donald W. Sue, who wrote about Asian Americans; and Jack D. Forbes, an expert on Native Americans.

The third phase identified by Banks was the result of the struggles for equity by women and by people with disabilities who had also been left out of the curriculum. They too demanded that their voices, histories, and contributions be integrated into the curriculum of K–12 schools and higher education. The result was that the definition of diversity expanded from ethnic, racial, socioeconomic, and linguistic minority groups to include women and people with disabilities.

Banks identified the fourth phase as that of research and theoretical development that relate race, class, and gender. One example is research on effective teaching strategies for low-income students and students of color that explores the interactions of race, class, and gender. Banks noted that because people of color have joined the middle class, there is even greater diversity within racial and ethnic groups, and that research on any ethnic or racial group that does not consider socioeconomic class is incomplete.

Bilingual Education as Part of Multicultural Education

Multicultural education has been criticized for being divisive because students learn about their own cultures and develop both understanding and pride in their ethnic, linguistic, and racial group. Arthur Schlesinger Jr. represented those concerns that multicultural education would erode their identity as Americans and divide them into separate racial and ethnic groups. John F. Kennedy, on the other hand, had earlier expressed his views on diversity and immigration by writing, "Immigration reminds every American, old and new, that change is the essence of life, American society is a process, not a conclusion" (p. 68).

Nieto broadened the definition of multicultural education by the inclusion of bilingual education for language minority groups such as students whose native language is other than English. In her description of levels of multicultural education, she classified two-way bilingual programs for *all* students to learn a second language at the highest level. Nieto advocated for the right of immigrant students to learn in their native language while learning English as a second language. This idea echoed the 1974 Resolution of the American Anthropological Association Council on Anthropology and Education. The 1968 Bilingual Education Act provided federal funding to support bilingual education programs in school districts. Most of those bilingual programs were also bicultural; students learned about American culture and their family's cultural heritage. Textbooks began to include the contributions of various racial and ethnic groups to America. Bicultural education evolved into multicultural education. States such as California and New York developed multicultural social studies curriculum guides.

Affirming Diversity Takes Many Forms

As Banks has written, a major goal of multicultural education is to reform education and provide experiences of educational equality to students of diverse ethnic, racial, and socioeconomic classes, although a related goal is for male and female students to experience educational success and societal mobility. Nieto broadened the definition of diversity to include language minority groups, and subsumed bilingual education within multicultural education. For many, the goal of multicultural education is social justice. Exceptional students—that is, students who have disabilities—should also be included. The inclusion of students with different sexual orientations has also been accepted in some multicultural education curricula.

For Nieto, multicultural education is the path to social justice not only through integration of the students' cultures in the curriculum and bilingual education, but also through halting racism and all forms of discrimination, applying critical pedagogy, and questioning the effects of structural practices, such as tracking, standardized testing, neglected school environments, and limited involvement of parents and students in the shaping of educational policy. Her conceptualization of multicultural education includes listening and responding to the voices of parents and students in the formulation of local school policies

and practices. In her *Levels of Multicultural Education*, from monocultural education through tolerance, to acceptance, to respect, to affirmation, solidarity, and critique, she gives an operational definition of critical pedagogy. At the first level, teachers and students begin to question the status quo. At the second level, students and teachers begin a dialogue that includes their experiences. Next, critical dialogue is the core of their education; students and teachers learn from the different perspectives each brings to the classroom. At the highest level, teachers and students go beyond dialogue to learning skills of decision making and social action. Her conceptualization embodies Paulo Freire's pedagogical approach in combining reflection and action and empowering students to take part in community activities, if they are relevant to their concerns. Bank's highest level of multicultural education reform, which he terms the *Action Approach*, is congruent with Nieto's.

As Banks and Nieto have indicated, multicultural education now has many forms. In some contexts, it has broadened from curricular reform—such as the inclusion of the study of the histories and cultures of diverse ethnic, racial, linguistic, socioeconomic, and gender groups—to structural issues such as the inclusion, education, recruitment, and hiring of teachers and educational administrators of color who have bilingual skills. Another area of structural reform in multicultural education is teacher education, from the perspective that all children can learn if teachers employ a broader range of strategies and modes of teaching and learning that address multiple intelligences, humanistic and social justice goals, and native and second-language learners. Earlier writers such as Manuel Ramírez and Alfredo Castañeda tended to characterize an ethnic group as demonstrating one learning style such as the idea that Hispanics are field dependent and so flourish in cooperative learning groups. This simplistic thinking has now lost ground. Later researchers, such as Nieto have found as much diversity of learning styles within an ethnic group as between groups. This means teachers of diverse classrooms need to employ a broad array of methods of teaching and learning rather than looking for a single learning style that fits a given ethnic group.

Multicultural Curricular Reform

Curricular reform has meant the integration of examples from different cultures to illustrate key concepts and theories, principles, and generalizations across all

subject areas of the curriculum—not just social studies, language arts, and literature, but science and mathematics, music and visual arts as well. According to Banks, curricular reform can go farther to Level 3, which he calls the *Transformation Approach*. In this approach, students are able to understand issues, events, and concepts from the varied perspectives of different ethnic, cultural, and gender groups. In popular culture, two 2006 films by the same director, *Letters from Iwo Jima* in Japanese, and *Flags of Our Fathers* in English, illustrate the same significant battle in World War II, one from a Japanese perspective and the other from an American perspective.

Another aspect of curricular reform in multicultural education is the integration of constructivist learning and knowledge construction by students, so that they are aware that knowledge is humanly constructed and the ways in which they can participate in its construction. For example, they may learn to interview their neighbors, and to record, tabulate, and analyze their responses to find out how they feel and think about local issues. Older students may analyze whether any differences by gender, ethnic group, or socioeconomic class exist in the interpretations of a given topic. In a school where the emphasis is on learning rather than on testing, more time may be spent on projects, cooperative learning groups, critical thinking, knowledge construction, and the use of portfolio assessment.

Curricular reform can also mean confronting racism by sharing examples of incidents of discrimination, and how they were addressed, and by participating in interventions designed to promote respect for diverse groups. These are ways of working toward the multicultural education goal of social justice through prejudice reduction, elimination of discrimination, and affirmation of the contributions of diversity.

Reforming the Social Organization of Schooling

Changing the social organization of schooling through multicultural education includes establishing what Banks terms *Empowering School Cultures*; that is, practices that change the culture of the school, so that low-income students are not penalized for coming from homes in which their parents did not complete high school or go to college, or who might not be literate or speak English. Depending on the age of the students, this might involve free preschool education, so that preschoolers from low-income homes have the

opportunity to learn in public school what many middle-class children learn at home from parents with a more privileged education.

Dual-language bilingual programs are another form of empowering school culture in which everyone, including monolingual English speakers, learns a second language. In dual-language or two-way bilingual programs, students who are English language learners can take advantage of their native language by developing native language literacy, as well as literacy in English as a second language; thus, they become bilingual and biliterate. This way, English monolingual students and some parents understand the advantage of bilingualism and support these dual-language programs.

In some middle and high schools, changing the social organization of learning includes de-tracking, so that all students are challenged to take a rigorous academic course of study to prepare for college and are encouraged to take advanced placement courses that are heterogeneously mixed, instead of having students tracked by achievement level measured by standardized tests. When needed, support should be provided in the form of after-school homework help or reinforcement of the curriculum. In some high schools, this means mentoring by college students for students whose parents are unfamiliar with the culture of higher education. This may include activities such as traveling to a college campus, study skills development, or acceptable social interaction during a college interview.

Culturally Compatible Education

Another approach to multicultural education that involves the social organization of learning, as well as teacher expectations and behavior, has been implemented among culturally homogeneous populations, for example, indigenous Hawaiian and Navajo children. This approach termed, *culturally compatible* schooling, builds upon the cultural practices that students learn in their homes and communities by translating some of them into classroom practices. Ethnographic study of the home life among indigenous Hawaiian children in the Kamehameha Early Education Project (KEEP), conducted by Cathie Jordan, Roland G. Tharp and Lynn Baird-Vogt, found the children were given a great deal of responsibility for the completion of chores such as washing, drying, and folding clothes and keeping the house clean while their parents were working. Therefore, the children do these tasks unsupervised by adults. Older siblings are responsible for taking care of younger ones and modeling their tasks.

A specific way of storytelling among the indigenous Hawaiians is called “talk-story.” After learning this, the American KEEP teachers, who were not indigenous Hawaiians, changed their expectations and behavior and allowed the students to be more responsible for the distribution of materials in the classroom, and organizing their time working in small groups at learning centers without teacher supervision. The teacher modeled what the tasks were as an older sibling might and then withdrew to further model parental behavior. The teacher worked on language arts with a small group of students using “talk-story” storytelling and other practices. As a result of these changes, the students participated in classroom life more actively, and standardized test scores increased significantly.

Cross-Cultural Literacy

E. D. Hirsch made *cultural literacy* a household term among middle-class parents when he wrote and specified the knowledge that well-educated American students should be aware of about their national culture and history, to understand the context of such referents in their reading and, not incidentally, to score well on standardized tests such as the Scholarly Aptitude Test (SAT).

By contrast, cultural anthropologists Marietta Saravia-Shore and Steven F. Arvizu have advocated cross-cultural literacy; that is, the knowledge and understanding of one’s own and other cultures’ patterns of interaction, values, institutions, metaphors, and symbols as well as cross-cultural communication skills. Edward Hall’s early work in the 1950s and 1960s demonstrated the significance of nonverbal communication, cultural differences in proxemics (the perception and human use of space) and communication in high and low-context cultures. Hall compared Japan, a high-context culture, that is, one with a homogeneous ethnic population with a long, shared history, to a low-context culture such as the United States made up of our many ethnic populations with diverse histories and heritages, some with relatively short histories here. His research suggests that verbal communication by teachers needs to be more explicit in low-context cultures if they are to be understood by a diverse classroom. Hall’s work continues to influence the field of intercultural communication. Clifford Geertz wrote on the interpretation of cultures in the 1970s. George Lakoff and

Mark Johnson identified the extensive use of verbal metaphors in everyday conversations in the 1980s and Saravia-Shore and Arvizu explored cross-cultural literacy in their collection of classroom ethnographies in the 1990s.

The educational anthropologists mentioned previously have contributed to multicultural education the notion that culture is deeper than holidays, heroes, and heroines. Anthropology is an academic discipline and mode of inquiry for the study of peoples and cultures that includes a comparative perspective and a holistic orientation. An event or behavior makes sense when it can be understood in its larger cultural context. Cultural anthropologists engage in an ethnographic approach to understanding cultures, that is, an extended period of living with and learning the language, in-depth interviewing and observing people within a culture through a cross-cultural lens. As members of cultures previously studied from the outside became anthropologists themselves, ethnographies were further enriched. One example is the work of anthropologist John Ogbu, who was born and raised in Africa. He brought his perspective to the study of youth and the relationships between teachers and low- and middle-income families in a California city.

In 1978, the Council on Anthropology and Education of the American Anthropological Association developed and passed a resolution for action on culture, which stated that culture affects the dynamics of the teaching-learning process, instructional activities, and curriculum: the organization of learning and pedagogical practice, and evaluative procedures and rules of schools. Although noting that culture was more than the heritage of a people in dance, food, and holidays, the resolution stated that culture is a dynamic, evolving, creative, and continuous process that includes language, behaviors, values, and substance, which are shared by people and that guide them in their struggle for survival. In earlier decades when the goal of immigrant education was solely assimilation into the dominant culture, students lost the language of their families. With the more humane goal of acculturation, to be able to participate meaningfully in a new culture but maintain what is deemed valuable in their family’s culture, students can have the advantage of flexibility, learning to cope with change, cross-cultural competencies, and a broader family support network. With bilingual and multicultural education, students can maintain their relationships with grandparents and extended family members who may not speak English.

Cross-cultural literacy means that educators start with themselves and become aware of their own cultural expectations, perspective, and interaction patterns. Hall suggested that the best way to learn about another culture is to embrace the culture, maintain friendships within it, learn their language, and by continually being aware of one's feelings towards that culture. In a way, ethnography is a model of constructivist learning. The ethnographer is their instrument and after taking in information through experiencing, observing, and interviewing, the ethnographer then compares it to prior knowledge. In their resolutions on culture, anthropologists stressed respecting the cultural and linguistic differences of the students and families they serve, and ensuring that members of the community participate in the decisions that affect the education of their children. The goal of the resolution was equity of educational opportunity for all students.

MULTICULTURAL EDUCATION, TRAINING, AND ADVOCACY (META)

Multicultural Education, Training, and Advocacy (META), Inc., was formed as an independent national public interest legal entity in 1983 by two lawyer/advocates, Roger Rice and Camilo Pérez Bustillo. Joined several years later by another former Center for Law and Education colleague, Peter Roos, META's sole focus from its inception has been the educational civil rights of all language minority and

immigrant students. In practice, this meant advocating for bilingual education when and where that was possible and for setting benchmark standards for programs for English language learners (ELLs), regardless of program models. Through its history, META and its attorneys have been involved directly or as advisors in nearly every case across the country brought to advance these purposes. This entry discusses META's advocacy of bilingual education.

As early as 1973, Rice had written briefs in support of the *Lau v. Nichols* plaintiffs in which the evidence for bilingual education was advanced in the U.S. Court of Appeals and the Supreme Court. Included in those briefs, along with legal and educational research citations, was a footnote written only in Chinese as a means of driving home to the Supreme Court justices the frustration of Chinese students who were receiving no classroom help at the time.

Following the *Lau* decision, META began a strategy of filing cases on a statewide basis in states with large language minority student populations such as Texas (*United States v. Texas*), Florida (*LULAC v. Florida*), California (*El Comité de Padres v. Honig*) and Massachusetts (*Lynn Hispanic PAC v. Commissioner of Education*). These cases led to the passage of new state laws (as in Florida) or court decisions and consent decrees that spelled out program standards in such areas as identification of students for services, teacher qualifications and training, program content, state obligations to monitor and evaluate programs, and program implementation. Similar court cases or administrative complaints were brought to defend and improve existing bilingual programs in cities with large non-English-speaking populations including Albuquerque (*Carbajal v. Albuquerque Public Schools*) and Denver (*Keyes v. School District No. 1*) among many others. In Albuquerque, META and cocounsel also successfully faced a challenge to the New Mexico Multicultural Education Act, legislation that had its roots in the history of New Mexico as a state where the Spanish language is valued and encouraged. Overall, as legal standards have shifted, much of META's work turned to whether school districts were actually implementing their ELL programs with adequate programmatic resources.

META's advocacy on behalf of ELLs also embraced efforts to ensure adequate and equitable fiscal support for educational programs. META, along with Mexican American Legal Defense and Educational Fund (MALDEF), successfully litigated a statewide

school finance equity case in Texas (*Edgewood v. Kirby*) on behalf of poor school districts with large language minority student populations. META also took the lead in pressing for equitable fiscal resources for poor schoolchildren in lower-income neighborhoods in Los Angeles (*Rodríguez v. LAUSD*). In these, and similar efforts in other states, META has worked in collaboration with other legal organizations such as MALDEF and Puerto Rican Legal Defense and Educational Fund (PRLDEF) and also with leading educational research and advocacy organizations including Intercultural Development Research Association (IDRA) in San Antonio, National Association for Bilingual Education (NABE), the National Council of La Raza, and others. META also initiated the convening of an Educational Equity Working Group in Washington, D.C., a coalition of Latino and bilingual education groups.

Even before the No Child Left Behind legislation era, another area of securing resources for ELLs focused on access to federal programs such as Title I funded schoolwide programs, Reading First, and School-to-Work. META suits in Massachusetts (*Latino Parents v. Boston School Committee*) and elsewhere established that Title I funds must be equitably allocated for programs that addressed the needs of ELLs, although a META case brought in California made clear that schools implementing bilingual programs could not be denied access to federal Reading First funding (*Pazmiño v. California Board of Education*).

It is impossible to calculate with precision the total additional resources META's advocates have helped direct to the education of ELLs through litigation activities, but the amount is likely to have reached in excess of several billions of dollars. Other important advances as the result of META's litigation included the development and implementation of a special program for immigrant students who came to the United States with gaps in their formal education, and various activities aimed at reducing the drop-out rates among Latinos and ELLs.

As more and more states moved toward the implementation of high-stakes testing for high school graduation, grade promotion, and entry into the teaching profession, META also focused through both litigation and research on the impact and validity of such tests on ELLs.

META has also spent considerable effort in defending the rights of undocumented students to attend

public schools. META's codirector, Peter Roos, argued the landmark *Plyler v. Doe* case in the U.S. Supreme Court before joining the organization, and thereafter META served as a national resource for the parents of undocumented students, helping intervene with local and state school officials to overcome barriers to their school enrollment. Following passage of California's Proposition 187, META worked in both state and federal courts to ensure that the *Plyler* rights of undocumented students were not restricted. META has also argued in court on behalf of undocumented high school graduates who sought in-state tuition status in the state of their residence, California (*Leticia A. v. Board of Regents*) and Kansas (*Day v. Sebelius*).

Although META is best known for its litigation efforts, its advocates also employed research, policy analysis, public advocacy, and community training to advance the civil and educational rights of ELLs. Parallel to its resource litigation, for example, META has researched and published findings on how federal grant programs failed to address the needs of ELLs, written policy briefs, and reviewed the state of the art in school finance cost studies to determine the extent to which those studies pointed to the need for specific resources for ELL programs.

Throughout its history, META has also devoted considerable attention to community education and coalition building. In Florida, META brought a diverse spectrum of community organizations together as the Florida Multicultural Network for Educational Rights in support of expanded statewide efforts for ELLs. Other statewide and more localized parent training activities were routinely conducted in California, Colorado, Massachusetts, Nevada, New York, North Carolina, Ohio, South Carolina, and Washington State. As part of its community education work, META published parent training handbooks and manuals in multiple languages on such topics as immigrant parents rights, school retention and promotion, and education equity.

META also played a public role in the debates in California and Massachusetts surrounding the efforts of antibilingual education forces to support English-only ballot initiatives. In Massachusetts, for example, META's Jane López helped local Latino parents document that 93% of Latino voters opposed that state's "Unz" ballot question. López also worked with parents of students in dual-language programs to gain an exemption from the antibilingual law for dual-language or two-way programs. In California, META's

attorneys and parent advocates have also devoted considerable efforts to mitigating the affect of that state's Proposition 227 law.

META's work has led to invitations to present at international human and civil rights events. In 1999, Roos presented a case study on Proposition 227 at a public hearing on the People's Communication Charter at The Hague, the purpose of which was to highlight issues of language minority students in Europe and globally. López presented at the *Primera Feria Hemisférica de la Educación Indígena* in Guatemala in 2001. In 2000, META signed a collaborative agreement with the Universidad Andina Simon Bolívar in Quito, Ecuador.

META held its founding board of directors meeting at the Latino Institute in Chicago in 1985. Founding board members, and their identifications at the time, were Mario Aranda (director of the Latino Institute, Chicago), Blandina Cárdenas Ramírez (member of the U.S. Civil Rights Commission, San Antonio), Courtney Cazden (professor, Harvard University Graduate School of Education, Cambridge), Henry Der (director, Chinese for Affirmative Action, San Francisco), Frank Espada (director, National Puerto Rican Diaspora Project, San Francisco), Ricardo Fernández (director, Midwest National Origin Desegregation Assistance Center, Milwaukee), Arthur Flemming (former secretary of the U.S. Department of Health, Education and Welfare, Washington, D.C.), Reverend Gérard Jean-Juste (director, Haitian Refugee Center, Miami), Juan Marichal (professor, Harvard University, Cambridge), Awilda Orta (assistant superintendent, District No. 12, New York), María Santiago-Mercardo (chairperson, ASPIRA, New York), and Alfredo De Los Santos (vice-chancellor, Maricopa County Community College District, Phoenix).

META's staff attorneys in addition to Rice, Pérez-Bustillo, Roos, and López have included Javier Colón, Miguel Pérez-Vargas, Deborah Escobedo, Irma Herrera, Mary Hernández, and statewide Florida parent advocate Sally Herrera.

META and its attorneys have received numerous awards from both educational, community and legal groups, including the NABE President's Award in 1998.

N

NATIONAL ASSOCIATION FOR BILINGUAL EDUCATION

The National Association for Bilingual Education (NABE), described in this entry, is a professional association of practitioners, researchers, and administrators involved in bilingual education. “Nah-Bay,” as it is popularly called, was incorporated as a nonprofit organization in April 1976 and is devoted to representing both the interests of language minority students and the bilingual education professionals who serve them.

Following is a list of NABE’s educational purposes:

1. Serving as an advocate for language-minority children and families
2. Recognizing, promoting, and publicizing programs of excellence
3. Promoting efforts to ensure equal educational opportunity
4. Encouraging research and publications
5. Promoting the provision of linguistically and culturally appropriate education services to children, youth, and adults
6. Promoting public understanding and appreciation of the linguistic and cultural needs of language-minority children, youth, and adults
7. Promoting development of standards of professional excellence
8. Conducting educational workshops and conferences

9. Promoting the inclusion of language-minority students in assessment systems that, to the extent practicable, assess students in a language and form most likely to yield accurate and reliable information

NABE has sought to achieve its goals throughout its 30-year history by strengthening the educational rights of English language learners (ELLs) and sharing information with policymakers who shape those rights, primarily through bilingual education. Following is a summary, organized chronologically, of selected aspects of the history and activity of the organization.

1965–1975

Before the birth of NABE, President Lyndon B. Johnson signed the Elementary and Secondary Education Act (ESEA) into law. Two years later, Senator Ralph Yarborough proposed the first federal Bilingual Education Act. That legislation was adopted as an amendment to the ESEA in 1968. The law, known alternatively as the Bilingual Education Act, or “Title VII,” was signed into law by President Johnson in 1968.

Four years later, the first National Bilingual/Bicultural Education Conference was held in Austin, Texas. Most of the attendees came from a handful of school districts nationwide. A second and much larger conference took place in San Diego, California. By this time, it was clear that the creation of a professional organization seemed necessary to bring together the nation’s leaders in the field and seeking avenues for that expertise to be heard by policymakers. At the

San Diego conference, other language groups—other than Hispanics—as well as international representatives were present, and steps were taken to form what became NABE. At the Third Annual International Bilingual/Bicultural Education Conference held in New York City, bylaws of a national bilingual education organization were adopted, and a slate of candidates for the executive board of directors was prepared. The constitution and bylaws of the new organization were approved, and members of the Association's executive board of directors were elected. The initial slate of officers was the following: Albar Peña, president; Hernán LaFontaine, president-elect; Toni Metcalf, vice president; Juan de Dios Solís, secretary; and Pepe Barron, treasurer.

The next conference of the fledgling organization was held in Chicago with María Medina Seidner as the local chairperson. The precedent was established that the work of organizing the annual conferences would be carried out by a committee of members from the city in which the conference was to be held. Nancy Zelasko, then at the Washington, D.C., Public Schools, took on the job of documenting the steps and procedures that were recommended by the preceding conference organizers and subsequently passed on to the next group of conference organizers.

1976–1980

In 1976, the *Bilingual Research Journal*, then known as the *NABE Journal*, was founded in keeping with the information dissemination function of the organization. Alma Flor Ada, then of the University of San Francisco, was the editor of the first volume, published in 1977. For the second volume, published in 1978, three coeditors were named: Josué M. González, then of Southern Methodist University; William Milán, then of Arawak Consulting Corporation; and José A. Vázquez, of Hunter College. Miguel Romo (director of El Congreso/National Congress of Hispanic American Citizens) became the organization's legislative analyst to assist the organization in keeping the membership abreast of congressional actions pertaining to bilingual education. With better communication channels, NABE was able to better educate congressmen and senators. Title VII increased its funding from \$135 million to \$200 million partly because of the work of Juan de Dios Solis, NABE's president-elect.

In the following years, NABE focused on organizational improvements. The first issue of the newsletter,

NABE News, was published in 1978. It was well received by the membership as evidenced by the involvement of members and a wide array of article submissions. Special interest groups (SIGs) were formed within the organization as a way to help increase membership.

As NABE moved to its first offices in the National Education Association (NEA) building in Washington, D.C., Carolyn Ebel was appointed as the first executive director along with its first full-time employee, Carolyn Riddick. NABE moved to its next challenge: to improve the network of state affiliates. The first Affiliate President's Summit was held led by Pepe Barron, Mary Destefani, Marcelo Fernandez, Carmen Perez, and Nancy Zelasko. In addition to the affiliate presidents, federal education officials, White House representatives, and congressional aides also joined this 3-day meeting.

1981–1985

Soon after President Ronald Reagan's election, the repeal of the proposed *Lau* regulations by the U.S. Secretary of Education, Terrel Bell, sent shock waves through the bilingual education community. The NABE board of directors requested a meeting with Secretary Bell to discuss his continued support of bilingual education for ELLs. Senator Edward M. Kennedy also expressed his support for bilingual education programs at the NABE conference in Boston, Massachusetts, in 1981.

With pressing issues and threats to bilingual education increasing, NABE felt a need to have a legislative counsel on Capitol Hill. James Lyons, a civil rights attorney and former staff member of the Office for Civil Rights, was appointed to represent NABE. Lyons provided outstanding leadership later becoming executive director of the organization.

NABE's Nationwide Writing Contest for Bilingual Students, on topics related to the meaning of being bilingual featuring elementary and secondary student essays, was made a permanent part of the annual conference in 1982 in response to its huge popularity with the membership.

In 1983, the annual conference was held in Washington, D.C., and featured presidential candidates and Mrs. Barbara Bush as special guests. During the same year, Gloria Zamora, NABE board president, presented testimony to Congress requesting that the Bilingual Education Act once again be reauthorized.

NABE led the effort to reauthorize Title VII in 1984, along with partner organizations the National Education Association (NEA), the National School Board Association, the National Council of La Raza, the Mexican American Legal Defense and Education Fund, and the League of United Latin American Citizens. James Lyons, NABE's legislative counsel, also presented testimony reinforcing the need for the reauthorization.

1986–1990

Joe Beard became NABE's first national office director in 1986. Beard's first task was to lead NABE and other related organizations to work together to stop the proposed cuts in funding for federal bilingual education programs.

NABE devoted a great deal of time and energy to educating federal policymakers on the needs of ELLs and to ensure that adequate services remained a viable option for the parents and teachers of children who are learning English. Also that year, NABE prepared a legislative agenda for the 108th Congress. Its legislative agenda included taking a leadership role in ensuring that the concerns and unique linguistic needs of ELLs were addressed as the U.S. Congress, shaping the education budget and a variety of education programs were being reauthorized.

1991–2007

The No Child Left Behind Act (NCLB) was passed in 2001. NCLB reauthorized a number of federal programs aiming at improving the performance of U.S. primary and secondary schools by increasing the standards of accountability for states, school districts, and schools and by providing parents more flexibility in choosing which schools their children will attend. Additionally, NCLB promoted an increased focus on reading and reauthorized the ESEA Although NCLB was said to reauthorize Title VII, ESEA, in effect, many of the specific programs previously available under that law were eliminated. Most of the programs for ELLs would now be granted to the states, rather than to school districts.

The latest legislation supported by NABE is the Development, Relief, and Education for Alien Minors (DREAM) Act. The bill's preamble states that the purpose of the legislation is to allow immigrant children achieve their dream of obtaining a college education.

If passed, it would allow undocumented immigrant students who were brought here as children, grew up in the United States, have good moral character, and have graduated from high school to become legal residents, go to college, and work in the United States legally. In 2003, the bill was voted out of the Senate Judiciary Committee, but not before the bill was weakened substantially. As this encyclopedia goes to press, NABE has joined a growing coalition of organizations that continue to work to strengthen the bill and securing support for its passage.

In 2004, the U.S. Department of Education announced new policies regarding the testing of English language learners and calculating how schools serve them. That same year, Delia Pompa, who had succeeded James Lyons as NABE's executive director, left the organization and was replaced by James Crawford in that role.

In 2005, NABE's conference in San Antonio, Texas, turned out an impressive attendance of more than 7,000 persons. Irene Bueno, a veteran staffer on Capitol Hill and in the Executive Branch during President Bill Clinton's administration, signed on as NABE's legislative representative. As cofounder and principal of the Nueva Vista Group, a government relations firm in Washington, D.C., Bueno has been an advocate in the areas of civil rights, immigration, and minority education. In 2006, Crawford left NABE as the executive director.

The *Bilingual Research Journal* continues to be the premiere journal in the country devoted to bilingualism, bilingual education, and language policy in the schools. Under the 8-year editorship of Josué M González and Alfredo Benavides, this publication excelled. They were succeeded as coeditors by Kathy Escamilla, University of Colorado, and Maria Franquiz, University of Texas, San Antonio, in 2006.

In 2007, a Memorandum of Understanding was approved and signed by the National Museum of the American Indian in Washington, D.C., NABE. Another official partnership is pending approval with the National Indian Education Association under the leadership of Willard Sakiestewa Gilbert (Hopi). This strong bond between Native American organizations and NABE is the first official partnership that supports each organization's mutual goals of promoting heritage language and cultures as well as bilingualism and biliteracy for all. Strong alliances with the NEA, the National Council of La Raza, the Mexican American Legal Defense and Educational Fund, the

National Association of Education of Young Children, the Congressional Hispanic Caucus, the International Reading Association, the National Council of Teachers of English, the Teachers of English to Speakers of Other Languages, and other national organizations continue, as do coalitions in countering the adversarial aspects of NCLB.

NATIONAL CLEARINGHOUSE FOR BILINGUAL EDUCATION

For more than 30 years, educators across the United States seeking information related to the education of English language learners (ELLs) and bilingual education looked to the National Clearinghouse for Bilingual Education (NCBE) for information and other resources. This entry provides a thumbnail history of NCBE and its eventual transition into the National Clearinghouse for English Language Acquisition (NCELA) during President George W. Bush's administration.

Although the Elementary and Secondary Education Act (ESEA) of 1968 provided the national impetus for bilingual education in the United States, not until

1974, under Section 742(c)(3) of Public Law 93–380, the reauthorization of Title VII, did Congress give the authorization to “establish and operate a national clearinghouse of information for bilingual education, which shall collect, analyze, and disseminate information about bilingual education . . . and related programs” (Pub. L. No. 93–380).

Two more years passed before an agreement was signed by the National Institute of Education (NIE) and the Office of Bilingual Education (OBE) in the Department of Health, Education and Welfare (DHEW) assigning responsibility to NIE for the implementation of this clearinghouse, NCBE. That same year, a series of six national assessment conferences were held across the country in San Diego, California; Seattle, Washington; Chicago, Illinois; New York, New York; San Antonio, Texas; and Miami, Florida. These meetings allowed federal planners to share information about the clearinghouse concept with potential users, primarily education practitioners working with ELLs in the nation's schools. The gatherings provided an opportunity for attendees, who were representing states with the largest numbers of limited- or non-English-speaking students in their schools and the most likely clients of the clearinghouse, to present their information needs.

The suggestions and recommendations made in 1976 for the proposed clearinghouse included establishing a national advisory board, a mission statement with wide distribution, and a national scope, supportive of all bilingual efforts in the nation; such scope was not expected to duplicate or bypass existing bilingual projects. Regarding information gathering and dissemination, the clearinghouse was expected to aggressively seek national and international information without screening out any information that differed from official policy. All information was collected, categorized, and prepared for quick retrieval. Regarding the clearinghouse's audience, recommendations addressed directly reaching individuals, professionals, parents, teachers, protagonists and antagonists, and industrial and commercial users of bilingual education. It was also suggested that the clearinghouse provide services free of charge, particularly in the first years, later incorporating sliding fee scales; these services would include having a public relations function, publishing a periodic newsletter, possibly a professional journal, and other specialized reports.

The topics considered for the clearinghouse to address included the following: curriculum materials;

tests and their evaluations; data collected on research projects, surveys, and census; information on sources in bilingual education; training materials for bilingual education; federal legislation and guidelines; funding sources for research and training; effective classroom practices and unpublished ideas; human resource files; court cases and decisions; parental and community involvement; bilingual education for handicapped, special, and gifted education; international data; research reports; and demographic data and studies. A last suggestion addressed the involvement of professional, multilingual, and multiethnic personnel from the field.

On the basis of data from the six national meetings, the funding sources decided what should be included in the NCBE scope of work. With slight modifications, most of the requests about what NCBE should be were included in the request for proposals (RFP). In 1977, an RFP was issued by NIE, and on October 1, 1977, a 3-year, 3-million-dollar contract was awarded to InterAmerica Research Associates (a consulting firm located in the Washington, D.C., area) to operate the National Clearinghouse for Bilingual Education. Included in the contract was a subcontract to the Center for Applied Linguistics (CAL). From October 1977 through March 1983, NCBE was located in Rosslyn, Virginia, and administered by InterAmerica Research Associates.

Although the creation of NCBE was well received by the bilingual education community, clarification was sought by one of the funding agencies regarding the nature of the relationship between the new organization, the clearinghouse, and the existing network of centers funded by OBE to provide similar services. These concerns were addressed and potential problems avoided. Within the Title VII Network, the NCBE's role was to provide information and referral services to the network components—basically to serve as a national conduit of information to support regional and local activities. Given its central position within the network, NCBE was primarily responsible for responding to the information needs that the Title VII centers found difficult to address given their regional focus.

As with any newly funded project, the first few months were challenging, as new staff were hired and trained to fulfill the requirements set forth in the scope of work statement. As timelines were established for meeting deliverable deadlines, NCBE staff became familiar with their respective assignments

and responsibilities; contacted school districts, publishers, and Title VII funded centers; prepared literature for dissemination; arranged and prepared for the first NCBE Advisory Panel meeting; published its newsletter; and collected information, documents, and materials to assist the staff in responding to incoming requests for information via the 800 number and preparing responses for distribution.

The NCBE advisory panel represented the various language communities enrolled in bilingual education classrooms across the nation. The panel was to meet twice each year. Advisory panel meeting agendas usually included an update on NCBE activities and the status of contract requirements, deliverables, and new materials, documents, or information deemed of interest to the panel. Guest speakers were often invited to share new information with the panelists and NCBE staff.

During the first 3 years of the contract, new technology for database development was added, as NCBE began building a collection of resources that would be used to respond to client requests, and the NCBE Newsletter *FORUM* was mailed to subscribers on a monthly basis. A major NCBE highlight was the 1979 launch of the NCBE database. The unveiling was done at the NABE conference in Seattle, Washington. The database was shared initially with the NCBE advisory panel members and showcased at the NCBE exhibit booth, along with other information products of interest to conference attendees.

In 1980, the NCBE contract was re-competed and a 3-year contract was awarded to the incumbent (InterAmerica Research Associates). Several changes occurred during this contract period. A new memorandum of understanding was written between NIE and OBE, giving the latter primary responsibility for NCBE. The OBE became the Office of Bilingual Education and Minority Languages Affairs (OBEMLA), a subcabinet-level unit. Changes within the NCBE structure included further expansion of staff, totaling approximately 40 employees assigned to divisions reflecting contractual responsibilities and activities related to an expanding level of work and increased reliance on new technologies. The reorganization within NCBE allowed for better information collection and further expansion of services, staff, and activities. A small visiting scholar program was instituted.

NCBE field offices were also established in New Mexico (Native American) and in California (Asian) during this time. Needs-assessment meetings were

conducted by NCBE staff in Guam for representatives of the then-Trust Territories and in Montana with representatives from various Native American communities.

At the end of 1985, the U.S. Department of Education decided to extend the NCBE contract for a period of 6 months instead of issuing an RFP to re-compete it. At the end of the extension, NCBE was asked to initiate the transfer of the clearinghouse to a new contractor as outlined in the NCBE contract. Following the contractual requirements related to a transfer of operations, all NCBE database files and documents housed in the NCBE library and resource collection were packed, along with equipment purchased under the existing contract, in preparation for the transfer to the interim contractor, Treviño Associates. Meetings were held with the interim contractor to respond to questions related to NCBE operations before all the materials were removed from the premises. Although efforts were made by the interim subcontractor to provide adequate services, end users generally expressed dissatisfaction with those services during the interim period. Following a Department of Education and an OBEMLA review of the NCBE contract that had terminated, a new RFP was drafted and issued in 1986. The contractor selected to run NCBE for a 3-year period was COMSIS, Corp. a consulting firm located in Silver Spring, Maryland. During the 3 years the contract was held by COMSIS, efforts were made by NCBE to meet the informational needs of the field; exhibiting at local, state, and national conferences; producing publications; and creating a newsletter.

After 3 years (1989), NCBE was again re-competed, and the contract was awarded to the George Washington University located in Washington, D.C. The contract included a subcontract with CAL to assist NCBE with editing and preparing contractually required publications. The newly funded NCBE was housed at CAL, located a few blocks from the George Washington University campus, and the ERIC Clearinghouse on Languages and Linguistics, also located at CAL. The newly contracted NCBE was soon back in operation. Start up for the new NCBE was relatively easy, given the experience and knowledge brought with them by the new directors: Joel Gómez, who had been the first NCBE director in 1977, and deputy director Minerva Gorena.

During the next few years, with the growing use of the Internet, changes in technology and information delivery led to the launch in 1990 of the NCBE Web

site as part of the Improving America's Schools Act (IASA). During the next several years, the NCBE contract was again extended to include option years picked up by OBEMLA. In total, NCBE was funded under five different presidents and their respective administrations—Ford, Carter, Reagan, Bush, and Clinton—before its name was changed to National Clearinghouse for English Language Acquisition and Language Instruction Educational Programs (NCELA), with the passage of the No Child Left Behind Act, and the end of Title VII, ESEA in 2001. Nancy Zelasko, then the director of NCBE, oversaw the transition of the organization into its new form and new functions.

NATIONAL DEFENSE EDUCATION ACT OF 1958

The launching of the first earth satellite, *Sputnik*, on October 4, 1957, by the Soviet Union raised concerns in the United States that the nation was lagging behind the Soviets in languages, science, and mathematics. The event was viewed as a security crisis for the United States during one of the most intense periods of political tension in the cold war between the two rival nations. To deal with the crisis, Congress passed and President Dwight D. Eisenhower signed the National Defense Education Act (NDEA) in September 1958. The act authorized use of federal funds to support education in all levels, public and private. Although the

new law appeared to have no direct relevance to bilingual education, the professional development programs it supported proved to be extremely important to the development of the concept of bilingual education in the 1960s and 1970s, and of the professional personnel who were to lead these programs in future years. In approving the new law, President Eisenhower commented that considerations of national security were imposing an array of growing needs on the U.S. education system, thus, the system needed to be strengthened. This entry describes the impact of the NDEA on bilingual education.

NDEA was the first national attempt to improve the teaching of science, mathematics, and modern languages, the areas in which Soviet education was seen as superior. NDEA also supported English as a Second Language (ESL) programs, technical and geography education, and school libraries and educational media centers. To stimulate higher college attendance, NDEA made possible low-interest loan incentives to students in postsecondary institutions. Many students from language minority communities used these loans.

Through intensive NDEA-funded summer language institutes, the legislation helped to reinvigorate national interest in languages other than English. Support for foreign-language programs had faded during the first half of the 20th century. The renewed interest in foreign languages and foreign-language teaching enabled groups such as the American Council for the Teaching of Foreign Languages (ACTFL) and Teachers of English to Speakers of Other Languages (TESOL) to assert their influence in education circles. One ACTFL affiliate, the Southwest Council of Foreign Language Teachers (now the Southwest Conference on Language Teaching) was responsible for leading the drive in support of bilingual education in the mid-1960s. The Southwest Council of Teachers of foreign languages—while arguing for increased Spanish instruction for Spanish-speaking students in the 1966 Tucson Symposium titled “The Spanish-Speaking Child in the Schools of the Southwest”—also built a persuasive case for bilingual education. As originally proposed, the program would target those children of Mexican heritage who had suffered language discrimination in the schools because of their language “handicap.” NDEA made it possible for language specialists to join forces with language minority groups and civil rights advocates in lobbying Congress to enact Title VII of the Elementary and Secondary

Education Act (ESEA). The strategy was simple: to have Title VII do for bilingual education what NDEA had done for modern language teaching. Many of the administrators and teachers who worked in the newly funded Title VII programs had been trained in the NDEA summer institutes or had completed graduate degrees with student loans funded by the NDEA law. This vanguard of bilingual educators was, for the most part, of minority origin and a product of the English-only public education system. Many of them were eager to change the school systems they had experienced in their own school careers.

Methods and materials used in foreign- (mainly Spanish) language programs stimulated by NDEA helped shape the first generation programs of bilingual teacher training at a time when trained teachers were few in number. Although first developed for the foreign-language programs in the elementary schools, these materials found extensive use in the bilingual programs operating during the early years of Title VII-funded programs.

To support the special programs in elementary and secondary schools funded by Title I programs of the ESEA, the NDEA funded a number of summer institutes in several universities to heighten awareness among K–12 educators of the learning needs of second-language learners and children from “disadvantaged” backgrounds. Faculty in schools of education realized that teacher education approaches that failed to recognize the social reality of a growing number of linguistically and culturally diverse students were inadequate for training future teachers. Prompted by the reform initiatives suggested by NDEA and subsequent federal programs to improve teacher quality, a new breed of faculty member emerged to help the colleges of education infuse the teacher preparatory curriculum with multicultural perspectives. These programs called for a new focus on the characteristics of culturally atypical learners and techniques for enhancing their access to quality schooling. Regional, state, and national entities in charge of accreditation eventually joined in with revised standards that improved the level of teacher education programs for future teachers nationwide.

By the mid-1960s, the country began a transition from the NDEA legislation and programs to the more comprehensive ESEA. The lessons learned from the NDEA experience helped program developers devise new strategies to intervene in what heretofore had been the exclusive domain of the states and local

school boards. Advocates for change who had started out in NEA-funded projects were among the first who helped shape educational initiatives, including bilingual education, in the 1970s after Title VII funding became available.

NATIONAL EDUCATION ASSOCIATION TUCSON SYMPOSIUM

In the United States, the centerpiece of bilingual-education legislation in the modern era was Title VII of the Elementary and Secondary Education Act of 1965 (ESEA). ESEA was the first and most important delivery vehicle for federal aid to public schools in the history of the nation. It was noteworthy first because it served as the federal government's primary funding mechanism for schools for more than 30 years but, equally important, because it was the primary device for creating a federal role in education, which until then had been a state and local function. The bilingual aspect of the legislation, often referred to as Title VII, ESEA, or the Bilingual Education Act (sometimes BEA) in the literature, was an amendment to the original ESEA legislation. Although the actual enactment of the bilingual aspect of the legislation did not occur until 1968, bilingual education advocates had taken

important steps before and after that time to shape and reshape its provisions. This entry reviews three seminal events in that chain of advocacy.

Two of those events, which helped build the necessary momentum for the creation of Title VII, were regional meetings held in Tucson, Arizona, one in 1965, and the other in 1966. The first of these conferences was held to announce the report of a survey called *Tucson Survey on the Teaching of Spanish to the Spanish-Speaking*. The second meeting, held a year later, expanded the original scope of the discussion. It no longer emphasized the teaching of Spanish as a school subject. Instead, the focus was redefined to teach Spanish as part of bilingual education programs to be supported by federal funds. It is more than coincidence that these seminal meetings were organized and conducted by Spanish teachers and professors—a group that recognized, perhaps earlier than others, that the Spanish language was an important tool that held potential for improving the education of Hispanic students. The theme of continuing to develop the home language rather than truncating it continues to echo in bilingual education circles.

Many of the organizers of these events were active members of the National Education Association (NEA). This meant that the organizers and participants had access to one of the strongest professional voices in Washington and through it, to other strong sources of support for the legislative agenda that concerned them: the absence of a national system of financial support for bilingual education.

Recommendations of the Survey

The Tucson Survey on the Teaching of Spanish to the Spanish-Speaking posed the challenge of providing better educational opportunities for Mexican American children and youth by improving how Spanish was taught to them. The survey was conducted by educators from the Tucson area and sponsored by the NEA. The report emphasized that a sound foundation for improving education for Mexican Americans must begin with the premise that Mexican American children “are not deficient human beings, but rather that the schools, techniques, and materials are deficient” and that these should be changed to meet the needs of children who are linguistically diverse. This was an important point that gradually lost its way in the passage of Title VII of ESEA to be replaced by the deficit-oriented assumption that the main problem faced by

these children is a “language barrier” (i.e., an inadequate command of English).

The NEA Tucson Survey report included the following recommendations that, though general in nature, contain most of the features that were sought in federal policy:

1. There is a need for a well-articulated program of instruction from the preschool level to the high school level in the student’s native language.
2. The preparation of teachers for bilingual programs must be based on: (a) the personal qualities of the teacher, (b) their knowledge of children and appreciation of the cultural environment of the community from which these students derive, (c) skill in the teaching process, and (d) bilingual fluency.
3. Teachers must be recruited from the Spanish-speaking population, and young Mexican Americans should be encouraged to pursue teaching as a career.
4. Curriculum models must be characterized by their diversity so that the needs of students will be met rather than continue to fit the children to the curriculum.
5. English must be taught as a second language, using appropriate techniques and materials.
6. Laws that directly or indirectly impede the use of the children’s native language in the classroom must be repealed.

The NEA Tucson Symposium of 1966

The NEA symposium, convened in 1966 at the University of Arizona, was a sequel to the 1965 gathering. “The Spanish-Speaking Child in the Schools of the Southwest” was a more pointed call to action than the meeting of the previous year. The presentations and areas of concern were expanded, although the focus continued to be on the education of Hispanic children and youth. Only a passing mention was made of the similar needs of Native American students in that region. Emphasis was on bilingual bicultural education for Mexican American children from preschool to college.

This event was characterized as “a prologue to action” because it was openly political. Symposium speakers concentrated on detailing facts about bilingual education, stimulating ideas, offering pertinent suggestions for supportive government action, and

presenting proposals relative to the education of Spanish-speaking children at all levels. Although little documentation survives, evidence indicates that six main areas dominated the interaction among the participants: innovative classroom practices, community participation in the schools, preschool education, university involvement, state legislation for bilingual education, and federal support for bilingual education in K–12 schools.

The recommendations resulting from the 1966 symposium built on the recommendations of the survey report but demonstrated greater political sophistication among the participants. Several legislators and legislative staff members attended the symposium. At the conclusion, a leadership group from the symposium continued to work with legislators and their staff through several versions of a bill that would eventually become Title VII of ESEA. The report of the symposium listed the following specific points of agreement among the participants:

1. Spanish-speaking teachers must be trained in accordance with specific criteria.
2. The school is an extension of the community and mutual support is imperative.
3. Universities and colleges must intensify their mobilization of talent.
4. A concerted effort ranging from the local to the national levels of government must be put into motion toward the accomplishment of the complex goals set for the education of the Mexican American child.
5. A variety of state and federal funding resources must be vigorously pursued.

Follow-Up to the Tucson Meetings

As a follow-up to the meetings held at the University of Arizona, a subsequent meeting was held in Albuquerque, New Mexico, in 1973 to reflect on the experience of Title VII, then 5 years old, and approaching the time for reauthorization the following year. The conferees wanted to strengthen the legislation, which had begun to show weaknesses and shortcomings. This meeting too was supported in part by the NEA through its minority teacher component. The conference was cosponsored and organized by a seasoned group of Chicano educators from throughout the region who had come together as an organization

called the National Education Task Force De La Raza. The conference was titled “A Relook at Tucson ’66 and Beyond.”

Although they acknowledged that enactment of Title VII was a symbol of significant progress, the conference organizers and speakers expressed dissatisfaction with the status of bilingual education 6 years after Title VII had begun supporting activities and projects around the country. Among the stated objectives of this retrospective event, the following stand out: (a) to review the rationale, conference activities, and recommendations of the 1966 Tucson conference, (b) to review the important activities in bilingual bicultural education since 1966, (c) to review present and pending *state* bilingual bicultural education legislation and appropriations, and (d) to develop new directions for bilingual bicultural education for the 1970s that could lead to national legislation.

The follow-up conference in New Mexico included a mix of speeches and workshops typical of the content of meetings concerned with civil rights and education at the time. Although the organizers represented a highly knowledgeable group with respect to bilingual education, the most important goal of the conference was to accelerate the planning for the reauthorization of Title VII in 1974. One of the leading personalities in this effort was one of the original sponsors of Title VII, U.S. Senator Joseph Montoya (D-NM). Montoya delivered the keynote address. Titled “The Challenge of Multicultural America,” the speech laid out strong proposals for amending Title VII in the reauthorization scheduled for 1974. Montoya had already introduced a bill containing much of his theme from the previous month. The senator’s remarks captured the need felt by many bilingual educators of the time to amend Title VII away from the remedial compensatory modality; these were the highlights of his speech:

1. Transitional bilingual education (TBE) is unacceptable because it turns monolingual Spanish speakers into monolingual English speakers. The net effect is zero sum. One language simply replaces the other.
2. Transitional bilingual education is a form of remedial education that does not serve the needs of language minority students. They should have the opportunity to continue to develop their home languages. It must also allow them to progress in their schoolwork more effectively.
3. Bilingual education can and should be the base on which to build high-quality programs of multicultural education that will prepare all children to live in the “multi-cultured” world of the 21st century.
4. Bilingual education should serve all students, not only those who already speak a language other than English. In addition, programs should be not only bilingual but also bicultural. They should help broaden the cultural horizons of majority students.
5. The nation’s professional educators were not ready in 1968 to meet the many complexities of supporting bilingual education across the country. Many programs were inadequate for that reason. Education leaders must gear up quickly to take full advantage of new legislation. In its reauthorized version, Title VII could help provide for program needs that have previously gone unmet.
6. Bilingual bicultural education must be “sold” to monolingual America as something that is good for all children, including their own.

Montoya’s agenda for reforming Title VII was well received and shared by many conference participants. His proposals were important because it was early enough in the history of Title VII to redirect what was then a relatively small program. But the proposals met with little support from President Richard Nixon’s administration. While well supported by practitioners, the proposals may have been overly ambitious. The successes and failures that ensued during the legislative dynamics to reauthorize Title VII, ESEA, were documented in some detail by Susan Schneider in her book *Revolution, Reaction, or Reform: The 1974 Bilingual Education Act*. Another accounting of the dynamics surrounding the proposed changes was done by Michael Croghan in a doctoral dissertation. Readers interested in a deeper level of analysis are referred to those sources. The ambitious plan outlined by Senator Montoya in his speech was only partially successful. Had it gained greater support in the Congress, the subsequent history of bilingual education in the United States may have taken a different direction.

NATIONALITY–CULTURE MYTH

Before the age of rapid transportation and instant communication in which we now live, it was common to think of human cultures as being contained within nation-states. Terms such as *French culture*, *German culture*, or *Mexican culture* were facile currency to identify the set of values, beliefs, and predispositions to action that were presumably unique to persons from a particular country. In this view, nationality and cultural identity were closely related. Every country—or most countries—could be expected to have a culture that differed in some palpable way from that of other countries. This entry explores the effects of the nationality–culture myth.

As international travel became more common, the presumed idiosyncrasies of “foreign” cultures seemed to diminish and the importance of commonalities among cultures was recognized. Notions of nationhood began to be regarded as something distinct from culture. Social scientists who study culture and society have pointed out that the differences *within* national cultures are often more important than differences *among* them. China, India, the United States, and most of Europe are good illustrations of this phenomenon, often referred to as *cultural diversity* or *multiculturalism*. All these nations are characterized by great *internal diversity* in their respective populations. In these examples, no single culture embraces all of the subgroups that make up the country.

Although national cultures may have been characterized by dominant patterns that served as markers of national identity, the rise of rapid communications, fast transport, and large-scale immigration around the world have softened many of the differences that once existed among nation-states and their cultures. Modern Americans have, collectively, become more worldly, hence more comfortable with cultures other than their own. Every summer, travelers everywhere encounter young Americans backpacking through every corner of the world. Although collective U.S. embracing of diversity is certainly debatable, some evidence indicates that portions of U.S. society have become more accepting of cultural differences between themselves and people of different countries, which has not always been true. Anthropology, the academic discipline that deals with human cultures, is a relatively new science. Anthropologists first focused attention and analyses on cultures that were removed from their own. Margaret Mead’s famous study of Samoan youth culture was reported at a time when few tourists went there, and many Americans did not even know where Samoa could be found on a map of the world.

Many feel that cultures are beginning to blend into new aggregations. The phenomenon of globalization has had an important effect on cultural differences. Whether these effects have been as significant as those that globalization has brought to economics can be debated, but they can hardly be denied. It is now common to believe that although cultures may still be somewhat different one from another, regional cultures—and regional economies—are becoming more important. Some observers believe that national cultures have begun to yield in importance to regional cultures. These have labels that denote aggregations or clusters of related cultures rather than the view that each nation harbors one culture. Some examples include “Islamic Culture,” “Western Culture,” or “Asian Culture.” Interestingly, these broader configurations tend to follow the general boundaries of regional *economies* or economic spheres of influence—for example, the Pacific Basin, the Latin American economic sphere, the “OPEC Sphere,” or the European Union.

It remains to be seen whether this pattern of cultural aggregations will continue or whether some societies will resist the trend and seek to identify with ancestral cultures that are more distinct. Whatever the ultimate outcomes of this trend may be, the blending of national cultures into regional cultures has not reduced

stereotyping that finds its way into schools and classrooms. Controversy continues with respect to the compatibilities of given cultural clusters one against another. Contemporary scholars Samuel Huntington and Lawrence Harrison argue that the worldviews of Islamic peoples and the worldviews of peoples shaped by Iberian Catholicism, respectively, are profoundly incompatible with the culture of the United States. Huntington and Harrison argue that efforts to achieve peaceful coexistence with Islamic nations and the harmonious assimilation of immigrants from Latin America are unlikely to succeed because the cultures involved are far too different from U.S. culture. Latin America is the largest source of U.S. immigrants, and Harrison claims that the Iberian version of Catholicism that helped to shape Latin America is vastly different from that of German or Irish Catholicism. This difference, he argues, makes it difficult for immigrants to integrate into a U.S. culture strongly influenced by Protestant ways of thinking and perceiving and by other varieties of Catholicism.

Critics of these theories argue, in turn, that these assessments of the primacy of cultural differences reflect a shallow understanding of human nature. They argue that the basic needs of all humans are the same across cultures whether they be national or regional: to protect the young, to seek adequate food and shelter, to avoid pain and suffering, to promote significant levels of freedom and self-determination, and to achieve freedom of religious and artistic expression. Meeting these needs, they assert, is powerful motivation to deal harmoniously with members of other cultures and societies and to avoid disruptions brought about by conflict. Indeed, since Abraham Maslow first announced his famous hierarchy of human needs in 1954, there has been little controversy regarding these apparent verities. In most cultures, perhaps in all, people need to meet their most basic human needs before they are able to pursue interests of a higher order. High levels of education are among those higher-order aspirations. This is especially true in families that have never known high levels of education and have never experienced a need to make the deep commitment involved in keeping young people out of the workforce and in school well into young adulthood. Schooling in the United States extends well beyond what many immigrants have experienced in their countries of origin. Persistent intergenerational poverty, a common condition of immigrants, combined with an educational system that is often

reluctant to change, stymies such aspirations. In short, the issues involved in this scenario are not cultural but *experiential*.

It is not uncommon to find immigrants who come from multigenerational settings of extreme poverty. Some of these persons have never known anyone who has escaped poverty simply by going to school. This lesson takes time to learn, perhaps decades or generations. Similarly, American school people are not familiar with families that are reluctant to postpone entry into the workforce by their teenage sons and daughters and may fail to understand why these families allow their children to drop out of school to enter the workforce at the lower end of the earning scale. For many immigrants, however, this is the only pattern of family survival they know. Once again, it is experiential and not cultural in origin.

The theory of national cultures and the incompatibility arguments of those who see the world as a collection of disparate cultures are problematic. These ideas emphasize differences among human beings rather than similarities. They create doubts and negative expectations in the minds of school personnel concerning the ability of immigrant children to learn as well as their classmates. Educators who subscribe to these ideas may come to believe that children who come from “incompatible cultures” cannot be expected to profit in the same way from classroom instruction that is based on presumed American values, priorities, and paradigms of study. These educators may also believe that parents from some cultures may lack an interest in education as evidenced by low levels of involvement in school activities. The result may be that the family and its culture are regarded as problems instead of assets. When such patterns recur, it is a small jump to the conclusion that school failure is rooted in dysfunctional cultures rather than in the inability of schools to address cultural differences. Once again, the problem is a lack of experience with the way American schools and families interact, and the schools’ inability or unwillingness to adapt to client groups with different experiential backgrounds.

Sometimes the opposite is true. Certain cultures such as the “Asian culture” are often seen as being highly compatible with the culture of American schools. What is overlooked is that children from all cultures have particular areas in which they excel. Stereotyping of this sort, whether it is positive or negative, clouds the collective judgment about the potential of minority students and some immigrants and fosters

expectations by school personnel concerning which groups are likely to succeed and which ones will fail based on presumed cultural traits. Stereotypes develop easily concerning the families of those children and the relative value that is placed on schools and schooling by particular cultures. Too often, school personnel develop stereotypes about which groups of parents are more likely to attend meetings, pick up report cards, go on class trips, or demonstrate involvement in their children's education. This leads to the creation of divergent expectations regarding school participation and the degree to which all children can learn. Generally, these expectations apply equally to subject matter instruction and to the acquisition of the English language. Depending on their preparation, which often includes some attention to anthropology, bilingual educators and specialists in English as a Second Language (ESL) may be more sensitive to this danger. An important goal of bilingual education is to bridge language barriers between school and home and to promote changes in school processes to meet the educational needs of immigrant and ethnic minority families.

NATIONALIZATION OF LANGUAGES

Languages are one of our most important human assets. Although most of the early human languages have either disappeared or evolved into something different, no evidence indicates that any human group has ever survived without language. Paleoanthropologists Donald Johanson and Blake Edgar describe two

different ways in which humans came to rely on languages: as a means for social groups to bond, and as art to help them communicate and express feelings and emotions. Among the mammals of the world, humans appear to be uniquely suited to use language, and we have elevated language to be one of our most important tools for surviving, moving ahead, and imposing ourselves on others. Identification of social groups with particular languages and the attribution of a high status to such languages is a phenomenon that evolved later in history. This entry explores, briefly, the relationship between languages and polity and attempts to relate those links to contemporary language policy in schools and society.

Languages in Human History

As our early ancestors moved out into different parts of the world, languages became diversified and wonderfully varied. Similar patterns of diversification and adaptation attended every branch of the human family as people spread throughout the world, over thousands of years. Languages grew in importance as people used different symbol systems to represent them, creating writing systems to leave markings on caves, monuments, parchment, and papyrus.

Early merchants and traders spoke several languages and carried with them translators to assist them in their travels. Languages were learned and used as needed. Eventually, merchants must have found that in a given territory where a certain language was used, their trading profits were greater. The association of particular languages with successful trading spots was perhaps the beginning of the association of particular languages with nationalism.

Such association of languages with the greatness or high status of a community, country, or region began to change as early civilizations and empires started to dominate others. Rich and powerful groups of people began to define themselves as members of the same community. Some of the markers of distinction they chose were cultural and linguistic, especially languages in various literary forms. Other indicators of high status may have been dress and adornment, art and architecture, and military might. Languages thus joined flags, banners, and other national symbols as objects of pride and a willingness to protect them against "the other," those who did not carry the same flags and symbols and did not speak the same language.

Nation-States and Their Languages Emerge in Tandem

The cultural and political importance of languages in relation to one another was a phenomenon that did not develop until well-defined nation-states and empires had emerged. Distinctions between the concepts of nation and state can be traced back to the Greek and Roman civilizations. For the Greeks, the term *polis* is better aligned with the current conception of *nation*: This is a population situated in a sociopolitical area, sharing a culture and history. For the Romans, the concept of *res publica* aligns with the current definition of *state*; referring to the legal and political authority regulating the citizens. Historical linguist Robert McColl Millar explains that before the early modern period, nations could be considered a part of larger states—giving as example the fact that several ethnic groups were ruled by one dynastic state.

Linguistic anthropologist Patrick Eisenlohr explains two different views of what constitutes a nation: a group that traces its origins as an identity group to premodern times, when certain ethnic groups developed into nations by the 18th and 19th centuries, and a group that views nations from a modernist perspective, linking their emergence to industrialization. For the former group, common languages were one of the aspects that united what later became the nations of Europe. France, Germany, and Spain are clear examples. For these nations and others, a common language was adopted for administrative and pragmatic reasons as industrialization and better transportation systems developed. The original intent was not to assign nationalistic symbolism to these languages of administration.

Eisenlohr notes the difference between these approaches to nation and languages, and that of linguistic anthropology, the discipline that explores the relation between language and ethnicity. John Gumperz, in his book *Language in Social Groups*, explains that a speech community does not necessarily have to be a group as large as a modern nation. A speech community can also refer to regions or smaller units, as long as there were significant differences in language use; he analyzes the case of India, where a great number of speech communities are found within one nation-state. He regards the standard languages of modern nation-states as representing the majority speech, codified and spread through education, urban centers, or mass media and, hence, associated with a certain prestige.

These processes came into play among emerging nation-states when they began to compete with one another for various forms of wealth, status, and power; an important identifier of who belonged to what group was language. In time, the relative status of one nation compared with another extended to its respective languages. A strong nation-state was assumed to have a mature and well-developed language, whereas the language associated with a small nation struggling to survive was regarded as primitive and uninspired. To propitiate the status of their respective languages, rulers and potentates throughout the world allotted resources to support the work of artists, writers, and poets to polish their respective uses of language; such works, in turn, reflected even greater glory on their respective nations. Poets and artists worked to gain the sponsorship of their rulers to devote themselves totally to the *belles lettres*. Schools and universities arose, which tended to favor certain languages over others. Thus, literary production helped to boost languages that were already on the way to being prestigious. When printing presses were invented and used widely, the most prestigious languages appeared in print first. The spread of certain languages continued in colonial contexts, where religion and the standard variety of language of the colonizers had important implications for colonial peoples.

Nation-States and Their Languages Today

By the mid-20th century, with few exceptions, almost every important language in the world was associated with a country or family of nations. Whether those languages were borrowed freely or imposed through subjugation, many people accept the use of these languages and their national associations without questioning the history behind them. Others reject imposed languages and fight against those they consider to be symbols of oppression. The world of the 21st century has many examples of these relationships and their various origins.

Several African countries have accepted the languages of their former colonizers and continue to use them alongside their own. Nigerian linguist Ayo Bamgbose explains that a multilingual approach is necessary for communication in most African countries. He describes a three-language model commonly used: This encompasses languages for use at the local/regional (several local languages/one regional

language), national, and international levels. He stresses the complexity in choosing a language for communication between African states, and the struggles to choose between African languages such as Swahili and Hausa, or languages of wider communication, such as English or French, as official languages for the Organization of African Unity (OAU).

India is a single country with 428 languages in common use, according to *Ethnologue*, an online reference resource on the languages of the world; 22 of them bear the label of official or “scheduled” languages. Rama K. Agnihotri explains that in 1967, a three-language formula was adopted in India, keeping regional languages for group identity purposes, Hindi as a national language, and English for administrative and technology-related arenas. China, long unified under a single political banner, is home to many languages. *Ethnologue* lists 236 languages found in China, with Mandarin as the country’s official language. Alone among the great contemporary powers, China and India are countries whose rising greatness on the international scene is not linked solely to one language.

In almost every case, however, a single national language is assumed to be the core language of the country. Every marriage of language to nation is not characterized by sweet harmony. Millar explores this issue comparing multilingual societies with those in which monolingualism is the norm. He uses France as an example where the ability to speak standard French has been the marker of belonging and being considered a “true” French citizen. Actually, the territories that now constitute France were a polyglot aggregation of regions where several other languages, now almost forgotten, were used. With the consolidation of the various “nations” into one, French was imposed as the language of the greater nation-state, and all other languages were discarded.

Claire Mar-Molinero describes the situation of the Catalans and the Galicians in Spain as groups that have kept their native languages alive, despite the Castilianization process and the role these languages play in marking their respective ethnic identity. Mar-Molinero notes that such situations challenge, especially in the 20th century, a notion of a monocultural nation-state. She also notes the struggle of indigenous communities in Latin America: the case of Nahuatl in Mexico, which is the indigenous language with the largest population of speakers, but that continues to dwindle because of the hegemony of

Spanish; Quechua in Peru, for which some bilingual programs exist, but more of a transitional kind; and Guaraní in Paraguay, where it shares official status with Spanish. She refers to this latter case as an exception compared with other indigenous languages; however, she points out that the “official” status accorded Guaraní does not necessarily mean it performs the same roles as Spanish does in Paraguayan society.

Linguistic Nationalism in the United States

As the American colonies began to unify into a single nation-state, the matter of language was not initially given much importance or debated in the chambers that produced the U.S. Constitution. Two European languages were in common use in the 13 colonies, but the shared challenge of independence from England and the creation of a well-supported form of democratic government took up the time and attention of the framers of the constitution. No official language was declared, but the issue of a national language was not unattended for long. A distinct preference for English, and only English, prevailed.

There have been several attempts to make English the language that marks what it means to be “American.” James Crawford, in his book *Language Loyalties*, reprints Noah Webster’s “Declaration of Linguistic Independence.” In 1789, Webster predicted that English would be the root from which North America’s national language would derive. He called for uniformity and standardization of American English, a task in which Webster’s dictionary was meant to play a role. As a nation of immigrants, the influx of different ethnic and linguistic groups continued through different historical periods, and so emerged political efforts to make English the official language of the United States. Senator S. I. Hayakawa, a naturalized citizen, sponsored the first version of an English Language Amendment in 1981. Today, groups such as U.S. English work continuously to make English the official and only language of the country. These efforts are often linked to propositions intended to eradicate bilingual education.

What lessons can be learned about national identity in monolingual and multilingual societies in the future? Absent a crystal ball, the answer to this question is little more than guesswork. The reason is that the world has changed greatly, as has the meaning of nationality and citizenship, and these changes continue

at an accelerated pace. Most Americans find it challenging to give a cogent explanation of the difference between nationality and citizenship in the United States. Many simply shrug and admit not knowing the difference. Further, globalization is perhaps the centerpiece of this change. Global-local processes related to technology, mass media, international commerce, finance, and immigration have a crucial role that must be considered. Millar points out that even powerful nation-states are part of a global economy; regardless, English is becoming a language for international communication. He believes full participation in this global economy will imply the mastery of more than one language, as other nation-states gain economic and political power, and processes of hybridity and transnationalism challenge the rigid and archaic view of one nation-one language. It remains for history to record whether the United States, an adherent of this view, will abandon it in favor of greater linguistic democracy in keeping with its oft-proclaimed adherence to that concept.

NATIONAL LITERACY PANEL

Through an award to SRI International and the Center for Applied Linguistics by the U.S. Department of Education, a project was undertaken to convene a national panel of experts to review and synthesize the available research on the literacy development of language minority children and youth. The project began on October 1, 2001, and the report of the panel was published in July 2006. Through five full-panel meetings and a series of small-group meetings and conference calls, the panel reviewed and synthesized the research on the following topics: the development of literacy in language minority children and youth; cross-linguistic and cross-modal (i.e., from oral proficiency to literacy) relationships, the sociocultural contexts and literacy development, instruction and professional development, and student assessment of literacy. The synthesis provides useful information to researchers and school personnel about the development of literacy in children who come from homes where a language other than English is spoken. This entry describes the work of the National Literacy Panel.

The panel's review indicated that many factors influence second-language literacy development, among them the age at which skills are acquired; individual differences in second-language oral proficiency and cognitive abilities, first-language oral proficiency and literacy, some sociocultural variables, and classroom and school factors. With regard to teaching literacy to second-language learners, the panel found that enhanced teaching of the key components of English literacy (i.e., phonics, fluency, vocabulary, comprehension, and writing) provides a clear advantage to English language learners. More complex, innovative programs typically taught several of these components simultaneously—and these efforts were usually successful in improving literacy for language minority students. However, although approaches that are

similar to those used with native-language populations are effective, the research suggests that adjustments to these approaches are needed for maximum benefit with language minority students.

Panel Process

The U.S. Department of Education constituted the panel in 2001. Panel participants included Diane August, who was principal investigator and managed the project; Timothy Shanahan, the chairperson, who helped guide the panel's work; and 12 other well-known panelists with expertise in various aspects of the problem under study. Donna Christian and Frederick Erickson served as senior advisers to the panel. In addition, the panel was staffed by two senior research associates who were instrumental in preparing several of the chapters. In addition to the reviews by the senior advisers and those of outside reviewers contracted by the panel, the final report also reflects the input of anonymous reviewers solicited by the funding agency. These reviewers provided detailed commentary on multiple drafts of the report, and their unnamed contributions were an instrumental part of the process leading to this final report.

To address the research domains listed earlier, the panel was divided into five working groups, each focused on a particular domain. Within each research domain, the panel identified a series of research questions that guided the review of research in that domain:

Development of literacy in language minority children and youth: What are the differences and similarities between language minority and native speakers in the development of various literacy skills in the societal language? What are the profiles of those language minority students identified as having literacy difficulties? What factors affect the literacy development of language-minority students? What is the relationship between English oral proficiency and English word-level skills? What is the relationship between English oral proficiency and English text-level skills?

Cross-linguistic and cross-modal relationships: What is the relationship between language-minority children's first-language and second-language oral development in domains related to literacy? What is the relationship between oral development in the first language and literacy development in the second language? What is the relationship between literacy skills acquired in the first language and literacy skills

acquired in the second language for children who are learning English as a second or foreign language?

Sociocultural contexts and literacy development: What is the influence of *immigration* (generation status and immigration circumstances) on literacy development, defined broadly? What is the influence of differences in *discourse and interaction characteristics* between children's homes and classrooms? What is the influence of *other* social and cultural characteristics of students and teachers? What is the influence of *parents and families*? What is the influence of policies at the *district, state, and federal levels*? What is the influence of *language status or prestige*?

Instruction and professional development: What impact does language of instruction have on the literacy learning of language minority students? Is it better to immerse students in English language instruction, or are there benefits to first developing a firm basis in the home language? What can be done to improve achievement in reading, spelling, and writing for language minority children? What do we know about various approaches to literacy instruction with language minority students, including language minority students in special education settings? What does the research tell us about teacher beliefs and attitudes, the nature of professional development of teachers who will teach literacy to language minority students, and the influence of professional development on teacher beliefs and practice?

Student assessment: What assessments do states and school districts use with language minority students for identification, program placement, and reclassification purposes? Are the assessments used for these purposes useful and appropriate? What do we know about alternative assessments of oral English proficiency and literacy? What first- and second-language vocabulary and wide-scale literacy assessments for language minority students have been investigated? What does the research say about accommodations for language minority students taking these assessments? Are the assessments currently used to predict the literacy performance of language minority students (including those with reading disabilities) useful and appropriate? What research has focused on language and literacy measures or methods developed for the identification of language minority students eligible for special education services (including speech and hearing)? What standardized

(commercial) and researcher-developed oral proficiency, literacy, and literacy-related assessments have been used by the researchers whose work is reviewed throughout this report?

Through the various mechanisms created for interacting with and reaching out to stakeholders, panelists established parameters for the synthesis. The synthesis focused on language-minority children ages 3 to 18 acquiring literacy in a societal language. To answer several of the questions, the panel also reviewed research on the acquisition of literacy in a foreign language, if the foreign language was English. For the most part, panelists reviewed only research published in peer-reviewed journals, dissertations, and technical reports dating back to 1980.

To identify studies for use in this review, the panel conducted extensive searches of various electronic databases and hand searches of particular journals. The purpose of these search procedures was to ensure the most comprehensive, unbiased search possible for all studies relevant to the questions. In addition, the intent was to use a set of search procedures that could be replicated for future reviews. In all, seven searches of the research literature were conducted.

A coding instrument was developed, and once studies had been identified, they were coded. It was important that key information be abstracted from each study so that it could be combined or compared with information from other studies, and that the coding process could be used to document why some studies were not used for the various analyses. The data in the coding instrument was also used to create a searchable database that is available with the report.

The approximately 1,800 titles initially identified were gradually reduced as the panelists examined each study more carefully. The database now consists of 972 studies, of which 299 were used for this report because they are especially relevant to the research questions posed and meet methodological criteria established by the panel. The societal language most represented in the database is English. Most studies were conducted in the United States, followed by the United Kingdom, Canada, and Australia. However, studies from the Netherlands, Finland, and Israel appear as well.

When a sufficient number of quantitative studies addressed the same conceptual hypothesis relevant to a given research question and met the other criteria specified later, meta-analytic techniques were used in

the review to make sense of the results. For those questions for which quantitative techniques were not appropriate, narrative review methods were employed. For each research question, using an iterative process, studies were categorized by major themes or foci. Studies in each group were reread and classified with regard to similarities, differences, and results to determine cross-cutting themes, as well as methodological strengths and weaknesses.

To gain public advice and input from educators, community members, and researchers who were not on the panel, two sets of outreach meetings were held. The first set of meetings was held to determine what the research, policy, and practitioner communities considered important research questions. The second set of meetings was held to obtain feedback on the draft final report. At both meetings, panelists presented preliminary findings from the draft report and answered questions from the audience.

Organization of the Report

The final report of the panel is organized partly around the traditional distinction between basic and applied research but is also structured to reflect specific areas of concern for educational policymakers. The first two parts of the report (I and II) address basic research questions about bilingualism, second-language acquisition, and relationships between first- and second-language oral proficiency and literacy. Part III, on sociocultural context and literacy development, addresses both basic research about the relationship between sociocultural variables and student outcomes and more applied research related to the influence of sociocultural variables on the contexts in which students acquire second-language literacy. Parts IV and V are organized around more practical issues: program evaluations that explore the influence of native-language instruction on second-language literacy, effective instruction, schooling processes and programming, professional development, and assessment. These topics were selected because they represent key areas of concern in current discussions of educational reform.

With regard to the chapters that focus on schooling and instruction, differing research traditions (program evaluation, research on effective instructional practice, and research that examines instructional and schooling processes or the context in which schooling occurs) are treated separately in individual chapters to

provide the reader with a sense of how the evidence from each tradition or data source is analyzed and how inferences are drawn. The chapters on language of instruction (Chapter 14) and research on effective instruction (Chapter 15) are based on experimental and quasi-experimental studies, but the chapter that examines instructional processes and contexts (Chapter 16) is based on qualitative studies.

A final contextual parameter for this report is a set of assumptions shared by the majority of panel members, which echo those of the Committee on Developing a Research Agenda on the Education of Limited-English Proficient and Bilingual Students: (1) All children in the United States should be able to function fully in the English language, (2) English language learners should be held to the same expectations and have the same opportunities for achievement in academic content areas as other students, and (3) in an increasingly global economic and political world, proficiency in languages other than English and an understanding of different cultures are valuable in their own right and represent a worthwhile goal for schools.

NATIVE AMERICAN LANGUAGES, LEGAL SUPPORT FOR

Several federal laws enacted since the late 1960s support the Native American interest in strengthening and continuing to develop Native American languages. Such laws have provided limited financial assistance as well as a change in federal policy regarding indigenous languages. They have proven useful in the various

American Indian, Alaska Native, and Native Hawaiian efforts to teach students in their languages. This entry reviews some of the advocacy efforts to create legislative protection and encouragement for native-language retention.

Historically, the indigenous peoples of North America recognized, as a necessary requirement of trade and other intergroup activity, that the learning and use of other languages were important skills to develop. Examples of this understanding are evident in the development of the Chinook Jargon (used among the Indian Tribes in the Pacific Northwest and Southeast Alaska, and with early Europeans) and in that many native peoples spoke more than one tribal or indigenous language.

As different Native American groups encountered early explorers and settlers from the European nations, they also began to learn those languages. The degree to which this happened depended upon the level and quality of direct contact among Native Americans, early explorers, fur traders, whalers, and missionaries. In addition, as the traditional educational systems of the different native groups were replaced by the more formal schools of the settlers, European languages were introduced in these schools. Indigenous languages were dropped, partly because these new trainers and teachers did not know the native language and partly because of a general belief that continued use of indigenous languages would limit the acquisition of English in school, or simply that Indian languages had little or no value for joining the emerging American society.

The level of contact with the Russians, the Spanish, the French, the English, and later the European Americans, or in some cases, governmental requirements for formal schooling, helped determine the speed by which native languages began to disappear. The stories of older relatives, formal governmental and church reports, and the literature on early schools indicate that the different tribal and indigenous groups had a mix of attitudes and experiences regarding the new and formal schools created by early European settlers and missionaries. In some cases, the experiences were positive; in many cases, those experiences were traumatic. A 1928 U.S. Senate report (the Meriam report) documented these experiences and was also the earliest comprehensive federally sponsored report promoting the use of American Indian languages as languages of instruction in schools, and supporting the continued use and development of those languages in the everyday lives of Indian peoples.

Hawai'i

In 1893, American businessmen with the help of the U.S. Marines overthrew the indigenous Hawaiian monarchy and began the process that led to the annexation of Hawai'i by the United States. Under this monarchy, Native Hawaiians had an extensive educational system that used the Hawaiian language as the language of instruction. It also incorporated the teaching of English and other additional languages as necessary in a modern world. After annexation, the Hawaiian language was outlawed as the language of instruction and replaced with English. At the time, literacy levels of Native Hawaiians were higher than those of Whites and Asians, and many were literate in two or more languages. Today, Native Hawaiians have a literacy rate significantly lower than Whites and Asians. Some scholars attribute this to the loss of the heritage language and attempts in the formal educational system to ignore or extinguish the Hawaiian cultural base. Eventually, there was little left of the base on which to build healthy linguistic and secure Hawaiian communities.

Alaska

In Southeast Alaska, the early Russian American Company introduced schools around 1784 for the Tlingit that allowed continued use of the Tlingit language as well as development in Russian and advanced training in business and medicine for a new "Tlingit professional." Other parts of Alaska were offered early opportunities for formal schools through the Russian Orthodox Church. Sheldon Jackson, a Presbyterian missionary, later had an important influence on territorial schools, which focused on English as the language of instruction, a policy that continues to this day in the state's public schools. Academic performance levels of Native Alaskans do not compare well with English-speaking students who are not Native Alaskans; especially in areas where the heritage language is still used daily and students are tested in English. Several native communities are trying to restructure the schools, introduce teaching in the heritage language, and create a curriculum that supports the different cultural priorities of Alaska Native communities.

The Lower Forty-Eight States

In the lower forty-eight states, some tribes maintained native language use into the 1970s, but scholars and tribal members have found that without a concerted

effort to maintain their language, Indian languages will continue to disappear. Scholars increasingly believe that native languages will only survive if they become the language of the school and if they are used in daily social and cultural activities. There is a similar recognition that complementary use of media such as radio and television, along with the development of the arts, all support indigenous language development.

As a result of these understandings, and the renewed interest in preserving, maintaining, and developing indigenous languages, a growing interest to provide opportunities to teach in native languages emerged in the mid-to-late 1960s and early 1970s. The Navajo Nation carried out one of the very first initiatives, forming a partnership with the Office of Economic Opportunity and the Bureau of Indian Affairs to start the Rough Rock Demonstration School in Arizona in 1966. The idea of a culturally based school curriculum and intensive study of native languages was further enhanced through the creation of the Navajo Community College (now called Diné College) in 1968 on the Navajo Reservation. In Alaska, during the late 1960s, the Bureau of Indian Affairs started a culturally based Yup'ik language program in the region of Bethel, and William Demmert started a culturally based education program in a public school in the region of Klawock, where the Tlingit language is taught as the heritage language. The 1928 Meriam Report describes earlier advocacy efforts. Since then, many individuals have noted the loss of native languages in the Americas and added their voices to the call for native language preservation and continued development.

Indian Education Act of 1972

Events leading to the creation of the Indian Education Act of 1972 (also known as the Kennedy Act) and the legislation itself, introduced a new and exciting period into the field of Indian education. This legislation helped support isolated and innovative approaches to the education of Native American students and helped to expand ideas about the role of culture and native languages in the education of Native America. Indian educators and tribal groups significantly influenced the content of the Indian Education Act of 1972 (now known as the No Child Left Behind Act of 2001 [NCLB]).

To begin this process, the U.S. Senate Subcommittee on Indian Education scheduled a series of

hearings across several states with large Indian populations. The committee invited Indian and Alaska Native tribal leaders, educators, and parents to present testimony regarding the education of their children. The National Indian Education Association—a new organization chartered in 1970—worked directly with the U.S. Senate on the wording and content of this legislation. The first cohort of Native American Indian students attending the Harvard Graduate School of Education in 1970 was instrumental in contacting their tribal leadership to gather direct support for the legislation when it was in danger of not being introduced in the U.S. Senate.

The report of this Special Subcommittee on Indian Education set the base for the contents of the original Indian Education Act of 1972. This legislation authorized the development of programs to meet the special educational needs of Native American and Alaska Native students by providing funding for the development of culturally based education programs and curriculum. Title VII, No Child Left Behind (NCLB), as the act is now referred to, includes a separate provision for Native Hawaiians and Alaska Natives for additional program support. Native Hawaiians were not included in the original version of the legislation. A section was added to the act in 1988 to provide support to those communities. Regrettably, few Native tribal groups or public schools have taken advantage of the opportunities to develop native language programs or culturally based education curricula allowed in the current NCLB version of the act.

Native American Languages Act of 1990

William H. Wilson describes a resurgence of interest in the highly endangered Hawaiian language and culture in the 1970s in Hawai‘i, parallel with a similar movement in Māori New Zealand, and with major activity in indigenous language studies elsewhere. At the time, Wilson and his wife, Kauanoie Kamanā, were studying Hawaiian, and raising their children to speak Hawaiian as their first language. With the help of Māori language activists, Wilson and Kamanā joined with other Hawaiian-language-speaking educators in 1983 to form the nonprofit organization known as *‘Aha Pūnana Leo*, aimed to reestablish schools with instruction in the Hawaiian language. As part of this organizing work, a decision was made to craft legislative language using the model established by the

Native American Religious Freedom Act (a separate piece of legislation rather than an amendment to existing legislation); at the same time, the *‘Aha Pūnana Leo* moved forward locally to provide Hawaiian language education for families, beginning with language nests for preschoolers in 1984.

In 1986, after considerable lobbying by the *‘Aha Pūnana Leo*, the state of Hawai‘i removed a century-old ban on the use of the Hawaiian language in the public schools. The following year, *‘Aha Pūnana Leo*’s program expanded, and its students moved into the public schools. Concomitantly, the Hawai‘i state legislature passed a resolution calling on the federal government to establish legal recognition and protection of Hawaiian and Native American languages.

Lucille Watahomagie, a bilingual educator from Arizona was instrumental in spreading this initiative to tribes nationwide. She shared ideas, textbooks, program structures, and pedagogical approaches with Kamanā for the Hawaiian language schools. At the Native American Language Issues Institute’s (NALI) 1985 and 1966 annual conferences, she also introduced Kamanā and other *‘Aha Pūnana Leo* members to several native scholars and linguists. Wilson drafted proposed federal legislation and with the help of other native education leaders, their work was introduced in Congress.

These events helped sustain local support and stimulated the national support required for the development of federal legislation. The partnership with Indian educators and tribal groups, and the interest of Senator Daniel Inouye and his staff in promoting the development of native language programs, eventually resulted in passage of legislation, first the 1990 Native American Languages Act, and subsequently the 1992 Native American Languages Act. Senator Inouye was successful in obtaining appropriation language for \$1 million as part of President Bill Clinton’s 1994–1995 budget.

Bilingual Education Act of 1968

The Bilingual Education Act of 1968 (Title VII of the Elementary and Secondary Education Act [ESEA]) was drafted and promoted by Senator Ralph Yarborough of Texas. Its purpose was to stimulate new programs to teach Spanish as a native language and English as a second language. This legislation became the most important vehicle for funding programs of bilingual education in the nation. It also

established an alternative to segregated schools as a way for ethnic minorities to receive special services and instruction in a language other than English.

Native Americans became eligible for funding under the 1974 reauthorization of the law. Schools serving Indian children were awarded about 10% of the total funding to serve roughly the same proportion of Indian students eligible for the program. Because of the *Lau v. Nichols* Court decision in 1974, a priority for teaching English to nonnative speakers was established. This priority was based on the Civil Rights Act of 1964, which established the principle that school districts must take affirmative steps to meet the language needs of limited-English-speaking students.

These events, and the priority for teaching English as the primary focus under the Bilingual Education Act, were not met with widespread support in the Native American communities that were more interested in promoting the use and development of Native American languages in the schools. Beginning with President Ronald Reagan's administration, the U.S. Department of Education began to limit program support for the development of native language programs in preschool programs. The 'Aha Pūnana Leo program in Hawai'i was one of the programs that had difficulty accepting the focus on developing English language skills as a priority under Title VII, ESEA, because the primary focus for this program was the development of the Hawaiian language among its students as a way of "saving the Hawaiian language." As a result of concerns expressed by native professionals, William Demmert organized a seminar at Stanford University in 1991 to address these concerns. This seminar offered the first formal contact between the newly formed Indian Nations at Risk Task Force and the leadership of the 'Aha Pūnana Leo program. A partnership was formed to work on an amendment to the Bilingual Education Act that would support a native language focus, as allowed under the Indian Education Act of 1972 and later, the Native American Languages Act of 1990.

Demmert, Pila Wilson, and Bob Arnold attempted to develop language for an amendment for the Bilingual Education Act, which was scheduled for reauthorization in 1994. This effort was coordinated with the Stanford Working Group led by Kenji Hakuta. After extensive discussion and debate, the majority of the Stanford Working Group agreed to support the recommendation. The group agreed that the most

efficient strategy would be a simple amendment that would grant Indian schools the same right as that given to Puerto Rico: the right to teach participating children in their home language even though Title VII itself, was now oriented toward the teaching of English.

Esther Martínez Native Languages Preservation Act of 2006

The Esther Martínez Native Language Preservation Act of 2006 was signed into law by President George W. Bush on December 6, 2006, and is the result of important and successful work performed by a group of scholars, a professional lobbying team representing the National Indian Education Association, and the direct involvement of the Navajo code talkers and other Indian groups.

Variations of this law had been introduced in previous Congresses but there was little traction or input provided from national Indian organizations. The impetus for the legislation that was reintroduced in the 109th Congress resulted from a personal interest of David Beaulieu and Ryan Wilson to ensure that there was program support for native-language school programs found at this time. Initially, Beaulieu suggested the need to support existing native-language immersion schools because these efforts were showing positive results both with regard to academic achievement and language preservation. Beaulieu also felt that in addition for the need to demonstrate research results for long-term policy benefit, a focused program effort would provide the best opportunity to move forward with scarce resources for native-language restoration.

There was concern about potential conflict between the Native Languages Act reauthorization and the Esther Martínez Native Language Preservation Act. This concern was eventually resolved between the House of Representatives, the U.S. Senate, and members of different native communities through the addition of grants for restoration programs and amended eligibility requirements that broadened the potential applicant pool. The restoration programs are primarily efforts at schools and community-based language programs that may take the form of language camps, after-school classes, community classes, or language classes at a school that does not meet the eligibility requirements for the language nests or survival schools. The restoration programs were added after further consultation with Indian Country (the states with a large

Indian population) and a field hearing held in New Mexico on the proposed legislation.

Although the bill passed fairly smoothly in the House, there were some challenges in the Senate. Senator Daniel Akaka expressed concern about the Esther Martínez Act and its potential impact on the reauthorization of the NCLB Act. Akaka had introduced a bill that provided grants for language survival schools and language nests that would be housed in the Department of Education and could potentially be included in the following session during the reauthorization of NCLB. This concern was resolved once it became clear that the reauthorization of NCLB could take years and that because of rapid erosion, many of the native languages did not have the time to wait.

Another potential problem was a concern expressed by Senator Tom Coburn regarding the learning of English. His concern was resolved by legislative language requiring that students participating in the program would do so with parental consent. Further, that the students would be assessed and would be expected to perform at grade level in English.

Discussion of Legislative Initiatives

Traditionally, members of different Native American communities have recognized the value of multiple language learning. With the arrival of European explorers, fur traders, and European settlers, English became the dominant language of the schools attended by native children. Early policymakers and educators did not value the continued development and use of indigenous languages, and laws were enacted or policies were initiated that limited the use and development of these languages, or outlawed them altogether. These attitudes and practices were first challenged by the Meriam Report of 1928 as misguided and, much later, by the Indian Education Act of 1972.

The landmark Native American Languages Act of 1990 (as amended) introduced a new federal policy regarding the use and development of native languages. This innovative legislation set in place a new federal policy of supporting the development and use of native languages. The Bilingual Education Act, as amended in 1994 (as Title III of the NCLB), and the recent Esther Martínez Native Languages Preservation Act provide additional support. In addition, President Clinton's executive order of August 6, 1998, and President Bush's executive order of April 30, 2004,

both supported native language development and culturally based education programs.

Despite favorable research findings, federal legislation, and the two presidential executive orders, many public schools and federal programs continue to oppose native language and culturally based education programs. The reason generally given has been that the NCLB legislative requirements for annual yearly academic progress (AYP) do not leave time during the school day for teaching native languages and culturally based curriculum. Advocates remain undeterred in their efforts to use the public schools as tools to preserve Native American languages. Today several innovative projects use a culturally based education curriculum and the native language either as the language of instruction or as a subject area in the school curricula.

Ministries of Education in Circumpolar Nations or States, the Organisation for Economic Co-operation and Development (OECD), the United Nations Educational, Scientific, and Cultural Organization (UNESCO), and other international groups have shown considerable interest in native language issues in the United States. This interest by international organizations underscores the importance of the work by Native American advocates in the United States and encourages those who believe that a strong relationship exists between heritage language development and school success by young Native Americans.

NATIVE ENGLISH SPEAKERS REDEFINED

English is a dynamic and ubiquitous language. No other language comes close to achieving the international acceptance English has gained around the globe. According to David Crystal, 400 million people worldwide speak English as a first language and 430 million have learned it as a second or foreign language. Aside from being the historic primary (and often only) language of Australia, New Zealand, the United Kingdom, and the United States, English is spoken as a foreign or second, third, or even fourth language in India, Africa, and the Pacific Rim. English also has an official or semi-official status in more than 70 countries and plays a critical role in 20 others. As a result of its versatility and use for international communications, science, business, and education

and in technological products such as iPods, Palm Pilots, and Blackberries, it is rapidly becoming the “lingua franca” of the world.

As English proficiency and use become more widespread, people who once were the undisputed “native speakers of English” are being outnumbered by new and different native English speakers across the globe. In the process, a second linguistic phenomenon is occurring: The number of monoglot English speakers declines and the number of multilingual speakers of English continues to increase to meet the communication needs of a global economy and international markets. These new native speakers also speak the other important languages of the world, chiefly Spanish, Arabic, Hindi/Urdu, and Mandarin. David Graddol, a British applied linguist and author of *English Next*, contends that world trends relative to English will ebb and flow with respect to that language. In time, they may diminish English as the primary world language as the younger populations prepare for the realities of a different future that encourages (and requires) them to acquire fluency in more than one language.

These contemporary trends in the growing number of English speakers worldwide have given rise to a new situation in which it is useful to reexamine the definition of a native speaker of English, as described in this entry. Traditionally, native speakers of British and American English have been regarded as the authoritative stewards of the quality and standards for English. Australians, Canadians, and New Zealanders are often included in the mix. Both American and British teachers are often considered the best teachers of English. The British, through the British Council (established in 1934 to promote knowledge about the United Kingdom and the English language abroad, as explained in its Web site), have earned a competitive edge with their active efforts to teach English worldwide. Many linguists and other observers of the situation believe that major changes are on the horizon. Traditional native speakers (British and United States) tend to be monolingual. In particular, they often do not possess the multilingual and multicultural background and skills, such as the ability to translate and interpret as well as teach various languages or to serve as cultural mediators.

In a number of areas in the world where English is flourishing, it does not exist alone but rather, in tandem with other critically important languages: Arabic, Chinese, Spanish, and Russian. Based on national

security needs, the United States has adopted a National Security Language Initiative through which \$114 million is being invested to strengthen America's foreign-language education in languages deemed critical to national security—specifically Russian, Arabic, Korean, and Chinese. Although the southern border of the United States is often mentioned as being critically important for national security, Spanish is not included in the Security Language Initiative.

Through interpretation, appropriation, and transformation, the new varieties of English have made the idea of a standard form of English, a language favored by privileged socioeconomic classes in certain English-speaking nations, ambiguous and debatable. Indeed, it turns out that only 20% of the world's English speakers are found in the United States, the country with the largest number of English-speaking citizens. In the same vein, millions of speakers of English throughout the world have learned English in a variety of forms reflecting their local circumstances, present situations, and histories—for many nations, colonial histories—and referred to as *New Englishes*, *World Englishes*, or *Global Englishes*. Along with this is the notion of nativeness, or what Braj Kachru distinguishes as “functional nativeness” from “genetic nativeness,” the latter refers to indigenous native speakers of English although the prior refers to those who have learned English as a second or foreign language. Peter Trudgill, for instance, describes New Zealand English as a “new dialect formation” in which some speakers have a unique sound of their own, although others resemble English, Scottish, or Irish people. In India, where Hindu/Urdu and 15 or so regional languages share official language status, several varieties of South Asian English are spoken. Collectively, these South Asian speakers rival the population size of English speakers in England. Another example is evident in the case of African countries, which inherited their forms of English from the colonial era but that now regard it as a vehicle of democracy and resistance. The Nigerian novelist, poet, and literary critic Chinua Achebe posits that African writers should have as a goal to craft a variety of English that can be universal, but also reflect the local experiences; this English should merge ancestral knowledge with the new needs Africans face. Similar transformations of English are occurring in other countries, thus making it more difficult to maintain the idea of a standard language that symbolizes

nativeness. In Great Britain, for instance, there are more of what might be called non-standard English speakers than British Broadcasting Corporation (BBC) or Oxford English speakers; only a small minority speaks the latter variety.

Graddol contends that as more people learn English as a second, third, or fourth language and make it their own, bilingualism, or multilingualism will become recognized as the norm. Paradoxically, mother-tongue education will also include learning in a language other than the home language. All in all, these modern transformations of English have led to a reexamination and reinventing of the teaching of English in ways that protects a country's unique national language and identity. This in turn has resulted in a rethinking of pedagogical practices and strategies in English as a Second Language (ESL) and foreign-language classes and in bilingual education as that concept is understood in the United States. For example, in China, the goal of language teaching is shifting from linguistic competence, which is based on traditional language teaching methods that focus on grammar and vocabulary and rote learning practices, to communicative competence, which focus on both receptive and productive skills that develop higher level expressive and reasoning abilities in English. Curiously, although spelling reforms of English were discussed extensively in the middle of the 20th century, none of the regional Englishes of the world today is making major efforts to reform the notoriously irrational orthography of English.

Because of the nature of language, especially a transnational language such as English, the spread of English has not been without political complications associated with power and prestige. English has been so widespread that those who come from English-speaking countries may believe that they do not need to learn another language because the world already speaks English. But, as business opportunities around the world continue to expand, more than one language is advantageous, beneficial, and necessary. For these and other reasons related to culture and identity as well as trade and commerce, English speakers today reflect a changed polyglossic reality that is transforming our understanding of how we define native speakers of English. Children and youth who participate in additive forms of bilingual education in which heritage languages are supported and maintained are more likely to benefit from these changes in the world's linguistic profile.

NATIVE LANGUAGE SUPPORT

See PRIMARY-LANGUAGE SUPPORT

NATIVISM

See ETHNOCENTRISM

NATURAL APPROACH

The natural approach, described in this entry, is a language-teaching philosophy that incorporates naturalistic principles identified by researchers in second-language acquisition. It espouses second-language acquisition without recourse to native language for support or reliance on grammatical analysis or drilling about the target language. The natural approach is often associated with Tracy Terrell's experiences teaching Spanish in California in the 1970s. Terrell subsequently worked with linguist Stephen Krashen in elaborating a theoretical rationale for the natural approach.

Terrell and Krashen identified the natural approach with an earlier natural method, which was also known as the direct method, a teaching method that predominated in the early 20th century in Europe. The two differ in a number of respects. In the natural method, emphasis was placed on teacher monologues, direct repetition, and formal production of sentences in the target language. In the natural approach, the emphasis is on providing exposure to language through comprehensible inputs, optimizing emotional readiness for learning, and openness to employing written materials and reading as a means to expose learners to the target language.

Similarly to their colleagues in other communicative orientations to language acquisition, Terrell and Krashen rejected the audio-lingual and other earlier methods of language teaching with a grammatical or structural focus. They maintained that the earlier methods were not theoretically grounded in the research knowledge in language acquisition, but in grammatical structure. Unlike their colleagues in the *communicative approach*, they pay little attention to language theory, other than to maintain that language is a vehicle for communicating meanings and messages.

Rather, Terrell and Krashen focused on language acquisition processes. According to these authors, language consists of lexical items, structures, and messages; grammatical structure does not require explicit attention by the teacher, by the learner, or to the learning materials for language acquisition to occur. Despite their disagreement with the audio-lingual method in general, Terrell and Krashen do share the audio-lingual method's view that learners acquire language via mastery of structures by stages.

Theoretical Framework

Terrell and Krashen's strong applied theoretical base in language acquisition theory, which some refer to as Krashen's language acquisition theory, distinguished the natural approach from other existing second-language learning methods and approaches of the time, which employed linguistics as a predominant theoretical focus. Krashen's language acquisition theory is summarized in a number of hypotheses: (a) the acquisition/learning hypothesis, in which a distinction is made between language acquisition as a natural phenomenon and language learning as one that is taught and learned like any other school subject; (b) the monitor hypothesis, which points out requirements so

learners can monitor their learning to improve second-language proficiency; (c) the natural order hypothesis, which maintains that the acquisition of grammatical structures occurs in a predictable order; (d) the input hypothesis, which relates what a learner is exposed to with language acquisition; and (d) the affective filter hypothesis, which argues that the learner's emotional state or emotions can pass, impede, or block input necessary to language acquisition.

The natural approach resembles the communicative approach in that it offers a general set of principles that apply to a variety of teaching and learning situations, depending on student's needs, interests, and the level of skill brought in the target language. Instructional arrangements are approached from two points of view. First are typical goals, such as the development of personal and academic communication skills orally and in writing. These goals may also be expressed as situations, functions, and topics. Second, Krashen and Terrell maintained that purposes of language courses tend to vary, depending on students' needs and interests, and as such are inconsistent with the prescription for instructional arrangements made by the first perspective. It is difficult to specify communicative goals that fit all students' needs. Nonetheless, content selection should aim to reduce the affective filter through interesting content and a friendly, nonthreatening learning environment. Instructional arrangements should provide broad exposure to vocabulary useful to basic personal communication and resist focusing on grammatical structures. Mastery of grammatical structures will emerge naturally through their incorporation in a variety of communicative topics and functions over time.

Practices and Roles

The primary emphasis in classroom instruction in the natural approach is presenting comprehensible input in the target language. Teacher talk focuses on objects in the classroom and the content of pictures. To minimize stress, students are not required to say anything until they are ready, though they are expected to respond to the teacher in other ways. The teacher speaks slowly and deliberately and offers simple response opportunities when students are ready to talk. Response opportunities begin with one-word answers and progress gradually from yes/no questions, through either-or questions, to questions that students can answer with words they heard used by the teacher. Acquisition

activities—those that emphasize communication over grammatical form—include pair or group work, followed by whole-class discussion led by the teacher, and complete the continuum of communications activities that are employed in instruction.

Learner roles are viewed as fluid in the natural approach, and they flow through four stages. In the preproduction stage, students participate in language acquisition through action; they can act out physical commands or point out objects the teacher describes in the target language. In the early-production stage, students respond to either-or questions, use single words or short phrases, fill in charts, and use fixed conversational patterns. In the speech-emergent stage, students involve themselves in role plays and games, contribute personal information and opinions, or participate in group problem-solving activities. In the intermediate fluency stage, learners can comprehend more and respond with more complex sentences and participate in more complex group problem-solving and role-play situations.

Learners have four kinds of responsibilities in the natural approach classroom. They provide information about their language acquisition goals, so that the teacher can structure activities according to their needs. They take an active role in ensuring comprehensible input through conversational management techniques to regulate input. They decide when to start producing speech and when to upgrade it. They decide with the teacher the amount of time to spend on particular learning activities and which parts should be completed and corrected independently. In addition, learners are also expected to interact with other learners, even though they fail to provide learners with well-formed and comprehensible input at a level slightly more advanced than the level of the speaker.

The natural approach teacher has three roles. First, the teacher provides a constant flow of comprehensible input in the target language. *Comprehensible input* is defined as cues that lie just beyond the skill or structure already known to the student. This avoids frustration and increases interest because the student realizes that he *almost* understands the cue and that he can do so without undue effort. This role places the teacher as the focal point in classroom instruction. Second, the teacher creates an interesting and friendly classroom environment. Finally, the teacher selects and orchestrates a rich mix of classroom activities, involving different group sizes, content, and contexts. The teacher is responsible to collect materials and

design their use, based not only on their perceptions but also on needs and interests elicited from students. In addition, the teacher communicates clearly the assumptions, organization, and expectations of the natural approach because in many cases these will conflict with what students would normally expect language learning and teaching to be.

Instructional materials consist principally of *realia*, objects such as coins or tools found in “real life.” Other typical materials include schedules, brochures, maps, and books at appropriate levels of difficulty. Games are particularly useful tools because they, by nature, encourage learners to focus on a larger goal than language structure. The goal of their use is to provide a context that helps the learner acquire the language by relating classroom activities to the real world and to foster interaction among learners. The aim is to promote comprehension and communication.

Practitioners of the natural approach employ a variety of strategies and techniques, including Total Physical Response (TPR), Situational Language Teaching, and Communicative Language Teaching. For instance, in a class at the preproduction level, the teacher may begin with general TPR commands that require learners to respond through action such as standing up or raising their right hands. The teacher then proceeds to targeted TPR exercises on a specific topic. If the topic were parts of the body, the teacher may request that students put their hand on their heads, or point to their feet. Then the teacher could change topics and introduce classroom objects into the TPR repertoire (e.g., “Lift your pencil.”). Then the teacher could use visuals to introduce new vocabulary and continue with activities that require only student names in response. In the activity, after describing the picture, the teacher could pass the pictures to students and then ask students who had a picture of a particular description. Then the teacher could combine the visuals with TPR, by requesting that particular students take particular pictures and give them to another student. In all of these activities, and others, the teacher maintains a constant flow of comprehensible input in the target language, using key vocabulary, gestures, context, repetition, and paraphrase to ensure that the input remains comprehensible throughout the sequence.

Contributions to Bilingual Education Practice

The natural approach complements other communicative approaches to second-language acquisition. The

approach focuses on authentic communication as its primary goal and is characterized by a low-anxiety environment in which to acquire a second language, where speech is not forced, and meaning takes precedence over form. It is guided by these principles: comprehension precedes production, production emerges in stages, curriculum consists of communicative goals, and task-based activities aim to reduce learner anxiety.

The natural approach addresses some of the shortcomings of the *communicative approach* and leaves others unaddressed. First, in the natural approach one finds a cogent theoretical rationale linked to language acquisition, which is an improvement over a theoretical base limited to linguistics that is the norm in other communicative approaches. The language acquisition theoretical rationale supports development of curriculum and instructional arrangements that are both responsive to learner characteristics and interests yet are also applicable to multiple situations, thus rendering them more readily replicable and understandable by practitioners preparing to implement the approach in instruction.

The natural approach leaves several unanswered questions. Terrell and Krashen recognized an inherent weakness in using pair and group work, which is inconsistent with an aspect of the input hypothesis stating that people acquire language best by understanding input that is slightly beyond their current level of competence. Yet they offer no remedy, and research literature beyond Terrell and Krashen’s work is minimal and offers no additional insight into the problem. The natural approach also leaves unanswered questions about teacher preparation regarding additional burdens placed on teachers, including most notably group process management skills and instructional materials development in lieu of using a textbook. An implicit assumption in the approach is that instructional materials would be compiled over time into packages resembling textbooks, but the feasibility of commercial development of these materials is not addressed.

These weaknesses notwithstanding, the natural approach has contributed to bilingual education by distinguishing between learning and acquiring language and developing a theoretical rationale advocating for the latter.

The natural approach has roots in classroom practice that were elaborated by research. This grounds the literature on the approach in terms that practitioners can understand, instead of using a research-driven agenda that was difficult to implement in the classroom.

Though its instructional strategies are arguably not innovative, the approach has extended attention to other, less-tangible aspects of language acquisition, such as setting clear expectations with learners and setting learning tasks in real-life contexts. These aspects have profound influence on learners' progress in acquiring a second language.

NAVAJO CODE TALKERS

The need for mastering other languages is often linked to national security concerns. An episode in one of the fiercest battles of World War II, as the United States fought the Japanese, drove this point home. At Iwo Jima, one of the bloodiest battles of the Pacific theater, a mysterious language was heard crackling from American radios amid falling bombs and gunfire. These were the secret messages developed and transmitted by Native American soldiers who served as Navajo code talkers over tactical military radios. This entry describes the service of the Navajo code talkers in World War II, and the instrumental use of the Navajo language.

The Japanese military was known for its highly skilled code breakers. Until then, they had deciphered every message sent between American troops. Early in 1942, Phillip Johnston, a son of Presbyterian missionaries to the Navajo reservation who had learned the Navajo language from the age of 4, proposed the use of the Navajo language for combat communications to Major General Clayton P. Vogel. Vogel was then commanding general of Amphibious Corps, Pacific Fleet. Johnston's rationale for the use of Navajo was based on the complexity of that language.

He told the general that fluency is extremely difficult if the language is not learned from birth because, at the time, it had no alphabet or symbols and was used only in remote areas of the American Southwest. The language was unknown outside the region and was likely to be totally foreign to Japanese code breakers.

According to retired Marine Alexander Molnar Jr., fewer than 30 non-Navajos could understand the language at the onset of World War II, and none of them was Japanese. This helped convince Vogel that the Japanese would be unable to break messages coded in that language by native speakers. Under simulated combat conditions, Johnston demonstrated how Navajo volunteers were easily able to encode, transmit, and decode a few lines of English in 20 seconds and break a cryptographic machine record that would typically take 30 minutes to send. Based on this demonstration, Vogel made an immediate recommendation to Commandant Thomas Holcomb of the Marine Corps to recruit Navajo volunteers.

In May 1942, the Marines started interviewing Navajos aged 17 to 32, of good physical condition, with high school diplomas, and with fluency in both the English and Navajo languages. The first 29 Navajo recruits were chosen and were sent to a boot camp in California. After a crash course in military coding systems, the Navajo recruits created and developed 411 terms often used in combat. A codebook was developed but was never taken into the battlefield. The code talkers memorized all the English-Navajo and Navajo-English word associations in the codebook. According to Molnar, when the Navajo code talker received a message, he had to translate each Navajo word into the English equivalent and then use the first letter of the English equivalent to encode the term in Navajo. For instance, the word "navy" could be coded as *tsah* (needle), *wol-lachee* (ant), *ah-keh-di-glini* (victor), and *tsah-ah-dzoh* (yucca).

More than 500 Navajos served in the Marines during World War II. Of these, some 400 were trained as code talkers who became invaluable assets to hasten the end of the war. Major Howard Connor praised the Navajos for the skills, speed, and accuracy they demonstrated as links between the various units in which they served. Connor had six code talkers in his division and according to him, "Were it not for the Navajos, the Marines would never have taken Iwo Jima." The code talkers played a vital role in every attack the U.S. Marines conducted in Guadalcanal, Tarawa, Peleliu, and Iwo Jima during World War II.

The Navajo code talkers had never experienced the valuing of their language to the same degree as they experienced during the war. By their fortitude, they inspired many people to keep their language and culture intact despite the linguistic repression they had experienced in the past. Yet these unique Marines went officially unrecognized for many years. Finally, on September 17, 1992, they were honored in a ceremony at the Pentagon. The renewed pride in their ancestral language led many of them to become supporters of bilingual education.

NEWCOMER PROGRAMS

Ricardo is an immigrant teenager from Mexico's Yucatán Peninsula who recently moved to Oakland, California, to live with his aunt and uncle. When he arrived in the United States, everything was foreign to him, including his relatives. Ricardo had never met the relatives he would be living with, nor had he ever had any interaction with people from "el norte" (a name commonly used in Mexico and South America to refer to the United States). Because of economic circumstances and inconsistent school attendance, Ricardo,

who is 15 years old, has received little formal schooling. His attire makes him stand out, and his new neighbors taunt him about coming straight from "el rancho." Furthermore, Ricardo did not expect to encounter the social tensions that exist between native-born U.S. Mexicans and those who immigrated to the United States. Personal safety is a concern, as a gang presence and high crime rates directly affect his daily life. Ricardo's new life is in turmoil because of his struggle to adapt linguistically, socially, psychologically, and academically to life in the United States.

For students like Ricardo, school districts with large concentrations of English language learners (ELLs) who are recent immigrants have developed newcomer programs or entire schools to help them make the transition and succeed. *Newcomer* refers to any immigrant who has recently arrived and has limited proficiency in the English language or little or no experience attending school. Many school districts are facing increasing numbers of immigrant students at the secondary level who, in many cases, have low levels of language literacy development in both their native language and in English. A significant number, like Ricardo, have gaps in their formal education. In some instances, immigrant youngsters have never attended school anywhere and are faced with the prospect of attending American high schools that are culturally alien, sometimes hostile. These students are required to learn English, take required content matter courses, and adapt socially to the school culture at the same time they are also struggling to fit into mainstream society.

Newcomer programs, as described in this entry, are designed to meet the myriad needs of immigrant students who enter secondary public schools in the United States. The main goals of newcomer programs are to assist students in the process of developing English literacy skills, provide instruction in core academic areas, and help students acculturate to the schools as well as youth culture in the United States. Some programs also include native-language development.

Newcomer programs vary throughout the United States and are structured in different ways, depending on the school district. Some types of programs are housed within a school, some are located at separate locations to accommodate students from more than one school, and others consist of an entire school in itself. For instructional design, most newcomer programs offer courses that are designed to meet specific stated goals of these programs; these also vary

depending on need and school district. The designers of newcomer programs believe recent immigrant students need time to adjust to their new schools and social surroundings without the pressure of being immersed in American youth culture too quickly. Although these programs provide a safe environment where students are able to build a strong foundation for English language development, acclimatize to the American school system, and succeed academically, these programs often face issues such as inadequate funding, a limited time in which to provide English and content instruction, low literacy skills of students, and student transportation. These programs are often pressured to keep students for only a short period to avoid illegal segregation.

Rationale for Establishing Newcomer Programs

Until the 1980s, special programs for newcomer students were extremely rare. However, during the 1980s, the arrival of nine million immigrants, including two million school-aged children soon created a serious need for these specialized programs.

School districts soon realized they had to meet the needs of students like Ricardo and had to develop program models that went beyond traditional programs, designed to focus only on English language development. The rationale for establishing newcomer programs differs across sites. According to researcher Deborah Short, programs may be developed for the following reasons: (a) students are at risk of failing educationally or of dropping out of school, (b) students are too old for their grade placement because of low skills and lack of a formal education, (c) students' needs are greater than the instructional design currently in place for ELLs, or (d) students are lacking in English or native-language literacy skills. Monica Friedlander maintains that to meet the needs of immigrant students, it is important to recognize the diversity within that population, even among the same nationalities. Friedlander considers these individual differences to be a critical consideration when developing programs and strategies that may require different approaches.

Program Types

Newcomer programs are categorized into three types, depending on their location: programs within a school, separate programs at different locations, and

whole schools dedicated to newcomers. In the most common program types, students attend a program situated within the school building (known as school-within-a-school). This type of setting gives newcomer students various opportunities to interact with English speakers in nonacademic classes (e.g., physical education, music, or art) during part of the school day. The time a student may attend a newcomer program within a school varies from one to two class periods, to half a day, or a full day. Available resources, time constraints, and the specific needs of the newcomer population determine the length of time a student spends in the program. In general, newcomer students in these types of programs attend a half or full day, and typically stay in the program for a full year. Some programs allow students more time within the program, depending on available resources.

A second type of program model is a secondary site. This is especially beneficial when school districts choose to develop a program that will serve more than one school. Students in this type of program typically attend for a full school day. Some school districts offer bus transportation to and from the students' designated home school and integrate students into their home school for part of the school day. Most students in this program model stay for approximately 1 year.

The third type of program entails an entire school designed for students who are new immigrants. This program is the least common of the various program types; presently, only six newcomer high schools exist nationwide. International High School at La Guardia Community College, in Long Island City, New York, is perhaps the best-known newcomer school. The school's goal is "to develop the linguistic, cognitive and cultural skills necessary for success in high school, college, and beyond." This school only accepts students who have limited formal educational experiences and have lived in the United States for less than 4 years. Students in a number of newcomer high schools are allowed to remain in the program until they graduate or until they reach the age of 21.

Instructional Design

International High School differs in this regard, but most newcomer programs are designed to provide services for a limited time. Courses within these programs are designed to develop language skills as well as facilitating students' cultural and social integration into the school culture and the culture of the larger

community. All newcomer programs offer intensive English language development courses to newcomer students. Some programs also offer heritage language literacy opportunities. All programs also offer content area instruction, though programs vary in how instruction is delivered. Content area instruction may be delivered via sheltered instruction, which uses English as the language of instruction but also uses a variety of strategies to make academic content comprehensible to non-English speakers. Instruction may also be delivered in students' native languages or a combination of both sheltered and native language. Effective newcomer programs may also offer courses and strategies for initial literacy development because many students enter these programs without formal literacy skills in any language. An instructional model known as "native-language support" may also be used. Courses and activities for orientation to U.S. schools and the community may also be part of a program's instructional design. A number of programs also offer career awareness courses.

Benefits and Drawbacks of Newcomer Programs

Three main benefits have been identified for students in newcomer programs. These include cultural participation, cultural sensitivity, and a collective sense of belonging. Newcomer programs provide a safe environment for recently immigrated students and provide more opportunities for them to participate fully while they develop language skills and engage in an academic curriculum. Recently immigrated students may also encounter teachers who are trained to be more sensitive to their linguistic, academic, and social needs. Generally, teachers in these programs have more preparation and experience than do general content teachers, especially at the secondary level. A collective sense of belonging is also a benefit to students in newcomer programs because most immigrant students often experience and share similar challenges and successes, and this helps them create a bond.

A number of issues should be considered when programs segregate recently immigrated students from native English speakers. Separating students may lead to linguistic isolation and limit the opportunities for newcomer students to converse and develop their English language skills through the help of native English speakers. Social isolation may also become a problem and can lead to negative stereotypes and limit

cross-cultural understanding. Another drawback of newcomer programs is labeling. Students who attend newcomer programs may be labeled as monolinguals, or are given other identifying terms that imply language limitation. Unfortunately, many of these labels also denote intellectual inferiority or learning disability. These labels may directly affect a student's identity and self-esteem because they are already struggling with issues of identity. Finally, newcomer programs may not always be equal to regular classes and programs in regard to materials available, the opportunities to participate within the school, and the preparation of teachers. English instruction may be limited to drill-and-practice instruction, emphasizing memorization and rote work.

Although newcomer programs segregate immigrant students from the mainstream population, the programs' design distinguishes between this type of segregation and the type of ethnic and racial segregation that is illegal. Many school districts have avoided the creation of newcomer schools or centers, fearing the entanglements of illegal segregation. The Office for Civil Rights (OCR) has reviewed several of these programs. Although OCR has been cautious in endorsing the design, they have not found programs of this type to be in violation of the Civil Rights Act.

Transitions to Regular Classrooms

Procedures for students to leave a newcomer program and transition to regular classrooms vary widely. In many 1-year programs, students exit automatically when the school year ends. A significant number of programs test students for language proficiency, and in some cases, content areas, to determine when newcomers can participate in regular school programs. Most newcomer programs allow flexibility, and students are allowed to exit before the end of a program term if they have made good progress, based on assessment. Students may also extend their time in the program if they arrived in the second semester of the year, or if they need additional time to address significant gaps in their educational or linguistic background.

To make the transition as smooth as possible, planning is imperative. Good program models include ongoing conversations between administrators and teachers about the students who will be transitioning. Decisions are usually made by committees rather than by a single teacher or administrator. Students may be given the opportunity to observe the classes

they will be attending, or collaborate with students in mainstream classes before their transition. When students must transition to a new school, it is important to provide opportunities to attend orientations or preregistration events conducted in their own languages. Another key to newcomer students' continued success after transition is to provide continued monitoring and support.

Even with the limitations and issues these programs face, their development has provided welcoming spaces for newly arrived students, and an opportunity to develop a sense of community. Newcomer programs benefit students like Ricardo directly, making the transition between two countries, cultures, languages, and educational systems less overwhelming.

NIETO, SONIA (1943–)

Sonia Nieto, a prominent author in the field of multicultural education, is Professor Emerita of Language, Literacy and Culture in the School of Education at the University of Massachusetts, Amherst, where she taught from 1980 until her retirement in 2005. One of

her most significant contributions to education is her conceptual work in which she places bilingual education within multicultural education. Previously, these two fields had been seen as parallel routes to equity and enhanced education for minority group children.

Nieto's education, career, and awards are described in this entry.

Born in 1943 in Brooklyn, New York, to Esther and Federico Cortés, Sonia Nieto began her education in the New York City public schools speaking only Spanish. She experienced firsthand the difficulties of learning English as a second language in a climate of discrimination and low expectations of language minority children. However, her mother and father, proud of their Puerto Rican culture, ignored pressure to speak only English and continued to speak Spanish in the home. By high school, Sonia Nieto was in honors classes.

Nieto received a BS in elementary education from St. John's University in 1965. She received her MA in Spanish and Hispanic literature in 1966 from the New York University Graduate Year in Madrid, Spain. That year, she began her career in teaching as a junior high school teacher of English and Spanish in the Ocean Hill–Brownsville community in Brooklyn, and in 1968 became a fourth-grade bilingual teacher at P.S. 25 in the Bronx, the first completely bilingual school in the Northeast and one of the first in the country to be funded by the new Title VII, Elementary and Secondary Education Act (ESEA), Bilingual Education Program. Her first position in higher education was as an instructor in the Puerto Rican Studies Department at Brooklyn College, where she worked in a joint program in bilingual education with the School of Education. In 1975, she and her family moved to Massachusetts, where she earned her doctoral degree in curriculum studies from the University of Massachusetts, Amherst, with special concentrations in multicultural and bilingual education.

Her work on the areas of multicultural and bilingual education is explicated in her book, *Affirming Diversity: The Sociopolitical Context of Multicultural Education*, now in its fourth edition. Her books and articles are used widely in multicultural education and professional development courses. The National

Association for Multicultural Education recognized her work with its Educator of the Year Award in 1997. She also received the New England Educator of the Year Award from Region One of the same organization in 1998.

In addition to multicultural and bilingual education, Nieto's scholarly work has focused on teacher education; curriculum reform; Puerto Rican children's literature; and the education of Latinos, immigrants, and other culturally and linguistically diverse student populations. Her books include *What Keeps Teachers Going?* (2003), *Language, Culture and Teaching: Critical Perspectives for a New Century* (2002), and *The Light in Their Eyes: Creating Multicultural Learning Communities* (1999). She edited *Why We Teach* (2005) and *Puerto Rican Students in U.S. Schools* (2000). She has also written chapters and articles on these issues in journals such as *Educational Leadership*, *Theory Into Practice*, *The Harvard Educational Review*, and *Multicultural Education*.

Her experience also includes working as the *Lau* Compliance Coordinator for the Massachusetts Department of Education from 1979 to 1980 and, while at the University of Massachusetts, she was a Parent/Teacher Trainer for the Bilingual Education Service Center from 1980 to 1983 through a consortium with Brown University.

Nieto's leadership and community service include serving on local, regional, national, and international commissions, panels, and advisory boards that focus on educational equity for all students. Among these have been the Massachusetts Advocacy Center, an advisory committee for California Tomorrow, and the National Advisory Boards of both Facing History and Ourselves (FHAO) and Educators for Social Responsibility (ESR). She has received many awards for her research and advocacy, including the Human and Civil Rights Award from the Massachusetts Teachers Association (1989), the Community Change of Boston Drylongso Award for Anti-Racist Activists (1995), and the Teacher of the Year Award from the Hispanic Educators Association of Massachusetts (1996), among others.

Nieto was also a recipient of the Annenberg Institute Senior Fellowship for 1998 to 2000, and she has received two honorary doctorates: one in Humane Letters from Lesley University in 1999 and the other in Intercultural Relations from Bridgewater State College in 2004. In June 2000, she was awarded a month-long residency at the Bellagio

Center in Italy, and in 2003, she was named to the *Críticas* Journal Hall of Fame as the Spanish-Language Community Advocate of the Year. In 2005, she received the Outstanding Educator in the English Language Arts Award from the National Council of Teachers of English, and in 2006, she was given the Enrique T. Trueba Lifetime Achievement Award. She is married to Angel Nieto, and they have 2 daughters and 10 grandchildren.

NO CHILD LEFT BEHIND ACT OF 2001, TESTING REQUIREMENTS

In 2001, Congress passed education legislation promoting school accountability and the implementation of standards and assessment for all students. These standards articulate what students should know and be able to do as they advance through school and are meant to align curriculum, instruction, and assessment. In accordance with these mandates, the purpose of

assessment, which generally translates into student testing, is to measure the extent to which students have met the standards that have been set. Ostensibly, standards and assessment offer a way to hold students, educators, schools, districts, and states accountable for student achievement. These mandates, as indicated by the legislation, include students who speak a language other than English at home and who are in need of language support services to succeed in English-medium classrooms. This population of students is commonly referred to as English language learners (ELLs).

The Elementary and Secondary Education Act of 1965 (ESEA), as amended by the 1994 Improving America's Schools Act, required states to adopt academic content and performance standards and assessments to evaluate student progress toward those standards. The recently reauthorized ESEA, titled the No Child Left Behind Act of 2001 (NCLB), builds upon earlier legislation and focuses even more heavily on accountability. In this way, NCLB has greatly intensified the involvement of the federal government in the education that each state provides. Within the law's accountability framework, student performance on assessments is used to determine whether schools will continue to receive federal funds without sanctions. Although NCLB does not specifically require states to use standardized tests for their statewide assessment systems, this is what is happening across the country because it is how the law has been interpreted by most states. As a result, standardized tests have become increasingly high stakes since the passage of this federal legislation, as a way for states to demonstrate measurable student progress and meet the law's accountability requirements. This entry describes the assessment requirements of NCLB as they pertain to ELLs.

"No Child Left Behind" Assessment Mandates for English Language Learners

NCLB mandates that accountability requirements apply to all students and entails the inclusion of ELLs as what the law terms a "subgroup" which must make measurable academic progress. Each state was required to put in place an assessment system that includes ELLs by the completion of the 2000–2001 school year. NCLB mandates a participation rate of at least 95% of all students in state assessments used for NCLB compliance. Central to this legislation is that all students must achieve the level of "proficient" in state assessment

systems by the 2013–2014 school year. With this emphasis on the inclusion of all students for accountability to the federal government, performance by ELLs on assessments can greatly affect the appraisal of a teacher, school, district, or state.

The assessment and accountability provisions of NCLB are spelled out in both Title I and Title III of the law. Title I provides additional federal resources to school districts and schools with high concentrations of poverty. Most ELLs are Title I recipients and attend schools that receive this funding, so they are greatly affected by the education reform efforts promoted through Title I legislation. In addition, Title III of NCLB is called "Language Instruction for Limited English Proficient and Immigrant Students," and funds the programming for ELLs that school districts provide (ELLs are referred to as "Limited English Proficient" in federal legislation). According to the U.S. Department of Education, Title I and Title III programs are more closely intertwined than ever before.

Titles I and III mandate both academic content and English language proficiency assessments for ELLs. The original legislation requires that inclusion in state assessment systems begin immediately, even if an ELL has been in the United States less than 3 years. Although there is great concern about this provision, the current law allows no exemptions for short-term residents or those who have not had adequate instruction in English. English language proficiency assessments are intended to evaluate a student's progress toward acquiring listening, speaking, reading, and writing skills in the English language. This type of assessment is mandated only for ELLs, so these students and those who educate them are required to prepare for additional assessments when compared with non-ELL students. A state must also evaluate the achievement of any ELL in meeting its reading or language arts academic standards, using assessments in English if the student has attended school in the country for 3 or more consecutive years. Furthermore, states must include all ELLs in their academic content assessments for subjects such as math and science by providing test accommodations or modifications. Accommodations or modifications are meant to make test content more accessible to ELLs, for example, by providing students with extra time or allowing them to use a bilingual dictionary. NCLB leaves it to the individual states to decide which assessments they will use and also which test accommodations or modifications they will permit to meet the law's mandates.

Title I Section 1111(b)(7) of NCLB requires each state to show that local education agencies will assess the English proficiency of all ELLs annually. In accordance with Title I, a state must include ELLs in its statewide academic assessment system and assess them in a “valid and reliable manner” that includes the following:

1. Reasonable accommodations; and,
2. To the extent practicable, assessments in the language and form most likely to yield accurate and reliable information on what those students know and can do to determine their mastery of skills in subjects other than English until they have achieved English language proficiency.

States must also identify all of the languages other than English that are present in the student population.

More accountability requirements are outlined in Title III of No Child Left Behind, which are aligned to those in Title I. Title III, Part II is titled “Standards, Assessment, and Accountability,” and required that each state set measurable achievement objectives in 2003. Each state is required to have goals for what NCLB terms “adequate yearly progress,” sometimes called simply AYP, which are achievement objectives measured each year to ensure that ELLs are developing English proficiency and meeting the same academic content standards as those of native-English speakers. As the law states, these objectives must reflect the following:

1. The length of time an individual child has been enrolled in a language instruction educational program; and,
2. Increases in the number or percentage of children making progress in learning English and in attaining English proficiency by the end of each school year, as determined by a valid and reliable assessment of English proficiency consistent with Title I section 1111 (b)(7).

Each state must determine the starting points for adequate yearly progress of ELLs and match the academic content standards and adequate yearly progress targets for ELLs to those of native-English speakers.

Challenges of “No Child Left Behind” Mandates for English Language Learners

The premise underlying the ESEA assessment provisions is that including English language learners in a state’s accountability system will improve the quality of education that these students receive. However, NCLB is increasingly receiving criticism for its top-down approach and lack of sufficient attention to providing the necessary resources to ensure that all students can attain the standards that have been set. Bilingual education supporters attack this position because NCLB removed the term *bilingual* from the 1994 version of the ESEA and the new law only emphasizes English acquisition. For example, the U.S. Department of Education’s Office of Bilingual Education and Minority Language Affairs was renamed by NCLB as the Office of English Language Acquisition, Language Enhancement, and Academic Achievement for Limited English Proficient Students. Many ELL advocates disapprove of NCLB for creating a context in which ELL students are penalized for their limited proficiency in English. The challenges that English language learners face in meeting the demands of NCLB mainly stem from the law’s emphasis on assessment. To prove that students are making “adequate yearly progress,” most states use standardized tests that were developed for the assessment of native-English speakers, not ELLs, and that are only provided to students in English. Only eight states permit the use of test translations for their statewide exams, and just five of these actually provide the translations they permit. Research indicates that any assessment of an ELL administered in English will be greatly affected by a student’s lack of English language proficiency. This is because testing in English makes any test, including a test of math or science, actually an assessment of English language skills, even if the test is intended to evaluate content knowledge.

As stated earlier, NCLB does not specifically mandate the implementation of statewide standardized tests, though this is how most states have interpreted it. In large part, states have done so because standardized tests are typically quite feasible and affordable on a wide scale. However, there are some examples of states seeking viable alternatives they feel may more accurately assess ELLs. The state of Delaware is piloting the use of portfolio assessments

to evaluate ELLs on a wide scale, with the intention that their portfolio system will meet NCLB requirements.

In most states, the same standardized tests used to comply with the NCLB assessment and accountability provisions are being used to make other crucial decisions that affect students' lives, such as grade promotion, high school graduation, and program tracking. ELLs typically do not perform as well as native-English speakers on these tests, and because of this, they are being penalized. The law is also being blamed for promoting standardized, proscriptive curricula and, overall, for changing programming and instruction for ELLs in ways that are more negative than positive. When this legislation comes up for reauthorization, ELL advocates are expected to lobby for major changes to be made to the law, particularly with regard to the assessment mandates for ELLs. NCLB has greatly affected the education of ELLs in recent years, but it remains to be seen if it will continue to do so.

NO CHILD LEFT BEHIND ACT OF 2001, TITLE I

The No Child Left Behind (NCLB) Act of 2001 is the continuing reauthorization of the 1965 Elementary and Secondary Education Act (ESEA) of 1965. Signed into law in January 2002, NCLB provides funding to states and schools and establishes federal education policy. Title I of NCLB, “Improving the Academic Achievement of the Disadvantaged,” is designed to provide federal assistance to states and school districts in meeting the educational needs of low-achieving children in high-poverty schools, limited-English-proficient students, migratory children, children with disabilities, Native American children, neglected or delinquent children, and young children in need of reading assistance, as discussed in this entry. Title I provides both formula grants to states to pass on to school districts and other funds that go directly to schools for special purposes. The act also provides competitive grant programs. When states and outlying areas of the United States accept federal educational funding—as all currently do—they must comply with the mandates of NCLB. Although some states have complained bitterly about these requirements and threatened to refuse funding, none have actually done so.

The stated purpose of Title I is to ensure that all children have a fair, equal, and significant opportunity

to obtain a high-quality education and reach, at a minimum, proficiency on state-level academic achievement standards as measured by state academic assessments (§1001). To achieve this purpose, Title I mandates annual student assessments of all students in Grades 3 through 8, and once in high school. It requires each state to create its own academic content and achievement standards and assessments to measure those standards, and use the results to hold schools, districts, and the state itself accountable. Assessments must include math and reading/language arts annually, and science must be tested three times between Grades 3 and 12. Title I also requires annual English language proficiency testing of all limited-English-proficient (LEP) students. States must issue individual student reports, as well as school and district “report cards” annually, that include the results of the student achievement assessments and are made available to parents and the public.

All students are expected to meet or exceed their state’s academic standards by 2014. In other words, Title I mandates that by 2014, 100% of students will meet passing criteria on their state’s assessment. Test score data must be disaggregated into different subgroups, including each major racial and ethnic group, students with disabilities, students with limited English proficiency, and economically disadvantaged students (§1111(a)(2)(C)(v)(II)). States must set annual measurable achievement objectives (AMAOs), which indicate the percentage of students expected to pass their state assessments each year; the AMAOs typically increase each year relative to the goal of ensuring that all students in each subgroup pass by 2014.

A subgroup is deemed to be making adequate yearly progress (AYP) if it meets or exceeds that year’s AMAO. In addition, to be deemed as making AYP, at least 95% of the students in the subgroup must be tested each year, and each subgroup must meet the criteria of one other achievement indicator (typically attendance or graduation rates). Thus, if a subgroup does not reach its AMAO or if fewer than 95% of the students in that group take the test, that subgroup is deemed as “failing” to make AYP. Furthermore, schools and school districts are held accountable for ensuring that each subgroup reaches its AMAO. If any one of its subgroups does not, then the entire school (or district) is deemed as failing to make adequate yearly progress.

Once a school has been deemed as “failing” to make AYP for 2 consecutive years, it is identified by

the state for “school improvement.” The school must notify parents and must provide students the opportunity to transfer to another school that is not “failing” and cover any necessary transportation costs (§1116(b)(1)(D)). Within 3 months, the “failing” school must develop and implement a 2-year school improvement plan. If the school fails to make AYP the following year, it must provide “supplemental educational services” to students from an outside provider, such as after-school tutoring from a private company. The district must also take “corrective action,” which could include appointing outside experts to advise the school, decreasing the authority of the school’s management, or even replacing school staff (§1116(b)(7)). If the school fails to make AYP the following year, it is subject to “Restructuring,” which could entail state takeover of the school, replacing the entire staff, converting the school into a charter school, or turning the school over to a private company (§1116(b)(8)). Title I does not clearly provide for accountability after state or private takeover, and no indication of when or how a school is to be returned to regular school district operation.

Before 2002, states and school districts were given flexibility in statewide testing and how and when to include LEP students. Title I of NCLB, in contrast, requires LEP students to take state academic assessments regardless of their English language proficiency and regardless of how long they have attended school in the United States. In other words, a non-English-speaking English language learning (ELL) student who arrived in the United States for the first time on the day testing began would nonetheless be required to take one or more state assessments. However, states are required to assess LEP students “in a valid and reliable manner” and must also provide “reasonable accommodations.” Guidelines issued by the U.S. Department of Education in 2003 suggest that these accommodations might include extra time, small-group administration, flexible scheduling, simplified instructions, audiotaped instructions in the native language or English, or providing additional clarifying information.

Reasonable accommodations for LEP students could also include, to the extent practicable, assessments in the language and form most likely to yield accurate data on what such students know and can do in academic content areas, until such students have achieved English language proficiency (§1111(b)(3)(C)(ix)(II)).

Title I requires each state to identify the languages other than English spoken by students, and languages for which state assessments are needed but not available. States are required to make every effort to develop such assessments and may request assistance from the U.S. Department of Education if linguistically accessible academic assessment measures are needed (§1111(b)(6)). If states do have native-language versions of their assessments, LEP students may only take these tests for 3 consecutive years, after which they must take the assessments in English. However, a 2-year extension may be granted for native-language assessments on an individual case-by-case basis, if it is determined that this would yield more accurate and reliable information on what the student knows and can do on tests (written in English) of reading or language arts (§1111(b)(3)(C)(x)). U.S. Department of Education guidelines make it clear that native-language assessments are only required “to the extent practicable.” At the time of this writing, fewer than 10 states have found it practicable to offer native-language assessments; thus, most ELL students are required to take, and are expected to pass, their state assessments in English.

In addition to its standards, assessment, and accountability mandates, Title I includes funding for drop-out prevention programs, family literacy programs, advanced placement programs, programs for migratory students, and programs for children and youth who are neglected, delinquent, or at-risk. Title I also includes the Reading First grant program, designed to assist schools establish scientifically based reading programs in Grades K–3 for struggling readers. Schools receiving Reading First grants typically have large numbers of ELL students.

Critics and proponents of NCLB agree that NCLB in general, and Title I (and Title III) in particular, have brought renewed attention to the needs of ELL students. If a school’s LEP subgroup fails to make AYP, the entire school is labeled as failing and subject to sanctions. Thus, districts and schools that have long neglected their ELLs can no longer afford to do so.

Negative Aspects of Title I for ELL Students

Intentions notwithstanding, scholarly research has provided evidence that the mandates of Title I related to ELLs may be causing more harm than good. One issue is that Title I indirectly discourages bilingual

education because of the immense pressure schools are under to raise ELL student test scores and that most ELLs take their state’s assessments in English. Researchers have also found that narrow test-preparation curriculum and instruction (teaching-to-the-test) have diverted time and resources away from English as a Second Language (ESL) and effective sheltered English content-area instruction. A criticism with ample documentation is that the high-stakes nature of state assessments has led to a narrowing of curriculum to only those subjects—and those skills within those subjects—that are included on state assessments, thus preventing ELLs and other students from receiving full-access to the core curriculum. Given this pressure, and given technical flaws of Title I, many state and school district officials have been finding creative and sometimes questionable means to avoid having the requisite number of ELLs in a given school, and thus, avoid being held accountable for the achievement of an LEP subgroup.

Even more problematic are technical flaws that ultimately will make it impossible for any school with an LEP subgroup to make AYP. These problems are outlined in the following sections.

Problems With Requirements and Expectations for ELLs

Common sense dictates that it is difficult to pass a written test in a language in which one is not yet proficient. Title I attempts to address this issue by calling on states to assess ELLs in a valid and reliable manner through the use of “reasonable accommodations.” However, this is a case of easier said than done. Charlene Rivera, Executive Director of the George Washington University Center for Equity and Excellence in Education, and her colleagues conducted an extensive review of research on testing accommodation for ELLs and on state-level accommodation policies. They found little research in this area and that which does exist is inconclusive. They also found that state practices vary widely and that most do little to address the fact that ELLs are not proficient in the language of the test. Rivera and her colleagues conclude that much more research is needed before it can be determined how ELLs can be included in statewide assessment programs in a valid and reliable manner, and the researchers call on the federal government to provide more funding for research.

Although testing students in the native language (L1 tests) appears to be the best accommodation, the creation of valid and reliable L1 tests that are parallel to their English versions is an expensive and time-consuming process few states have found practicable. Only a small number of states have L1 versions of their state tests, nearly all of them in Spanish. Thus, most ELLs, especially those who speak a language other than Spanish, have no access to this accommodation. Even states that have L1 tests may only have them for certain grade levels and may have restrictions for how many years students can take L1 tests. Furthermore, many ELLs are illiterate in their native languages because they have only received literacy instruction in English. Even if they are literate in the L1, they may not be familiar with L1 academic vocabulary if most of their instruction has been in English. Thus, L1 tests only make sense for ELLs who (a) are literate in their L1, and (b) have received L1 content instruction in the subjects being tested, such as students enrolled in bilingual education programs or newcomers with adequate schooling in their home country.

Flaws in Determining AYP for the LEP Subgroup

At least two major flaws in NCLB will affect any school with large numbers of ELL students. The first is related to the AMAOs set by the states. Schools with large numbers of ELL students will likely be well below the AMAOs for any given school year and, thus, have farther to go to catch up than other schools. Also, the AYP requirements are unable to account for newly arrived ELLs; these students end up being expected to make the same progress at the same rate as their peers, but without having had the benefit of instruction or sufficient opportunity to first learn English. NCLB's AYP provisions assume all students progress through the school system starting in kindergarten at the beginning of the school year. The reality, however, is that newcomer ELLs can arrive at any time, at any age, and in any grade level, thus, AYP expectations for these students are unreasonable.

The other flaw is even more detrimental, with the potential to deem any school with an LEP subgroup as failing to make AYP and ultimately subject to state takeover. Title I treats the LEP subgroup as it does all other subgroups; however, unlike other subgroups such as ethnicity, the membership of the LEP subgroup

does not stay the same. Few students who enter school designated as LEP are still LEP by the end of 12th grade. ELLs eventually learn English and are removed from the LEP subgroup. They are replaced each year by newly arrived ELLs with the lowest levels of English proficiency. In other words, the ELLs with the highest levels of English proficiency—those most likely to be able to pass state assessments—are replaced by those with the least amount of English proficiency—those least likely to pass. This is illustrated in Figure 1.

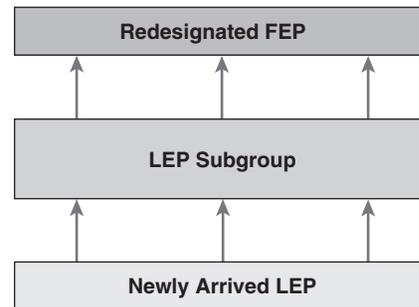

Figure 1 Movement Into and out of the LEP Subgroup

Notes: Fluent English Proficient (FEP). Limited English Proficient (LEP).

Given the nature of this movement into and out of the group, and depending on immigration patterns, the LEP subgroup could appear as if no progress is being made by ELL students, and the school may be designated as failing to make AYP and subject to sanctions. What has happened is that potentially every child who is redesignated as no longer LEP will have been replaced by a newly arrived immigrant child making it appear as if no progress had been made in reducing the number of ELLs.

In partial recognition of this flaw, in 2004 the U.S. Department of Education (DOE) announced two changes to the way the LEP subgroup is treated for AYP purposes. First, LEP students could be excluded from the reading test in English for the first year, allowing the English language proficiency test to serve as a substitute, though results would not be counted for AYP purposes. Second, test scores of redesignated LEP students would be counted for 2 years after redesignation as fluent English proficient. Newly arrived ELL students were still expected to take—and pass—their state's math assessment, and their scores would count in the school's AYP calculations. Two years later

in 2006, however, the DOE made a slight change to this requirement as well. Newly arrived ELLs in the country for less than 12 months would still be required to take the state math assessment; however, their scores could be excluded from the school's AYP calculations. Unfortunately, these changes are insufficient, and at best delay the problem rather than solve it. Concerned educators have pointed out that it is unreasonable to expect newly arrived ELLs to learn enough English in one school year (about 180 school days) to pass the same reading and math assessments as their English-fluent peers. Although the allowance for counting ELLs for 2 years after redesignation may help a little, it does not solve the basic problem of the highest students being replaced by the lowest students in English language proficiency. Thus, these changes are insufficient to ensure that the LEP subgroup will be able to make AYP.

By NCLB's own definition, an LEP student's difficulties with the English language may be sufficient to deny the individual the ability to meet the state's proficient level of achievement on state assessments. Nonetheless, Title I mandates that they do just that. Concerned educators have pointed out that to identify a group of students who by definition cannot meet the standards, treat that group as static, and then require that 100% of students in that group attain proficiency in those standards is not reasonable.

Other Problems With Title I for ELLs

Another problem affecting instruction for ELLs is related to the Title I requirement that paraprofessionals working in classrooms have at least 2 years of college. This requirement has made it difficult for schools to keep or recruit bilingual paraprofessionals who provide primary-language support and other needed assistance for ELL students under the supervision of certified classroom teachers.

Yet another problem with Title I is related to the Reading First grants. In 2006, the federal Office of Inspector General identified corruption within the U.S. Department of Education in regards to Reading First's application process. One result of this corruption was the requirement of school districts to adopt specific reading programs—program that several members of the expert review panel had commercial ties with and thus personally profited from by requiring their adoption. Many recipients of Reading First grants are schools serving large numbers of ELL

students. Despite questionable claims from the DOE that these programs were "scientifically based" (as required by NCLB), concerned ELL educators have questioned the mandated instructional and assessment material, which they believe are inappropriate for addressing the unique language and academic needs of ELL students.

Failure of the DOE to Provide Adequate Assistance

In 2006, the U.S. Government Accountability Office (GAO) issued a report acknowledging most of the problems outlined in this entry. The GAO report noted that its panel of experts found states were failing to take adequate steps to create valid and reliable assessments for ELLs and that no state had implemented an assessment program for ELLs consistent with technical standards. The GAO looked closely at 48 states and found that in nearly two-thirds of them, ELLs did not meet state proficiency goals in language arts and math, and that in most of these states, elementary school ELLs scored lower on math than other student groups did. Furthermore, the GAO found that given the complexities of testing of ELLs in a valid and reliable manner, states needed more guidance and assistance than the U.S. Department of Education was offering.

An immediate result of this GAO report was the creation of the LEP Partnership in July 2006 by the U.S. Department of Education to provide more technical assistance to states in developing appropriate assessments for ELLs. As of this writing, however, documents published by the LEP Partnership, made available on the DOE Web site, merely point out the problems and offer little technical assistance in how to actually create assessments that are valid and reliable for ELLs and that fulfill the requirements of Title I.

NO CHILD LEFT BEHIND ACT OF 2001, TITLE III

Title III, “Language Instruction for Limited English Proficient and Immigrant Students,” is part of the No Child Left Behind (NCLB) Act of 2001. It replaced, but is substantially different from, Title VII of the Elementary and Secondary Education Act (ESEA), also known as the Bilingual Education Act of 1968. As a reauthorization of the 1965 ESEA, NCLB was signed into law in January 2002 to provide education funding to states and schools and to establish federal education policy. Title III was designed to provide federal assistance to states and school districts in meeting

the language and academic needs of students classified as limited-English-proficient (LEP). (Although English language learner [ELL] is the preferred term, LEP will be used in this article because it is the official classification in NCLB.) Title III provides states with formula grants to distribute among state schools with LEP students. When states and outlying areas of the United States accept federal education funding—as all currently do—they must comply with the mandates of NCLB. These mandates include strict accountability measures related to students’ progress in learning and attaining English proficiency and in meeting state academic standards. This entry describes Title III of the No Child Left Behind Act of 2001, and its implications for the education of language learners.

The stated purpose of Title III is to improve the education of LEP children by assisting children to learn English and meet challenging academic content and student academic achievement standards. Title III provides formula grants to state education agencies (SEAs). The SEAs, in turn, make subgrants to eligible local education agencies (LEAs) (i.e., school districts and charter schools) that apply to the state for such funds.

Title III defines an LEP student as a student between ages 3 and 21, who is enrolled (or preparing to enroll) in an elementary or secondary school and whose difficulties in speaking, reading, writing, or understanding the English language may be sufficient to deny the individual (a) the ability to meet the state’s proficient level of achievement on state assessments described in Title I, (b) the ability to successfully achieve in classrooms where the language of instruction is English, or (c) the opportunity to participate fully in society.

Title III requires that LEP students be placed in a language instruction education program, defined simply as an instructional course in which an LEP student is placed for the purpose of developing and attaining English proficiency, while meeting challenging state academic content and student academic achievement standards. The law stipulates that these programs may make instructional use of both English and a child’s native language to enable the child to develop and attain English proficiency. Thus, Title III allows bilingual education, though it intentionally avoids the use of this term. Dual-language programs are also allowed under the stipulation that programs may include the participation of English-proficient children, if such course is designed to enable all participating children to become proficient in English and in a second language.

Essentially, Title III programs only need to meet two requirements: (a) teach English, and (b) teach content (as defined by state standards). Title III gives ultimate authority to each state in what types of program models for LEP students will be allowed. The law declares that Title III does not require states or schools to establish, continue, or eliminate any particular type of instructional program for LEP students, nor can the U.S. Secretary of Education mandate or preclude any instructional approach. Furthermore, the law declares, none of the requirements of Title III can be construed to negate or supersede state law; thus, in states with laws restricting bilingual education, schools cannot use the allowances for native-language instruction in Title III to offer bilingual programs (unless they meet the state's waiver requirements, if any).

School districts must submit Title III plans to the state, which in turn must submit plans to the U.S. Department of Education to receive Title III funds. In these plans, school districts and their states must describe how their language instruction curriculum is tied to scientifically based research on teaching LEP children that has been demonstrated to be effective.

NCLB requires each state to develop English language proficiency standards and English language proficiency assessments designed to measure LEP students' progress in attaining those standards. These standards and assessments must be based on the four domains of speaking, reading, listening, and writing and must include the domain of comprehension as exhibited through listening and reading. The English language proficiency assessments must be given annually to all LEP students enrolled in schools in the state. Most of the language proficiency assessments states and school districts used before NCLB did not meet these requirements, and thus, new statewide English language proficiency standards and assessments had to be developed. Most states have struggled to fully comply with these requirements by the deadlines set forth in NCLB.

Local school districts receiving Title III funds are required to submit an evaluation of their programs for LEP students every 2 years to the state. The evaluation must include the following: (a) progress of students (as determined by the mandated assessments) in attaining English language proficiency; (b) percentage of students attaining English language proficiency, and progress of students in attaining English language proficiency; (c) percentage of students transitioned into non-LEP instructional settings who have

a sufficient level of English language proficiency to achieve in English and make that transition; and (d) percentage of students who made progress in meeting state academic achievement standards, as measured by the state content achievement test.

Results of the English language proficiency assessments are a part of the state's accountability system. As with the state content area tests, the states must set annual measurable achievement objectives (AMAOs) to hold school districts accountable for the progress of LEP students in attaining proficiency in English. School districts' adequate yearly progress in achieving Title III AMAOs is determined by "annual increases in the number or percentage of children making progress in learning English" and "annual increases in the number or percentage of children attaining English proficiency by the end of each school year." In addition, AMAOs under Title III includes LEP students meeting the adequate yearly progress requirements (AYP) under Title I.

There are serious consequences for failing to make the AYP related to LEP student's attainment of English language proficiency. If a school district fails to make the AYP for 2 consecutive years, it must develop and submit an improvement plan to the state. The state is required to provide technical assistance to the district. If the district fails to make the adequate yearly progress after 4 consecutive years, the state may (a) require the district's school to modify its curriculum program or method of instruction, (b) withhold Title III funds, or (c) replace educational personnel in the district's schools.

Each state must submit detailed consolidated performance reports every year, and an evaluation report every 2 years to the U.S. Department of Education, using the evaluations from the local school districts. The results of English language proficiency assessments are also used to determine state-level AYP designations.

Positive Aspects of Title III for LEP Students

The change from the competitive grant system of the old Title VII to the new formula-grant system under Title III means that more federal funds for LEP students are reaching the most eligible students in the country. The mandates of Title III include all LEP students in all the schools in the country. Thus, Title III brings federal attention to the ELL needs of LEP

students to an all-time high. States, school districts, and their schools can no longer ignore the linguistic and academic needs of their LEP students.

The mandates for state English language proficiency standards, and assessments aligned to those standards, means each state must now make its expectations for students' English language development explicit to classroom teachers. Accountability for students' progress in learning English and attaining English proficiency highlights the need for programs and teachers that focus on English language development. Potentially, these requirements could lead to more training for teachers to enable them to provide the types of English as a Second Language (ESL) and content area instruction necessary to help LEP students meet or exceed these standards.

Negative Aspects of Title III for LEP Students

Title III focuses exclusively on English. In the transition from Title VII, ESEA, to Title III, NCLB, the word *bilingual* was completely expunged from the legislation and even from the names of offices previously connected with Title VII. The Office of Bilingual Education and Minority Languages Affairs (OBEMLA), which had been responsible for administering Title VII grants, was changed to the Office of English Language Acquisition, Language Enhancement, and Academic Achievement for Limited English Proficient Students (and goes by the more manageable acronym, OELA). The National Clearinghouse for Bilingual Education (NCBE) was changed to the National Clearinghouse for English Language Acquisition and Language Instruction Educational Programs (and goes by the shorter acronym, NCELA).

Title III has no lists of recognitions or findings related to LEP students as in past versions of Title VII, ESEA. There is only a long list of "purposes." Absent from Title III are any recognitions of the benefits of bilingual education and bilingualism, issues of cultural differences, or the need for multicultural understanding. Gone are any acknowledgments of the factors that have negatively affected the education of LEP students (e.g., segregation, improper placement in special education, underrepresentation in gifted and talented education, shortages of bilingual teachers). Acknowledgments of the personal and societal benefits of bilingual education and bilingualism no longer exist. The goal of Title III is to move LEP students

into all-English (mainstream) instruction settings as quickly as possible and to ensure that LEP students pass state tests in English.

Although the flexibility afforded state and local education agencies to define their own approaches to teaching LEP students potentially creates the opportunity for funding bilingual programs, Title III is unlikely to encourage more bilingual programs for several reasons. First, state education agencies have been given unprecedented power in deciding which types of programs they deem to be "scientifically based" and thus eligible for funding. In Arizona, for example, despite Proposition 203, bilingual programs are still possible through the waiver provisions. Nevertheless, in 2003, Arizona's superintendent of public instruction threatened to withhold Title III funds from schools that do not adhere to his strict interpretation of the waiver provisions. This superintendent's interpretation makes it nearly impossible for LEP students younger than 10 years of age to qualify and even for charter schools and schools on Indian Reservations previously deemed by the state's attorney general as exempt from Proposition 203. The superintendent cited a single magazine article as "scientific evidence" that bilingual education does not work. This represents the potential for abuse that the flexibility of Title III affords to state education officials.

In addition, the testing and accountability requirements of Title III for English proficiency are likely to discourage the use of bilingual education programs. Despite the allowances for native-language instruction, schools are under immense pressure to ensure that the LEP subgroup makes AYP in developing and attaining English proficiency as quickly as possible, at the risk of being labeled as failing and suffering the consequences outlined in the law. The Title III expectations for LEP students to pass the same state high-stakes tests as English-fluent students (as mandated by Title I), and that most LEP students take their state's tests in English, only further adds to this pressure. Many well-meaning administrators and teachers may incorrectly rationalize that all-English instruction is necessary to prepare students for English proficiency tests and content area tests in English.

Although the need for LEP students to attain fluency in English has not been debated, Title III has been challenged as a giant leap backward in promoting programs designed to help LEP students attain high levels of proficiency and literacy in both English and their native language. Other federal agencies,

such as those related to diplomacy, commerce, and national security, have been raising the alarm about the lack of its citizens' proficiency in languages other than English, and how this has greatly hampered the country's internal and international efforts. A federal report from the National Security Education Program in 2002 emphasized that the United States currently needs more speakers of more languages at higher levels of proficiency than ever before. The report also mentions the problem of the nation's schools annihilating any knowledge of other languages students initially learned to speak at home. Thus, the Title III exclusive focus on English is at odds with the urgent need for bilingual Americans identified by other federal agencies. It is also at odds with students' personal needs for and benefits of bilingualism, including better communication and relations with parents, relatives, and community members; the cognitive benefits of bilingualism; increased employment opportunities because of bilingual skills, the ability to travel or work in countries where their native language is the dominant language, and so forth.

Other Problems With Title III

Though few would disagree that it is important for schools to be held accountable for ensuring that LEP students make progress in learning English, and ultimately attain proficiency in the language, the Title III mandates and expectations have problems. First, there has to be some reasonable limit on the percentage of students expected to be redesignated as fluent English proficient each year. A more reasonable policy would have to consider the length of time the student has been in the United States and consider other factors outside the school that may affect English language learning.

The expectation for students to make progress each year toward the goal of English proficiency is not unreasonable; however, there can be problems here, too. Current research still supports the view that it takes from 5 to 7 years to obtain fluency in a second language. However, state assessments typically only define four or five levels of English proficiency, the highest being fluency. Let's then say, for example, a state has only four levels of proficiency, but it takes a student 6 years to become fluent. The student is expected to move up one proficiency level each year, but soon he will run out of levels to move to before attaining proficiency. This is precisely what is happening

in many states. In California, for example, state reports from the Legislative Analyst's Office in 2004 and 2006 have documented that LEP students quickly move from one level to the next at the lower levels, but get stuck in the higher levels for several years.

The biggest problem with the Title III AYP expectations, however, may be that they are entangled with the Title I AYP expectations. A school district's LEP students may make great progress in learning English, but if too many fail the regular state test required of all students (as mandated by Title I), they will not make the AYP under Title III. In other words, making AYP under Title III requires that LEP students make AYP under Title I. Because of both conceptual and technical flaws in Title I, most LEP students will likely not do well on a content area test written in English, nor will a school's LEP subgroup make AYP. In short, as the expectations increase each year, it will become increasingly difficult and ultimately impossible for school districts to make AYP under Title III. This failure to make AYP will have nothing to do with how well students are progressing in learning and attaining English fluency but, rather, will be the result of illogical reasoning and technical flaws within NCLB.

Another issue related to the Title III requirement is inconsistency in how states assess the English language proficiency of LEP students. Language proficiency tests used from one state to another vary widely. Different states and school districts also follow different procedures to use the results of language proficiency tests to make decisions regarding when to exit students from LEP programs.

Before NCLB, each state set its own policies regarding how to identify LEP students. In most states, schools would administer, at the time of initial school enrollment, a home language survey to determine if students come from a household with a "primary home language other than English" (PHLOTE). School districts were then required to assess these students with an English language proficiency test to identify LEP students. A number of such tests are on the market, and decisions regarding which test to use were frequently made at the district level. These different tests vary widely across practices from one district to the next, and across each state in assessments used and procedures followed to identify and report the number of LEP students. Even at the national level, attempts to accurately measure the national LEP student population proved problematic given the lack of data and inconsistencies between various data sets.

With the change to a formula grant process in Title III, a standardized procedure was needed to identify the size of the LEP (and immigrant) student population in each state. Title III stipulated that during the first 2 years of NCLB (2002–2003), the U.S. Secretary of Education would use data from the U.S. Census. After 2003, the secretary is directed to use data from the American Community Survey administered by the Department of Commerce. Alternatively, and most likely preferably, the secretary may determine the size of the LEP student population based on the number of students assessed in each state on new statewide English language proficiency assessments.

This lack of consistency leads to two major problems. First, regardless of what methods are used, the number of LEP students will most likely be underestimated, thus, the amount of Title III funds allocated will fail to reach all eligible students. Second, comparisons in the achievement of LEP students in both English language learning and academic achievement across states is problematic, given that each state identifies and redesignates its LEP students using different criteria. Simply put, a student identified as LEP in one state may be deemed as English-fluent in another state. States with easier language-proficiency tests, and content area tests, may appear to be making greater progress in helping LEP students learn English and meet academic standards than states with more challenging tests and rigorous standards.

Future of Title III

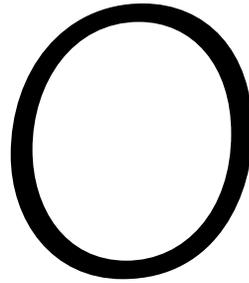

In whole or in part, the future of NCLB is murky. At the time of this writing, substantial debate surrounds the provisions and requirements of NCLB in the face of the upcoming reauthorization of the federal education law. Part of this debate focuses on the mandates for LEP students. The fundamental flaws inherent in the law, as well as its unrealistic expectations for LEP students, are increasingly recognized. Although some hope for a few changes to make the law a bit more reasonable, even the most optimistic advocates are doubtful that the kinds of substantial changes to the underlying principles and policies needed to fully and fairly address the linguistic and academic needs of LEP students will be made.

OCR MEMORANDUM OF MAY 25, 1970

See AFFIRMATIVE STEPS TO ENGLISH; APPENDIX C

OFFICE FOR CIVIL RIGHTS, U.S. DEPARTMENT OF EDUCATION

The Office for Civil Rights (OCR) of the U.S. Department of Education had its genesis in the civil rights movement and in the “War on Poverty” of the 1960s. The agency’s mission is ensuring equal access to education and promoting educational excellence through vigorous enforcement of civil rights protected by federal law. Much of the activity concerning language minority students and their rights occurred before the creation of the Department of Education under President Jimmy Carter. At that time, this activity was conducted by the Office for Civil Rights of the Department of Health, Education and Welfare (DHEW).

OCR is charged with the enforcement of Title VI of the Civil Rights Act of 1964 as it affects education.

Simply, that act prohibits discrimination based on race, color, and national origin by all recipients of federal funds. Since all school districts and state educational agencies receive federal funds, all are barred from engaging in national origin discrimination. *National origin discrimination* is that which is directed at a person or group because of ethnicity. It has also been construed to include discrimination based on common indicators of ethnicity, such as language.

Beyond the Civil Rights Act of 1964, OCR enforces a variety of laws. This is important information for educators and others concerned with the education of students categorized as limited English proficient (LEP), for the LEP student might also fall within another category and derive legal protection for that situation as well. For example, a student might be one with disabilities as well as being LEP, thus referred to as a SPEDLEP (special education limited-English-proficient) student in OCR parlance. The antidiscrimination laws enforced by OCR include Title VI of the Civil Rights Act of 1964 (race, color, and national origin), Title IX of the Education Amendments of 1972 (sex), Section 504 of the Rehabilitation Act of 1973, Title II of the ADA (Americans with Disabilities Act), and the Age Discrimination Act of 1975.

OCR is charged with the promotion of the U.S. Department of Education’s mission of access to education and educational excellence. An assistant secretary for civil rights manages 12 regional enforcement offices that handle complaints, conduct agency-initiated compliance activities, and provide technical assistance. The span of OCR’s institutional coverage is broad. Its jurisdiction includes virtually all educational institutions receiving federal funding, including

state education agencies, school districts, colleges and universities, proprietary schools, libraries, museums, vocational rehabilitation programs, and educational programs in correctional institutions. The laws protect students as well as employees of these institutions.

Most of OCR's activities involve complaints of discrimination. The agency receives more than 5,000 complaints per year. Anyone can file an OCR complaint: the victim of discrimination, a teacher aware of discrimination, an advocacy organization, and so on. No attorney is required, and complaints need not be in English. They can be handwritten in any language and will be translated by OCR. Complaints must be filed within 180 days of the last act of discrimination, but continuing practices of discrimination can also be complained about. Complaints may be individual or class based. The agency has loose guidelines for timeliness in resolving complaints. Years ago, OCR was under court order to resolve cases in a timely manner, and the need to move expeditiously is generally accepted by agency personnel today.

OCR was established in the 1960s to create an administrative mechanism to combat school segregation. Over the years, OCR's jurisdiction has greatly expanded. Today, the majority of complaints involve disability discrimination. Examples of discriminatory conduct investigated by OCR include the following (as indicated on the OCR Web site):

- Title VI (race, color, or national origin): language discrimination, tracking/ability grouping, disparate discipline, student assignment policies, racial harassment, college/university admissions, unequal allocation of resources
- Title IX: women's athletics, sexual harassment, college/university admissions, treatment of pregnant students
- 504-ADA: access, free appropriate public education (FAPE), evaluation, least restrictive environment, discipline, accommodations, and auxiliary aides

In 2002, the president signed the Boy Scouts of America Equal Access Act, prohibiting denial of equal school access to the Boy Scouts. OCR was given the task of enforcing this law despite the organization's discrimination against homosexuals. Because it is an agency of the executive branch, conflicts of this type occasionally occur in OCR's work because of priorities and preferences of the administration currently in power.

Language Discrimination Under Title VI of the Civil Rights Act

In this arena, OCR conducts its work in three different ways: (1) complaint resolutions, (2) compliance reviews, and (3) technical assistance. Its work is limited to looking into agencies and organizations that receive federal funding and does not include allegations made against individuals or companies. In complaint investigations, OCR is to act as a neutral fact finder. OCR does not represent the complainant; rather, it speaks for the U.S. government. Complaints can be filed with any of the enforcement offices or online. OCR resolves complaints through use of its "Case Resolution and Investigation Manual," also available online at the OCR Web site. This manual is regularly changed by each new administration. It gives the agency a fair amount of discretion in how to resolve complaints.

Should a violation of law be found, OCR's ultimate weapon is the termination of federal funds. This occurs only after full due process hearings and thus is quite rare. OCR cannot go to court and must rely on the U.S. Department of Justice if court action is deemed appropriate. As a consequence, most complaints are resolved through a negotiated agreement. Information on filing complaints with OCR, OCR processes, as well as substantive law followed may be found on OCR's Web site.

Compliance reviews are agency-initiated activities designed to treat major problems, national in scope or newly emerging. Over the years "Lau Reviews" (after the *Lau v. Nichols* decision of the U.S. Supreme Court in 1974) focusing on language minority students have been undertaken as reviews designed to help all of the students in a district. A few reviews also have concerned state education agency monitoring and enforcement activities. In addition, over the years, OCR has looked at the overrepresentation of minorities and LEP students in special education programs (MinSPED) as well as the underrepresentation of LEP students in gifted and talented programs.

Finally, OCR engages in technical assistance activities. This is often done at the request of school districts or parents. When OCR is in a proactive mode, it presents at national and state conferences to share information with the public. Technical assistance is an important outreach activity that informs the public of its right to file a complaint, and it is frequently a part of a resolution agreement.

As previously noted, federal involvement in bilingual education matters date back to the civil rights struggles of the 1960s and the passage in 1964 of Title VI of the Civil Rights Act. While OCR's primary task is to enforce Title VI, it has been necessary for OCR to define what constitutes a violation of the act. This has been especially true with respect to language discrimination.

The first and most prominent of OCR's interpretations on this topic is known as the "May 25th Memorandum." Issued on May 25, 1970, it was the first government document concluding that the failure of a school district to address the language needs of national origin minority students constitutes discrimination under Title VI. The memorandum states that school districts must take "affirmative steps" to allow for "effective participation" in the educational program. Prior to the issuance of the May 25th Memorandum to school districts and its ratification by the U.S. Supreme Court in *Lau v. Nichols*, school districts were not considered obligated to provide special assistance to students to address their language needs. The May 25th Memorandum also suggests that school districts with a significant number of English language learners must make school information linguistically available to parents. Parental notice in a language understandable to parents continues to be the rule, and OCR has enforced the rule in a number of recent cases (e.g., Tucson U.S.D., available on the OCR Web site). Finally, the memo also bars misclassification of language minority students in classes for the mentally retarded.

Lau v. Nichols (discussed elsewhere in this encyclopedia) held the May 25th Memorandum to be a valid interpretation of Title VI: "There is not equality of treatment merely by providing students with the same facilities, textbooks, teachers, and curriculum." This created a new interpretation of equality, the idea that some students are entitled to different treatment. This has been a critical concept for students with disabilities as well as for LEP students. From the earliest cases dealing with illegal segregation of students, the assumption was that all students must receive the same instructional program. Hence, *Lau v. Nichols* and *Brown v. Board of Education* (1954) deal with educational disparities differently because language differences were not a factor in the latter.

Neither *Lau* nor the May 25th Memorandum spelled out the specific obligations of school districts. Following the *Lau* decision in 1974, OCR convened a

panel of experts to advise the director and staff. The panel created a document known as the "*Lau* Remedies," which provided much greater guidance. Although never issued as a regulation, and nominally only a guideline to redress a previously found school district failure, "the Remedies" served as a model for appropriate services between 1975 and 1980. It set standards for entry and exit, delivery of programs, and teacher qualifications. Importantly, it required that where there was a nucleus of LEP pupils, a district should provide a teacher who spoke the children's language and should teach them in that language while they learned English. Using the Remedies as a guide, OCR negotiated approximately 500 "*Lau* Compliance Plans" during the 1975 to 1980 period.

In the late 1970s, there was an effort to turn the Remedies, with variations, into a formally published regulation. This "Notice of Proposed Rule Making" (NPRM) was published in the *Federal Register* in August 1980 but was withdrawn in the first month of the Reagan administration. No other regulation was ever issued to take its place. Since that time, OCR has generally enforced the May 25th Memorandum and *Lau v. Nichols*, using a standard based on a case known as *Castañeda v. Pickard* (1981). The ruling requires that a school district must have (a) a reasonable approach to identify all students who are in need of special help due to a linguistic barrier, (b) a theory that addresses both the need to learn English and substantive work that relies upon responsible expertise, (c) an implemented plan designed to achieve success and assessment mechanisms to evaluate success or failure, and (d) the willingness to change in a reasonable manner, should the program prove inadequate.

OCR policy documents available at the OCR Web site include the May 25th Memorandum, a 1985 memo, and a 1991 memo that incorporates all of the above, including the *Castañeda* decision. All of the guidance discussed above is for the purpose of ensuring that school districts and states comply with Title VI. Compliance is generally accomplished by either compliance review or complaints filed with OCR by covered persons, their parents, and/or advocacy organizations. In late 1999, OCR published *Programs for English Language Learners: Resource Materials for Self-Assessments*. Drafted and edited by cautious voices in OCR, this document represents the bare minimum requirements that districts must meet to satisfy OCR. It also serves as a guideline for OCR investigations. Issues that may be involved in these

activities include identification, assessment, programming to teach English and subject matter, conducting classes in the least segregative manner, staffing (teachers and aides), access to other services, monitoring, and redesignation.

OCR's enforcement energy over the years has waxed and waned. During the Nixon and Ford administrations, successful lawsuits were brought against OCR to process complaints and compliance reviews in a timely manner. Agency priorities also change over time. In the 1990s, compliance activities for LEP students were a major national OCR priority. After 2000, the number of such activities substantially diminished. Complaints regarding disability, and to a lesser extent gender, flood OCR, making it easy for the agency to avoid the more politically controversial compliance reviews. In 2005, OCR's annual report noted that 52% of the complaints received involved disability. Only 18% of the complaints concerned Title VI (race, color, or national origin). Fewer language minority complaints are filed, perhaps because the students and their families are not as legally knowledgeable as other complainants (such as women and persons with disabilities) and may not be fluent in English. Thus, OCR-initiated compliance activities are essential in serving these students. According to the OCR report, in 2005, only 7 of the 73 compliance reviews concerned LEP students, and all of these involved special education (SPEDLEP) students. The majority of reviews, 39, were Title IX reviews.

Lau plans negotiated by OCR in the 1990s are much more detailed than current plans, which tend to simply outline the law and invite the district to fill in the detail. Technical assistance has often taken the place of serious enforcement of the civil rights laws. Technical assistance can be of great value; for example, after the September 11, 2001, attacks on the United States, technical assistance targeting Arab American communities was undertaken to encourage filing of complaints for racial harassment and other illegal activities. Until that time, the Arabic-speaking community was largely unaware of OCR's activities. Unlike the Equal Employment Opportunities Commission (EEOC), which posts signs in workplaces, OCR does not post signs in schools or conduct many outreach activities. As a consequence, there is a real need for OCR enforcement activities if LEP students are to receive an "equal educational opportunity."

OCR's technical assistance for LEP students is now highly scripted and regulated by the agency. All

presentations, including PowerPoint displays, must be approved at the Washington, D.C., level. Without meaningful technical assistance, complaints are not generated. The agency has also been hesitant to allow technical assistance at important gatherings of LEP educators.

At present, there are two national nonprofit organizations with significant experience in assisting persons to evaluate possible OCR complaints: Multicultural Education, Training, and Advocacy (META), which can be reached at 1-800-466-2226, and the Mexican American Legal Defense and Educational Fund (MALDEF), which can be reached at 1-213-629-2512.

OFFICE OF BILINGUAL EDUCATION AND MINORITY LANGUAGES AFFAIRS

It is indisputable that the modern era of bilingual education in the United States is inextricably linked to the rise and fall of Title VII of the Elementary and Secondary Education Act, also known as the Bilingual Education Act. For much of the life of Title VII, the administrative unit responsible for setting funding guidelines and priorities and for distributing the funds provided under the act, the Office of Bilingual Education and Minority Languages Affairs (OBEMLA), held center stage. In 1968, after Title VII was signed into law by President Lyndon Johnson, the unit was a relatively small one in what was then the U.S. Office of Education (USOE). In keeping with the relatively small role of the federal government in public education at the time, USOE was also a small component of the Department of Health, Education and Welfare, the antecedent to the cabinet-level Department of Education, which had not yet been created. The counterpart antecedent to OBEMLA within USOE was the Office of Bilingual Education (OBE).

At the outset, Title VII funding was modest. The initial administrative unit was fashioned by the simple expedient of reassigning personnel who had worked in a unit that was disbanded in 1968. A national search for a program leader with knowledge and experience in the emerging field of bilingual education resulted in the appointment of Dr. Álbarr Peña, a Texas native, as director. Dr. Peña had also served as a teacher of Spanish and English in South Texas, one of the areas where bilingual education had begun to take root. Because program funding was limited and little controversy existed at the time, OBE met few obstacles in setting priority objectives. This was also facilitated by the fact that the legislation itself gave little direction and focus to the program. To a higher level than would later be possible, Peña and his staff were able to promote their own understanding of bilingual education, including the significant use of children's home languages and efforts to support programs with maintenance and biliteracy objectives.

It should be noted that, historically, there was little collective experience in USOE in managing discretionary grant programs. Title I, the largest funding program, was a formula-driven program in which funds were apportioned to states and school districts, according to the number and concentrations of children

in poverty. Title VII legislation was different. It gave the Commissioner of Education, the head of USOE, the power to select grantees from throughout the country. Creating competitive funding mechanisms and support structures were among the major tasks of the OBE. These processes were well established by the time OBEMLA came on the scene to replace OBE. Small programs, such as the Bilingual Vocational Education Program and services for immigrant and refugee children and youth, were added to OBEMLA's scope of work.

In 1980, President Jimmy Carter succeeded in creating a cabinet-level Department of Education. Bilingual education advocates took the opportunity created by the reorganization of existing units and the creation of new ones to raise the status of OBE. Their goal was to create an expanded unit headed by an assistant secretary of education, who would be part of the secretary's cabinet. These efforts were largely successful. Under the newly created U.S. Department of Education, the Office of Bilingual Education became the Office of Bilingual Education and Minority Languages Affairs. The head of the unit was to be a "Schedule C" director, a political appointee. The first director of OBEMLA was Josué M. González, who had previously served in Washington as a staff member of a U.S. Senate Committee chaired by Senator Walter F. Mondale. González became director of OBEMLA in September 1978.

Under González, OBEMLA took on larger responsibilities for coordinating the work of the department in research, a function assigned to it under Part C of the 1988 reauthorization. Improving the knowledge base and disseminating research findings on bilingual education had become increasingly important as criticisms of bilingual education mounted. OBEMLA carried out this function in partnership with the National Institute of Education. It further increased its capacity to disseminate information by creating a National Clearinghouse for Bilingual Education in 1977, an organization that continues its work today under the name of the National Clearinghouse for English Language Acquisition. Similarly, OBEMLA played a major role in crafting departmental policies for the enforcement of Title VI of the Civil Rights Act, in keeping with the mandate of the *Lau v. Nichols* decision, a 1974 ruling that had not been given a major emphasis in the intervening years. This aspect of OBEMLA's work in partnership with the Office of Civil Rights resulted in the publication, in August

1980, of a “Notice of Proposed Rulemaking” (NPRM) in the *Federal Register*. The document attempted to settle the issue of school district responsibilities in complying with the *Lau* decision. The *Lau* NPRM was denounced as overly intrusive by school boards and education organizations across the country, and the proposed rules never went into effect. They were withdrawn as part of Ronald Reagan’s presidential campaign promise to lessen the regulatory role of the federal government.

Between 1968 and 2001, through program accretion and rising public pressures relating to the education of English language learners, OBEMLA was an important resource for educators concerned with serving these students. At the peak of Title VII funding, over \$200 million annually flowed through OBEMLA to state departments of education, support centers, the National Clearinghouse, universities, and local school districts.

OBEMLA’s contributions to bilingual education went beyond the efficient management of grant funds, serving as internal advocate for the program and the students it endeavored to serve. Through a series of program management institutes, the National Clearinghouse, and participation in annual conferences, OBEMLA served as a professional development resource for those involved in program design, implementation, and evaluation. A doctoral fellowship program funded by OBEMLA to doctoral-degree-granting institutions allowed for the continued training of young scholars who agreed to work in the field of bilingual education, as a condition for receiving financial support for their own studies.

With the passage of the No Child Left Behind (NCLB) Act of 2001, the era of federal support for bilingual education ended. Bilingual education as a distinct program passed into history, to be replaced by a single-minded and unbending focus on learning English; OBEMLA, too, passed into history. Under NCLB, OBEMLA was replaced by the Office of English Language Acquisition, Language Enhancement, and Academic Achievement for Limited English Proficient Students. All references to bilingual education were removed from its mission statement. Under NCLB, funding for English language program improvements are now channeled to the states, and their respective state departments of education decide the best use for those funds.

OFFICIAL ENGLISH LEGISLATION, FAVORED

Essay

Editor's Note: *The author of this entry was invited to submit an article reflecting the views of his organization, U.S. English. We acknowledge that parts of it could be disputed or given an alternative interpretation. In several instances, we found this approach helpful in more realistically portraying the history and current status of bilingual education in the United States.*

The diversity of the United States has long been its hallmark. Although in many nations, the vast majority of the population shares the same background, the American population does not share a common ancestry or race. In other diverse countries, the differences in these immutable characteristics have often complicated the formation of a cohesive society. In the United States, these differences have been bridged largely through a common language: English.

This common bond has been a staple in what has long been a nation of immigrants. For more than 200 years, the societal expectation that immigrants would be on the road to learning English led to the creation of English classes and minimized government-sponsored multilingualism. Regardless of the leading nation of origin for that generation of immigrants,

English remained the focus. Though not legislated as such, it could be considered to have been the operational official language.

From the earliest days of the nation, it was possible to live in isolated communities and speak only one's native, non-English language, although most activity involving the government required English proficiency. As the population of certain immigrant groups swelled, government agencies began publishing materials and extending translations to speakers of these languages.

Since the late 1960s, there has been a gradual decline in governmental emphasis on a common language. Non-English-proficient individuals able to live in non-English-speaking communities and survive with jobs that did not require English fluency were now also receiving the message from the government that English proficiency was not necessary for life in the United States. This message was further underscored with a general decline in English-language-learning opportunities.

This growth in government-sponsored multilingualism also runs contrary to the fact that, for speakers of most languages, English remains the de facto official language of the United States. Speakers of Spanish and Vietnamese may have driver's licenses and zoning forms in their languages, but speakers of Gujarati and Latvian are afforded no such benefits. The latter groups are likely to interpret the government message as meaning that they must learn English. The former, noting that services in their native languages are commensurate with those offered in English, receive a strong message that the two languages have equal standing for getting by in the United States.

Full government multilingualism also has limits. Forms and documents may be easily translated from English into another language, but the subsequent demands would put a strain on the government. Individuals such as police officers and emergency workers cannot be fluent in all the languages spoken in a community. Road signs cannot be translated into all of the local languages, due to space and economic constraints. In the case of a sudden natural disaster, when warnings must be issued in a matter of minutes, only a very limited amount of information can be communicated. In these instances, such as a tornado or chemical catastrophe, there would be no way to get out messages in multiple languages. Furthermore, differences in dialects and word meanings can make translations difficult for some languages. For example, many Spanish words have various meanings in

various countries, and some languages in equatorial regions lack words for *snow*.

Official Language Policy as Beneficial Message

Official language policies mirror other government policies in that, when the government takes a position on an issue, presumably it is one that promotes individual and societal benefit. An emphasis on assimilation and language learning is in line with existing messages promoting high school graduation, prenatal care, and healthy eating habits. In each case, the individual makes the ultimate decision regarding the choice to make. Yet this individual freedom does not keep the government from suggesting the path with the best outcome.

Embodied in policy, government advice sends a constant message to the community at large. However, this message must be amplified when individuals approach government agencies for assistance. The government requires that individuals seeking unemployment benefits demonstrate good-faith efforts to find a job. Similarly, welfare recipients are granted assistance on proof that they are making an effort to improve their standing. In both cases, the extension of services is made only upon the demonstration of effort and, even then, only for a limited amount of time. By encouraging the individual to become self-supportive, the society will benefit from increased revenue and less dependency on government services. Otherwise, the provision of services in perpetuity, and with no demands for improvement, would stifle the growth of the nation.

Official language policies are built on the expectation of growth. The advancement of society must come with the advancement of its residents. With the understanding that lack of language proficiency, like unemployment and low education levels, is a solvable matter, official language laws ensure that language services are a short-term crutch, not a long-term solution.

Americans with limited English proficiency often struggle to find work. These individuals are less likely to be employed, less likely to be employed in desirable jobs, and often earn very low wages. Without growth in English, these employees cannot advance beyond their starting roles. Whether as dishwashers, maids, or landscapers, they are stuck in those positions. Individuals with a degree of English proficiency can become managers or go out on their own, but advancement is not possible for those fluent only in a non-English language. The lack of English proficiency also

makes it more difficult to find other employment if the business should close or move.

Official Language Policies Common Worldwide

Worldwide, official language policies are the rule, not the exception. More than 90% of the nations of the world have adopted a language policy for government. In some cases, the decision is a natural one, such as French in France or Spanish in Mexico. In other nations, such as India and Nigeria, a neutral language serves as the official language in order to ensure that one minority language is not placed above another. Furthermore, nations such as Austria, Canada, and Australia maintain proficiency in the official language or languages as a key component in determining fitness for naturalization.

Official languages also serve an important purpose within organizations. Multinational organizations such as the United Nations, the European Union, and the North Atlantic Treaty Organization have an official language to facilitate communication and minimize costs. Due to the critical nature of communication and comprehension in the skies, the International Civil Aviation Organization has mandated English as their official language for more than 50 years. For the 2006 World Cup soccer tournament in Germany, all referees were required to be English proficient, even though the tournament contained teams with 15 different official languages.

It is often forgotten that an official language does not mean “the only language.” Most official language policies apply only to government business, addressing formal proceedings and written documents, such as legislative records and official communications. Emergency services, judicial proceedings, and other activities protected under federal law are specifically exempted from official English legislation. Similarly, exemptions are provided for items like mottoes and cultural works, tourism materials, and the teaching of foreign languages.

Courts have generally found no legal issues with official English legislation, so long as the measure does not impose on private communication or contradict existing federal law. Though Americans may have a right to speak as they choose, government employees are required to act as agents of the government and do not have a right to interpret policies or contradict existing policy as they see fit during their work. Just as an employee could not use the First

Amendment as a defense for insulting the individual's boss or the policies of the department, an employee could not use the same constitutional guarantee to defend the use of foreign languages while conducting government business.

Clients of the government also cannot claim First Amendment protections to the extreme. U.S. laws permit all residents with many freedoms, including speech, religion, and protection from illegal search and seizure. Americans remain free to practice their cultures and customs at their will, as long as the activity is not in violation of U.S. law. Religious and cultural customs, such as the use of certain drugs and the possession of certain animals, are not acceptable practices in the United States.

Though Americans are generally free to do as they choose, they do not have the right to demand that the government cater to their unique needs. Employees may take days off to celebrate certain cultural holidays, but they cannot ask that government offices shut down accordingly. They can practice certain eating customs, but they cannot require government food services to comply. They can speak whatever language they choose, but they cannot request the government to provide services in that language.

Official Language Policies Widely Supported

Official English legislation remains among the most widely supported issues in the United States. On the federal level, official English legislation has been introduced in Congress in every session since 1981. First proposed by Senator Samuel Ichiye Hayakawa of California, a former linguist, college professor, and university president, measures to make English the official language have received considerable support over the years. The U.S. House of Representatives passed a bill in 1996 to make English the official language of the United States, and the Senate passed a measure in 2006 to make English the national language, but neither was enacted into law.

At the state level, bills to make English the official language have been passed in more than half of the states and considered in nearly all of them. Counties, cities, and towns have also passed measures to make English the official language.

Nearly every poll regarding making English the official language has found 75% or more of the population favoring such legislation, with majority support among immigrants, Hispanics, and within

each political party. The widespread support is further demonstrated by the fact that voters have passed official English measures all eight times such measures have appeared on a statewide ballot.

For most, the appeal of a national language is both personal and patriotic. Residents of a nation generally support themes that encourage unity and pride, such as the waving of the flag, the playing of "The Star-Spangled Banner," and the celebration of Independence Day. In a nation where our differences outnumber our similarities, a showing of unity is often prized.

On a personal level, most Americans see the importance of a common language in their daily lives. Conversations with neighbors, friends, and colleagues could not occur without a common language. Business transactions would also be far more difficult absent a common language, a point underscored by the frustration customers often feel when they cannot understand an employee. Further, most Americans can trace their lineages outside of the United States and have knowledge of ancestors who took great pains to learn English once they had immigrated.

English, Our Unofficial Language

Although the United States has yet to make English the official language by law, government policies and practice illustrate the reliance on a common language. Even with the immigrant population numbering in the millions, official government acts, such as the Constitution, Bill of Rights, and the Congressional Record, have been printed only in English. English is the language spoken on the floor of Congress and in the halls of justice. Since the early 20th century, nearly all candidates for naturalization have been required to demonstrate fluency in English in order to achieve U.S. citizenship.

This history of assimilation, not a lack of consensus regarding the common language of the United States, minimized any discussion of an official language for more than 100 years. The issue of an official language legislation in the United States first arose during the nation's involvement in World War I. With the conflict ongoing in Germany, official English measures were first drawn up. As nearly all government business was already being conducted in English, these bills sought to influence the language spoken by individuals. As with many matters drawn up in response to fear, many of these laws were overly broad, banning the mere use of a language other than English. Due to the limits they placed on freedom of speech, many of these were later found to be unconstitutional.

Many opponents of official English legislation use restrictive English-only measures and their origin as the basis for opposing official English legislation today. However, the official English laws of today correctly place their focus on the language of government. A matter of policy, none claim that English is under “threat,” passing in states with historically low immigration levels, such as North Dakota, Iowa, and Tennessee, as well as those with a long legacy of immigration, such as California, Florida, and Arizona.

While there is considerable debate about the rates of English learning among today’s immigrants, the effect of the actual rate is unimportant when considering government policy. Laws emphasizing English acquisition are not based on current trends, but on the principle that the needs of the nation are best served if immigrants to the United States are on the road to learning English. In much the way that the government promotes high school graduation and discourages smoking, there is a need for policies that address these issues now, rather than deal with the repercussions later.

Our Common Language, Past and Future

English has long been, and will continue to be, the language that links all Americans. While foreign-language learning remains a worthwhile subject of study, history indicates that the most common second language of one generation may not be the most common second language of the next. The United States has long had a popular foreign language of the times. In the late 19th and early 20th centuries, German was commonly spoken across much of the northern United States. French was widely suggested as the second language to learn in the 1960s, and Japanese received the same billing in the 1980s. Recently, the focus has been on Spanish, with some suggesting that Chinese or Arabic will be the next language to receive the spotlight.

For adults, children, and immigrants, a solid grasp of English is a requirement for success in the United States. The focus must remain on making sure that immigrants are learning English and not on asking the U.S. government and the American people to learn a specific second language in order to converse with fellow citizens and residents of this nation.

OFFICIAL ENGLISH LEGISLATION, OPPOSED

See APPENDIX E

OFFICIAL ENGLISH LEGISLATION, POSITION OF ENGLISH TEACHERS ON

Given the evident interest on the part of many to preserve English as the common language in the United States, one might be curious about the position of English teachers concerning “official English” initiatives. This entry examines relevant documents of the National Council of Teachers of English (NCTE), the Center for Applied Linguistics (CAL), the National Association for Foreign Student Affairs (NAFSA, now known as the National Association of International Educators), the Modern Language Association (MLA), and the Speech Communication Association of America (SAA, now known as the National Communication Association, or NCA). All of these organizations recognized the need for research in English as a second language (ESL) in the 1950s and 1960s. From such documents, one can draw inferences about the stance of English teachers on official English.

Historical Background

The MLA was established in 1883 to promote the study and teaching of language and literature. The NCTE was established in 1911 to provide for the professional development of English teachers and a framework for cooperation to deal with issues that affect the teaching of English. Established in 1914 as the National Association of Academic Teachers of

Public Speaking (NAATPS) and known as the Speech Association of America from 1946 to 1969, the SAA was organized to provide for the development of speech as an academic subject apart from the NCTE, in which its membership had its roots, and specialists saw obstructions to achieving status as a full discipline. CAL was established in 1959 to be a resource base for ESL and to become a national resource for the application of linguistics, and of new methods generally, to the teaching and learning of second languages. NAFSA was founded in 1948 as the National Association of Foreign Student Advisers to promote the professional development of American college and university officials responsible for assisting and advising foreign students who had come to study in the United States after World War II. Together, these organizations were instrumental in the formation of Teachers of English to Speakers of Other Languages (TESOL, Inc.), which was established in 1966. TESOL brings together teachers and administrators at all educational levels with an interest in teaching English to speakers of other languages.

During the first half of the 20th century, no research of any consequence existed that would result in concern among English teachers or the general public about the many people in the United States who were not native speakers of English. In 1957, the NCTE sought to interest their Elementary Section in studying the problem of learning ESL in elementary schools, but according to a 1981 NCTE position statement, no action resulted until the publication in 1960 of *The National Interest and the Teaching of English as a Second Language*, which revealed a dearth of research on English language learning. A federally funded national survey followed, which was cosponsored and published by the NCTE in 1966. The survey results revealed inadequacies in teaching materials and teacher preparation.

One outcome of this study was the creation of TESOL. Two developments occurred as outcomes of the formation of this organization: (1) research-supported insistence that students with a language other than English receive at least the initial content instruction in their own language and (2) a concomitant cultural component that would enable students to value their ethnic and linguistic identities in their own minority groups. These developments did not articulate how to accomplish these conditions. However, these deliberations did yield recognition of the differences between bilingual/bicultural education and ESL. The former is a program, and the latter is a discipline, which can function as an integral part of the program or separately.

Relationship Between Organizational Policy Stance and Official English

The NCTE, NCA, and TESOL have since been the most vocal critics of official English and English-only policies. The NCTE Conference on College Composition and Communication's position statement on national language policy, revised in 1998, states that English-only laws are (a) unnecessary, because immigrants now, as always, are learning English; (b) unrealistic, because there are more people on waiting lists for English classes than there are classes and English-only laws do not normally account for increased demand in budgeting for programs; (c) educationally unsound, because they limit instead of expand educational opportunity; (d) unfair and dangerous, because the effect is to impede communication of essential information; (e) invasive of people's right to privacy and counterproductive to the need for multilingualism in a global economy; and (f) unconstitutional under the First Amendment guarantee of free speech.

The NCA made a policy statement in 1996 that clearly and succinctly opposes legislative efforts to mandate English as the official language of the United States of America.

TESOL has a long history of opposition to official English initiatives through its 1987 "Resolution on Language Rights," its 2000 "Position Statement on Language Rights," and its 2005 "Position Paper on English-Only Legislation in the United States." In their "Position Paper," TESOL debunks five myths held by proponents of official English: (1) English-only promotes unity; (2) English-only will empower immigrants; (3) English-only will promote efficiency and fairness in government by conducting all official business in a single language; (4) English-only will help protect the English language in the United States, which is in danger of being replaced by Spanish; and (5) bilingual education and bilingualism prevent immigrants from effectively learning English and integrating effectively.

The histories, missions, and purposes of these professional organizations generally reflect a commitment to researching and developing linguistic and cultural pluralism. On this basis, one can infer that generally, English teachers oppose "official English" policies. Additional research on how educational language policy promoted by these organizations relates to educational practice among English teachers would be helpful in clarifying the veracity of this inference.

OFFICIAL LANGUAGE DESIGNATION

The United States is one of only a few countries in the world that has never adopted an official language or languages. In the late 1970s, a movement began in Miami, Florida, that soon spread across the country, calling for the formal adoption of English as the sole and exclusive language of the country. The first organized effort was a voter initiative later overturned in the courts. It consisted of a poorly crafted ban on the use of public funds in Dade County for any expense in a language other than English and any culture other than “the American culture.” The voter initiative

passed handily, despite much opposition and warnings that it would not survive a court challenge. The ordinance passed, but later was successfully challenged in court.

In some cases, the focus for making English official and exclusive has been limited to an official language used for conducting the work of government agencies. Other versions of the demand for official English have been more encompassing: an order that the county, state, or federal government limit itself governmentally and socially to communicating in only one language in all spheres, including cultural and social institutions such as museums, libraries, and schools. Harsh measures are not common, but they are plausible in the political climate found after 2000. An English-only voter initiative adopted in Arizona in 2000 imposed a 5-year blacklisting on school administrators who willfully violate the English-only mandate of Proposition 203. Some advocates of official English have gone as far as to propose that radio and TV station licenses be limited to stations that broadcast only in English. The constitutionality of such a measure has yet to be well tested in the courts. In the case of Miami, when the first English-only measure was adopted, the results were tame and uninspired. The ordinance ended a variety of minor county services in other languages: bus schedules, health care brochures, and Latin signage on animal cages at the county zoo. The press editorialized that the new ordinance seemed to have no clear purpose other than to remind speakers of other languages that those languages were subservient to English.

The motivations that drive proponents of an official language designation are often muddled. Advocacy messages favoring official language legislation are often interlaced with anti-immigrant sentiments. It is not unusual to hear proponents of an official language simultaneously protest bilingual education, Spanish-language tests for obtaining driver licenses, and curtailment of immigration from the Spanish-speaking world. Some proponents have claimed that the English language is in danger of being overrun by Spanish. If English is not protected by granting it legal status, they claim, Spanish will someday displace English as the lingua franca of the nation. This position seems somewhat alarmist in that it ignores the fact that English is rapidly becoming the most commonly used language in the world and that no countermovement exists to supplant it with any other language.

In this entry, in broad terms, the question of adopting an official language is reviewed, specifically English in the case of the United States, and some of the allegations and positions on both sides of the issue. To further clarify the controversy and to examine in more detail the views of groups that oppose the concept and those who favor it, see Appendix E, Official English Legislation, Opposed. The issue is also discussed elsewhere in this encyclopedia.

What Does "Official Language" Mean?

Generally speaking, the designation of *official* implies that the item (or person) in question has had a special status bestowed on it by a government and that status makes it in some way more important than other items similarly situated. The extra measure of prestige or power may be truly meaningful or purely symbolic. A person wearing a military uniform is an official warrior of a particular government who is licensed by that government to kill others on its behalf. He or she is subject to special laws and a separate code of justice that differs from that which applies to civilians. But the designation of being in some way official may also mean much less. Thus, the officially designated state flower of Texas or the official bird of Indiana hold no particular status among their peers. Their function, by legislative action, is to serve as symbols of the beauty of the flora and fauna of a given state. The eagle, on the other hand holds a higher patriotic status in the eyes of most Americans than any state bird, including the turkey, the bird with which it competed to become the official symbol of the United States.

Perhaps the most ubiquitous use of the concept of *official* is in conjunction with currency. Most countries have an official currency that represents the wealth of the country and its citizens and the way that wealth will interact with other currencies around the world. Another common application of *official* relates to legal documents. A legal document emanating from a court or government agency is much more than an informative piece of paper. It contains a decision, an announcement, a measurement, or an order that must be obeyed. Violating the official nature of such a document can lead to a fine or some other civil punishment. In the United States, the deed to one's house is one of the most valued of official documents, because it guarantees shelter for its owner even when the owner has declared bankruptcy.

Perhaps the most sacred of all legal (official) documents in the country are the papers attesting to the

fact that a person is a citizen of the United States. Citizenship, more than anything else, offers the person the greatest status and privilege over other residents. A person who enters the country without the benefit of official documents is considered an *illegal alien* and is subject to punishment and deportation. Although it failed in the Senate and never became a law, a bill to make illegal aliens guilty of committing a felony by their presence here was introduced and approved by the House of Representatives on December 16, 2005 (HR 4437). Interestingly, depending on the circumstances, citizenship can be easy or difficult to obtain. It is difficult for foreign-born adults to acquire American citizenship. However, for example, a child born to a tourist mother who is temporarily in the United States can become an American citizen without difficulty. The only requirement is that the baby be born on U.S. soil, even if the mother's presence here was incidental.

Why Didn't the Founding Fathers Adopt an Official Language?

The historical record is unclear on this point. It would seem likely that the founders discussed the matter, but historians provide little explanation for lack of original sources. Some historians assume that the drafters of the Constitution simply had too many items to discuss and that the question of language was overlooked. Still other historians believe that the presence of a large number of German speakers in the Continental Congress would have made it difficult to adopt an official language if the choice was between English and German. Their assumption is that the drafters chose to avoid an internal confrontation over language in an effort to gain consensus on other contested points. German played an important role in the early colonies, but it never achieved official status. The myth that German missed becoming the U.S. official language by one vote is only that, a myth. A separate entry in this encyclopedia explores this point in greater detail.

Arguably, the most important point here is that for over 200 years, the absence of an official language was not an obstacle in the development of the country as a world power. Calls for designating English as the official language did not begin until the last quarter of the 20th century, when the hegemony of English was firmly established and its dominance as the *lingua franca* was unchallenged.

There are two situations under which the adoption of an official language is most important. The first is at the birth of a country when several languages prevail and the founders wish to clarify, for posterity, what their intentions are. The second is the point of emancipation of a country from the control of another, such as the decolonization of African nations from European powers. The first of these conditions did not exist in the territories that were to become the United States. Many languages existed, to be sure, including almost every European language and a multitude of Native American languages. But representatives of those groups—with the notable exception of German speakers—were not invited to join the deliberations leading to the unification of the European settlements under a new flag. Even French and Spanish speakers were absent from this conversation, although they occupied large segments of land in North America. In addition, both France and Spain had contributed men and other resources to help the English-speaking colonies wage their war of independence from England.

The exclusion of speakers of all language groups other than English and German from the discourse leading to the creation of a new nation could be the subject of much speculation. For these purposes, it suffices to note that the framers of the Constitution and the English colonists may have taken for granted that English would be the common language of the new country and that no formal steps needed to be taken in this regard. As opposed to the colonies of Africa, the 13 colonies of the Atlantic Coast were not seeking to create a new culture and language and social institutions totally different from those of England. The colonists were not uncomfortable in their English-speaking skins. Indeed, many had fought the mother country only reluctantly. Many were reluctant to abandon a monarchical form of government. The use of English for all of the documents surrounding independence and the writing of the Constitution attests to that.

There is little question that had the founders adopted English as the official language of the country, there would have been an immediate reaction: The German speakers who predominated in Pennsylvania, also known as the Pennsylvania Dutch, would have objected—how vehemently, we do not know. Given the bold nature of their revolt against a great European power and the difficulties of founding a new nation, it is likely that the organizers of the new republic did not feel they could take that chance. Subsequently, as the

nation expanded, steps were taken to underscore their commitment to English, but these efforts did not rise to the declaration of an official language. Most of this activity was directed at Native Americans and new immigrants from countries outside Western Europe. As Ronald Takaki details in his book, the push to Americanize was directed at the darker-skinned people of the Mediterranean and African and other racial minorities. It is not clear whether the primary cause of concern was that these people spoke other languages or that they simply looked sufficiently different from the White European colonists so as to cause the specter of racism to emerge.

What Problems Does Official Status Solve, and What Issues Does It Create?

Although English was not adopted as an official language early on to the exclusion of any other, there is considerable evidence that from the outset, the founders of the new nation envisioned a homogenous society composed primarily or exclusively of White, English-speaking people. In pursuit of this ideal, the colonial government passed the Naturalization Act of 1790. Thomas Jefferson, one of its proponents, believed that the act would create a nation in which citizens spoke a common language that would better link them to a democratic form of government. With the passage of this law, citizenship was reserved exclusively for Whites. Benjamin Franklin argued that any deviation from English was a danger to a pure, White race, and, in 1828, Noah Webster sought to improve the chances of achieving a common language with the publication of his dictionary.

While the nation did not adopt an official language, the close nexus between English and the preferred national identity was clear from the outset. The idea of a nation composed of White, English-speaking people was openly supported by several of the so-called founding fathers. Some went even further and proposed that the new nation should limit certain privileges and opportunities only to White citizens who were born in America. Election to the presidency, for example, is reserved for persons born in the United States. A willingness to embrace English and abandon other languages of origin soon became a symbol of national loyalty by immigrants. This early ideology may be compared to that of those who fear large-scale immigration today and advocate for

ending it by building walls along the southern border of the country.

It is not difficult to see how the concept of a cultural and linguistic “melting pot” arose a few decades later and grabbed the imagination of the majority. It is also not difficult to see how these proclamations and actions would be viewed with distrust by those who were not White and English speaking. The cases of Irish and Jewish immigrants and others are prime examples of groups that were not initially welcomed to these shores. Time and space limitations preclude a detailed examination of the many examples of exclusion and oppression on the basis of language that were visited on certain immigrants to the United States, even without the benefit of an “official language.” The accumulated history of these efforts makes contemporary language minorities wary that new instances of exclusion and linguistic restrictionism might not be far behind the adoption of English as the official language even today.

Like immigrants, American Indians have also experienced language chauvinism under the guise of helping them adapt to the American way of life. Their relationship to English may have been even harsher and more oppressive than it was for most immigrants. There were great pressures exerted on American Indians to learn and embrace English. The first step in this direction by the federal government was the Dawes Act of 1887. The act allotted plots of land to American Indian families and specified that if the families were able to work the lands productively for 25 years, they would then be eligible to receive title to that land. In addition to conveying land, the Dawes Act required that American Indian children be educated in English. Many were sent to boarding schools, distant from their parents and other family members; they were allowed little contact with their homes for fear that the Americanization process would be truncated.

The historical record is clear that Indian education policies from the 1880s through the 1920s focused on the forced assimilation of American Indians to non-Indian ways and the teaching of English at the expense of native tongues. One mechanism for making this goal work as intended was land granted in exchange for having the children of the family moved away, with the express hope that they would abandon the ancestral languages and become “less Indian.” It seems clear that for the half century that this policy was in effect, English was in fact the official language

for educating American Indian children and youth, even though the term *official* was not used.

Sensing the negative impact of designating a national official language 250 years after the founding of the country is far easier than identifying the benefits or advantages of such a measure if it were to be adopted today. Many observers reject the arguments commonly advanced by its proponents: that English is threatened and must be rescued, that national unity can be ensured only if all citizens are forced to speak the same language, and that social stability is not possible in a polyglot society. History does not lend credibility to these claims. The opposite seems to be true. Many societies rely on several languages and have done so for generations without conflict. Social bilingualism and diglossia have been studied and documented by linguists around the world.

In those countries where conflict has arisen over language, it appears to be linked to the desire by one group or another to set its language above all others, to be the chest-thumping king of the hill. A well-intentioned, rational, and tolerant approach to the existence of several languages seems to solve most problems associated with multilingualism. Declaring one language to be above all others—by action of the state—sets the stage for resentment and conflict. By design or not, languages are identified with specific cultures, and the designation of one language as the official language of the nation also gives a higher prestige to the culture represented by that language. In short, it creates categories of speaking and being.

The claim that the English language is threatened by other languages in U.S. society is a particularly weak claim. Almost no one in the country denies the critically important role of English. Many immigrants endure long waiting lists to learn it. Indeed, English has the best chance of becoming the lingua franca of the world, not merely the United States. This does not deny that immigrant speakers of some languages may wish to continue to speak their original languages for worship, for family conversation, or in social gatherings of their own group. These uses of language do not constitute a threat to other languages. It is axiomatic among linguists that language usage tends to follow paths of least resistance and utilitarian patterns. Languages survive and endure when they serve a special purpose in the life of a collective. They rarely flourish when they are mandated by powerful forces. Even a cursory look at the consequences of adopting an official language at this point in the nation’s history

suggests that it is variously too late, too meaningless, or too threatening to civic harmony to do so now.

How Official Does an Official Language Need to Be?

Technically, it is a simple act to qualify the degree of officialness of a language, although politically it can be quite difficult. A law designating English as the official language of a state could be limited to its usage in government matters such as the publication of laws in the *Federal Register* or holding hearings in Congress. Informally, that level of officiality already exists, since the U.S. Congress does not publish laws in any other language. A moderation of such a policy could specify that the official language should be used except in cases of eminent danger, in which case all common languages of the realm should be used to warn citizens of impending danger. Such a clause would require radio and TV stations, as well as all emergency warning systems, to issue emergency warnings in two or three languages in order to preserve life and property.

At an even higher level, the meaning of *official* could extend its use in social and cultural institutions, such as schools, libraries, and museums. This would be a difficult escalation because taxpayers whose taxes support those institutions may wish to have their languages used in the education of their children. Prohibiting the use of Chinese, Navajo, or Spanish in schools would in effect mean that millions of citizens would be precluded from having their languages passed on to future generations even though they support the schools with their taxes. A step very much like this has already been taken, by voter initiative, in Arizona, California, and Massachusetts, where bilingual education is prohibited. This is an odd departure from the concept of parental involvement in their children's education and their participation in setting school policy. In these states, at least, the message is that participation has its limits. It can be argued that such steps constitute abuse of power by the majority in that such actions nullify the wishes of one or more language minorities.

How Can a Language Be Made Official Today?

The Constitution of the United States specifies that all powers not formally assumed by the federal government

be reserved to the states. Since the Constitution is silent on the matter of official language, we can make the assumption that every state has the right to choose an official language and to define the breadth of the concept of official language by specifying the areas in which the language would be required and situations in which it might be optional. Many U.S. states have already declared English to be their official language, although few have specified what they intend by the designation of *official status*.

An alternative way for English to be declared the official language of the United States would be through adoption of a constitutional amendment, a rare and difficult process. In the history of the United States, the Constitution has been amended only 28 times. Measures to initiate the process of adopting a constitutional amendment to make English the official language have been introduced in almost every session of Congress over the last quarter century. The first of these was introduced by Senator S. I. Hayakawa, Republican of California, who introduced the first bill in 1981. His amendment proposal failed, as has every other attempt since then. The reason is that legislators are wary of opening up the process of a constitutional amendment and have it disintegrate into a morass of competing proposals that would mire the Congress for months or even years. Amending the Constitution requires that Congress pass the proposal by a two-thirds vote and that it then be adopted by a majority of state legislatures. In short, a constitutional amendment must be considered by both houses of Congress plus 50 other legislatures.

Prospects

Is the thrust to make English the official language of the United States motivated by linguistic necessity, cultural pride, or mere jingoism? Is the project doomed to fade away because it is a solution that seems to lack a consensual problem? Although the motivation of its proponents varies in its power to persuade, there can be no definitive answers to those questions. The project to make English the sole official language of the United States is likely to continue throughout this century as the immigration of speakers of other languages continues to exert linguistic and cultural pressures on the lingua franca. As long as political leaders regard immigration and the assimilation of immigrants as major problems to the maintenance of a national culture, they are not likely to

abandon the notion of adopting official English as an organizing tool. Proof of this is that every time the issue has been put to the electorate, the vote is nearly always overwhelmingly in favor of making English the official language. The situation seems to call for more dialogue, introspection, and reflection. Collectively, we may decide that the key question is not whether English should be made the official language of the United States, but rather *why*? As the nation's workforce grows older and the need to import workers becomes clearer, efforts will no doubt be made to differentiate the rights and privileges of those who have been here longer from those we are willing to grant to new arrivals. A vow of monolingualism in English may someday become another requirement for gaining citizenship in the United States.

OGBU, JOHN (1939–2003)

John Uzo Ogbu (1939–2003), professor of anthropology at the University of California, Berkeley, was born and raised in Nigeria. He brought an *etic*, or outsider's, view to his anthropological studies of minority education in U.S. schools in their sociopolitical contexts. He is best known for his studies of differential educational achievement among minorities in the United States.

Ogbu was born May 9, 1939, in the village of Umudomi, to a family of farmers. Initially, he planned to become a Protestant minister. After attending Hope Waddell Training Institute and Methodist Teacher Training College, he taught for 2 years in a missionary high school in Nigeria. He emigrated to the United States to study at the theological seminary at Princeton University. After a short time in the United States, he decided to study anthropology and transferred to the University of California, Berkeley. There, Ogbu earned a BA in anthropology in 1965, a master's degree in 1969, and his PhD in anthropology in 1971. Beginning in 1970, he taught in Berkeley's Anthropology Department, was awarded tenure in 1976, and was promoted to full professor in 1980. In 1997, he was appointed Chancellor's Professor at this institution.

One of Ogbu's major contributions was conceiving a distinction between minority groups. He developed a classification scheme he termed *voluntary* and *involuntary* minorities in the United States. *Voluntary minorities* are immigrants who choose to emigrate from their countries to the United States for the chance of a better life, economically or politically. According to Ogbu, *involuntary minorities* are groups that historically have been incorporated into U.S. society against their will by having been conquered. Some examples of involuntary minorities include Native Americans who lost their lands and livelihood when forcibly moved to reservations, Mexican Americans who already lived in the territory of the United States at the conclusion of the Mexican American War in 1848, Puerto Ricans whose country was colonized as a result

of the Spanish-American War, and the descendants of Africans who were forced into slavery and brought to the United States in chains.

Ogbu believed that the history of discrimination against involuntary minorities has implications for the present sociopolitical context of their education and the ways in which they are regarded by members of the dominant society. An example of teachers' discriminatory attitudes toward parents of different socioeconomic levels was documented by Ogbu in an ethnographic study in California. In interviews, teachers said they felt accountable to the higher-socioeconomic-status (SES) "taxpayers," most of whom were White, but not accountable to the lower-SES Black and Mexican American parents, whom they regarded as "welfare clients" and to whom they were giving a service.

Although critics of Ogbu's scheme have pointed out that the distinction between voluntary and involuntary minorities may be overly simplistic and cannot explain all minorities over time or in other nations, his theory has become part of the framework for understanding race and ethnic differences in education as well as the difficulties minority students face in learning English. He learned from interviews that recent voluntary immigrants from Mexico, Central America, or parts of Asia believed in the "American dream." They left situations of poverty, hard labor, and sometimes war and worked hard to achieve an education because they believed it would lead to opportunity and economic success. By contrast, the involuntary minorities—lower-SES African Americans and Mexican Americans—usually had older relatives who had suffered discrimination; although they were educated and worked hard, they were not in positions earning incomes commensurate with their education. No longer believing that education and hard work would bring success, these students dropped out of school.

Further exploring the academic situation of African American students, Ogbu coauthored a study in 1986 with Signithia Fordam. They concluded that African American students in a Washington, D.C., high school did not live up to their academic potential because of the fear of being accused by peers of "acting White." This was an important contribution to the negative pressure exerted by some students on their peers. Ogbu also conducted ethnographic research to help Black middle-class parents in a highly regarded suburban school system in Shaker Heights, Ohio, understand why some of their children

were "disengaged" from academic work and performed less well than their White counterparts. In *Black American Students in an Affluent Suburb*, Ogbu concluded that the Black students' own cultural attitudes hindered academic achievement and that these attitudes were too often neglected by educators and policies.

In the late 1990s, Ogbu, as part of a task force on African American education in Oakland, California, took a controversial position over the place of Ebonics, or Black American English, in education. Ogbu considered Ebonics a distinct, rule-governed vernacular form of Black English spoken in the homes of African Americans across the United States, as documented by the sociolinguist William Labov. Ogbu encouraged teaching Ebonics as a way to help African American students transition to standard English.

In recognition of Ogbu's contributions to anthropology in education, a special issue of *Anthropology and Education Quarterly* of the American Anthropological Association was devoted to his work. Ogbu also received the American Educational Research Association's Research Contribution to Education Award and the Margaret Mead Award given by the Society for Applied Anthropology. In 1997, Ogbu was elected to the International Academy of Education. His articles and books have been translated into French, German, Italian, Japanese, Mandarin, Spanish, and Croatian.

Ogbu was married to Marcellina Ogbu and had five children. He remained active with the Nigerian community in the United States and in Africa until his death on August 20, 2003.

ONE PERSON-ONE LANGUAGE (OPOL)

The *one person-one language* (OPOL) strategy for helping develop bilingualism in families is also known as *one parent-one language*. It refers to a language strategy in which two parents who speak two different native languages use each of their native languages to converse with their children. The goal of OPOL is to raise the child to be a balanced bilingual or a native speaker of both languages by providing a highly structured bilingual environment for the child. The theory behind OPOL is that by strictly separating the two family languages, the child will acquire them in a balanced and fluent way, without much confusion from mixed language use.

According to Suzanne Barron-Hauwaert, the term was first used by French linguist Maurice Grammont in 1902 as *une personne: une langue* in French, literally translated as "one person: one language." In this approach, Grammont advised parents to simply speak to their children in their own languages consistently and not reverse the roles. By so doing, the child would unconsciously speak the languages without special effort. About a decade later, French linguist Jules Ronjat followed Grammont's formula and applied it to a study with his own son Louis, speaking to him in

French, the language of the mainstream society, while his wife spoke to the child in German. Ronjat and his wife spoke German to each other. Ronjat was very strict in keeping the two languages separate. In this case, in addition to a parent, there were other people who spoke the minority language to the child. They had several German servants, and they also often visited relatives on the mother's side in Germany. Both parents spent a lot of time with Louis. As a result, Louis Ronjat grew up to be a very-well-balanced bilingual adult.

Later, in the 1930s, German linguist Werner Leopold conducted an extensive study of the same type by raising his daughter Hildegard bilingually using OPOL. After earning his doctorate degree in English literature in Germany and a 3-year stay in Costa Rica, Leopold came to the United States and married a third-generation German American. When they had a baby, they wanted to raise their daughter bilingually from birth, and they decided to speak their own native languages after their daughter's birth. Leopold spoke German to their daughter; his wife spoke English to her; and they spoke English to each other in front of her. Leopold started, as a descriptive linguist, to keep a detailed diary of his daughter's language development, which was published in four volumes. The first three volumes described Hildegard's language development during her first 2 years: vocabulary development in Volume 1, sound system in Volume 2, and word combination and sentence formations in Volume 3. The fourth volume included his observations of other periods in the girl's life and that of her younger sister Karla. At that time, child language acquisition was an area not much studied by linguists, and thus Leopold's study was a pioneering work, later emulated by other researchers.

For the first 2 years, Hildegard appeared to confuse the two languages and seemed to mix them indiscriminately. She could not associate a specific language with specific people. However, at about age 3, she no longer mixed the languages and could use the correct language for the right person. When Hildegard was about 5 years old, they visited Germany, and she did not have any problem communicating in German with families and friends there. Although Leopold tried to keep the OPOL rules, he was not as strict as Ronjat in keeping the two languages separate. He often used English when they were speaking with English monolinguals. Hildegard's bilingual proficiency could not be considered balanced. Her dominant language had

always been English, and, at the age of 15, German became her weaker language.

Other studies on OPOL have been conducted using case study research methods, such as those authored by Traute Taeschner in 1983, Annick De Houwer in 1990, and Susanne Döpke in 1992. Most of the parents consciously adapted OPOL in order to facilitate their children's bilingual acquisition. The usual outcome was that the child acquired a passive competence in the minority or low-status language but did not actively use that language. Many pointed out that the consistency and the strict separation of two languages are the key points for success in this approach. However, the generalizability of the above statement is questioned by the critics because these studies feature minority languages that are not stigmatized and the children come from privileged families.

Many bilingual families with each parent speaking a different native language often search for the most effective language strategy that will promote their children's bilingual acquisition. One person-one language is often recommended as an optimal environment in which to raise children bilingually without privileging one language over the other. Although, theoretically, it seems pretty straightforward for parents to follow the guidelines, in reality some complexities exist in putting OPOL into practice. In real family interactions, parents do not always talk one-on-one with the child alone. Most of the time, they talk to the child with other people present and involved, such as siblings, extended family, friends, and neighbors, who might not share the same languages. Using the minority language in the mainstream community with people who do not understand can cause awkwardness. For example, let us say a mother decided to speak her native language to her child all the time in the United States. When her English-speaking in-laws are around, she and her child speak English to them, and then they switch to the mother's native language when they speak to each other, leaving others wondering what they are talking about. In many cultures, it is considered insensitive to speak one's language and exclude others who would otherwise naturally be part of the conversation.

The intricacy of these interactions raises some complexities in implementing OPOL in real life. Therefore, actual implementations of OPOL are not uniform. Although many people claim that they used OPOL, it might not be a classic use of the concept because of the variations that may creep in. This is a problem that affects mostly researchers, since the participants might find the variations quite easy to handle.

There are several criticisms against OPOL. The first concerns the socioeconomic backgrounds of the families in the studies using OPOL. Most of them come from middle-class or upper-class backgrounds and may not represent the situation of many bilingual families, such as migrating families who are in disadvantaged positions; often their languages are stigmatized.

A second criticism points to the artificiality of the language environment. OPOL is said to have too much unnecessary restriction of the natural interaction between people who speak more than one language. Some scholars say that code mixing and code switching among bilingual speakers are quite natural phenomena and those who grow up in this environment become competent bilinguals, which proves that OPOL is not a necessary condition for bilingual acquisition. Finally, OPOL does not automatically guarantee success due to other variables, and its outcomes are somewhat unpredictable given these variables.

However, there are some positive aspects of the use of OPOL strategies. By adapting OPOL, parents can manipulate a microlevel of interaction to provide a language environment in which the child can use a minority language. To acquire a language, a person needs to be a part of a speech community. When a parent uses a minority language with a child, the child becomes a member of that speech community, in which he or she will have opportunity to use the language with speakers other than parents. Because of the dominance of the majority language, in many cases minority languages are not maintained or acquired if not used in the family.

Although there is a belief that code mixing or code switching is a natural speech behavior of bilinguals, pedagogically, the principle behind OPOL somewhat supports the separate use of two languages. By not allowing mixing, OPOL forces children to use the words in both languages. Failure to use the language does not mean immediate loss of it, but continued lack of use of vocabulary can contribute to language attrition or at least make that knowledge passive. This is especially true with minority languages. Hence, bilinguals choose appropriate languages according to the context. The context can be a person, a place, or an occasion. In OPOL, the bilingual child uses the person as a reference point in choosing his or her language behavior. By adhering to a consistent language choice, parents create a domain for the minority language. Scholars such as Joshua A. Fishman and Susanne Döpke believe that without a clearly specified domain for a

minority language, the minority language will gradually give way when two languages compete.

OYAMA, HENRY (1926–)

Henry “Hank” Oyama, Jr., has been a vigorous proponent of cultural dignity and civil rights throughout most of his long life. A quiet and dignified activist, Oyama fought for the educational rights of Mexican American students for more than half a century. Oyama made his mark in bilingual education as a contributor to a landmark report on the educational needs of Mexican American students in the Southwest. The

report, titled *The Invisible Minority*, was published by the National Education Association in 1966 and led directly to the passage in Congress of the Bilingual Education Act in 1968.

Of Japanese descent, Oyama was born in Tucson, Arizona, on June 1, 1926, and was raised in a Mexican American barrio, speaking only Spanish at home. His mother was born in Hawai‘i but grew up in Mexico. She did not speak Japanese or English. Later, she met and married Henry Oyama, Sr., in Tucson. In 1942, the Oyama family was sent to a Japanese relocation camp near the Colorado River. There, after 1 year and 4 months, Oyama was permitted to leave after he agreed to work in places where there was a great hiring need. This included a hotel, and paper and aluminum factories in Missouri and Kansas. In 1945, he was inducted into the army at the age of 18. During basic training at Camp Hood, superior officers assumed Oyama spoke Japanese and announced their intention to send him to the South Pacific as an interpreter. He explained his lack of fluency in Japanese, and he was sent to a Minnesota language school, where military authorities discovered that he spoke fluent Spanish and posted him instead to the Panama Canal Zone as a bilingual counterintelligence officer.

After the war, Oyama returned to Tucson, where he attended the University of Arizona. In 1956, he became a teacher of history and Spanish at Pueblo High School, where he joined a remarkable group of educators, among them Adalberto Guerrero, María Urquides, and Rosita Cota. In the late 1950s, these forward-thinking educators pioneered the creation of Spanish Honors and Spanish for Native Speakers courses at Pueblo High School, in the Tucson Unified School District, as a way to maintain and enhance the Spanish language proficiency of Mexican-origin students. It was an early form of bilingual education.

Oyama’s efforts for social justice were not limited to the field of education. In 1959, his quiet struggle for racial equality and social justice became personal. That year, he met and fell in love with Mary Ann Jordan, a White woman, whom he was prevented from marrying by an Arizona state law (Arizona Statutes, 1942, Section 25–101, on Void and Prohibited Marriages). That law forbade “the marriage of persons of Caucasian blood with those of Negro, Mongoloid, Malay or Hindu blood.” Oyama and Jordan challenged the law, which was declared unconstitutional by the U.S. Supreme Court in 1962.

Meanwhile, Oyama continued to work on behalf of Mexican-origin students. In 1965, he was invited by

the National Education Association (NEA), together with Guerrero, Urquides, and Cota, to participate in the "Tucson Survey on the Teaching of Spanish to the Spanish-Speaking." Conducted in the southwestern states of Arizona, California, Colorado, New Mexico, and Texas, the survey documented the success of bilingual education programs under way at the time.

The work of Henry Oyama and his Pueblo High School colleagues had a direct bearing on the creation of the Bilingual Education Act (Title VII) of the Elementary and Secondary Education Act. Their efforts led to a national symposium later that year in Tucson, attended by U.S. Senator Ralph Yarborough of Texas, who subsequently sponsored congressional hearings to discuss the importance of bilingual education for the educational success of Spanish-speaking students.

Oyama earned a bachelor's degree in Spanish, history, and political science and a master's degree in education at the University of Arizona. In 1970, he joined the faculty and staff at Pima County Community College as director of bilingual and international studies. Oyama rose through the administrative ranks at Pima Community College, becoming associate dean in 1978, a position he held for 10 years. In 1989, he became associate vice president of the college; he retired from this position in 1992. In 1993, he was honored with the Pima County Man of the Year Award, and, in 1996, received an honorary doctor of laws degree from the University of Arizona. He remains active in raising scholarship funds for minority students at Pima Community College.

OYSTER BILINGUAL SCHOOL

James F. Oyster Elementary School, a public elementary school located in the Woodley Park neighborhood of Washington, D.C., was built in 1926 as a 10-classroom school to accommodate 240 students. By the late 1960s, it was a school in decline, serving a predominantly White population that was aging and/or moving to the surrounding suburbs of Maryland. Importantly, its attendance zone stretched deep into the heart of the Adams Morgan neighborhood, which, in the late 1960s became the center of the expanding Hispanic community of Washington. This demographic change accelerated in 1965, when U.S. immigration laws were amended to increase the number of immigrants from the Western Hemisphere. Washington, D.C., became a port of entry for working-class immigrants from Central America, due to the immigration reforms of the 1960s. Prior to the Immigration Reform and Control Act, the Hispanic community of Washington had consisted mainly of professionals working in city, state, and federal governments and international agencies.

With the influx of large numbers of poorer Hispanic immigrants who settled into the Adams Morgan area, the number of Hispanic students enrolled in the D.C. Public Schools increased. Soon tensions rose, and subsequently there were even riots.

Using the 1960s "Great Society" rhetoric of President Lyndon Johnson's administration, which stressed the importance of education, grassroots leaders directed the energy and goals of the emerging Hispanic community toward improved education services. In June 1969, the District of Columbia Manpower Office funded Project Adelante, designed to teach English to adults. Hispanic leaders in the city also called for an elementary-level bilingual school that would serve both English-speaking and Spanish-speaking students. They believed that a bilingual program for both groups, working together to learn each other's languages, would create in the school a microcosm of the community that would benefit the entire city.

Federal funds were sought and obtained through a project called "Model Schools." These funds provided teacher training for 20 native Spanish-speaking teachers selected to meet certification requirements for D.C. Public Schools. These teachers were charged with the responsibility for designing an integrated two-way bilingual school emphasizing language learning in a multiracial, multicultural environment; and together with community leaders, they were charged with

“selling” the program to the community. In the spring of 1971, after 2 years, the D.C. Public School Superintendent responded to community requests by proposing to use local funds to pay for the teaching and staff salaries of a bilingual school. The Ford Foundation provided a grant for curriculum development and program evaluation.

The existing Oyster Elementary School was selected as the ideal site to implement a two-way bilingual program for all its students. The reasons for selecting this school were that its student population had the highest number and percentage of Hispanic students in the city and the total school program would be small enough to test the educational model.

In the fall of 1971, Oyster School launched its two-way bilingual program for all its students. After the first year of the program, the student population began to grow, due to the influx of more Central Americans into the Adams Morgan neighborhood. By 1973, the student population was well over the capacity of the school, with students numbering beyond 300. The school became known unofficially as “Oyster Bilingual Elementary School.”

The Program

Oyster Bilingual Elementary School, with the adjective *bilingual* later added officially, is today a world-renowned, dual-language immersion program in which all students, from prekindergarten to sixth grade, participate in an *inclusive* learning environment. At the heart of Oyster Bilingual School’s mission and philosophy is the belief that every child’s learning ability, employment potential, and cultural interests are enriched by achieving competency in a language beyond his or her own—and this in a school where children from various cultures learn and share together. Native-Spanish-speaking children learn to perform better in English in an environment that respects their native language and provides continued growth in that language. The education of English-speaking children is enriched by achieving competency in a second language. Oyster Bilingual School’s explicit goals have always included additive bilingualism for all its students.

Since its inception in 1971, every classroom has housed one English-dominant teacher and a Spanish-dominant teacher. Because of this, equal weight is given to the acquisition of both languages and the learning of math, science, social studies, art, music, physical fitness, and technology in either language.

Throughout the grades, approximately 50% of the students’ instruction is in English, and 50% is in Spanish. This 50/50 distribution of language instruction across content matter provides the basis for the development of both cognitive and language skills. The two languages of instruction are equally distributed throughout the students’ week and throughout their academic experience. Ideally, the English-dominant teacher speaks and is spoken to only in English, and the Spanish-dominant teacher speaks and is spoken to only in Spanish.

English and Spanish Reading/Language Arts are taught everyday for a 2- to 3-hour block. During this time, the students separate into two heterogeneously mixed language groups—spending half of the time with the English-dominant teacher and the other half with the Spanish-dominant teacher. They learn to speak, understand, read, and write English and Spanish. Both languages are recognized by students and staff alike as being valuable. In this format, the two languages are mastered because they are the vehicle of instruction, rather than its object. Whole-language techniques are used so that the students learn the languages in meaningful ways. The teachers use real literature with students. Reading and writing activities are promoted, celebrated, and enjoyed. Where applicable, they are consistently incorporated in content-area lessons.

Typically, math, science, and social studies can be team taught, whereby concepts are introduced in one language and reinforced in the other, as long as the same language is not used to introduce the concepts all the time. Another method typically used is dividing the students into two groups, with each group receiving instruction in one language for a week, a month, or an entire semester in a given subject, and the reverse occurring after the specific period of time.

Oyster Bilingual School’s teachers, staff, and administration employ an educational discourse that socializes English-speaking and Spanish-speaking students into seeing themselves and each other as equal participants in school. Because the goal of the dual-language program is for all students to develop the necessary skills to become bilingual and to achieve academically in content areas in both Spanish and English, the motivating principle behind the students’ acquisition of two languages is interdependence. This interdependence revolves around the English-speaking and the Spanish-speaking students and is reinforced by the presence of two teachers in the classroom.

The hallmark of Oyster School's dual-language immersion program is that it nurtures students' valuing of themselves and their valuing of others. That cherishing of human growth comes in significant measure because of the way that the dual-language program is delivered at Oyster. While English and Spanish are the languages of instruction, the equal valuation of two languages communicates to the children that cultures and the people who are products of those cultures are also to be equally valued. Oyster students learn that to be good citizens of their communities, they must at the same time be good citizens of the world. The school community constantly builds on this solid base.

Oyster Bilingual School goes a step further in its promotion of bilingualism. It conducts its business in both languages. All documents sent home to parents and families are written in Spanish and in English. There are no page numbers used, and the official letterhead appears on both sides of every page. This avoids the subtle message that one language is privileged over the other. Brochures promoting Oyster's program are also written in both English and in Spanish. This policy is another symbolic reflection of the school's dedication to being bilingual and inclusive.

The Community

Oyster Bilingual School has had broad parental and community involvement since the beginning of its bilingual program. Decision making at the school is accomplished through the Oyster Community Council (OCC) and the Oyster School Restructuring Team (OSRT).

The OCC functions through its board of elected officers and committees. Committees can number as many as 25, depending on the need and the priorities of the school. Parents elect their officers, and teachers elect their representatives, but all teachers, parents, and staff compose its membership. The main functions of the OCC are directly related to fund-raising initiatives, to budgeting, and to support of instructional initiatives that are not typically provided for by D.C. Public Schools. The council's purpose is to augment and supplement, rather than to supplant.

Cochairs, one English speaking and one Spanish speaking, are charged with the task of ensuring that all information is available in both languages, either through bilingual oral communication at meetings, through simultaneous translations, or through the printed

word. Again, to the extent possible, equal weight is given to both languages. The language for conducting school business alternates at OCC meetings. One meeting is run in Spanish, with translations into English; the following is conducted in English, with translations into Spanish.

Working closely with the OCC, the ORST, since its inception in 1993, was established according to the districtwide guidelines, and it is the center of the governance system of the school. The OSRT is composed of an equal number of teachers and parents, elected by their constituents, the principal, the union representative, and an elected member of the support staff. It reaches decisions collegially, through consensus, and it shapes the educational policies and procedures of the school. To ensure communication and linkages with the OCC, a member of the executive board of OCC is a member of the OSRT. In addition to developing the local school improvement plans, the OSRT works closely with the OCC to establish funding priorities that are aligned with the school improvement plan. The OSRT reports on its activities at every OCC meeting and solicits input from its members.

The Building

From 1991 to 2001, the OCC oversaw the progress of the public/private partnership to rebuild and expand teaching space in the Oyster Bilingual School. Recognizing that Oyster's successful bilingual program was hindered in several ways by its small and aging facility, the Oyster Bilingual School community wrote a position paper on the facility needs of the school. The original school building had been built in 1926 and was slightly refurbished in 1977. Three portable classrooms ("dismountables") housed 25% of its student population and two of these temporary buildings were seriously deteriorated. Code violations of all types were a concern. Typical classrooms did not serve current teaching and learning methods well, with two teachers in every classroom using the cooperating learning model of instruction. The building did not support educational technology, and the optimal enrollment for the program was greater than the capacity of the building.

In the early 1990s, Oyster Bilingual School almost closed its doors forever. The D.C. Public Schools, suffering a fiscal crisis, considered closing the school because of the unsafe and unsuitable conditions of the

building. But the Oyster community mobilized, held press conferences, and organized hearings attended by experts in bilingualism from across the country, by local city leaders, and by graduates of the program. In response, the community was given 1 year to come up with an alternative plan.

The 21st Century School Fund, a nonprofit organization founded by a former Oyster School parent with community-organizing and construction experience, requested and received funding from the Ford Foundation to lead an effort to create what came to be called the “Oyster Public/Private Development Partnership.” The purpose of the project was to modernize the Oyster Bilingual School building using capital generated by private development of a portion of the school site. The site was developed with private financing to accommodate both a high-density residential apartment building and a new, modernized Oyster Bilingual School. The project survived three mayors, four superintendents, four school district governance structures, and seven project managers. The public-private partnership included the following elements:

1. The 21st Century School Fund was responsible for keeping the vision alive, for developing project milestones, and for managing and monitoring every detail for 8 years.
2. The District of Columbia Government, owner of the site, agreed to dedicate property taxes from the apartment building for 35 years to repay bonds that would help pay for the construction of the new building.
3. The District of Columbia Public Schools traded a portion of the existing Oyster School site in exchange for the design, construction, and furnishing of a new Oyster Bilingual School building.
4. LCOR, the developer, built on the site the new Oyster Bilingual School building and the Henry Adams House, a 211-unit apartment building.

During the construction process, beginning in August 1998, the students and staff of Oyster School were relocated for 3 years to an empty school building located near Howard University, approximately 3 miles from its original site and community. During this time, the entire school community worked especially hard to stay connected and active despite both the psychological and physical distances separating the community from its original home.

Enrollment and statistical information for the last school year (2000–2001) before relocating to the new school building was as follows:

<i>Total School Enrollment:</i>	325
Language Minority Students:	65%
Language Majority Students:	35%
Limited English Proficiency:	28%
Free/Reduced Lunch:	43%
Females:	59%
Males:	41%
Ethnic/Racial Student Groups:	
Hispanic	56%
Caucasian	24%
African American	17%
Asian/American Indian	3%
Students' Attendance Rate:	96%
Attendance at Parent-Teacher Conferences (4):	99.8%

Program Improvement

During the 3 years that Oyster Bilingual School awaited the completion of its new building, the principal and teachers embarked on a period of analysis and reflection of the dual-language program. High-stakes testing across the country had begun, and test results at Oyster were stagnant. In addition, students were not being tested in Spanish. The principal solicited funds from the OCC to administer Aprenda, the Spanish version of the SAT 9 standardized tests being used by the school system. The Aprenda test was administered for the first time in the spring of 1998.

Analysis of SAT 9 and Aprenda test scores on a class-by-class basis indicated that the students with the highest test scores in reading, in both English and Spanish, were those who participated in a challenging writing program. As a result, priorities were established for the following school year that included requiring all students to read 26 books per year, 13 in Spanish and 13 in English, and to write two books, one in English and one in Spanish. Prekindergarten and kindergarten students would “author” two big books, one in each language, per class. A “Young Authors’ Night” was held for the first time, and students were given the opportunity to read their books to parents and to other students. In addition, the school’s curriculum specialist, with feedback

Table 1 2000 SAT 9 and Aprenda Scores

SAT 9 in English				
<i>Reading:</i>	Below Basic 0	Basic 22%	Proficient 48%	Advanced 30%
<i>Math:</i>	Below Basic 0	Basic 19%	Proficient 45%	Advanced 36%
Aprenda in Spanish				
<i>Reading:</i>	Below Basic 6%	Basic 35%	Proficient 41%	Advanced 18%
<i>Math:</i>	Below Basic 3%	Basic 20%	Proficient 40%	Advanced 37%

from teachers and the principal, wrote a proposal for federal funding that was submitted by the D.C. Public Schools on behalf of Oyster Bilingual School, under the Bilingual Education Comprehensive School Grants Program (Title VII, ESEA) for Project OMAR (Oyster Dual-Language Model for Academic Reform). The program was approved for funding for 5 years. Project OMAR was based on implementing a unique model that included the adoption of America's Choice systemic reform model, created by the National Center for Education and the Economy. This component enabled Oyster to become a fully operating standards-based school for its English language curriculum, emphasizing writing.

Utilizing the framework of America's Choice, federal funding also enabled Oyster School to articulate, align, and translate the Spanish language component of the program, so that it too became standards based. The 5-year project goals addressed professional development, articulation and alignment of content and performance standards in Spanish and English, family involvement, student assessment, enrichment of curriculum and instruction, building community partnerships, and the development, replication, and dissemination of the model. Through this project, Oyster Bilingual School had the opportunity to standardize and solidify the reading and writing component of the dual-language program to meet the needs of all its students.

Test scores in the spring of 2000 soared in both the SAT 9 and Aprenda. School results are listed in Table 1.

Oyster Bilingual School had moved from being ranked 25th out of 119 elementary schools in the results of standardized test scores in reading in 1982 (top 21%) to being ranked 6th out of 110 elementary schools in its results in reading in 2000 (top 5%).

Recognition, Accolades, and Awards

The Oyster Bilingual Elementary School has received many accolades and national awards over its years of existence, including the following:

1. In 1987, the U.S. Department of Education's National Advisory and Coordinating Council for Bilingual Education gave it a Citation for Excellence on seven salient characteristics: high expectations/high achievement; whole-school, two-way model; team teaching; application of linguistic research; integration of program students with mainstream students; support of the administration; and parent/community involvement.
2. In 1993, Oyster was the first elementary school selected by *Hispanic: The Magazine for and About Hispanics* as the U.S. School of Excellence for its quality program and making a difference in the lives of its Hispanic students and community.
3. In 1998, Rebecca D. Freeman published a book titled *Bilingual Education and Social Change*, highlighting the Oyster program as an important model for effectively creating social change in the United States.
4. In 2000, Jim Cummins published a book titled *Language, Power, and Pedagogy*, which highlights Oyster's program as one of three schools that has demonstrated continued success for its effectiveness in its two-way bilingual program.

In September 2001, Oyster Bilingual School celebrated 30 years of offering a dual-language program to all its students and moved into its new 21st-century building designed specifically for the program. Above its main entrance, a sign reads, "Oyster Bilingual School/Escuela Bilingüe Oyster," its new official name.

P

PARADOX OF BILINGUALISM

Essay

Editor's Note: *This essay is an abridged version of the Du Val Lee Lecture delivered by the author as part of the Community Faculty Lecture Series of the University of Arizona, in 1999.*

There is an essential paradox, a contradiction, in the way we have conceived of the role of languages other than English in public life in the United States. This paradox can be stated simply as follows: *Other languages are to be pursued by those who don't have them, but they are to be abandoned by those who do.* This paradox, now embedded in laws and pervading our norms, has led to a number of other strange and seemingly contradictory ideas that are the engines for much of U.S. public policy.

Many others have also noted this paradox and have described it in various ways. For example, Kurt Müller, in 2002, stated it in this way:

We prevent first-generation natives from developing competence in the language and culture of their heritage, and we require those already assimilated into the common culture to begin learning another language later than their competitors abroad. At its worst, in many school systems we limit the choice of languages to the very one that the objectors do not want the immigrants to maintain. (p. 10)

Müller sees it as our “self-imposed handicap in international affairs.” Sandra McKay and Sau-Ling Wong,

in 2000, made much the same point, characterizing existing language education policy as “curtailing mother-tongue maintenance among immigrants and then providing foreign-language programs for Anglophone monolinguals (many of whom are former bilinguals)” (p. 3). Patricia MacGregor-Mendoza goes further, suggesting that the number of cases in which Spanish speakers have been punished by the courts constitutes the “criminalization” of Spanish in the United States, but it is clear she is talking about local, “ethnic” varieties of Spanish. James Crawford, among many others, also analyses the paradoxical nature of policies on bilingual education.

Arizona is a state full of beautiful natural culture and linguistic diversity, yet its people are full of ambivalence with respect to it. We treasure our natural wonders yet see with suspicion efforts by environmentalists to preserve them for our children and grandchildren. Phoenix has been for a long time a “suburb” of Los Angeles, and California is the tail that wags the dog called Arizona. As previously mentioned, in 1988, Arizona passed a law making English the official language of the state by constitutional amendment; that was 2 years after California passed much the same law for the second time in its history. In 2000, just a few months after California passed a law by which teachers are told how best to teach bilingual students, Arizona did the same. Parts of Arizona have a long, established identity and a sense of purpose; as a state, we do not yet know what we are or where we are going. This is especially true with respect to cultural and linguistic diversity.

Finally, we are, in the United States, a country that has for more than two centuries resisted the idea of an

official language at the national level—yet has a long history of embracing restrictionist policies and laws with respect to the public use of languages other than English. The proposals for immigration reform discussed in the U.S. Congress after the 2006 elections make it clear that from one extreme of the political spectrum to the other, whatever disagreements there might be on other details, the primacy of English must be an absolute requirement in the law.

The historical and political contexts in which we live help to shape how we think about language and its role in our public life. Let us discuss briefly in more detail some of the principal historical developments that have influenced our perceptions. But there must be some dispelling of historical myths at the outset; in some ways, these are more powerful than any actual data that might be brought to bear.

One often hears on talk radio and reads in letters to the editor statements such as the following: “My ancestors came here from (wherever, usually Europe), and they didn’t have bilingual education, but they still got ahead. Why do the Spanish speakers need it?” We are about to see how wrong this perception among the general public is, but it is even more disturbing when it is held by those who should know better. One example, for instance, is the *New York Times* editorial by Joan Keefe, in 1985, who at the time was a member of the National Advisory and Coordinating Council on Bilingual Education of the U.S. Department of Education. She was described as a teacher of English as a Second Language (ESL) and French at Washington area universities. Keefe asked whether bilingual education is needed. She asserted,

If it had existed earlier in the century, some of today’s leading educators, scholars, and entertainers would have been placed in classes in languages their immigrant parents spoke. Would they have gained their present prominence—or have stagnated in cultural and linguistic ghettos? (p. A27)

There are many approaches to answering this question, which is why at universities we give whole courses devoted to addressing it. But for now, let us disabuse ourselves of some of this particular historical myth. At the time of Keefe’s editorial, some 182,000 children were being served in federally funded bilingual education programs. While it is true that many more were enrolled in state and locally supported programs, the number of children affected by these programs

was extremely small as a percentage of total school population. Keefe implied that these were unprecedented numbers. Nothing could be further from the truth.

German Language in the Midwest

The heyday of publicly funded bilingual education in this country was from about the middle of the 19th century to the second decade of the 20th, roughly 1840 to 1920. These programs primarily served western and northern European groups, the largest of which were the Germans. While there was some concern expressed early in the development of these programs that schools were spending too many public resources on non-English instruction (e.g., see work by Conrad Patzer and Bessie Pierce), these communities generally tended to be well received in urban neighborhoods and the schools. They met resistance to the extent that they were perceived as hostile to what was by that time the main purpose of the public schools—Americanization. The 1860s and 1870s saw a dramatic rise in the study of German in the public schools, and also study conducted in German. This accompanied the enhanced political status of Germans in the communities of the Midwest. By the middle of the century, Germans in St. Louis, for example, constituted one quarter of the population and according to St. Louis Public Schools, in 1876, had “a considerable portion of the active business and manufacturing community, holding a great amount of the wealth of the city, and contributing largely to its revenues” (p. 114).

The political status of Germans in the Midwest accompanied their heightened economic interest and weight, suggesting that the accommodations that could be made with public funds for the education of ethnic communities were proportional to the general perception of their economic benefit to the larger society. Advocates for including the German language in public school curricula argued that German study would encourage German parents to send their children to public schools, at that time a tenuous institution because of the strength of competing Catholic and Lutheran parochial school systems. These arguments prevailed: In 1864 and 1865, in St. Louis, 450 elementary students, about 5% of the school population in 5 schools, studied German under the tutelage of 5 specially trained German teachers furnished by the Cincinnati schools. By the end of that year, the Office of German Assistant Superintendent was established.

The increase in resources allocated for German instruction was dramatic. By 1870, 37% of the students studied German; in 1875, 73% studied German, with 73 teachers in 45 schools; and the numbers increased into the 1880s. This pattern was mirrored throughout the Midwest, especially in the so-called German triangle (St. Louis-Milwaukee-Cincinnati). Pierce and the St. Louis Public Schools state that in Milwaukee as late as 1907, some 70% of Milwaukee high school students were enrolled in German classes. The national statistics on foreign-language study in high school also show this interest in language study.

The historical context is important to keep in mind. The great majority of the teachers in these programs were not proficient in English, at least not to the extent that they could teach basic subjects in English. John Sterns and Jerome Waltrous confirm that many of them had been prepared at German seminaries such as those in Milwaukee and Chicago, having only recently arrived from Germany for the purpose of teaching basic subjects in German. In other words, while many of these students were studying the German language, it appears that many of them were also using the German language to learn other subjects. In effect, they were experiencing German immersion, a form of bilingual education, in public schools. The figures in Table 1 demonstrate the popularity of such study.

The table also illustrates the precipitous decline of German study throughout the country after 1915. In Milwaukee, for example, between 1916 and 1918, enrollment in German classes dropped from 30,000 to 400, and the number of German teachers from 200 to 1; by the end of the 1919 school year, the teaching of German was completely discontinued in elementary schools. Heinz Kloss and Bayrd Still maintain this was a common pattern throughout the Midwest in this period. This is understandable given the ethos of the time. Much had happened in the world to make people and institutions in the United States suspicious of anyone of German ancestry who wanted to study German. It became a sign of disloyalty and disrespect to maintain the language of a people at war with the United States. This association of language and political loyalty was to be ingrained in the public mentality from that period to the present. William Parker claims that from 1918 to 1925, about half the states passed anti-foreign-language laws, many of them aimed at schools. Shirley Brice Heath and Frederick Mandabach claim that perhaps the most remembered of these laws were the twin Siman and Bartels Laws, in Nebraska and Iowa, respectively; these became the subject of one of the most famous U.S. Supreme Court cases, *Meyer v. Nebraska*, in 1923. The arguments of the justices in these cases mirrored much of the sentiment in the country: Even while, in some instances, such as *Meyer*,

Table 1 Foreign-Language Enrollments in U.S. Public High Schools: 1890–1964

<i>Year</i>	<i>Total High School Enrollment</i>	<i>% Latin</i>	<i>Modern Languages</i>	<i>% French</i>	<i>% German</i>	<i>% Spanish</i>
1890	202,963	34.7	16.3	5.8	10.5	
1895	350,099	43.9	17.9	6.5	11.4	
1900	519,251	50.6	22.1	7.8	14.3	
1905	679,702	50.2	29.3	9.1	20.2	
1910	915,061	49.0	34.3	9.9	23.7	0.7
1915	1,328,984	37.3	35.9	8.8	24.4	2.7
1922	2,230,000	27.5	27.4	15.5	0.6	11.3
1928	3,354,473	22.0	25.2	14.0	1.8	9.4
1934	5,620,625	16.0	19.5	10.9	2.4	6.2
1949	5,399,452	7.8	13.7	4.7	0.8	8.2
1954	6,582,300	6.9	14.2	5.6	0.8	7.3
1958	7,897,232	7.8	16.4	6.1	1.2	8.8
1959	8,155,573	7.9	19.1	7.4	1.5	9.8
1964	11,056,639	5.4	26.2	10.8	2.6	12.3

they were compelled to find the laws unconstitutional, they nevertheless made it evident that states could find ways to restrict the public use of languages other than English. In Meyer, the justices even gave guidance on how that could happen, and the state quickly took its advantage: Nebraska's official English law is the oldest in the country, dating from 1923.

Spanish Language in the Southwest

The early situation of German Americans stands in stark contrast to the way in which, at the very same time, new Mexican citizens were being treated in the territorial Southwest. Not only was there no accommodation for their language and culture needs in schools, but they were viewed with considerable suspicion, to the extent that they were actively discriminated against in all aspects of the public sector. After numerous Mexicans were incorporated into the United States after the Mexican War in 1848, their lands were confiscated, their culture was undermined, and their language suppressed, sometimes in ruthless fashion. According to reports prepared by the U.S. Commission on Civil Rights on the Education of Mexican Americans clear into the 1960s, Spanish was proscribed in many schools of the Southwest. No-Spanish rules were notorious in Texas, Arizona, and parts of California. Arizona developed a segregated system of education for Mexican Americans called the "1C Program"; some researchers compare it to the segregated schools for Blacks in the South of the same period, as Mary Carol Combs and her colleagues explain.

What accounts for this difference? It is part of the paradox of bilingualism and bilingual education in the United States.

The Paradox Restated

When Arizona was passing Proposition 106 in 1988, making English the official language of the state and targeting bilingual education, the state's department of education was promulgating rules, with much popular support, that would provide for every student in every grade level in every school in Arizona the opportunity to study a foreign language. Ironically, but predictably, Arizona follows the same pattern at the present time: The constitutional amendment passed in 2000 outlawing most instances of bilingual education is accompanied by initiatives in local districts

to promote foreign-language study. In 2007, the Arizona Department of Education has been pushing legislation by which the state would fund international schools promoting the study of foreign languages. In its most recent iteration in 2007, a bill to create three international schools failed to pass the state legislature amid criticisms from some legislators that such schools would be "un-American."

This apparent contradiction has to do in part with the ideas we have about language, about the roles that languages should play in our public life, and about the communities that use these languages, for example,

- We have a highly instrumentalized view of language. We see it as essentially a tool, an instrument for getting social goods. To the extent that it does that, we see a language as valuable; to the extent that it does not, we devalue it.
- This is in contrast to a view of language that sees it as part of identity, as part of the tradition and history and culture and personality of a community. While language can still be seen instrumentally, that is not its essence.

Ethnicity is seen as a sort of sentimentality, an allegiance toward community, toward local attachments, and toward intimate relationships, rather than toward the public, transethnified needs of the bureaucratic state. When we see ethnicity, we see a breakdown of the state based on a faulty commitment toward sentimentality demonstrated by the concern to maintain heritage languages other than English and the cultures of which they are a part. As a society, we devalue these groups, and we see their languages as equally depreciated. Even worse, we see these groups as threats to our way of life.

Language study that deemphasizes commitment to local community, that urges us toward allegiance toward the larger public state, and that promotes the instrumental values that fuel a capitalist system are those that are valued. Others are seen as at best inadequate, perhaps even threatening to the public good.

So, the paradox mentioned by Müller and others above is not perceived as a contradiction. Foreign languages are academic, not intimate. They do not form part of our personal identities, and they do not impel us to any sort of political action. They are not attached to a local community of which I am, or am becoming, a part. Their purpose is to enhance my academic or social status, and perhaps to allow me to travel with a

little more ease. One studies them for a year or two, but they are rarely if ever completely mastered, at least not through the current ways of teaching them employed by public schools, except perhaps to read; they are tools to be used on occasion, not a means to attach or reattach individuals to communities. This is precisely what local community languages are, or are perceived to be. Therefore, bilingual education is seen as the agent of irredentism, of maintaining or bringing back into the fold those who could be transformed by a severe acculturation into *real Americans*, loyal not to their parochial interests, but to those of the commonweal, the state.

The paradox described at the outset can thus be restated as such: Spanish (or French or German or any other non-English world standard foreign language) is to be pursued by those who do not have it, but Spanish (or French or German or any other “little” non-English community language) is to be abandoned by those children and youth who do. Spanish uplifts and enhances and builds up; Spanish tears down and fragments and holds back all who maintain it. If this is a paradox, it is easily accommodated by those who see these as quite different languages.

But there is an even more fundamental and puzzling paradox: Publicly funded, especially federally funded public school bilingual education, has never really been about bilingualism or about bilingualization. Although we have had a bilingual education law in the United States since 1968, there was very little in any of its pronouncements to allow us to infer that its purpose was true bilingualization. Those whose purpose it has been to implement these laws at the federal level have been consistent in their insistence that they were designed to promote the teaching and learning of English; all else is secondary. This position is stated explicitly in policy and position papers commissioned by federal education offices. Beatrice Birman and Alan Ginsburg, in 1981, provided the following prime example:

Underlying this paper is the assumption that the ultimate goals of bilingual education programs are to learn English and to keep up with English-speaking peers in subject matter. While bilingualism is a laudable and worthwhile outcome, we judge benefit in terms of English acquisition and subject matter learning. (p. 5n)

The United States is unusual if not unique in the world in this: Bilingual education is not designed to

create bilinguals, but rather monolinguals in English out of those who previously spoke another language. Joshua A. Fishman, a leading researcher and advocate for bilingual education in the world, has been blunt in his criticism of the U.S. law. According to Fishman, in 1981, it is “primarily an act for the Anglification of non-English speakers and not an act for bilingualism. . . . The act is basically not an act *for* bilingualism, but, rather, an act *against* bilingualism” (pp. 517–518). This is the irony of the present controversy in this state and in this country. Opponents of bilingual education argue against it because it promotes other languages over English. Proponents of bilingual education argue against most of what we have up to now called bilingual education because all it does is promote English over all other languages.

If we truly had bilingual education in this country, we might then be able to realize the great potential of those children who come to our schools speaking all those many and varied languages, build on those experiences to learn English and much more, and use their language proficiencies to make the world better. The present sociolinguistic and political dynamics in the United States preclude that bright future.

PEER PRESSURE AND LANGUAGE LEARNING

Peer pressure is defined as the pressure individuals experience to adopt certain behaviors, patterns, or attitudes in order to be accepted as part of a group. Peer pressure associated with adolescence is particularly strong because during adolescence, children are seeking to fit in with their friends and differentiate themselves from their parents. This pressure to fit in may come directly from friends and schoolmates and also from the influences of music, television, and the Internet. Young people are particularly vulnerable to peer pressure because they are attempting to live up to factors they believe are favored by their peers. Eventually, this pressure exerted by others may be internalized and accepted as one's own. This search for social approval may supersede the traditional values, practices, and beliefs of the adolescents' families.

Peer pressure is not always welcome, but adolescents may elect to go along with choices made by their peers even if they may find those choices uncomfortable or distasteful. In contexts where two or more languages or language varieties are found, the choice of which language to use or learn is an area where peer pressure may play an important role.

In bilingual education settings, students come from diverse cultural backgrounds and have different needs and goals. These differences determine how certain groups may react to peer pressure. With adolescent language learners, peer pressure can be a powerful force that can (a) affect a learner's desire and ability to learn a second language, (b) determine how and when they use their ancestral language, (c) affect whether or not they engage in code switching, and (d) support or undermine goals set by parents and teachers.

For students learning English as a second language (ESL), trying to sound like a native speaker may be regarded by peers as a signal that an individual no longer wants to be a member of the native-language peer group. Bilingual education teachers need to understand second-language learners' peer pressures and be aware of the following issues: (a) What is the group's attitude toward the first and second languages involved? (b) What peer groups are influential in the school? and (c) What additional circumstances in the community environment may exert further pressures? As mentioned previously, different language groups experience peer pressures in their own way. One

PARAEDUCATORS

See BILINGUAL PARAPROFESSIONALS

group may be very amenable to keeping and improving the home language, while another is just as likely to abandon it in the context of a subtractive bilingual education program.

Teachers and other school personnel should examine social attitudes that have the potential to cause problems in the classroom. Specific attention should be given to how the schools deal with regularities, patterns, and traditions concerning language in the community served by the school. Although it is, of course, not recommended that linguistic conventions be promoted in a heavy-handed way, the school should inform students of the importance of conventions in the languages being studied. For example, success in school requires formal styles of talking and standard varieties of English (e.g., one does not use the word *ain't* in a typical English class), while conversations with friends and relatives may be full of nonstandard words that are perfectly acceptable in those settings. Consequently, students whose manner of speech outside of school is valued when used in the appropriate context are more likely to be open to acquiring a second language and to continue to develop their first. Under such conditions, students are more likely to realize that any new discourse will expand their communicative repertoire rather than displace their usual method of speaking.

At its best, peer pressure can mobilize adolescents' energy, motivate them for success, and encourage them to conform to healthy behavior. Peers can and do act as positive role models and also demonstrate appropriate behaviors. Adolescents often listen to each other when no one else will and accept one another unconditionally; they understand the frustrations, challenges, and concerns associated with being a teenager. By the same token, linguistic peer pressure cannot be ignored. Peer pressure has the capacity to eradicate any desire a language learner possesses for working toward achieving nativelike pronunciation, because, as noted earlier, pronouncing words like a native speaker may be unconsciously regarded by peers as a sign of one no longer belonging to the "native-language" group. Teachers working with students who are learning a second language should understand that these students do have peer influences, and an effort should be made to foster a positive image regarding second-language proficiency.

Generally speaking, adults differ from teens when learning a second language because their motivation for doing so is often more pragmatic. Some adults

may lack confidence (especially when speaking to a native speaker in the second language) and fear looking foolish or incompetent. Teens may share this problem, although with one added dimension: They are terrified to lose face in front of their peers, though losing face might mean that they not only want to avoid appearing ineffectual but also do not want to step outside the boundaries of their social group—showing their ability might appear as if they are acting like "they're somebody." What happens is that the adolescent skilled in second-language acquisition will appear to be the opposite, since that is what is expected in his or her peer group.

The learner's attitude regarding the target language can be crucial in determining success or failure. Language students frequently exhibit their beliefs regarding the target language, its speakers, its society, cultural mores, the social worth of acquiring the language, specific uses of the language, and themselves as members of their own culture. Students with positive outlooks who achieve some success will likely have their beliefs strengthened. The reverse is also true: If a student holds negative beliefs or attitudes about the language in question or its users, the effect may be slower progress in achieving mastery of the language. Many teachers have reported the experience of teaching second-language classes in which adolescents who possessed an upbeat, optimistic approach at the beginning adopted a negative attitude later on because of peer influences that were not attended to or given minimal importance. The intersection of language use, identity, and sense of belonging to a social group should be considered by teachers and school leaders seeking to broaden their conceptions of success or failure in language classrooms.

PEÑA, ÁLBARR ANTONIO (1931–1993)

Álbarr Antonio Peña, first director of bilingual education programs in the United States at the national level, was born in 1931, in Ciudad Mier, Mexico, and died in San Antonio, Texas, in 1993. His family, which included four older siblings, moved to Falfurrias, Texas, following the death of his father. Peña completed high school in Falfurrias and then served in the U.S. Air Force during the Korean War, rising to the rank of sergeant. Upon completion of his military service, Peña attended the University of Texas at Austin, where he completed a BA degree in foreign languages in 1957. Following college graduation, he married Englantina Canales, and the couple moved to Brownsville, Texas, where they worked as teachers in the Brownsville Independent School District. Subsequently, Peña completed an MA degree in Spanish and educational administration from Texas A&I University in 1961 and a PhD in curriculum and instruction, with specialization in bilingual education and English as a Second Language (ESL), from the University of Texas at Austin in 1967.

Peña became nationally known in the field of bilingual education following passage of the 1968 Bilingual Education Act (Title VII of the Elementary and Secondary Education Act), when he was asked to head the office created to administer the act. Between 1969 and 1973, Peña served as director of the Bilingual Education Programs Branch in the U.S. Office of Education, at a time when very little infrastructure existed to support the creation of bilingual education programs in school districts across the nation. Title VII legislation represented an attempt to respond to a wide array of needs, providing initial funding for demonstration bilingual education projects within participating school districts. Peña was responsible for planning, funding, and initial implementation of over

200 Title VII bilingual education projects throughout the nation that focused on development of bilingual instructional models as well as curriculum materials in non-English languages. In these programs, 24 languages were represented, and over 4,000 professional educators were directly involved in the initial funded experimentation of bilingual education projects at the local school district level. During his tenure in the U.S. Office of Education, in addition to guiding implementation of the first federally funded bilingual education projects, Peña also helped lay the groundwork for future enhancements in Title VII, including funding for relevant research as well as fellowships and teacher training grants designed to increase capacity in schools and universities to provide support in critical areas.

Peña's professional life was marked by a number of significant firsts. In addition to heading the first bilingual education office at the national level, he also served as the founding president of the National Association for Bilingual Education (NABE), a professional organization whose mission included advocacy on behalf of language minority students and support for bilingual educators through a broad range of professional activities. During its initial year of existence in 1974, Peña administered NABE out of his office in San Antonio, Texas, with the help of a secretary and a small group of volunteers. At the time of his death almost 20 years later, the organization had developed into a full-fledged professional organization with thousands of members and a recognized national profile.

In 1973, Peña left his position in Washington, D.C., to return to Texas and serve as the founding director of the Division of Bicultural-Bilingual Studies at the University of Texas at San Antonio. At the time, no similar academic units existed within the United States, and hence no models existed for creation of degree programs within the area of "bicultural-bilingual studies." Drawing on his vision of a new kind of school within which bilingualism and biculturalism would be fostered for all children, Peña led a small group of interdisciplinary faculty in creating an innovative master's degree program in bicultural-bilingual studies designed to prepare professionals with the knowledge and skills to serve as leaders in the field. The creation of similar graduate programs at other institutions in Texas and elsewhere allowed for teacher certification in the area of bilingual education to emerge, thus solidifying professional preparation

efforts in this new teaching area. In addition, the hiring of specialized bilingual studies faculty within universities spurred the creation of relevant research agendas that over time helped develop a knowledge base for this emerging field.

In recognition of his important contributions, Peña received numerous awards as well as *Who's Who* listings in the areas of American government, international education, U.S. Hispanics, and bilingual education. Peña served as professor of bilingual education in the Division of Bicultural-Bilingual Studies at the University of Texas at San Antonio until his retirement in 1993.

PÉREZ-HOGAN, CARMEN (1939–)

Carmen Ana Pérez-Hogan was born on July 28, 1939, in Vieques, an island off the coast of Puerto Rico. Her lifelong work has been to make the best educational opportunities available to children and youth who, like herself, spoke another language upon entering school. Only 7 years old when she came to New York City, she attended public schools on the Lower East Side and in Brooklyn before there were English as a Second Language (ESL) programs or bilingual classes. She went through the discomfort of repeating second grade while she learned English in a “sink or swim” school. After graduating from Bay Ridge High School, Pérez-Hogan earned a BA in Early Childhood Education from St. Joseph’s College in Brooklyn. She then earned a master’s degree in ESL from Hunter College of the City University of New York.

After several years of teaching sixth graders and ESL in District 13 (Brooklyn), Pérez-Hogan became district coordinator of the ESL program. When the

Bilingual Education Act was passed by the U.S. Congress in 1968, Pérez-Hogan wrote the first Title VII proposal for a bilingual program for District 13, which was funded to establish two bilingual schools in that district. Subsequently, she received a fellowship to do doctoral work in educational administration at New York University, where she studied for a year.

After working in District 13 for several years, Pérez-Hogan was invited to work in higher education in the Bilingual Education Project at the State University of New York (SUNY), Albany. She moved to Albany and taught courses, advised students, and wrote proposals for funding for the master’s and doctoral programs in bilingual education at that university. Pérez-Hogan also organized the first statewide conference of the New York State Association for Bilingual Education. She was elected president of the National Association for Bilingual Education in 1979.

Pérez-Hogan became chief of the Bureau of Bilingual Education of the New York State Education Department in 1978 and continued to manage the state’s bilingual education programs for 27 years as the leader of the State’s Office of Bilingual Education, playing a major role in shaping policy and practice until she retired in 2005. Among her accomplishments as the coordinator of the Office of Bilingual Education for the New York State Education Department are establishing state certification requirements for teachers of bilingual education and ESL; founding a Bilingual ESL Teacher Leadership Academy to identify and further prepare bilingual and ESL teachers with outstanding potential; securing more than \$100 million in state aid for English language learner (ELL) students over her career; developing and funding a two-way bilingual education program model; coordinating a technical assistance network of 13 Bilingual Education Technical Assistance Centers, including centers to address the specific needs of Asian, Haitian, and Spanish language communities; creating an ESL curriculum for secondary schools; drafting guidelines for the education of ELL children with handicapping conditions; producing bilingual glossaries for global history, American history, mathematics, and science in Chinese, Spanish, Haitian Kreyòl, Korean, Russian, and eight other languages; developing ESL and language arts standards and assessments for ELLs; and creating a successful parent leadership model for parents of limited-English-proficient (LEP) students.

Pérez-Hogan has also held several leadership positions in professional organizations. In addition to the

presidency of NABE, she was president of the Puerto Rican Educators Association and the New York State Teachers of English to Speakers of Other Languages. Pérez-Hogan has received numerous awards in recognition of her contributions to education and to linguistic minority communities. The most recent, in 2006, was the Ramón L. Santiago President's Award from the National Association of Bilingual Education. One of her most cherished honors has been her adoption into the Hawk Clan of the Seneca Nation of Indians in western New York. She is married to Tom Hogan and lives near Albany, New York.

PHONICS IN BILINGUAL EDUCATION

The New Lexicon Webster's Dictionary of the English Language defines *phonics* as the use of sound-symbol (phoneme-grapheme) relationships in the teaching of reading. The issue of the role of phonics in bilingual education programs may be framed as a question: What is the role, if any, of phonics in the reading development of bilingual (or becoming bilingual) children, both in their native languages and in English? To answer this question, we may begin by clarifying yet another question: How should we define reading? Alternatively, we might ask: What do children do when they read? These are important questions because they are at the base of answering the initial question, regarding the role of phonics in reading.

Symbols, Sounds, and Predictions

Some persons believe that when children read, they look at the squiggles or the symbols that are on the page and they pronounce the words. Children learn that particular symbols represent particular sounds or sequences of sounds, and they use this knowledge to sound out these symbols. This commonsense view of reading focuses almost exclusively on discrete, individual units of language within a text. This is possible in alphabetic languages such as English or Spanish. The answer might be different for a symbol-based written language, such as Chinese, which contains several thousand symbols, each denoting a word. This view of reading as pronouncing or sounding out begins with the letters that represent the sounds that together make up words. This view of reading asserts that children learning to read need to learn the sounds represented by letters. When this task has been accomplished, that is, when children are able to associate or connect letters and sounds, they will be able to read. This suggests that phonics knowledge, knowing the sounds that letters make, is central to reading, particularly beginning reading.

The basic assumption here is that if you can sound out the words, you can read, as Constance Weaver explains. While this view of what it means to read is a widely held one, it is not the only one. A different definition of reading begins with meaning or comprehending. According to this second view, what children do as they read is make predictions about the text and attempt to create meaning from the symbols on the page, whether or not they have a clear understanding of what symbols go with what sounds in the target language, as Kenneth Goodman and Weaver explain. For example, a child is reading a picture book about a young girl and her love of horses. The child turns to a page in the story that includes an illustration of a green and brown hill and, in the distance, a spotted horse. The child comes to the sentence: "Annie saw a horse on the hill." One child reads the sentence: "Annie saw a h-h-h-o- ho- house on the hill." A second child reads: "Ann saw a house on the hill. No, wait. Ann saw a horse on the hill." A third child reads: "Annie saw a pony on the hill." A fourth child reads: "Ann seed a horse up in the hill." None of these children has read exactly what is on the page. How are these ways of reading different, and what might they tell us about definitions of reading and about the role of phonics in reading?

The first child has read “saw a house” instead of “saw a horse.” The child focused on individual letters in the word *horse*, sounding them out several times before producing the word *house*. The graphemes (letters) in *horse* and *house* are similar enough to cause uncertainty. Even though a glance at the illustration accompanying the words would suggest that the word *house* was not the appropriate choice in the context of the story, the child does not change her rendition of the sentence. This child’s theory of reading appears to be that reading is looking at the words and sounding them out. The goal of reading instruction, from this definition of reading as sounding out, is the accurate pronunciation of the words on the page.

The second child differs from the first in that she corrects her first rendition of the text from *house* to *horse*. Certainly, she is using letters and sounds to make predictions, but she also is using the context of the story. She may have looked at the illustration and decided that the word *horse* makes more sense than the word *house*.

The third child substitutes the word *pony* for the word *horse*. From a phonics perspective of reading, this child’s rendition bears no graphophonic similarity to the text. The child is not demonstrating accuracy in terms of using sound-letter relationships. So, why would the child read the word *pony* for the word *horse*? Analysis from a predicting/creating meaning point of view would focus on the similarity in meaning between the words *horse* and *pony*. While the two terms are not synonymous, they are closely related. A young child might view the two as the same. Further, an illustration of a horse might be perceived by a child as a pony. Thus, the young reader may be seen as making use of his own vocabulary and his own background of experiences, as he predicts a word and creates a rendition that is meaningful for him irrespective of what the writer intended.

The fourth child substitutes the word *seed* for the word *saw*, substitutes *in* for *on*, and adds a word, *up*, that is not in the text, so that the end of the sentence is rendered as “up in the hill” rather than “on the hill.” How might these variations from the written text be interpreted, particularly if we consider that this young reader is an English learner whose native language is other than English—Spanish perhaps? As children learn English, they have to figure out how to express happenings in the past in English. The most common way, but certainly not the only way, that English expresses past occurrences is by adding the ending *-ed*

to verbs. Thus, this child, who is still learning English, may very well read “I saw” as “I seed” because she is utilizing (and in this case overgeneralizing) an English rule she has obviously learned. If this is how the child expresses the past tense when she talks, it would be very common for this to carry over into the child’s reading. The child has demonstrated that she understands the sentence and is simply rendering it in her own variety of English by applying a common rule.

In looking at the substitution of *in* for *on*, second-language acquisition data make it clear that *in* and *on* frequently are confused by second-language learners from a variety of language backgrounds, Spanish being one of them. Spanish uses the same preposition *en* for both *in* and *on*, which is another reason the child may substitute one word for the other. The child’s substitution of *Ann* for *Annie* reflects the reality that many readers substitute names in text. What about the addition of the word *up* (“up in the hill”)? In this instance, the child’s rendition may be influenced by the illustration in which the horse appears to be in the distance. It may also be that this rendering of the text sounds better or more natural to the child.

Research Findings

Reading researchers such as Yetta Goodman, Dorothy Watson, and Carolyn Burke term these kinds of renditions of texts reading *miscues*. A careful look at the miscues in the examples above has shown that readers at different levels of skill are not bound exclusively to sounds and letters. Rather, as they read, along with letters and sounds, children use their backgrounds and life experiences, story illustrations, the language of the stories, and their own ways of expressing themselves, especially in a second language, to figure out text. Children attend to how sentences are constructed, and, most important, they attend to meaning. A significant amount of work done with children reading in native languages other than English and in English as a second or additional language has demonstrated that in all languages studied, children make these miscues. Sarah Hudelson provides several examples in multiple languages in *Learning to Read in Different Languages*. These miscues clearly show that children use a variety of language and text clues when they read. One of these clues consists of letters and sounds.

Returning to the question regarding the role of phonics in the reading development of bilingual children, it can be argued that phonics provide what

reading experts like Kenneth Goodman would term “one set of cues” or “one cueing system,” which bilingual readers use when they navigate a text. The examples above are of children who are already reading. Other questions related to the role of phonics in bilingual education have to do with the teaching and learning of phonics: How do children learn phonics? Are there special considerations that should be given to the teaching of phonics in a second language? The commonsense view of teaching reading in alphabetic languages has traditionally focused on early and sustained teaching of sounds and letters. This view has held that learning letters and the sounds they represent is fundamental to reading and should be learned prior to concern for other reading cues or cueing systems. In this view, it is critical to first learn letters and sounds, and then attention may be paid to other cues. Thus, in Spanish, a common approach to beginning reading begins with children learning the five vowels and their sounds (*a, e, i, o, u*); combining the vowels with consonants to form syllables (*ma, me, mi, mo, mu*); combining the syllables to form words (*mamá*); and combining the words to form sentences (*Mi mamá me ama*). In English, in which the vowels represent multiple sounds, children learn to pronounce vowel sounds in combination with consonants to form patterns, in words and syllables such as *fat/fate, cap/cape, mak/make, The cat is fat, The cat sat*, and so on. In both of these examples, the goal of instruction is the accurate pronunciation or decoding of the letter-sound combinations. Decoding is viewed as a prerequisite to other kinds of reading experiences and instructions, as explained by David and Yvonne Freeman.

In contrast, a meaning-based view of phonics learning and teaching proposes that comprehending is the core of reading. It follows that the focus of children’s beginning reading instruction needs to be on experiences that have meaning and purpose for children. Phonics teaching and learning is a part of children’s literacy development, but this development always occurs within the context of purposeful reading and writing experiences. Within the context of meaningful literacy experiences, teachers help children come to understand and utilize sounds and letters in both their reading and writing. This kind of contextualized phonics learning and teaching happens in both first- and second-language literacy development. According to Freeman and Freeman, Hudelson, and Irene Serna, bilingual teachers and teachers of English

language learners utilize these experiences in children’s native and second languages. Some examples follow.

Teachers utilize read-aloud and shared reading of poems and stories (particularly predictable stories) to engage children with these literary forms and rich language. After children have experienced these texts as wholes, particular words are chosen to teach sounds and letters. If, for example, a teacher has read aloud Bill Martin’s book *Brown Bear, Brown Bear*, he or she can use some of the animal names in that story to focus on the consonant *b* (*bear, bird*, etc.). This involves first reading and sharing the book as a whole multiple times and, then, as children begin to put parts of this predictable book into memory, to focus on particular letters and sounds.

Poems and songs in written form also are used in this way. Teachers first share written versions of entire poems and songs and then examine particular letters and sounds.

In some classrooms, teacher and children often begin each class with the “news of the day.” Children share happenings in their lives orally, and the teacher writes these down. So, if Ana shares that today is her birthday and her mom is making mole and a cake for a party, the teacher writes, “Ana said, ‘Today is my birthday. My mom is making mole and a cake.’” After the class has read and reread the news, the teacher returns to the sentences to select particular sounds and letters for a lesson. In the sentence provided, it would be logical to pick out the sound represented by the letter *m* and also to ask children for examples of other words that begin with the same sound.

Children engage in independent writing daily, often creating personal narratives that reflect their own lives. Many primary-grade teachers also use dialogue journals, in which children write to their teachers daily and their teachers write back to them. The perspective on children’s writing that is central to these experiences is that children construct their meanings as they are able, using whatever understandings of written language they have at a particular time, and these understandings change over time. Thus, children learn to write conventionally by engaging in writing and by having others respond to their efforts. Early childhood educators have demonstrated that a major way in which young children learn phonics is through their own writing. An illustration of this point is the following: At the beginning of the school year, a child wants

to write in Spanish that she has a new pair of shoes (*Tengo zapatos nuevos*). The first writing is this: LICMT. Later in the year, the child writes: OOAEO. Still later, the child writes: TGOSPATONVOS. At the end of the year, the child writes: “*Tego sapatos nevos.*” Clearly the child’s understanding of sound-letter correspondences (phonics) has evolved from the beginning to the end of the year, so that by the end of the year, the writing is easily readable, even while writing conventions are still being mastered. Freeman and Freeman explain that engaging regularly in writing for real purposes helps children learn phonics.

These two approaches to phonics learning and teaching illustrate that within the community of reading educators, there are different views about how children best learn phonics as part of becoming an independent reader. This includes bilingual children and children who are English language learners. This question of whether certain methodologies and materials are most effective in teaching young children to read has been investigated for many years by reading researchers.

The National Reading Panel Report and Its Critics

The results of an important investigation, a review of selected studies related to beginning reading, was published in 2000 as the National Reading Panel (NRP) report. The NRP served as the basis for the “Reading First” portion of the federal legislation signed into law in 2002, known as No Child Left Behind (NCLB). Reading First defines reading, particularly beginning reading, as consisting of five components of what has been termed *scientifically based* reading instruction. These components are phonemic awareness, phonics, vocabulary development, fluency, and comprehension. Three of these components, phonemic awareness, which focuses on children distinguishing individual sounds in words prior to connecting sounds to letters; phonics; and fluency (defined as the number of syllables or words a child pronounces accurately in a set amount of time), connect directly to the decoding view of beginning reading instruction described previously. Any school that receives Reading First money must use these five components to teach reading to children “explicitly and systematically” for a minimum of 90 minutes a day. In this way, Reading First has privileged one particular view of beginning reading and phonics instruction.

With regard to bilingual and second-language learners, Reading First’s mandates have been scrutinized and critiqued by a variety of bilingual and English as a Second Language (ESL) educators and scholars. One critique has pointed out that none of the studies analyzed in the NRP included ESL children and that the original NRP noted that its results should not be generalized to second-language learners. However, Elaine Garan reasons that the Reading First summary of NRP makes no such distinctions and assumes that a “one size fits all” model of reading instruction is what should be implemented, regardless of the language backgrounds of the learners. Other critiques have pointed out that a very narrow body of research was analyzed by the National Reading Panel and that the vast majority of the literacy research carried out on bilingual and second-language populations was not included in the NRP’s work. This work includes questions of cross-linguistic relationships (how reading in the native language may influence reading in another language); social and cultural contexts and experiences that influence children’s reading; and teacher understandings and expectations of second-language readers, as reported by Diane August and Timothy Shanahan. Classroom teachers and teacher educators have noted that in second-language settings, children often are learning English at the same time that they are learning to read. The meaning-based contextualized phonics practices described previously have been identified as particularly effective for ESL children, according to Eugene García, precisely because they do attend to the oral English abilities of developing ESL children as well as their reading and writing. Yet many of these practices have been replaced by materials with a skills/decoding emphasis, as claimed by Freeman and Freeman, Elaine Garan, and James Venable. These practices often make little sense to children whose cultures and languages are not reflected in commercial programs.

Conclusion

There seems to be little question that phonics has a place in native- and second-language literacy programs that are a part of bilingual education curricula. It can also be argued that contextualized, meaning-based approaches to phonics offer bilingual learners better opportunities to learn and utilize phonics in the

work of becoming readers and writers who use literacy for multiple purposes in and out of school.

PHONOLOGY, MORPHOLOGY, AND SYNTAX

Building Blocks of Language

Language is a communication tool that may be unique to humans. It serves to meet people's social, psychological, and survival needs as well as being a means of transmitting culture from generation to generation. Through language, we capture the breadth and depth of human thought. Language enables us to explore the distinct past, record the present, and make predictions into the future.

According to *Ethnologue*, there are close to 7,000 distinct living languages in the world today. The continent of Asia alone accounts for more than 2,000 varieties, with approximately 3.5 billion speakers. There are 350 languages with at least 1 million speakers that account for about 95% of the world's population. Of these, Mandarin is the most widely spread language internationally, followed by English, Spanish, Hindi/Urdu, and Arabic. The majority of countries in the world support more than one spoken language. With over 300 language groups represented, the United States is the fifth most linguistically diverse country in the world, while New Guinea, with its 820 indigenous languages, ranks first.

Principles of Languages

All languages consist of a complex system capable of generating infinite numbers of ideas, and all languages are equally valid in stature. The vocabulary of any language is dynamic; that is, it is readily expandable to account for new concepts. In fact, a characteristic of language is that it evolves and changes over time. Speakers of all languages are competent in being able to understand and create an endless number of meaningful utterances.

Children born anywhere in the world are capable of language learning and are not predisposed to learning one language over another. The language or languages that predominate in children's lives are those they will acquire.

Language as a System

Language primarily consists of oral and written communication, with paralinguistic meaning expressed

through body language. Each language is unto itself an intricate system with distinct sets of rules by which speakers abide to ensure mutual understanding. Languages consist of different configurations of a finite set of sounds and conventional symbols that express concepts, thoughts, and emotions. In addition, languages tend to have similar grammatical demarcations, such as in nouns or verbs, with specific conventions for formulating words, sentences, and discourse.

Persons with normal hearing abilities have the capacity to produce sounds and sound patterns that signify specific meaning when grouped together; the arrangement of meaningful elements forms a logical string that results in comprehensible communication. These building blocks of language are quite universal. In the next section, the building blocks or components of language systems are described.

Components of a Language System

A language system consists of four major components: (a) phonology, the sounds; (b) morphology, the smallest units of meaning within words; (c) syntax, the grammatical structure; and (d) semantics, the overall meaning conveyed. Imagine a set of nesting cups or blocks that fit one inside the other, as in Figure 1; this analogy applies to how a language system is built from the smallest to largest unit. When these four components are in simultaneous use for a given purpose within a certain context among members of the speech community, then the system also encompasses the field known as *pragmatics*.

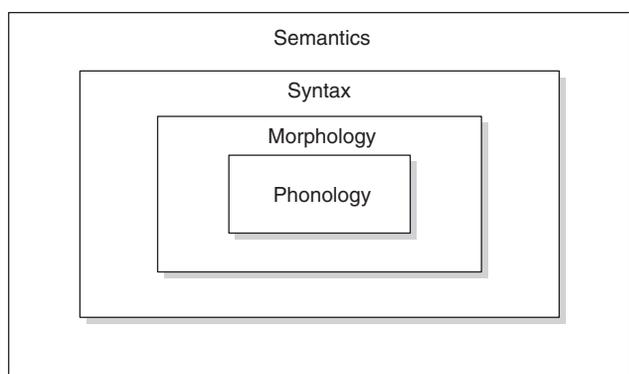

Figure 1 The Progressive Building Blocks of Language, From Phonology to Semantics

Phonology

Every native word in a language is represented by a specified sound sequence; *phonology* defines and describes the way the sounds of a language operate. The manner in which *phonemes*, or the individual units of sound, are arranged in a language is dependent on three factors: (1) the language's available inventory, (2) the effects of neighboring sounds on each other, and (3) permissible sound combinations. With thousands of different representations and possible arrangements of sounds, there are numerous possibilities within the world's language communities.

1. *The language's available inventory*: Every language is confined to a finite set of sounds. In oral production, every spoken language has discrete sound elements that can be classified as consonants and vowels. For example, according to the International Phonetic Alphabet, English is composed of 44 distinct phonemes, or individual units of sound; the spoken language is confined to 24 consonants and 20 vowel sounds. Arabic, on the other hand, has an alphabet of 28 letters, mostly consonants, with vowels expressed as marks above or below the letters.

2. *The effects of neighboring sounds on each other*: Each language has different combination of sounds, and their placement within and across words affects their pronunciation. In English as well as in Spanish, for example, the letter *c* has either a soft sound, like *s*, when followed by *i* or *e*, as in *cite* and *cede* or *cine* and *cena*, or a hard sound, like *k*, when followed by *a*, *o*, or *u*, as in *cast*, *cost*, or *cute* and *cama*, *coche*, or *cuna*.

3. *Permissible sound combinations*: Phonological rules of languages dictate which sound sequences are allowed, in what order, and how they are pronounced. Some consonant diagraphs in English do not appear in other languages: *sh* in English, for example, does not exist in Spanish. And, although the combination *sc* does appear in Spanish, it always does so following a vowel, so the word *school* in English, with the initial *sc*, is expressed as *escuela* in Spanish. The lack of congruence between the sounds in languages or their positions in words produces sound-symbol transfer issues, which may result in mispronunciation by nonnative speakers or those acquiring a new language.

Morphology

Morphology accounts for the formation of words by combining the smallest units of meaning, or morphemes. Knowledge of the morphology of language, the smallest building blocks for comprehension, is important for vocabulary development.

In English, morphemes include base words, such as *friend*, *book*, or *love*, as well as affixes that alter the meaning and category of the words, such as *un-*, or *-ly*, to make *friendly* and *unfriendly*; (regular) plural *s* or *es*; and the past tense, marked by *d* or *ed*. In some languages, such as Vietnamese or Haitian Creole, verbs do not change to express tense, nor are there plural or possessive markers.

Syntax

The stringing of individual words in a particular sequence to create sentences or meaningful utterances is rule bound; these grammatical forms of a language constitute its *syntax*. The knowledge of English syntax allows us to recognize that the following two sentences, while containing different word order and levels of complexity, essentially convey the same meaning:

The girl kicked the soccer ball.

The soccer ball was kicked by the girl.

In essence, use of certain grammatical forms is appropriate only under certain discourse conditions, which leads to the roles of semantics and pragmatics in a language.

Semantics

Semantics relates to the ways that language conveys meaning above and beyond the other components or building blocks of the system. It involves more than the literal meaning of words to include figurative language, nuances, and idiomatic expressions that often do not translate into other languages. Thus, the semantics of a language is culture dependent. In English, we constantly use distinct idiomatic expressions that carry unique interpretations, such as “take a bath,” “catch a cold,” or “buy time.”

Pragmatics

Pragmatics pertains to the ways people communicate and how they achieve their goals using language;

it involves the sociocultural aspects of language. Knowing how to analyze the social context to determine appropriate language use or understanding the acceptability of the style of speech or writing, as in the register (type of language specific to a domain) to apply, is part of pragmatics. It also entails using the proper degree of formality for a situation or audience, as in the way siblings speak to each other is different from the interaction between newly introduced acquaintances.

The building blocks of language—the knowledge and use of phonology, morphology, syntax, and semantics coupled with the pragmatics for a given context or situation—enables meaningful communication.

PLAYGROUND LANGUAGE

See BICS/CALP THEORY

PORTER, ROSALIE PEDALINO (1931–)

Rosalie Pedalino Porter is best known as an outspoken opponent of bilingual education and an advocate for English-only instruction in the education of English language learners. Porter was born in Italy in 1931, in a small village near Naples, and came to the United States when she was 6 years old. She was placed in an English immersion school, the only instructional model available to immigrant children at the time. She learned English and achieved academically.

Porter earned a bachelor of arts degree in 1974; her original concentration was in Spanish literature, but her direction changed, and she focused on bilingual education instead. In 1979, Porter received an MEd degree in

Bilingual Education and English as a Second Language (ESL), both from the University of Massachusetts, Amherst. Porter also received her doctoral degree in Bilingual Education and ESL from the same institution in 1982. She taught in Massachusetts and was a bilingual and ESL teacher from 1974 to 1979.

By appointment of the U.S. Secretary of Education, Porter served from 1985 to 1988 as a member of the National Advisory and Coordinating Council on Bilingual Education of the U.S. Department of Education. She was a research fellow at the Mary Ingraham Bunting Institute at Radcliffe College in 1987 and 1988. Porter is a former member of the executive board of the Massachusetts Association of Teachers of English to Speakers of Other Languages (MATSOL). She is also a former chair of the Program Advisors' Group of the International Association for Teachers of English to Speakers of Other Languages (TESOL, Inc.), serving in that role from 1986 to 1987.

Porter's professional service includes serving as the Coordinator of Bilingual and ESL Programs for Newton Public Schools in Newton from 1980 to 1990, before founding the Institute for Research in English Acquisition and Development (READ) in 1989. Under her leadership, READ became one of the more successful organizations to oppose bilingual education. According to READ's Web site, the organization has three goals: (1) to support research on English learning and effective schooling for language minority children in the United States in an effort to reform bilingual education; (2) to promote public discussion and informed choices by making its findings available to scholars, educators, policymakers, and citizens concerned about the education of language minority students; and (3) to focus on two major activities, namely, the publication of current research studies on effective programs and the provision of expert assistance to school districts in developing and evaluating programs for limited-English-proficient (LEP) students.

Porter is the author of *Forked Tongue: The Politics of Bilingual Education* as well as a number of articles arguing against bilingual education and in favor of English immersion. In 1998, she testified in a legal brief in favor of California's Proposition 227. She also served as an expert witness in court cases, including *Teresa P. et al. v. Berkeley Unified School District* (1989) and *Quiroz et al. v. California State Board of Education* (1997).

Porter's ideas are controversial because they are very similar to the ideas behind the English-only initiatives enacted in California, Arizona, and

Massachusetts, which require "structured/sheltered English immersion" as the means of educating English language learners in schools. Whereas each of the three states has interpreted structured English immersion (sometimes "sheltered English immersion") differently, Porter was deemed an expert and testified at the Arizona English Language Learners Task Force meeting on November 30, 2006, about the definition of SEI.

PRAGMATICS

Pragmatics, a branch of the science of linguistics, focuses on the study of how words are understood in context. Drawing on the title of a book by John L. Austin, pragmatics is the study of “how to do things with words,” that is, how language produces meaning effects in communication. Based on the premise that when they communicate, people share a set of underlying assumptions or unspoken rules about how meaning is created, pragmatics refers to that aspect of communication that involves the interpretation of meaning by hearers (*perlocution*) and the intention of meaning by speakers (*illocution*) and the match or mismatch between the two.

Pragmatics, as a field, is of importance to bilingual education because different cultural groups have different sets of shared assumptions about how to interpret meaning in context. Because these shared understandings, which are generally below the level of consciousness, are not universal, when two individuals from different cultural or linguistic groups interact with one another in the same language, there is a possibility for miscommunication. The consequences of miscommunication are further associated with the relative degree of power of the groups in question.

The relevance of the study of pragmatics to bilingual education rests in research that examines how to teach pragmatic competence in a second or additional language, including research that makes different patterns of communication in the classroom more transparent, with the aim of sensitizing teachers to pragmatic differences.

Development

The field of pragmatics, with its focus on understanding speaker meaning or intention, draws on work in philosophy and linguistics. The field began to develop in the 1970s as a response to the focus in theoretical linguistics on the structure of language. Pragmatics, as well as the related field of sociolinguistics, introduced the speaker, speaker meaning, and the notion of context into the field of linguistic study.

Early work in pragmatics focused on exploring universals in meaning or intention behind words and drew on the insights and work of Austin; H. Paul Grice, who introduced the concept of the cooperative principle; and John Searle, who introduced the concept

of speech acts. Searle outlined differences in meaning associated with direct speech acts, such as “Give me that book,” versus indirect speech acts, such as “Are you using that book?” with the same intended meaning, that is, a request for the book.

Classic work in the area of pragmatics, extending from work on speech acts, sought to associate referential meaning with social meaning. This research focused on speech acts such as compliments, requests, and apologies, as well as on the concept of politeness, seeking to outline the underlying sets of assumptions that speakers and hearers make as they interpret others’ words in social space. Penelope Brown and Stephen Levinson’s 1978 study of politeness outlined a scale of politeness and associated it with, among other things, the degree of directness of that speech, with the basic observation that the more indirect an utterance is, the more polite it is.

Intercultural Pragmatics

Early work on pragmatics did not take into account cultural differences in speaker meaning. Beginning in the 1980s, however, researchers began to examine differences between cultures in how members “naturally” construct meanings associated with forms of language. The field of cross-cultural and intercultural pragmatics is closely aligned with anthropological linguistics. Three areas of research within these fields are important to bilingual education and the teaching of English language learners (ELLs): The first focuses on differences in pragmatics and their effect on miscommunication; the second extends the first by examining how power differences between groups can cause significant consequences for members of less powerful groups; and the third area focuses on the development of second-language pragmatic competence, that is the ability to become a fully competent speaker and hearer of a second or additional language. Applications of these strands of research include the development and adaptation of curricula and teacher training programs that attempt to raise awareness about the sources of such miscommunication.

Inquiries in this area have examined how speech acts such as apologies, compliments, and requests are encoded by different cultural groups, as well as how mismatches occur across and between groups. Mismatches in intention of words on the part of the speaker and interpretation of meaning on the part of the hearer may increase in the case of second-language

learners who have not yet acquired full competence, including pragmatic competence; and similarly, mismatches may increase for bilingual students, who, as they move between and among codes, are moving between at least two sets of underlying assumptions about how to interpret words. This information has been used to inform teaching practice in second- and foreign-language classrooms. An important goal of this work is to support the development of nativelike competence, with the view that pragmatic competence is particularly complex to learn and can therefore benefit from direct instruction.

Researchers who employ qualitative research methods in examining classroom behaviors seek to uncover patterns of communication that differ between teachers and students from different cultural backgrounds. For example, Shirley Brice Heath's work in classrooms pointed out the ways in which teachers typically use indirect requests of students, such as "Do you have a pen?" when they are referring to unspoken rules of behavior in the classroom. That is, "Do you have a pen?" in the context of school is not a simple request for information, such as "Are you in possession of a pen?" Rather, this utterance means "Get out your pen and paper and get ready to do some writing." Students with a different set of pragmatic expectations may not interpret such indirect requests as requests for action. In a case like this, the consequence of inaction may be that students are labeled as unwilling, uninterested, or recalcitrant rather than as members of cultural groups who operate with a different set of pragmatic assumptions or sensibilities. Fine-grained examinations of patterns of interaction can be used to develop teacher training with the goal of raising teachers' awareness of different patterns of meaning and helping teachers to readjust stereotypes about students that are based on misreadings of their actions and inactions in class.

Applications of classroom research in the area of (intercultural) pragmatics can also focus on how teachers can employ an understanding of discourse and pragmatics in order to increase the learning potential of second-language learners in their classrooms—essentially making visible the hidden assumptions behind the interpretation of words. Recent work in the area of pragmatics, in particular intercultural pragmatics, can be found in *Intercultural Pragmatics*, an international journal that addresses a variety of topics related to bilingual education, as briefly outlined above. These include the (a) study of the nature of interaction between native speakers and nonnative speakers and

bi- and multilinguals, (b) investigation of the effect of dual-language and multilingual systems on the development and use of pragmatic skills, and (c) examination of the teachability and learnability of pragmatic skills in instructional environments.

PRESIDENT'S COMMISSION ON FOREIGN LANGUAGE AND INTERNATIONAL STUDIES

President Jimmy Carter issued an executive order on April 21, 1978, to form the President's Commission on Foreign Language and International Studies. The commission consisted of 25 members appointed by the

president. The commission conducted research and held a series of meetings, hearings, and interviews from 1978 to 1979. The four main objectives of the commission were to (1) improve communication and understanding with other nations, (2) evaluate the demand and job market for foreign-language and area specialists, (3) identify which foreign-language-area studies programs are appropriate at all academic levels, and (4) make accommodations that allow the commission's recommendations to be fulfilled.

Published in November 1979, the commission's report is a summary of the state of foreign-language and international studies. The report is divided into six chapters: foreign-language competence, K–12 education, higher education, research and academic and scholarly exchanges, citizen education, and business and labor needs abroad. Each chapter identifies major issues and concerns in the field, followed by a list of the commission's recommendations. The recommendations stress the need for additional funding at all levels, greater public awareness, and an overall increase in academic course offerings and curriculum, with international content at all levels.

Contents of the Report

Chapter 1 describes the need for a higher level of foreign-language competence at all educational levels, with communicative proficiency being a priority. The commission identified complete public support as a necessity in solving problems such as teacher training, budget, curricula, methodology, supplies and materials, and testing in foreign-language instruction. The commission's recommendations for improving foreign-language competence include professional development of teachers, incentives for education institutions, the creation of language and international high schools, pedagogical experimentation, such as dual-immersion programs, building a national criteria and assessment program, establishing an advisory council on foreign-language and international studies, assessment of federal government language needs and the creation of a national public awareness campaign.

Chapter 2 focuses on the education of students in Grades K–12 and their preparation for participation in a global world in the 21st century. The commission identified a need for children to gain knowledge of the surrounding world and a greater awareness of other people and other cultures. The commission stated its belief that it is important to begin educating children

during early childhood on languages and international affairs. For the educational system to create a more global perspective for students that would include international content in all subjects, the commission noted that teachers need additional training, knowledge, and tools. At the K–12 grade levels, the commission recommends creating model international curricula via statewide "lighthouse" programs and placing international education specialists at the state level to provide guidance and leadership. Further recommendations in the commission's final report were the inclusion of international education requirements for the licensing and certification of all teachers, the improvement of professional development for teachers, the incorporation of international content in curriculum development, the use of minorities and foreign visitors for intercultural teaching and learning experiences, the development of high school exchange programs, media programs in international education, professional associations, and research on the impact of overseas experiences on students and teachers.

The needs of higher education are addressed in Chapter 3. Higher-educational institutions that have international programs tend to experience financial difficulties; have low enrollment; are slow to change with academic and national needs; and face a need for more training and knowledge of linguistic skills, understanding "new" international issues, and information on finding sources of information on international problems. The commission recommended maintaining and building upon the international resources already available in higher education.

The commission's recommendations at the undergraduate level sought to improve offerings in the field of international studies by requiring courses, implementing "domestic" junior year programs, incorporating international and comparative perspectives in subjects, building knowledge in area and issues studies, offering new grants, and making international studies a high priority for college graduates. The commission also recommended advanced training and research through national and regional centers with the capacity to provide training and produce materials, strengthen international programs and emphasize foreign-language fluency at professional schools, and offer fellowships in international studies. Further recommendations included advocating institutional international exchanges; offering library assistance to cover the basic costs of books, mailings, space, and technology upgrades; the continuation of an already existing

network of national facilities in the international studies field; and creation of an advisory committee on international education to focus on policy relevant research, analyze the market for international skills, and provide financial support. The commission's final recommendation was to build a closer government-academic relationship by allowing international experts to assist the government, locate overlapping interests, and develop long-term proposals together.

The commission's perspective on advancing international research and teaching through academic and scholarly exchanges is developed in Chapter 4. An increase in funding is necessary to revitalize and support programs that promote high-quality research and create involved citizens. With respect to the International Communication Agency, the commission recommended expanding Fulbright and other grants to the undergraduate level, including underrepresented geographical areas in exchange programs and strengthening staff at U.S. institutions overseas. The need for increased funding was reiterated by the commission in its recommendation for the National Endowment for the Humanities, the National Science Foundation, and the Institute for Scientific and Technological Cooperation. The commission further recommended the involvement of new foundations and the increased involvement of continuing foundations in grant programs, the development of K-12 grant programs by the U.S. Department of Education, and the involvement of higher-education institutions in reciprocal programs of study, research, and teaching.

Chapter 5 looks at citizen education in international affairs. The commission agreed that there is a great need to ensure that U.S. citizens are well educated and well-informed on international issues. The commission stated that international education programs tend to do poorly because of a lack of continuity over time, uneven quality and quantity, failure to identify target audiences, gaps in knowledge about suitable resources, weak organization and planning skills, inadequate funding, and variation across nations and within states. The commission's recommendations for citizen education included use of media through increased programming and time spent on international issues; a stronger emphasis on citizen education in community colleges; a revitalization of foundation and corporate support for international education and citizen education; and, at the government level, the supplying of materials and other

resources and expanded education to include nonformal and continuing education of adults.

Business and labor needs abroad are described in Chapter 6. The commission identified a lack of foreign-language and area expertise as a barrier for American businesses. According to the commission report, research and training on issues affecting American workers and on America's role internationally should be accelerated. The report states that institutions of higher education should contribute more of their expertise. In general, more lines of communication between business, academic community and government are necessary. Broadly, the recommendations of the commission at the federal level with respect to business and commerce were to encourage international business and labor studies in higher education, establish regional centers of international business studies and research, establish advisory councils, create a network of small-business export development centers, and encourage minority businesses. On the state level, the commission recommended charging equal tuition fees to U.S. and foreign students. The commission suggested that business and labor unions make foreign-language and international studies a higher priority when hiring personnel. Increasing requirements in business programs in higher education and developing curricula and programs with international centers should remain important.

The final section of the commission report is dedicated to improvements in organization both inside and outside the government. Within the federal government, the commission expressed a need to provide oversight and coordination at the highest levels of authority through the appointment of an officer on foreign-language and international studies, the appointment of an assistant secretary for international affairs, and the creation of a national commission on foreign-language and international studies. The national commission would hold greater responsibility as a private agency to monitor organizational arrangements.

Conclusion

The President's Commission on Foreign Language and International Studies issued its final report in November 1979, just 1 year before the Democratic Party lost control of the White House to Ronald Reagan and the Republican Party. Its recommendations, therefore, were lost amidst the campaign rhetoric, none of which focused on the subject of the report.

Consequently, almost none of the commission's recommendations at the federal level were adopted. The commission may have lost a potentially enduring set of allies by refusing to include bilingual education in its agenda. In fact, the final report made no mention of the possible overlap and congruence between the goals of the commission and those of bilingual education advocates. This occurred even though the director of the Office of Bilingual Education and Language Minority Affairs, Josué M. González, met with the commission's executive director and suggested this nexus. The commission representative refused the outreach, arguing that bilingual education was too controversial and that the commission felt that its inclusion in their recommendations could bring about a loss of focus on the more academic recommendations it intended to make.

Another point missed by the President's Commission was the failure to anticipate the movement toward free trade, which was looming on the horizon, as well as the links of its work to the concept of globalization, especially in business and commerce. In retrospect, the commission's failure to link its recommendations to these developments may have resulted in the loss of one more opportunity to emphasize the importance of academic work in language and international studies in U.S. schools and colleges.

PRIMARY-LANGUAGE SUPPORT

Primary- (or native-) language support (PLS) refers to the use of students' primary languages to support English language content instruction and/or English as a Second Language (ESL) instruction. It is different from primary-language instruction, which refers to the teaching of entire lessons in the native language of students. The purpose of PLS is to make instruction in English as comprehensible as possible for English language learners (ELLs) so they can learn the content and acquire more knowledge of English. It is, in effect, a light form of bilingual instruction.

PLS is consistent with Stephen Krashen's theory of comprehensible input. When done properly, PLS maximizes ELLs' comprehension of instruction in English, and it allows them to learn English more effectively. PLS is also consistent with schema theory. By building students' background knowledge and activating their prior knowledge through their first language, students' schemas (mental structures or categories people rely on to remember or learn information) are activated, and thus they are better prepared to learn more about the topic in their second language. PLS is also a form of scaffolding. The students' native language provides substantial support as new concepts are introduced. Once students understand, the PLS scaffold is removed and students are better prepared to learn the new concepts through English.

PLS is an especially important component of non-bilingual programs, such as sheltered English immersion (SEI) programs. It is one of the key components of the sheltered immersion observation protocol (SIOP), a popular tool for designing effective sheltered instruction. Even opponents of bilingual education recognize the need for ample primary-language support in nonbilingual programs. Keith Baker, a longtime opponent of bilingual education, suggested that from 10% to 30% of instruction time in SEI classrooms should be reserved for PLS. He described several ways in which PLS is helpful to ELLs: (a) It makes the students more comfortable, (b) it helps students get through communication problems with teachers more quickly, (c) it boosts students' self-esteem, (d) it motivates students, and (e) it can maximize the effectiveness of instruction. The importance of PLS is recognized within the so-called English for the Children laws in California, Arizona, and Massachusetts, which restrict bilingual education programs by mandating the SEI approach. These

laws, while requiring that all instruction be provided in English, nonetheless state that teachers may use a minimal amount of students' native languages when necessary.

Nina Weber, a member of the UCLA Teacher Research Program in 2000, conducted an action research project in her first-grade English immersion classroom on the use of PLS. She identified several beneficial uses of PLS: (a) to affirm understanding or identify misunderstandings, (b) to extract details and provide explanations, (c) to engage students, (d) to discuss problems, and (e) to help students write.

There is empirical evidence that PLS is effective in helping ELLs acquire new vocabulary in English. Researchers Sharon Ulanoff and Sandra Pucci conducted an experimental study in third-grade classrooms in which one group of students received PLS through the preview–review method (see below) while another group received no PLS, in connection with the reading aloud of a storybook in English. They found that students in the PLS group acquired more new vocabulary words in English than did the non-PLS group.

Ways of Providing PLS

PLS is easier to provide when the teacher or a classroom paraprofessional can speak the native language of the students. However, even when they cannot and when there are multiple languages within the same classroom, there are still ways teachers can provide effective PLS. Not all methods of PLS are effective, however. Ineffective PLS techniques are described first, followed by a discussion of more effective ways of providing PLS.

Ineffective Ways of Providing PLS

The least effective use of students' native language(s) in the classroom is direct or concurrent translation. This refers to providing a direct translation of everything the teacher says in English: Either the teacher, or a paraprofessional translating for the teacher, repeats everything into the students' native language. When direct translation is provided, students have no need to attend to the English. Under these circumstances, little English is acquired. In the study by Ulanoff and Pucci described above, the researchers also included a group that received concurrent translation. This group acquired fewer vocabulary words not only than the preview–review group but also than the group that did not receive any PLS at

all. Thus, when used improperly, PLS can hinder, rather than facilitate, the learning of English.

Another ineffective use of PLS is when teachers or paraprofessionals simply translate books or other materials aloud into students' native language. For example, during reading instruction, some teachers or paraprofessionals might “read” an English book aloud to ELLs, but rather than reading the actual words on the page, they simply translate the book aloud as they read it. All the student hears is the translation, and there is no correspondence at all with the written words on the page. The same problem occurs when paraprofessionals or teachers point to words on a worksheet in English and simply translate them aloud, as if they were written in the students' native language. This procedure changes the construct from reading in English to listening comprehension in the native language. Under these circumstances, students are unlikely to acquire much English, as there is no English for them to attend to.

One other poor use of PLS is for teachers or paraprofessionals to simply code-switch throughout the day, meaning that they switch back and forth between using English and the students' native language, often within the same sentence. While code switching is a natural phenomenon in bilingual communities—and may even be considered a separate variety distinct from standard English and the standard version of the native language—effective teachers keep the languages separate during language instruction for ELLs. They make it clear when they are using English versus when they are using the native language. Otherwise, students are not required to attend to, and thus do not acquire, the full repertoire of English.

Effective Ways of Providing PLS

One particularly effective technique for providing PLS is called *preview–review*. This technique takes just a few minutes before and after a lesson or read-aloud and maximizes students' comprehension in English. If the teacher cannot speak the students' language, preview–review may be provided by a bilingual paraprofessional. Preview entails having a brief discussion with students in their native language to activate prior knowledge related to the book to be read or lesson to be taught. For example, if a teacher were doing a unit on plants, he or she would ask students in their native language everything they know about plants and would guide the discussion to cover the key

ideas, which will be taught in English. For a read-aloud session, the teacher would activate prior knowledge about the topic of the book and build background knowledge by discussing the cover, do “picture walk” to help students understand the characters and settings, and allow the students to make predictions about what they think will happen. After this brief preview, the teacher would then present the lesson or read the book in English, using appropriate strategies and techniques. At the conclusion, the teacher or paraprofessional would briefly review with the students in their native language the key ideas in the lesson or ask comprehension questions about the reading.

If the classroom teacher or bilingual assistant can speak the students’ language(s), the following techniques are other effective ways of providing PLS: (a) quickly explain a confusing key concept or term during whole-class or small-group instruction; (b) provide quick explanations in the native language to individual students if help is needed during independent seatwork; (c) pull students aside and reinforce/reteach concepts that students are struggling with in English; (d) read books aloud in the students’ native language that reinforce concepts being taught in English; (e) accept students’ contributions in the native language during class discussions, then repeat back in English what they said; and (f) label objects in the classroom in English and the students’ language.

If the classroom teacher does not speak the students’ language(s) and does not have a bilingual paraprofessional, the following techniques could still be used to provide PLS: (a) provide bilingual dictionaries, show students how to use them, and assist them with their use during instruction; (b) accept initial writing in students’ language as they transition to English writing; (c) place native-language books and recordings in the listening center that are similar to books being read in class in English or that reinforce key concepts being taught; (d) send the above native-language books home for students to read with their families; (e) send home letters in the native language explaining concepts being taught in school and ways parents can give support at home (letters in several languages are often provided in the back of teachers’ guides of various curricular programs); (f) allow bilingual students in class to use their language skills to provide assistance to lower-level ELLs in their native language; (g) allow students who speak the same language to work together in cooperative learning groups so that they may discuss and reinforce key concepts in

their native language; (h) seat students with the lowest levels of English proficiency next to students with higher levels of English proficiency who speak the same native language, so the lower-level students have friends with whom they can seek clarification and assistance from as needed; (i) utilize computer software and Internet resources with built-in bilingual or multilingual support; and (j) seek bilingual-parent or community volunteers who can provide assistance in the classroom.

These strategies are just a few of the ways teachers can provide effective PLS. Any strategy or technique for providing PLS can be effective, as long as it assists ELLs with coping in the classroom and prepares them to attend to English instruction with greater comprehension.

Conclusion

PLS, when provided properly, can maximize students’ comprehension of English language instruction and thus help them acquire English more quickly and effectively. In addition, PLS also sends students a strong message that even in an English language classroom, their native language is valued and is a viable resource for learning. This, in turn, creates a very positive environment for ELL students that is conducive to effective language teaching and learning.

PROFESSIONAL DEVELOPMENT

From the moment bilingual schools began operating in Miami, Florida; Laredo, Texas; and Rough Rock, Arizona, in the early 1960s, a major concern of program and school leaders related to the qualifications of the teachers who would be involved in the programs. That concern continues today in schools with bilingual education programs. There is common agreement that teachers who teach in two languages require different forms of professional development from those who teach only in one language. Sound pre-service and in-service programs of professional development are needed to ensure effective teaching. This need is particularly acute today because the No Child Left Behind legislation requires that all children be taught by “highly qualified” teachers.

That there is a strong connection between student achievement and teacher quality is undisputed. Coupled with other resources, such as a demanding and culturally relevant curriculum, shared leadership activities, high expectations for students, and robust community and parent partnerships, well-prepared teachers may be the most important programmatic component in successful programs of bilingual education. Effective teachers of minority students understand the classroom implications of a diverse student population. This is especially true in the early grades.

High teacher quality refers to the teacher’s ability to have a conclusive and positive effect on students’ academic achievement and social development. There is little question that a high level of teacher quality, combined with small class size, can have a dramatic impact on student achievement, especially at the elementary school level. The weight of the research evidence on the need for teacher quality is so well documented that it has led to state and national efforts to put a highly qualified teacher in every classroom.

Although criticized by a number of researchers for exacerbating historical inequities through the punitive effects of state policies that have a disparate impact on English language learners (ELLs), the use of high-stakes testing remains the major measure of student academic achievement. Regardless of the assessment measures used, the research supports a strong link between teacher quality and academic achievement. Professional development programs are a major vehicle that schools use to respond to the need for upgrading teacher capacity. *Professional development* can be

defined simply as a process through which learners systematically acquire a corpus of knowledge, attitudes, and skills that combine to improve the quality of teaching and yield positive learner outcomes. High-quality programs of professional development create seamless connections with authentic classroom practices.

This entry summarizes several principles used in a sampling of schools to guide the design of professional development programs for bilingual education teachers. These may not be the only principles schools might use, but they are proven ideas for designing effective programs.

Teacher Language Proficiency

The single most important characteristic that defines teachers in bilingual education is their ability to teach in English and in a language other than English. Early on in the expansion of bilingual education around the country, program leaders found out, sometimes to their chagrin, that *bilingual teachers* and *bilingual education teachers* are not synonymous terms. In short, the ability to speak another language with an unspecified degree of fluency does not mean that a teacher is prepared to teach in that language. Ideally, all teachers in these programs should be biliterate in English and the other language they use for teaching. Literacy, however, has gradations. Some teachers may require intensive help in either their first language (L1) or second language (L2) and in how to use those languages for instruction. This is especially true in cases in which the teacher has not previously used the terminology of the content area in his or her work.

While they may be difficult to manage, the range of abilities in L1 found in most schools can be an advantage. Teachers can and should be encouraged to help each other improve their command of either their L1s or L2s by making that process part of their personal plans for professional growth. Such arrangements can have the additional benefit of improving the status of the L1 in the school. When students overhear teachers in the playground, the cafeteria, or in other shared spaces using their home languages freely and openly, the stigma that sometimes attaches to a low-status language can be significantly reduced.

Plans for L1 and L2 enhancement should be tailored to the language proficiency required for good teaching at a particular subject and level, elementary, middle, or secondary. However, those skills should not be overprescribed. This is an area in which the

participant teachers usually have an excellent grasp of their own needs. Teachers should be encouraged to develop individual growth plans to fit those needs rather than submitting them to formal tests of fluency and categorizations by ability. Such measures can become counterproductive by creating a reluctance to be tested for fear of being branded or causing unnecessary embarrassment in front of peers.

A Lifelong Process

Students are the ultimate beneficiaries of effective professional development in schools. They are the ultimate clients. Not unlike physicians, attorneys, and accountants, teachers in today's schools must update their skills and knowledge continually. Most feel the urge to keep up-to-date on new teaching techniques and strategies. Through the new technologies available online, volumes of information are now available to professionals on a daily basis. This is important because new teachers bring adequate knowledge of bilingual education theories and methods but often have not been prepared well by their universities to deal with the exigencies of actual day-to-day teaching. Teacher preparation programs in universities are hugely uneven in their abilities to prepare pre-service teachers for the realities of bilingual classrooms. Often, student teachers are not provided enough opportunities to experience and apply learning in a variety of real classroom situations. As a result, new teachers are coming to work in classrooms with serious professional development needs related to the new expectations of teachers in an age of accountability.

Addressing this topic, Joan McRobbie describes teaching as a lifelong journey of learning, as opposed to having as a main goal mastering teaching "know-hows" as though checking them off a list. Teachers embrace opportunities to update their skills and knowledge to become more effective professionals. Professional growth activities must be continuously aligned with new knowledge and be related to the real responsibilities of a good teacher. Activities must be connected to the curriculum and knowledge about the students. The use of technology for instruction has become commonplace in professional development programs. Teachers must be afforded the necessary time to develop their professionalism. Schools should not expect the weight of professional development to be the teachers' responsibility while they are not in school. An investment in good professional development

is an investment in greater student performance and success.

Not Just for Teachers

Research has documented the important role that school leadership teams play in effective schools. School board members and administrators must be knowledgeable of basic pedagogy to support policies and practices that facilitate instruction. In short, education is a team effort that cannot be relegated solely to teachers.

Although limited in scope, competitive grants are made by the U.S. Department of Education to assist high-need local education agencies to recruit and train principals, assistant principals, and teachers seeking advanced certification and credentials in bilingual education. The department also offers competitive grants to schools and partnership organizations to improve the knowledge and skills of early childhood educators who work in communities with high concentrations of ELLs. Additional state and local funding sources should be explored and pursued. In the best of worlds, programs of professional development should not be dependent on outside funding. They should be considered part and parcel of the school's usual and customary life as a learning community.

Partnership With Parents, Families, and Communities

Why parental and community involvement in schools? Schools should involve parents, families, and community in the educational process because (a) parents have useful information about their children that teachers may use to make their teaching more effective; (b) communities offer abundant cultural resources that represent new ways of communicating with students and scaffolding instruction; (c) parents and families share school educational goals and aspirations for students' educational success; and (d) schools are accountable to communities, parents, and families for the academic success of students. Good partnerships are not limited to classroom activities with children. Professional development programs should link parents, families, and communities in ways in which both school and community work together to increase student success and exemplify the shared role of developing the whole child.

Role in Program Design and Operation

An effective professional development program must have the active involvement of teachers themselves in its design and operation. It should not be dictated from above and/or by outside “experts.” There are many forms and formats teachers can use to shape their development: creating learning communities and study groups to learn about research on best practices, using data based on actual children and families in designing lessons, observing outstanding examples by colleagues, reflecting on practice, creating processes for the management of instruction, creating accountability networks with critical friends, and designing their own ways of being accountable to each other for what happens in shared classrooms. Hilary McLellan, an expert in the field, refers to the need for a “situated cognition approach to learning,” in which knowledge is shaped by the context and culture in which it is applied. In other words, professional development requires the application and adaptation of knowledge and cognitive skills to solve issues related to the needs of specific populations. Professional development planning is an area in which one size most definitely does not fit all. Larry Mikulecky and his collaborators describe a process in which teachers witness proven practice, are able to connect new knowledge to context (knowing in action) and experience, and use their own metacognitive learning skills to better understand the teaching process.

Adapting and Practicing Skills

Teachers must have opportunities to adapt and practice newly learned skills in their own contexts. Lectures are rarely enough to make learning realistic and help it stick. Teachers must be provided opportunities to reflect on the impact of new knowledge and skills on children’s academic achievement and on the feedback provided by mentors and coaches. Research reported by Josué M. González and Linda Darling-Hammond relates the essential elements of a successful school for minority students. A standards-based approach for professional development that defines the characteristics of a good teacher in a school with a diverse student population is one of the most critical features. For example, a great teacher for ELLs can be expected to have the following professional characteristics:

1. Knowledgeable about the cultures represented in the classroom
2. Practices people skills such as empathizing with the needs of others, caring, and cooperating with other teachers
3. Willing to unlearn and debunk myths (for example, “interference” of the first language, poverty as the “reason” for underachievement, and parents who “do not care” about the education of their children) that interfere with quality teaching for minority students
4. Knowledgeable about effective assessment and teaching strategies (for example, active, inquiry-based, activating prior knowledge, cooperative learning, accelerated learning, critical pedagogy)
5. Knowledgeable of first- and second-language acquisition and learning
6. Knowledgeable about curriculum standards

Professional development programs for teachers of ELLs should strive to integrate these qualities into school plans to upgrade teacher skills and performance.

Enhancement Through Technology

Various forms of technology are now commonplace in professional development activities. Concerns are sometimes voiced that pulling teachers out for the time required for good professional development can affect the quality of instruction in the classrooms they leave behind in order to participate in professional development activities. These concerns are quite valid when professional development is seen only consisting of workshops and presentations. It can be a serious problem when the school lacks a well-prepared pool of substitute teachers who can be integrated into the professional team to avoid instructional lacunae. The problem is not trivial. Many schools are faced with some version of this dilemma at one time or another. The amount of time for teachers to be out of the classroom can be minimized through technology. Multimedia technology offers good solutions to this problem because such technologies have unique features. They can help teachers understand how ideas and actions are connected. Because video images and texts are presented together, often on the same television or computer screen, the relationships between practice, research, and theory can be made more apparent.

The use of technology has greatly enhanced the traditional live workshop, but it can never replace the one-on-one interaction that is central to effective communication. The workshop provides opportunities to produce together with guidance from an expert and to be challenged cognitively to produce responses to problems. Guidance for using relevant applications can be provided through the technology itself.

Links to a Strong Curriculum

Professional development must be linked to a strong curriculum. A research-proven curriculum customized for a particular student population is a prerequisite for success by teachers and students alike. Many states now have standards-based curricula that must be followed by all teachers. Through statewide testing programs, students must show mastery of certain levels of content. Those who fail to meet minimum expectations do not graduate or pass to the next grade. Professional development topics must have a clear connection to these standards and equip teachers to use these standards to prepare daily lesson plans.

Successful teachers take continuous measurements of all aspects of learning and development. Their assessment of students is comprehensive and varied to measure levels of knowledge and skills. They do not rely on single-test measurements, and they do not teach “to the test.” Instead, they align their teaching to instructional standards, in general terms.

Accountability and Professional Development

Professional development is critical in an accountability system. An accountability system that ignores the value of professional development is flawed and inconsistent with what research demonstrates about factors that contribute to student success. The No Child Left Behind Act has tightened requirements by specifying acceptable rates of progress to ensure that all groups of students—disaggregated by poverty, race, ethnicity, disability, and English proficiency—succeed in school. Many state departments of education have similar requirements for schools to remain in the “acceptable,” “recognized,” and “exemplary” status levels. Schools must have quality teaching to achieve these results. Quality teaching is the product of strong teacher support, the right teaching strategies and techniques, a strong curriculum, and teachers’ high expectations and positive attitudes toward diversity.

Financial Support and School Governance

Professional development requires financial support from all levels of school governance. Funding for professional development is shrinking even as its importance for long-term progress is widely recognized as imperative. At the federal level, the 15 comprehensive assistance centers (training and technical assistance centers) are undergoing a reconfiguration, and their potential for impact is not yet known. The U.S. Department of Education has eliminated the Eisenhower Professional Development grants in mathematics and science. States, however, are allowed to use federal funds for reforming tenure systems, teacher testing, and pay differentiation initiatives.

School districts receiving funds to operate a federal program are required to use between 5% and 10% of their funding for professional development. Local education agencies and schools identified as low performing must use at least 10% of their allocations for professional development aimed at correcting the deficiencies that defined them as low performing.

Conclusion

Schools can become true learning communities, but experts warn of the risks inherent in top-down professional development approaches. They promote the use of collaborative teamwork approaches that foster collaboration, coaching, and learning organization modes as the answer to solving professional development problems. Notwithstanding these cautions, many professional development models reflect a deficit-driven approach in which teachers’ existing knowledge is not valued. In traditional programs, teachers are expected to participate as passive consumers of knowledge, with little acknowledgment of the knowledge they have gained through their own observations and accumulated experience. Schools face many challenges in formulating, implementing, and integrating a comprehensive professional development program in an already full day of work. Furthermore, despite the strong research support for effective professional development, schools face two other major obstacles that hinder their efforts in this area. First, there is a trend nationwide to further reduce training and technical assistance to school districts. Second, funding to develop teacher expertise at the local level is declining, thereby diminishing the available number of learning and training opportunities available to school

personnel. Although the federal government has asked states to put a highly qualified teacher in every public school classroom, funding is not sufficient to meet the challenge.

It is a common assumption that all teachers are adequately prepared to teach when they complete their college studies. In fact, many are simply beginning to learn the craft through practice, observation, reflection, and continued learning and experience. The issue becomes even more acute when it is evident that knowledge and understanding of the implications of a diverse student body is lacking. Failure to provide adequate learning opportunities to students is a major cause for underachievement. Despite these challenges, schools must find ways of ensuring that teacher quality continues to improve.

PROFICIENCY, FLUENCY, AND MASTERY

Proficiency, fluency, and mastery are some of the terms used to describe how well a person has acquired and is able to use a language. Agreeing on a definition of language mastery is important for second-language speakers because such a definition serves as a referent for measuring the progress and achievement of a language learner and also serves as a referent for defining who is a limited-English-proficient (LEP) speaker.

In the United States, the definition of an LEP person is important as a legal term for public school funding and bilingual and English as a Second Language (ESL) education programs, as well as in personal terms for the way it affects the school trajectory of many English language learners (ELLs). The basic question “How well does someone know X language?” may seem at first blush to be straightforward and simple, but there is little agreement from experts about how to determine or define proficiency, mastery, or fluency. This is because the question becomes much more complex when these terms are operationalized, such as when criteria for assessment are developed, since the definitions of these concepts necessarily entail a common understanding about the nature of language, what constitutes language knowledge, and how to best measure it.

Fluency

Of the three terms, *fluency* is perhaps somewhat less problematic. Most people agree that fluency refers to a person’s ability to use language in a fluid and coherent way. It includes the ability to manipulate a range of linguistic resources: vocabulary, grammatical structures, productive skills (speaking and writing), and receptive skills (listening and reading). A second-language (L2) learner with a high degree of fluency, therefore, would be able to use the language to clearly articulate his or her meaning without undue hesitation or backtracking. Researchers have argued that for L2 speakers, there is a correlation between fluency, accuracy, and complexity, such that the more attention an L2 user puts on fluency, the more grammatical errors and sentences with less complexity he or she will make. The inverse relation applies as well: The more attention put on, say, grammatical accuracy, the slower and more hesitantly L2 learners proceed as they divert their attention from the meaning they want to express and instead focus more on how to form their utterances correctly.

Proficiency and Mastery

Language proficiency encompasses all three aspects of fluency, accuracy, and complexity, as well as several other features related to language use. *Mastery* is essentially a synonym for *proficiency*; however, the latter term is generally preferred because it better connotes a range of expertise. Language users, especially those learning a second language, have a range of

different proficiency levels, and even an individual L2 learner may be more proficient in one skill area or in certain situations than in others.

It is important to distinguish proficiency from other similar but distinct concepts, such as *achievement* and *competence*. A language proficiency test, for example, is distinct from an achievement test, since it is meant to be indicative of what sorts of things the language user can do with and in that language. Sometimes the know-how and ability to do something, especially when it is expressed as a curricular objective, is called a *competency*. Typically, these are worded as “by the end of the course (or unit, etc.), the student will be able to . . .” By stating competencies, such as writing a short narrative or giving a brief oral report, the expectations associated with different levels of language proficiency are made more concrete. Hence, *competency*, a term borrowed into education from business, should not be confused with the term *competence* in the strictly linguistic sense, which is a central concept of Chomskyan linguistics referring to a native speaker’s intuitions about what constitutes well-formed sentences.

Finally, there are other extralinguistic features that are also part of how well someone can use and understand a second language. Although these features are much harder to evaluate in formal assessments, some language experts argue that they are as much or more important than the language features. The *pragmatic* aspect of language is a case in point, since it involves the intentions and personal meanings of speakers, as well as what can be considered appropriate for a given social situation. In turn, what counts as appropriate in a particular situation varies from culture to culture, so a complete definition of proficiency must include some consideration of how well a language user can interpret cultural references and ways of using language. In one culture, for example, a rising intonation pattern may signal a friendly, polite request, whereas in another culture, it may be the opposite. This could cause an L2 speaker who is trying to be polite to give native speakers the impression that he or she is being rude. Likewise, many idiomatic expressions, such as “He’s out in left field,” draw on specific cultural practices, in this case a baseball metaphor, may be unfamiliar to an English user from another culture. So, knowledge of what is language appropriate in a given social situation and for a particular cultural group is an important, though less tangible, aspect of proficiency.

Common Ways of Defining Proficiency Levels

Since proficiency, especially L2 proficiency, is best thought of as a continuum that extends from “novice” to “expert,” there are any number of ways to specify a person’s level of proficiency. All of these levels, however, are arbitrary gradations along the proficiency continuum. The most influential language groups, for example, the American Council on the Teaching of Foreign Language (ACTFL) Council of Europe, divide the proficiency scale into five levels. Often the middle or intermediate level is defined as an independent user. For example, the Common European Framework of Reference for Languages (CEFR) calls this the *threshold level* and defines it as the level needed to communicate basically but effectively on an interpersonal level.

Situational Factors That Influence Proficiency

For individual language users, proficiency varies according to different skills and for different situations. This is especially true for L2 users. An engineer who is an L2 English speaker may be quite proficient in reading highly technical engineering plans but may have very low proficiency when it comes to interacting orally in social situations. Likewise, L2 students may be able to perform well on a grammar-based language test but have little knowledge of English pronunciation. Since proficiency is meant to indicate how well a language user can perform, there are many factors beyond just the user’s linguistic skills and resources that influence his or her performance. Among these are the following:

- How familiar is the topic?
- How simple or complex is the language involved (ordering a meal or debating politics)?
- What is the register (formal or informal)?
- Who is the person addressing (a friend, the boss, or a large audience), and how much pressure is associated with the scene?
- Is it a monologue or dialogue?
- What is the channel (face-to-face or over the phone)?
- How much time does the person have to prepare what he or she will say (spontaneous or rehearsed)?

Because of the many different aspects associated with language proficiency, a global score or simple

proficiency level usually gives only a very limited idea of what someone can do with the language. While many tests can accurately assess a person's linguistic knowledge (grammar and vocabulary), it is more difficult to evaluate the social and cultural aspects of proficiency.

For purposes of planning bilingual education programs and other interventions related to the provision of civil rights in education, the term *proficiency* is the most commonly used. It is often used in tandem with the designation of *limited English proficient* (LEP), as a label for students who are L2 English users, and is commonly used in legal matters. Most educators, however, now prefer the term *English language learner* (ELL) over LEP because it emphasizes the project in which the student is engaged, learning English, as opposed to his or her limitations with respect to the majority language. Still, there is no uniform definition of what constitutes full proficiency, presumably the minimum command of English needed to function in an all-English classroom. More than 30 years after the nation began to practice bilingual education, there is no legal definition of standards for comparison, that is, what the level of proficiency might be for native speakers of English, much less for immigrants or speakers of other languages, such as Native American, Alaska Native, or Hawaiian language speakers.

PROGRAM EFFECTIVENESS RESEARCH

Since the *Lau v. Nichols* decision in 1974, legal responsibility was placed on schools to provide effective programs for English language learners (ELLs). It comes as no surprise, therefore, that considerable attention has been given to the question of how schools, by evaluating their offerings, can best serve these students. Since 1998, three states, California (Proposition 227), Arizona (Proposition 203), and Massachusetts (Question 2), have passed ballot initiatives that restrict the types of educational methods and programs that may be used to instruct ELLs, favoring English-only instruction.

Hundreds of program evaluations at the local school and district levels have attempted to ascertain whether bilingual or English-only instruction best serves ELLs. These reports fall into two broad categories: narrative reviews and meta-analyses. The *narrative review approach* uses “vote counting” of the results of individual studies to report an overall synthesis of the research literature. Only studies judged to be methodologically rigorous are included in the synthesis under this approach. The vote-counting approach allows researchers to evaluate a program as more or less effective, whereas meta-analysis calculates not only which program is most effective but also exactly how much more effective one program is than another. The *meta-analytic approach* integrates studies' findings by computing an overall effect size for each study. Meta-analysis is considered a more accurate and sophisticated method of evaluating groups of studies because it considers effect size, whereas the narrative review approach generally does not.

A limitation of most effectiveness studies is their focus on standardized test scores as indicators of success, ignoring other important outcomes such as dropout rates and other long-term effects, which may vary by program type. These studies also do not usually pay attention to important outcomes such as bilingualism, biliteracy, and positive self-image, which can significantly influence later success in school.

Narrative Reviews

Baker and de Kanter, 1981

Keith Baker and Adriana A. de Kanter's 1981 study focused on 28 studies, published between 1968 and 1980, which the researchers judged to be methodologically sound. They rejected studies in which (a) the effectiveness question was not addressed; (b) students were not randomly assigned to the treatment and comparison groups or nothing was done to control for possible initial differences between the groups; (c) appropriate statistical tests were not used to demonstrate program effects; (d) the norm-referenced design was used, comparing student growth against test norms; (e) gains over the school year were examined without a control group; or (f) grade-equivalent scores were used.

Baker and de Kanter were interested in comparing transitional bilingual education (TBE) to three alternatives: submersion, English as a second language (ESL), and structured immersion (SI). They defined TBE as a program in which subject matter is taught in the children's home language until their English is strong enough for them to participate in an all-English classroom, with the use of the native language gradually phasing out and the use of English gradually phasing in. Submersion refers to the approach in which ELLs are placed in a regular, all-English classroom and receive no special support in learning English or in understanding the regular curriculum. The ESL approach was defined as a program in which children are placed in regular (not sheltered) English-only classes for most of the day but are provided with concentrated instruction aimed at teaching ESL during part of the day. SI, on the other hand, provides a specially structured version of the regular curriculum so that students may acquire the language of instruction while simultaneously learning content. SI also requires that teachers receive training in immersion methods and are proficient in the children's home language. This means that in SI, children can ask questions and make comments in their home language or in English; the teacher understands both languages but always replies in English.

Reviewing studies of these various approaches, Baker and de Kanter painted a mixed picture. Studies included in the review varied in their conclusions, with some findings indicating that TBE was better than, as good as, or no different from SI; others indicated that ESL was better than or as good as SI and TBE. The authors nonetheless made more favorable

comments about the success of SI than they did about other programs. Their preference for SI was based partly on the success of SI programs in Québec, where English-speaking children were immersed in French. It is important to note, however, that in those programs, instruction in the children's home language (English) increases gradually until the proportion of French and English instruction is 50/50. In the United States, immersion in English rarely, if ever, leads to the reintroduction of Spanish or other home language at any point. Further, it is not clear that the students in the Canadian programs were of socioeconomic status similar to those in the U.S. programs, a factor that could have influenced the findings.

With regard to the comparison between TBE and SI, two studies were included in the review. One of these, conducted in the Philippines to teach ESL, found no difference between SI and TBE. In the other, conducted in a McAllen, Texas, kindergarten, Baker and de Kanter reported that students in SI outperformed students in TBE. In fact, however, the kindergarten students in the program labeled SI spent half of their instructional day in native-language instruction, which places the program solidly within the TBE category, according to Baker and de Kanter's own definitions. In light of this error, many researchers have argued that Baker and de Kanter's analysis actually supported the claim that TBE is superior to SI. In the end, Baker and de Kanter reported that the evidence was insufficient to warrant exclusive reliance on any one program model.

Rossell and Baker, 1996

In 1996, Christine H. Rossell and Keith Baker conducted a narrative review with the intention of updating the earlier review by Baker coauthored with de Kanter. The authors judged 72 studies to be methodologically acceptable, based on selection criteria similar to those used in the Baker and de Kanter report.

Rossell and Baker, in 1996, included as SI programs those that "typically include at least 30–60 minutes a day of native-language arts beginning sometime in the early elementary years" (p. 10). This conception of SI is a departure from that proposed by Baker and de Kanter, whereby SI is distinguished from bilingual instruction in that the home language is never spoken by the teacher and subject area instruction is given in the second language from the beginning. If we consider bilingual education to be simply

the use of the native language to instruct limited-English-speaking children, then it appears that the authors' SI program description overlaps in significant respects with their bilingual education program description. Such imprecise definitions make it difficult to know whether a program described as "immersion" in a study was not actually a bilingual education program for the purposes of Rossell and Baker's review. Like Baker and de Kanter in 1981, Rossell and Baker concluded that there remains no consistent research support for TBE as a superior instructional practice for improving the English language achievement of limited-English-proficient children.

Slavin and Cheung, 2002

In 2002, Robert E. Slavin and Alan Cheung conducted a "best evidence" review of studies focused on methods of teaching reading to ELL students, comparing the practice of teaching ELLs first to read in their native language (a bilingual education strategy) with that of teaching them first to read in English (an immersion strategy). The best-evidence approach is a version of the narrative review approach but also involves the systematic inclusion criteria and effect size computations typical of meta-analysis, whenever such calculations are possible.

Following a broad search for all studies involving ELL students, assisted in part by outside organizations, Slavin and Cheung selected studies according to the following criteria: (a) the studies compared children taught reading in bilingual classes with those taught in English immersion classes; (b) either random assignment to conditions was used, or pretesting, or other matching criteria established the degree of comparability of bilingual and immersion groups before the treatments began; (c) the subjects were ELLs in elementary or secondary schools in English-speaking countries; (d) the dependent variables included quantitative measures of English reading performance, such as standardized tests and informal reading inventories; and (e) the treatment duration lasted at least 1 school year. Slavin and Cheung identified 16 studies, published between 1971 and 2000, that met these criteria.

Slavin and Cheung's review concluded that on balance, the evidence favors bilingual approaches, especially paired bilingual strategies that teach reading in the native language and English at the same time. Most of the studies they found to be methodologically acceptable favored bilingual approaches over immersion

approaches; although some found no difference, none favored immersion programs. Slavin and Cheung's conclusions, then, strongly differed from those reached in the earlier Baker reviews.

Meta-Analyses

Willig, 1985

Meta-analyses have provided the best published sources of integrated evidence regarding bilingual program effectiveness thus far. Ann Willig published the first meta-analysis of bilingual education program effectiveness in 1985. She conducted a meta-analysis to determine whether conclusions drawn by Baker and de Kanter's narrative review could be sustained using meta-analytic procedures. Willig imposed stricter selection criteria than Baker and de Kanter, requiring that studies focus on K–12 students in U.S. schools. As a result, Baker and de Kanter's 28 studies dropped to 23 in Willig's review. Willig's meta-analysis found positive effects for bilingual programs for all major academic areas.

Greene, 1998

The next meta-analysis comparing language-of-instruction programs published was Jay Greene's, in 1998. Whereas Willig's meta-analysis was drawn from the studies Baker and de Kanter had reviewed, Greene's meta-analysis was based primarily on the studies included in Rossell and Baker's narrative review, imposing additional selection criteria, narrowing the corpus to only 11 studies. Like Willig, Greene found positive effects for bilingual education. Greene concluded that the strength and consistency of results, especially from the highest-quality studies included in the analysis, strongly supports the view that bilingual programs are more effective at increasing standardized test scores measured in English when compared with English-only alternatives.

Rolstad, Mahoney, and Glass, 2005

The most recent meta-analysis of program effectiveness studies reported here was conducted by Kellie Rolstad, Kate Mahoney, and Gene V. Glass. Their study drew from a corpus of 17 studies that were conducted in the years following Willig's 1985 publication. Unlike previous studies, this analysis

provided comparisons not only for TBE and English-only approaches but also for developmental or dual-language bilingual education. The goal of TBE approach is to transition children out of instruction in their home language and into English-only instruction as quickly as possible. By contrast, students in maintenance and dual-language bilingual programs receive instruction aimed at sustaining bilingualism and biliteracy, and lasting more than 3 years. Also unlike previous studies, the Rolstad et al. synthesis included as many studies as possible in the meta-analysis, without applying selection criteria bearing on study quality, as intended by the original developers of the method.

This meta-analysis, like those before it, showed that bilingual education is consistently superior to all-English approaches. In addition, it showed that long-term maintenance and dual-language programs are superior not only to English-only approaches but also to TBE programs.

While the two earlier Baker reviews raised questions about the conclusiveness of the available research, more recent work has concluded much more confidently that studies on the effectiveness of bilingual education strongly favor bilingual approaches over English-only approaches. However, the highly politicized nature of educational programs for Spanish-speaking and other immigrants appears to conflict with proper application of these findings in the context of federal and local policy.

PROGRAM GOALS, PURPOSE OF

Some years ago at a conference on bilingual education, a paper was delivered with the title “If Bilingual Education Is the Answer, What Is the Question?” The presentation suggested that all the stakeholders involved in bilingual education were not in agreement about its central purpose. Since then, many pages have been written about the effectiveness of bilingual education and its value in and out of the classroom. Some studies have found it to be effective, while others have found inconclusive results. Programs such as Title I and Head Start have met with similar inconsistencies, but few program evaluations have been disputed as vigorously as those employed to assess programs of bilingual education. Researchers have not been alone in their disagreements. Essays and editorial opinions have also differed widely, sometimes acrimoniously, regarding the merits of this educational approach.

Why has it been so difficult to determine the degree to which bilingual education is useful, meritorious, or effective? Part of the answer is that poor methods were used to evaluate some programs, a situation that has now been largely corrected through the use of more sophisticated methods of evaluation. However, part of the answer also lies in a persistent lack of clarity concerning the problem(s) it was intended to solve. In addition, sociocultural and political frictions are created by programs of this type because they do not meld smoothly with the country’s education traditions.

Historical Background

The Miami Experience and Its Legacy

Bilingual education as it emerged in Dade County, Florida, in the early 1960s had a clear and unambiguous goal: helping Cuban refugee families preserve the Spanish language for their eventual return to Cuba, a return that most Cuban refugees believed was imminent. In that context, neither the English nor the Spanish language was regarded as a problem or barrier. The unquestioned expectation was that Cuban children and youth would learn English in American schools. The principal objective of the bilingual program in Dade County, at that point, however, was to ensure that Cuban children and youth would retain and improve their use of Spanish during their expatriate stay. Parents and school leaders alike understood this need, and there was little dissent among policymakers concerning the goal. The financial resources needed to create the program were readily available. The Ford Foundation and the federal government provided funds to the Dade County schools to transform the concept of dual-language instruction into a working reality.

Nationally, the concept of educating children in two languages owes a great deal to the Miami experience in educating Cuban refugee children. But the language goals adopted by that early program in Dade County did not become the model for the rest of the country. The differences between the first programs of bilingual education and what became standard practice through federal funding are revealed in part by studying the creation of Title VII, Elementary and Secondary Education Act (ESEA), the program that became the largest and most important funding source for bilingual education nationwide. This analysis also reveals why ambiguities with respect to program goals arose and have plagued the program from the outset.

Education and social legislation tend to be time-stamped. The legislative history of every congressional enactment bears distinct social and cultural markings of the historical period in which it was first launched. Indeed, the very fact that an idea is enacted into law suggests that a positive climate existed around that topic or at a minimum, an absence of controversy. Title VII was no different, although it had no precedents. It was aimed at a specific subset of children and youth who had never before been addressed in federal legislation. Planning and advocacy for Title VII began shortly after the passage of the Civil Rights Act of

1964. The environment for improved services and access by all sectors was still positive. The war in Vietnam was about to end President Johnson's political career, but a liberal climate prevailed in Congress regarding domestic programs, especially small interventions such as Title VII, which were meant to serve only certain regions. The idea for federal funding of bilingual education came before Congress at a favorable time.

It is worth noting that the proposal to fund bilingual education from Washington came at a time when Hispanic voters were beginning to be noticed by both political parties. Cautious politicians of both parties stood to gain favor among Latinos by hinting at a language preservation goal. This was safer than embracing that goal in a bear hug, a position that may have met with mixed reactions in the states and regions they represented. The principal Senate sponsors of Title VII were Senators Javits, Montoya, Murphy, and Yarborough, representing New York, New Mexico, California, and Texas, respectively. In 1967, these were the states with the largest proportions of Latino voters. It is interesting to note that the version of Title VII introduced in the House of Representatives by Congressman Henry B. González, of San Antonio, Texas, mentioned only Spanish speakers in its original title. Senator Ralph Yarborough, who chaired the committee sponsoring the hearings on the legislation, fought hard to keep other language groups from being added to the bill. He yielded on this point only after other senators and congressmen urged him to do so. Before going to the floor, the bill was amended, reluctantly on the part of the sponsors, to include other language communities. Given the ethnic composition of his district, González had little need to include other language groups. In the Senate, however, Yarborough found it politically helpful to include the French speakers of northern Maine in the legislation at the request of Senator Edmund Muskie, a liberal Democrat who supported the idea of bilingualism. An early bilingual education program in northern Maine had attracted some attention, but the state did not embrace transitional bilingual education with the same fervor as other regions of the country. Even during the heyday of Title VII funding, few school districts in Maine participated in the program. The same was true of other European language groups throughout the country. However, Senator Muskie's request that francophone children be included in the legislation opened the door to other language groups.

Arguably, it would not have been possible for politicians to exclude any language group, whether or not that group was interested in the concept of bilingual instruction or language preservation. The point here is that with this change, programs to be funded under Title VII were not limited to Spanish and English. In fact, no language group, however small, was excluded. Thus, while one purpose of the act may have been to stroke Hispanic voters by recognizing the importance of their language, opening the program to all other languages may have diminished that focus enough to raise questions as to what its broader primary purpose may have been.

Changing the program from a focus on “Spanish-speaking children” to “children of limited-English-speaking ability” (LESA), moved the concept of bilingual education away from language preservation—however unclear that goal may have been—toward remediation and the ultimate goal of moving children toward English-only instruction as soon as possible. That goal became more explicit in the reauthorization of 1974 and every subsequent reauthorization that followed. The term *limited English proficient* (LEP) underscored the shift in goal by placing emphasis on the language skills that children did not have, rather than positioning their home languages as assets to be further developed in school.

Title VII: A Closer Look

There are important differences of opinion about the goals and objectives of Title VII, ESEA, during its early years. Some observers of its history believe that Title VII had as one of its goals that of helping language communities preserve and maintain their respective languages. To some degree, the language maintenance goal of the Dade County experiment became part of the history of Title VII. This congruence was reflected in the funding guidelines during the program’s formative years. Those guidelines clearly announced that one of the purposes of bilingual education was the continued development and maintenance of the children’s home language. References to language maintenance occur in the testimony, but the concept was not the major theme at the Senate hearings leading up to the enactment of the measure. Native Americans had begun to argue in favor of preserving their native languages, but that issue did not arise in the context of Title VII. Native groups were not mentioned in the original legislation, although they were included in the 1974 reauthorization. The funding

discretion of the Commissioner of Education (prior to the creation of the Department of Education) and directors of the Office of Bilingual Education (OBE) and the Office of Bilingual Education and Minority Languages Affairs (OBEMLA) were originally quite broad. Their orientations with respect to language maintenance had some impact in directing funds to one purpose or another. After the first reauthorization, their discretion narrowed as Congress and pressure groups insisted that the central goal of the act must be the expeditious teaching of English.

Examining the goals and objectives of Title VII at its inception helps to explain some of the lingering ambiguities concerning the goals and objectives of bilingual education 40 years later. The issue is important because Title VII quickly became the most important funding source for bilingual education, and funding often influences program design. What was the true goal or purpose of the act? That analysis is not transparent. By the time hearings were held by Congress in 1967 on the proposal to add Title VII to the ESEA and provide federal funding, uncertainty had begun to set in. If they were clear before, by the time hearings were held on the Title VII bill, the goal and purposes of the program with respect to language preservation and maintenance had become muddled. The preface of the legislation, the “Bilingual Education Act,” stated the purpose of the program simply:

Sec. 702. In recognition of the special educational needs of the large numbers of children of limited English-speaking ability in the United States, Congress hereby declares it to be the policy of the United States to provide financial assistance to local educational agencies to develop and carry out new and imaginative elementary and secondary school programs designed to meet these special educational needs. For the purposes of this title, “children of limited English-speaking ability” means children who come from environments where the dominant language is other than English.

A review of the testimony offered by witnesses at the Senate hearings on the bill sheds some light on the matter, although the hearings are not dispositive of the issue. In reviewing the list of witnesses called by Chairman Yarborough, one is struck by the unusual mix of speakers. There were some school administrators but almost no researchers or academics invited to testify. The predominant numbers came from nonprofit or advocacy organizations for Latinos; politicians from

local communities in California, New York, and Texas; and a sprinkling of parent advocates. In general, the majority of witnesses were connected with advocacy organizations and politics. They spoke in general terms of the need to improve the education of immigrant and language minority children. While advocates for a better education supported the bill, there is little in the hearing record to indicate that the witnesses had a clear vision of what bilingual education could accomplish or how new funds might be used.

To the degree that the problem to be addressed by Title VII funding was recognized, it was generally couched in terms of a presumed language barrier that language minority children must somehow overcome in order to participate effectively in American schools. It was not made clear how these language barriers are best overcome, although the assumption was clearly made that it involved the use of the home language in school. The few linguists and/or language teaching specialists who spoke did not discuss research on alternatives to the tradition of teaching exclusively in English. The main theme of the testimony in favor of Title VII was simple: Students and teachers could communicate more fruitfully if they were all speaking the same language. In short, the knowledge base of what was known with respect to the problem of language incompatibility and how it could be overcome was not stated explicitly in the original Title VII hearings. In the bill itself, there were no provisions to pay for program infrastructure needs: research, new ways of training teachers, or ideas on how to evaluate the new programs to be created under the bill. The concept of using the home language to help students learn English was discussed only briefly. A few legislators voiced concern about the thin rationale presented at the hearings, but if the testimony was naive, the legislators also failed to probe the issues deeply. The assumption seemed to be that once funds were appropriated and made to flow to the schools, school leaders would know how to use these funds wisely.

At this point, and given the limited primary sources available to researchers, we can only conjecture that the concept of transitioning students from one instructional model to another was not yet fully developed in the minds of educators or legislators. In fact, the term *transitional* as a complement to *bilingual education* did not arise until Massachusetts adopted its own state bilingual education law in 1972. With respect to language preservation and maintenance, the best we can assume is that legislators failed to make clear that Title VII would not be the funding vehicle for the

continued development or maintenance of languages other than English. We may also infer that the interests of politicians were not furthered by stating this goal in plain English. The Massachusetts state law was the first to use the term *transitional bilingual education*, thus becoming the first state to specify this intent clearly.

Funding began under Title VII at the modest level of \$7.5 million for the fiscal year beginning October 1, 1969. At the time, guidelines and regulations for making grants directly to school districts were simple or nonexistent, since the concept of discretionary funding in education was new. Title I, the largest funding source, was formula driven. It sufficed for school districts to report the number of poor children in the district for a check to be issued. Title VII was not meant to be managed in the same way. Álbarr Peña, the founding director of the Office of Bilingual Education (OBE), did not preclude maintenance-oriented programs. We can only speculate as to how the vague congressional purpose for Title VII became the highly specific language of the funding regulations. It is clear, however, that the goal of home language maintenance embraced in Dade County found its way into the policies of the federal government, even though that specific goal was not written into the legislation in an explicit manner. The language produced by the OBE staff could not have been clearer. At best, we can determine there were no objections filed with OBE or with the Commissioner of Education concerning the matter.

As the program grew from an initial appropriation of \$7.5 million in 1969 to more than \$160 million in 1980, bilingual education acquired more supporters as well as detractors. It became a favorite target of many opponents of bilingualism, language diversity, and immigration. But the level of funding was only one of several issues faced by the program. The Great Society was aging, and the political climate of 1968 had evolved by the mid-1970s into a less hospitable environment for programs aimed at minorities and the poor. Title I of ESEA, which served economically disadvantaged schools, also came under criticism, but a powerful constituency base was unrelenting in its support for reauthorization.

Critical Voices

The public knew little about the policy debates under way in Washington concerning the goals of Title VII, ESEA, or of bilingual education generally. In 1978, after publishing a series of articles in the

Washington Post, Noel Epstein, education editor for the newspaper, published the series as a short book, titled *Language, Ethnicity, and the Schools*. Epstein dramatized the debate in an unusually readable form. He compared the development of bilingual education with the strategy followed by Christopher Columbus, sailing out without a map in hopes of running into something. Epstein also accused advocates of bilingual education of having an agenda of “affirmative ethnicity,” under which the public schools were asked to keep children’s cultures alive at taxpayers’ expense and delaying their assimilation into American life. He claimed that the goal of teaching English was a minor objective at this point and needed political attention. Epstein’s book, the first overtly critical work on bilingual education, was followed by others throughout the 1980s and 1990s, leading the way to the English as official language movement. By the end of the century, efforts to suppress bilingual education had escalated, giving rise to movements such as English for the Children and other campaigns to eliminate bilingual education altogether.

PROGRAM QUALITY INDICATORS

Bilingual education researchers have identified several program quality indicators. Seven of the most commonly cited indicators that are foundational to all good programs are summarized below. Having high expectations for student achievement and promoting additive models of bilingual education are two of the primary indicators. These are followed by caring teachers, culturally competent pedagogy, supportive school leaders, a continuing program of professional development, and meaningful parent engagement.

High Expectations

A school climate of high expectations for achievement is the norm for English language learners (ELLs) participating in high-quality bilingual education programs. In such programs, high expectations for student achievement are held by all members of the learning community, and they are frequently reiterated to parents and students. Administrators, teachers, support staff, and parents maintain high standards for students as well as themselves. Providing students a challenging and rigorous curriculum is a major way to demonstrate high expectations. Academic rigor provides opportunities for students to be successful. This indicator is closely linked to expectations. Students cannot be expected to perform at high levels unless they engage in a challenging curriculum that demands high levels of academic work. Having ELLs engage in higher-order thinking skills and problem solving are two activities that support a challenging curriculum.

Additive Model of Bilingual Education

High-quality bilingual education programs subscribe to additive models of bilingual education. In this model of bilingual education, the goal is to maintain students’ native languages rather than to ignore or eliminate them. In some cases, the native language of the student (L1) is maintained as a supportive foundation for transition into English (L2). In other cases, the language is further developed to achieve biliteracy at a modest level. Some programs develop the home language to the same degree as English, which means full biliteracy for all students. To achieve such high goals,

school staff must value students' native languages and not view them as a deficit or a problem to be overcome. Students develop and maintain skills in their native language because the language is used in instruction.

Students who are learning a second language must first develop basic interpersonal communication skills (BICS) in that language. These lead to a cognitive academic language proficiency (CALP), the ability to use the language for active engagement in learning. Additive models of bilingual education help students to build these skills more than do programs of transitional bilingual education (TBE). In addition, students learn from their peers in classroom environments that encourage collaboration. Through the socialization process, bilingual students will enrich their native-language skills and scaffold their transition into English.

Caring Teachers

High-quality bilingual education programs have teachers with a strong background in all of the foundational principles of bilingual education. These teachers demonstrate a strong commitment to student success. They are skilled in bilingual program design and sustainability. Good teachers are trained in second-language acquisition strategies. They use these strategies daily to support students' language development in both languages under study. They work to meet the oral and written language needs of their students. Often they create their own materials to supplement existing teaching tools by focusing on specific problems that are unique to their students. Most important is that the teachers genuinely care about the adaptation and eventual success of their students in all respects—social, cultural, and academic. This often involves substantial investments of time and effort inside and outside the school. The extra time and effort afforded by these educators is emblematic of their caring work ethic.

Culturally Competent Teaching

Teachers in high-quality bilingual education programs use culturally relevant pedagogy to inform instruction. A component of this pedagogy is to focus lessons on students' prior knowledge, backgrounds, and experiences. Integrating students' experiences helps to make the lesson more relevant to the students. Teachers promote materials that reflect the students

they serve. Using culturally relevant books that represent student demographics is one way teachers help ELLs engage in the learning process. Students are able to make stronger connections to the material. In this way, students take on an active rather than a passive role in their learning. Culturally relevant teaching portrays the commitment of bilingual education teachers in supporting students' academic and affective development.

Supportive School Leaders

High-quality bilingual education programs have supportive school leaders. Principals and assistant principals familiar with additive models of bilingual education demonstrate program support in various ways. These include being visible and active in bilingual classrooms as instructional leaders. Supportive school leaders have knowledge about bilingual education goals, program design, and program sustainability. School leaders work to get to know the teachers and students in their programs. By doing this, they demonstrate the value they place on bilingual education and on the non-English language(s) used in the school. These school leaders also allocate resources to assist teachers in meeting student achievement objectives. Principals and assistant principals with knowledge about bilingual education understand the importance of resource allocation for program success. School leaders also demonstrate their support for the instructional program by advocating for bilingual teachers and students. They serve as advocates in their interactions with school district officials, school board members, and the community. They bring attention to the success of ELLs resulting from the high-quality implementation of their schools' bilingual education programs.

Parent Engagement

Parents obviously play an important role in the academic and social development of their children. In excellent programs of bilingual education, parents are continuously encouraged to participate in their children's learning process. Schools offer opportunities for parents to engage in classroom experiences, campus decision making, and school support. Staff members involved in these high-quality bilingual education programs understand the contributions that parents can make to support culturally relevant teaching and learning. The parents are fully aware of program

goals and actively engage in efforts to strengthen these goals by their own efforts at home and at school. This is evident through open and constant communication between school and home. Correspondence is distributed in the parents' home language to facilitate this communication. Parents are viewed as partners with the school, working toward the shared goal of high academic achievement for ELLs. Students are the beneficiaries of this school-parent partnership.

Professional Development

No school program can maintain high levels of performance without a parallel program of professional development for all persons involved in the program. Major changes have taken place in the conceptualization and design of excellent programs of professional development. The most successful models are those in which the school personnel design and assess their own training and seek outside help only when they believe they need it. Otherwise, teachers and others actively participate in the improvement of their own performance and that of their colleagues. Generally, outstanding programs of professional development are constructivist in their design philosophy and are self-managed by the personnel who participate in them. Program leaders and administrators provide the necessary resources and participate in the development programs as well.

PROPOSITION 203 (ARIZONA)

Arizona's Proposition 203, the "English for the Children" initiative, was approved by 63% of the state's voters on November 7, 2000. The initiative, sponsored by Ron Unz and his English for the Children campaign, was nearly identical to Proposition 227 in California, which effectively eliminated bilingual education in California after its passage in 1998, although there were attempts to close some loopholes and some of the Arizona provisions were more punitive. Prior to the passage of Proposition 203, Arizona schools had flexibility in the use of instructional models for English language learners (ELLs). At the time, only about 30% of ELLs were in bilingual programs. Others received services through pull-out or in-class English as Second Language (ESL) instruction and/or classroom support from ESL-endorsed teachers.

Proposition 203 was designed to end bilingual education programs. Opening declarations in the initiative allude to bilingual programs as being responsible for high student drop-out rates and low English literacy levels. Based on these declarations, the law requires that all children in Arizona public schools be taught English by being taught in the English language and that all children be placed in English language classrooms. Two types of English language classrooms are identified in the law, although they are poorly defined: mainstream and sheltered or structured English immersion (SEI). *Mainstream classrooms* are defined in the law as those in which the students either are native-English-language speakers or have already acquired reasonable fluency in English. *Structured English immersion* is defined by Proposition 203 as an English language acquisition process for young children in which nearly all classroom instruction is in English but the curriculum and presentation are designed for children who are learning the language. It further stipulates that in SEI classrooms, books and instructional materials are in English and that all reading, writing, and subject matter are taught in English. According to this law, teachers in SEI classrooms may use a minimal amount of the children's native language when necessary;

however, no subject matter may be taught in any language other than English, and children in SEI classrooms must learn to read and write solely in English.

The law requires that ELLs be educated through SEI during a temporary transitional period not normally exceeding 1 year. Despite the suggested time limit, students must remain in SEI classrooms until they are redesignated as fluently English proficient. In addition, Proposition 203 requires that a standardized, nationally normed written test of academic subject matter given in English be administered at least once each year to all Arizona public school children in Grade 2 and higher.

Parental Waiver Provisions

Proposition 203 outlines waiver provisions for parents who want their children to participate in bilingual education programs. To obtain a waiver, the child must meet the criteria of one of the following three waiver types:

1. *Children who already know English.* The law stipulates that sufficient proficiency in English to obtain a Type 1 waiver provision is determined by an oral evaluation or standardized test of English vocabulary comprehension, reading, and writing, in which the student scores approximately at or above the state average for his or her grade level or at or above the fifth-grade average, whichever is lower.

2. *Children who are 10 years old or older.* In addition to age, to obtain a Type 2 waiver, the law stipulates that it must be the informed belief of the school principal and educational staff that an alternate course of educational study would be better suited to the child's overall educational progress and rapid acquisition of basic English language skills.

3. *Children with special individual needs.* To obtain a Type 3 waiver, a child must first spend 30 days in an English language classroom, and parents must write a description of no less than 250 words to document their child's special individual needs. In addition, the law stipulates that it must be the informed belief of the school principal and educational staff that the child has such special and individual physical or psychological needs, which are above and beyond the child's lack of English proficiency, and that an alternate course of educational study is better suited to the child's overall educational development and rapid acquisition of English. In addition, the law states that a Type 3

waiver must be signed by both the principal and the district superintendent, that teachers or schools may deny the waivers without explanation or legal consequence, and that the existence of such special individual needs does not compel the issuance of a waiver.

Parents must personally visit the school (each year) to apply for a waiver. If waivers are granted, then the student must be transferred to classes in which English and other subjects are taught using bilingual education techniques. If 20 or more students in a school at the same grade level receive a waiver for bilingual education, then the school is required to offer a bilingual class. Otherwise, students who receive waivers must be permitted to transfer to a public school in which such a class is offered.

Enforcement

Proposition 203 gives parents legal standing to sue for enforcement of the law's provisions. The law warns that any school board member, administrator, or other elected official who willfully and repeatedly refuses to implement the terms of the statute may be held personally liable. In addition, the law stipulates that such officials be immediately removed from office and barred from holding any position of authority anywhere within the Arizona public school system for an additional period of 5 years. Provisions with this level of punitive intent do not exist anywhere else in Arizona school law.

Implementation of Proposition 203

Upon passage of Proposition 203, the initiative was written into law as Arizona Revised Statutes, sections 15-751 to 15-755. Implementation, however, has varied greatly, due in large part to ambiguous language and the lack of clear definitions and guidelines within the text of the initiative. Implementation has largely been dependent on the personal interpretations of the law by different state superintendents of public instruction. As of this writing, three superintendents have held this position since the passage of Proposition 203: Lisa Graham Keegan, Jaime Molera, and Tom Horne.

Proposition 203 Under Superintendent Keegan

Superintendent Keegan's first response to the passage of Proposition 203 in November 2000 was to postpone its implementation to the beginning of the 2001-2002

school year. The legality of this postponement was upheld by the state attorney general, Janet Napolitano, on January 16, 2001. A major question surrounding Proposition 203 was whether or not the law applied to schools on Indian reservations, which used bilingual programs to develop and preserve federally protected Native American languages, all of which face the threat of extinction. The attorney general was asked to review the law and answer this question. Napolitano issued her official opinion on February 15, 2001, which stated that if a school is run by the tribe or the federal government, then the school is not subject to Proposition 203. She further declared that while state public schools are generally subject to Proposition 203, state law must be applied in a manner consistent with federal law, including principles of tribal sovereignty and the federally recognized right of Native Americans to express themselves through the use of native languages. The attorney general concluded that Proposition 203 cannot prohibit a state public school located on the reservation or elsewhere from teaching students Native American languages and culture.

Aside from the attorney general's opinions, schools received little to no direction from the state in terms of how to implement the new law. In response to requests for state guidance from district administrators, Keegan and other Arizona Department of Education (ADE) officials responded that it was up to each local school board to decide how to abide by the new law. This lack of direction and guidance resulted in widespread confusion. Implementation varied greatly in districts and schools across the state. Although many schools ended their bilingual programs, others kept them.

Following the passage of Proposition 203, the state ended efforts to develop a Spanish language version of its high-stakes test, the Arizona Instrument to Measure Standards (AIMS). In addition, the state ceased offering the SABE-2 (the Spanish language equivalent of the SAT-9). Thus, Spanish-speaking ELLs could no longer take state tests in their native language.

Proposition 203 Under Superintendent Molera

Superintendent Keegan resigned in the summer of 2001. Governor Napolitano (elected shortly before Keegan's resignation) appointed Jaime Molera, one of her staff members with educational policy experience, as Keegan's replacement. Superintendent Molera was aware of the ambiguities of Proposition 203, and he responded to school districts' requests for direction by

issuing an extensive guidance document. This document answered many questions but still gave districts flexibility in offering ELL programs. The guidelines stated that bilingual education programs are allowed for English learners through the waiver process. Under Molera's direction, the state department of education (ADE) monitored districts to ensure they were complying with the guidelines and following proper procedures in granting waivers.

Proposition 203 Under Superintendent Horne

By the end of 2001, the overwhelming majority of ELLs were in English-only programs, and Proposition 203 received little attention in the press or public policy arena. Bilingual programs remained in only a handful of districts that were strongly supportive of bilingual education and where parents were willing to go through the difficult process of obtaining waivers.

Notwithstanding the small number of schools involved in bilingual education, Proposition 203 became a major issue once again during the 2002 campaign for superintendent of public instruction. Tom Horne, a former state legislator and long-time school board member in a suburban Phoenix school district, ran on an antibilingual education platform in which he accused his opponent, Superintendent Molera, of failing to enforce Proposition 203. Horne received the endorsement and full support of Ron Unz and the local chairpersons from the Proposition 203 campaign. He defeated Molera in the Republican primary in September 2002 and went on to win the general election a few months later.

Upon taking office, Superintendent Horne appointed Margaret García Dugan, one of the local chairpersons of the English for the Children campaign, as an associate superintendent with direct responsibility for the implementation and enforcement of Proposition 203. Soon after her appointment, Horne and Dugan issued a letter to school districts and charter schools to set forth guidelines for the implementation of Proposition 203. The letter mainly addressed the issue of the law's waiver provisions. Regarding Type 1 waivers, Horne and Dugan declared that some districts had included test scores defined by language proficiency test publishers as "limited English language skills" as evidence of "good English language skills," as required by the law to qualify for a waiver. Horne and Dugan described this as a violation of the plain language of the statute and argued that limited English language

skills cannot be considered good English language skills. Horne and Dugan's guidelines stipulated that students must score as fluent using the standards established by the publishers of the language proficiency tests. This interpretation of the law meant that it would be impossible for an ELL to qualify for a Type 1 waiver since, by definition, an ELL student is one who has not yet reached the fluent level on an English language proficiency test.

New interpretations were also given for Type 2 waivers (children 10 years or older). Horne and Dugan declared that schools must conduct an individual analysis of the needs for each student before granting a waiver and stipulated that schools may not use a form that was repeated for more than one student. One additional issue was the applicability of these new guidelines to charter schools. Up to this point, charter schools were viewed as exempt from Proposition 203; thus, the attempt to apply these guidelines to charter schools came as a surprise.

The legality of Horne's guidelines was called into question by district leaders and opponents of Proposition 203. The attorney general, Terry Goddard, was asked to intervene. Goddard issued two opinions. Regarding charter schools, his opinion was simple and straightforward: Charter schools are not subject to the requirements of Proposition 203 unless a school's charter provides otherwise. The opinion regarding the waiver provisions was highly technical but essentially found problems with Horne's interpretations and requirements for a Type 1 waiver.

Despite these attorney general opinions, Horne nonetheless declared that his waiver guidelines had been upheld. Soon afterward, ADE announced that public schools would lose their ELL funding unless they complied with the new guidelines. Horne announced that monitors from ADE would act as police officers who would visit schools and classrooms to enforce strict compliance with Proposition 203. Charter schools, even though exempt from Proposition 203, were also informed by Horne that he would cut their ELL funding if they did not comply with his new guidelines.

Impact of Proposition 203

Superintendent Horne's strict enforcement of Proposition 203 has ended most bilingual education programs for ELLs, particularly in the primary grades and especially programs of transitional bilingual education. Nevertheless, widespread confusion remains over the mandated SEI approach. Teachers have

received little or no guidance from their administrators or the state regarding what SEI is, how to implement it, and how it differs from regular English-only mainstream instruction. There is confusion over whether teachers can provide primary-language support, or even pull-out or in-class ESL instruction. Implementation of SEI varies greatly across districts, schools, and classrooms.

Effectiveness of Proposition 203 in Improving Education for ELLs

Proponents claimed that Proposition 203 would ensure that ELLs learn English quickly. Superintendent Horne repeatedly declared that ELLs would soar academically as a result of English-only instruction. The evidence to date, however, reveals that this is not happening. Analyses of English language proficiency test data show that ELL students are not learning English at a faster rate. Analyses of third-grade test scores from the SAT-9 between 2002 and 2004 reveal that ELL students never scored higher than the 35th percentile, while the majority of their English-proficient peers scored at or above the 50th percentile. In addition, average percentile rankings for ELLs declined between 2003 and 2004 on all three subtests—reading, language, and math—and ELLs fell further behind their English-proficient peers. On the Arizona Instrument to Measure Standards (AIMS) in 2004, the majority of third-grade English-proficient students passed all sections of the AIMS test; in contrast, 68% of ELLs failed the math subtest, and 67% failed the reading subtest. The passing rates for ELLs on these AIMS tests declined between 2003 and 2004, and the gap between ELLs and English-proficient students has not decreased. By any of these measures, critics point out, the ban on bilingual education in Arizona appears unwarranted.

Post-Proposition 203 Bilingual Education Programs

Despite efforts to end all bilingual education programs in the state, a small number have survived, and some new programs are emerging. At the time of this writing, of the few remaining bilingual programs in Grades K–3, most serve only English-proficient students; however, a small number of ELLs under age 10 have qualified for Type 3 waivers, which have enabled them to participate in bilingual classrooms. Some schools offer bilingual programs for ELLs in

Grades 4–12 utilizing Type 2 waivers. Some charter schools have forgone state ELL funds in order to continue their bilingual programs; new bilingual charter schools are in development. A few schools are attempting to provide primary-language instruction through the state's requirements for foreign-language instruction in the elementary grades. A few other schools are offering native-language instruction as an after-school supplemental program. Bilingual programs for Native American languages on the reservations have continued, despite pressure from ADE officials to end them.

PROPOSITION 203 (ARIZONA), IMPACT OF

Language policies not only reflect the educational preferences and curriculum decisions of a community but also represent a recognition, or lack of recognition,

of the rights and preferences of language minority groups. In addition, they reveal the preferences and intentions of the majority with respect to the assimilation of language minority groups into the political and social structures. Educational policies such as Proposition 203 in Arizona have severely limited the programs and curricula available to language minority students in the state. This entry summarizes the most important changes brought about by Proposition 203 since its passage by the voters in 2000.

Changes to Programs

As intended, the educational program options available to English language learners (ELLs) were significantly changed with the passage of Proposition 203, also known as the “English for the Children” initiative. The passage of this voter initiative ended local flexibility regarding program options for educating students learning English as their second language. This was accomplished by repealing Article 3.1 of the Arizona Revised Statutes, which allowed a variety of program models. Article 3.1 was replaced with a requirement that all ELLs in the state of Arizona be taught using structured English immersion (SEI) unless they obtain a waiver. According to a report from the Arizona Department of Education, only about one-third of ELLs were enrolled in any of the bilingual education programs offered in the state prior to the passage of Proposition 203, while twice as many were already attending English as a Second Language (ESL) programs, a model similar to the newly mandated SEI approach.

Structured English Immersion (SEI)

SEI is considered one of the weakest forms of education for language minority students. The societal goal for an educational approach such as SEI is assimilation, and the language outcome for SEI is monolingualism. The distinction between SEI and mainstream education as written in Proposition 203 is vague. According to Proposition 203, mainstream education is defined simply as “students [in mainstream education] are native English speakers or already have acquired reasonable fluency in English.” Similarly, according to Proposition 203, SEI classrooms are defined by having books and instructional materials in English; reading, writing, and subject matter taught in English; curriculum and presentation designed for ELLs; and nearly all classroom instruction in English.

In an SEI classroom, as long as all content area is taught in English, primary-language support is allowed by Proposition 203. However, teachers and students are warned by their building administrators not to talk in Spanish. Because of the similarity in concept between SEI and no differentiated program, teachers and schools struggle to understand the differences and advocates for ELLs question whether basic educational rights for ELLs are met through the use of this program.

According to a study done by Wayne E. Wright, following the implementation of Proposition 203, teachers were not distinguishing between SEI and mainstream instruction. According to the law, the two distinguishing factors between mainstream and SEI are specially designed curriculum and presentation, and primary- or home language support. Proposition 203 has resulted in confusion about what is allowed and what is not allowed in the classroom and what it means to be an SEI instructor. According to the Wright study, there has been little guidance by the Arizona Department of Education for SEI teachers, and many do not understand the difference between SEI and no program at all. Many teachers feel that as a result of Proposition 203, students are receiving submersion education instead of a structured immersion model of education designed for language minority students. Also at issue is whether the state of Arizona, as a result of Proposition 203, fails to meet the requirements outlined elsewhere in this encyclopedia relative to the ruling in *Lau v. Nichols* (1974) of the U.S. Supreme Court.

Changes in Assessment Procedures

Program options were not the only major change to education resulting from Proposition 203. The Arizona State Code revised after Proposition 203 also mandated that a standardized, nationally normed written test of academic subject matter be given in English each year for children in Grade 2 and above. Prior to the implementation of Proposition 203, state law did not require students who were not yet proficient in English to take an academic achievement test in English. A district's governing board could exempt students classified as ELLs from such tests for up to 3 years, beginning with second grade, provided that a suitable alternative academic assessment was used.

Prior to the implementation of Proposition 203, many districts used the Aprenda, a Spanish language test of academic subjects, for students who had been exempted from the statewide English-medium test of

academic achievement. Just 1 year after Proposition 203 brought the mandate for all ELLs to be tested in English, federal policy in the United States, under the No Child Left Behind Act of 2001 (NCLB), also mandated full inclusion of ELLs in high-stakes tests and for those students, teachers, and their schools to be held accountable for the test results. Although test scores of ELLs are being used in a variety of ways to evaluate students, teachers, and schools, the validity of these test scores remains in question because there is yet no standardized testing method, given in English, that will validly measure what ELLs know and are able to do.

The Waiver Hoax

In principle, Proposition 203 permits alternatives to English-only instruction in Arizona public schools. Waivers allowing students to participate in alternative programs such as bilingual education are available for older children who are at least 10 years of age, children with special needs, or children who already know English. To apply for a waiver, parents must submit a written request at the start of each school year, when they personally visit the school and receive from a school official a full description of the educational materials to be used in the alternative program. Once these requirements are met, waivers are intended to be granted at the discretion of the district superintendent.

According to the law, a child who already knows English is one who possesses good English language skills, as measured by oral evaluation or standardized tests of English vocabulary, comprehension, reading, and writing, in which the child scores approximately at or above the state average for his or her grade level or at or above the fifth-grade average, whichever is lower. Because the grade-level average for students in Arizona on English oral language assessments has not been determined, many districts had been using their own district testing data to estimate the state average in order to determine the required minimum score for a waiver. In response to request for waivers, the Superintendent of Public Instruction in Arizona, who campaigned by promising to eliminate bilingual education, issued guidelines insisting that children qualifying for waivers under this provision must meet the test publisher's passing score rather than the district's estimated statewide average for the appropriate grade. Despite challenges to the superintendent's guidelines by state politicians and an attorney general's opinion, the superintendent's guidelines remained in place, with

slight modifications. Many of the state's few remaining bilingual education programs have now been disbanded, and waivers are rarely allowed by district officials, who are unwilling to challenge the state superintendent's expressed position against them.

Background Information and Underlying Assumptions

Proposition 203 was modeled after California's Proposition 227, passed in 1998, and is otherwise known as the English for the Children initiative. Both of these propositions were approved by more than 60% of voters in highly debated and politicized campaigns in which English-only activists played an important role—one similar to previous eras of linguistic intolerance toward minority languages. Both measures were written with the assumption that students with English-only instruction will transition from their native language to English within 180 days of being introduced to English—an assumption that contradicts what is known about second-language acquisition for language minority students.

An especially controversial aspect of Proposition 203 was the suggestion in the text of the initiative that children would become proficient in English within a year's time: "Children who are English learners shall be educated through sheltered English immersion during a temporary transition period not normally intended to exceed one year." The assumption that ELLs can learn English very quickly in an all-English instructional setting plays a key role in the underlying rationale for SEI. This rationale introduces a fine line between whether or not language minority students understand classroom instruction. The underlying assumption of Proposition 203 raises concerns similar to that of *Lau v. Nichols*, the 1974 U.S. Supreme Court case that found that "students who do not know English are effectively foreclosed from any meaningful education" because they cannot understand classroom instruction.

SEI advocates believe that young children learn English so quickly under conditions of immersion that they can readily catch up to other students once classroom instruction becomes understandable. Although it endures, there is no research evidence to support that position. Proponents of bilingual education, on the other hand, maintain that classroom instruction in the native language is necessary to help children keep up academically during the time it takes to learn English

well enough to get by in an all-English instructional setting. The time frame required to learn English is understood to be a matter of years, rather than months. Opponents of Proposition 203 warned that the negative effects of incomprehensible classroom instruction would take a toll among immigrant children.

Because children who have limited knowledge of English cannot fully participate in an all-English school curriculum until they have learned English well enough to follow English-medium instruction, whether students will learn English at the hypothesized rate is of critical importance. If, indeed, children learn English within a year's time, they might reasonably be expected to catch up on missed content the following year. If children require much more time to learn English, then the approach may have the effect of deferring academic instruction for a prolonged period, possibly leading to long-term negative effects on the academic achievement of ELL children.

Language Policy Frameworks

There are various ways of portraying and interpreting the meaning of policy changes such as those inherent in Proposition 203. It should be remembered, however, that Propositions 203 and 227 might rightfully be seen as changes in instructional policy rather than changes in language policy. As is pointed out in several entries in this encyclopedia, the nexus between uses of L1 and transitional bilingual education is a weak one. There is little doubt, however, that with the introduction of Proposition 203, a major shift in Arizona educational policy from *accommodation* to greater *restrictionism* has occurred. Former policies allowed ELLs to use their native language and participate freely in bilingual education. Proposition 203, which mandates the use of English-only in schools and restricts the use and development of students' native language, is now the status quo. From the point of view of parental choice, Proposition 203 is patently undemocratic because it denies parents of limited-English-proficient or ELL children the choice to involve their children in programs of bilingual instruction. That same choice, according to the waiver provisions, is not denied to English-speaking children and their parents. Seen in this way, the impact of Proposition 203 is in the political rather than in the linguistic realm because there is no clear connection between participation in transitional bilingual programs and the maintenance and further development

of L1. Further, Proposition 203 does not infringe on the use of non-English languages outside the classroom or in schools that are not public. Other analysis can be done that would highlight other aspects of the results of implementing the policy, but space and time limits precludes analysis of other types.

The stated intention of Proposition 203 was to transition language minority students into English as rapidly as possible. It therefore represents a vehicle for quick assimilation. Before Proposition 203, for three decades, Arizona language policies were good examples of language minority accommodation policies that allowed for the use of the native language in schools.

It is important to consider the social, emotional, and psychological impact that restrictive language policies such as Arizona Proposition 203 might have on ELLs and their families. Issues about the civil rights of ELLs and their parents have been raised by researchers Mary Carol Combs, Carol Evans, Todd Fletcher, Elena Parra, and Alicia Jiménez, focusing on an urban school in Arizona well-known for its dual-language program in 2005. These researchers have argued that interpretation of the law's waiver system by state education officials has seriously reduced the number of students eligible for the urban school's dual-language program and that forcing ELLs into SEI is traumatizing some of them and distressing their parents. Taken together with the anti-immigrant actions also taken by the Arizona legislature in recent years, these fears are probably justified.

There are many ways to classify language policies and the ways policies recognize a student's language needs. Proposition 203 is based on the lowest level of recognition of student needs in regard to language and other social and emotional needs. This categorization in language policy is known as *restricted-oriented policy*, defined as a policy whereby restrictions are made on the use of minority languages. The attainment of social, political, and economic benefits, rights, and opportunities are tied to the ability to use the dominant language, in this case, English.

PROPOSITION 227 (CALIFORNIA)

Proposition 227 was a voter initiative passed in California in 1998, by a vote of 61% of those who voted. Of the Hispanic voting population, 63% voted against this initiative. Statewide, only the Bay Area's Alameda County (55%) opposed this measure. The proposition, billed as the "English for the Children" initiative, was the first of several attempts—and the first one to succeed—by Ron Unz (its sponsor and chief architect) to alter education policy at the polls using political campaign strategies designed for elections. California is one of only five states where such voter initiatives are permitted by law. This entry summarizes the requirements and intent of that law, viewed by some of its critics as an unorthodox way of determining a curriculum matter normally left to local boards of education.

English for the Children was an antibilingual education campaign mounted in several states. The language of the proposition declared that children were to be taught English through mostly English instruction, given that English was the language of opportunity,

advancement, productivity, and literacy. Proponents asserted that California had failed in its venture with bilingual education programs and suffered from high drop-out rates and low literacy levels among its immigrant student populations and that young children deserved to be taught English by being immersed in that language as much as possible. Campaign rhetoric obscured the fact that while much of the underachievement of immigrant children persists, only a portion of those children were actually being instructed bilingually. Hence, as opponents of the proposition pointed out, the campaign managed to blame bilingual schooling for problems that were not directly related to it or of its making.

Instructional Program Prescribed by the Proposition

Proposition 227 required that English language learners (ELLs) be placed in English language classrooms that use *sheltered English immersion* or *structured English immersion* for 1 year. The two terms are used interchangeably in the proposition and are not uniformly distinguished one from another in the professional literature. According to the proposition, the same English language classroom could have ELLs of different ages and language backgrounds. Further, ELLs could be placed in mainstream classrooms upon acquiring a good working knowledge of the language.

Concerning some of the critical components of effective programs for English learners, the proposition made the following points:

1. *Teachers' knowledge and use of the English and primary language (L1)*: The teacher or other instructional staff are to be proficient in English and use English overwhelmingly. There is no mention of the teaching staff's requisite knowledge of the students' L1.
2. *Students' knowledge and use of the L1 in learning contexts*: There is no mention of the students' knowledge or use of the L1.
3. *Instructional time in English and in the L1*: Nearly all daily instruction is to be done in English.
4. *Level of teaching in English*: This is to be done in a way that is understandable to English learners. There is no specific reference to the different levels of English learners.
5. *Duration*: Under normal circumstances, children are to be taught using sheltered English immersion or structured English immersion for 1 year. Students are considered to be ELLs so long as they cannot perform regular mainstream work in English.

Parental Exceptions

According to the proposition, parents can apply for a waiver to the required English programs under three different circumstances: (1) if a child at or below the fifth grade demonstrates grade-level knowledge of English; (2) if the child is at least 10 years old and site personnel (principal and instructional staff) believe the child would benefit from a program other than structured or sheltered English immersion to foster quick development of English language skills (Note: The proposition makes no distinction between English language skills and subject matter knowledge and skills in English, although this distinction is a critical one in practice. This is discussed in work by Grace McField); and (3) if a child has been enrolled in a structured or sheltered English immersion classroom for at least 30 days and the principal and instructional staff determine that due to emotional, psychological, educational, or physical needs, the student would perform better in an alternate instructional setting.

Community-Based Tutoring

The proposition also contained provisions to support English language assistance for ELLs by providing \$50,000,000 per year to fund English language instruction programs, on a free or subsidized basis, for adults such as parents or community members who pledge to tutor young ELLs. According to the proposition, the office of the state superintendent of public instruction would administer the funding process, the local school board would distribute the funds locally, and the state board of education would establish and review the guidelines for the use and distribution of those funds.

Legal Standing and Parental Involvement

The proposition makes provision for a parent or legal guardian of an ELL to sue public school employees and officials, such as the school board, other elected public education officials, schoolteachers, or administrators,

and hold such parties personally liable if the English learner is not given an English language program option as described in the proposition. Such suit is limited to attorney's fees and actual damages and does not include punitive or consequential damages.

Operative Date and Legal Sequel

The proposition was to become governing policy beginning 60 days after the proposition was passed by the voters. School terms that began 60 days after the proposition became effective had to fully conform to the policy.

Since Proposition 227 became law (California Education Codes §300–340), various aspects have been considered in the courts at the state and federal levels. In *McLaughlin v. State Board of Education* (decided in September 1999), local school boards sought a mandate from the state board of education to review and approve requests to waive Proposition 227 under Ed. Code §33050, which allows school boards to take such general action and apply for exemption from programs. The trial court ordered the state board of education to review the waivers (Superior Court of Alameda County, No. 8008105, Henry E. Needham, Jr., Judge) on the grounds that Ed. Codes §300–340 were not relevant, along with the subsequent interpretation that the two education codes were coextensive.

The decision was reversed by the court of appeals (opinion by J. Ruvolo, with P. J. Kline and J. Haerie concurring) on the basis that the two education codes could not be coexistent, since §33050 allows school boards to apply for program waivers for its students collectively and Proposition 227 requires parents to apply for program waivers only for their own child or children. It was found that the drafters of Proposition 227, owing to an oversight, had not included specific clauses to amend §33050 in the proposition but that this failure could not be the basis for school districts applying for waivers when parents had not requested them. The specific role of parents in requesting program waivers was to be instituted in all California schools.

It can be argued that Proposition 227 transferred authority to choose programs for ELLs from schools to parents, assuming that the waiver process remains viable. Some have interpreted this as a positive change, in that parents can have more control over the education of their children. Others have interpreted this as a negative change, in that the parents given this burden are those of ELLs, who are largely less educated than

parents at large and must grapple with obtaining information about complex programs and accessing schools in the face of linguistic and cultural differences. A similar provision in the Arizona version of English for the Children resulted in a waiver provision with even less flexibility and therefore less choice for parents who may want something other than English-only instruction. Hence, in Arizona, the choice of bilingual education has been effectively taken away from parents who might prefer it.

In *California Teachers Association v. Davis* (decided in 1999), plaintiffs brought suit under 42 U.S.C.S. §1983, on the grounds that in California Education Codes §300–340, the requirement for educators to provide an “English language educational option” was not measurable and was thus subject to vague enforcement. Specifically, plaintiffs asserted that the phrases “nearly all” and “overwhelmingly” were vague as to when teachers are required to speak in English and therefore subject them to liability. The Central District Court of California ruled that the parental provisions in Proposition 227, California Education Codes §300–340, were not unconstitutionally vague, in that the codes sufficiently specify that “English language instructional curriculum” should be provided and that violation occurs when teachers “willfully and repeatedly” refuse to provide English instruction.

The plaintiffs appealed to the U.S. Court of Appeals for the Ninth Circuit, and the judgment was affirmed. In the ruling, Circuit Judge Robert Boochever wrote that it was determined that “instruction” and “curriculum” are commonly understood terms and unequivocally include the teaching of subjects such as math, science, history, and other content areas. It was further determined that “instruction” and “curriculum” do not include activities such as supervision outside of the classroom, disciplining students, or conversing with parents, all of which can legally be done in any language. In the dissenting opinion, Circuit Judge A. Wallace Tashima noted that several other cases, including those at the U.S. Supreme Court level, have interpreted “instruction” and “curriculum” to include students' personal expression on school grounds and in school-sponsored publications and activities, including plays and presentations that occur outside the traditional classroom setting. Judge Tashima wrote that plaintiff teachers were legitimately concerned about vagueness in the restriction of non-English language use in the contexts of tutoring, nonacademic classroom activity, supervision, field trips, discipline, and so on,

not only in light of precedent cases but also in light of the fact that Ron Unz, the sponsor of Proposition 227, and the defendant in the case, the State Board of Education, disagreed as to the scope of language restriction, with the former advocating the application of language restriction beyond the classroom and the latter insisting that the language restriction concerned only classroom instruction.

Judge Tashima further asserted that the terms “overwhelmingly” and “nearly all” were not sufficiently clear terms for persons of “ordinary intelligence” to interpret. He noted that school districts, in implementing Proposition 227, had interpreted the terms to mean anywhere from 60% to 90% instruction in English, hardly evidence of obvious and consistent construction of common terms by school personnel of “ordinary intelligence.”

In his view, “willfully and repeatedly” refusing to use English was vague and clearly difficult for educators to fathom, given that the amount of required non-English and English use was imprecise to the point that various school districts included anywhere from 60% to 90% instruction in English. He noted that vagueness abounded for school officials under the proposition, including a teacher who taught to the school district guidelines of using English 60% of the time, who could be charged and found to be liable if a parent charged that such a percentage was insufficient. The threat of parents at individual will filing suit (versus a governmental authority) would subject educators to “discriminatory enforcement” of the parental provision. Teachers would not have fair notice of how much English and non-English language use would or would not lead to a lawsuit, and this would subject them to live with an infringement on their First Amendment protection, since the vagueness of the proposition effectively silences teachers who might fear legal action against them.

In 1998, the *Valeria v. Davis* plaintiffs (limited-English-proficient students) filed a preliminary injunction in the U.S. District Court for the Northern District of California to stop the implementation of Proposition 227 on the grounds that it was unconstitutional. Plaintiffs asserted that the proposition violated the requirements (a) for “appropriate action” to be taken for ELLs under the Equal Educational Opportunity Act (EEOA), (b) Title VI of the Civil Rights Act of 1964, and (c) the Equal Protection Clause and Supremacy Clause of the U.S. Constitution.

The court ruled that (a) the proposition did not violate the EEOA because the programs stipulated in the

proposition did constitute “appropriate action,” in that there was no evidence that sheltered English immersion or structured English immersion programs were not viable instructional programs according to experts; (b) it did not violate the Supremacy Clause because the proposition did not complicate the EEOA; (c) it did not violate Title VI because exclusion, denial, and discrimination would not be the necessary consequence for English learners; and (d) it did not violate the Equal Protection Clause.

In his opinion, Judge Charles A. Legge wrote that plaintiffs were not yet suffering from irreparable harm from the impact of Proposition 227 and that any such alleged harm could be avoided by the parent waiver process or by other steps districts could take that were not precluded by the proposition. The case was appealed, and the U.S. Court of Appeals for the Ninth Circuit denied the rehearing (*Valeria v. Davis*, in 2002). Circuit Judge Pregerson wrote in his dissent to the decision not to rehear the case that Proposition 227 restructures the political process by shifting authority about programs for ELLs from local schools and districts to the state. He stated that because the persons affected by such restructuring of the political process are language minority persons, racial focus is a discernible aspect of the proposition. In his view, minority interests are necessarily burdened and equal protection violated under the proposition.

Further, in his view, it is a false claim that Proposition 227 addresses only an educational issue, not a racial one. The term “immigrant” appears multiple times in the proposition, and at the time of the passage, 82% of the state’s ELLs were of Latino backgrounds, clearly suggesting both an intended and actual impact of the proposition on a particular racial group. Although at face value, the proposition gives parents the right to choose a program for their children through the waiver process, in fact, the proposition shifted the power from the parents of ELLs to the voter electorate and effectively entrenched the process of program selection into the state education codes. Any subsequent restructuring of the political process would now require a state-level legal or legislative course of action, a clear shifting of political access away from the parents of ELLs.

Initial Effects of Proposition 227

Upon passage of the proposition, school districts were primarily concerned with the legal requirement of programs that were to teach ELLs (i.e., structured

English immersion and sheltered English immersion programs). Many school districts reported some uncertainty concerning what qualified programs to meet the statute's requirements, but most ultimately implemented programs that were combinations of instructional practices already in use, such as English language development, sheltered instruction, or a combination thereof. Some districts also maintained bilingual education programs, although the percentage of such programs fell from 25% to 8% after Proposition 227.

District guidelines and handbooks for English language programs were scrutinized, redrafted, and regularly reviewed for adherence to the proposition. Some districts' descriptions of structured English immersion between 1999 and 2003, for example, show change and development over time (e.g., Oceanside Unified School District). Of particular concern was the role of the L1 in various instructional contexts for ELLs. In the 2-year impact study of the proposition, conducted by the American Institutes for Research (AIR) and WestEd in 2002 (Thomas Parrish, Robert Linqanti, Amy Merickel, Heather Quick, Jennifer Laird, and Phil Esra), it was found that 44% of the 75 surveyed districts in California needed additional guidance on the use of L1 in both instructional materials and in teaching. It was also found that 68% of surveyed districts permitted L1 use for academic instruction and 88% allowed L1 use for preview or review of academic instruction as well, with 48% using L1 with instructional aides. The report noted that the frequency of use of the students' first language that is accepted in sheltered English immersion made it hard to distinguish between this model of instruction and bilingual education. Their findings also evidenced that there was a notable lack of consistency in the program models in the state of California.

Midterm Impact of Proposition 227

The impact on parental choice was significant. Some districts actively disseminated information on parental rights to choose, while other districts took matters into their own hands and did not inform parents of the right to choose.

The AIR and WestEd, in their report on the impact of 5 years of Proposition 227, in 2006, examined districts that had maintained or changed programs before and after Proposition 227 along the categories of "continuing-bilingual," "transitioning-from-bilingual," and "never-bilingual" (conducted by Parrish, Merickel,

Linqanti, and María Pérez) and noted the following major findings. First, all types of site and district-level factors, including staff capacity, overall program coherence, shared priorities, expectations and support by all stakeholders, and regular assessment-informed instruction, were found to play critical roles in the outcomes of English learners. That is, it was found that language of instruction was not necessarily the sole determining factor in influencing student outcomes. Second, another significant finding was the estimation that on average, ELLs who were in California schools for 10 years had less than a 40% chance of being redesignated to fully English-proficient status and being mainstreamed into an English language classroom.

Program consistency remains a critical issue at state and local levels. AIR/WestEd's 5-year report again noted among the school districts in California a lack of clear operational definitions for the various instructional approaches to the education of English language learners. Also noted was the wide variation in program descriptions for sheltered or structured English immersion programs across the state and the regularity with which the students' first language is included in some minority percentage in most sampled districts, suggesting that the native language continues to play a critical role in the instruction of English learners.

PROPOSITION 227 (CALIFORNIA), IMPACT OF

On June 2, 1998, California voted in favor of Proposition 227 (now codified as California Education Code §§300–340) by a 61% to 39% margin. This law requires that all public school instruction in the state be conducted in English, thereby dismantling California's previous system that allowed English language learners (ELLs) to be instructed in their native language while they gradually learned English. Proposition 227 requires that ELLs be taught "overwhelmingly in English" through sheltered/structured English immersion (SEI) programs, during "a temporary transition period not normally intended to exceed one year," then be transferred into mainstream English classrooms.

A 2006 report entitled *Effects of the Implementation of Proposition 227 on the Education of English Learners*,

K–12: Findings From a Five-Year Evaluation, authored by Tom Parrish, María Pérez, Amy Merickel, and Robert Linqunti, examines the effects of the implementation of Proposition 227 and provides a portrait of California's ELL population. According to this report, California has significantly more ELLs than any other state. Nearly one-third of the nation's 5 million ELLs are in California, and Proposition 227 was introduced following a 10-year period in which ELLs had grown from less than 15% to approximately 25% of the state's K–12 population. Spanish is by far the most common primary language, accounting for 85% of the California ELL population. Therefore, the challenge of serving ELLs effectively is an ever-present challenge in the state.

A number of studies have examined the impact of Proposition 227 in California. The largest of these studies, the one mentioned above, for example, was carried out collaboratively by WestEd and American Institutes for Research. It was submitted to the California Department of Education, which published the report in January 2006. This report's findings serve as the basis for this discussion on the impact of Proposition 227. An important consideration to note when discussing the impact of one particular policy is that Proposition 227 was being implemented at the same time as several other important policy initiatives that directly affect ELLs and the programs in which they participate. During the initial implementation of Proposition 227, educators identified California's class size reduction, the state's new English language development (ELD) standards, and California's emerging accountability standards as the policies that most affected the education of ELLs. More recently, educators refer to federal and state accountability systems as most directly affecting the educational practices impacting ELLs in California.

According to the report, subsequent to the passage of Proposition 227, the proportion of ELLs receiving primary-language instruction with ELD (also known as bilingual instruction) dropped significantly (from 30% to 8%), and the proportion who are instructed using specially designed academic instruction in English increased. Although significant gaps in academic achievement among students in California remain, there is some evidence of improved academic success with ELLs. Numerous issues make it difficult to ascertain what attributes to the gains in test scores and how those gains can be interpreted. The overall research that has thus far been conducted in California cannot definitively point to one model of instruction as being

relatively superior for instructing ELLs. However, the research does seem to conclude that rather than focusing on specific models in an attempt to find one that meets the criteria of “one size fits all,” California would do better to focus on the specific factors that appear to make a difference for ELLs in diverse contexts. Eugene García and Julia Curry-Rodríguez report that the basic premises underlying Proposition 227 were flawed; however, at least some effects can be seen as positive. The passage and implementation of Proposition 227 has led to a focus on the ELL population as an important subgroup within our schools. The methods of instruction for this population are being reevaluated, and mandates for English ELD standards, an annual ELD assessment, and supplementary ELL services have come about in part due to Proposition 227. One of the negative effects, as reported by Kris Gutiérrez, Patricia Baquedano-López, and Jolynn Asato, has been a move toward a more scripted curriculum, allowing less flexibility, for example, in how reading is being taught to English learners.

Implementation and Impact of Proposition 227

There has been a shift in how educators have perceived the effects of Proposition 227. In the first years after the passage of Proposition 227, educators stated that it overemphasized an English-only philosophy, greatly restricted the use of primary language instruction, and diminished the focus on student cultural heritage. Educators also expressed concern with the ambiguous legislative language used in the proposition, for example, respondents’ interpretations of instruction “overwhelmingly in English” varied widely.

Initial reports on the impact of Proposition 227, such as the one by Patricia Gándara and colleagues, found that what teachers were choosing to do in their classrooms was based largely on what they had done prior to the proposition’s passage, as well as on their own skills, experiences, and beliefs about effective teaching and student learning. When educators were surveyed in 2002 for the *Effects of the Implementation of Proposition 227* report, they indicated that Proposition 227 had not helped substantially in regard to ELL redesignation, integration, or student academic performance. Several studies, including the one by Gándara, have reported that teachers exercised considerable autonomy in interpreting the directives provided by schools and districts. In 2005, respondents selected on the basis of exceptional ELL performance

in the post–Proposition 227 era tended to more favorably assess the impact of the proposition overall, as Tom Parrish and coresearchers discovered. However, it is important to note that they emphasized the significantly increased attention the law has placed on ELLs and their academic performance more than the structured English immersion (SEI) model of instruction mandated by the law.

While stating that some positive effects could be attributed to the implementation of Proposition 227, these educators, mentioned above, also identified a number of barriers to implementing the proposition’s mandates. These barriers included (a) the short timeline and insufficient guidance for implementing regulations in the law initially, (b) confusion over what the law requires and allows, and (c) the lack of clear operational definitions for the various instructional approaches to the education of English learners. Specifically, there exists significant evidence for concern regarding uneven school and district understanding and implementation of alternative instructional waivers. Under Proposition 227, parents can request instruction in an “alternative” (i.e., bilingual) instructional program for their children. Nonetheless, it appears that parents’ understanding of their waiver rights and schools’ acceptance of waiver requests are frequently governed by prior practice and the inclination of providers toward particular instructional programs.

Although students across all language identifications and all grades have shown gains on the SAT-9 and California Standards Test (CST), standardized tests given in California, it is difficult to directly attribute those gains to the implementation of Proposition 227 or to any one of the other policy changes put in force at the same time. The 2006 Proposition 227 report looked at individual models of instruction; there seemed to be little evidence of differences in ELLs’ academic performance based on any particular model (i.e., bilingual education, structured English immersion). When examining ELLs’ achievement as measured by their redesignation from English learners to a status of “fluent English proficient,” there are variations across school districts, socioeconomic status, ethnic categories, and the grades in which students arrived in their school districts. Overall, the major report by WestEd and the American Institutes for Research examining the impact of Proposition 227 reported that districts varied between 14% and 72%, with an average of less than 40%, in the probability of an ELL being redesignated to fluent-English-proficient status after 10 years in California.

Understanding how specific districts determine the process of reclassifying students is critical to discerning the variation in redesignation rates.

Promising Practices for English Language Learners

Another important issue that has been examined within the context of Proposition 227's impact is identifying practices that are critical to academic excellence among ELLs. Many of the practices that are vital to the success of ELLs are also important to the success of all students, regardless of language backgrounds. However, it is important to note that a focus on the needs of ELLs is what has in part led to the success of this population of students. The 2006 report indicates that school principals who have been interviewed regarding factors that contribute significantly to the academic success of ELLs in post-Proposition 227 California have identified four critical features: (1) staff capacity to address ELL needs; (2) systematic, ongoing assessment and data-driven decision making; (3) shared priorities and expectations in regard to educating ELLs; and (4) schoolwide focus on ELD and standards-based instruction.

More specifically, these same principals of schools, with high numbers of ELLs, emphasized that teachers need to have the knowledge and skills needed to adequately support the needs of ELL students and they should also be purposefully developing academic language and literacy development across the curriculum. In addition, schools should have carefully designed plans for the provision of ELD services. Other strategies that have been identified by district administrators in various studies include sustained, on-site technical support and professional development; timely delivery of data as well as careful use of the data; and strategic resource allocation.

Understanding Redesignation of ELLs to RFEP Status

One of the measures often used to determine the success of a model of instruction for English learners is the time it takes to consign an ELL student to redesignated fluent-English-proficient (RFEP) status. Post-Proposition 227, redesignation continues to be a controversial and unclear process. A statistical examination of ELL enrollment and redesignation data submitted to the state yielded an estimate that the

probability of an ELL being redesignated to RFEP after 10 years in California was less than 40%. Notably, redesignation rates varied dramatically across districts that enroll large numbers of English learners. Noteworthy differences have been identified with regard to districts' redesignation criteria, including chosen cut points. Educators have reported in various studies, such as the one by Gándara that examined achievement scores, that 1 year is not sufficient for students to acquire enough English language proficiency to achieve academically without further language support. Differences in procedures in place to carry out redesignation, as well as the importance placed on redesignation in local accountability systems, have also been noted. Other key issues that affect local redesignation policies and practices include the following: (a) unrealistic reporting timelines inconsistent with assessment and school year calendars, (b) vague and perhaps contradictory guidance on criteria and cut points, and (c) debatably problematic redesignation rate calculation methods that may underrepresent success and do not take into account ELLs' progress over time or consider the full range of their linguistic and academic performance. Furthermore, it is important to monitor ELLs' linguistic and academic progress before and after redesignation.

Community-Based English Tutoring Program

One of Proposition 227's provisions was the establishment of a Community-Based English Tutoring (CBET) program. This program was to provide funds to local educational agencies to be used to provide free or subsidized English instruction to parents as well as to other community members. These individuals were then to pledge to provide English language tutoring to English learners. For a local educational agency to qualify for CBET funds, it must have enrolled at least one ELL in the previous school year. Other than this requirement, the agencies are given great flexibility in how the funds may be used. Contingent on budget approval by the legislature and governor, a budget of \$50 million per year was allocated for this program. The effect of this provision has been varying implementation at the local level, based in part on the ambiguous legislative language regarding the goal of CBET. In 1999, Assembly Bill 1116 established the English Language Acquisition Program, which allocates \$100 per ELL in Grades 4 through 8 in local

education agencies. A statewide achievement analysis by Parrish and colleagues evaluating the impact of these funds found a modest, statistically positive relationship between the English Language Acquisition Program and selected student outcome measures. These findings point to the need for looking closer at how CBET, as well as other tutoring programs, impact the education of California's ELL population.

Further Steps Needed

As educators carry on their search for the most effective strategies and models to educate our continually growing ELL population, it is critical that school sites and districts that are successfully educating ELLs at all grade levels are identified and provide opportunities for other schools to learn from them. It is also recommended that the state also standardizes and clarifies alternative instructional program waiver provisions of Proposition 227 in order to allow more flexibility in the types of programs offered. Furthermore, a clarification of performance standards for key statewide measures of ELLs' progress and achievement is also needed.

P.S. 25, NEW YORK CITY'S FIRST BILINGUAL SCHOOL

Public School 25 (P.S. 25), the Bilingual School, was founded in 1968, with Hernán LaFontaine as the school's principal and Muriel Pagán as assistant principal. Located at 811 East 149th Street, in the borough of the Bronx, in New York City, P.S. 25 was New York City's first bilingual school serving mostly Latino children. The school aimed at providing students with 7 years of bilingual instruction, from kindergarten through sixth grade. The school's objective was to enable students to achieve proficiency in listening, speaking, reading, and writing two languages. Through a gradual process, students ultimately received 50% of instruction in English and 50% in Spanish.

The school came to the aid of the large number of Hispanic students who were struggling with English in the public schools of New York City. The language problem came to the public's attention in the 1960s, when community groups of Hispanic citizens, predominantly Puerto Rican, presented themselves at several public meetings of the city's board of education and disrupted sessions, demanding to be heard. Demands made by community activists included making school improvements and the incorporation of bilingual educators into schools that served primarily Puerto Rican youngsters. These requests were a direct result of the great number of Hispanic students who had difficulty with English and were unable to speak the language.

P.S. 25 was an accommodation to the Puerto Rican community by the city's board of education. Although widely regarded as an experiment, it managed to recruit students from an impoverished neighborhood in the immediate community and from other parts of the city. Like many other early bilingual schools, P.S. 25 attracted students from a low-socioeconomic background. In its first year, the school had a student body of 900 students. The ethnic composition of the school was predominantly Hispanic, chiefly Puerto Rican, Cuban, Ecuadorian, Peruvian, Dominican, and Colombian.

The teachers at the school were all Spanish/English bilingual, the majority being Puerto Rican; other teachers at the school were of Cuban and African American heritage. The teachers held qualifications that included a bachelor's degree, an English as a Second Language (ESL) certification, a New York City teaching license, and additional training through courses in ESL, cross-cultural studies, cultural heritage, and literature in the target language. Teachers also received continuous guidance by a master's-level supervisor and attended workshops and coursework provided by faculty from New York University. As a result of these initiatives and collaborations, many teachers went on to earn a master's degree in bilingual education. Most teachers also had previous teaching history in a Spanish-speaking country and had taught in the New York City area. In addition, P.S. 25 employed several bilingual paraprofessionals. The paraprofessionals' responsibilities included tasks such as teaching; in some instances, this included whole-class, small-group, or individual tutoring. Other responsibilities incorporated clerical duties and serving as liaisons to parents.

School Organization

Most classes in the P.S. 25 program had an average of 26 students, which was considered small by New York City standards. Teachers were encouraged to provide individualized instruction to children and use a subject-centered curriculum. Because the school opened with a diverse student population who had different proficiency levels, students were screened and grouped primarily by language dominance into their subject classes, either Spanish dominant or English dominant.

The use of the second language at the school had two functions. First, it was a separate subject of study, and, second, it served as a medium of instruction for other subjects. Teachers, paraprofessionals, and students did not mix languages; only one language at a time was used in the classroom for instructional purposes. Teachers at the school respected the students' native language, and the speech they produced in the class was accepted. However, teachers corrected students' language by identifying errors and then modeling proper standard language forms.

The primary teaching method at the school was the audio-lingual method, with an emphasis on communication. To complement this approach, teachers sought to compare and contrast the sounds of the two

languages through the use of audiotapes, structural drills, and dialogues. The sequence of instruction prioritized the development of listening-speaking proficiency; only when this proficiency had been informally assessed as adequate by teachers were students allowed to proceed to the development of reading skills. Reading instruction in the target language was pursued only after students had learned to read in their dominant language, which was reported to take place in the third grade.

Materials used were designed by curriculum specialists. Social studies materials were developed in Spanish and implemented not just at P.S. 25, but eventually at other New York City schools. In addition, materials imported from Puerto Rico and written in Spanish were adapted for use in the school. An early example of multicultural curriculum was demonstrated by the staff, who developed school activities and materials that focused on and represented African American and Puerto Rican values.

The medium of instruction in the early grades at the Bilingual School was predominantly Spanish; the use of English gradually increased, over several years, until 50% of instruction was practiced in each language throughout the day. The amount of time devoted to each language varied by grade level. For each year spent in the program, children were expected to use greater amounts of English in the classroom. The ratio of language of instruction, from dominant to second language, for students in kindergarten was 95% to 5%. The ratio for first grade was 85% to 15%; second grade was 85% to 15%; third grade was 80% to 20%; fourth grade was 70% to 30%; fifth grade was 60% to 40%, and, finally, in sixth grade, it was 50/50. Because the school accepted students at different grade levels from the outset, adjustments were made to the medium of instruction ratio to account for the years of bilingual instruction the students did not receive if they had not enrolled at P.S. 25 in kindergarten. The gradual increase in the use of English instruction allowed students to function comfortably in the second language without subjecting them to undue stress.

Extended School Services

The school started a summer school program beginning in 1969. The program focused on remediation and aid for students with learning disabilities in reading and mathematics. The classes formed included

Grades 1 through 5, regrouped by language dominance and disability. Evaluation was based on daily and weekly tests that were designed and administered by teachers, since these were not available in Spanish. At the conclusion of the session, it was obvious to the school staff that, in the past, many students had been misdiagnosed as disabled when, in fact, they had merely had difficulty with English.

The school also created an adult education component that informed parents of the content in the curriculum and methods used in the classroom. Parents were trained in the basic skills needed in order to help their children with schoolwork at home. Groups were also formed among parents with the goal of learning English or Spanish. As they developed language skills in the second language, parents demonstrated leadership by covering topics at group meetings that addressed social, political, and economic issues within the school and the community.

P.S. 25 remained open for many years and served as an early example to the New York City Board of Education of the viability of bilingual instruction in serving Hispanic youngsters. A few years later, in 1974, the *Aspira* Consent Decree provided a strong impetus that mandated bilingual education programs in other parts of the city.

PUERTO RICO, SCHOOL LANGUAGE POLICIES

Puerto Rico, a Caribbean possession of the United States since 1898, has experienced numerous language policies throughout its history. The term *language policy* refers to the official designation of particular languages for educational or governmental functions. Although Puerto Ricans are a primarily Spanish-speaking population, they were obligated for 50 years to receive their education exclusively or partially in English, as part of an Americanization effort aimed at displacing their native language and integrating them, culturally and linguistically, into the United States. Since 1948, when the first Puerto Rican governor of the island was elected, the language of public education has been Spanish, with English as a mandatory school subject from early elementary school up to college graduation. An extensive private school system offers varying amounts of English-medium education, including English monolingual classes, completely bilingual instruction, and English solely as a required subject. There are also some model bilingual public school programs.

The Spanish language has a powerful symbolic significance for Puerto Ricans because it represents their ethnicity, or sense of belonging to the Hispanic world, as opposed to their official nationality as U.S. citizens. Despite all efforts to replace Spanish with English, the Puerto Rican people have remained fiercely loyal to their mother tongue. In the 2000 census, only 50% reported being able to speak English, which is popularly referred to as *el difícil* ("the difficult one"). The maintenance of Spanish in Puerto Rico is the result of various factors, among them the world status and extensive literature possessed by the Spanish language, the small geographic size and large population of Puerto Rico, the high level of Spanish literacy of its people, and the active efforts of political elites and intellectuals on the island to defend their native vernacular and resist the encroachment of English.

It is the opinion of numerous scholars that the failure of many Puerto Ricans to learn English is a form of resistance to U.S. cultural dominance. While there is a small but vocal minority of about 5% who advocate for total independence for Puerto Rico, most Puerto Ricans are divided evenly between those who favor Puerto Rico becoming a state and those who favor continuation of the current commonwealth

status, known as *Estado Libre Asociado* (“free associated state”), with some increase in local autonomy. Regardless of party affiliation, however, there is unanimous support across party lines for the maintenance of Spanish and Puerto Rican culture.

This is not to say that there are no competent English speakers in Puerto Rico. There is a strong correlation between higher social class and knowledge of English, which is somewhat complicated by the existence of working-class return migrants from the mainland United States who are fluent speakers of nonstandard varieties of English. Competent English speakers can be found in banking, international business, the tourist industry, the professions, academia, and the military. Nor can it be said that Puerto Ricans do not wish to learn English. There is nearly unanimous support for individual bilingualism, in this case the learning of two languages by individuals to further their personal and employment goals, and English language institutes have a flourishing business on the island. However, societal bilingualism (the officially sanctioned use of two languages throughout a society) is a notion many Puerto Ricans are uneasy with.

Historical Background

The often-contradictory changes in language policy in Puerto Rico prior to 1948 were primarily the result of the conflict between the U.S.-appointed governors’ desire to incorporate the island into the union and the desire of the Puerto Rican populace to maintain its distinctive identity. During the first 2 years following the end of the Spanish American War (in which Puerto Rico, Guam, and the Philippines were ceded by Spain to the United States), the U.S. government took a callous attitude toward the Spanish of Puerto Rico, deeming it not worthy of maintenance. The openly expressed policy was eradication of Spanish in order to create allegiance to all things American.

After the 1900 Foraker Act established a civil government and created the Department of Public Instruction, 10 different commissioners of education experimented with seven different language policies (see Table 1 below). Until 1948, the federal government in Washington had ultimate control over educational policies in Puerto Rico, since the president of the United States directly appointed the commissioner of education and had the power to dismiss the holders of this office whenever they proved ineffective. In addition to implementing language policies, commissioners

also created incentives for learning English, including bringing in English teachers from the United States, obligating regular classroom teachers to pass tests in English, providing extra stipends for those who taught in English, and examining candidates for high school graduation in English. Most notable among these policies was the “Philippines plan” promoted by Roland Falkner, which consisted of special English training programs, summer institutes, and obligatory weekly English classes for Puerto Rican teachers; \$10 monthly raises to teachers qualified to teach in English; and annual teacher testing in English, with the threat of suspension or even loss of license for any who did not pass.

At each juncture, the pro-English measures met with rigorous protests on the part of teachers’ associations, parents, the intelligentsia, and outside evaluators. Many of the commissioners resigned in the face of public outcry at their policies. Mariano Villaronga, on the other hand, was forced to resign in 1947 because his pro-Spanish views did not find favor in Washington; however, in 1948, when Luis Muñoz Marín became the first elected governor, Villaronga was reinstated and rapidly made Spanish the instructional language at all levels of schooling, with English as a special subject. His policy has remained in force to this day.

The variable school language policies did not exist in a social vacuum, but rather responded to or were influenced by laws and events at an insular and an international level. For example, in 1902, the Official

Table 1 Language of Instruction in Puerto Rican Public Schools, 1900–2006

<i>Years</i>	<i>Elementary School</i>	<i>Intermediate & High School</i>
1900–1903	Spanish	English
1903–1916	English	English
1916–1934	Gr. 1–4 Spanish Gr. 5 both Gr. 6–8 English	English
1934–1937	Spanish	English
1937–1942	Gr. 1–4 Spanish Gr. 5 both Gr. 6–8 English	English
1942–1948	Gr. 1–6 Spanish	Gr. 7–12 English
1948–2006	Spanish	Spanish

Languages Act declared that in all insular governmental departments, courts, and public offices, English was to be treated as co-official with Spanish and translations and interpretations from one language to the other would be made when necessary to ensure that all parties could follow the proceedings. Spanish would continue as the language of municipal offices, courts, and the police force. While not aimed at the educational arena, the law provided a legal rationale for the inclusion of English in the local curriculum.

The periods of most active reaction against English-only language policies tended to coincide with the flourishing of groups that openly criticized the U.S. government and sought independence for Puerto Rico (e.g., the founding of the Free Federation of Workers, 1906; the Partido de Independencia, 1911; the first Socialist Party of Puerto Rico, 1920; and the Nationalist Party, led by Pedro Albizu Campos, 1922). Periods of severe unemployment, like the Great Depression of 1930, which crippled the economy of Puerto Rico, made insistence on English-only education for an impoverished Spanish-speaking population an impossibility. Commissioner José Padín's policy of utilizing Spanish as a medium of instruction through the eighth grade reflected this reality.

Teachers played a critical role in the protests against what was termed the "cultural colonization" of the island. For example, in 1911, the Puerto Rican Teachers Association petitioned Commissioner Edward M. Bainter to implement Spanish as the teaching medium in the first grade, with content courses divided between Spanish and English up to the eighth grade. English would continue as the language of instruction in all high schools. Rural schools would be exempt from the policy due to their lack of resources and would teach in Spanish only. As a result of the teachers' protests, the annual English exams for teachers were abolished, and the Puerto Rican Legislature created the special post of Supervisor General of Spanish to oversee the teaching of Spanish in the public schools and ensure that Puerto Rican children continued to learn their vernacular in school.

Similarly, in the early 1920s, teachers' protests against Commissioner Juan B. Huyke's policies forced the Puerto Rico legislature to request a study of the school system. The famous Columbia Study of 1925 to 1926 recommended the use of Spanish as the medium of instruction until the seventh grade. Huyke called this "the suppression of English," since he felt that bilingualism could most easily be achieved during early childhood. However, many well-known

Puerto Ricans denounced the imposition of English, and Huyke resigned amidst public outrage.

In 1943, on the eve of the U.S. entry into World War II, the U.S. Senate's "Chávez Committee" denounced the fact that despite 45 years of U.S. rule, Puerto Ricans were still limited in English skills, and accordingly, Commissioner Gallardo was formally reprimanded. However, as more and more Puerto Ricans surpassed an elementary school education and were enrolled in intermediate and high school programs (where instruction was in English), public resistance to teaching exclusively in English again mounted. In 1946, a bill was presented in the Puerto Rican Assembly to make Spanish the medium of instruction at all levels, with special attention to the teaching of English. This was vetoed by interim Governor Manuel A. Pérez. The bill was then sent to President Harry S. Truman to see whether he would override the governor's veto, but it was retained by the Department of the Interior until the deadline for approval had passed. A federal lawsuit to obligate the passing of the bill was rejected by the U.S. Supreme Court. Nevertheless, the protests continued, and Gallardo finally resigned in 1946.

Recent Developments

Despite the stability of the educational language policy since 1948, language continues to be a bone of contention in Puerto Rico, particularly among politicians. In 1991, for example, the Official Language Act of 1902, which gave co-official status to both English and Spanish, was revoked by the Partido Popular Democrático (Pro-Commonwealth Party) in what many observers saw as a political ploy to gain votes. The new law (Law No. 4) declared Spanish to be the sole official language, although it recognized the importance of English on the island and did not alter the school language policy. This move prompted the government of Spain to award Puerto Rico with a medal for its defense of the Spanish language, and supporters of the new law exulted in this symbolic triumph. However, in January of 1993, when the Partido Nuevo Progresista (statehood party) came back into power, Governor Pedro Rosselló, fulfilling a campaign promise to return English to its original status so as to facilitate the eventual acceptance of Puerto Rico as a state, promptly revoked the "Spanish-only" law and signed into effect Law No. 1, which essentially conformed to the stipulations of the original 1902 law. In 2003, the Commission of Education,

Science, and Culture of the Puerto Rican Senate produced a report on language in Puerto Rico, which concludes that it is precisely this sort of politicization of the conflict over bilingualism that has led to language learning problems among Puerto Rican children.

Given the demands of the “information age,” parents and educators are deeply concerned about the difficulties that many Puerto Rican children have with both English and Spanish. To this end, the Department of Public Instruction (now Education) has experimented with various programs to improve the language mastery of children in public schools, including bilingual programs for return migrant students and a Project to Create the Bilingual Citizen, which featured intensive summer English camps and the teaching of math and science in English in certain schools. There has been considerable debate since the early 1980s regarding the right time to start English instruction. The Academia Puertorriqueña de la Lengua Española (Puerto Rican Spanish Language Academy) analyzed the situation in 1998 and recommended the teaching of literacy in the mother tongue before the teaching of English. In 2003, a “curricular framework” for English was developed by the Department of Education; however, by 2007, implementation was not yet complete. Shortly after, funds from the No Child Left Behind legislation were utilized to train and certify all English teachers in Puerto Rico and improve other critical aspects of the teaching process, such as instructional materials and school facilities.

PULL-OUT ESL INSTRUCTION

The term *pull-out ESL instruction* refers to the common practice, used mainly in elementary schools, in which English language learners (ELLs) are placed in mainstream classrooms but are also “pulled out” of those classrooms for part of the day to receive English as a Second Language (ESL) instruction from a specially trained ESL teacher. Under federal law (e.g., *Lau v. Nichols*, 1974, and the No Child Left Behind Act of 2001), schools must ensure that ELL students learn both English and core academic content (e.g., math, science, social studies) simultaneously. Pull-out ESL instruction meets the first of these two requirements, as its purpose is to help ELL students learn English as quickly and effectively as possible. In practice, pull-out ESL models vary widely in terms of the types of ELL students, the amount of time allotted for instruction, the curriculum used, the skills targeted, the qualifications of the teachers assigned to this function, and the role of this program component as part of the total range of instructional services provided for ELLs.

The pull-out ESL model is most frequently used (and most needed) in schools in which most classroom teachers do not have the training or certification to provide effective daily ESL instruction for ELL students in their own classrooms. Thus, pull-out ESL models are common in schools that do not have bilingual education programs or well-designed sheltered English immersion classrooms. In these schools, ELL students typically make up a smaller percentage of the population, and thus ELL students are placed in mainstream classrooms. However, some schools with bilingual and/or sheltered English immersion classrooms may also have pull-out ESL classes to service

ELL students who are not participating in these programs, or the school may simply elect to use pull-out ESL to provide the ESL component of the bilingual or sheltered English immersion program.

The amount of instruction time varies greatly. In some schools, ELLs may be pulled out of their regular classrooms every day for anywhere from 30 minutes to 2 hours or more. In other schools, ELL students may be pulled out only 2 to 3 times a week. This frequently depends on the number of ELL students within a school and the demands placed on the time of the pull-out ESL teacher. In some districts, the number of ELL students in each school is small enough that a single ESL teacher may be sufficient to service two or more schools. In other cases, the ELL student population may be large enough to justify several pull-out ESL teachers at a single school. ELL students are entitled to ESL instruction until they are officially redesignated as fluent English proficient and no longer require special language services. However, some schools provide pull-out ESL instruction only to newly arrived non-English-speaking ELL students or to ELL students at the lowest levels of English proficiency. These schools operate under the assumption that once ELLs reach a level of basic oral English proficiency (i.e., they know basic vocabulary and can carry on a simple conversation), they will be able to continue learning English on their own in regular classrooms. This can be a questionable practice. Evidence from language proficiency tests given in California and other states show that many ELL students get stuck at the intermediate and advanced levels of English ability for several years. This suggests that ELL students at these higher oral fluency levels may need more intensive ESL than can be provided through the pull-out instruction alone. Until and unless that service is continued, the students cannot be redesignated as fully English proficient. This is especially true in reading and writing, as compared with oral English.

The curriculum utilized in pull-out ESL programs can also vary greatly from district to district. Most often, the focus is on developing speaking and listening skills in English or on increasing students' English vocabularies. However, many pull-out ESL teachers are also expected to help their ELL students learn to read and write in English. In some pull-out ESL programs, the ESL teacher replaces the classroom teacher as the language arts teacher. For example, a school may arrange for ESL students to be pulled out of their regularly assigned classrooms during language

arts instruction and instead receive this instruction from the ESL teacher. In this model, the ESL teacher can integrate listening, speaking, reading, and writing instruction in a manner that is appropriate to the level of their ESL students. Some pull-out ESL teachers also integrate content-based ESL instruction, meaning they may teach lessons in the content areas such as science, social studies, math, or art but with a focus on helping students develop language and vocabulary through these content area lessons.

Some schools adopt comprehensive ESL curricular programs produced by textbook companies for use in pull-out ESL classrooms. Examples of these are *Into English* or *Avenues* (Hampton Brown), *On Our Way to English* (Rigby), *Scott Foresman ESL* (Pearson Longman), or *Zip Zoom English* (Scholastic), and/or other supplementary ESL materials. In other schools, ESL teachers utilize district-created ESL curricula. In some schools, pull-out ESL teachers find they must create their own teaching materials. Often, they have limited resources or expertise with which to do so. Effective pull-out ESL teachers attempt to correlate their instruction with what the students are learning in their regular classrooms. This can prove to be difficult, especially for ESL teachers who pull students from several different classrooms. It is an important part of a total program, however, since the children who are pulled out must return to their mainstream classes and be able to participate in those alongside English-speaking classmates.

In most schools, the ESL teacher is a fully certified teacher with specialized training and certification in working with ELL students. This training and certification typically includes linguistics, second-language acquisition, effective approaches and methods, multicultural education, and effective assessment practices. Having proficiency in the students' native language(s) is desired but not required. Many ESL teachers provide instruction to ELL students from a wide range of language backgrounds, and it is not reasonable to expect them to speak all of these languages. However, most ESL teacher certification programs require teachers to take 1 or 2 years of a "foreign" (or world) language so they have personal experience in the challenge of learning a second language. In some schools, pull-out ESL instruction is provided by paraprofessionals with little to no training. Administrators may rationalize that bilingual paraprofessionals can teach ESL because they know both languages. However, simply knowing how to speak a second language does not qualify

someone to be an effective ESL teacher. In cases where paraprofessionals must be used owing to shortages of qualified teachers, they should receive training in the functions expected of them and be under the supervision of certified master teachers who prepare effective lessons and activities for them to use.

Effectiveness and Criticism of the Pull-Out ESL Model

The pull-out ESL model has been widely criticized in the professional literature. It is described as the most implemented, most expensive, and least effective model. The pull-out ESL model requires hiring one or more teachers in addition to regular classroom teachers. Space also becomes an issue, especially in schools that are already overcrowded. Many pull-out ESL teachers are itinerant; they have no assigned classrooms. They may hold their classes in portable classrooms, in the basement, the cafeteria, on the auditorium stage, or even outdoors on lunch tables. The space issue often contributes to a view of the ESL students (and their teachers) as neglected second-class citizens within the school. A major concern of the pull-out model is that students miss out on instruction in their regular classrooms while they are being pulled out. As a result, some ESL students never receive critical content area instruction, such as math or science, or miss out on fun and meaningful classroom projects and activities. Many ESL students report feeling embarrassed about being pulled out of their classes in front of their English-fluent peers. Another criticism is that in the pull-out ESL program, ELL students do not have native-English-speaking peers who can serve as models and authentic communication partners (this criticism, however, ignores the fact that ESL students are with native speakers for most of the day). Another concern is that the regular classroom teacher may adopt the attitude that ELL students are the full responsibility of the pull-out ESL teacher and may not make sufficient efforts to provide appropriate language and sheltered content area instruction for these students in their own classrooms.

The preferred model is that classroom teachers be trained and certified to provide both effective ESL and content area instruction in their classrooms. When classroom teachers provide daily ESL instruction, there is no stigma for students who are pulled out, teachers can ensure that ESL instruction is correlated with classroom content area instruction, and they take

on full responsibility for the language and content learning of their ELL students.

Better Than Nothing

Although pull-out ESL instruction is widely criticized as insufficient, it is important to recognize that it is better than nothing. Indeed, without pull-out ESL programs, many ELLs would simply be left to “sink or swim” in mainstream classrooms. In other words, submersion is far worse as a model, which is why it was declared illegal in the *Lau v. Nichols* (1974) case. If schools cannot provide comprehensive bilingual or sheltered English immersion programs, pull-out ESL may be the only way to meet the language and educational needs of ELL students. Pull-out ESL teachers are typically dedicated professionals who care deeply about their students. The small size of the group of students they work with means they can provide individualized attention to each ELL student, which the typical classroom teacher is often unable to give. Whereas sheltered English immersion teachers are supposed to provide daily in-class ESL instruction, research has shown that in many cases, this does not happen. Many classroom teachers do not understand the difference between ESL and sheltered content instruction and thus only provide the latter. Even for those who do understand the difference, pressure to prepare students for high-stakes tests places huge demands on teachers’ instructional time, and thus they may conclude there is no time for ESL instruction. Teachers who have both ELL and English-fluent children may not know how to manage their classrooms in a manner that allows them to work daily with just their ELLs to provide in-class ESL instruction. Thus, in reality, in many sheltered English immersion classrooms, instruction differs little from that provided in mainstream classrooms. At the very least, pull-out ESL models provide ELL students some time each week with a certified ESL teacher who is sensitive to their needs and trained to help them acquire the English language proficiency needed to succeed in their regular classrooms.

Q

QUÉBEC AND LANGUAGE CONFLICT

See CANADIAN AND U.S. LANGUAGE POLICIES

QUESTION 2 (MASSACHUSETTS)

On November 5, 2002, Massachusetts voters passed English-only educational legislation, known as “Question 2,” with 70% voter approval. Question 2 modified the original 30-year-old Transitional Bilingual Education Act, which required school districts to implement transitional bilingual education (TBE) programs if there were 20 or more students enrolled from the same language group who were of limited-English-speaking ability. The passage of Question 2 practically eliminated TBE in the state. The new legislation established that all children in Massachusetts public schools are to be taught in English only. The law, however, did not affect students registered in two-way bilingual education programs, in which native English speakers and native speakers of another language learn in both languages; students who already knew English and were educated in foreign-language classes; or students in special education programs for the physically or mentally impaired.

According to Question 2, unless a waiver was granted, English language learners (ELLs) from kindergarten through 12th grade were to be educated through *sheltered English immersion* (SEI). In SEI classrooms, the curricula and presentation were

designed for children learning the English language, and all books and instructional materials were required to be in English. Question 2 established that teachers in SEI classrooms could use a minimal amount of the children’s native language(s) when necessary, although children had to learn to read and write solely in English. ELLs placed in SEI were to receive the service during a temporary transition period not normally intended to exceed 1 school year. However, the federal Civil Rights Act of 1964 required students to stay in the program until they acquired a good working knowledge of English that allowed them to participate meaningfully in a district’s mainstream education program.

Parents or legal guardians of ELLs had the right to request a waiver from their children’s participation in SEI programs; however, waivers were very restrictive for children younger than 10 years old. There were three circumstances in which parents could request a waiver: (1) for children who already knew English, as measured by the state English proficiency tests; (2) for children 10 years or older whose principal and educational staff believed that an alternate course of educational study would be better suited to the child’s overall educational progress and rapid acquisition of basic English language skills; or (3) for children younger than 10 years old with special individual needs.

Question 2 gave parents and legal guardians the right to sue any school district employee, school committee member, or other elected official for the legal enforcement of the provisions of the law. To do so, parents were required to prove that the school district employee or official willfully and repeatedly refused

to implement the terms of the law. If a person were found personally liable, he or she would then be responsible for attorney's fees, costs, and compensatory damages and would be forbidden to be indemnified for such monetary judgment by any public or private third party, such as the teachers union. In addition, these individuals would also be barred from election or reelection to any school committee and from employment in any public school district for a period of 5 years. Parents who were granted exception waivers retained full and permanent legal right to sue the individuals who granted such waivers if they subsequently discovered before the child reached the age of 18 that the application for waivers was induced by fraud or intentional misrepresentation and injured the education of their child. Nonetheless, before parents could sue teachers and other school officials, they must have exhausted the administrative process at the local and state level.

Finally, Question 2 stated that ELLs had to be taught to the same standards as all students, delineated in the Massachusetts Curricular Frameworks, and be provided the same opportunities to master such standards. To ensure the progress of students learning English, children were required to be assessed each year using standardized, nationally normed written tests of academic subject matter in English and of English proficiency. Aggregated percentile scores and distributional data for individual schools, program types, and school districts of students classified as ELLs had to be made available to the public.

When Massachusetts voters approved Question 2 mandating English-only classrooms for ELLs, these mandates were implemented in a specific context. During the 1990s, Massachusetts, along with the majority of states, developed content and performance standards, including the Massachusetts Comprehensive Assessment System (MCAS), to test all public school students on the state's learning standards. With the reauthorization of the Federal Elementary and Secondary Education Act, the No Child Left Behind Act of 2001, ELLs in Massachusetts were required to participate in all the state assessments scheduled for their grade levels regardless of the number of years they had been in the United States. The only exception involved ELLs who were in their first year of enrollment in an American school. In addition, ELLs had to annually take newly created English proficiency assessment tests in reading, writing, speaking, and listening.

Implementation

Question 2 went into effect during the 2002–2003 school year. Within a few months, more than 50 school districts in the state restructured their programs for ELLs in order to accommodate Question 2 mandates. At the beginning of the 2003–2004 school year, almost all TBE programs were disarticulated, and most ELLs were placed in either SEI programs or in mainstream classrooms.

The interpretation and implementation of Question 2 mandates, however, was complex: Districts had to implement Question 2 mandates without much time for planning curricula, materials, and/or professional development. Almost all TBE programs were dismantled regardless of the quality of those programs; programs that successfully taught English as well as another language were eliminated.

Implementation in SEI Classrooms

The majority of the former TBE teachers who remained in the system after the passage of Question 2 were placed in SEI classrooms. Two forms of SEI programs were implemented in the state. The first type was SEI classes for students from the same language group in which the teacher provided instruction in English but used the students' native language(s) for clarification. The second type was classes designed as SEI for mixed-language students in which all instruction was provided in English.

SEI teachers went through many changes and challenges during the first years of implementation because the structure of the SEI programs was weak: Implementation guidelines were too general, ambiguous, or continually changing, so that SEI teachers were left with unanswered questions about curricula, instruction, and assessment.

Because Question 2 specifically prohibited teaching through languages other than English in SEI classrooms, some former TBE teachers who switched to SEI classrooms felt the difference without the support of students' native language when teaching instruction only in a language that students either did not understand or were not adequately proficient. The inability to teach through students' native language was very challenging for these teachers, particularly when teaching newcomers with interrupted schooling and U.S.-born children whose native language was not English and who had low native-language literacy

skills. Although many teachers did not feel they were being monitored in their use of language in the classroom, they did feel constrained as to how and when to use the students' native language, and they feared possible sanctions. There were inconsistencies in the ways in which teachers were informed about the acceptable use of students' native language for instruction. Therefore, SEI teachers interpreted the amount and purpose of students' native-language use in different ways. Whereas some SEI teachers used students' native language only on very few occasions and for oral language communication, other teachers allowed students to read and write in their native language.

Impact in Mainstream Classrooms

Many schools prior to Question 2 did not have particular programs for ELLs; therefore, these students had attended mainstream classrooms. Although Question 2 identified mainstream programs as an option for ELLs, the legislation did not give these programs any specification, as it did with SEI programs. After the passage of Question 2, several dismantled TBE programs were replaced by mainstream classrooms. In general, mainstream classrooms experienced a limited impact of Question 2 mandates. Those classrooms most impacted by Question 2 were those that experienced an increase in the number of ELLs after the law's passage but lacked the resources to meet the specific needs of these students. The increase of ELLs in mainstream classrooms was related to the pressure for rapid transition of students from SEI to mainstream classrooms even though these students still had limited English proficiency.

After the passage of Question 2, more efforts and resources were allocated to provide professional development for mainstream teachers working with ELLs. Before Question 2, the education of ELLs was perceived as solely the responsibility of TBE and English as a Second Language (ESL) programs.

However, with the increased number of ELLs present in mainstream classrooms, the state required mainstream teachers to be prepared to work with them. Although school districts had been developing and providing more professional development opportunities for their teachers, there was a need for allocating more resources in this area.

Impact of Question 2 in Two-Way Bilingual Education Classrooms

The original text of Question 2 excluded two-way bilingual education as an acceptable educational program for ELLs. However, several months after Question 2 passed, the legislation was amended, and two-way bilingual programs were exempted from the legislation. After this amendment, two-way bilingual teachers did not feel the impact of Question 2 to the extent their colleagues did in other types of programs.

R

RAISING BILINGUAL CHILDREN

Raising bilingual children in the United States may be more challenging than it is in other societies, where language diversity is favored and less burdened by negative attitudes. Bilingual families face the same myriad of child-rearing uncertainties as their monolingual peers do, with the added complexity of maintaining linguistic diversity in a society where diversity, although valued in some circles, is far from being embraced across all levels and sectors. Support for raising bilingual children varies extensively; however, the situations many confront are similar.

Parents raising bilingual children in the United States are participating in a culture that embraces monolingualism as its dominant linguistic ideology; English remains the primary or exclusive language of dominant discourse and economic power. Languages are cognitive, linguistic, and societal resources. The decision to nurture and value bilingualism affirms the importance of all languages in communicating parental wisdom and experience. This choice, however, carries with it differing consequences for differing populations. Asymmetrical relationships among languages, and the speakers of those languages, ensure differential levels of acceptance of bilingualism. Donaldo Macedo summarizes this by remarking that when a dominant-language-speaking person learns a second language, it involves the addition of the second language to this person's linguistic repertoire, whereas a minority-language speaker learning the dominant language feels subordinated because such a person's own language is not valued, and having to learn the dominant language is not a free choice.

This entry describes the research-based knowledge on raising bilingual children in both families of the majority culture language and minority families in the United States.

Hegemony of English

Parents raising bilingual children face significant linguistic pressure to acquire English at the expense of a heritage language. English is the language of the outside environment within the United States and of popular culture throughout much of the world. As such, its usefulness cannot be denied. Often, however, the cost of learning English is the eradication of the family language. Evidence of the pressure to assimilate linguistically is found in data that testify to the rapid language loss among immigrant and indigenous groups within the United States. Researchers Lily Wong Fillmore and Stephen Caldas discuss how English is in no danger of losing its preeminence. Rather, languages other than English are most threatened, and parents desiring to raise bilingual children must maximize exposure to the minority language.

A first step in resisting the pressure to become a monolingual English speaker is to understand the consequences of language loss on family relationships. Caldas and Wong Fillmore show that often language loss has occurred before parents have attended consciously to how they will combat it. Children's education and socialization concerning language and related subjects begins in the home where families impart knowledge about their beliefs, values, attitudes, and knowledge base. Wong Fillmore has referred to these lessons as the *curriculum of the home*. She identifies

particular elements of this curriculum as including a sense of belonging; knowledge of who one is, where one comes from, and how one is connected to the important people and events in life; the ability to handle adversity; and knowledge of one's responsibility to self, family, and community.

Many researchers, including Caldas and Wong Fillmore, document the difficulties parents face when trying to socialize or discipline a child in a language they do not know intimately. Parental hardships are particularly vexing during the adolescent years when children often reject the ancestral language or appear embarrassed by parents who have replaced a well-spoken first language with a superficially understood second language. On the other hand, Colin Baker, Una Cunningham-Andersson, and Staffan Andersson claim some evidence indicates that parents may retain more prestige and respect within the family by speaking the minority language. These researchers recommend, therefore, that families model and promote mature language use in the home. According to Baker and Wong Fillmore, culturally rich language use by the parents may include sharing oral histories, acting out folk tales, imparting traditional colloquialisms, or reading native language texts. These are topical areas in which parents have unmatched expertise that cannot be easily rejected by the child. Parents may find that certain elements of their heritage, such as the language of affection or familial traditions like favorite songs and children's games can only happen through the family's first language. The choice of which language to use with a child may have lasting implications for the parent-child relationship and for emotional intimacy.

Language Strategies

The goal of raising bilingual children requires a thoughtful approach to regulating when and where children will engage with each language. Children may acquire two languages simultaneously from birth, or languages can be learned in succession. Lenore Arnberg and Colin Baker describe how either strategy can result in high levels of bilingual competency. According to Arnberg, decisive research findings regarding the advantages of raising children as simultaneous bilinguals versus sequential bilinguals are unavailable. There do not appear to be advantages to either. Children raised as simultaneous bilinguals know no other system. They, therefore, according to Arnberg and Baker, exhibit no resistance to acquiring more than one

language and learn early the social and cultural advantages of expanded communicative opportunities. Those who acquire a second language sequentially have a greater understanding of the world and may be able to employ conscious learning strategies to aid the process. In addition, in situations where there is great danger of language loss, sequential language acquisition may allow families to concentrate exclusively on building a solid foundation in the minority tongue, such that the ability of the majority language to suppress the minority language is buffered.

There is no evidence to support the commonly espoused myth that the younger a person is, the more easily and completely he or she acquires a second language. Actually, the primary advantage of childhood bilingualism is not the ability to learn the language but, rather, the facility of acquiring an undistinguishable accent. Given that more of the world speaks English as a second language than as a first language, the dichotomy between "native-like" or "nonnative" pronunciation is far less important than most parents believe. Indeed, some linguists have questioned which version of English might be considered "native" given that more speakers of English now live outside of the United States, Australia, New Zealand, and the United Kingdom. Thus, accent should not be the decisive factor when considering which strategy is appropriate for fostering childhood bilingualism.

It is generally more fruitful to view languages in all their variations as pluralistic, and to acknowledge that they are all functional for the communities that use them. Family circumstances often dictate whether children are raised as simultaneous or sequential bilinguals. Many families have no choice. Those who do must examine their individual situations and resources to decide which method is most advantageous and sustainable. Arnberg, Edith Harding-Esch, and Philip Riley list some considerations as the parents' fluency in the languages, the family's opportunities to engage the child meaningfully in each of the languages outside of the home, the effect of language on extended family relationships, how inter-family communication may be affected, the amount of social tension between the languages, travel plans, and educational opportunities. The decision about which language to use in the home should be made thoughtfully because it could unintentionally result in a sense of loss for a parent rather than a gain for the child.

Establishing language boundaries is one way parents aid children in becoming bilingual. Baker, a

worldwide observer of languages in contact, suggests that the “appropriateness” of languages is defined by the people who speak them, the places they are spoken, or the occasions when they are used. Cunningham-Andersson, Andersson, Harding-Esch, and Riley describe common strategies as the following: one parent, one language (also known as one person-one language); one language, one location; a weekday language and a Sunday language; and a holiday language and a year-round language.

Families experience differential amounts of control over which strategy they employ. The one parent, one language strategy assumes that adult family members have different dominant languages and that the family goal is simultaneous language acquisition. Such families typically also want their children to learn to respect both languages equally. Each parent speaks his or her language with the child, and the child is expected to respond in kind. The child associates one language with one parent and learns to separate the two communication systems. This strategy has been employed and documented by many scholars and researchers who have used it with their own children.

There are some obstacles to this approach. One is which language to use when communicating with each other. Assuming both parents are bilingual, they can choose to mix languages by using the language of the person who initiates the conversation or by having each remain in his or her dominant language. Another option is to choose between the majority and the minority language. Some have suggested that one way to counteract the hegemony of English and to increase minority language status is to give it preference within the home. Another complication arises when one of the parents does not know the other’s language. Feelings of exclusion can be created when one parent cannot participate in, or understand, all familial conversations. Finally, it is difficult to be completely consistent. A parent who speaks a minority language to a child will undoubtedly encounter occasions when reverting to the majority language is inevitable. Parents will need to determine how to handle situations such as telephone conversations and the presence of monolingual friends, family, or playmates.

A second popular strategy is one language, one location. This strategy has many variations, depending on individual family circumstances and goals. Families employing one language in one location must determine which language to use in the home, in public, in school, or in places of worship. Children quickly

realize what place relates to what language rather than attaching significance to the person. This method is often chosen by families when both parents speak the minority language. A common native language is spoken in the home, and the second language is acquired in the community. This is frequently the situation for immigrant families when the parents are monolingual speakers of a language other than English. Other families choosing this method are mixed language parents, where one of the parents agrees to forego using his or her dominant language so that the family can develop the other language. This strategy elevates the status of the minority language by valuing its use as the family language. A final version of this strategy within the United States is its use by monolingual English-speaking households desiring to raise bilingual children. These families depend heavily on educational institutions to provide the environment for second-language learning. When the option exists, parents in these situations often choose to send their children to international or immersion schools.

Again, parents will find one language, one location decisions challenged by societal pressures to engage in speaking English. Caldas illustrates this dilemma by documenting his family’s struggles around language use and homework completion. A one language, one location policy can be challenged when a parent must switch languages to provide homework assistance. Caldas’s qualitative data regarding this phenomenon suggests that these switches often result in extended periods of the nontargeted home language use.

Other family language strategies involve devoting particular days of the week to target language use, or having language use be dependent upon patterns of geographic migration. Language acquisition may be linked to religious affiliation, as is the case for many families whose children attend Hebrew school, or may be enhancing family languages by participating in particular educational opportunities outside the home such as Saturday school. As can be seen, families can employ many strategies to meet their purposes for supporting childhood bilingualism.

Developmental Bilingualism

Pioneering the case-study research in childhood bilingualism was linguist Werner Leopold, who meticulously documented the language development of his German-English bilingual daughter who was raised with the one parent, one language strategy. Leopold’s

study was published in 1952 in a four-volume work and began a continuing tradition of scholars documenting their personal experiences with bilingualism. Leopold concluded that bilingualism influences one's worldview and affords children the early understanding of the arbitrariness of words.

The researchers mentioned so far, as well as Kenji Hakuta and Tracey Tokuhama-Espinosa have all written about how the case-study tradition has contributed a nuanced understanding of language acquisition in childhood bilinguals that is generally described as having two or three stages. The stages are characterized by the extent to which children distinguish between the two linguistic systems. In the two-stage definition, the first stage is a period characterized by a lack of differentiation between languages. During this stage, children will mix words and sounds and may even apply the syntax of one language when speaking the other. Children exposed simultaneously to two languages generally need between 2 and 3 years to differentiate and categorize the sounds, vocabularies, and grammars of each language. It is not uncommon, in this period, for children to mix the two language systems indiscriminately. This is a natural stage in the process and does not last for very long, nor does it indicate any long-term confusion by the child. The second stage is characterized by a near separation of linguistic systems with the growing ability to translate between the languages. Some evidence indicates that children raised acquiring more than one language simultaneously exhibit greater metalinguistic awareness than their monolingual peers. The former understand that one concept can be labeled with many words. In the three-stage characterization, researchers refine the phases with stage one being subdivided into *amalgamation*, or no separation of language, and *differentiation*, a period in which a child exhibits growing separation of language, but may employ only one grammar system with both languages. The final stage is labeled *separation* and does not differ from the previous definition of stage two bilingualism.

As these stages imply, language mixing is a normal phenomena in the linguistic development of childhood bilinguals. Rather than being evidence of confusion, it aids the child in formulating and testing language hypotheses concerning the languages in question. The age and speed at which a child moves through each stage varies according to a number of factors: how separated the languages are within the child's environment, the amount of exposure to each

language, the experiences the child associates with each language, and the parents' acceptance or lack of acceptance of language mixing.

As bilingual children mature, language mixing may become deliberate. This phenomenon is described in the field as *code switching*—the ability to choose words from linguistic and cultural repertoires developed in more than one language. This rule-governed behavior affords bilingual community members extended linguistic resources for meaningful expression. Holly Cashman and Iliana Reyes argue that the choice to engage in code-switching communicative practices evidences a sophisticated understanding of how to strategically employ language for a particular audience or purpose. Harding-Esch and Riley argue that complex code switching requires a high level of bilingualism and should serve as evidence of dual-language abilities rather than bilingual confusion. Code switching is a legitimate discourse pattern within multilingual communities and is often employed by young people simply as a way of having fun with their language. Reyes's research shows incidents of code switching increasing as children get older and have acquired more highly developed proficiencies in each language. Monica Heller and Cashman argue that the ability to choose from more than one code creates space for individuals to demonstrate their bilingual identity and to negotiate their power and status.

Bilingual Identity Formation

How we think about ourselves is greatly influenced by how others interact with us. In other words, how we treat others and how others treat us contributes to our identities. Thomas Ricento writes about how identity is not something constructed in the mind but, rather, formed by means of a dialectic relationship with other human beings. These relationships develop in particular political, historic, and economic milieus and are influenced by societal pressures. Identity, then, is a social construct linked inextricably to the sociopolitical and socioeconomic context in which it develops. Adrian Blackledge, Aneta Pavlenko, and Bonny Norton show how identity is a fluid state that can be consciously or unconsciously constructed across time and space. The paradox of societal acceptance of bilinguals is linked inextricably to language status. Those who speak English as a first language but acquire a second are celebrated, whereas speakers of other languages are often criticized for maintaining a first language while acquiring English.

In a land where there is much pressure to become a monolingual speaker of English, parents face a formidable task when embarking on the journey to help children value and embrace bilingual identities. But when the dominant society projects the image that being normal entails being a monolingual speaker of English, the message received by those who speak more than one language is that there is something unusual about being bilingual, and that, perhaps, it is undesirable or harmful to be bilingual.

Linguistic hegemony reproduces inequitable power relationships, and these relationships influence identity formation. Blackledge, Pavlenko, Ricento, and Norton, all show how language mediates and transforms developing identities, becoming both a tool for identity formation and a site for struggle in the quest to define identity. According to Norton, language is not just about exchanging information with one's interlocutors; it is also a vehicle for expressing and formulating societal relationships because when language learners speak, they also organize and reorganize their sense of who they are and how they are related to the world.

As children mature, they begin to contemplate who they are, and who they are becoming. All children explore identity along such lines as gender, class, religion, sexuality, and race. The child who speaks more than one language must also decide whether or not to embrace or reject his bilingualism as an important identity marker. As Arnberg, Cunningham-Andersson, and Andersson point out, children may feel torn between the language and traditions of their monolingual peers and those of their bilingual parents. They may feel their allegiances are being questioned and challenged. Children learn to negotiate their status between and within groups; however, group membership is a social condition, and individual choice is insufficient to ensure group membership. Blackledge and Pavlenko note that acknowledging linguistic difference, or engaging in linguistic change, can be painful and risky because it means leaving the safety of the culturally familiar. Many have reported that it is an uneven road and that families can expect children's attitudes to change over time.

Immigrant children often adjust to cultural and linguistic change sooner than their parents do. In a study conducted by Rubén Rumbaut, second-generation children who were born in the United States reported a greater desire to assimilate culturally and linguistically than their parents did. This study found that

increased parent-child household conflict was linked to the embracing both the English language and U.S. dominant society culture. Wong Fillmore, too, has documented the detrimental effect language shift can have on family relations, especially when language practices create rifts and separation between young people and their grandparents.

Caldas writes about a long-term ethnographic study that found that early adolescents project "parallel monolingual" identities rather than embracing their bilingual identity, but that pride in bilingualism increased throughout adolescence. The children were French-English bilinguals who embraced English speaking when in the United States, and French speaking when in Québec. Language preference was documented as being context specific and not tied to language proficiency. The authors stress the increasing importance of the peer group as children approach adolescence. Cunningham-Andersson and Andersson note that bilingualism may attract unwanted attention.

Families help children learn to embrace and celebrate bilingualism by providing a stimulating linguistic environment and modeling positive attitudes toward the child's developing bilingualism. Praise can do much to motivate a young child. Parents should emphasize communicative competence over linguistic correctness. The early development of a positive self-concept about being bilingual may influence children's later attitudes as peer influence increases. Parents can and should provide secondary language support through the visual and print media in the home. Bilingual family libraries emphasize the importance of immersing oneself in each of the blossoming languages. Parents foster biliteracy by listening to children read aloud in each language, even if the parent is not literate in both languages. Games and hobbies provide the basis for positive language experiences. Parents should find opportunities to engage in meaningful linguistic and cultural activities. Bilingualism extends an individual's social opportunities and should be viewed as an advantage that facilitates, rather than hinders, friendship possibilities.

Cognitive Development

Although many scholars and theorists continue to support and affirm the viability and advantages of knowing more than one language, bilingualism has experienced a more unstable history in the field of psychology. Early psychologists employed intelligence (IQ) tests to

compare the cognitive development of monolingual children to that of bilingual children. Typifying the early studies are those conducted by Madorah Smith, a contemporary of Leopold. Smith examined the speech patterns of monolingual and bilingual children by quantifying the number of linguistic errors the children committed. Some of the “errors” Smith included were actually instances of the child mixing languages, a normal developmental phenomena in children learning two languages. She also discounted idiomatic expressions not found in standard English, even if they were common to the community. Unsurprisingly, Smith’s criteria confirmed that bilinguals commit more linguistic errors when compared with their monolingual peers. Smith concluded that bilingualism resulted in a retardation of language development.

The tradition of using “objective” measures to compare the linguistic and cognitive development of monolingual speakers of English to bilingual individuals continued throughout much of the first half of the 20th century. IQ tests were cited as evidence that bilingualism disrupted efficient thinking and led to cognitive confusion. The implication was that clear thinking required one well-developed language. It is now widely accepted that these tests, given in the students’ second languages, were biased and unfair. Had the students been tested in their first languages, the results might have differed significantly. Further criticisms implicate the comparison of middle-class English speakers with working-class bilinguals. Social class differences can account for linguistic variation. Ellen Bialystok, James Cummins, Harding-Esch, and Riley all note that these studies reported findings that confirmed the political and educational goals and presuppositions of the monolingual majorities in the countries where the testing occurred.

The mid-1960s saw a shift in this deficit view of cognitive capability in bilinguals when a seminal study carried out at the St. Lambert School in Québec found cognitive advantages for balanced bilinguals. Baker and Françoise Grosjean note that at the heart of many arguments is whether and when it is appropriate to compare a bilingual person with a monolingual person. Cunningham-Andersson, Andersson, Harding-Esch, and Riley argue that bilingual people use their languages with different people for different purposes. Bilingual people experience particular parts of their lives in one language and may not have the vocabulary to discuss such experiences in the other language. The vocabulary used at home may have little overlap

with the vocabulary of the school. It would be unusual, therefore, for the bilingual to have the same linguistic repertoire as a monolingual who must communicate in all circumstances with only one language. Studies that compare bilinguals with monolinguals operate under the assumption that the bilingual has two separate language competencies and that these can and should be measured in isolation. A number of scholars, such as Baker and Grosjean have proposed that bilingualism is itself a language and that this language must be viewed as an integrated holistic communication system through which thought is expressed. Even those studies conducted on within-group bilinguals have been subject to academic criticism. Within-group variation is great. Language status and circumstance, as well as individual opportunity, for linguistic engagement is highly divergent.

So, can we really conclude anything regarding the cognitive advantages or disadvantages of raising our children to be bilingual? Perhaps not. Grosjean pointed out these studies do not show a direct, unambiguous, causal relationship between using more than one language in everyday life and various cognitive or developmental effects on such a language user.

Conclusion

Raising bilingual children in a monolingual culture requires dedication and conviction. Community support and encouragement are often mitigated by language status and majority culture membership. Commitment to providing children with the social and communicative advantages of the ability to converse in more than one language necessitates nurturing either simultaneous or sequential language acquisition. Family language strategies should consider language proficiencies and opportunities and foster stimulating linguistic environments emphasizing positive communicative practices. As children mature, they will employ more and more sophisticated language strategies as evidence of their bilingual competencies. Early language mixing becomes deliberate code switching as bilinguals operate within multilingual communities.

REMEDIAL-COMPENSATORY EDUCATION

See DEFICIT-BASED EDUCATION THEORY

RODRÍGUEZ, ARMANDO (1921–)

Armando Rodríguez was born in Gómez Palacio, Durango, Mexico, to Andrés Rodríguez and Petra Cárdenas. When Armando was 6, his family immigrated to San Diego, California, where he started school, speaking only Spanish. From an early age, he sought to create links of understanding between Spanish-speaking students and the rest of the school. This trait characterized much of his career. In 1941, as the country geared up for war, Rodríguez registered for the draft. While serving in the Army Signal Corps, he became a U.S. citizen.

After the war, he worked to organize Hispanic veterans and cofounded the Rudolph Martinez Post of the American Legion. At 26, he married Beatriz Serrano. He attended college at the San Diego State College on the GI Bill and graduated in 1949. After graduation, he became a special education teacher at Memorial High School in San Diego. He received a master's degree in special education and later served as vice principal of Gompers High School in San Diego.

Early in his education career, Rodríguez became involved in national, state, and local politics as a Democrat. He met figures such as Edward and Bobby Kennedy, César Chávez, and Dolores Huerta, worked with the Urban League, and was campaign manager for George Smith, who successfully ran for a seat on the local school board. In 1962, Rodríguez unsuccessfully ran for the 77th assembly district. In 1964, he attended the Democratic Convention, and he was later appointed to the Compensatory Education Commission by California Governor Pat Brown. While in that capacity, Rodríguez was offered a job in the state capital by Wilson C. Riles, associate superintendent of public

instruction of California. In Sacramento, Rodríguez became chief of the Bureau of Intergroup Relations. During this time, he helped organize a walkout from a meeting with the Equal Employment Opportunities Commission; his group had wanted to discuss the elimination of English-only regulations from the workplace.

President Lyndon Johnson invited Rodríguez to join the Department of Health, Education and Welfare as liaison to the Hispanic community. In that role, he headed the Office of Mexican American Affairs (later the Office of Spanish Speaking Affairs), where he worked on bilingual education issues. As part of this advocacy, Rodríguez visited Spanish-speaking communities and schools across the country, including Cuban exiles in Dade County, Florida, who were running successful bilingual education programs. In 1967, he met with a congressional committee studying bilingual education to help plan a response to the growing demand for bilingual education funding. Congress subsequently passed the Bilingual Education Act, Title VII of the Elementary and Secondary Education Act.

To help support needed work in curriculum development, Rodríguez invited Randolph Hearst, heir to the Hearst newspaper fortune, on a cross-country tour of classrooms with second-language learners trying to cope in English-only classrooms. In his 2007 memoir, Rodríguez describes the issue, mentioning that children who do not speak the language used at school are at disadvantage; however, to participate effectively as citizens in their new country, they need to be fluent in standard English. He describes the aim of bilingual education as an attempt to prepare American citizens, who can be competitive in areas such as business or politics. For students to become competitive citizens, they need to communicate in the language of power. Hearst agreed with Rodríguez's viewpoints, and his foundation funded bilingual education programs for several years until federal funding was increased.

After two more years of service in the Johnson administration, Rodríguez left Washington to become president of East Los Angeles Community College. When Jimmy Carter became president, Rodríguez returned to Washington as a commissioner in the Equal Employment Opportunity Commission (EEOC). As part of EEOC, he was involved in the commission's deliberations on the extent to which English could be required in the workplace. In 1983, Rodríguez retired from government service. He was subsequently elected to a local board of education, thus ending his career as it had begun: at the local public-school level.

Throughout his long career, Rodríguez was a persistent and effective leader in advocating for Hispanic issues, among them bilingual education.

RODRÍGUEZ, RICHARD (1944–)

Richard Rodríguez is a Mexican American writer, born in San Francisco on July 31, 1944, of Mexican immigrant parents. In the context of bilingual education, he is noteworthy for his divergent thinking on the subject of language, and the controversy his autobiographical writings have elicited. This entry describes his life and career.

Rodríguez attended Stanford University, Columbia University, and the University of California at Berkeley, where he earned a doctorate in English Renaissance literature. He later spent a year in London as a Fulbright scholar. Rodríguez's initial intention was to pursue a career in academia, but in 1976, he opted to become a freelance writer. Throughout this period, he analyzed, questioned, and came to terms with how his education had affected his life permanently, which resulted in the 1982 publication of his autobiography *Hunger of Memory: The Education of Richard Rodríguez*.

His autobiography sheds light on a journey of acculturation and assimilation that began at the age of 6 when Rodríguez entered school speaking only his native language, Spanish, and continued throughout his school life, through the awarding of his doctorate. It is a compelling narrative of his journey from the private Spanish-speaking world of his home, to the encompassing, dominant, and powerful public world of English. He narrates how his passage toward becoming an assimilated American moving from the

Spanish-speaking world of his family was only achieved after a painful separation from his past, his family, and his culture.

In his published work, Rodríguez makes a distinction between what he calls “public” and “private” language. In his private world of childhood, Spanish was the language of intimacy and warmth. It was the language spoken at the Rodríguez home as he was growing up in the 1950s. Rodríguez’s teachers (from Catholic school) urged his parents to stop speaking their native tongue in the home. The rationale for switching from Spanish to English in the home was to help the young child adapt to the English-speaking world in which he was to develop and succeed as an American. The family accepted the recommendation of the teacher, and young Richard went through his school years in an English-only environment. Dutifully, Richard embraced English as his public language even though it meant that the family must make awkward and uncomfortable adjustments to their patterns of interaction.

Rodríguez believes that, in his case, Spanish was the private language and should not be the language of instruction at school. He is highly critical of learning about one’s private life and culture in school and feels that the trend to learn in one’s private language and culture results in disengagement from the public world. Although Rodríguez does not think that the private language of the home should be made into a public language in school, he does not contest the reverse: making the public language of English into another private language that displaces the first private language of the home. He believes the public language should be the language of instruction rather than the home language because public language is the language used with strangers.

Critics of Rodríguez’s negative position on bilingual education argue that such a rigid uncompromising position on the primacy of English privileges the public language at the expense of English learner’s mental health, harming the child’s language and his or her cultural identity. Rodríguez’s opposing views have drawn much criticism from the Latino community, especially the Mexican community, which rejects his private/public dichotomy of language. Although he endured a harsh assimilation experience, he later understood that intimacy is not restricted to a given language but, instead, is the result of the quality of particular relationships with persons with whom we wish to be close. He posits that learning English was

an indispensable requirement to his becoming an active participating member of American society.

Rodríguez’s publications include *Days of Obligation: An Argument With My Mexican Father* (published in 1992), and *Brown: The Last Discovery of America* (published in 2002) as well as several essays on issues of culture and assimilation. In 1997, Rodríguez received a George Foster Peabody Award, one of television’s highest honors, for his *NewsHour* essays on American life. Other awards include the Frankel Medal from the National Endowment for the Humanities and the International Journalism Award from the World Affairs Council of California. As of 2007, Rodríguez could be seen as a commentator on public television’s *MacNeil/Lehrer Productions*. He also appears occasionally on National Public Radio.

ROOS, PETER D. (1941–)

Peter Roos, now retired, served as director of litigation for the Mexican American Legal Defense and Educational Fund (MALDEF) in San Francisco and as codirector of Multicultural Education, Training, and Advocacy Inc. (META). He was formerly a staff attorney and Research Associate at the Harvard Graduate School of Education. For more than three decades, he has been a significant force in the United States in advocating for the legal foundation for bilingual education for language minority and immigrant students. He has also been a champion for the establishment of standards for bilingual education programs to ensure quality as well as access. His life and career are described in this entry.

Roos was born in San Francisco on December 9, 1941. He earned a BA from Occidental College in Los Angeles and a law degree from Hastings College of Law at the University of California, San Francisco, in 1967. As an attorney for MALDEF and META, Roos has been involved in several major court cases including *Soria v. Oxnard* (1972), *United States v. Texas* (1977 and 1981), *Alvarado v. El Paso Independent School District* (1979), *Idaho Migrant Council v. Idaho* (1981), *Plyler v. Doe* (1982), *Keyes v. School District No. 1* (1983), and *Leticia v. Regents of the University of California* (1985). He has argued two major cases before the U.S. Supreme Court. In 1975, he argued *Goss v. Lopez*, which established the right of students to a hearing before suspension from school. In December 1981, he argued the *Plyler V. Doe* (decided in 1982) case dealing with the rights of children of undocumented workers in the United States to free public education.

Roos's impressive record of litigation on behalf of language minority and immigrant students in U.S. schools is best illustrated by decisions handed down in three distinct court cases. The landmark case *Plyler v. Doe* (1982), was taken all the way to the U.S. Supreme Court. In this case, the Supreme Court ordered that public schools are *prohibited* from: (a) denying undocumented students admission to school, (b) requiring students or parents to disclose or document their immigration status; and (c) requiring social security numbers of all students. This ruling was significant in ensuring that children in the United States, regardless of their legal status, had the right to a free public education. Moreover, this case was significant because it figured prominently in other states in legal cases regarding immigrant children. The *Plyler* case was cited in California by a judge's ruling striking down many of the provisions of Proposition 187, a ballot measure passed by California voters in 1994 in an attempt to slow down illegal immigration.

In the *Keyes v. School District No. 1* case, decided in 1983, Roos successfully argued that language minority students deserve to have access to bilingual education programs that are of high quality. In *Keyes*, Roos used the *Castañeda* standard (from the court case *Castañeda v. Pickard*, decided in 1981) that established that educational programs for language minority students need to be (a) based on sound theory; (b) implemented effectively with adequate resources and personnel; and (c) evaluated for effectiveness. In this case, the U.S. District Court ruled that the second

and third criteria for the transitional bilingual program in Denver had not been met. The program was judged as being not adequately implemented. The court declared that more bilingual teachers needed to be hired; standards for measuring teachers' bilingual proficiency needed to be established; adequate professional development for bilingual and English as Second Language (ESL) teachers must be provided, and appropriate assessment instruments must be used to measure the program's effectiveness.

The third case was the *Leticia A. v. University of California Regents*. This case established the right of undocumented immigrant students, under certain circumstances, to attend institutions of higher education in California and pay in-state tuition and fees. This case established the legal precedent for in-state tuition for undocumented immigrant students that enabled Roos to work with other states to draft state legislation for in-state tuition for immigrant students. Subsequently, California, Utah, Kansas, Illinois, New York, Oklahoma, and New Mexico passed legislation to allow immigrant students to attend state colleges and universities and pay resident tuition.

In addition to his considerable skills as a litigator, Roos has also contributed to the implementation of bilingual education programs in the United States through his published work and teaching. This work has helped guide and assist school districts and policymakers in implementing quality programs for language minority and immigrant students.

His published work includes a chapter titled "Equity and Excellence" that was designed to aid in developing school and work programs for Hispanic youth. This essay appeared in the book *Make Something Happen: Hispanics and Urban High School Reform: Report on the National Commission on Education for Hispanics*. Other work includes "Cultural, Educational and Legal Perspectives on Immigration: Implications for School Reform," a chapter in the book *Law & School Reform: Six Strategies for Promoting Educational Equity*, and "Intradistrict Resource Disparities: A Problem Crying Out for a Solution," a chapter in the book *Strategies for School Equity: Creating Productive Schools in a Just Society*.

Roos has also offered his legal expertise to universities involved in the preparation of bilingual and English as a Second Language (ESL) teachers and administrators. He has developed online teaching modules related to legal issues and English for Speakers of Other

Languages (ESOL). An example module developed for the University of South Florida discusses the educational rights of language minority students. Drawing on his many years of experience as a lawyer working in this area, Roos provides a historical overview of programs and provisions for the education of these students. Moving from the national to the state level, he talks about the Florida Consent Decree and about concerns with the infusion process that is being undertaken by universities which train teachers.

Roos's legacy as an attorney, author, and professor has focused on ensuring that language minority and immigrant children have access to specialized language programs and that these programs are of high quality.

ROYBAL, EDWARD R. (1916–2005)

Edward Ross Roybal rose from humble beginnings to become a prominent activist for Hispanic civil rights and a powerful member of Congress, serving in the U.S. House of Representatives for 30 years as a Democratic Representative from California. A trailblazer in developing Latino politics, Roybal, a Mexican American, brought federal funding and needed attention to key areas for Latinos, including voting rights and the judicial system, and was one of the original architects of bilingual education in the United States. His life and career are described in this entry.

Born in Albuquerque, New Mexico, Edward Roybal moved with his family to the Boyle Heights barrio of Los Angeles when he was 6. He attended public schools during his formative years, graduating from Roosevelt High School in 1934 and joining the Civilian Conservation Corps. Roybal continued his education at the University of California, Los Angeles, where he studied business administration, and later attended law school at Southwestern University in Los Angeles.

From 1942 to 1944, Roybal was a public health educator for the California Tuberculosis Association (CTA). After serving in the U.S. Army during World War II, Roybal returned to Los Angeles and continued his work with the CTA, becoming director of health education for the Los Angeles County Tuberculosis and Health Association, where he remained until 1949.

After a failed attempt to win a seat on the Los Angeles City Council in 1947, Roybal helped to found the Community Service Organization (CSO) with the help of local organizer Fred Ross and a cadre of Mexican Americans who supported his campaign. As president of the organization—one of the first broad-based organizations in East Los Angeles's Mexican American community—Roybal helped spur political involvement among Latinos by holding

voter-registration and get-out-the-vote drives. Roybal soon got back into politics, however, winning a seat on the city council in 1949—the first Latino to do so in the 20th century in California—where he served until 1962, rising to the position of president pro tempore.

In November 1962, Roybal was elected to the U.S. House of Representatives, becoming the first Hispanic from California to be elected to Congress since 1879. This would mark the beginning of an illustrious career in Washington defined by a passion for protecting the rights of minorities, the elderly, and the physically challenged, and promoting public health care.

When first elected, Roybal was assigned to a variety of committees, including the Interior and Insular Affairs Committee, the Post Office Committee, Foreign Affairs Committee, and the Veterans' Affairs Committee. He also continued his work on behalf of Spanish-speaking people early in his career in Washington, supporting measures that included the 1968 Bilingual Education Act, the first official federal recognition of the needs of students with limited-English-speaking ability. Initially, though, he sought to expand the act to provide services for children who spoke languages other than Spanish, and introduced his own companion legislation to the bill to address this need. In later years, particularly during President Ronald Reagan's administration, Roybal strongly fought efforts to diminish the act through inadequate funding. Roybal also helped to establish the Cabinet Committee on Opportunities for the Spanish-Speaking in 1968 with the goal of improving housing, education, and employment opportunities for Spanish-speaking U.S. citizens, and sponsored legislation to establish National Hispanic Heritage Week (now National Hispanic Heritage Month).

During the 1970s, Roybal's passion for and commitment to Hispanics and the underrepresented became even stronger, particularly as a result of his membership on the House Appropriations Committee. In the 93rd Congress, Roybal introduced legislation to provide bilingual proceedings in courts, supported the language assistance provisions in the renewal of the Voting Rights Act in 1975, and in 1976 became one of the founding members of the Congressional Hispanic Caucus and the National Association of Latino Elected and Appointed Officials (NALEO). The congressman also worked on behalf of Vietnam-era veterans, helped pass legislation to outlaw age discrimination, and pushed for numerous benefits for those with disabilities.

In the 1980s, during the 97th Congress, Roybal chaired the Congressional Hispanic Caucus, where he led the unsuccessful opposition against the Simpson-Mazzoli immigration bill, which imposed sanctions on U.S. employers who hired illegal immigrants. In health care, he pioneered support of AIDS research, playing a key role in directing millions of dollars to disease research in 1982. As a tribute to his advocacy for public health care and research, the Centers for Disease Control renamed its main campus in Atlanta after him.

Roybal remained in Congress until 1992, when he decided not to seek reelection, opting to retire and live the remainder of his life in Southern California with his wife, Lucille, their three children, and several grandchildren. A fitting tribute to his indelible mark on the history of civil rights in the United States, Roybal was acknowledged by President Clinton in 2000 with the Presidential Citizens Medal.

RUIZ, RICHARD (1948–)

Richard Ruiz is a highly respected authority and leader in language planning in education. He is best known for his framework on language orientations, which examines people's views of language difference: language-as-problem, language-as-right, and language-as-resource. Since its conception in the late 1970s, this framework has been influential among education researchers, practitioners, and policymakers around the world. Ruiz's life and career are described in this entry.

Ruiz was born on December 31, 1948, in Mesa, Arizona, to Guadalupe and Prudencio Ruiz. He grew up in Phoenix, Arizona, with his parents and seven siblings. The parents, from a humble background, worked in the agricultural fields, and young Ruiz himself harvested alongside his family during the summer months, picking cotton in Arizona and fruits and vegetables in the farms of the Santa Clara Valley of California.

His early experiences traveling between Arizona and California taught him to adapt to changing community and schooling situations. The family eventually settled in the San Jose, California, area, where he attended junior high school and high school. His native language was Spanish, but he learned English at a young age. His English literacy was gained at school, but his Spanish literacy was learned by reading the Bible in Spanish during church services and other religious events.

Motivated by the support of a school counselor, Ruiz applied to and was accepted into Harvard University in the mid-1960s. There he obtained his BA in Romance languages and literatures and became proficient in two additional languages, French and Italian. He was among the first cohort of Mexican American students to graduate from Harvard University. While living in the Boston area, he met Marie Lorusso, who later became his wife. For his graduate studies, he attended Stanford University, where he earned his PhD in philosophy of education in 1980.

His interdisciplinary studies in anthropology, education, and philosophy of science exerted a strong intellectual influence on Ruiz, leading him to develop the language framework he published as “Orientations in Language Planning” in the *National Association of Bilingual Education (NABE) Journal* in 1984. This article, published when he was a professor at the University of Wisconsin at Madison, differentiated between three ideological orientations that educational policymakers tend to have when creating language policies. The first orientation, *language-as-problem*, views students’ linguistic diversity as an obstacle to be overcome, and the educational solution is to teach either incrementally, through transitional bilingual education, or exclusively in the majority language. The second, opposing orientation, *language-as-right*, views language as a basic human right, independent of the social or economic status that language may have outside the social spheres where that language is spoken. The third orientation, related to the second, is *language-as-resource*. Through these prisms, according to Ruiz, policymakers interpret the need for particular approaches to bilingual education

and to the teaching of English. There is little crossover between these views. Practitioners tend to rely on one of these views to help them fashion programs that include the teaching of minority native languages in schools, especially for language minority students. Ruiz argues that viewing language as a resource can alleviate conflict between language minority and language majority communities and enhance the status of subordinate languages. Although the first two orientations are embedded in divisiveness and hostility, the third orientation, Ruiz’s main theoretical contribution, allows for a more comprehensive and respectful approach to language planning.

From Madison, Ruiz relocated with his wife and 1-year-old son, Zachary, to Tucson in 1986 where he took a teaching position at the University of Arizona. His second child, Daniel, was born in Tucson in 1988. At the University of Arizona, Ruiz popularized his orientations framework and became a highly influential scholar in language policy. He became a regular consultant and presenter for international agencies (e.g., UNESCO), national governments (e.g., Bolivia, Mexico, Guatemala, United States), and academic bodies (e.g., National University of Colombia, Mexican Academy of Sciences, and the American Educational Research Association in the United States).

An example of his work took place in Guatemala, where he helped draft and evaluate adult literacy programs in indigenous languages. Ruiz’s main approach was to dispel the popular belief that any of the 23 officially recognized indigenous languages were partially at fault for the low socioeconomic status of indigenous communities, and instead assisted educators to understand that the vernaculars were an integral part of the cultural wealth of those communities.

A gifted teacher, Ruiz has become a favorite among students at the University of Arizona and one of the most sought-after instructors for establishing mentoring relationships. A new generation of scholars has emerged under his tutelage, and several have gone on to develop their own international reputations in language research and scholarship. Students and colleagues alike have recognized his passion for teaching and research, awarding him the Outstanding Faculty Award in 1999, the Graduate Student Advocate of the Year Award in 2000, and the Faculty Fellow Award in 2001, some of the most coveted honors bestowed on professors.

In Ruiz’s vision of language planning, the cultural wealth found in language minority communities ought to be an integral part of language research and policy implementation practices. In his ideal, every

society would create the conditions for everyone to master dominant and subordinate languages, so that eventually the dichotomous and antagonistic relationship between majority and minority languages would give way to a relationship of cooperation and mutual appreciation and respect.

SAVILLE-TROIKE, MURIEL (1936–)

Since the beginning of her professional life, Muriel Saville-Troike has been a staunch defender of language minority children's rights to preserve their heritage language and receive a good education. Born on August 8, 1936, in Sacramento, California, she later worked as a teacher of children of migrant farm workers in California, where she sidestepped the English-only rule and used the children's native Spanish in her kindergarten classroom to assist their learning. Experiencing the language situation of these children motivated her to pursue a PhD in linguistics at the University of Texas. After receiving her doctorate in 1968, she worked in various ways to support bilingual education. Her achievements in the field include the development of bilingual materials and curricula, workshops and handbooks for bilingual educators, leadership in professional organizations to strengthen bilingual policies, and research on child second-language acquisition and learning and on native-language maintenance and loss. This entry discusses her career-long efforts for bilingual education.

A major contribution was her work on bilingual education for Navajo children. Her research on Navajo child language development underscored the importance of children's native-language maintenance and the risk of language loss caused by ill-conceived language education policies. She developed Navajo curriculum materials for the first Navajo K–1 bilingual programs for the Bureau of Indian Affairs and wrote a curriculum guide for teaching English in Navajo kindergartens. Continuing research in this area, she showed that the

implementation of bilingual education on Navajo reservations resulted in increased language competence in both Navajo and English. Her more recent research demonstrates that when English-dominant educational environments are promoted, children do not develop full competence in their native language.

Saville-Troike's second major contribution reached a wider audience of bilingual educators: In 1970, she wrote, with Rudolph Troike, *A Handbook of Bilingual Education* for the ERIC Clearinghouse for Linguistics. Revised and reissued by the Teachers of English to Speakers of Other Languages (TESOL) organization in 1971, it was for many years the most widely used textbook in bilingual teacher preparation programs in the United States. It was later translated for Spanish-Quechua bilingual educators in Ecuador. This volume was influential in defining the linguistic, psychological, and sociocultural foundations for sound pedagogy in bilingual classrooms. It offered guidelines for teaching the components of language, provided suggestions for assessment, and emphasized the need for school personnel to understand students' cultural background before designing bilingual programs. Despite the passage of 30 years and advances in linguistics and psychology, this handbook still provides solid, practical guidance for bilingual educators.

Following the Bilingual Education Act of 1968, the 1970s was a time of intensive policy development and research in bilingual education, and Saville-Troike played a major role in these activities. When the class action suit filed by parents of Chinese-speaking students in San Francisco schools resulted in the *Lau v. Nichols* decision in 1974, she was part of the Center for Applied Linguistics (CAL) task force that formulated a master

plan for bilingual/bicultural education in San Francisco. The work resulted in the *Lau Consent Decree*, which stressed maintenance of the students' native language as they mastered English. When the country saw an influx of refugees from the Vietnam War, the CAL turned to Saville-Troike to help prepare teachers for meeting the needs of Indochinese refugee children. And significantly, during this period of serious debates about the respective roles of English as a Second Language (ESL) and bilingual education, as 1974–1975 president of TESOL, Saville-Troike was instrumental in developing the organization's position statement that ESL should be recognized as an essential component of bilingual education.

Another foundational contribution to bilingual education has been Saville-Troike's consistent call for language to be understood as an integral part of culture, and the need for language to be taught within a cultural context—understanding what social and cultural knowledge and communicative practices students bring into the classroom, and building on those to introduce the students to the target language and culture. She has written and delivered numerous presentations on the cultural component of bilingual teacher education programs, on developing children's bilingual and bicultural competence, and on teaching English as a second culture. She has published several works on this topic, among them *A Guide to Culture in the Classroom* and *The Ethnography of Communication*, the latter a leading work now in its third edition.

Any review of her work must note that, in the end, Muriel Saville-Troike is above all a scholar whose research on second-language acquisition and first-language maintenance and loss offers an empirical basis for those who support bilingual instruction. Her ongoing research relates to children's native-language maintenance, along with documentation of language attrition and revitalization efforts, especially in American Indian languages.

SCHOOL LEADER'S ROLE

The changing landscape of a culturally diverse society frames the complex dynamics now taking place in schools. Schools, as we know them today, require new leaders who are more amenable to change than their predecessors and able to manage the many adjustments required in staffing, curriculum, and instruction. The roles of school leaders, especially those of school principals, are being transformed as the effects of complex education policies are felt.

One critical organizational challenge facing school leaders today is bilingual education. Administrators who lead schools that serve large numbers of English language learners (ELLs) face a multitude of complex tasks. These tasks become especially complex where several languages other than English are present in the school. School administrators and their leadership teams bear much of the responsibility for managing diverse resources and encouraging others to adopt new avenues to school success. They must help select and implement new programs that work better than those of yesterday. Although schools are notoriously conservative institutions, the challenge of implementing a variety of new programs has given unprecedented importance to the idea of leading in a culture of change.

Professional organizations, practitioners, and experts on school leadership have examined the requirements these leaders must meet. This entry summarizes one such effort to pinpoint the characteristics of the new and more competent school leader. Members of the School Leadership Learning Community (a study group) held a meeting at the Institute for Educational Leadership (IEL) in Washington, D.C. Their objective was to address critical issues surrounding the preparation of school leaders and to identify concepts and practices that highlight new ideas about school leadership. At the close of their deliberations, five major themes emerged, encapsulating the most important topics discussed.

The participants agreed that, among the issues discussed, cultural competence deserved overriding

concern and that not much difference exists between an effective leader and a culturally competent leader. They also agreed that without cultural competence, one cannot become an effective leader. The consensus was that school leaders increasingly need to be grounded in the issues, both overt and covert, related to race, culture, and the social differences that affect student learning, in all contexts—rural, urban, suburban—and in all settings, regardless of whether the populations are homogeneous or diverse.

Key Themes

The capacity to deal with many levels of linguistic and cultural diversity in a variety of settings was perhaps the most important principle, according to the participants at this consultation. Other important themes are outlined here.

Educational leaders who are not culturally competent cannot be fully effective. This broad theme emerged from the process of identifying the knowledge, skills, and attributes that encompass a culturally competent leader. Culturally competent leaders possess the ability to articulate their own philosophy of education and establish an environment conducive for stakeholders to participate in their own transformation. These leaders share a global perspective and have the ability to question their own values, beliefs, and prejudices and to create opportunities for teachers, students, and community members to share in this process. These leaders value cultural diversity, are comfortable in sharing power, are open to change and to differences, and are thus able to engage people from different cultures and backgrounds. Decisions are data-driven, determined by specific needs, and guided by principles of moral leadership.

Culturally competent leaders work to understand their own biases as well as patterns of discrimination. They have the skills to mitigate the attendant negative effects on student achievement, and the personal courage and commitment to persist. Participants concurred that if school leaders are serious about closing the minority achievement gap, an emphasis must be placed on the ability of leaders to value self-awareness, which provides the foundation for cultural competence. School leaders need to demonstrate the ability and willingness to engage the school staff in honest and straightforward conversations pertaining to issues of race and class. However, this cannot effectively

transpire until leaders have participated in their own reflective processes that address the complex issues of race, class, discrimination, and diversity. This process involves self-assessment of personal values, behaviors, and attitudes.

Preparation programs play an integral role in the development of culturally competent leaders. Instructors learn to provide safe environments for school leaders to “take the blinders off,” and provide supportive settings that encourage them to share their own stories, values, beliefs, and assumptions they possess with others who have different stories to tell. Leaders in preparation programs should be prodded to explore more difficult and often unsettling questions, such as the following: What privileges do they enjoy? How do they use their power and influence? What kind of prejudice and bias influence their leadership decisions and behaviors? And do these beliefs affect the lives of their students?

Much of what culturally competent leaders must know and be able to do is learned in relationships with families and communities. During the discussions, participants emphasized the importance for leaders to know how to engage families and community partners in collaborative efforts. According to participants, culturally competent leaders are also community leaders who can create an environment in which all stakeholders can openly address cultural issues, and not use cultural differences as an excuse for student underachievement. The participants envisioned school leaders who can provide time management and resource facilitation. These are necessary to engage school communities in difficult and ongoing conversations about ways to change schools from what they are to what they could be. For this to occur, local school leaders must learn to regard human diversity as an asset rather than a liability.

Culturally competent leadership develops over time and needs to be supported from preparation through practice. Creating collaborative frameworks and structures can be useful. The participants stressed that collaborative efforts between preparation programs and school districts need to develop a variety of structural supports for aspiring, new, and current leaders. Although no single training model can fulfill all the contexts for which leaders must be prepared, effective leadership frameworks share several key features. An effective leadership structure incorporates safe settings in which participants can question their own perspectives with

mentors and coaches, who are themselves culturally and ethnically diverse, as well as culturally competent to engage persons from cultures other than their own. The structure should be extended beyond initial preparation programs because transformational leaders need to be continuously nurtured and challenged.

State and local policies need to build a sense of urgency about preparing culturally competent leaders. The participants acknowledged that most college and university training programs are anchored in standards developed by the Interstate School Leaders Licensure Consortium (ISLLC); however, notice was taken that none of these standards specifically addresses cultural competence. The participants proposed the need for clear-cut standards that require leaders to demonstrate knowledge, skills, and attributes needed to work effectively in diverse settings. In the conclusions reached by the participants, such a standard could be invaluable in creating a sense of urgency about the incorporation of training components, curricula, and strategies related to cultural and linguistic diversity, as well as cultural competence in leadership preparation programs.

Conclusion

How to become effective leaders suited for our complex times is a growing concern for all those in positions to make a difference. Preparing diverse and culturally competent school leaders, as the nation's population continues to become more diverse and culturally complex, is a major challenge. The themes summarized in this entry are difficult to incorporate into the traditional university-based programs in which administrators earn their credentials. A non-negotiable tenet of a culturally competent leader is one who is guided by the principles of moral leadership. These leaders are grounded in critical theories pertaining to how people learn and are capable of helping teachers enact the most appropriate ideas to support bilingual and multicultural teaching in their classrooms. These leaders are also responsible for understanding and valuing the importance of multicultural proficiency and for ensuring that the staff and learning environment reflect this perspective. Without the guidance and vision of the leader to put these themes into practice, teachers, working alone, can find them difficult to carry out.

Implementing a collaborative learning community that fosters the perspectives, values, and diversity of the

students and community members can be instrumental in helping make sense and meaning of the themes selected for a given school. The challenge inherent to the leader depends on the ability to integrate the themes, so that they are made operational and become the fabric of the school culture. The themes must be reflected in all aspects of the school, so that they include relevant and culturally responsive school curricula, school policy, continuous and multifaceted ways of communication, and programs that reflect the specific needs of all stakeholders. The leader must ensure that attaining high-achievement levels among all students is high on the agenda because they need to effectively use limited resources to support ongoing professional development and programmatic needs that represent the voices of stakeholders who have different agendas, needs, and priorities.

Recent statistics indicate that our youngest children are the most diverse group in the United States, making the nation more diverse as they age. Almost 9 million children from the age of 5 to 17 years old come from homes where a language other than English is spoken; 2.6 million of these children have difficulty speaking English. Further, the statistics indicate that approximately one-half million students are being raised in families where no English is spoken at home, and that at least 125,000 students will require specialized instruction to learn to speak English and use it as a tool for learning school subjects.

School leaders who can engage these new groupings of students must be adept and comfortable with change and ambiguity. They must also be visionary enough to envision new types of schools that embrace critical elements of the aforementioned themes. A school that has traditionally experienced low parental participation from a specific group of parents, for example, may find that this group may have increased parental involvement—as a result of creating a culturally responsive school. As the voice of this group becomes more discernable, so may the demands. Potentially, this can affect how specific programs or activities are included, removed, or shaped. Priorities of the school may change, affecting how resources are prioritized and allocated.

Time demands on the administrative team and faculty may also need to be modified to reflect the needs of a new constituency of parents and students. A school with a new program of bilingual education must ensure that the staff is capable of interacting with parents in a language other than English. This can be

especially challenging where a low-status language in the community suddenly becomes a high-status language that will be used in the classroom. The degree of success attained in changing a school culture to meet the multifaceted needs of new or diverse populations hinges on the skill, vision, and commitment of the school leaders. They serve as advocates while juggling all the parts, which may seem separate but are actually interdependent, constituting the system at large. The culturally competent leader will never lose sight of the vision of attaining and sustaining a culturally responsive school. The leader will strive to have a school that is populated by teachers and staff who themselves are culturally competent and who incorporate the values, beliefs, and assumptions needed in these schools.

SECOND-LANGUAGE ACQUISITION

Second-language acquisition (SLA) is the process by which people learn languages in addition to their native tongue(s). The language to be learned is often referred to as the *second* or *target language* (L2). A key question related to this field is, “How do children acquire a second language?” To answer this question, it is helpful to examine in detail the principal SLA theories. A thorough knowledge of these theories enables teachers to make informed decisions about how best to teach second-language learners.

Theories of SLA are based on research from different fields. Researchers relying on particular theoretical frameworks ask different questions and use different methods to investigate how people learn a second language. This entry reviews the perspectives represented by each of these approaches and subfields of linguistics.

Psycholinguistics

Psycholinguists look for insights into SLA from the fields of linguistics and psychology. They examine the system of language the learner is developing. This system is sometimes referred to as the learner's *interlanguage*. This term can be defined as the linguistic system that language learners develop as they approximate the use of the target language and that might reflect features of the students' native language. For English language learners, the interlanguage is the version of English the learner speaks. It is different from the English of a native speaker, and yet it is a regular language with rules and logic of its own even though it is not yet the complete target language or L2 as spoken by native speakers. Psycholinguists often use evidence from errors to determine learners' strategies as their interlanguage develops. For example, if a student produces a word such as *goed* as the past tense of “go,” the strategy used is overgeneralization of a grammatical rule. The student is applying the past tense rule to an irregular verb. Knowing this allows the teacher to take corrective action.

Herbert Seliger, a professor of linguistics, identified three major questions psycholinguists ask about SLA “psycholinguistics”:

1. How does the learner develop his or her second-language system? What are thought to be the processes involved?

2. What role does previous knowledge, such as knowledge of the first language, play in second-language acquisition?
3. What psychological characteristics contribute to successful second-language acquisition? Are there good learners and bad learners?

The answers to these three questions have important implications for teaching English language learners and point out the areas of interest from a psycholinguist's viewpoint, which puts the focus on cognitive, linguistic, and psychological processes.

Sociolinguistics

Sociolinguists consider the influences of social and cultural factors on language development. They pay attention to the relation between language use and social processes and situations. In addition, they analyze the way speakers from a particular social class, ethnicity, or gender use language. Some of the major questions that sociolinguists attempt to answer are these:

1. What are the social and cultural variables that affect language varieties?
2. Does the learner's language variety change over time, and if so, what causes the variation?
3. How do L2 learners develop communicative competence?

Sociolinguists are interested in how people learn to use a second language in various social contexts to communicate effectively. They address issues such as language, culture, and identity; focus on power relationships; and consider how society's structures are reflected, marked, or challenged through the use of language.

Neurolinguistics

Neurolinguistic research is a relatively new field, and the findings of neurolinguists are only beginning to be applied to language teaching. Although advances in technology have increased our understanding of how the brain processes language, neurolinguists concern themselves with how language is represented in the brain. These are some of the questions that neurolinguists are attempting to answer:

1. Where in the brain are first and second languages located?
2. What are the ways that languages with different characteristics are represented in the brain?
3. Is there a critical period for second-language acquisition?

All three areas of research—psycholinguistics, sociolinguistics, and neurolinguistics—have contributed to the development of current theories of second-language acquisition. For the purposes of this entry, models based on psycholinguist and sociolinguist approaches are explored in more depth.

Schumann's Acculturation Model: A Sociolinguistic Theory

One important theory of SLA comes from John Schumann's theoretical, sociolinguistic research. Schumann claims that acquiring a new language is part of a more general process of acculturation. For Schumann, language acquisition can best be understood by looking at what happens when people from one cultural group are transplanted into a new setting. Schumann focuses on sociocultural factors that act on the language learner. Much of his theory can be understood by examining Schumann's analysis of one learner, whom he called Alberto.

Alberto, an adult from Costa Rica, acquired English without formal instruction. Alberto's English proficiency was much lower than might be expected, and it improved little during the 10 months Schumann studied him. Even though Alberto was intelligent and interacted regularly with native speakers of English, Alberto's English remained limited. Schumann's analysis was that Alberto's social and psychological distance from speakers of the target language accounted for his lack of proficiency. Schumann posits that the greater the social distance, the lower the likelihood is of developing proficiency in the second language.

According to Schumann, eight factors influence social distance: social dominance, integration patterns, enclosure, cohesiveness, group size, cultural congruence, intended length of residence, and attitude. Social distance, then, is greater in the following scenarios: when one group dominates another, when limited integration exists between cultural groups, when learner groups form their own communities as distinct areas within the larger community, when learner groups are

tight-knit, when learner groups' size is large, when the learners' culture is very different from the culture of speakers of the new language, when learners plan to stay in the new country for a relatively short time, and when learners have a negative attitude toward the members of the target language culture.

In addition to social distance, which describes relationships among social groups, Schumann identifies psychological distance as a second factor that can be used to predict the degree of language acquisition. In situations in which social distance neither strongly promotes nor inhibits language acquisition, psychological distance may play a crucial role. Three main factors determine the psychological distance a second-language learner has from the target language and culture. These include motivation to learn the new language, attitude toward the new language and culture, and culture shock.

An important component of psychological distance is a person's attitude toward members of the cultural group whose language they are learning. Schumann's theory suggests that a positive attitude toward members of the target language group decreases the psychological distance between learners and the group whose language they are learning. Schumann's acculturation model highlights the importance of the effect of social factors on language acquisition. Teachers can promote second-language acquisition by creating a classroom environment in which students can interact with and develop positive attitudes toward speakers of the target language. Schumann's theory provides useful ideas about the effects of contextual factors on learning. Concepts such as social and psychological distance help us understand why certain people succeed or fail in learning a new language. However, Schumann's theory does not address linguistic or cognitive processing. Psycholinguistic theories of second-language acquisition place more emphasis on this aspect of SLA.

Krashen's Monitor Model: A Psycholinguistic Theory

Another theory of second-language acquisition is Stephen Krashen's monitor model, a theory based on insights from both psychology and linguistic theory. Schumann's acculturation model focuses on external, social, and cultural factors that affect language acquisition, whereas Krashen's theory is based on internal psychological factors and is thus considered a nativist

theory. Nativist theories hold that humans have an innate ability to learn language. The monitor model consists of five interrelated hypotheses.

The Acquisition-Learning Hypothesis

Krashen makes an important distinction between two ways of gaining a new language. The first of these is acquisition. According to Krashen, we acquire a new language subconsciously as we receive messages we understand. For example, if we are living in a foreign country and go to the store to buy food, we may acquire new vocabulary or syntactic structures in the process of trying to understand what the shopkeeper is saying. We are not focused on the language. Rather, we are using the language for real purposes, and acquisition occurs naturally as we attempt to conduct our business.

In contrast, learning is a conscious process in which we focus on various aspects of the language itself. This process is what generally occurs in classrooms when teachers divide language into chunks, present one chunk at a time, and provide students with feedback to indicate how well they have mastered the various aspects of language that have been taught. Learning is associated with classroom instruction and is usually tested. It is less common in the world beyond the classroom.

The Natural Order Hypothesis

Krashen's second hypothesis is that language is acquired in a natural order. Some aspects of a language are picked up earlier than others. For example, the plural *s* morpheme added to a word like *girl* to form *girls* develops earlier than does the third person *s* added to *walk* in "He walks." Krashen points out that all learners of a particular language, such as English, seem to acquire the language in the same order no matter what their first language may be.

The natural order applies to language that is acquired, rather than language that is learned. Students may be asked to learn aspects of language before they are ready to acquire them. The result may be good performance of the items on a test but inability to use the same items in a natural setting. In these cases, students' performance may exceed their competence. Krashen points out that if a teacher focuses on acquisition activities, rather than trying to get students to learn certain grammatical points, all students will acquire language in a natural order. The rate of

acquisition will differ for different students, but the order will be the same.

The Monitor Hypothesis

The monitor hypothesis helps explain the different functions that acquisition and learning play. Acquisition results in the vocabulary, phonology, and syntax we can draw on to produce utterances in a new language. Without acquisition, we could not produce anything. Learning, on the other hand, provides us with rules we can use to monitor our output as we speak or write. The monitor is like an editor, checking what we produce. The monitor can operate when we have time, when we focus on grammatical form, and when we know the rules. The monitor is most useful in checking written output.

Monitoring is helpful if the monitor is not overused or underused. Teachers can help students become optimal monitor users. It does help to know the rules, but it's essential to know when to apply them and when to concentrate more on the meaning of a message. Sometimes teachers hope that by correcting their students' errors, they will increase students' proficiency. Krashen believes that error correction affects learning, but not acquisition. Error correction causes us to think about consciously learned rules and has limited value. Learning, according to Krashen, has little or no effect on basic language competence.

The Input Hypothesis

The key to Krashen's theory of language acquisition is the input hypothesis. He claims that people acquire language in only one way—when they receive oral or written messages they understand. Krashen says these messages provide comprehensible input. For acquisition to take place, learners must receive input that is slightly beyond their current ability level. Krashen calls this $i + 1$ (input plus one). If the input contains no structures beyond current competence ($i + 0$), no acquisition takes place. There is nothing new to pick up. On the other hand, if the input is too far beyond a person's current competence ($i + 10$), it becomes incomprehensible noise, and again, no acquisition can take place.

According to Krashen, comprehensible input is the source of all acquired language. Students do not have to produce language to acquire it. Only input leads to acquisition. Consequently, output—that is, speaking or writing—does not contribute to acquisition, although it

may result in cognitive development. Because comprehensible input is the key to language acquisition in Krashen's model, the teacher's job, quite simply, is to find ways to make academic content comprehensible. This model has been implemented in several language methods used for teaching a second language that are designed to help teachers develop techniques for turning academic content matter into comprehensible input.

The Affective Filter Hypothesis

In Krashen's work, the affective filter hypothesis explains the role of affective factors in the process of language acquisition. Even if a teacher provides comprehensible input, acquisition may not take place. Affective factors such as anxiety or boredom may serve as a filter that blocks input. When the filter is up, input can't reach those parts of the brain where acquisition occurs. Those parts of the brain are sometimes referred to as the language acquisition device, or LAD. Many language learners realize that the reason they have trouble is because they are nervous or embarrassed and simply can't concentrate. In other words, the input is filtered out.

Krashen's theory of language acquisition is based on input, thus in his discussion of the affective filter, he only refers to language that is coming in, not to language the person is attempting to produce. This hypothesis does not apply to a person's output, only to the ability to acquire language.

Krashen's insistence on the importance of providing learners with comprehensible input in a risk-free environment sends an important message to teachers. Krashen claims that a classroom can be an optimal source of comprehensible input. Actually, the classroom may provide more comprehensible input than a trip to a foreign country where no attempt is made to ensure that input is comprehensible.

Even though Krashen's ideas have been debated and sometimes discounted by other researchers, they have been found useful by practitioners because they are understandable and cogent. In short, they make sense. The monitor model greatly affected classroom practice, and teachers see positive results when they apply techniques based on this model in the classroom. One drawback of the monitor model is that it fails to place a stronger emphasis on social and cultural factors; its focus is placed on the psychological and cognitive processes that individuals go through in the SLA process and on the role teachers have in facilitating such processes.

Output Theory

As noted earlier, Krashen argues that acquisition occurs when learners receive comprehensible input, messages that they understand. Other researchers have given importance to output as well as input. Rod Ellis refers to theories such as Krashen's as *reception-based*. Theories that include attention to output he classifies as *production-based*. Production-based theories give importance to learners' attempts at producing the new language.

Michael Long developed the interaction hypothesis, a theory of SLA that is production-based. Long claims that learners make conversational adjustments as they interact with others and that these adjustments help make the input comprehensible. Merrill Swain also argues that language learners need the opportunity for output. Swain's claim is that when we receive input that we understand, we focus on meaning or the semantic level. However, in talking, we need to string sentences together, and that requires attention to syntax. Our syntactic analysis is probably not conscious, but producing output requires us to access different parts of the language system than we use to comprehend input.

Production-based theories of SLA recognize the importance of input but add output as an important component. Krashen's argument is that output will not help us acquire new vocabulary or grammatical structures. A student is unable to learn a new word simply by talking. Simultaneously, we learn language for communicative purposes, and no language teacher would feel successful if students never uttered a word of the new language. In an acquisition-oriented class, teachers do expect students to show they comprehend the input. They do this without requiring students to produce language beyond their current level of proficiency.

Conclusion

Second-language acquisition theory, then, is informed by different theoretical frameworks, each one emphasizing certain types of processes. Psycholinguistic approaches make the distinction between learning and acquisition; cognitive processes focus on language comprehension and production and on variables that might make this process hard for language learners. Sociolinguistic approaches view language as a series of social acts, and consider those cultural and social factors that influence how students acquire a second language, and the effect of this process in their sense

of belonging to a particular society. These approaches to second-language learning give educators insight about models that inform their teaching and the possibility of best practices for their student population.

SEIDNER, MARÍA M. (1938–)

María Medina Seidner, whose career in bilingual education spans more than three decades, was herself the product of bilingual schooling. Born in San Juan, Puerto Rico, she started school on the island, receiving academic instruction in Spanish and studying English as a second language. Seidner was the child of a military officer. By the time she graduated from high school, she had attended schools in four different countries and

was fluent in Spanish, English, and Italian. At the University of Texas in Austin, she majored in French and received a BA in romance languages in 1960. This entry describes her career.

From 1960 to 1968, she taught French and Spanish at the secondary and college level. She left teaching to work at the state department of education. As consultant in French for the Texas Education Agency (TEA) from 1968 to 1971, she provided technical and academic support to foreign-language educators throughout the state. While at the state agency, she became involved in bilingual education, assisting the newly created Office of International and Bilingual Education with workshops and conferences, including the First International Bilingual Bicultural Education Conference, which was held in Austin in 1971. That same year, she completed an MA degree in foreign language education at the University of Texas.

In 1972, as the state of Illinois prepared to implement legislation mandating bilingual education, Seidner moved to Chicago to establish and direct a center to provide training and technical assistance to bilingual education programs throughout the state. The first of its kind, it was an instant success. It became the staff development arm of the state department of education, conducting local, regional, and statewide workshops and providing on-site consultant services to school districts. From 1972 to 1979, under her leadership, the Bilingual Education Service Center grew to encompass multiple projects: the Illinois Resource Center, the Title VII Midwest Resource Center, the Illinois Statewide ESL/Adult Education Center, the Midwest Indochinese Refugee Education Program, the Illinois Bilingual Vocational Education Program, the Illinois Bilingual School Psychologist Network, and others.

During this time, Seidner gained national recognition as a bilingual educator, speaking at state, regional, and national conferences, providing testimony on bilingual education before Congress and the Illinois General Assembly, serving on advisory panels for various agencies, participating in special task forces, and publishing in professional journals. A founding member of the National Association for Bilingual Education, she was actively involved in the organization and served as its third president. She also worked closely with the U.S. Department of Education, serving on the National Advisory Council on Bilingual Education from 1978 to 1982.

In 1979, Seidner joined the Illinois State Board of Education (ISBE) as manager of bilingual education and served in that capacity until 1993. She led the state in developing and implementing new state policies with uniform criteria for identification, assessment, and instruction of English language learners; administrative procedures for evaluating and funding district applications; guidelines and processes for on-site monitoring; and provisions for professional development of bilingual personnel and coordination of federal bilingual programs. She succeeded in establishing collaborative programs with special education, making Illinois one of the first states to provide state certification in bilingual special education.

In 1993, Seidner retired from ISBE and returned to Texas. But her work in bilingual education was not over. In 1994, she joined the Division of Bilingual Education at the TEA and became state bilingual director the following year. As state director, she reached out to bilingual educators to ensure that state policies and programs addressed statewide needs. She traveled throughout the state and led the development of state academic standards for English language learners in Spanish Language Arts and English as a Second Language and was instrumental in the implementation of Spanish-language versions of state academic assessments and reading proficiency tests in English.

While at TEA, Seidner participated in committees and panels on the improvement of English language learners' academic assessments, convened by groups such as the Council of Chief State School Officers, the Center for Applied Linguistics, the National Research Council, Educational Testing Service, and the Center for Research on Evaluation Standards and Student Testing. She retired from TEA in 2003, but continued providing consultative services in planning and evaluation of educational programs, curriculum, and assessment for English language learners. In 2004, she joined Pearson Educational Measurement to work on assessments for English language learners in various states.

During her career, Seidner has received many honors, awards, and special recognitions from government officials, professional associations, and community organizations. Among the achievements in which she takes greatest pride is that of having served as director of bilingual education in two states, Texas and Illinois. Seidner lives in Austin, Texas, with her husband, Stan.

SEMILINGUALISM

The term *semilingualism*, discussed in this entry, was first introduced in 1962 by the Swedish philologist Nils Erik Hansegård (who called it *halvspråkighet*); the term was picked up by Håkan Ringbom, who conjectured that “a period of ‘double semilingualism’” occurs when an individual abandons his or her native language altogether in favor of an imperfectly acquired second language. For Hansegård, the term denoted a lack of competence in all languages an individual knows in any of six areas: (1) size of the repertoire of words and phrases that are understood or actively available in speech; (2) linguistic correctness; (3) degree of automatism; (4) ability to create or neologize; (5) mastery of the cognitive, emotive, and volitional function of language; and (6) richness or poorness in individual meanings (whether reading or listening to a particular linguistic system “evokes lively and reverberating semantic images or not”).

In the United States, however, use of the term *semilingualism* is owed instead to James Cummins, a Canadian scholar whose research has deeply influenced bilingual education theory in the United States and internationally. Cummins invoked the notion of semilingualism as one of three “types of bilingualism” in his idea of a threshold hypothesis. These included *additive bilingualism*, defined as having “high levels in both languages”; *dominant bilingualism*, having a “nativelike level in one of the languages”; and *semilingualism*, the condition of having a “low level in both languages.” The threshold hypothesis posited that the level of language ability attained by bilingual children in their first and second language may affect cognitive growth in academic subjects. Cummins believed that immigrant children were at risk of semilingualism because they might experience attrition (or decay) of the first language before learning the second, making

it difficult for them to function in either language in school. The solution, Cummins argued, was to place children in classroom settings in which they received rich instructional support in the first language, with the intention of preventing the onset of semilingualism.

Cummins’s use of the term and concept of *semilingualism* has been much criticized. Carol Edelsky and colleagues, for example, characterized the idea as “a confused grab-bag of prescriptive and descriptive components,” and Marilyn Martin-Jones and Suzanne Romaine referred to it as “a half-baked theory of communicative competence” in the title of a highly critical article. Perhaps partly because of strong remarks such as these, Cummins soon began using the phrase “limited bilingualism” instead of “semilingualism,” but the definition of the term and the role it played in Cummins’s overall account of language minority children’s difficulty in school, captured in the threshold hypothesis and related notions, remained unchanged.

It is important to note in the context of the controversy what Cummins meant by “language proficiency.” Cummins conceptualized language proficiency along two continua, called *context-embedded*—interpersonal communication in a mutually understood context where the need for explicit linguistic elaboration of a message is reduced—and *context-reduced*—communication that does not occur in a mutually understood context and that therefore requires elaborate and explicit detail.

The value of this system, for Cummins, was that it reflected a “developmental perspective,” that is, a view of language as growing and developing over time. Moving beyond the acquisition of the “species minimum” (a term borrowed from Jerome Bruner to denote the acquisition of the rules of word order, word formation, pronunciation, and meaning), Cummins believed other aspects of language proficiency continue to develop throughout the school years and beyond, principally including literacy-related language skills such as reading comprehension, writing ability, and vocabulary/concept knowledge.

Cummins’s objective was to find a unified view of language proficiency befitting both the goals of second-language instruction in school and children’s home language, one that differentiated the two in developmental levels of language growth. Although critics were comfortable with the curricular goals for the second-language classroom, the apparent implications for children’s home language proficiency were troubling: It positioned the language of school as

developmentally superior to the language of other contexts, recalling traditional claims by linguistic prescriptivists, who had long maintained that the language of the educated classes was developmentally superior to the language of other cultural and linguistic groups.

More broadly, *prescriptivism* is a view of language that holds one or another particular language or language variety to be inherently superior to others, and generally holds that a model variety should be used as the standard of “correct speech” for the larger community. Prescriptivists set up language academies charged with the task of “purifying” the regional linguistic descendants of Latin as early as 1582 in Italy, 1635 in France, and 1713 in Spain. Proposals for a language academy in England were also popular among academics in the 17th century, but the suggestion lost support as it became evident that the Continental academies could not preserve Latinate structure against the tide of language change. Prescriptivism fell into disfavor as a result of the work of early 20th-century linguists in the United States who had, following Leonard Bloomfield’s lead, undertaken to analyze all languages using the same taxonomy. This extensive body of empirical research led to the conclusion that all languages, even so-called “primitive” ones, were equally rich and complex.

Some of Cummins’s early contemporaries saw similarities between the kind of linguistic dichotomies he introduced and those of another contemporary scholar, Basil Bernstein. Bernstein formulated a distinction between “public language” and “formal language,” later termed “restricted” and “elaborated” code, after studying speakers of a stigmatized dialect in London. According to Bernstein, *public language* is characterized by “fragmentation and logical simplicity,” and *formal language* or *elaborated code* may be used to express “universal meaning.”

Efforts have been made to evaluate the notion of semilingualism empirically, and these have consistently found no linguistic basis for the idea. For instance, Christine Paulston surveyed existing research through the early 1980s and determined, “Semilingualism does not exist.” Similarly, Jeff MacSwan, in an extensive critique, reviewed various sources of reputed evidence for semilingualism and found no support for it. Studies of commercially available Spanish language tests frequently used in school and that have been used to assess Spanish language-background children as “non-” or limited speakers of their native language, have also been studied and found to lack validity.

Many of the original advocates of semilingualism have come to disapprove of the term, but some continue to endorse the concept in a limited way despite the lack of scientific evidence for it. Much of the controversy appears to be connected to how one defines language proficiency. For instance, although Cummins and others have insisted that literacy and school-related language are aspects of language proficiency that stand at the higher end of the proficiency scale, others have argued that these constitute just one of many possible domains of language use whose special status derives from social and political forces, rather than linguistic science. This difference lies at the center of the controversy because linguists tend to avoid rather than encourage judgments based on social valuing of languages and language differences. *Semilingualism* appears to be a statement of societal valuing of language forms. The degree to which the controversy has penetrated the practice of bilingual education is perhaps another example that schools do not operate solely from a base in linguistic science. They also reflect the society that builds and maintains them.

SIMON, PAUL M. (1928–2003)

Paul Martin Simon was a Democratic Representative, two-term U.S. Senator, and presidential aspirant from southern Illinois. He was known as a charismatic, honest, and compassionate lawmaker, and tireless advocate for the less fortunate. In Congress, Simon was a seasoned legislator whose tenure included working for bilingual education and language education programs, among other causes. His career and efforts promoting bilingual education and modern language study are described in this entry.

Born in Eugene, Oregon, on November 29, 1928, Simon attended local public schools, graduating from high school in Portland. He entered the University of Oregon, Eugene, in 1945, but left after a year to finish his studies at Dana College in Blair, Nebraska, where he graduated in 1948. Upon graduation, he pursued a career as a newspaper editor and publisher in Troy, Illinois, becoming the nation's youngest editor-publisher at age 19. In a short time, he built a chain of 15 weekly publications in Downstate Illinois, and used his influence to expose various forms of corruption, including illicit gambling operations, among other things, in the St. Louis area. Simon served as an expert witness before the U.S. Senate's Crime Investigating Committee as a precocious 22-year-old.

Simon went on to serve as an intelligence agent for the U.S. Army in Eastern Europe from 1951 to 1953 and began a political career upon his return. In 1954, he was elected to the Illinois House of Representatives, where he served until 1962. He was subsequently elected to the state senate, serving until 1968. In each of his 14 years in the Illinois legislature, Simon won the Best Legislator Award from the Independent Voters of Illinois, a nonprofit organization dedicated to government activism and honesty. Simon was elected lieutenant governor in 1968, becoming the first person to hold this office while belonging to a different party than the governor. He served as lieutenant governor until 1972.

After Simon lost a Democratic primary for governor, he taught at Sangamon State University in Springfield, Illinois, where he created the Public Affairs Reporting Program. He also taught at Harvard University's John F. Kennedy School of Government. But his time out of public office was short-lived. In 1975, he was elected to the U.S. House of Representatives and served until 1985. His tenure there was marked by leadership positions in education and

foreign affairs and an interest in care for the disabled, especially children. In the House, he sponsored the Missing Children Act, paving the way for the National Center for Missing and Exploited Children. He also supported the reauthorization of the Bilingual Education Act of 1978.

Simon moved to the Senate in 1984, and was reelected in 1990, serving until 1996. He also ran for the Democratic presidential nomination in 1988. In the Senate, Simon continued his work in language education and minority language advocacy, supporting legislation such as the Foreign Language Competence for the Future Act of 1989, the Native American Languages Act of 1991, and the Voting Rights Act Language Assistance Amendments of 1992. He was also the main Democratic sponsor of the Balanced Budget Amendment.

Upon leaving congressional office, Simon founded and became director of the Paul Simon Public Policy Institute at Southern Illinois University, serving from 1997 to 2003. He wrote a number of books, including *The Tongue-Tied American*, which bemoaned the nation's poor record in preparing students fluent in other languages. He spoke prolifically, particularly about the need for American schoolchildren to learn a new language and what he described as a shortfall in American foreign-language education. Simon won numerous honorary degrees and lived in Carbondale, Illinois, until his death following heart surgery on December 9, 2003.

SIOP

Sheltered Instruction Observation Protocol (SIOP) is an instructional model of teaching academic content to English language learners (ELLs) developed by Jana Echevarria, Mary Ellen Vogt, and Deborah Short. SIOP provides a detailed (operational) description of sheltered instruction (in which content is made accessible, or sheltered for language learners), and provides teachers practical step-by-step guides: from lesson preparation and instruction to implementation of the lesson that will enable ELLs to understand their grade-level content lessons. These lessons are intended for sheltered instruction classrooms and for other programs where content instruction can be improved for ELLs. SIOP, as indicated in the term *observation protocol*, comes in the form of a rubric that enables evaluation of instruction provided to ELLs. Thus, it can be used either as a rubric to assess teachers' instructional practices, or as a checklist or guideline.

The SIOP model is composed of eight sections: (1) lesson preparation, (2) building background, (3) comprehensible input, (4) strategies, (5) interaction, (6) practice/application, (7) lesson delivery, and (8) assessment. Each section is described in this entry.

Lesson Preparation

Lesson preparation begins with clear objectives concerning both content and language. These objectives are usually written on the chalkboard and are clearly introduced to the students at the beginning of the lesson. When planning a lesson, teachers consider the appropriateness of the concepts of instruction for age, culture, and the educational background of students, as well as linguistic aspects; these include students' first-language literacy, second-language proficiency, and literacy in the content area of instruction.

To enhance the level of comprehension, teachers prepare supplementary materials such as visuals and manipulatives (e.g., pictures, illustrations, charts, graphs, realia, hands-on manipulatives, adapted text, related literature, and multimedia). Content is also adapted to ELLs' needs through the use of graphic organizers, outlines, labeling of pictures, study guides, adapted text, highlighted text, taped text, jigsaw text reading, marginal notes, and texts in the students' native languages. Teachers also plan meaningful activities that meet the content objectives and

give students ample opportunities to practice all four skills of language learning (i.e., listening, speaking, reading, and writing). Meaningful activities for students are of an authentic nature, where the students actually experience what they are learning about.

Building Background

Instruction begins with building background. Background is built in several ways. First, it is through building connections with prior information, and then through providing experiences to build background knowledge. Connections are made between the new lesson concepts and the students' prior background knowledge and experiences to make it more comprehensible and meaningful for the students. Links are also made with previous lessons and new lessons. If the students do not have prior experience, teachers can provide experiences as a means through which children can build background for themselves.

Vocabulary plays a big part in background building and in academic achievement. Students develop content language by emphasizing key vocabulary words before the lesson, and through various activities such as contextualizing key vocabulary, vocabulary self-collection strategies, personal dictionaries, world wall, concept definition map, cloze sentences (where words are omitted and students fill in the gaps), word generation, word study books, and vocabulary games.

Comprehensible Input

Drawing on the work of Stephen Krashen, SIOP emphasizes the importance of comprehensible input, which is suggested to be measured throughout the lesson to ensure that students understand what is communicated. Comprehensible input begins with a clear speech. This form of speech is appropriate for students' proficiency level in the pace, enunciation, and complexity of the sentence structure. Clear instruction and directions for academic tasks are necessary for both ELLs and native English speakers. Directions can be made clearer through adapting a step-by-step manner, accompanied with written directions, visual examples, and teacher's demonstration. The use of a variety of techniques to make the concepts clear is encouraged. These techniques include modeling, visuals, hands-on activities, demonstrations, gestures, and body language.

Strategies

Students can benefit from explicit teaching of self-regulating learning strategies. Teachers provide ample learning strategies related to the lesson contents, as well as language learning strategies. Three categories of learning strategies are presented in the SIOP model: metacognitive, cognitive, and social/affective strategies.

Scaffolding techniques, in which students are gradually apprenticed to a task by an expert (teacher or peer) are used throughout the lesson. Verbal scaffolding can be done through paraphrasing, think-alouds, and reinforcing contextual definitions. Procedural scaffolding can be achieved through structuring the instruction in such a way that students gain more independence when performing a task. The lesson will provide explicit teaching, modeling, practice with others, and individual application. Teachers also scaffold through one-on-one teaching, small group teaching, and assigning group work with diverse students at their language proficiency and achievement level.

Interaction

English learners benefit from interaction where they have ample opportunities to use the target language in various settings. Teachers provide various types of activities that promote interaction, which can be in oral or written form. Through interaction, students have opportunity to practice the target language, negotiate meanings, clarify ideas, ask and answer questions, and give and justify opinions.

When grouping the students for interaction, a variety of grouping configurations are suggested. Homogeneous grouping can segregate students by performance or ability level, which often parallels socioeconomic and ethnic groupings, and can potentially end up promoting differential expectations and differential treatments among them. Configurations that are diverse better serve students' interests by providing various learning situations and increasing the opportunity for students to find their preferred modes of instruction.

Ample wait time for responses should be planned during the interaction. Wait time differs by culture; English language learners in particular need extra time to process questions in English. Effective teachers provide sufficient wait time for ELLs and balance it well enough that the class will not lag and the needs of mainstream students are accommodated.

ELLs can also benefit from clarifying concepts in their native languages.

Practice/Application

Teachers identify various ways to make students practice their content learning and language knowledge. Hands-on materials and manipulatives are used as practice to help students apply what they learned. This notion aligns with the “guided practice” coined by Madeline Hunter, which is the process where teachers lead students through practice sessions that precede independent application. In “guided practice,” teachers use a meaningful amount of material to be practiced at one time: Practice should take a short time, so that students can put in efforts intensely. Massed practice for new learning and distributed practices for old learning are beneficial, and specific feedback should be given to students.

SIOP emphasizes that knowledge should be applied in a meaningful way. Actual doing helps ELLs grasp the abstract content better. It also provides them the opportunity to apply language knowledge in a real-world context. Thus, teachers plan practice activities that integrate the four language skills of listening, speaking, reading, and writing.

Content objectives and language objectives are supported by lesson delivery. The goal is that students are engaged 90% to 100% of the lesson period. Allocating time appropriately improves students’ time-on-task and makes this period a time when students are focused on learning the content and language that is closely related to the lesson objectives. Teachers need to consider the appropriate pacing according to the level of the students.

Assessment

Throughout the lesson, teachers use various techniques to review lesson objectives as well as key words and key concepts. Teachers also provide periodic feedback on students’ output. Through feedback, teachers can reinforce or correct students’ language usage. In SIOP, the notion of assessment is differentiated from evaluation. Whereas evaluation means making judgments about student learning, assessment is an ongoing process of gathering and combining information about students’ learning to make instructional modifications. These assessments are authentic, informal, multidimensional, and drawn from multiple sources in nature.

Critiques of SIOP

SIOP is gaining popularity among ESL teachers in sheltered English immersion classrooms because of its simple and clear step-by-step how-to guides. One of the criticisms of SIOP, however, is that it oversimplifies teaching ELLs and presents it as if this simple step-by-step guide alone can achieve an effective teaching for all ELLs. When it comes to teaching ELLs, SIOP provides basic skill-based tools that can come in handy; however, the matter of teaching ELLs takes more than following a simple methodology. SIOP may be very useful, however, in helping build confidence among young or inexperienced teachers who are new to the work of teaching ELLs.

Another limitation of SIOP is that language objectives presented in the model are somewhat limited, too general, or even superficial; they fail to show concretely what needs to be achieved in language proficiency. This happens especially in a class with varied levels of language proficiency, and when there is lack of extended knowledge about how to teach a language, how language objectives are set, and how they are taught. Teachers find themselves unable to successfully set appropriate language objectives beyond the superficial level, not to mention successfully teaching students the lesson simply by following SIOP. However, this limitation is more a practical issue of setting language goals, rather than a theoretical one because language objectives do need to be set. SIOP leaves the role of efficiently setting language objectives to users of this method.

SITUATED LEARNING

Through their notion of “situated learning,” described in this entry, Jean Lave and Etienne Wenger introduced a broad theoretical framework that brings the socially situated nature of shared learning to the frontiers of learning theory. From this view of learning, individual learners participate in collective or group meaningful activities in which they acquire new knowledge and a continuously renewed set of relations with older members of the group. In this view, learning is not limited to an individual’s cognitive processes. Rather, learning requires learners to engage in socially organized and situated activities by practicing new ways of acting, believing, and understanding that result from such practice. Lave and Wenger refer to these situated activities as *legitimate peripheral participation* and believe that all learning necessarily results from learners’ participation in legitimate social practices that over time become increasingly similar to the practices, actions, and understandings of their teachers or older members of the group. A learner’s participation in social practices is necessarily peripheral because as learning occurs through more intensive participation, the periphery adjusts to the new learning goals. However, situated learning is not a linear process, nor does it need to result in core participation. Its essence is legitimate peripheral participation in collective or social structures and socially meaningful activity. Accordingly, human communication, social activity, and the conceptual understanding of learning tasks occur in a situated context that derives from legitimate peripheral participation in goal-oriented practices rather than from an individual’s cognitive internalization of the meaning and abilities associated with the practice.

This theoretical approach to learning stems partially from the sociocultural theory described by Lev Vygotsky, which treats learning as a social practice that first appears on interactions with others and is then transformed by mediational resources, such as language, to reach the individual cognitive level. Based on this approach, scholars theorize that teaching activities should engage students in social participation in concrete community practices, which lead to the development of new knowledge. However, unlike Vygotsky, who acknowledges both the socially and individually transforming constructs of learning, this framework accentuates even further the socially

derived learning practices. It centers more on the relations that arise between new and old learners as they participate in legitimate peripheral practices and learn to think, act, behave, and believe like older community members. Generally speaking, situated learning as legitimate peripheral participation is akin to the apprenticeship process, in which learners spend time watching and practicing as apprentices to masters of a particular trade. Once the apprentices can demonstrate to the master tradesperson that they have learned skills of the trade to a certain level, they can move on to become more independent of their master.

Learning in Peripheral Participatory Modes

At the core of situated learning practices are peripheral or auxiliary modes. Novice learners enter a community of practice to acquire new skills, actions, beliefs, and knowledge that will help them identify with and gain membership in a particular community of practice. In the process of becoming members of a new learning community, the novice’s goal is to acquire the skills, actions, beliefs, and knowledge to become fully integrated within that community. Early membership is peripheral or auxiliary to the extent that the learner is engaged in social activities in preparation for more intensive participation over time. As learners become increasingly more able to participate in learning activities, the periphery adjusts and learners are invited to participate in deeper levels of knowledge, actions, and beliefs.

This notion of legitimate peripheral participation is analogous to craftwork apprenticeship practices in different societies and among different conventional professions, such as midwives among Yucatec women in Mexico, tailors in West Africa, quartermasters in the U.S. Navy, and butchers in the United States. The apprentices in these communities of practice begin their participation in minimal supporting roles, by assisting with practices in small ways. As their participation continues, they gain more knowledge and expertise in their craft, which facilitates a more assertive control of other, more central aspects. As the apprentices’ participation is enhanced, they take on additional responsibilities and contribute more actively to the final product. Apprentices in these communities of practice gradually move along the lines of peripheral participation to a more centralized role. In short, they become members of this professionally oriented

practice community, taking on the ways of being, believing, and acting that established members possess.

Within these theoretical premises, Edwin Hutchins examined the joint constructs of navigation as they emerge among U.S. quartermasters on a helicopter transport carrier. Experienced U.S. quartermasters well versed in complex technological means cooperate with less qualified members of their team to help them progress from peripheral to essential tasks, and in the process, quartermasters help novices learn to recognize and locate errors, and then to make appropriate diagnoses. The results indicate that such tasks are complex and require a high degree of expertise and that collaborative and interpersonal communications among team members are imperative because full internalization of such processes or knowledge by a single quartermaster is not possible.

The notion of moving from the periphery toward mastery of key tasks, required for full recognition as a legitimate participant of the community, leads to the construction of new identities and a sense of community affiliation. However, neither the identity affiliations nor the learning of new practices are static. On the contrary, they are dynamic, evolving, and continuously dependent on social structures and power relations that develop through these socially oriented participatory processes. As learners' legitimate participation becomes more intense and increasingly integrated with the desired practices, their peripheral participation gains in value and recognition by peers, simultaneously becoming less and less peripheral relative to where they began as novices.

Implications for Bilingual Instruction

Situated learning has gained wide appeal in educational circles because it offers a sociocultural framework to examine second-language and bilingual learning in collective and peripherally organized modes, in specific institutional and community practices. To understand learning in the second-language and bilingual classrooms, it is important to examine the role of apprenticeship as it emerges through interactions between the teacher and students, as well as among students with multiple abilities. That is, as new learning environments, classrooms can offer a wide range of learning opportunities to apprentices that open the path to moving toward more central participatory modes, as well as helping learners create new identities as members of various learning communities.

One of the first steps to understanding the nature of situated learning in classroom settings is to acknowledge the local and situated context of classroom communities of practice, as they evolve in specific sociohistorical and cultural contexts. An important aspect of classroom communities of practice is the set of language socialization practices that learners bring with them to the classroom setting. The ways that students have been socialized to use language for communication, for expressing identities, and for making meaning may or may not be recognized as valuable for classroom interaction. For example, immigrant students entering American schools may have developed ways of using their home language that are not well understood or appreciated by the teacher and English-speaking peers. Accordingly, bilingual classroom research based on situated learning principles focuses on making sense of how English learners gain proficiency in English. It also includes how they learn academic content and in the process create new identities through participation in collaborative discourse with their peers.

This research indicates that the social and academic communities available to English learners are neither linear nor static. Rather, classroom communities are dynamic and ever changing, depending on the extent to which learners' entries are encouraged or hindered by English language proficiency, reading ability, social skills, or other factors that contribute to each learner's participation in social and academic communities of practice. In classroom settings, unlike those of butchers, midwives, and tailors, English learners' capacities to participate in social and academic communities of practice are a function of the social dynamics of the classroom, the role of the learners' home language, and the extent to which their new identities as English learners are facilitated through interaction with others.

All English learners bring into the classroom setting a personal and community-based language and cultural repertoire, which may not include oral and written proficiency in English, but it does include years of situated learning in their home communities. Hence, the participation of English learners in classroom communities and, more broadly, in the wider communities outside of school in which English is required, is likely to be difficult for learners who are new to and unfamiliar with these environments. In this sense, English learners may not only be new apprentices in academic communities, they may also need to be apprenticed

into ways of using language and literacy that differ from their first-acquired practices.

Thus, the legitimacy and peripherality of English learners may be formed by the sociocultural knowledge and practices they bring to a classroom, in which the new knowledge and academic practices being used happen in an unfamiliar language, embedded in unfamiliar practices. Moreover, because English learners may not know the language or ways of the classroom, it is easy for the teacher and English-speaking classmates to identify them as belonging to a different learning community, outside of the mainstream. In this manner, the legitimate status assigned to English learners by their teacher and their classmates, and perhaps even the broader school community, can hinder their legitimate participation in social and academic practices recognized as essential for academic success. Thus, although English learners are exposed to classroom communication, their participation in exchanges that result in language learning, while they are also gaining academically, is likely to be minimal. Researchers such as Kelleen Toohey have studied groups of English learners at the primary school level and have indicated that these children often become silent and isolated because they cannot fully comprehend or respond to their teachers' or their English-speaking peers' questions. Furthermore, in some instances, English learners in classrooms where most students are English speakers may have few opportunities to participate in academic activities exchanges with English-speaking peers.

English learners are positioned at the outer periphery of their classroom community on two levels: first, they are newcomers to the academic knowledge community (as are all students), and second, they bring with them a language and cultural foundation that is likely not to be drawn upon for learning. To be academically successful, English learners need to acquire the new knowledge that is situated in academic learning communities, and do so while they are acquiring a new language.

One of the ways that English learners gain access to English and become members of academic communities is by engaging in scaffolded activities organized around Vygotsky's concept of the Zone of Proximal Development (ZPD). When English learners are invited into collaborative activities that are within their ZPD, the assistance they receive from the teacher or peers enables them to extend their academic knowledge in specific areas, while they are trying and using

English to accomplish the particular goals of the activities. Scholars such as Pauline Gibbons and Christian Faltis and Cathy Coulter, examining peripheral participation in mixed-language classrooms, have shown how teachers can create opportunities where scaffolded activities enhance English learners' participation in academic activities. Experienced teachers who are well grounded in social learning practices can also organize learning environments in which English learners use their developing language with English speakers so that they acquire language while they are engaged in academic community practices essential to school achievement.

An important ingredient for effective legitimate peripheral participation in academic classroom setting is the existence of multiple social uses of language. This view of language implies that learners with diverse oral and written language abilities can participate in a wide range of socially organized activities, which involve the creation and development of multiple identities. From a situated learning perspective, language is not a unitary or an abstract general system; rather, it lives in and develops from multiple socially situated practices. This view of the language multiplicity and its learning as socially situated is important for understanding how English is acquired in mixed-language classrooms; it asks teachers to question teaching and learning practices that place what happens in the learner's head at the center of how language and knowledge are acquired.

Learners gain proficiency in new ways of doing things, including using a new language, through legitimate peripheral participation in multiple communities of language practice. This perspective requires teachers to acknowledge the multiplicity of voices brought into the classroom by different learners. Some of these voices may be shared with and among English learners, but others may conflict with other voices, especially those held in high esteem by the school because they are based in social practices that reflect certain power relations and valued identity affiliations.

Identities taken up by English learners have been shown to be multidimensional and complex. While engaging in academic interactions with their peers, English learners are drawn into contexts that call for the appropriate use of language and social identities. Faltis and Coulter have emphasized that the identities of English learners create derive from socially and institutionally constructed identities already in existence. Identities emerge during socially situated learning

activities in which learners are provided multiple opportunities to try new identity affiliations as members of new language and academic communities. In this manner, English learners create new identities for themselves as a way to join and participate in established learning communities.

As English learners are invited into unfamiliar learning activities, they are simultaneously invited to establish school or institutional identities, which are demonstrated through their performance during assessment and any number of classroom practices. The ability to adapt to school and establish friendships among classmates contributes to the kinds of identities English learners create and nurture during their time in school. Beginning English language learners may not be able to adequately display their academic knowledge in English, which places them in a disempowered position relative to learners who are proficient in English. Most English learners become consciously aware very quickly that their ability to use oral and written English for academic tasks contributes to the formation of their identity. English learners realize as well that their status as classroom community members is also partially determined by the extent to which they gain access to the hierarchical power structures that exist in the classroom.

Part of what English learners learn through classroom settings is that how and what they communicate is not simply located at the local, classroom context; rather, it is also situated within larger academic, institutional, and social contexts of the different communities to which they already belong or are attempting to belong. This means that in any classroom a multiplicity of identities is involved in becoming a new member of an academic community. Learners are apprentices who need to participate in socially organized activities to acquire new language proficiency and the knowledge and skills coupled with the identity affiliation associated with them. Accordingly, students should be viewed as apprentices to broader institutional and social communities, where they create and assume multiple identities during the learning processes.

The sociocultural tenets of situated learning provide teachers with a new way to disengage from the conventional monolithic approaches to learning that give preference to fragmented skill development and locate learning entirely in the head of learners. However, it could be argued that the argument for learning as legitimate peripheral participation in communities of practice underestimates the role of cognitive and emotional processes involved in learning.

To be sure, learning is necessarily social and often peripheral in nature, but it can also have an individual character. Although language learners are situated in different discourse communities, which leads to peripheral participation, they can gradually gain the required knowledge to participate by controlling their learning processes based on how they feel about participation, and their knowledge of and ability to use previously acquired learning strategies.

SKILLS TRANSFER THEORY

Skills transfer theory has been applied to the study of human learning for at least 100 years and is an important

concept of education. Transfer of learning is the influence of prior learning on performance in a new situation. The theory explains how learners can transfer their skills and knowledge so that each new learning situation does not require that they start from zero. Young children learn to get along with their siblings and transfer this learning to their relationships with peers when they attend school. Adults who learn how to drive a car are able to transfer this knowledge to new contexts (for example, driving a truck or a boat). The assumption is that prior learning influences performance in new contexts.

Increasingly, researchers on bilingual education have been paying attention to the application of skills transfer theory—specifically, which skills seem to transfer from one language to the other for second-language learners, under which circumstances, and why. This entry describes research on skills transfer theory.

Learning Theories and Transfer of Learning

Skills transfer theory provides valuable insights about important topics in teaching and learning in bilingual/ESL classrooms, such as the following: (a) the relationship between proficiency in the L1 (native language) and achievement in L2 (English, the second language), (b) the relationship between overall reading abilities in L1 and in L2, and (c) the relationship between oral language proficiency in English and reading abilities in English. Furthermore, study of skills transfer theory helps researchers learn more about L1 literacy transfer to L2 literacy. Educators who work with second-language learners have found that skills transfer theory helps them understand more about the relationship between the processes involved in developing reading skills in the second language and the learner's reading ability in the native language.

The Linguistic Interdependence Hypothesis

Skills transfer theory states that language and literacy skills can be transferred from one language to another in bilingual learners. The linguistic interdependence principle holds that certain processes are basic to reading and that, once learned, they can be applied to reading other languages. Specifically, when children learn the meaning of print materials that characterize

their native language and home sociocultural community, the linguistic interdependence principle predicts that they will be able to extend their literacy expertise to a range of language and social contexts in their second language. Children who can read well in Spanish, for example, are actively involved in highly selective, multifaceted processes that are identical to the mental processes used to read in English. The skills needed to read well in Spanish are also needed to read well in English. Therefore, children who learn to read well in their native language need not totally relearn basic literacy skills in English. In other words, learning to read in the native language is beneficial because students apply many of the skills and strategies they acquired when learning how to read in their native language to the task of reading in the new language, English. A high level of proficiency in the native language leads to accelerated cognitive growth and, hence, to positive academic outcomes in the second language. Furthermore, instruction in native-language reading helps limited or non-English speakers appreciate their linguistic heritage, develop positive literacy experiences, and attain competence in both their home language and English. In contrast, excluding the native language from a student's instructional program or minimizing its use in classroom pedagogy may seriously reduce the learning options for nonnative speakers of English, compared with their English-dominant peers.

Cross-Linguistic Transfer Hypothesis: Metalinguistic Knowledge

This theory of second-language acquisition provides information about literacy instruction for teachers of English language learners (ELLs), supporting the notion that knowledge in the first language is transferred to cognitive and linguistic tasks in a second language. Bilingual readers acquire "metalinguistic" knowledge in their first language and transfer this knowledge to their second language as they develop literacy in both languages. Regardless of previous educational experiences, second-language learners have developed a sense of how language works. For example, they have learned the sounds of their native language; they know how to combine sounds to form words and to use words to convey their thoughts and ideas in verbal exchanges. They understand that a relationship exists between sounds and symbols. All of this knowledge about language and writing will

serve them well when they learn to communicate in their new language, English.

When students have developed literacy skills in their own language, however, teachers should keep in mind that transfer of literacy skills from one language to another depends on the similarities and differences between the languages and writing systems, including the units of speech symbolized by each character. If students are not yet literate in their native language, they must be taught relationships between written and spoken language and basic functions of print. This information is important for teachers, who provide students with opportunities to capitalize on their existing language skills.

Many literacy skills transfer across languages, including students' knowledge about the general processes of decoding, interpretation, and constructing meaning from text. For example, the letters /b/, /c/, /d/, /f/, /l/, /m/, /n/, /p/, /q/, /s/, and /t/, represent sounds that are similar in both English and Spanish. The letters /c/, /g/, /h/, /l/, /m/, /n/, /p/, and /q/ represent sounds that are similar in both English and Vietnamese. These sounds will transfer readily as children begin to read in English if they are fluent readers in their native languages. Teachers can use explicit instruction to develop pronunciation skills by explaining how sounds are the same or approximate. Minimal phonics instruction is needed when teaching the sounds of these consonants. However, much more instructional time needs to be devoted to teaching those sounds that do not exist in the language being taught, or exist with different symbols in students' primary languages. For Spanish speakers, some of those sounds and symbols are the unvoiced /th/ as in *thing*, the /j/ as in *jacket* or *cage*, the /z/ as in *zero*, the /sh/ as in *shell*, among others. For Vietnamese speakers, some of those sounds are the /r/, /v/, /x/, and /z/. Care must also be taken, however, because some of the sounds will transfer from one language to the other but a sound-symbol match may not exist. For example, the /f/ sound will transfer from Vietnamese to English but no sound-symbol match exists. That is, the sounds are represented by different symbols. Similarly, the /ck/ sound transfers from Spanish to English but no sound-symbol match exists. On the other hand, vowel sounds look the same in English and Spanish but their sounds can be very different: In English vowels have different pronunciations, whereas Spanish vowels are more uniform. English vowel sounds and their spellings are difficult even for

proficient readers of Spanish. It is important to teach children to attend to vowel spellings.

The writing systems of some languages have no resemblance to English. For example, many of the sounds in Cantonese exist in English, such as /c/, /k/, /f/, /h/, /l/, and /m/, however, the symbols that represent those sounds are different because of the origins of Chinese versus Western writing systems. Teachers must consider this information when planning instruction for Cantonese-speaking children and other language groups, particularly those children who are literate in their own native language.

Research on Literacy in the Native Language: Spanish

Research on skills transfer with Spanish-speaking children suggests that literacy instruction in the native language appears to be the most pedagogically sound way of learning about the relationship between meaning and print in both Spanish and English. Spanish-dominant youngsters acquire English more efficiently when they have attained literacy proficiency in their mother tongue. In general, children who are dominant in a language other than English acquire academic language and literacy skills more rapidly in both the native language and English when they attain literacy proficiency in the first language. Instruction in the students' native language simultaneously promotes the development of literacy skills in both the native language and second language. Thus, time invested in developing first-language literacy works to the advantage of second-language literacy achievement.

Instruction in Spanish reading helps limited or non-English speakers appreciate their linguistic heritage, develop positive literacy experiences, and attain competence in both academic Spanish and English. In contrast, excluding the native language from a student's instructional program or minimizing its use in classroom pedagogy may seriously reduce the learning options for Spanish-dominant children compared with their English-dominant peers. Students who arrive as immigrants in this country must learn English. They cannot fully benefit from the schools until they are able to profit from instruction conducted primarily in this language. At the same time, research on skills transfer theory has produced a large and growing body of evidence pointing to the vital role of native-language literacy in educating the whole child, enabling them to express all the creativity and wide

range of skills, talents, and prior knowledge they bring with them to school.

Research on skills transfer theory indicates that language skills acquired in the mother tongue will transfer positively to English if they are sufficiently developed in the native language. Findings from these studies also suggest that native-language instruction in literacy may be the most pedagogically sound method for helping immigrant children with limited English proficiency develop the skills and knowledge they will need to become proficient in the academic uses of their second language—English.

SOCIAL BILINGUALISM

Although psychologists and linguists have traditionally viewed and studied bilingualism as an individual's ability to speak two or more languages, it is also important to understand bilingual's social dimensions. The latter is a focus on the uses and functions, statuses, and relationships of two or more languages within a society. From the sociolinguistic perspective, languages are studied in relation to social groups, social class, ethnicity, and other interpersonal factors in communication.

At its most basic definition, *social bilingualism* refers to the presence of two or more languages in a given society. Many countries include various language or speech communities that is, groups that speak several languages or dialects. Social bilingualism, discussed in this entry, is often used interchangeably with the terms *societal bilingualism*, *collective bilingualism*, and *diglossia*.

What Is Diglossia?

The term *diglossia* is a Greek word meaning “two languages.” Charles Ferguson first described *diglossia* as referring to two varieties of the same language or dialects. Following Ferguson, the sociologist Joshua A. Fishman extended the concept of *diglossia* to refer to two languages of differing prestige found in a geographical area. The languages, each of which is associated with a higher or lower degree of prestige, have different functions and purposes. The higher-prestige one, designated as H, is used in formal texts and institutions such as by the government, in religion, education, high culture, business, and commerce. Often, this language is learned later in life in a formal institution outside the home, which makes it differentially accessible depending on the availability of access to such institutions. Additionally, the higher-status language is considered the gateway to educational and economic success and, thus, is viewed as the more desirable and powerful one. It follows, then, that the high language allows for social mobility.

In contrast, the lower-prestige language, designated as L, is the one that is used in daily life, the home and family, social and cultural activity in the community, and in communication with family and friends. Using the low variety in a situation where the high variety is the norm is unexpected and can mark

the user as an outsider, uneducated, or of a lower class. Low languages or varieties can be stigmatized, and sometimes speakers of the high variety will deny speaking the lesser-prestige language for fear of negative consequences. The high-low binary can also be described as between a majority (higher prestige) and minority (lower prestige) language within a country. Genetically related languages can be closely related, or more distantly related, depending on how directly they trace back to a common source.

Diglossia can manifest itself in different forms. Fishman explains the various linguistic relationships between the high- and low-status languages, taking into consideration whether H and L are genetically related or not (tracing back to a common source/language family): First is the case where the two languages are genetically related, and H is a classical language, and L is the vernacular. An example of this situation can be found in previous centuries when Latin was the high language preferred by Western European scholars and clergy, over the Romance-language spoken idiom of everyday use. The second is exemplified in European Judaic culture, in which Hebrew/Aramaic (H) remained the written language of religious discourse and ritual, and Yiddish (L), a High German language, was the medium of everyday speech among Jews. In this case, the classical (H) and the vernacular (L) are genetically unrelated. The third situation is found in Paraguay, where Spanish (H) is written and spoken formally but Guaraní (L), which is spoken by the indigenous Guaraní people, constitutes the vernacular. Here both H and L are genetically unrelated. The fourth case comprises a high language that is written and formally spoken and a vernacular, both genetically related to each other. An example is the arrangement found in the Caribbean where standard English and Caribbean Creole are the H and L languages, respectively.

The previous categories are only a beginning in trying to explain the linguistic relationships found in social bilingualism. There are also more complex situations within each of these groupings. For example, in some cases two high languages with one low language may exist, such as in the Philippines where national policy fosters English and Pilipino/Filipino as high languages and Tagalog as a low language. In other words, social bilingualism is shaped and influenced by political, economic, social, educational, and cultural forces. The idea of social bilingualism is broad; it looks very different from country to country

given the presence or absence of language compartmentalization in bilingual settings. Additionally, open networks, fluid role relationships, interactions across status lines, increase of interaction in the work arena, increasing urbanization, intermarriage, and mobility, among other factors, tend to diminish the compartmentalization of languages or language varieties.

Relationships Between Bilingualism and Diglossia

Fishman provides some useful perspective on the different types of social bilingualism that exist today. In his well-known typology, he describes the various relationships that exist between bilingualism as an individual phenomenon and diglossia as a social one. In the first type, both bilingualism and diglossia are present. Widespread access to the languages means that people know and use both the high- and low-status language or variety. But, the roles associated with each language or code are compartmentalized and kept separate. Examples around the world where bilingualism and diglossia are present include such countries as Switzerland where German is high and Swiss-German is low, and Egypt, Syria, and Lebanon where the high language is the Koranic Arabic used for Islamic studies, and the vernaculars including Lebanese, Syrian, and Egyptian Arabic are used for informal conversation.

Diglossia without bilingualism describes the second situation. This refers to a situation where two or more languages (or varieties) are spoken but one of the languages is restricted to only one speech community. In other words, one group speaks one of the languages, and another group speaks a different language. A common example can be found in Switzerland, where different language groups including German, French, and Italian are located in different areas. The official status of the different languages theoretically may be equal, and fluent bilingual speakers of both languages may be the exception rather than the rule. In some cases, the ruling group will speak the high language and the larger, less powerful group will speak the low language. This is a common pattern in colonial situations such as Haiti, where the elite spoke French and the masses spoke a language or dialect known as French Kreyol (also Creole).

The third relationship consists of bilingualism without diglossia, which occurs in areas that are undergoing

rapid social change or social unrest. In this situation, there are large groups of immigrants. The children become bilingual at an early age, but this bilingualism is transitory or transitional in that the language of the school and government replaces the language of the home. As a result, children become monolingual in the language of the public sphere, the high language. For example, the trend among Mexican immigrants in the United States is that the second generation is bilingual in the mother tongue and English, but the third generation is monolingual in English. Thus, the southwestern United States, which is home to large numbers of Mexican Americans, has witnessed extensive loss of Spanish among the third and subsequent generations of immigrants. The dominance of English, the high-prestige language, fosters this. Few resources exist for the maintenance of the home language. Painfully aware of the status and prestige of English, some immigrant parents do not encourage their children's learning of the heritage language. Furthermore, kids as young as 3 years old become aware of the higher prestige and status of English, and they may feel shame when speaking their parents' home language, which further diminishes the use of the language. In addition to Spanish and other immigrant languages, there exist varieties of English, which are low including Chicano English, African American Vernacular English (AAVE), and some southern dialects.

The fourth type of relationship between bilingualism and diglossia is distinguished by the presence of neither diglossia nor bilingualism. No fully differentiated languages or varieties exist. However, this fourth state is difficult to find because all speech communities seem to have certain rituals, ceremonies, or events that are carried on in a particular language or variety to which access is limited. One example is where a formerly linguistically diverse society has been forcibly changed to a relatively monolingual society because the native languages have been exterminated. Another example is a small speech community that uses its minority language for all functions and has no relationship with the neighboring majority language.

Politics, Policies, and Language Rights

Although social bilingualism is considered to be a stable, permanent, and continuing structure, it involves a complex interplay of power struggles, ideologies of

nation, and politics that can affect the stability of the various systems. Scholars who have tested Fishman's typology of the relationship between bilingualism and diglossia among nine language groups have found that it has only limited predictive value. Colin Baker writes that ease of travel and communication, increased social and vocational mobility, a global economy, globalization, and more urbanization leads to more contact between language communities, often making language shift more typical than language stability. Even when countries attempt to preserve the compartmentalization of languages through policy, the political and power base of the two languages changes over time.

Two such attempts at separating languages are "the territorial principle" and the "personality principle." The territorial principle refers to a language having been given official status in a specific geographical area, for example, Belgium has three designated regions where Flemish, French, and German speakers have language rights inside their regions, but not outside in the remainder of Belgium. On the other hand, in Canada, under the "personality principle," Francophones have the right to use French wherever they travel across their country. Language status is given to individuals or groups wherever they live within a country. The "personality" refers to the linguistic status of the person traveling. The attempt to merge the territorial and personality principles has been termed the *asymmetrical principle* or *asymmetrical bilingualism*. Canadians conceived this principle to give full rights to minority language speakers and to redress discrimination against them. In this way, the question of social bilingualism intersects with the question of language rights.

The term *language rights* refers to the notion that the once-suppressed languages of national minorities should be recognized and revived. An argument for the maintenance and spread of a language is often based on its historic existence within a defined boundary. Language rights for indigenous or minority languages may be protected by law. Spain, for example, has a policy that reflects a commitment to language revitalization, taking into account the historical marginalization, dating back to the 19th century, of minority languages. Latvia and Canada have instituted similar policies. However, because language policies are never neutral nor inconsequential, the focus on revival has brought about new language conflicts.

Implications for Bilingual Education

The functions and boundaries of two languages in a diglossic society will both affect and be reflected in bilingual education policy and practice. Many questions remain to be assessed and decisions to be made about the language that is to be used in schooling, oral communication, and biliteracy. These questions are complicated and laden with controversy when it comes to schooling the nation's children. In the United States, for example, bilingual education has been hotly debated for decades and continues to be a source of political conflict as the dismantling of bilingual education in California, Arizona, and Massachusetts demonstrates. This brings back the call for more of a focus on the social aspects of bilingualism to help illuminate the phenomenon of individual bilingualism.

SOCIAL CLASS AND LANGUAGE STATUS

Most Americans can tell that English speakers from different geographical regions use distinct varieties of the language. The same is true for regional and

national dialects of Spanish, Chinese, and Swahili, although that may not be as apparent to those who do not speak those languages. However, how people use language depends more than just on where they come from. A range of social categories influences speech, such as age, gender, ethnicity, style (formal or informal), and social class. Although these categories are undoubtedly interrelated, social class has long been studied as an important factor of the way language is used, as discussed in this entry. The noted sociolinguist William Labov asserted that social class is the fundamental sociolinguistic pattern of variation and that other patterns of variation (for example, gender or ethnicity) are derivative patterns. Although all languages and language varieties are equal in the linguistic sense, they are not all worth the same in the social sense. Standard varieties are privileged, and nonstandard varieties are stigmatized, both by degree. French sociologist Pierre Bourdieu used the term *linguistic capital* to refer to the positive aspects of privilege and status that languages carry with them wherever they go.

Social Class and the Patterned Variation of Language Use

The father of modern linguistics, Ferdinand de Saussure, made a key distinction between *langue*, or language as a system, and *parole*, or speech. In a collection of his lectures published posthumously in 1916, Saussure asserted that *langue* is the proper object of linguistic study and analysis. Early linguists followed his lead, and although it was observed that people actually did use language quite differently across different areas and in different social situations, they wrote off these differences as instances of *free variation*. Free variation was seen as the random, inexplicable differences in language use. Noam Chomsky's concepts of *competence* and *performance* mirror *langue* and *parole*, respectively, in many ways. Chomsky also stressed that his object of study was language competence, not language performance. Indeed, he viewed performance as a secondary level or layer to language analysis, whereas within competence lay the key to understanding the true nature of language.

During the 1960s, however, a group of scholars began working to show that language use in everyday social situations is patterned in interesting ways, when it had previously been discounted as random free variation. Moreover, these scholars noted that the regularities

of language use revealed the social structures within which people use language. The work of this group of scholars came to be known as *sociolinguistics*. Specifically, studies in *correlational* or *variationist* sociolinguistics sought to link a particular linguistic variable to its social significance. By using quantitative methods, researchers were able to prove that the idea of free variance was flawed, that language use is patterned in regular ways. A *linguistic variable* can be any salient feature that marks difference in language use; often researchers chose phonological markers because they were easy to identify and count—for example, whether the vowel in the words *pen* and *pin* are pronounced the same or differently, or whether the “-ing” tense is pronounced with the final sound as [ŋ] as “playing” or [n] as in “playin.” A linguistic variable can be a grammatical feature as well, such as the way the third-person singular is conjugated (“he does” versus “he do”). Finally, word choice can also be a variable, say whether a person uses *bag* or *sack*.

The form a person uses depends on what position that person wants. An elderly White woman from a rural community will have adopted ways of talking: her accent and choice of vocabulary and grammatical structures that identify her as a member of a particular *speech community* (a social group that shares ways of using language). An inner-city youth may take on very different ways of talking that are meant to project traits valued by his social group—for example, toughness, manliness, and a particular style of humor. So a researcher, for instance, could find salient linguistic variables within the inner-city adolescents’ speech community and correlate those to some other social factor, such as the youths’ attitude toward school. Sociolinguist Penelope Eckert used this approach in her study of gender differences across two school social groups she called “jocks” and “burn-outs.”

Labov’s study of three New York department stores is seminal in this field because of the methodology he used and because his results clearly showed the connection between social class and language use. Labov identified working-, middle-, and upper-class department stores. In each one, he entered and asked the store clerk the location of an item (for example, “Where is the shoe section?”) for which he knew the answer would be “the fourth floor.” He carefully noted how the respondent pronounced the final “r” in each word (called the post-vocalic /r/) because he had previously identified it as his linguistic variable. By asking multiple employees in each store, he was able

to quickly generate data that showed a clear correlation between the presence or absence of the post-vocalic /r/ and social class. His results reflected that the more working class a person is in New York City, the more likely that person is to drop the final “r”: 62% for the working-class store versus 20% for the upper-class store. The post-vocalic /r/ is also an indicator of social class in the city of Reading, England. However, in Reading, the correlation is reversed: The *higher* a person’s social class is, the more likely that person is to drop r’s. The same sort of analysis also discovered that both in Detroit, Michigan, and Norwich, England, working-class people were more likely to drop the -s in the third person singular (“he go”), but that the difference between middle- and working-class norms were greater in Norwich than in Detroit. An interpretation of this result could be that there may be more mobility in the U.S. social system.

Language Standards and the (In)equality of Variety

That dropped r’s have the exact opposite social value in New York City as in Reading, England, tells us an important sociolinguistic truth: that ways of talking correspond to, but do not determine, social standing. Some linguistic forms have higher social status than others, but the value of a particular linguistic form, whether it is seen as an “upper-class” or “lower-class” way of talking, is created by historical social conditions rather than because of anything inherent in the forms themselves. This may seem obvious, but it has important implications for sociolinguistics.

One of the main premises of sociolinguistics is the assumption that no one’s way of using language is better than another’s; they are simply different. Although sociolinguists stress that these differences are patterned, they also stress that there is no means of making linguistic judgments about which way of using language is better, more proper, or “correct.” Evaluations about proper and correct ways of using language are *social*, rather than *linguistic*, judgments. Hence, common admonitions made by English teachers on proper usage—not to use “ain’t” or to end a sentence with a preposition—are based on *prescriptivist* views of language, according to a sociolinguistic approach. A prescriptivist view holds that established norms of language use, most obviously those laid out in pedagogical grammar books, constitute the rules of proper usage and are therefore more

correct than alternate or deviant forms. However, again, from a sociolinguistic point of view, there is no such notion as “correct” or “incorrect” language. The best dictionaries of English are almost certain to point this out in the preface to the list of meanings but the point is often lost when people look up a word to find its “correct” usage.

Sociolinguists take a *descriptive* approach to language study and observe that those ways of using what constitutes *language standards* merely represent one particular way of using language by one particular language group at a particular point in time. Standard language forms in the United States, for instance, reflect dominant White, middle-class linguistic norms. Nonstandard and vernacular forms largely correspond to marginalized working-class and racial or ethnic minorities. Ebonics is often stigmatized because it is generally spoken by poor African Americans. However, a linguistic analysis of Ebonics shows that it is every bit as rule-governed (in the descriptivist sense) as is standard American English (SAE). Characterizations of Ebonics as a “linguistic ghetto” and SAE as the “cash language” reflect social judgments, rather than linguistic evaluations, of the relative value of these varieties as linguistic capital. Studies done in a related field of linguistics called *discourse analysis* have considered what happens at an interactional level when speakers of vernacular varieties interview for jobs, attempt to gain access to health care services, interact with school administrators, and other social situations where nonstandard speakers must use their linguistic resources to negotiate dominant institutional structures.

Class Differences Challenge Educators

Most educators agree that one of the main imperatives of public education is to equip students with the language resources necessary to allow them to successfully navigate mainstream institutions and mainstream life. That is, the school curriculum ought to develop the language and literacy skills that count as linguistic capital in mainstream U.S. society. This means that all students should become articulate and literate in SAE. As sociolinguists and ethnographers of education such as Shirley Brice Heath have found, this is much easier for students who arrive at school speaking SAE, and thus provides them with an advantage. In her 1983 work *Ways With Words*, Heath showed how

language socialization practices, the myriad of ways parents teach their children to interact and use language, differ across culture and class. She and other researchers have noted, for example, how African American children’s narrative structure differs from how White children organize a storytelling event. The effect of these differences is that some children come to school already knowing how to interact and use language in ways that are valued and rewarded in schools, whereas other children struggle to learn these norms. Susan Philips used an approach called the *ethnography of communication* to document how Warm Springs native children’s patterns of language use are distinct from those of mainstream children and showed how the native children struggled to adjust to the Anglo discourse and interactional structures teachers created in the classrooms. Children who have a harder time adjusting are often seen as nonparticipatory, disruptive, attention-deficit disorder, or learning disabled. Because these language differences correspond to lower socioeconomic status, they often contribute to academic failure.

On the one hand, the school has an obligation to teach children the standard language that will give them access to social opportunities and mobility. On the other hand, the school also should value and honor children’s linguistic and cultural heritage, rather than reinforce negative stereotypes that denigrate certain language varieties. One significant approach to the problem of how to best understand and value children’s language resources is called *household funds of knowledge*. This approach advocates an ethnographic view of seeing how families use the linguistic capital they have, their everyday language and literacy practices in their homes and communities, to negotiate real-world challenges. In turn, these can serve as starting points for curricula and classroom practices that are more relevant and meaningful to nonmainstream students.

with the notion of class differences. As a society, Americans tend to regard low social class not as a condition with long-term consequences, but as something that can be outgrown through diligence and hard work. Many Americans believe that education trumps class. They proudly proclaim that class has little or nothing to do with finding one's niche in U.S. society. U.S. residents are, as a people, proud of having discarded the idea of nobility and social standing based on lineage or high birth.

Recent research and analysis on the subject suggests that this collective wisdom may be wrong. Class, the relative status of groups within U.S. society, may have as much to do with the school success of immigrants and linguistic minorities as does language incompatibility between schools and learners. Equally important is the close association between the "hidden curriculum" of the schools (the "unofficial" or "unintended" knowledge that children get from schooling, such as good manners or competing for good grades) and middle-class, English-speaking society. The hidden curriculum favors individuals and groups who share the social and cultural assumptions of the persons who design the curriculum. This entry discusses those issues.

SOCIAL CLASS AND SCHOOL SUCCESS

Most immigrant children and youth who enter U.S. schools are not proficient in English. This is their most salient feature, or at least it is what schools and school people focus on as the biggest challenge for the schools and the children alike. Many of these young people also have an additional characteristic that is probably no less important. Many of them come from a social class and an experiential family history that is substantially different from that of the White English-speaking group with whom they will share classrooms for several years.

What role do social class and histories of family schooling play in the way that immigrant children engage their school experience in the United States? How do issues of class compare with language incompatibilities in the school context? These questions are difficult to answer partly because American researchers have not paid enough attention to the formal study of social class as a factor in school success. Researchers have studied poverty, but social class is a broader concept. Americans tend to be uncomfortable

Class Defined

For the purposes of this entry, *class* is partially a sociological and partially a cultural phenomenon. *Class* encompasses a wide range of shared beliefs, values, and predispositions that are largely related to earning power but that are not totally defined by wealth or earnings. Those in the United States do not equate class with wealth, poise, elegance of bearing, or any other of the ways humans have invented to position themselves as being of a higher status than their neighbors. This entry discusses "class" in the sociological sense, rather than "classiness."

Research has shown that sociocultural notions of class are embedded in the curriculum and interactive style of schools and school people. The features of middle-classdom most favored by schools includes demonstration of the following: polite interaction with others, conventionalities in the use of oral language, appreciation for urbane patterns of conduct such as waiting in line for one's turn, and public expressions of respect for the historical aspects of national identity. Diligent effort, constancy of work patterns, competitiveness, and a commitment to

improvement are all part of what schools regard as useful and necessary behaviors. Schools disdain bullies and honor team players who are able to put the needs of the group above their own. All of these values and preferences are part of the hidden curriculum. They are reinforced in children who already have them and pushed on those who do not.

Class Differences in a School Context

The differences in the school manifestations of class differences can be illustrated through the following example:

Pablo comes to his first day of school. On the basis of an interview with his parents, he has been placed in the fourth grade. His parents have had little formal schooling beyond the early grades of elementary school in a small rural school in a developing country. His literacy skills in Spanish are below par. He can read only the simplest text and then only laboriously. He speaks English haltingly, although he is quick to understand new language he has not heard before. Pablo is unfamiliar with the routines of the school lunchroom because he has never attended a school that had such a facility. His school was a small one-room building in which individual behavior was valued much more than was one's social behavior. Because there was only one teacher and more than 80 children in the school, quiet and orderliness was highly valued. In his new school, as recorded in his cumulative record file, Pablo is considered to be overly quiet and introverted.

Pablo's family does not have a checking or savings account. They have never had one. Their earnings are paid in cash, which is spent as fast as it comes in. The few pennies that are left over after the weekly purchases of food and other necessities are kept in a coffee can in his mother's kitchen.

Pablo's family has never taken a vacation. Members of his family are at home during daylight hours only when they are between jobs. His mother and father both have two jobs that keep them away from home most evenings. He has several brothers and sisters, and his oldest sister, Marina, is pregnant at the age of 15. She has no husband or fiancé and must endure the outcome of the pregnancy alone. Her parents are very upset at her. When they discovered she was pregnant, she was immediately withdrawn from school. The parents are debating

whether to send her back "home" to have the baby. Marina has lived in the United States since she was seven. School personnel are probably not aware of her pregnancy. No one in the family has sufficient literacy skills in English to help the younger children with their homework. Other than occasional visits to a doctor or dentist, Pablo has never met a professional person in any field outside of teaching. The reasons for attending school and working hard on his schoolwork have never been clear to him.

Pablo sits across the aisle from Paul, a bright-eyed youngster with a high interest in team sports and electronic toys. Paul is assertive in his interactions with fellow students, eagerly engages in class discussions, and is not hesitant to volunteer answers to the teacher's questions. He always seems to know what the teacher wants by way of a response. Pablo is keen to develop this skill. He is amazed at Paul's ability to finesse his way to good grades that Pablo feels are undeserved. Pablo is also surprised that the teacher seems not to mind that Paul is often light-hearted and somewhat playful about his school assignments. Pablo's own experiences in the prior grades were rigid and far from enjoyable.

Paul is the second child in the family. His mother is a college graduate who has never worked outside the home. She chooses to stay home and devotes most of her energy and time to taking care of her three children and doing volunteer work at a battered woman's shelter. She is an avid reader and has taught her children to enjoy books and magazines during their quiet times. Although they are not wealthy and only have one income, Paul's mother has a standing policy that the children can purchase one book per month on any subject, provided they finish reading one book before buying another. All of her children are good readers, although they seem to have well-balanced interests. They could not be called bookworms by any means. She discourages excessive television watching, although Paul manages to take in most of the important sports events, especially NASCAR racing and football. Pablo prefers soccer but has found few other boys who like the sport in his school.

Paul and his family live in an ex-urban community with green spaces, bicycle paths, and golf courses. He has never been involved in an automobile accident and has never experienced violence to his person. Before moving to the United States, Pablo had a traumatic experience. He witnessed

a shooting of a neighbor by men in uniform in the street. Paul, on the other hand, has an extensive collection of G.I. Joe toys and dreams of wearing a uniform, any uniform. Paul has never experienced physical pain or bloodshed beyond the cuts and scrapes associated with an active sports life. He smiles and waves at police cars; Pablo averts his gaze when he sees a police car and pretends he has not seen it.

Paul has a 15-year-old sister, Martha, who is sexually active with her boyfriend. With her mother's consent, she has been instructed in safe sex by a youngish aunt. Martha has been using birth control pills for at least one year. She is a straight-A student who frequently helps Paul with his homework. Paul's sister is very close to him. Much to his embarrassment, she seems ready to take on any kid who might hurt or embarrass him.

In class, Pablo is quiet and almost withdrawn. He rarely volunteers an answer even when he is sure he knows it. Pablo is puzzled that Paul, who is sometimes loud and somewhat overbearing, makes better grades than he. The two boys were friendly toward each other for the first few weeks of school but have now grown apart because they do not understand each other well. Paul is not patient with Pablo, who feels that Paul is somewhat pushy and impolite toward him. Pablo has few friends and looks forward to the end of the school day when he can go home to an empty house and watch television for several hours until his parents return.

Although this vignette is fictional, teachers who have read it often say they have had children like Pablo or Paul in their classroom. When asked to say whether the two boys are in the same or in different social class, most teachers assert that Pablo is lower or working class, whereas Paul is solidly middle class. They also suggest that Paul is more likely to do well in the higher grades. Pablo's lack of English is identified as a problem, even though the narrative does not mention that as a serious problem for Pablo. It is not easy, however, for teachers to agree which problem is the most serious, language or class. The dynamics of class difference and the long-term effects of those differences are not always apparent to teachers and school officials. When the story is extended to relate Pablo's involvement with a hoodlum gang in his high school years, and Paul's successful career as a star football player in high school, few educators are surprised. They nod

their heads in understanding and find it easy to accept the credibility of those episodes in the lives of the two boys. Generally, the effects of class difference are acknowledged as important, but are not seen as being equally challenging as the language barrier.

Current Research

One of the few contemporary scholars who has examined social class differences in a sustained manner is Richard Rothstein, a former education columnist for the *New York Times*. In his book *Class and Schools*, Rothstein examines the research literature on social class and school success. His particular focus is African American students. He also looks at a sampling of studies from other countries. Rothstein concludes that, at least for Black students, class is an element that must be considered in the drive to reform schools. Rothstein is among a handful of education writers who assert that the current thrust to place strong accountability on schools is likely to fail because the schools, acting alone, lack sufficient power to overcome the social class barriers faced by poor African American families.

Rothstein's conclusions are of special interest to bilingual education because the problem of being a non-English speaker does not arise in the same way in the case of African American students. This seems to highlight the importance of class over language differences.

Rothstein argues that some aspects of what we commonly understand as social class are obvious, whereas others are less obvious but no less important. Among the latter, Rothstein claims that many differences in what is commonly referred to as "quality of life" topics stem from social class disparities: health care quality and access, nutrition, child-rearing styles, housing quality and stability, parental occupation and aspirations, and even exposure to environmental toxins. All of these play a part in how well children learn and succeed in school. A multipart report in the *New York Times* claimed that in some cases, social class is a key factor in whether a heart attack victim survives that trauma and determines the type of care such victims receive after the incident. This is because class determines the type of health care Americans aspire to or demand. Poor patients settle for whatever medical care they can get; more affluent patients demand the best care available and often insist on more than one opinion when surgery is involved.

Among other social class factors identified by Rothstein as having an effect on school success are parental occupation and home literacy practices. School people are not surprised by this assertion: The children of doctors, lawyers, and successful merchants are likely to do better and to do so more quickly than are children of families who work in low-prestige jobs. Among immigrant families, a similar pattern exists. Children of high-prestige immigrant families catch up more quickly in school, even when English mastery is an issue, than do children of illiterate parents or parents from unskilled groups. Rothstein found in his review of research literature that this situation exists not only in the United States but also in Germany and England, where it is even more marked.

Finally, poor minority children of all races and ethnic groups are disproportionately affected by high family mobility. Poor families tend to move more often than middle-class families do, thereby disrupting the lives of children and youth and affecting their schoolwork negatively. These displacements are caused by job loss or seasonal variations in job availability. Poor families may also move because of housing problems. No matter what the causes, frequent movement between schools and teachers makes learning more difficult. Depending on class, adults may not recognize the affect of family moves on their children. The bottom line for Rothstein is that children's lives must be improved inside and outside the classroom simultaneously.

This overview raised the question, Are the language differences of immigrant youngsters more important than differences of social class as factors in their school success in U.S. schools? A review of important research concerning social class makes a convincing argument that social class differences are important. The probative value of this research seems high although by no means conclusive because the two factors have not been compared empirically. We must await further research before we can make a stronger statement of relative importance. Conceptually, an interesting beginning in this direction was proposed by Milton Gordon, who coined the term *ethclass* to refer to a combination of factors relating to class and ethnicity as a promising way of assessing these differences. Gordon defines the *ethclass* as a combination of ethnicity and class, where the latter is chiefly regarded as a matter of wealth. This juxtaposition of distinct concepts suggests that class may be as important as ethnicity, although Gordon did

not factor language into his framework. Gordon was attempting to find a more robust concept with which to analyze social phenomena. His postulate is that millionaires from almost any ethnic group have more in common with each other than with destitute people from their own ethnic groups. Similarly, chronically poor people from almost any culture or country have more in common with each other than they do with an upper-middle-class professional from their own ethnic group. Gordon's conclusions do not consider language differences, although it could be argued that at least in part, they are subsumed under ethnicity.

Class and Culture

An important footnote to close this discussion is that social class and culture are different concepts. Explicit in this concept is the assumption that such a culture cannot be changed and that those who carry it are doomed to suffer its effects generation after generation. Social class is more tractable. It is no doubt difficult to overcome patterns of thought and behavior that have evolved over more than one generation, but it is far from impossible. Many people from the poorest strata of society have overcome the limitations of the class they were born into and moved up to partake more fruitfully of the American dream. It is not clear why this happens in some cases but not in others. As more is learned about this transition, schools may someday be able to claim, credibly, that low social class is but one more barrier to overcome and that schools know how to do it.

SOCIALIZATION

See ENCULTURATION

SOCIAL LEARNING

Social learning refers to the belief that thought has its genesis in social interaction. It emphasizes the importance of human activity in social interaction as the primary process for gaining knowledge. Social learning is based on the theories of Lev Vygotsky, a Russian cognitive psychologist of the early 20th century. Vygotsky's theories emphasized the central role of the social interaction, transactions, and context in all learning and development and the dynamic interdependence of social and individual process. This is in contrast with other learning paradigms that emphasize gaining knowledge as an individual process, occurring solely in the mind. Another approach to social learning theory is that found in the work of Albert Bandura, whose approach is related to the social learning of Vygotsky, but emphasizes the importance of observing and modeling the behaviors, attitudes, and emotional reactions of others. Bandura's theory has been applied to the understanding of aggression and other psychological disorders. This entry addresses the nature of social learning as viewed by Vygotsky, and its applications to understanding language and literacy development.

Human Development and the Social Context

Learning and development occur in socially and culturally shaped contexts. During early human development, young children enter into a social dependency with their caregivers. As children participate in human activity, they learn from the experiences of others. Throughout the early development, there exists a predominance of the social interaction and interdependence with other individuals. Vygotsky referred to this interdependence as the "genetic law of development" through which socially shared activities are later transformed into internalized processes. For example, Barbara Rogoff describes how children involved with parents in agricultural and household work assumed increasing responsibility for their own learning and participation in joint activity. She characterized this

process as guided participation. Developmental activities are the products of social and cultural practices belonging to the community to which the individual child has access.

In Vygotsky's theory of development, every mental function or task being learned goes through the process first in the social realm, while interacting with others, and later at the individual internal level. In the interpsychological plane, the individual learns in social interaction with others through the use of tools such as language and other symbolic systems. In the intrapsychological plane, the individual uses mental tools such as thoughts, which were created and shaped in the social and cultural contexts. So an individual may first learn a new task in the interpsychological plane working with others and then use that knowledge in the intrapsychological plane.

Social learning and development are culturally contextual, mediational, and best understood through genetic analysis within their historical development. This entry examines three important contributing factors that summarize Vygotsky's notions: (a) learning is a process best understood by genetic or developmental analysis, (b) learning has its origins in social interactions, and (c) learning is mediated by tools.

First, in social learning, the process or the origins of what is to be learned is central; that is, learning a particular task means examining the process of change or development of the thing being studied. Studying the process means discovering its nature or essence, which maximizes the experience and the opportunity to learn. The origins of the process and the continued development become what James Wertsch calls "the genetic matter" of the social conceptions of mind. The social conception of mind contrasts with the mind as individual. The socially conceived mind is not something solely residing in the individual for the individual's uses; it is a mind molded, developed, and used in a social plane.

Second, social learning blurs the roles and reshapes the connection between the repository of knowledge and the learner of the knowledge. Social learning is not concerned with learning as a transfer of knowledge from a repository (e.g., text), or a person (e.g., teachers), to the learner's mind but, rather, focuses on the cultural process within the social systems. Knowing is a cultural process through which the individual engages the knowledge of the other, through a transaction that is interdependent between the learner, the text, practice, and context.

Third, social leaning emphasizes the role of mediational tools—for example, language, texts, and media—in human mental functioning. The mediational tools and the human mental functioning around the use of the tools are situated in cultural and historical context. The social interaction and use of mediational tools shape the interdependence of thought and language, speech and activity, immediacy and context. By considering the very nature or the representational activities, for example, forms of inner speech, imagery, or conceptual artifacts, and the culturally shared systems, we may explore the way cognitive processes depend on the social as well as the physical practices. Wertsch distinguishes between those mediational tools directed toward the physical world and the tools directed to internal psychological process, but emphasizes that both are appropriated during social activity. Thus, the artifacts and the social interaction around the artifacts both enable and constrain the individual's potential to make meaning—that is, to learn.

The Role of Language

Social learning stands in the foreground of the role of language in social interaction and in the meaning-making processes. Language is viewed as a mediational tool, and language and literacy are learned in social interactions situated within cultural and historical systems. The very acquisition of language, whether first or second, occurs in social interactions and social settings requiring cooperation between novice and more expert speakers. Thus, the first stages of language development appear as an interpsychological process, where the learner in social interaction with others learns to use language to control, regulate, and communicate. In the second stage of language development, language becomes an intrapsychological process, where the learner internalizes the use to regulate one's behavior and to use it as a tool for further learning. Examining perspectives of social learning contributes to understanding of the interplay between language development, literate processes, and the social and cultural lives of children as they carry out literacy, meaning-making, and problem-solving activities.

Social learning has been applied extensively in programs for second-language learners, particularly in the context of language and literacy learning. It is also the foundation for the conceptualization of

collaborative and cooperative group techniques and strategies used in many second-language classrooms. In classrooms, where children come from social groups that may have different patterns of preferred interaction, children will work on collaborative activities requiring them to assume new patterns of behavior. In these collaborative or cooperative groups, children will begin to share, explore, and integrate new ways of being social and learn other cultural norms. In these groups, Vygotsky's concept of "Zone of Proximal Development" (the space between the learner's current level of knowledge and a higher level that is achieved through collaboration) is bridged in the social process as learners assist one another to accomplish the task or activity. Children will be able to perform tasks within the collaborative or cooperative group that may be beyond their developmental level, and through the collaborative performance will learn and be able to later accomplish similar or higher-level tasks individually. As the learning tasks become more difficult, so does the social human activity, which engages in increasingly complex processes that include transmission, construction, transaction, and transformation at increasingly higher levels of mental functioning.

Sociocultural Theory

Sociocultural theory emanates from social learning and has made directional changing contributions to our understanding of language and literacy development. Concern with issues of culture and language in educational settings emerged as an important research question that led to studies that examined the complex relationships of social factors in language and literacy learning, especially for culturally and linguistically diverse learners. Kathryn Au and Jane Mason studied the successful literacy lesson practices in the Kamehameha Elementary Education Program that reflected the social and cultural ways of the children in the class. Shirley Brice Heath studied the social context of language development and literacy practices of African American and White children, both from working-class households. She also examined the discontinuity in social and cultural practices in these communities and the literacy practices of public school classrooms. Luis Moll studied the social networks and "funds of knowledge" found in Mexican American communities. He examined how knowledge was socially distributed and how

through mediating structures, such as after-school labs, strategic connections could be facilitated to use the household knowledge to understand school material and classroom activities. These and many other applications of sociocultural theory to research have provided valuable insights to improve the quality of education for students who come from diverse backgrounds and to understand the social processes involved in the learning of language and literacy.

SOUTHEAST ASIAN REFUGEES

In the 1970s and early 1980s, thousands of refugees from Cambodia, Laos, and Vietnam came to the United States. The Vietnam War had spread to Cambodia and Laos, leading to civil war and other conflicts within those countries. Unlike traditional immigrants who move from one country to another by choice, refugees are individuals who are forced to flee from their country to escape danger or persecution. Many Cambodians, Laotians, Hmong, and Vietnamese escaped from their countries to avoid political persecution, starvation, or execution. Most of these refugees spent a few months to several years living in refugee camps in neighboring countries. When it proved too dangerous for them to return to their home countries, arrangements were made for many of them to resettle in the United States and other countries. This entry discusses the background, demographics, and bilingual education programs for this population.

By 2005, more than 2 million Southeast Asian Americans whose families originated from Cambodia, Laos, and Vietnam were living in the United States. About one-third of the Southeast Asian American population was between the ages of 5 and 17, and thus of school age (K–12). Although the Southeast Asian American student population is much smaller than the Spanish-speaking student population, several large, Cambodian, Hmong, Lao, and Vietnamese communities exist in cities throughout the United States, posing significant challenges to the local schools charged with meeting their unique linguistic, cultural, and educational needs. Although many students from these communities have been successful, Southeast Asian American refugee students have not done well academically as a whole. This is partly due to the trauma of months of uncertainties in refugee camps, but perhaps more importantly, caused by the lack of bilingual and other language education programs designed to meet their needs.

Four major ethnic groups constitute the Southeast Asian American refugee population today: Vietnamese, Cambodians (or Khmer), Laotians (or Lao), and Hmong (from the highlands of Laos). Some smaller ethnic group refugee students from Laos include the Thaidam and Iu Mien. By 2005, most Southeast Asian American students in Grades K–12 were U.S.-born. A small number of recent immigrants are from Cambodia, Laos, and Vietnam, most of whom have

been sponsored by relatives or others who came as refugees in the previous decades. Also, a large group of Hmong refugees who had been living in an unofficial refugee camp in Thailand were allowed to resettle in the United States in 2004 (see below).

Although there are students in American schools today from other Southeast Asian countries, including Thailand, Malaysia, and Singapore, these students are not discussed here because they are fewer and are traditional immigrants not associated with the refugee experience.

Historical Background of Southeast Asian Refugee Groups

Cambodians

The Vietnam War spread to Cambodia in 1970 as the United States began bombing the Ho Chi Minh Trail, a supply line for the Viet Cong that passed through parts of Northern Cambodia. The bombing, along with a U.S.-sponsored coup d'état, gave rise to Pol Pot and his Communist Khmer Rouge regime, leading to a major civil war and genocide in Cambodia. Following the pullout of American troops and diplomats, the Khmer Rouge captured the capital city of Cambodia, Phnom Penh, on April 17, 1975, and immediately emptied the capital and forced the entire population into the countryside, where people were organized into communes and forced to do agricultural labor under slavlike conditions. The Khmer Rouge operated a program of genocide in which between 1 and 3 million Cambodians (about one-third of the population) died. Many—particularly members of the educated classes—were systematically executed, but many others died of starvation or disease. The genocide ended in 1979 following the invasion of Cambodia by Vietnam, which ended the Khmer Rouge's reign of terror, but that launched Cambodia into a new phase of civil war that lasted another 20 years and beyond. During the chaos that ensued during and after the invasion, thousands of Cambodians fled to the border of Thailand, where they were allowed to stay in refugee camps, including some established by the United Nations.

The education of most refugee children was disrupted for 4 years or more because the Khmer Rouge had shut down the schools and executed teachers. Schooling in the refugee camps was limited. Cambodian students suffered traumatic experiences under

the Khmer Rouge and in the refugee camps. Few spoke English, and many of the younger students were not literate in Khmer. Most came from rural backgrounds where their parents had had little formal education.

About 13,000 Cambodian refugees managed to escape before the Khmer Rouge takeover in 1975. This group tended to include members of the educated classes. Most refugees, however, are survivors of the genocide and came to the United States in the 1980s. Most of these refugees were from rural backgrounds with low levels of literacy and education. Beginning in the mid-1990s, it became possible for some Cambodian American families to sponsor their relatives left behind in Cambodia to the United States. Thus, although in the early years of the 21st century, most Cambodian American students were born in the United States, some students recently emigrated from Cambodia.

Laotians

Laos is an ethnically diverse country with approximately 60 different ethnic groups. It is also one of the poorest in Southeast Asia and historically has had the lowest levels of literacy and education. The dominant and ruling ethnic group, the "Lowland Lao," made up about 50% of the population. A Communist movement, the Pathet Lao, resisted French occupation beginning in the 1950s and waged civil war against the royal government. By some estimates, the Pathet Lao controlled more than one-third of the country by the early 1960s. The Pathet Lao became allies of the North Vietnamese (Viet Cong), and soon after the end of the Vietnam War, the Pathet Lao captured the Laotian capital and took over the country. Unlike the Khmer Rouge, the Pathet Lao were not genocidal, and even had a strong educational agenda to open schools, particularly in ethnic tribal areas where schooling was limited. Nonetheless, thousands of Lowland Lao—particularly those of the middle and upper classes affiliated with the former government—feared for their lives and fled as refugees, making dangerous journeys through the jungle to the Thailand border. After spending anywhere from several months to several years in refugee camps, thousands of Laotian refugees were allowed to resettle in the United States and other Western countries. Most Laotians settled—either initially or later as a result of secondary migration—in California, though large communities

also exist in Texas, Minnesota, and Washington, and smaller communities in many other states. Despite being of higher social class and having better access to education than Cambodian and Hmong refugees had, Laotian refugee students struggled greatly because local schools were ill-prepared to meet their unique language and educational needs.

Hmong

The Hmong originate from southern China but are now also residing in Vietnam, Burma, Thailand, and Laos because of migration since the 1600s. Hmong Americans are from the highlands of Laos. As an ethnic minority that made up only about 10% of the population of Laos, they differ greatly from Laotians (the Lowland Lao) in language, religion, and culture. As the Vietnam War spread to Laos, the United States recruited the Hmong to fight against the Communist Pathet Lao and Northern Vietnamese troops moving supplies through Laos. The Hmong army also rescued American pilots shot down over Laos and protected U.S. military radar facilities. The Hmong suffered great casualties as a result of what is now referred to as the “secret war,” with estimates that more than 67,000 Hmong soldiers and civilians were killed between 1969 and 1975. The Hmong reportedly had an agreement with the CIA that the United States would protect them should the war be lost. However, the United States all but abandoned the Hmong after their defeat in 1975. Only about 2,000 were evacuated following the war, leaving tens of thousands behind and at the mercy of the Pathet Lao and North Vietnamese forces. Former Hmong army members were executed, and others were sent to reeducation camps. Thousands of families fled as refugees to Thailand, making a dangerous journey through the jungle, and perilous crossings of the Mekong River under the cover of darkness on crudely fashioned rafts or other improvised floatation devices. During the journey, many were killed by Communist forces, others died of starvation or disease, and many others drowned in the Mekong before they could reach safety.

Even before the war, the Hmong were poorly treated by the ruling Lowland Lao and were denied full access to education. The Hmong language did not have a writing system until the 1950s. Even in the Thailand refugee camps, schooling opportunities were limited. Refugee resettlement programs enabled thousands of Hmong to enter the United States and other Western

countries. The Hmong have very tight clan structures. Despite efforts to resettle Hmong in different cities across the country, secondary migration brought families and extended clan members together resulting in large Hmong communities primarily in central California, Minnesota, and Wisconsin. Given the lack of access to schooling in both Laos and in refugee camps, many Hmong refugee children attended school for the first time in the United States, thus posing significant challenges to their local schools.

In 2004, the United States began admitting an additional 15,000 Hmong refugees whose families had been living for decades in an unofficial refugee camp at the Wat Tham Krabok temple in Thailand. Most of these Hmong refugees were children, and once again, local schools receiving these students faced a number of challenges. However, unlike the experience of the first wave of Hmong refugees, these new refugees had the advantage of coming into established Hmong American communities, and educational needs of many newcomer Hmong students are being addressed by Hmong American educators who understand their language and culture.

Vietnamese

Most Vietnamese refugees fled their country after 1975 following the U.S. pullout of the Vietnam War. Many Vietnamese refugees escaped in dangerous journeys by boat and, thus, have been referred to by many as the “boat people.”

Recent Demographics of Southeast Asian Americans

The most recent demographic information on Southeast Asian Americans comes from the U.S. Census Bureau’s 2005 American Community Survey (ACS). Southeast Asian Americans have made tremendous progress since they first began arriving in the United States as refugees in the early 1980s. When the refugees first arrived, they literally had nothing. Very few spoke English, employment prospects were minimal, and most lived in the poor, crime-ridden neighborhoods. They were required to rebuild their lives in a new country with strange customs and a difficult language, with very few resources. Parents in particular faced the challenge of raising children in this difficult new environment as their children learned English and adopted American customs and culture,

while losing knowledge of their native languages and cultures.

Table 1 provides ACS data on the size of Southeast Asian American populations in the United States. The Vietnamese American population was by far the largest of the four groups, with more than 1.5 million people, whereas the other three Southeast Asian Americans groups have population sizes between 189,000 and 241,000. There were more than a quarter of a million Vietnamese Americans between the ages of 5 and 17, and thus of school age. More than one-third of the Hmong American population and about one-fourth of Cambodian and Laotian Americans were of school age. Overall, there were more than half a million Southeast Asian American children attending K–12 schools.

Table 1 ACS 2005: Total Population and Population Ages 5–17

	<i>Total population</i>	<i>Population ages 5–17</i>
Cambodian	241,025	60,979
Laotian	209,627	49,682
Hmong	188,900	70,460
Vietnamese	1,521,353	289,057
Total	2,012,284	660,973

The top five states for each Southeast Asian American population are shown in Table 2. California has by far the largest share of the four Southeast Asian American groups. Texas and Washington are also among the top five states for Cambodian, Laotian, and Vietnamese Americans. Outside California, most Hmong live in Minnesota and Wisconsin.

Table 3 shows the 2005 nativity and citizenship status for Southeast Asian Americans. About three-fourths of Southeast Asian Americans are native born or naturalized U.S. citizens. Just over half of the Hmong American population, and less than half of Cambodian, Laotian, and Vietnamese Americans were born in the United States. Thus, most Southeast Asian Americans were born outside the United States, which suggests they still maintain strong ties to the languages and cultures of their home countries.

Table 2 ACS 2005: Top Five States With the Largest Southeast Asian Populations

	<i>Top 5 States</i>	<i>Population</i>
Cambodian	California	83,562
	Massachusetts	24,172
	Washington	16,082
	Texas	12,112
	Florida	7,889
Hmong	California	65,345
	Minnesota	46,352
	Wisconsin	38,814
	Michigan	7,769
	Colorado	4,285
Laotian	California	63,318
	Texas	12,643
	Minnesota	11,636
	Washington	10,638
	Iowa	6,129
Vietnamese	California	539,150
	Texas	159,107
	Washington	60,543

Table 4 shows the foreign-born population by year of entry into the United States. Most Southeast Asian Americans came to the United States before 1990

during the periods of refugee resettlement. The foreign-born population that entered the United States between 1990 and 1999 and after 2000 includes a number of school-aged children. These data suggest that there are larger numbers of Vietnamese and Hmong students than Laotian and Cambodian students in U.S. schools who are foreign born. Overall, however, these data reveal that schools continue to receive foreign-born Southeast Asian students from all four groups in need of specialized language programs such as bilingual education.

Note: Numbers may not total to 100 because of rounding.

Table 5 provides data on the educational attainment of Southeast Asian Americans. Between one-third and one-half of Cambodian, Laotian, and Hmong Americans did not have a high school diploma in 2005. Less than 15% of Cambodian, Laotian, and Hmong Americans had completed a bachelor's degree or higher. Educational attainment is slightly higher for Vietnamese Americans; nearly three-fourths had

graduated from high school, and a little more than one-fourth had completed a bachelor's degree or higher. Overall, however, educational attainment for Southeast Asian Americans is quite low, and thus, many Southeast Asian American students come from homes with parents with low levels of education.

Median family incomes and poverty rates in 2005 for Southeast Asian Americans are shown in Table 6. Of the four groups, Hmong had the lowest median income (\$38,335), which was far below the national median family income of \$55,832. Hmong Americans also had the highest poverty rates with about one-third living in poverty. Vietnamese Americans had the highest median income, but this was still less than the national median. All four groups had poverty rates above the national average of 10%. Thus, these data suggest that many Southeast Asian students are coming from lower-income families. Also, according to ACS 2005, nearly half of Cambodian (48%) and Hmong (49%) American families, and more than one-third of Laotian and Vietnamese American families lived in renter-occupied housing units. This suggests that a large number of Southeast Asian students are transient because families who rent tend to move more than do those who own their own homes.

Table 7 shows the number of speakers of Southeast Asian American languages in the United States. These data are from the 2000 census and thus are slightly older than the data from the ACS 2005 reported in the tables. The numbers in Table 7 roughly parallel the total ethnic populations for each of the four Southeast Asian American groups reported in the 2000 census. Thus, these data demonstrate that Southeast Asian Americans of all ages maintain some level of spoken proficiency in their native languages. Even most school-aged children were reported as being speakers

of their native languages. This does not mean they have difficulty with English. As shown in Table 8—also from the 2000 census—the overwhelming majority (85% or higher) of school-aged Southeast Asian Americans speak English well or very well. However, between 8% and 15% of school-aged children reported difficulties speaking English. For ages 18 and older, although the majority reported speaking English very well or well, about one-third reported difficulties with the English language.

Overall, these data suggest Southeast Asian American students have made great progress in learning English and still speak their native language at home. However, many students come from homes where parents or other adults may lack fluency in English. Therefore, these data also suggest that despite progress in English, many Southeast Asian American students still need specialized language programs. Furthermore, the census does not ask *how well* family members speak the native language or about literacy skills in the native language. Very few Southeast Asian American students today can read and write in the native language, and Southeast Asian American parents and community leaders are greatly concerned about the rapid loss of children's oral proficiency in the native languages. Thus, Southeast Asian American students—particularly those born or raised in the United States, need opportunities to develop and maintain proficiency in their home languages.

Bilingual Education Programs for Southeast Asian Americans

Despite the significant language, educational, and cultural needs of Southeast Asian American students, very few schools have been able to offer bilingual programs in Cambodian, Hmong, Laotian, or Vietnamese. Given that so few Southeast Asian Americans were in the United States before refugee resettlement began, there were few, if any, bilingual teachers who could speak these languages, and no curricular materials were available in Southeast Asian languages. Initially, the best most districts could do was to hire bilingual paraprofessionals to assist in the classrooms, provide district-level training, and translate or create materials for student use. Eventually, some Southeast Asian Americans were hired as teachers, and a few schools were able to offer bilingual programs in Southeast

Asian languages. Long Beach Unified School District in California, and Lowell Public Schools in Massachusetts, for example, offered Khmer bilingual programs in select schools with large Cambodian American student populations. These states also had a small number of bilingual programs for Hmong or Vietnamese. Most of these programs ended, however, following the passage of the English for the Children Initiatives in their respective states. Even though most Southeast Asian American students are born in the United States, many are identified as English language learners when they enter school. This suggests that Southeast Asian languages continue to be the dominant language of many homes, and thus children from these homes need the types of bilingual education programs currently restricted by some state laws.

Some secondary schools, specifically in California and Massachusetts, offer Khmer-for-Khmer-Speakers, Vietnamese-for-Vietnamese-Speakers, or Hmong-for-Hmong-Speakers classes that students can take to earn foreign-language credit. Fresno Unified School District in central California has a newcomer program for newly arrived Hmong refugee students. The principal and many of the classroom teachers are native Hmong speakers. A few schools in other states, such as Texas, Florida, Oregon, and Massachusetts, offer Vietnamese bilingual education programs.

In Minneapolis, Minnesota, the Hmong American community became frustrated with the local school district for its consistent failure to offer quality Hmong bilingual programs. In response, the Hmong American community began opening and running its own charter schools, which emphasized Hmong language and culture. Soon afterward, the local school district increased efforts to offer Hmong language programs at the elementary and secondary levels to prevent the loss of more Hmong American students to these charter schools. In Milwaukee, Wisconsin, the local school district responded to community demands by establishing the Hmong American Peace Academy charter school, which provides a Hmong bilingual program.

Although the number of programs is relatively small, they nonetheless demonstrate that a continuing need and demand for bilingual and other specialized programs designed to meet the unique linguistic and educational needs of Southeast Asian American students. The case of the Hmong communities in Minneapolis and Milwaukee in particular demonstrates that community activism is often necessary to ensure needed programs are provided. Given the lack of school programs, many Southeast Asian American communities offer their own

heritage language programs through community organizations, Buddhist temples, or Christian churches, or in conjunction with local schools to sponsor programs after school.

SPANGLISH

The word *Spanglish* is a combination of the words *Spanish* and *English* and describes the mixing of those languages in oral and written production. Historically, Spanglish has been a source of disagreement. Some people consider Spanglish a valid form of communication, but others think that the two languages should be kept separate at all costs. Of the people who find value in Spanglish, some believe that Spanglish is an offensive way to describe this language use and instead prefer using the terms *code switching* and *code mixing*. Others, however, argue that Spanglish reflects the bilingual reality of its users. In this entry, the term *Spanglish* is used purposefully, and its value in oral production is described from the sociocultural perspective. To show how Spanglish functions in the classroom, an example of children using it in a content area is presented. Implications for teachers conclude this entry.

Dialectal variation exists within all languages. Language use varies according to gender, class, geographical region, and the multiple identities speakers create when they use language varieties. Some ways of making sounds, using grammatical structures, and selecting vocabulary are shared among members of particular speech communities. Furthermore, there are rules for when, where, and how to use language variations, as well as when not to use them. The varieties of English spoken in California differ from the ones spoken in New York, the varieties of English spoken in Chicago differ from those used in Texas, the Spanish spoken in Mexico differs from the one spoken in Peru, the Spanish spoken in central Mexico differs from the Spanish spoken along its northern border, and so on. Another language variety is Spanglish, and what makes Spanglish unique from the other varieties is that its speakers bring together the phonological and grammatical systems of two languages.

Spanglish is a language variety found in the United States that results from intense and prolonged contact between speakers of Spanish and English. Speakers of Spanglish blend the languages in different situations for a number of purposes. Ana Celia Zentella, an educational linguist, argues that Spanglish speakers can use their languages differently in a variety of situations. The use of Spanglish, as opposed to Spanish or English, depends with whom the bilingual speaker is talking. If a Spanglish speaker addresses a person that is known to be or is perceived to be a monolingual speaker of Spanish or English, then the Spanglish speaker can remain in that language. In contrast, if this same speaker knows or perceives that the person being addressed uses both languages, Spanglish can be used. In this manner, to whom one speaks, the topic of conversation, and the physical setting influence whether or not bilingual speakers can use Spanglish.

Often, the “turning on” and “turning off” of Spanish or English does not happen. Some words in Spanish do not easily translate into the English language. For instance, the word *educación* in Spanish means more than what *education* captures in English. In Spanish-speaking communities, *educación* is more than the education in formal settings, it is also the education that occurs in homes and communities. This example should help in understanding that although a bilingual speaker may be speaking to a monolingual English speaker, a word in Spanish may be necessary in the conversation. Another reason to explain the “turning on” and “turning off” is that at times bilingual speakers

can use Spanglish because of the effect that they wish to convey to those around them. Spanglish becomes an indication they belong to a certain group, or that they are a member of a specific community. Overall, one language may be more dominant than the other in different situations or life stages.

Another unique characteristic of Spanglish and its speakers is that they grow up using it by belonging to a bilingual community. Sociolinguist Shana Poplack maintains that bilingual speakers know when and where to switch, whether between sentences or within sentences, and how to mix words in one language with words of the other to coin new words. What is commendable is that bilingual speakers use Spanglish without relying on the rules of both languages. Accordingly, Spanglish is a valid language variety that is comprehensible to other bilingual speakers but is especially relevant to speakers who belong to a bilingual community.

Opponents of Spanglish, often the foreign-born Spanish speakers residing in the United States or professors in Spanish departments, maintain that it is “a chaos of words” or “state of confusion,” and some, like Mexican writer Octavio Paz, have gone as far as describing it as “neither good or bad, but rather abominable,” as Ilan Stavans reports. Opponents view speakers of Spanglish as linguistically or intellectually deficient because they supposedly lack full proficiency in either Spanish or English. Also, because opponents view Spanglish as a mixed and not “pure” variety of Spanish, it is perceived as an illegitimate form of language use. An ideal situation, these critics maintain, is to keep each language separately, *or purely*, from the other and never use them simultaneously. This ideology, however, is linguistically uninformed. Spanglish is a phenomenon that is rule-governed and is, as Gloria E. Anzaldúa (a Chicana feminist scholar) and Rosaura Sánchez (professor of Latin American and Chicano literature) have argued, influenced by many social and political factors. Like every other language, however, Spanglish is rule-driven.

Although many people have begun to accept Spanglish as a valid form of language use, disagreement exists regarding the use of the word *Spanglish*. On the one hand are those who believe that the phenomenon should be called *Spanglish*, and on the other hand are those who believe that it should be called *code switching* and *code mixing*. This second group argues that referring to the phenomenon as code switching and mixing is aimed at removing the negative connotation

from the minds of teachers and other gatekeepers. Members of this group also consider other words that are “more appropriate,” such as Spanish of Mexican Americans, Chicano Spanish, and New York City Spanish. Proponents of the word *Spanglish* agree that the phenomenon has been stigmatized and, as Zentella argues, Spanglish—much like “Nuyoricano,” “Chicano,” and “Dominican York”—needs to gain a different meaning, one of pride. Teachers do not regard Spanglish as the final form of either language to be learned by their students. One of the teachers’ functions is to be the facilitators for children to be proud of *who they are* and *how they speak*, while they learn other, more academic, varieties of Spanish and English.

Spanglish in the Classroom

In a scenario in a second-grade dual-language classroom, a group of four children are at one of the math activity stations while the teacher works with another group of students for small-group instruction. The children at the math activity station explore missing addends of addition and subtraction by playing a version of Chutes and Ladders. They first need to calculate the missing addend on one of the flashcards and if it matches the number in the back of the card, they throw the die and move that many spaces. The following is their conversation:

- Esmeralda:* Okay, ¿quién va a empezar?
[Okay, who’s going to start?]
- Emily:* I think *que debemos tirar el dado y él que sacar* [sic] *el número más grande va primero.*
[I think that we should throw the die and the one to get the biggest number goes first.]
- José:* Sí, yo voy primero.
[Yes, I’ll go first.]
- Jesús:* No, I’m first ’cause I’m always last.
¿Dónde están las tarjetas? Gimme one.
[No, I am first because I am always last.
Where are the cards? Gimme one.]
- Esmeralda:* Here!
- Jesús:* (Calculates the missing addend correctly.)
Yes! (Throws the die.) ¡Dos! (Moves his marker twice on the board.)
[Two!]

They later determine who goes next and the following is what happens after 15 minutes:

- Esmeralda:* ¡Jesús, estás cheareando! ¡Maestra!
[Jesús, you are cheating! Teacher!]
- Group:* ¡Maestra, Jesús está cheareando!
[Teacher, Jesús is cheating!]
- Maestra:* (Speaks from where she is working with other students.) ¿Quién está haciendo trampa?
[Who is cheating?]

Esmeralda, José, and Jesús are native Spanish speakers, but Emily is a native English speaker. In line 7, Esmeralda is the first to express that Jesús is cheating. In line 1, Esmeralda uses “Okay,” which is considered a tag-switch similar to its use in English, and the rest of the question is in Spanish. Overall, her switches are single words more than phrases or sentences, but are still considered between-sentence switches. When the group sets out to tell the teacher, the group merely mimics what Esmeralda has already conveyed, that Jesús is cheating. The children have combined the word “cheating” with the bound morpheme “-ando” of the present progressive in Spanish to coin the new word, “cheareando.” Aside from the bound morpheme, the word maintains its English phonology with the exception of “t” which the children have replaced with an “r.” Of the four students, Jesús proved to be the one to code-switch the most, both between and within sentences. In line 4, he performs a between-sentence switch from English to Spanish and back to English. In line 6, he switches from English to Spanish with single words. Although the teacher has recast the standard form of “cheareando” as “*haciendo trampa*” (cheating), the children continue to use “cheareando.”

The students’ continual use of the word *cheareando*, even after the teacher has modeled the standard form, should not be confused with the children being deficient or disobedient but, rather, be interpreted as the social language used between them. They are engaged in an activity that reinforces a math skill; hence, the learning is more important than the language they use. To use the phrase *hacer trampa* (to cheat) presently goes beyond how they use language with each other. Over time, they will add “*hacer trampa*” to their verbal repertoire. This scenario is akin to adults interrupting children at play and proceeding to tell them which way is best to play.

Implications for Education

Many teachers, both monolingual *and* bilingual, may be biased against minority students who use Spanglish. These teachers expect students to keep their languages compartmentalized, but an important feature of any language is that it changes constantly to meet its speakers' needs. Spanglish is a manifestation of language contact between Spanish and English, and it is a behavior that is both functionally and formally systematic. Teachers should modify their perceptions of the status and value of Spanglish and understand that blending Spanish and English is a phenomenon not related to intellectual skills; bilingual children who use Spanglish can reason just as much and as well as monolingual children, and this language variety does not mean they are necessarily confused.

In addition, teachers must realize that English, however important for success in school and society, may not be the only language in a child's verbal repertoire. Other language varieties such as Spanglish have distinctive and valued roles in the community. Choosing to ignore that they exist or negating their value by claiming the exclusive use of standard Spanish and standard English runs contrary to the communicative and identity functions of language. It can also be detrimental to the child's self-respect and cultural affiliations. Learning the standard forms of the languages should not be at a subtractive cost of the range of verbal behaviors in a child's repertoire; teachers should promote the inclusion of all language varieties in the classroom. They can find ways to use the students' language varieties through activities such as those examined by Mary Beth Monahan and Roxanne Henkin. Such activities engage children, and in the process teachers, about language varieties in the communities where they teach. The most effective teachers are those who honor language varieties instead of criticizing them. The ultimate goal of language is to communicate effectively and to allow language users to identify with varieties of that language.

Teachers should gradually model the standard forms of Spanish and English instead of constantly "correcting" children who speak Spanglish because this can threaten the children's linguistic and social development. By ensuring that children have abundant time to talk in mixed-ability groupings with children that speak different language varieties, teachers provide language models in a nonthreatening

atmosphere. Children can reap the social and academic benefits of bilingual and bidialectal proficiency.

In addition, bilingual teachers can also use Spanglish with their bilingual students. Children need to hear the way they speak in their communities and homes reflected and honored in the classroom and school by the adults. This, in turn, can lift their self-esteem and encourage them to learn and add the standard forms to their repertoires, which is necessary for their academic achievement. A significant part of this achievement starts when teachers recognize and value Spanglish as a legitimate language variety.

SPANISH, DECLINE IN USE

Some voices in the United States today regard Spanish as a threat to the continued dominance of English and argue that an increase in Latino immigration and natality may lead to a bilingual society and to drastic changes in American culture. In general, these voices argue that Hispanics or Latinos have little interest in learning English. Conversely, there have also been studies that have proved that after a few

years of moving to the United States, Latinos abandon the use of Spanish and become competent English speakers. They integrate linguistically following the same pattern as earlier immigrants from around the world. These polarized positions have played a role in a political debate that has contributed to the development of language policies dividing the country into those that support bilingual education and those who oppose it. This entry assesses the future of the Spanish language in the United States by examining research findings on these questions: What is the current status of Spanish in the United States? Do Hispanics learn and use English less than other immigrants do? Is the Spanish-to-English shift process similar or different from that followed by other groups of immigrants?

Although Spanish was the first European language with a significant presence in what is now the United States, it has become controversial in the country that now holds the fifth largest population of Hispanics in the world, as indicated by National Virtual Translation Center. Mexicans, Puerto Ricans, Cubans, and Dominicans are the four largest Spanish-speaking groups in the United States. Los Angeles is the city with the largest population of people of Mexican origin, second only to Mexico City; New York has as many Puerto Ricans as San Juan, the capital of Puerto Rico, does; Miami is home to the largest population of Cubans outside Cuba; and more than a million Dominicans live in northeastern cities, mainly New York.

The increasing population and arrival of immigrants to the United States has caused adverse reactions. Some believe that Hispanics represent a threat to U.S. society and English. Victor Davis Hanson and Samuel P. Huntington, for example, argue that Latinos are failing to integrate culturally and linguistically. Huntington maintains that the large influx of Latinos into the United States during the last three decades of the 20th century endangers American identity and society in the future. He believes that Latin American immigrants have no interest in assimilating culturally or linguistically as did earlier generations of European immigrants because Latinos speak a common language, concentrate in common areas, live within Spanish-speaking communities, and are persuaded by political activists to maintain their identities. In particular, Huntington doubts whether Mexican Americans will integrate linguistically. He states that the third generation (individuals whose parents were born in the United States and have at least one grandparent of foreign descent) will tend to

remain bilingual and that competency in both languages will be liable to become established in the Mexican American community unless the second generation discontinues the use of Spanish.

Although many scholars rejected Huntington's arguments, these arguments were nonetheless extensively disseminated and accepted among various social and political groups. Calvin Veltman in 1988 and Ruben G. Rumbaut, Douglas S. Massey, and Frank D. Bean in 2006 have reported research findings that contradict Samuel P. Huntington's theory. These researchers have concluded that Spanish does not constitute a peril to the supremacy of English in the United States. Those concerned with Spanish persistence in the United States, they assert, should not be afraid. Much evidence shows that, like other immigrant languages, Spanish fades away rapidly across generations, even in communities of high concentration of Spanish speakers.

Hispanic Immigrants Learn and Use English

Veltman states that because of a rise in immigration and natality, the number of Spanish speakers will increase, but contrary to public opinion, U.S.-born and immigrant Latinos commit themselves to learning and speaking English fluently and quickly. The preference, use, and preservation of Spanish depend on the permanent influx of new Latino immigrants. Because of the continual arrival of large numbers of immigrants, bilingualism may persist longer among Latinos than it did among other immigrant groups. However, ongoing immigration does not discourage U.S.-born or immigrant Hispanics from studying and becoming competent users of English. Actually, newly arrived or established immigrants believe that proficiency in English is key to their participation in American society and a condition for accessing its benefits. Despite Hispanics' interest in assimilating linguistically, the government has been incapable of meeting their language learning needs. James Thomas Tucker, in a report issued by the National Association of Latino Elected and Appointed Officials, reveals a shortage of English classes for Hispanics. His report shows that instruction in English as a Second Language (ESL), one of the means whereby Hispanics could integrate fully, is facing a crisis. Providers of ESL courses have been unable to satisfy the demand, and students sometimes wait as long as 3 years for enrollment.

The Language Shift Process

Children of Hispanic immigrants, Veltman says, tend to lose their ability to read and write their parents' mother tongue, which may happen at a different pace from their ability to speak it; this leads to the deterioration of literacy skills. Once this happens, the remaining spoken fluency weakens over time and the prospects for bilingualism vanish. This language shift extends over three generations and sometimes less than that. In southern California among the second and higher generations, there is a high likelihood of English becoming the language of communication with spouses, children, friends, and coworkers. Veltman asserts that English becomes the first language and Spanish the second language of more than 50% of Spanish-speaking immigrants who enter the United States at or before the age of 15. Veltman further adds that an interruption of the flow of Spanish-speaking immigrants into the United States would stabilize the number of Hispanics for about 15 years. After that, the decline in preference and use of Spanish would tend to accelerate.

Conclusion

If Hispanics do not make attempts to use and prefer Spanish past the third generation, the possibilities for its continued existence in the United States are uncertain. Rumbaut and his colleagues indicate that a linguistic survival analysis yields a life expectancy of 3.1 generations for Mexican Spanish, 2.8 for Guatemalan and Salvadorian Spanish, and 2.6 for Spanish spoken by other Latin Americans. Under this scenario, the daily use of Spanish is expected to fade away after 2 generations among Mexicans, 2.1 among Guatemalans and Salvadorians, and 1.7 among other Latin Americans.

Spanish will continue to be a controversial language in the United States. Its linguistic life expectancy appears unpredictable and will depend on a number of factors. According to recent studies, the United States is still regarded as a "graveyard for languages." Current language policies discourage rather than encourage multilingualism or even bilingualism. Bruce Gaarder states that issues related to political and economic power and prestige influence bilingualism in important ways. These issues do not seem to favor the maintenance of Spanish. Rather, Spanish continues to be regarded as a threat to the domination of English in the United States and efforts are made to slow its use in programs such as bilingual education.

Rumbaut and his collaborators state that there are more than 200 million speakers of English in the United States. Historical and contemporary evidence indicate that Spanish or bilingualism has never been a menace to the supremacy of English in the United States. What is in danger is the use and preference for Spanish by the second and third generations of U.S. Hispanics. Bilingualism and dual-language education represent opportunities still to be recognized and achieved.

SPANISH, PROACTIVE MAINTENANCE

The challenges of maintaining minority languages are well known and well documented. In most contexts all over the world, extrasocietal languages are abandoned by their speakers in three to four generations. These shifts happen whether minority languages are

indigenous to a nation-state (e.g., Breton in France, Basque in Spain, Navajo in the United States, aboriginal languages in Australia) or whether they are the languages of groups who arrived in a country after the national language was already established (e.g., Chinese in the United States or Turkish in Germany).

Sadly, for those who care about language diversity and its unique role in maintaining cultural continuity, the shift away from minority languages to the national language has been found to be tragically inevitable across a range of societies and contexts. The literature on language maintenance and language shift offers many examples of the challenges involved in attempting to reverse language shift and in reviving languages that have been abandoned by their original communities of speakers—such as work published by Joshua A. Fishman and jointly by Peter Thomas and Jayne Mathias. The pattern of shift and abandonment is similar: The older generations, indigenous residents, and early arrivals speak the minority language. The next generation, because its members are schooled in the majority language and because they are surrounded by a society that speaks that language, tends to become dominant in it, shifting to this language for a range of purposes and using the minority language in a reduced set of situations. The youngest generations tend to be largely monolingual in the societal language. If they speak the minority language at all, they often cannot transmit this language to the next generation.

For Fishman, a scholar who has devoted much of his scholarship to the study of language maintenance and language shift, the process of reversing language shift (i.e., of intervening in the seemingly inevitable three-generation process) involves a conscious assessment and a clear valuing of language resources by the linguistic community. This involves the ways of strengthening the proficiency of younger generations, who are still at childbearing age, and of the prospect of aiding the process of intergenerational transmission within the community that will ensure the acquisition of the language as a primary language by young children. According to Fishman, this process must involve intergenerational transmission, that is, use of the language by parents at home to their children. He argues that, despite the great faith that many communities have in language instruction schools (i.e., in programs such as bilingual education), these institutions by themselves will do little to retard or reverse language shift. This entry describes proactive maintenance of the Spanish language in the United States.

The Case of Spanish

For Latinos, the pattern of transitional bilingualism leading to language shift has been masked by the continuing arrival of new, monolingual, Spanish-speaking immigrants into bilingual communities. Research on language use in Latino communities conducted over time, however, has made clear that, despite the influx of monolinguals into Latino communities, the shift toward English among Latinos is unmistakable. Recent scholarship has demonstrated that Latinos are regularly acquiring English and shifting away from the use of their ethnic language (see work by Alejandro Portes and Ruben Rumbaut and Marta Tienda and Faith Mitchell). Among Latino professionals, the shift is even more rapid; it appears to take place by the second generation, as indicated in the survey conducted by Guadalupe Valdés, Fishman, Rebecca Chavez, and William Pérez. From these data, it is amply clear that language shift is ongoing among Chicano professionals in California. The low frequency of “sometimes/rarely” survey answers to Spanish language use, even with monolingual Spanish interlocutors, and the first-, second-, and third-generational decrease in Spanish-speaking, both strongly indicate language shift.

The Role of Educational Institutions in Maintaining Spanish

If Fishman is correct regarding the importance of intergenerational transmission in the proactive maintenance of minority languages, Spanish will only be maintained in the United States if parents personally commit to speaking Spanish at home with their children. However, bringing about the maintenance and development of *high-level, literacy-related proficiencies in Spanish* cannot be carried out by parents alone. As is the case with all languages, the development of Spanish for both personal and professional purposes will require the direct involvement of elementary, secondary, and postsecondary educational institutions making common cause with the parents who wish to see this outcome in their children. Unfortunately, the American educational system—in its present mind-set—has not been designed to involve itself in the maintenance and development of nonmajority languages. It can only support Latino students in the development of their Spanish-language proficiencies in two main types of non-English language instructional programs: (a) maintenance bilingual

education programs in which Spanish is used as the language of instruction after students have acquired English and (b) foreign-language programs in which Spanish is taught as a subject. This entry examines the role of traditional “foreign” language programs and their potential role in proactively helping to maintain Spanish in this country after briefly commenting on maintenance bilingual education programs.

Maintenance Bilingual Education

Transitional bilingual education programs are those in which minority languages are used in subject matter instruction only during the period when students are acquiring basic English skills. Maintenance bilingual education programs, on the other hand, continue to educate students in a minority language even after students have acquired English. Regrettably, bilingual education, especially the maintenance variety, although much discussed in the literature, is an option that is open to only a small fraction of English language learners (ELLs), primarily in the first 3 years of schooling. Maintenance programs currently appear to be almost nonexistent.

Traditional Foreign-Language Students

Foreign-language students in the United States have primarily been fluent speakers of English who elect to “take” foreign languages as academic subjects. Although some of these students may have been speakers of languages other than English, until recently, it had not been common for these students to enroll in classes of languages they already spoke. Italian-background students might study Spanish or French. Spanish-background students might study Portuguese, and Polish-background students might study Russian. For reasons that now seem arcane, it was generally felt by school people that students would not profit from continuing the study of their own ethnic/immigrant languages. Therefore, the traditional foreign-language student has been a monolingual English speaker who is expected to move from a state of monolingualism through various stages of incipient bilingualism. Nativelike attainment of the foreign language, however, is rarely expected and almost never reached by school-based programs alone.

In sum, the foreign-language teaching profession in the United States has traditionally been dedicated to teaching non-English languages to monolingual

English-speaking students. However, members of the profession have continually struggled against the indifference of the American public toward languages in general. Language teachers have been largely unsuccessful at persuading parents that language study is worth the time it requires to achieve mastery. Moreover, teachers have had difficulty producing a significant number of young Americans who are functionally proficient in the languages they have studied.

From time to time, particularly during periods of national emergency, various government agencies have paid attention to foreign-language teaching and learning. During World War II, for example, concern about the availability of language-competent military led to the development of the Army Specialized Training Programs and to the rise of the Audio-Lingual Method. The late 1950s, the Sputnik era, brought about the passage of the National Defense Act and projects designed to enhance the preparation of foreign-language teachers. Currently, in the aftermath of September 11, 2001, there is again interest in non-English languages, particularly in the development of heritage language resources. In the section that follows, the changing boundaries of the foreign-language teaching profession are described as the profession endeavors to involve itself in teaching immigrant and ethnic languages.

Teaching Heritage Languages

In the United States, the term *heritage language* has come to be used, broadly, by those concerned about the study, maintenance, and revitalization of non-English languages in the United States. For individuals interested in the strengthening of endangered indigenous languages or the maintenance of immigrant languages that are not normally taught in school, the term *heritage language* refers to a language with which individuals have a personal historical connection, as explained by Fishman. In this view, the historical and personal connection to the language is salient rather than the actual proficiency of individual students. Armenian, for example, would be considered a heritage language for American students of Armenian ancestry *even if* such students were themselves English speakers. For strengthening and preserving Armenian in this country, such heritage students would be seen as having an important personal connection with the language and an investment in maintaining it for future generations. Their motivation for studying Armenian would thus contrast significantly with that of typical students of foreign language.

The foreign-language teaching profession currently uses the term *heritage student* to refer to a student who is raised in a home where a non-English language is spoken. The student may speak or merely understand the heritage language and is to some degree bilingual in English and the home language. This is distinct from the scenario described previously, where individuals work with endangered indigenous languages or immigrant languages that are not regularly taught in school, like the case of Armenian. Moreover, for foreign-language-teaching professionals, the term refers to a group of young people who are different in important ways from English-speaking monolingual students, who have traditionally undertaken the study of foreign languages in American schools and colleges. This difference has to do with *developed functional proficiencies* in the heritage languages.

Within the foreign-language teaching profession, the use of the term *heritage speaker* is relatively new. Its use was generalized for the first time in the *Standards for Foreign Language Learning* (published by the American Council on the Teaching of Foreign Languages in 1996). Until that time, Spanish instructors were the only members of the foreign-language teaching profession who had worked with large numbers of students who already understood and spoke the language. In an attempt to differentiate between this new group of foreign-language students and traditional students, the Spanish-teaching profession referred to these students as “native speakers of Spanish,” as “*quasi* native speakers of Spanish,” or as “bilingual” students.

Dissatisfaction with these terms led to increased use of other terms such as *home background* speakers (as used in Australia) and *heritage language speakers* (as used in Canada). Members of the profession in the United States are currently engaged in examining the use of the term *heritage language* as they research the various types of students who have a family background in which a non-English language is or was spoken. Researchers and practitioners are also engaged in exploring ways to expand approaches, methods, and alter course sequences to meet the diverse needs of different groups of students.

Teaching Spanish as a Heritage Language

Until the mid-1970s, foreign-language teaching professionals almost exclusively taught Spanish to monolingual Anglophones. Beginning in the mid-1970s, the

increasing number of Spanish speakers in the country significantly affected the Spanish-teaching profession at both the secondary and the postsecondary levels. College and university faculties with experience in teaching Spanish as a foreign language have had to open their doors to students who, in some cases, were more fluent in the language than they were, but who could not talk *about the language* using the terminology used in the traditional conventions of the academy. Individuals involved in teaching Spanish to such students, in the classroom setting, quickly discovered that these young people had a very difficult time learning grammar rules taught to foreign-language students. Not only did they become confused by explanations of aspects of the language that they already knew (e.g., the difference between *ser* and *estar*), but they also refused to confine themselves to the limited vocabulary of the textbook. Because many Latino students who made it to college had been schooled exclusively in English, they had no experience in reading and writing in Spanish. Worst of all, they were often speakers of stigmatized varieties of Spanish (e.g., rural Mexican Spanish or urban Puerto Rican Spanish). There were few textbooks on the market that could adequately deal with this “problem,” and there was little agreement among Spanish-teaching professionals (most of whom had been trained in literature) about what to do and how.

The general consensus, reflected in the textbooks of that period (e.g., Pauline Baker’s *Español para los Hispanos*, published in 1966; and Marie Esman Barker’s *Español para el Bilingüe*, published in 1972), was that bilingual Hispanophone students were in need of remediation, of techniques and pedagogies that would help undo the damage that had been done at home. In short, instead of looking favorably at the Spanish they already knew, professors of Spanish continued to stigmatize the Spanish of their *hispanoparlante* students.

More recently, secondary-school Spanish teachers have faced an even more difficult situation. Given the rising numbers of Latino students nationwide, enrollments in high school Spanish classes now include traditional foreign-language students (Anglophone monolingual students), second- and third-generation bilingual Latinos and Chicanos who are largely English-dominant, and newly arrived Latino students who speak little or no English, and who have been schooled to a greater or lesser degree in Spanish in their home countries. For many of these students, the Spanish language class is the only non-English as a

Second Language (ESL) core academic subject they are allowed to take. The remaining part of their day may be filled with physical education and electives such as drawing and cooking, and one or more “study halls.”

The situation is no better at the college and university level. According to a survey of college and university foreign-language departments conducted by the Modern Language Association (MLA) (reported by David Goldberg, Natalia Lusin, and Elizabeth Welles), Spanish heritage language classes are offered at 24% of 772 colleges and universities offering majors and advanced courses in Spanish. According to a survey conducted by the National Foreign Language Center (NFLC) and the American Association of Teachers of Spanish and Portuguese (AATSP), however, only 18% of 146 campus responding have implemented special courses for heritage speakers (reported by Catherine Ingold, William Rivers, Carmen Tesser, and Erica Ashby). At the secondary level, the percentage is much smaller. According to a survey of foreign-language instruction in elementary and secondary schools conducted in 1997 (reported by Nancy Rhodes and Lucinda Branaman), 9% of secondary schools in the country currently offer Spanish heritage language programs.

Teaching Spanish to Spanish-speaking bilinguals, however, is not a new area of interest. Indeed, as Guadalupe Valdés-Fallis and Richard Teschner found when they put together a bibliography on the subject in 1977, interest and concern about how to teach Spanish to students who already spoke the language had been present in educational circles since the 1930s. Despite the long-standing interest in this question, teaching Spanish to the Spanish-speaking as an academic subject was not widely discussed until the late 1970s and early 1980s. Apparently, an increasing enrollment at state colleges and universities by non-traditional students (particularly Chicanos and Puerto Ricans) led to a realization that existing practices were inappropriate. Several articles in the late 1970s and early 1980s attempted to define the field by discussing the difference between foreign and native language, for instruction, the implications of the study of linguistic differences for teaching Spanish to bilingual students, concerns and questions surrounding teaching the prestige or standard variety, and implications for teacher preparation. Articles began to appear that described classroom practices and shared suggestions about what to teach and how. Attention was given to

teaching grammar, spelling, reading and writing, syllabus design, and testing and assessment. During this period, much activity in the field also centered on the production of textbooks intended to be used for the instruction of bilingual students. By the end of the decade, practitioners, especially at the university level, settled into what appeared to be comfortable teaching patterns using a variety of readily available materials.

By the late 1980s, however, it became clear that the problems surrounding teaching Spanish to bilingual speakers had not been solved. Few materials of high quality were available for the secondary level, and younger college faculty, trained primarily in peninsular and Latin American literature, found themselves facing the same problems others had faced in earlier decades.

The profession itself had begun to change. The emphasis in foreign-language teaching had shifted away from grammar-based instruction to a proficiency orientation, but there was much confusion about the right kinds of instruction and assessment. By the late 1980s and early 1990s, articles began to appear that examined old issues in new ways or that posed new questions (e.g., the use of the oral proficiency interview with bilingual students), the question of dialect and standard, the role of foreign-language teachers in teaching bilingual students, and the role of the foreign-language teaching profession in maintaining minority languages. Again, much attention was given to describing instructional practices and to curriculum development.

Beginning in the late 1990s and continuing today, professional activities focusing on teaching heritage languages have increased enormously. The AATSP initiated its Professional Development Series Handbooks for Teachers K–16 with Volume 1: *Spanish for Native Speakers*, published in 2000. The NFLC in cooperation with the AATSP developed in 2001 a language-based resource named *Recursos para la Enseñanza y el Aprendizaje de las Culturas Hispanas* (REACH, <http://www.nflc.org/REACH>) for teachers of Spanish to heritage speakers. NFLC also developed *LangNet* (<http://www.langnet.umd.edu>), a searchable database that includes Spanish and contains numerous resources for teaching heritage languages. In collaboration with AATSP, NFLC conducted a survey of Spanish-language programs for native speakers (mentioned earlier). The Center for Applied Linguistics and NFLC also launched the Alliance for the Advancement of Heritage Languages. The Alliance sponsored two national conferences in 1999 and 2002 on teaching

heritage languages, in which many members of the Spanish-teaching profession participated. The first conference led to the publication of the volume *Heritage Languages in America* (edited by Joy K. Peyton, Donald Ranard, and Scott McGinnis) in which much attention was given to teaching uncommonly taught languages as well as to the publication of a special issue of the *Bilingual Research Journal* focusing on heritage languages (edited by Terrence Wiley and Guadalupe Valdés). The second conference, led to the publication of a report on research priorities on teaching heritage languages entitled “Directions in Research: Intergenerational Transmission of Heritage Languages” (edited by Russ Campbell and Donna Christian).

Additionally, a number of conferences and workshops focusing on teaching Spanish as a heritage language have been held around the country. In 1998, UCLA hosted a summer institute, sponsored by the National Endowment for the Humanities, on teaching Spanish to heritage speakers that included 30 secondary-school teachers. Participants in the workshop produced a document entitled *Spanish for Native Speakers (SNS) Education: The State of the Field* making recommendations on program design, teacher preparation, and policy development (edited by Lynn Fischer). New Mexico State University hosts an annual summer conference on teaching Spanish to heritage speakers. Multiple ERIC digests have been produced on a variety of topics; these and numerous other online resources are listed and described by Ana Roca, Kathleen Marcos, and Paula Winke. The Alliance Web site at the Center for Applied Linguistics also includes listings of online, print, and video resources.

Collections of articles and articles in edited books and journals focusing on teaching Spanish as a heritage language continue to appear. For example, *Mi Lengua* (edited by Ana Roca and M. Cecilia Colombi) includes a range of articles on such topics as student characteristics, revitalization versus eradication of students’ varieties of Spanish, language attitudes, and theoretical principles guiding the teaching of Spanish to heritage speakers.

In comparison with other heritage languages (e.g., Arabic, Farsi) and even languages that are taught more commonly, such as Chinese and Japanese, teaching Spanish to heritage speakers is well established within secondary and postsecondary programs. However, although much has been written about Spanish heritage programs, there is a great deal that we do not

know about the role of schools in language maintenance and language shift, about ways of measuring progress in the reacquisition or revitalization of heritage languages, and about the most important differences between learners of a first and second language.

The scholars who contributed to the research agenda created at the second national heritage conference stated in Campbell and Christian’s edited work that it is important to understand the external pressures that heritage speakers are subjected to in this country, the ways in which language ideologies interact with particular pedagogical goals, and the ways in which measurement procedures can engage both community and academic norms. In establishing research directions for the study of intergenerational transmission of heritage languages, Campbell and Christian point out that numerous questions must be attended to by the research community if the formal educational system is to succeed in its efforts to maintain heritage languages.

Remaining Challenges

Despite the expanding number of classes for heritage speakers of Spanish, many challenges must be surmounted if such instruction is to contribute to the maintenance of Spanish in the United States. In a recent survey of instructional practices in secondary and postsecondary Spanish heritage programs in California (reported in Valdés, Fishman, Chavez, and Pérez), it was determined that, with very few exceptions, heritage language programs were established to respond to institutional challenges in serving an increasing population of Latino students. These researchers found no evidence to suggest that high schools or colleges and universities offering such programs see themselves as engaged in the process of language preservation. Heritage programs (sequences of language course or single courses) are designed to be part of existing Spanish language and literature programs. They focus on achieving traditional academic goals in the study of foreign languages and literatures. Heritage program personnel have not developed ways of assessing the bilingualism of heritage students effectively. Few institutions at the secondary and postsecondary levels use departmental placement examinations or special placement examinations for placing heritage students in courses. Survey results indicate that high schools and colleges offering heritage programs frequently rate instructional goals that are

closely aligned with teaching the standard dialect as important in the instruction of heritage students. Instructional practices considered effective are also closely aligned with teaching the standard dialect (e.g., correcting anglicisms, archaisms, and other nonstandard forms in students' oral and written language; teaching grammatical terminology; or teaching spelling). Respondents at both the secondary and post-secondary levels came from institutions that claimed to be very satisfied with students' achievement as measured by course examinations or by success in subsequent courses within the Spanish departments of which they are a part. They are not much concerned with students' continued use of Spanish in their homes, communities, and the wider Spanish-speaking world. In general, instructional goals of existing programs for heritage speakers of Spanish at both the high school and the college levels are not consistent with recommendations being made by those concerned with the development of professional proficiencies in Spanish.

Despite the challenges, the possibility of using traditional foreign-language programs to contribute to the maintenance of minority languages is an attractive one. However, the proactive, effective involvement by the foreign-language teaching profession in maintaining and developing the non-English languages currently spoken by immigrants, refugees, and their children will require that the profession expand and broaden its scope beyond the mere recognition of heritage students as more advanced learners of the "target" language. To serve heritage students' needs, the profession's areas of interest needs to extend to include a population of students who are very unlike traditional foreign-language learners at all skill levels. This new population of students includes youngsters who have acquired the target language as their first language, students who have acquired two languages simultaneously, and students who have developed excellent receptive abilities in the language but are reluctant to speak it.

Second-language acquisition theories, as well as traditions now guiding foreign-language instruction, have little to say about these students and what they should be taught. Existing research on incipient or developing bilingualism in foreign or second languages is not relevant to teachers of heritage students. Moreover, views about second-language developmental sequences and proficiency hierarchies also contribute little to the understanding of the instructional needs of this population. What is required is a new

"knowledge base" that draws from preexisting knowledge in related areas but also looks to create knowledge that does not now exist.

The results of the survey cited previously (conducted by Valdés, Fishman, Chavez, and Pérez) on teaching Spanish as a heritage language in California suggest that to respond to these students' needs, members of the foreign-language teaching profession and government agencies charged with building capacity in strategic languages must acquire an understanding of societal bilingualism and language contact, as well as of theories of second dialect acquisition. Instruction for these very different students must be informed by clear views about the nature of bilingualism itself, the controversies surrounding definitions of bilingualism and the ways in which bilingual individuals use two languages in their everyday lives.

As was pointed out by the high school teachers participating in an ACTFL/Hunter College heritage language teaching initiative (in John Webb's and Barbara Miller's work) in their *Statement of Shared Goals and Fundamental Beliefs* (pp. 83–85), teachers of heritage languages should (a) "understand how complex heritage learners are," (b) "acquire the sociolinguistic foundations that enable them to be respectful of language origins and ever-evolving language varieties, dialects, registers, and styles that students bring with them to class and build upon them," and (c) "help students to recognize the uses and purposes of their heritage language both in their immediate environment and in a global society."

The challenges surrounding the development of Spanish for students who have been raised with Spanish at home as well as for students who have been educated through Spanish in transitional, two-way and maintenance bilingual programs are not simple. Latino communities will need a deep commitment to Spanish as well as a willingness to take on the struggle to transform existing educational programs. To be effective, proactive language maintenance must involve a deep understanding of existing educational institutions and sustained efforts to influence their future ability to serve the needs of the nation's Spanish language speakers.

SPANISH, THE SECOND NATIONAL LANGUAGE

Essay

Editor's Note: *The author of this entry was invited to submit an article reflecting a mix of information and expert opinion. We acknowledge that parts of it could be disputed or given an alternative interpretation. In several instances, we found this approach helpful in more realistically portraying the history and current status of bilingual education in the United States.*

The idea of a formal nexus between nationhood and one or more languages is recent. Only within the last 500 years has there been a tight connection between nationality or citizenship and the language or languages one expects residents of particular countries to speak. In the United States, no historical evidence exists that the founders devoted much time or effort to determining what language or languages would be identified with the country. The push to make English the official language did not occur during the formative years of the republic. When it did emerge in the mid-1980s, it was not as a positive statement of nation-building—the United States was already a world superpower—but as an expression of antiimmigrant sentiment. Perhaps because of its uncontroversial origins, the idea that English is the language of the nation and that it should be safeguarded in that position is widespread and firmly held by many Americans.

English appears to have fallen easily into the role of sole national language even though it was the language of England, the country against which the American Revolution was fought. Although numerous Native American languages existed in what is now the United States before arrival of the Europeans, there is no evidence that any Native American language was ever considered to be honored with a special recognition by the new nation. Of all the European languages spoken here during the colonial period, English and

German were the main languages spoken, although other European languages were used in some settlements. The first European explorers and settlers spoke Spanish, but that language was concentrated away from the centers of greatest cultural and political influence, and its use in early colonial history was limited to the Spanish settlements. Today, the use of Spanish has changed dramatically and it is now spoken throughout the country.

Speakers of Spanish are the language group that is most responsible for bilingual education. This entry reviews the current status of Spanish as an important language in the United States. It also suggests factors to consider in assessing the future of Spanish as a cultural element in the country and the place of bilingual education in this.

In the discussion that follows, I make a distinction between *official language* and *national language*. The former is a status officially conferred by the political apparatus of a country on the main language in which the bulk of civic and political affairs is to be conducted. The status of official language is usually determined during the formative years of a new nation such that both the country and its language shape each other's history. Importantly, the status of official language does not mean that only one language can have a special status bestowed to it. A national language refers to a language that is in wide use throughout the country and one that, although something less than official, is afforded recognition for use in particular domains or situations such as education, court proceedings, media, public documents, voting, cultural events, or commerce. No conflict is inherent in acknowledging that more than one language is used by the citizenry in their daily interactions and expression. Many modern countries employ more than one language without conflict or difficulty. Some nations designate more than one official language either for the entire country or portions of it. In most cases where conflict erupts between speakers of one language and those of another, it is usually because of repressive or restrictionist policies by which the speakers of one language seek to restrain or eliminate the use of another language.

Current Status of Spanish

The simplest and arguably most important measure of the status of Spanish in the United States today is the sheer numbers of the population that speak that

language on a regular basis. Of the U.S. population, 10.71% is Spanish-speaking, according to figures reported by the Modern Language Association. Of the total population that speaks a language other than English in the United States, 64.5% of them speak Spanish. The big picture, on a global scale, is straightforward and uncomplicated. According to the last official U.S. Census (2000), the number of Spanish speakers here was larger than the combined populations of four Latin American countries combined: Bolivia (8.15 million), Honduras (6.34 million), El Salvador (6.13), and Paraguay (5.59 million). (The next decennial census is likely to add two more countries to this list.) The only countries with individual Spanish-speaking populations larger than that of the United States are Mexico (99.92 million), Spain (39.82 million), Colombia (38.65 million), and Argentina (37.49 million). In 2000, the total population of U.S. Spanish speakers was 28.1 million, making it, even then, the fifth largest Spanish-speaking country in the world. Although it is not customary to regard the United States as a Latin American country, the number of Spanish speakers suggests it is moving in that direction. Given this context, to deny the importance of Spanish in the United States is to deny present and future reality.

Problems Facing the Spanish Language

With nearly 40 million speakers and students, Spanish in the United States appears to be in good health. However, in assessing the current and future trajectory of the Spanish language within the United States, it is important to consider other factors beyond the number of speakers: the assimilative power of English, the wide divergence between the two languages with respect to social prestige, the relative health of bilingual education, the absence of social and cultural institutions that provide an infrastructure for the continuing viability of a language in any society, and the degree to which the dominant culture and language welcomes diversity.

The Power of English

Never before in the history of the world has a language reached the worldwide prestige and level of use of English. Linguists suggest there is no longer one form of English. *World Englishes* has emerged as the

term to describe the various forms of English appropriated for local use in different regions around the world. Beyond the simple metric of numbers of speakers, English has become a cultural phenomenon that transcends nationalities, most notably in education, popular culture, and the Internet. Although the language has its roots in the British Empire, it is now embraced by many nations and cultures, especially among the young.

Any assessment of the role and status of other languages, including Spanish, must take place against the backdrop of the domestic dominance of English and its worldwide hegemony. With or without a sociopolitical or culturally imperialistic motive—a topic we do not examine here—speakers of English have the power to promote or ignore other languages within the nation's boundaries. Americans are notably inconsistent in this regard. The link between being American and speaking English seems unbreakable. At the beginning of the 21st century, it is difficult to imagine English-speaking America creating an official opening for Spanish as a second national language. For the foreseeable future, an opening of this type can only occur in the cultural rather than political arena. It may also occur at a city, county, or state level. New Mexico, for example, was once officially bilingual, although the influx of English speakers into the territory ended that distinction. If one or more cities were to embrace Spanish as an official second language, the news would create a major stir nationwide. This development would likely cause consternation among those who feel there is room for no other language here.

Relative Status of Languages

The prestige of its speakers attaches to the language they speak. Hence, in the United States, almost no competition exists between the social status of English and that of any other language. In the public eye, English is the language of progress, education, and leadership whereas Spanish is the language of illegal immigrants, unskilled manual labor, and the Third World. Under the pall of these contrasting views of the two languages, it is difficult to envision the healthy growth and acceptance of Spanish by middle-class native speakers of English, the population that best represents the cultural core of the country. Although many Americans do not feel this way, many see little advantage, for themselves or their children, in learning a language they do not see as promising

them better employment or other social advantage. This problem may be age-related. Young college-age Americans appear to be more receptive to studying and speaking Spanish. Every year more of them enroll in Spanish-language classes. Clare Mar-Molinero, professor of modern languages at Southampton University, highlights some areas in which Spanish can rely on in its positioning as a global language: its cultural and literary tradition, its role in schooling in the countries where it is regarded as a national language, and the stabilizing influence of the Royal Academy in Spain (*Real Academia Española del Idioma*), to name some.

Scope and Health of Bilingual Education

Much of bilingual education remains a deficit-based remedial compensatory tool, in which the object is to transition young people out of bilingual instruction, rather than seeking to develop two languages to high levels of proficiency and literacy. Further, the limited participation of native-English-speaking children and youth in bilingual or dual-language schools is testimony that U.S. families do not value Spanish and other languages highly. Spanish is the most studied modern language in the United States today, but the numbers are not sufficiently robust to suggest a strong commitment to Spanish as an important national language. Reforms now being discussed for improving the teaching of Spanish and for its role in the curriculum may contribute to an improvement in that situation. Even the terminology of Spanish teaching needs attention. Although Spanish is the most frequently studied modern language in the country, schools and colleges continue to label it a “foreign language” even though millions of Americans use it on a daily basis. Carlos J. Alonso, chair of Spanish and Portuguese at Columbia University, is among those who believe that Spanish should no longer be regarded as a foreign language. He calls for a change in university language departments to position Spanish as a second national language and afford it a more prominent role in the curriculum to reflect its status as the second national language.

In the past, neither bilingual education nor modern language programs have demonstrated sufficient cultural and political power to move Spanish—or any other language—to a higher status than it held before. In some cases, namely Native American, Alaska Native, and Pacific Island languages, the opposite has occurred: Some languages have all but disappeared.

This situation is partially the result of a misimpression regarding bilingual education. *Transitional* bilingual education (TBE), the most common variety of the program over the last four decades, does not have, nor has it ever had, the goal of maintaining and improving the home languages of participating students. The goal of TBE is to move language minority children away from using their home languages and push them to use English exclusively as quickly as possible. A little-used but more accurate label for efforts to maintain home languages would be *programs of home-language support* or *primary-language support*. Regrettably, the term *bilingual education*, when used as a synonym for TBE, has persisted.

Foundations of Robust Languages

Even if bilingual education were to change dramatically in the future, languages do not stand alone as sole instruments of culture and communication. Nor do they thrive simply because they are taught in classrooms. Enduring languages are strengthened and supported by institutions that help the languages keep current, adapt to changing conditions, and create new communicative tools and cultural forms. Transitional bilingual schools do not fit that bill. In Canada, where English and French coexist as important languages deserving mutual respect, both languages have strong social institutions behind them. There are English-language universities and schools, as well as institutions that teach exclusively in French or bilingually. Civic organizations exist in which both languages are used. Government agencies have the capability to engage them in the language of their choice, English or French. Importantly, both languages have strong literary traditions and the literature of both groups is studied by young people of both language communities. Although these social institutions are now firmly in place, the struggle to have both languages recognized, honored, and freely used was difficult and has taken many decades to achieve. In the United States, the possibility of replicating the current Canadian profile with respect to bilingualism is hard to imagine at a macrolevel. Many Americans regard the Québec experience in setting bilingualism policy as a troubled chapter in Canada's history, one that should be avoided here. At present, however, there is no active advocacy for moving in that direction with respect to national language policy; the dominance of English in the United States is accepted and unchallenged.

Climate for Linguistic Diversity

The preceding discussion is not exhaustive. Many factors and conditions combine to create a favorable climate for language diversity. This brings us back to the notion of a language that is endowed with a special, perhaps official, status. How likely is it that Spanish could be afforded a formally recognized status as second national language in the foreseeable future? That question must be addressed in the shadow of the status of English, the undisputed national language with the weight of history and tradition behind it. It should be noted that English is not, at present, the official language of the country although pressure groups continually lobby to have it declared so through a constitutional amendment. Persons who argue for this designation often use the argument that unless it is protected by law, English will eventually be replaced by Spanish, given the rapid increase in population among Latinos and the somewhat slower population growth of native speakers of English. Those who oppose the idea believe that making English official is a solution without a problem because the global hegemony of English ensures its continued dominance in the world. They argue that designating English as the sole official language sends a gratuitous message to those who speak other languages that their languages are officially second tier. Although the latter may be true, it may also be the case that designating English as the official language is a necessary antecedent to recognizing Spanish in some way. Advocacy for making English the sole official language is relentless. Several Washington-based organizations have as their only purpose to amend the U.S. Constitution to make English the sole official language of the country. They collect and spend millions of dollars annually in this effort. The call for official English is often linked to other reforms in the society, namely preventing the continued influx of undocumented immigrants and trying to end bilingual education in the public schools. Neither the main agenda of these organizations nor their peripheral goals can be interpreted as supporting Spanish as a cultural symbol of an important segment of the population. Perhaps the English-speaking population requires its own symbol.

Factors That Favor Spanish in the United States

The preceding paragraphs describe a negative climate in which it could not be expected that Spanish could be afforded a higher status than that of other "foreign

languages.” But other factors also support the continued use and increasing respect for Spanish in the United States. An ascendant role that Spanish has begun to play here is as the language of the marketplace. Increasingly, U.S. stores and firms sell to Latin American investors and frequent visitors as well as to domestic Spanish-speaking customers. High-end retail outlets in all major cities strive to employ bilingual sales people. Advertising space and time on Spanish radio and television has become more expensive. One of the two Spanish television networks was recently purchased by one of the major mainstream networks, and the other is rumored to soon follow. Around the country, automatic teller machines (ATMs) allow customers to use Spanish to conduct electronic banking without using English. Telephone systems allow callers to “press 2 to continue in Spanish.” An important American city, Miami, is often mentioned in business circles as the banking capital of Latin America. The use of the language is underscored by the number of radio and TV outlets broadcasting in that language. The Spanish-language evening news is superior to any English media in its coverage of news of Latin America and the Caribbean. In short, Spanish is becoming the language of business and commerce, not merely the language of unskilled workers in the underground economy. This new role for Spanish as an important business language can be expected to influence the general status of the language in U.S. society.

In other venues, such as the Catholic Church, change has been slow but seems inevitable. Some 30% of all Catholics in the United States are Hispanic and tend to worship in Spanish. In every U.S. city, inner-city grand old churches that were once Irish, German, or Eastern European are now predominantly Hispanic, although the hierarchy of the church is still dominated by its European traditions and personnel. Whenever church leaders gather to discuss the status of the church among minorities, the theme of the Hispanization of the Catholic Church is ever present. One clear result of this internal dialogue is an increased visibility of the church in the political debates affecting Hispanics, such as the recent demonstrations and congressional wrangling over undocumented immigration. As the Catholic Church becomes increasingly Hispanic, its Spanish accent in sociopolitical arenas is likely to be heard more often. An activist church, especially one that embraces elements of Liberation Theology, could go far in promoting the Spanish language in the country.

In other arenas, English-speaking America has been willing to accept the use of Spanish: movies, radio, television, and sports. In 2007, for example, 25% of the players on the Cleveland Indians baseball team were Latinos, and some of them spoke little English. Their fan base is probably similarly large. Soccer, long an unimportant sport in the United States, has now become popular. Professional players from around the world come here permanently or as visitors to play American teams. The language of these athletes often is Spanish. Once limited to the purely Hispanic markets, Latino entertainers now cross over to English easily, although reverse crossovers are fewer. Nonetheless, popular culture may be an important arena in which Spanish will continue to develop a large and uncontroversial user base.

Much of what we do not know and cannot easily anticipate about the place of Spanish is in the domain of cultural pluralism and linguistic and cultural democracy. Until now, the United States and its leaders have not found it difficult to maintain Spanish for use as the language of unskilled work and other low-level domains. Spanish speakers have not insisted that their language be accorded greater respect and recognition. But the presence of more than 40 million Latinos, the rapid growth of that group, coupled with the slow but steady decline in the birthrate of mainstream native English speakers, cannot be ignored. Numbers alone may someday bring us to a tipping point where the status of Spanish must be addressed more formally rather than leaving it to chance. That dialogue may once again bring bilingual education to the foreground as a tool for addressing challenges in language study and learning. Scholar Joshua A. Fishman calls for action to preserve Spanish across generations and to prevent the loss of the national resource Spanish is in the United States.

Finally, as Spanish-speaker migration from Mexico and Latin America continues to increase, its growth is matched by its diversity. Immigration has begun to broaden its demographic base. In the past, only the poorest, least-educated, and least-skilled workers came. This continues today, as we are continually reminded by evening news stories about our porous southern border. The story that remains untold concerns legal migration, which is also at an unprecedented high. Legal migration from these same countries now includes growing numbers of professional and technical workers with skills that allow them to enter the U.S. job market at higher levels. Most of these immigrants are literate in

Spanish and many have a high command of English. Importantly, they are not looking to divest themselves of language and culture as the immigrants of the past were forced to do. Many are sophisticated binational individuals who move easily between the United States and their countries of origin and do not see themselves as permanent immigrants. They are more aware of notions of cultural and linguistic democracy. Many have fled repressive regimes, vowing never to accept repression for their families. In time, these new residents and citizens will enter the civic mainstream in important numbers. In time, this phenomenon may be a bigger news story than that of undocumented aliens crossing the Arizona desert. As Spanish-speaking Americans become more engaged with the political processes of the country and their levels of education rise, they may find unique ways to demand higher recognition of Spanish, their first language.

SPANISH-LANGUAGE ENROLLMENTS

In 2000, a reported 53,358,000 students were enrolled in public and private schools in the United States. Some of them studied foreign languages. This entry focuses on one language, Spanish, which is arguably the most popular language studied in schools and institutions of higher education. The popularity of Spanish is generally attributed to a number of factors, including the large numbers of Spanish speakers in the United States, proximity to Spanish-speaking countries, and corresponding demands for a workforce capable of communicating in Spanish with these trade partners.

Three professional organizations for linguists, second- and foreign-language educators, and educational language policymakers regularly survey elementary, secondary, and higher educational institutions about foreign-language program characteristics and enrollment patterns. This entry summarizes the results of the latest available surveys published by the Center for Applied Linguistics (CAL), the American Council on the Teaching of Foreign Languages (ACTFL), and the Modern Language Association (MLA) in 1999, 2002, and 2004, respectively.

Spanish Language Programs

Nancy Rhodes and Lucinda Branaman reported that in 1987, 68% of elementary schools teaching a language reported teaching Spanish. This proportion increased to 79% in 1997. In 1987, 1% of elementary schools reported teaching Spanish for Spanish speakers. This proportion grew to 8% in 1997. This growth pattern is unlike the rest of commonly taught modern languages, such as French and German, which experienced declines during the same period. A similar pattern was reported by secondary schools. In 1987, 86% of schools reported offering Spanish, and in 1997, 93% offered Spanish. In addition, 9% of secondary schools reported offering instruction in Spanish for Spanish speakers. No data exist for Spanish for Spanish speakers in 1987.

Spanish instruction was not confined to any particular region; Rhodes and Branaman reported that Spanish instruction was commonplace throughout U.S. elementary schools offering modern language instruction. The lowest proportion reported was 77% in the Northeast and the highest was in the Southwest (95%). The region reporting the next highest proportion was the Pacific Northwest at 89%. At the secondary level, 100% of Northeast schools offering modern languages reported offering Spanish, followed by the Pacific Northwest (95%), the Southwest (94%), the central states (91%), and the South (89%).

Program types at the elementary level include Foreign Language in the Elementary School (FLES), Intensive FLES, Foreign Language Experience/Exploration, and Immersion. Of particular interest is the immersion type, which when situated in bilingual communities can be a useful tool for developing bilingualism for language minority students and for native speakers of English.

Spanish Language Enrollments

Jamie B. Draper and June H. Hicks report a high demand for Spanish at the elementary and secondary

levels. In their 2002 study of foreign-language enrollments in public schools during the fall 2000 semester, they reported 20,192 of 30,620 elementary-school foreign-language students were studying Spanish. At the secondary level, 4,057,608 modern foreign-language students in Grades 7 to 12 were studying Spanish (see Table 1), representing 68.7% of all foreign-language students. Another 2.0% (137,703) were enrolled in Spanish for Native Speakers classes.

E. Welles reports that from 1960 to 1990, there were fewer Spanish students in colleges, community colleges, and universities than those studying the rest of the modern languages combined. In 1960, 430,060 studied languages other than Spanish at the undergraduate or graduate levels, and 178,689 studied Spanish (see Table 2). In 1995, the trend changed. The Modern Language Association survey reported that 490,317 studied languages other than Spanish, and 606,286 studied Spanish. As shown in Table 2, this trend continued in 2002, where 746,267 students were enrolled in Spanish classes, and 600,769 students were enrolled in other languages. Between 1960 and 2006, enrollments in languages other than Spanish experienced declines as a proportion to the total number of students, but the number of students of Spanish

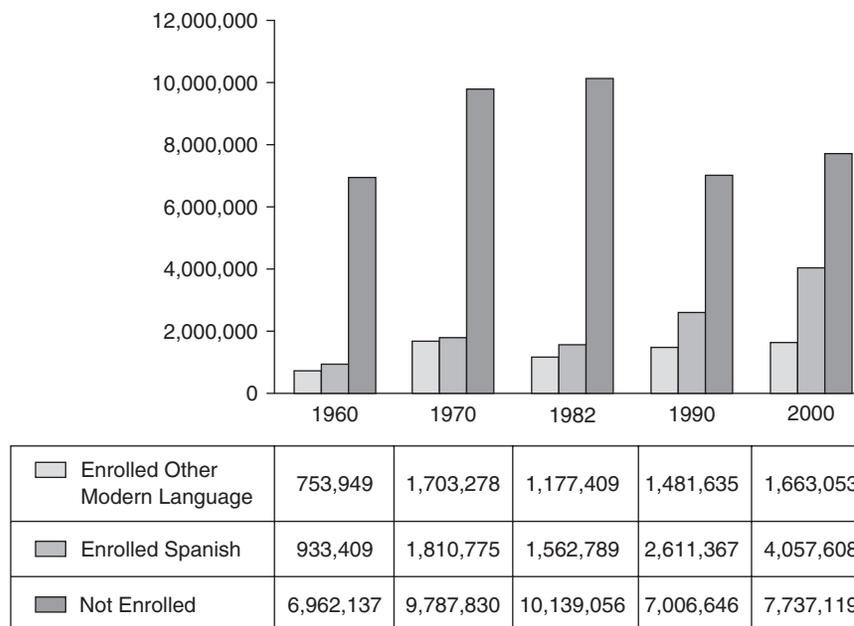

Figure 1 U.S. Public High School Spanish Enrollments: 1960, 1970, 1982, 1990, 2000

Source: American Council on the Teaching of Foreign Languages, 2002. In Draper, J. B. & Hicks, J. H. (2002). *Foreign language enrollments in public secondary schools, Fall 2000*. Alexandria, VA: American Council on the Teaching of Foreign Languages.

increased consistently from a low of 178,689 in 1960 to 823,035 in 2006. This trend shows no sign of changing.

Conclusion

Draper and Hicks report that Spanish and other foreign-language enrollment data are weak or nonexistent. For instance, no data were available at all from Alaska, Oregon, or Washington State because relevant data were not collected in those states. Also, no other readily accessible mechanism is available for assessing the status of Spanish enrollments in other settings other than schools and institutions of higher education. Draper and Hicks maintain that poor-quality enrollment data reduces the ability to determine more specifically the overall health of individual languages other than English. These data also mask the extent to which advanced Spanish and other languages are studied in settings other than schools, colleges, community colleges, and universities.

Draper and Hicks also report that despite the advent of national foreign-language standards, calls to begin language study in lower grades, and a national climate that suggests support for more extensive study of languages and cultures, there remains no appreciable difference in the numbers of students studying Spanish or other languages beyond the introductory levels. Draper and Hicks also remind us that Spanish dominates in

a small piece of the overall enrollment pie. In 2000, only 44% of all high school students in the United States studied a language other than English, and Spanish students were 69% of all high school language learners. In 2002, modern language learners were less than 9% of all college students, and a little more than 56% of that percentage studied Spanish in colleges, community colleges, and universities.

Contrary to the optimism generally expressed that Spanish enrollments are growing exponentially, the broader context suggests otherwise. J. Lipski calls for a language of goodwill and common cause when researching the enormity of enrollments in Spanish courses in comparison with languages other than Spanish. One might argue that firmer data from a comprehensive research agenda will contribute to the achievement of this goodwill and common cause, especially when aimed at investigating how many are studying Spanish or any other language and for how many years, with what curriculum, where, and for what purpose. The foreign-language instruction surveys of K–12 and higher education enrollments are an important part of this research.

Similar surveys of other educational providers of language instruction, such as commercial language schools and community-based language instruction, would be helpful in addressing the need for a more complete understanding of Spanish language teaching and learning in the United States. SPANISH LOAN WORDS IN U.S. ENGLISH

Young people who study more than one language are often intrigued to know that many languages are inter-related, that they grow portions of their lexicons by adopting words from other languages. These young people are particularly interested when their own language can be identified as the source of English words

and ideas. Word loans occur all over the world except in languages that are in geographically isolated settings or those whose host societies arbitrarily restrict word loans from other languages. In linguistics, the science of language, this is known as “word borrowing” and the items are often referred to as “loan words.” This entry discusses the use of Spanish loan words in U.S. English.

Some of the words that enter a language this way may have been borrowed, in turn, from yet another language. Over centuries, the process may be repeated several times, often obscuring the relationship between the “new” word and its lexical ancestors in other languages. The word borrowing process is freewheeling. Permission to borrow is neither sought nor given before the borrowing takes place. The process is also complicated because, in the process of borrowing, the borrower language may change the meaning of the word slightly or in a major way. An example of this is the words *prejudice* and *prejudgment* in modern English. Both terms come from a common Latin root meaning *to judge*. When these words came into English, they had similar meanings but, over time, their meanings became different. *Prejudgment* came to mean a judgment made in advance of the full facts, but one that could be changed as new or more convincing evidence came to light. In contrast, we consider a *prejudice* to be a stubborn or intransigent belief that may have been based on a prejudgment but is not amenable to change in the face of new evidence that is contrary to what was first assumed. In short, although they share a common lexical ancestor, prejudgments are reasonable and flexible whereas prejudices are understood to be more rigid and resistant to modification.

Languages borrow words for reasons ranging from the sublime to the pedestrian. A clever tool, an intriguing idea, a pretty picture, and a tasty morsel are good reasons for a word to jump from one language to another. It then becomes the job of etymologists, the historians of words, to document the borrowing. More than 1,000 word borrowings have come into English from Spanish, making Spanish one of the big lender languages to contemporary U.S. English. When young people study in bilingual classrooms, teachers may point out these word dynamics to their students to help them understand how the two languages in question are related and how they may differ in assigning meanings to words.

With this brief description of word borrowing in mind, this entry reviews some of the Spanish words

that have been loaned to English. Although borrowings have occurred in all fields, the best-known examples of lexical borrowings from Spanish have to do with foods and food preparation. This is not surprising because English and Spanish speakers in the United States have been sharing foods for hundreds of years. This relationship can be seen clearly in the history of the beef industry as well as in the contemporary cuisine of the United States where Spanish words and dishes are common. Few Americans today have not sampled *tacos*, *guacamole*, *burritos*, and *salsa* at a favorite Mexican restaurant. Some of the historical words associated with the beef cattle industry are no longer in common use by urban Americans, but in the Western region, they are very much alive and in use.

Soon after arriving on the Atlantic coast, the English-speaking immigrants—at that point, they were not yet Americans—began to experience foods with Spanish names. In the midst of a harsh New England winter, probably little note was taken of the etymology of words, but some of those overlooked origins surely had a connection to Spain or the Spanish colonies to the south and west. Whether they were noted at the time, these connections began at that time and increased markedly as the country expanded to the west, where the Spanish language was already well established.

The key foods that saved the early settlers from almost certain starvation were squash, beans, and corn. All of these had been brought from Mexico, probably by the Native American traders known as the mound builders of the Mississippi River. The mound peoples linked the native tribes of the northeast downstream to those who lived around the Gulf of Mexico. The most important of these foods was undoubtedly corn because it could be stored for long periods, even from one year to the next. The word *corn* itself is a borrowing from an ancient pre-Germanic word meaning *grain* or *seed*. At the time of the American colonies, *corn* was a term applied generically to several European grains, probably different grains in different countries. The Native Americans who helped colonists cultivate this grain may have referred to it by a Native American name or even by the Spanish term *maíz*. The latter term had been used in the Spanish colonies for several decades before the English settlers arrived here. *Indian corn* was also used. The grain we know today as *corn* was not a Spanish creation. Spain helped to disseminate corn, but the Spanish did not discover it. The Spanish became familiar with corn in the Caribbean, where it was first

cultivated by the native Taínos and Arawaks. Mexicans are often credited with the widespread cultivation and use of corn, but it is more likely to have been cultivated first in Cuba, Hispaniola, and Puerto Rico. The native Mexicans, however, can be rightfully credited with popularizing it, diversifying its use, and helping make it into one of the great grains of the world, alongside wheat and rice.

Maíz, written in English as *maize*, was an early borrowing but it was soon followed by a number of other Spanish terms associated with the beef cattle industry of the Old West and derived from the language of Hispanic colonists. J. Frank Dobie, renowned historian and folklorist of the American West, claims that it is almost impossible to talk about the cattle industry without using Spanish words. Figure 1 shows a sampling of loaned Spanish words and their original meanings in the *lingo* (from the Spanish *lengua* or tongue) of Mexico and subsequently the West. Many have to do with food and cuisine, but others are related to the cowboy era, its tools, and the animals involved.

An important point to remember in studying word loans and borrowings from Spanish is that most of these have occurred in U.S. English and may not be recognizable by a person from another English-speaking country. Another important point is that etymology is not an exact science. In some cases, the original source or origin of a word or phrase may be shrouded in centuries of freewheeling borrowings by explorers and visitors to other lands.

Two cases illustrate how meanings change because of borrowings. The Old West term *Dolly Welter* is used in rodeo parlance to describe a specific step that occurs after the *vaquero* or cowboy has wrestled the animal to the ground and is preparing to immobilize it with the lariat. The term, in its original Spanish was *dale vuelta*, a shouted admonition by fellow cowboys that it was time for the animal to be hobbled by winding the rope around its ankles. So it was that *dale vuelta* became *Dolly Welter*. Another odd translation of a Spanish borrowing is the *ten-gallon hat* favored by cowboys and country and western singers. Most people assume that the ten gallon reference has something to do with the large size of the brim. This is incorrect. A *sombrero galoneado* is one that is festooned or decorated, a Spanish tradition from pre-Colombian days. The size of the brim has nothing to do with being embroidered or festooned. Rendering *galoneado* into *gallon* is simply a mistranslation. Today most ten-gallon hats are no longer decorated

<i>avocado</i>	The name of this fruit came from the Nahuatl (Aztec) language, but it moved into English from Spanish.
<i>barbecue</i>	This Native American word is of Caribbean origin but strongly associated with Spanish whence it jumped to English.
<i>bravo</i>	This is a tribute used to praise the bravery of a bull in the bullring but is also used to express admiration for an inspired musical or acting performance.
<i>buckaroo</i>	This word comes from the Spanish equivalent of “cowboy”; in its original form, it was <i>vaquero</i> .
<i>burrito</i>	This literally means “little donkey,” but in the United States, it is a Mexican dish consisting of a stuffed tortilla wrapped to resemble a Chinese egg roll.
<i>cafeteria</i>	The original <i>cafetería</i> was a place for coffee and light fare. In U.S. English, it usually denotes much broader offerings.
<i>canyon</i>	This is from the Spanish <i>cañon</i> with a slight spelling alteration because the ñ is not used in English.
<i>cargo</i>	This is from the Spanish verb <i>cargar</i> , to load or carry; hence, the popular <i>cargo pants</i> with several roomy pockets.
<i>chaps</i>	This is an Old West term for protective cowboy gear worn while riding through thorny brush. The original Mexican <i>vaquero</i> word is <i>chaparreras</i> .
<i>chihuahua</i>	This is a diminutive dog breed named after the Mexican state of the same name.
<i>chile relleno</i>	This Mexican dish consists of a <i>poblano</i> pepper stuffed with cheese or ground beef, then breaded and fried.
<i>chocolate</i>	Another word from the Nahuatl or Aztec language, <i>chocolate</i> was appropriated by Spanish and disseminated in Europe during the colonial period. The Dutch are credited with improving the taste and texture of chocolate, but the product is of Mexican origin.
<i>cilantro</i>	This is an aromatic cooking and garnishing herb.
<i>cockroach</i>	The two component words <i>cock</i> and <i>roach</i> may have come into use together because they are similar in sound to the original Spanish <i>cucaracha</i> .
<i>corral</i>	This word from the Old West era is still used to describe a large open pen for holding livestock.
<i>coyote</i>	The wily one owes its name to the Nahuatl <i>coyotl</i> , but, as in other cases, it was disseminated by Spanish speakers throughout the Americas.
<i>criollo</i>	This is sometimes equivalent to its cognate <i>creole</i> , but there are important variations in how the word is used in different countries.
<i>El Niño</i>	This is an important weather pattern in the Pacific Ocean that affects North American climate. It literally means “the child,” a name given to it because it tends to occur around Christmas.
<i>embargo</i>	The original Spanish verb <i>embargar</i> means “to bar.” In English, it may also mean to defer release, as in to embargo a press release.
<i>enchilada</i>	This is a Mexican dish deriving its name from the verb <i>enchilar</i> , to season with chili. In contemporary Mexican cooking, some enchiladas contain little or no chili.
<i>fajita</i>	This Mexican dish derives its name from the noun <i>faja</i> or belt, known in English as skirt steak. In contemporary Mexican-style cooking, there are <i>chicken fajitas</i> and <i>shrimp fajitas</i> in addition to beef. Oddly, neither shrimp nor chicken contain the cut of steak from which the name derives.
<i>fiesta</i>	In modern Latin American Spanish, the word is used generically for any kind of celebratory event much as <i>party</i> is used in vernacular U.S. English.
<i>flauta</i>	The literal translation is <i>flute</i> , but it is also the name of a Mexican dish consisting of a filled, rolled, and fried tortilla.

Figure 1 Sample List of Spanish Loan Words to English

(Continued)

Figure 1 (Continued)

<i>guacamole</i>	This is yet another food term of Nahuatl origin that is commonly thought of as Spanish. The original meant something like <i>avocado sauce</i> .
<i>guerrilla</i>	In Spanish, <i>guerrilla</i> refers to a fighting group or movement, rather than to an individual. An individual member of such a group is a <i>guerrillero</i> . English does not usually make that distinction.
<i>hurricane</i>	The word and the concept come from <i>huracán</i> , an indigenous Caribbean word now as firmly ensconced in English as it is in Spanish.
<i>incomunicado</i>	This describes a person who is held prisoner while being denied any communication with others.
<i>jalapeño</i>	This is a person or object from the city of Jalapa (also Xalapa) in the Mexican state of Vera Cruz. The jalapeño pepper is presumably native to that region.
<i>lariat</i>	This word is a combination of two Spanish words <i>la</i> and <i>reata</i> . The reference is to the stiff rope used by cowboys to lasso cattle.
<i>machete</i>	A large knife used for hacking through brush the machete is also used in the <i>safrá</i> or sugar cane harvest.
<i>machismo</i>	In Spanish, <i>macho</i> means male; hence, <i>machismo</i> could be translated as <i>male-ism</i> . In English, <i>machismo</i> is negatively charged. That connotation has been popularized even in contemporary Spanish to denote chauvinistic behavior offensive to women. It is not clear why a Spanish term was chosen to represent this negative idea, which is aptly expressed in English as <i>male chauvinism</i> .
<i>maize</i>	The word comes from <i>maíz</i> (stressed <i>í</i>), which is probably of Caribbean origin but long ago became firmly ensconced in Spanish.
<i>margarita</i>	This word started out as a woman's name, Margaret or Daisy. It is still used that way but is also widely recognized as a tequila-based cocktail.
<i> mariachi</i>	The origins of this term are obscure, but some believe it to be a borrowing from French "mariage" or wedding. The musical group now called <i>mariachi</i> may have evolved during the French occupation of Mexico under Maximilian when it became a popular form of wedding music.
<i>marijuana</i>	This literally means "Mary Jane," but few if any parents would give that name to a daughter today. It is now used almost exclusively as the name of a recreational drug.
<i>matador</i>	The word means "killer," usually in the context of killing bulls in the ring.
<i>menudo</i>	The word means "small" and is used in some countries to mean loose change. In the cuisine of northern Mexico, it is the name of a spicy soup made from beef tripe.
<i>mesa</i>	It is most commonly used in Spanish to mean "table." In the U.S. Southwest, it is also used to describe a hill or mountain with a flat top.
<i>mesquite</i>	There are many varieties of this tree, which grows from the United States in the north to the southern cone of South America. The word is of <i>Nahuatl</i> origin.
<i>mestizo</i>	A race descriptor for persons with mixed European and Native American ancestry. Some countries such as Mexico and Guatemala have large proportions of <i>mestizo</i> citizens, whereas others such as Costa Rica and Argentina do not.
<i>mole</i>	In the United States, only one kind of mole is well known, <i>mole poblano</i> , which contains chocolate in the sauce. In Mexico, there are other types: <i>amarillo</i> , <i>colorado</i> , <i>coloradito</i> , <i>mancha</i> , <i>manteles</i> , <i>negro</i> , and <i>verde</i> . Note that the word <i>mole</i> does not carry a written accent; it is stressed on the first syllable.
<i>mustang</i>	This is an Old West term meaning a stray or wild horse. In the original Spanish, the word was <i>mesteño</i> .
<i>nada</i>	The word means "nothing" in Spanish. It is sometimes used in U.S. English for emphasis, e.g., "Nothing, zip, nada."
<i>olé</i>	This word expresses approval of actions occurring in the bullring at the moment. It is typically used to praise the usual survivor, the bullfighter rather than the bull.

<i>paella</i>	This Spanish dish is based on rice but containing seafood or pork depending on the region of origin.
<i>palomino</i>	This is a highly valued breed of show horse.
<i>patio</i>	Originally, this was the inner courtyard of a Spanish or Spanish colonial home.
<i>peccadillo</i>	A <i>peccadillo</i> is a small <i>pecado</i> , a sin that is not considered very serious—at least by the person(s) who commits it.
<i>piña colada</i>	This alcoholic drink from Puerto Rico is made with rum and pineapple juice. The literal meaning is “strained pineapple.”
<i>piñata</i>	These are made of <i>papier maché</i> or clay. As part of a Mexican birthday celebration, blindfolded children take turns trying to break them open with a stick to get at the candy goodies inside. The job of the adults is to protect other children from the sometimes wildly swinging stick.
<i>pinto</i>	This is a mottled or mixed-color horse. Other animals and items can also be described as pinto or pintos, e.g., <i>pinto beans</i> or a <i>gato pinto</i> .
<i>plaza</i>	In almost every Spanish and Spanish colonial town, there was a central square or <i>plaza</i> around which public offices and at least one church were built. In English, the term is used loosely to suggest a public space, e.g., the “toll plaza” on the New Jersey turnpike.
<i>potato</i>	Both the name and the spud itself came from Spanish-speaking nations. The name is probably of Caribbean origin, a variant of <i>batata</i> .
<i>pueblo</i>	In Spanish, the word can mean “town” or “people.” The indigenous pueblo dwellers of the U.S. Southwest use the word both ways.
<i>quesadilla</i>	Literally, the word means “a small cheese thing.” In actual practice, this morsel is usually a hot flour tortilla with cheese stuffing and perhaps other ingredients.
<i>ranch</i>	The English <i>ranch</i> comes directly from the Mexican Spanish <i>rancho</i> . In U.S. English, a secondary use is a type of single-story house, as in “a three-bedroom ranch.” The latter usage does not occur in Spanish.
<i>remuda</i>	During long cattle drives, most of the cowboys herded cattle but a few of them were in charge of moving and caring for the <i>remuda</i> , the herd of spare horses they rotated to ensure a fresh mount everyday.
<i>rodeo</i>	Originally, this was the annual roundup in which cattle were branded and sorted in preparation for moving them to market. Today, it is a festive but serious competition among cowboys and professional riders and ropers.
<i>salsa</i>	In Spanish, <i>salsa</i> is the generic equivalent of “sauce” and is not restricted to the spicy variety. Use of the term to refer to a type of Afro-Cuban music derived from the <i>mambo</i> is fairly recent but widespread.
<i>savvy</i>	The word comes from the Spanish verb <i>saber</i> , “to know.” A person is said to be “savvy” when he or she has intimate knowledge about a subject or situation. In Spanish, equivalent terms are <i>listo</i> or <i>lista</i> .
<i>serrano</i>	This adjective describes the provenance of a person or item as native to a <i>sierra</i> , or mountain region. It is used often to describe food items such as <i>serrano</i> peppers or, in Spain, the famous <i>serrano</i> ham.
<i>siesta</i>	The common meaning of this word has not changed in the transition to English: a nap, especially an afternoon nap taken as part of the lunch break.
<i>stampede</i>	The term comes from the Spanish <i>estampida</i> , a wild uncontrolled rush usually by herd animals.
<i>taco</i>	In Mexico, a <i>taco</i> has a similar function to a sandwich. It holds food inside for easy consumption without a fork. In Mexican cooking, <i>taco</i> is a generic name. It can contain almost anything. The

(Continued)

Figure 1 (Continued)

	commercial U.S. version consisting of ground beef, lettuce, and tomatoes is not commonly served in the same way in Mexico.
<i>tamale</i>	This savory Mexican, Cuban, and Central American dish may be wrapped in corn husks or banana leaves depending on its country of origin. The final “e” in “tamale” is not present in the Spanish singular of this noun: <i>tamal</i> .
<i>tequila</i>	This alcoholic drink, which is one of Mexico’s cultural symbols, is made from the fermented juice of the blue <i>agave</i> plant. The Mexican state of Jalisco is the primary producer of tequila. Although tequila can be abused, in Mexico, it is considered an aperitif and is usually consumed only in small quantities.
<i>tobacco</i>	The product as well as its name came from the Western Hemisphere, probably the Caribbean. In Spanish, the word is <i>tabaco</i> .
<i>tomatillo</i>	Mexican tomatoes can be red or green. The tomatillo is the green variety. It never turns red and is a different fruit from its red cousin. Tomatillos are used in cooking and are rarely eaten raw.
<i>tomato</i>	This popular fruit is known worldwide but was first cultivated by the Aztecs. The name comes from the original Nahuatl <i>tomatl</i> . In Mexico, to distinguish it from its green relative, red tomatoes are known as <i>jitomatess</i> .
<i>tuna</i>	In Mexico, <i>tuna</i> is the fruit of the prickly cactus, and <i>atún</i> is the name of the fish. In U.S. English, the cactus fruit is known as “cactus pear.”
<i>vanilla</i>	This is another New World condiment. The name in English is a slight variation of the Spanish original, <i>vainilla</i> .
<i>vaquero</i>	This word is commonly rendered in English as <i>cowboy</i> . In Spanish, it is more generic and could also be translated as “cowman.”
<i>vigilante</i>	The word comes from the Spanish verb <i>vigilar</i> , to keep watch. In English, it usually refers to a member of a group that seeks to enforce the law without official designation as law enforcement agents.

except in the case of *charros* and *mariachis*, whose hats are still well decorated for use on stage.

See ENGLISH IMMERSION

SPECIALLY DESIGNED ACADEMIC INSTRUCTION IN ENGLISH

Specially designed academic instruction in English (SDAIE) refers to academic content area instruction provided in English to English language learners (ELLs). Teachers of SDAIE classes provide ELLs with grade-appropriate content by using special techniques to make lessons understandable. They evaluate the students’ academic content knowledge, rather than their English language proficiency. When properly understood and implemented, SDAIE can be an extremely effective approach for older English learners. This entry presents a brief overview of the development of SDAIE, compares SDAIE and English language development (ELD), and suggests strategies to support SDAIE instruction.

Development of SDAIE

English as a second language (ESL) instruction has taken many forms over the years, and the goals of programs have changed. At one time, ESL instruction was designed to help students develop basic communicative competence in English. The focus was on the social language students needed to survive day-to-day in and out of school. Lessons emphasized vocabulary, grammar, and correct pronunciation. As a result, many ESL classes were taught much like foreign-language classes.

A major shift in recent years has been toward teaching the academic language of the different content areas rather than teaching social language. In ESL classes, students acquire English as they learn social studies, science, math, and language arts. Support for this content-based approach to language teaching comes from Stephen Krashen's theory of second-language acquisition. Krashen argues that we acquire a second language when we receive comprehensible input: messages we understand that are a little beyond our current level of competence. Students can learn academic content at the same time that they acquire English as long as the instruction is understandable.

Stephen Krashen and Tracy Terrell proposed the natural approach, a content-based method of teaching ESL, applied most often at the elementary level. Teachers use various techniques to make instruction comprehensible as they teach lessons on topics such as families, animals, or nutrition. Students' use of English is mainly oral until learners reach high levels of proficiency. Whereas the natural approach was widely used in elementary grades, educators in the upper grades found the content demand for their subjects was greater and students needed to be able to read and write as well as respond orally to instruction. In addition, teachers of older students used fewer techniques designed to make lessons understandable for ELLs.

Development of Sheltered Instruction

Older students, particularly at the middle school and high school levels, need to learn English and, at the same time, learn content. Teachers of older students often use techniques such as lecturing, and long reading assignments that prove difficult for students with limited English proficiency. These teachers generally have students for single subjects, and they see their job as teaching that subject, not as developing their students' English proficiency.

A program model for older students proposed by Krashen and others included a component called *sheltered content*. In this model, students are taught some subjects in their primary language, some in sheltered classes, and some in mainstream classes. As students become more proficient, they are transitioned from primary-language instruction to sheltered instruction, and then they are mainstreamed. For example, students might take social studies classes at first in their primary language. Later they would have a sheltered social studies class, and eventually they would be mainstreamed in social studies.

ELLs were grouped for placement in sheltered classes. The classes were sheltered in two respects. First, ELLs were sheltered because they did not have to compete with native-English speakers. Second, the content was sheltered because the teachers used techniques to make the English instruction more comprehensible. Sheltered instruction was a step in the right direction because in these classes, students were instructed in content area subjects, and they acquired English at the same time.

Three problems arose with sheltered instruction, however. The first was that teachers were often not adequately prepared to teach these classes. A high school biology teacher, for example, might be given a 2- or 3-hour in-service on sheltered techniques, and then be expected to work effectively with English learners. This was simply not enough time. The second problem was that content teachers were forced to slow down to make lessons understandable for ELLs. As a result, teachers of sheltered classes were seldom able to cover as much content as mainstream teachers did. In effect, academic content was sacrificed to meet language needs.

This led naturally to a third problem. Students who succeeded in sheltered classes often floundered when mainstreamed. They were generally behind in the content, and they had difficulty catching up because the mainstream teacher didn't use the techniques that the English learner still needed.

The real problem was that students were often placed in sheltered classes too soon. They simply needed more time to develop English language, cognitive, and academic proficiency. Virginia Collier and James Cummins, among others, have suggested that students need from 5 to 7 years to develop the language they need to compete academically. Older students often do not have 5 years before graduation or to pass exit exams, and few are given 5 years before

being completely mainstreamed. Primary-language instruction is essential for these students, but it is seldom available. Sheltered instruction helps, but it can't speed up the process.

A New Approach: ELD and SDAIE

The failure of ELLs to succeed in mainstream classes after sheltered instruction caused educators to rethink the goals of content-based ESL. Was the goal content or was it language? Should students in a sheltered biology class be learning English through studying biology, or should they be learning biology through the medium of English? Often, ELLs with different levels of English proficiency and different degrees of subject area knowledge were grouped in the same sheltered class. Students with relatively low levels of English proficiency could not learn as much biology as could their classmates with greater English proficiency. In addition, students with limited science background could not understand more advanced science instruction. On the other hand, it would be possible for students at intermediate-to-advanced levels of English proficiency to learn biology in a sheltered class if they have the necessary background knowledge of the subject.

A good way to think about what might be reasonable for these two different groups of students is to picture native-English speakers going to Japan next week. If their level of Japanese is low or nonexistent, they certainly would not want to be thrown into a sheltered biology class where they have to compete with native Japanese students. The teacher could use wonderful techniques to make the content comprehensible, but if she tried to cover the normal biology content, they probably would not receive a high grade in the course.

On the other hand, if the students have a reasonable level of proficiency in Japanese, they might succeed in the sheltered class. Of course, it's not just their knowledge of Japanese that would make a difference. Their success would also depend on how much biology they had studied in English. That knowledge would transfer to the new setting. Both content knowledge in the first language and level of proficiency in the second language influence success in learning content in a second language.

The problem with sheltered English was that students with quite different levels of English proficiency and primary-language education were lumped

together in the same class. No matter how well teachers used sheltered techniques, they couldn't succeed with these different types of students. This led educators to distinguish between two kinds of content-based ESL instruction. The first type of class, called English language development (ELD), is designed for students with lower levels of English proficiency or less primary-language academic development. In ELD classes, the focus is on learning English through content instruction suited to the level of the students' academic background. The second type of class, SDAIE, is for students with intermediate to advanced levels of English proficiency and grade-level academic development in the subject area. SDAIE classes are content classes taught using special techniques to make instruction comprehensible. Students are evaluated on their content-area knowledge. The primary goal of ELD classes is English language development, and the primary goal of SDAIE classes is academic development. In ELD classes, students are evaluated on their English language proficiency. A final difference between SDAIE and ELD classes is that SDAIE was developed for ELLs studying the academic content of different subject areas. This implies that SDAIE is intended to support students in the upper grades, middle school, and high school where the content is most demanding. Table 1 contrasts ELD and SDAIE.

Strategies to Make the Input Comprehensible

In SDAIE classes, the assumption is that language and content can be developed together if teachers use the needed techniques to make the input comprehensible. Teachers can use several techniques to make the academic content comprehensible:

1. Use visuals and realia (real things). Try always to move from the concrete to the abstract.
2. Scaffold content learning through the use of graphic organizers including Venn diagrams, webs, and charts.
3. Use gestures and body language.
4. Speak clearly and pause often, but don't slow speech down unnaturally.
5. Say the same thing in different ways (paraphrase).
6. Write key words and ideas down. (This slows down the language.)

Table 1 Distinctions Between ELD and SDAIE

Student characteristics	
<i>ELD</i>	<i>SDAIE</i>
English proficiency—beginner	English proficiency—intermediate to advanced
L1 academic proficiency—not considered	L1 academic proficiency—at grade level
Focus of instruction and evaluation	
<i>ELD</i>	<i>SDAIE</i>
Teach language through content with emphasis on language development	Teach grade-appropriate content using special techniques to make the language understandable
Evaluation focuses on language	Evaluation focuses on academic content
Most often used at	
<i>ELD</i>	<i>SDAIE</i>
Elementary or secondary school	Middle school and high school

7. Use media, PowerPoint presentations, overheads, and charts whenever appropriate.
8. Make frequent comprehension checks.
9. Above all, keep oral presentations or reading assignments short. Collaborative activities are more effective than lectures or assigned readings.

Preview–View–Review

The role of the first language is an important one in teaching language through content. SDAIE classes are not bilingual classes, but teachers can use students' first languages to provide access to the academic content. Preview–view–review is an important strategy to use. This strategy can work in classes with English learners from different primary-language backgrounds, and it can work whether or not the teacher speaks the students' languages. If the teacher, a bilingual peer, a bilingual cross-age tutor, a bilingual aide, or a parent can simply tell the English learners in their native language what the upcoming lesson is about, the students are provided a preview. This preview might be a few sentences explaining what is going to happen in the class that day or that period or it could be more extended. For example, in a world history class studying the causes of World War II, the teacher could preview the lesson by having a more proficient bilingual classmate explain in the students' native

language, "Today we are going to study about World War II. We are going to look at the major events that led up to the war." A more complete preview might be the reading of a book or a few paragraphs about the topic to be studied in the students' native language(s). The teacher could also ask students to form same-language groups and, speaking in their first languages, brainstorm what they know about World War II and then report back to the class in English.

During the view, the teacher conducts the lesson in English using the strategies listed earlier to make the input comprehensible. With the help of the preview, the students can follow the lesson better during the view and acquire both English and academic content. Finally, the teacher would plan a short time of review during which students again use their native language. When no first-language resource people are available, students who speak the same first language can meet in groups to review the main ideas of the lesson and then report back in English. Students who are literate in their first language might read something in their native language that supports the concepts and then summarize in English, or they might investigate a topic on the Internet in their first language. Preview–view–review is a way to use the first language as a resource for second-language content instruction. Figure 1 outlines the technique.

The preview–view–review technique provides a structured way to alternate English and native-language

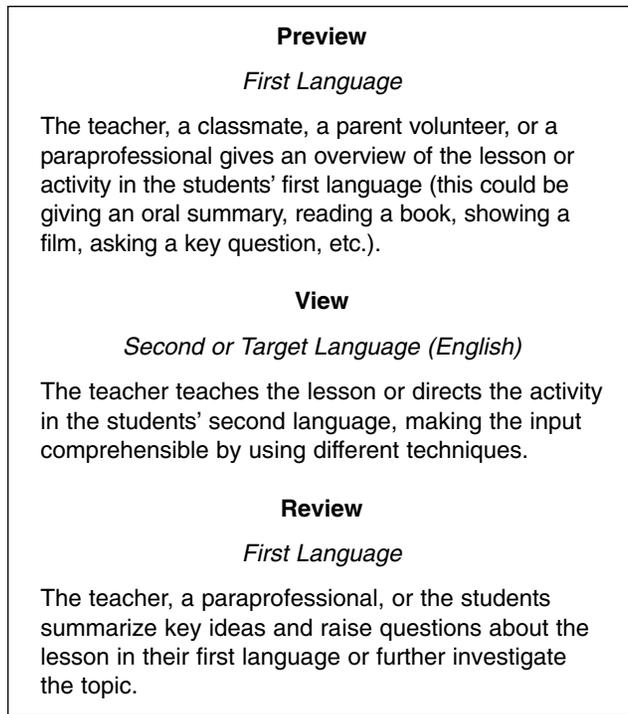

Figure 1 Preview–View–Review

instruction. Students are given access to the academic concepts they need to know and, at the same time, acquire English.

ELLs face a challenge in trying to learn academic content in a new language. SDAIE classes can be an important support for these students. In successful programs, ELLs are placed appropriately in either ELD or SDAIE classes, and teachers use a variety of techniques to make the content comprehensible. Well-implemented SDAIE classes support ELLs and help them to learn the essential content they need to succeed in school.

SPOLSKY, BERNARD (1932–)

The unifying theme in Bernard Spolsky's globe-trotting life is a profound concern for the language rights of indigenous populations that began when, as a young high school teacher in New Zealand, he became interested in the bilingualism of his Māori students. His energy and commitment are well known to his colleagues. Wherever he has been, he has initiated centers, organizations, or journals to affect knowledge and decisions related to language. His work has greatly influenced language education through his insights into language testing and the many factors affecting second- and foreign-language acquisition. More recently, he has focused on national language policies around the world. This entry traces his career.

Spolsky was born in New Zealand, where he earned a BA and MA in English from Victoria University in Wellington, and then set off to teach in England, Australia, and Israel. He pursued a PhD in linguistics at the University of Montreal and remained in Canada to teach at McGill University. Subsequently, he accepted the position of assistant professor of linguistics at Indiana University, where he also directed its English as a Foreign Language program and served as associate chair of the Research Center for Language Sciences. In 1968, Spolsky moved to the University of New Mexico as professor of linguistics, anthropology, and education, where he served as director of the innovative Navajo Reading Study, and dean of the graduate school.

In 1980, Spolsky returned to Israel as professor of English at Bar-Ilan University. He has remained in Israel ever since, but has continued to influence research, education, and public policy throughout the world. After having served as chair of Bar-Ilan's English Department, he served as dean of the university's

faculty of humanities. As of 2007, Spolsky is an emeritus professor of English and founding director of the Language Policy Research Center. His retirement does not preclude his continuing to serve as senior associate at the National Foreign Language Center (Washington, D.C.) and editor-in-chief of two influential journals, *Language Policy* and the *Journal of Asia TEFL*.

Spolsky has conducted and published research in language testing, second-language learning, applied linguistics, sociolinguistics, language policy, and computers in the humanities. He has written or edited 24 books and published 200 articles and chapters. His books reflect the breadth of his expertise including, among others, *Language Policy* (2004), *The Languages of Israel* (with Elana Shohamy, 1999), *Concise Encyclopedia of Educational Linguistics* (1999), *Sociolinguistics* (1998), *Measured Words: The Development of Objective Language Testing* (1995), *Language and Education in Multilingual Settings* (1986), *The Languages of Jerusalem* (with Robert L. Cooper, 1991), *Educational Linguistics: An Introduction* (1978, 1981), *Case Studies in Bilingual Education* (with Robert L. Cooper, 1978), and *Frontiers of Bilingual Education* (with Robert L. Cooper, 1977). His book *Conditions for Second Language Learning: Introduction to a General Theory* (1989) was awarded the 1989 Kenneth W. Mildener Prize by the Modern Language Association of America and the 1990 Book Prize by the British Association for Applied Linguistics.

Spolsky's service to professional organizations is remarkable: He has served as president of the Teachers of English to Speakers of Other Languages Association, secretary-treasurer of the American Association of Applied Linguistics, president of the Israeli Association of Applied Linguistics, chair of the board of trustees of the Center for Applied Linguistics, and president of the International Language Testing Association. He has held numerous fellowships and visiting positions, including Guggenheim and Mellon fellowships. He has also served as senior research fellow at the National Foreign Language Center in Washington, and as visiting research fellow at the University of Auckland's International Research Institute for indigenous and Māori Education.

STANFORD WORKING GROUP

The Stanford Working Group on Federal Education Programs for Limited-English-Proficient Students (hereafter SWG) was created in 1992 in California under the leadership of Diane August and Kenji Hakuta to address emerging policy issues in the education of limited-English-proficient (LEP) students in the context of standards-based education reform. Members of the SWG included practitioners, researchers, policy specialists, and advocates. Though diverse in their backgrounds, the group held a common view that efforts to reform education had often ignored the special needs of LEP students especially under services funded by the federal government under Title I of the Elementary and Secondary Education Act (ESEA). The long-range goal of the group was broad:

to position the public discourse on bilingual education and services to LEP students to incorporate the most recent thinking and research in educational reform. The spirit of the group's effort is best described as advocacy through an organized attempt at improving the quality of the public discourse—a discourse that might be characterized as often discordant—on education reform and inclusion of LEP students. This entry describes the work and contributions of the SWG to the field of bilingual education.

The work was driven by a key observation that became increasingly evident with the approaching 1994 reauthorization of ESEA: LEP students were at best an afterthought in the education reform movement. This conclusion was supported by the fact that very few of the leaders in the education reform movement could articulate—beyond the recitation of a routine pledge that the movement addressed “all students”—how this group, composed at the time of 3.3-million school-aged children of limited English proficiency, might be productively included. In addition, members of the SWG noted that the key concepts and language of “systemic reform” were absent from the repertoire of many advocates and educators principally concerned with LEP students.

During its work, funded over 5 years by several big foundations, including the Carnegie Corporation of New York, the SWG developed major policy and legislative recommendations for the reauthorization of the ESEA and its subsequent implementation. The SWG also convened stakeholders, experts, and policymakers on a variety of policy and research issues surrounding LEP students, and issued recommendations for federal, state, and local policymakers.

Several characteristics of the SWG's composition deserve comment. The membership of the group extended beyond the individuals and organizations traditionally associated with bilingual education and policy advocacy on behalf of LEP students. This reflected the group's desire to incorporate broader reform efforts into their considerations of LEP education. Moreover, although members came from a variety of organizations, they participated in this project as individuals, not as representatives of their respective groups.

This latter characteristic of the SWG had disadvantages and advantages. The primary disadvantage was that the individual members making recommendations did not have an organized political constituency; thus, to ensure that the report had significant legislative

impact, its recommendations had to be supported by those that possessed such constituencies. Viewed from the opposite perspective, however, this was a source of strength. Because members participated as individuals, the findings and recommendations were independently derived and relatively unconstrained by institutional affiliations. This independence also enabled the group to look for greater coherence among disparate pieces of the legislation. In addition, the relatively small size of the group enabled it to analyze issues in far greater depth than could be accomplished in a larger group.

Blueprint for the Second Generation

The SWG's first product was a document titled *Federal Education Programs for Limited-English-Proficient Students: A Blueprint for the Second Generation*, released in June 1993. This document became the basis for a diverse array of follow-up work in the policy, advocacy and research arenas.

Blueprint was driven mainly by legislative proposals, namely ESEA within the context of Goals 2000, a prior landmark legislation setting the stage for standards-based reform. The document identified two overarching principles:

1. Language minority students must be provided with an equal opportunity to learn the same challenging content and high-level skills that school reform movements advocate for all students.
2. Proficiency in two or more languages should be promoted for all American students. Bilingualism enhances cognitive and social growth, competitiveness in a global marketplace, national security, and understanding of diverse peoples and cultures.

In its review of the legislative and programmatic records of existing federal programs, SWG noted that a mind-set persisted within these that saw LEP students' languages and cultures as academic deficits rather than as potential strengths. Federal and state policies thus operated from the damaging assumptions that “disadvantaged” language minority students were incapable of learning to high standards and that they would be distracted from learning English when taught in the native language. Despite the strong educational research and practice evidence that showed these assumptions were faulty, the mind-set permeated legislation, policy, planning, and practice.

In addressing these programmatic issues, the Working Group adopted the view that a necessary part of the change was to address fragmentation of educational services. For example, it noted that states played a limited role in Title VII projects, which in turn were rarely coordinated with Chapter 1, migrant education, or other federal, state, or local efforts, leading to scattered resources, partial rather than holistic attention to students' needs, and lack of accountability. Often, this meant that resources were dispersed, students' needs were only partially addressed, and no one was held fully accountable. Generally, SWG noted that the education of LEP students was not conceived as part of any larger mission, and that programs to address their unique needs tended to remain ghettoized within state educational agencies, local educational agencies, and schools. The SWG made recommendations in three areas.

The first set of recommendations addressed how the federal government should actively encourage state education agencies to play new leadership roles in school reform, and how state efforts on behalf of LEP children must be part of a *comprehensive plan* for system wide reform.

The second set of recommendations concerned Chapter 1, ESEA (re-titled as Title I in the reauthorization), and noted that existing programs overemphasized remediation of basic skills rather than higher order skills and that there was fragmentation of services and isolation of Chapter 1 programs from the general school program and failure to target funds to sufficiently affect the condition in high poverty schools and districts. Key recommendations included requiring a state education plan that would include provisions to ensure that LEP students have access to the same challenging curriculum and instruction as all other children, increasing access to Chapter 1 programs through targeting funds to high-poverty schools or districts, and requiring that all eligible LEP students be equitably selected for Chapter 1 services.

The third set of recommendations concerned Title VII (re-titled as Title III), and urged that Title VII be made more effective in its second generation by working in tandem with new federal efforts to guide and support states to ensure that LEP students meet high performance standards. Key recommendations included redefining the role of the Office of Bilingual Education and Minority Languages Affairs (OBEMLA); enhancing and improving the state's role in planning, coordination, program improvement, evaluation, dissemination

of effective practice, and data collection; and reformulating the types of grants awarded to schools and school districts to encourage innovation and to limit fragmentation of services.

Starting in June 1993, the group carried its work into the political arena, engaging in discourse with key advocacy groups (the Mexican American Legal Defense and Education Fund, the National Association for Bilingual Education, the National Association for Asian and Pacific American Education, the Congressional Hispanic Caucus, the Hispanic Education Coalition, the Puerto Rican Legal Defense and Education Fund, and the National Council of La Raza), major "mainstream" associations concerned with education (Council of Chief State School Officers, the National Education Association, the American Federation of Teachers, the National Association of State Boards of Education, principals' associations, Council of Great City Schools, and the National Governors' Association), and other professional organizations with an interest in education (American Psychological Association, American Educational Research Association, and Society for Research in Child Development).

During subsequent years, the group carried the discourse several steps further, in addition to continuing the discourse at the political level. These steps are described here.

Political Discourse, Continued

With the formal appearance of the administration's proposal for the ESEA, titled the "Improving America's Schools Act," the group prepared an analysis of the bill with respect to the recommendations of the *Blueprint*. The group also prepared an analysis of H.R. 6, Improving America's Schools Act of 1994 (the version that was passed by the House), in anticipation of questions that it expected to receive during conference. In all cases, the group was careful to offer its analysis as "objective" comparisons of the bills and the recommendations in the *Blueprint*, and avoided the perception of being "lobbyists" for any particular position. Perhaps as testimony to the fact that the group was perceived by legislative staff as an objective resource for their efforts to balance a difficult political issue, members were invited, in the case of the House subcommittee hearings, as a "balance" between the Hispanic Caucus and the Republican witnesses (July 22, 1993), and in the case of the Senate

subcommittee, as the only witness to testify regarding bilingual education (April 14, 1994).

What was interesting to the group at the time about the discourse in this arena was the extent to which the political process continued to engender the fragmentation of programs (especially the division between Chapter 1 and Title VII programs), and the degree to which the question, “But are these kids learning English?,” continued to dominate the question, “Are these kids learning academic content?” Academics, researchers, and policy analysts had no difficulty in appreciating the problems of program fragmentation and the question of English as the dominant, driving force of the debate. But legislative staffers, and their bosses tended not to weigh these “intellectual” considerations on the same scale as issues of constituency and the symbolic politics of sentiments about immigration.

Another important discourse the group contributed to in the legislative arena was on the topic of the Emergency Immigrant Education Act (EIEA). Legislators became acutely focused on this issue as politicians, especially in states heavily affected by immigration, began using the issue to help focus their upcoming election bids. In collaboration with the Urban Institute, the group held a conference that brought together federal, state, and local education officials and other interested parties. This meeting helped identify and discuss the distributional and service issues that confronted legislators considering changes to the act. Legislative staffers reported that the discussions and recommendations that resulted from this meeting were critical in the reauthorization process.

Discourse With the “Education Establishment”

The “education establishment” at the time was the Council of Chief State School Officers (CCSSO), by far the most enthusiastic among the Washington education establishment about systemic reform, as embodied in Goals 2000. The SWG collaborated with CCSSO to obtain a grant from the U.S. Department of Education, Office of Planning, Budget and Evaluation to conduct a survey of inclusion of LEP students in state systemic reform initiatives. This effort added to the survey design that CCSSO had already developed, but that did not explicitly address LEP students. Foundation funds provided staff time to develop the proposal and work with CCSSO staff in designing the survey. This work yielded valuable information,

enhanced the capacity of CCSSO to address the needs of LEP students, and highlighted the issue of LEP student inclusion in systemic reform to state education agency staff because CCSSO was making the effort to collect this information.

Discourse on Standards and Assessment

As SWG members discovered in their participation in the multiple discourses on education reform and inclusion of LEP students, the “traditional” advocates for bilingual education—for example, those definable as recipients of Title VII grants (now Title III)—were among the last of the participants to be included in the discourse on standards and assessment. Through additional funding from the OBEMLA (now the Office of English Language Acquisition) and the Department’s Goals 2000 Management Council, the SWG sponsored a series of two meetings on this topic, especially focused on Goals 2000 and the somewhat confusing move toward the setting of national content standards, and what they meant for LEP students. Many of the individuals at the meeting had heard about the issue of standards and assessment, but had not actively participated in a broad discussion of its implications for LEP students. For many, it was the first time that they had discussed the many difficult issues.

Based on these meetings, a consensus document, *For All Students: Limited-English-Proficient Students and Goals 2000*, was developed that included contributions from a wide range of authors. This document was disseminated to a wide range of audiences, including state teams working on Goals 2000. It was also disseminated by the National Clearinghouse for Bilingual Education so that it could reach all professionals working on federally funded bilingual education projects.

Discourse With State and Local Educators of LEP Students

The SWG held regional meetings in Texas and the New England region (primarily Connecticut, Massachusetts, and Rhode Island) to discuss systemic reform and its impact on LEP students. Each meeting was attended by about 60 state and local educators, where they were briefed on federal initiatives in systemic reform, and asked to articulate local and state level concerns about the inclusion of LEP students.

Among the concerns the group heard, for example, was the unavailability of appropriate assessments, of adequate resources, and of appropriate staff development for both teachers and principals.

Discourse With Civil Rights Advocates

The SWG convened a group of advocates with a civil rights perspective to discuss and achieve consensus on state and local responsibilities in addressing the needs of LEP students. Participants included more than 20 persons representing some of the more important organizations involved in some aspect of education legislation at the federal level. Participants discussed current law concerning school districts' responsibilities with regard to LEP students, Chapter 1 requirements regarding LEP student eligibility and services, and current state and local policy and practice in serving LEP students. Participants reached consensus on changes in Chapter 1 legislation, strengthening the role of the Office for Civil Rights (OCR) in enforcing Title VI and the Equal Educational Opportunity Act (EEOA), and the importance of further research and development efforts in improving programs and practices for LEP students.

Discourse With Researchers

SWG members worked with Deborah Phillips of the National Board on Children and Families of the National Academies of Science to develop a panel study on research on the education and development of bilingual children. The panel study, titled *Improving Schooling for Language-Minority Children*, was published in 1997 by the National Academy Press and has been widely disseminated. Its findings have been influential in informing educators, researchers, and policymakers about the education of language minority students.

STATUS DIFFERENCES AMONG LANGUAGES

Human languages do not all share equal status or standing. Some are spoken more ubiquitously than others, although many have been given an officially high status in particular countries. According to Daniel Abrams and Steven Strogatz, the status of a language can often be determined by the social and economic opportunities it offers its speakers. In a bilingual or multilingual society where social prestige and power are not distributed evenly, each language is generally assigned a different function and allocated a different status. Languages that monopolize official and public functions have high status, but languages reserved for more private domains have low status. For example, in the British colonial era in Hong Kong, English was the high-status language of territorial administration such as in government and legal affairs, and Cantonese, the native language of Hong Kong people, was the low-status language of everyday life. This phenomenon is known in linguistic science as *diglossia*, two languages (one high and one low) performing distinct communicative functions in the society without overlapping. Often, languages compete with each other for specific domains in the society. Research in Hong Kong revealed a clear language shift after its decolonization in 1997. This finding illustrates that the status of a language is fluid and may change from high to low, or vice versa, for different reasons. Michael Clyne proposes three main factors that cause changes in the status of languages: (1) individual factors, including generation, age, exogamy, gender, socioeconomic mobility, and proficiency; (2) group factors, including community size, culture, religion, premigration experience, and situation in the homeland; and (3) general factors of time

and place. The change of language status in a community may be caused by one or more of the factors described earlier.

When two or more languages compete against each other in a community, the one with the greatest number of speakers, and that also offers the best opportunities to its speakers, will prevail over other languages and achieve a higher status. Other languages are relegated to a low status and may become endangered and, eventually, disappear altogether. According to Christopher Pountain, a low-status language dies every two weeks. Pountain believes that by the end of the 21st century the number of languages in the world will diminish from about 6,000 to about 1,000.

With a continuous influx of immigrants from all over the world, the United States is a linguistically diverse society. According to the U.S. 2000 Census, the top five most spoken languages in U.S. homes, in descending order, are English, Spanish, Chinese, French, and German. Even though the immigrants bring great diversity of languages into the nation, the speed of new immigrants assimilating into monolingual English speakers seems faster than the spread of other languages. Among the top five languages spoken, 81.3% of the population speaks only English. Looking at the numbers of speakers of all languages, English overwhelmingly dominates other languages and is accorded the highest status in U.S. society. The social and economic opportunities the general public perceives as the advantages that English language can bring to them, along with the language policies favoring English use, may well explain the fast and extensive adoption of the English language in other societies.

In recent years, as evidenced by a strong movement to make English the official language of the country, there has been a growing nativism concerning English. English is considered the language of business, aviation, and scientific research nationally and internationally. Globally, English is the preferred language of communication in many modes. It is dominant on the Internet and has become the official language of many multilingual countries. Although the United States currently has no official language, it is largely monolingual, with English being the de facto national language. With language policies favoring English overwhelmingly, some 30 states have adopted English as their official language. In addition, English is the language of official and legal affairs nationally. For example, one must demonstrate the ability to read, write, and speak English to become

a naturalized citizen. The English-only movement, which advocates that English be the sole official language of the United States, is militant about keeping the high status of English. Even the written tests for drivers' licenses once commonly available in any of several languages are disappearing; several states now require that the driver test be done in English. In Arizona, it is against the law for undocumented immigrants to take English language courses that are supported with public funds. Bilingual education too has now been discontinued in several states, partially as a reaction against undocumented immigrants.

Spanish is considered a high-status language in many parts of the world except in the United States where it is decidedly low status. According to Pountain, there were 332 million native Spanish speakers worldwide in 1999, overtaking the number of native English speakers of 322 million. Spanish is a prestige language internationally, especially in the large number of countries where it is an official language. It is one of the official languages of the United Nations, the European Union, and other international organizations. However, Spanish has a much lower status in the United States despite being the second most commonly spoken language in the country, with no fewer than 30 million speakers.

Advocates of the English-only movement perceive the Spanish language as an intrusive threat to the socioculture of the United States. As a result of this perceived threat, public use of the Spanish language has been restricted, and the status of Spanish continues to erode. Although the hegemony of English worldwide would suggest that the Spanish language poses no threat to English, the perception that Spanish threatens the use of English in the United States persists for reasons that are unsubstantiated. Complicating the status picture for Spanish in the United States is that Spanish speakers are often associated with *Spanglish*, a linguistic admixture (code switching) that is often viewed as a low-class dialectical variation of Spanish. Spanglish is often spoken by young people and working-class persons. Even though the use of Spanglish is a fascinating linguistic phenomenon, requiring a high level of proficiency in both English and Spanish, it suffers from poor acceptance by English and Spanish speakers alike.

The languages with the lowest status in the United States are the Native American languages, taken as a group, and Haitian Kreyol (sometimes *Creole*), the latter associated with the poorest country in the

Western hemisphere. Low-status languages often become endangered languages, in turn resulting in the phenomenon of language loss. Evidence of this can be drawn from the rapid decline of speakers of Native American languages in the nation. Of more than 300 languages originally spoken before the contact with Western culture in the early 1500s, only 175 of the languages are still spoken in the United States.

The status of a language is so dynamic that it can change from high to low status in a relatively short time. Before the U.S. annexation of Hawai'i, the Hawaiian language, the only Native American language on the islands, was powerful and prestigious. As a result of the U.S. annexation in 1959, Hawaiian has now been largely displaced by English. The number of native speakers of Hawaiian is about 0.1% of the statewide population. Even though the native speakers of Hawaiian who live on the islands have remained fairly isolated and have continued to use Hawaiian almost exclusively, the number of native speakers of Hawaiian has diminished drastically. According to Michael Krauss, no one under the age of 70 could still speak Hawaiian in 1996, except 200 Hawaiian residents of a small, isolated island.

According to James Crawford, the causes for a language becoming a low-status language and possibly an endangered language can be categorized into two types of factors: external forces and internal changes. In the case of the Native American languages in the United States, the external factors include the proliferation of English language media, language policies disfavoring Native American languages, and attempts at cultural genocide. In the late 1880s, the U.S. Bureau of Indian Affairs (BIA) adopted a policy to "civilize" the Indians by eradicating native languages and substituting English on Indian reservations. As part of this effort, the BIA mandated English-only instruction in all Indian schools. The rationale of the policy was to repress indigenous languages so the Indians could become "civilized."

The internal factors of a language receiving a low status are native speakers' language attitude and choices. Language choices and attitudes are influenced by external changes, such as social changes. For example, moving away from reservations and intermarriage with other language groups are external changes that affect the language choices of Native Americans. Other factors include economic forces and mass media. These social changes force the native speakers of a low-status language to question the value of their

language versus that of the dominant tongue. If the native speakers of a low-status language decide to speak it in certain domains, teach it to the next generations, and promote the language in their communities, the low-status language will be more easily maintained or even move to a higher status from its current position. If the native speakers of a low-status language cease to use the language and do not pass it down to the next generation, the language will likely become not just a low-status language but, more seriously, an endangered language. For bilingual educators, the question of the relative status of languages is important. This is especially true in the United States, where no language matches English in status. Hence, English has a decided advantage in education whereas all other languages are less favored by students and parents because they are associated with a lower status in society.

ST. LAMBERT IMMERSION STUDY

The story of the St. Lambert "experiment" in Canada began in the early 1960s during a time of rising tensions between the Anglophone (English-speaking) and Francophone (French-speaking) communities in

the province of Québec. Throughout the first half of the 20th century, Canada in general, and Québec in particular, constituted what the novelist Hugh MacLennan called “two solitudes.” One could effectively live one’s life in Montreal, for example, almost entirely in English with hardly an occasion in which one absolutely needed to communicate with someone in French about social, occupational, recreational, or other matters. But change was in the air. A variety of political initiatives were under way during the 1960s to legislate French as the official “working language” of the province, and many parents—particularly those whose children attended English-medium schools—were concerned that the second- or foreign-language programs in the public schools did not adequately prepare their children to acquire the communicative skills they would need to participate effectively in Québec society in the future. This entry describes the implementation of this program, and its contributions to bilingual education research.

St. Lambert Bilingual School Study Group

A number of parents in the suburban community of St. Lambert, Québec, formed the St. Lambert Bilingual School Study Group to explore alternative educational options that might be pursued to enhance the bilingual proficiency of their sons and daughters. The parents read widely, and they consulted with local specialists in the area such as Wilder Penfield, a neuroscientist at the Montreal Neurological Institute who had conducted important research on relevant topics such as the development of speech and its underlying brain mechanisms. Also involved was Wallace Lambert, a psychologist at McGill University who had conducted extensive research on social and cognitive aspects of bilingualism.

After a good deal of investigation and discussion, the parents persuaded the South Shore Regional Protestant School Board, the local administrative unit for their children’s school, to begin an experiment—one in which groups of Anglophone children would be immersed in a kindergarten program in which all communication and instruction (except for matters related to health, safety, and security) would be conducted in French. The parents and the school board enlisted the cooperation of Wallace Lambert and Richard Tucker to assess the implementation and the outcomes of the program, and in this way, a long-term

partnership began between the school board and the Language Research Group, a rotating group of faculty members and students in the psychology department at McGill University in Montreal.

Design of the Bilingual Program

The immersion program that was begun in this setting in fall 1965 called for Anglophone children to attend kindergarten and then Grade 1 classes in which virtually all instruction (language arts as well as content material) was provided in French. The youngsters proceeded through an instructional program that gradually introduced English Language Arts and the teaching of content material in English beginning in Grade 2 and moved on to an approximately equal allocation of instructional time in French and English by Grades 5, 6, and 7. That is, by Grades 5, systematic instructional time during each day was devoted to English Language Arts, French Language Arts, with some content instruction (e.g., Science and History) in English and some content instruction (e.g., Math and Geography) in French. At secondary school (which in those days ended in Grade 11 in the province of Québec), the balance shifted in favor of English with some content-based instruction still being offered in French together with a French Language Arts program.

Framework for Assessing Student Progress

At the very beginning, a commitment was made to assess the affective, cognitive, and linguistic development of the participants over time and to compare their progress with two other groups of students—a randomly assigned counterpart control group of English-speaking youngsters who participated in English-medium instruction, and a matched control group of French-speaking youngsters who attended a French-medium school located in a nearby neighborhood. The initial matching accounted for parental education and socioeconomic status as well as for the participating children’s initial nonverbal IQ. The lead cohort of students, and their control counterparts were carefully monitored, as was a second follow-up group of youngsters who began their education in fall 1966. The Canadian government, through a series of research grants, funded what became a 12-year program of research to document the effects of program participation on these students.

Effects of Bilingual Instruction

To make a complex story brief, the data revealed over time effects or patterns of development that might not have been predicted by a series of cross-sectional snapshots taken at any one point or even at multiple points in time. The data revealed, among other things, that over time, the immersion youngsters developed significantly greater cognitive flexibility, creativity, and nonverbal intelligence than did their monolingually instructed English or French control counterparts; they also developed a broader, more positive, and more charitable view toward other people, values, attitudes, and traditions than their counterparts did; and they developed a basic level of bilingual language proficiency that prepared them for a broader array of educational or occupational options than their monolingually educated counterparts. In general, repeated research has shown that the second-language receptive skills of the program's students were more "nativelike" than were their productive skills, although they certainly possessed adequate communicative competence and confidence.

The results of this research also demonstrated that longitudinal studies of this type were absolutely essential for documenting the cumulative benefits associated with the instructed development of bilingual proficiency. A cross-sectional snapshot taken at any particular moment would likely not have revealed the cumulative richness of this educational innovation.

Spread of Immersion Education Across Canada

As the students in the lead cohort moved from one grade level to the next, new cohorts entered the program. Each year, Lambert and Tucker and their students assessed the progress of the students and their control counterparts and presented the results of their findings, in nontechnical terms, to members of the school board, to parents at meetings of the local home and school associations, and to various professional organizations. As the students progressed, and as word of the findings began to spread to various communities, similar programs were begun in the city of Montreal itself (within the Protestant School Board of Greater Montreal) as well as in Toronto and throughout other regions of Canada. Researchers at other Canadian universities such as Merrill Swain, James Cummins, and their colleagues at the University of Toronto began similar studies in their communities and

again found remarkably consistent and positive results. The programs spread fairly rapidly to other regions of Canada with financial support for the underpinning research in the early days provided by the Canada Council and the office of the Commissioner of Official Languages of Canada.

Spread of Immersion Education to the United States

During the early 1970s, numerous visitors from the United States came to observe immersion classes, including Russell Campbell from UCLA who spent a sabbatical at McGill University with Lambert and Tucker visiting immersion classes and participating in the work of the Language Research Group. When he returned to California, Campbell worked with parents and community leaders in Culver City, California, to implement the first Spanish immersion program. Other early programs in the United States were begun as well following visits to St. Lambert, such as those within the Montgomery County, Maryland, Public School System.

Lambert and Tucker spoke frequently at professional meetings in the United States and told the story of their research. The message that they brought was that bilingual education for North American youngsters should not be viewed as problematic or troublesome or as something likely to result in an educational or intellectual deficit but, rather, that bilingual education could be cognitively, socially, and academically enriching for those who participated. They described the desirability of helping all children develop what Lambert referred to as "additive" bilingualism. The distinction that Lambert made between "additive" and "subtractive" bilingual education was a particularly important one. He noted that support and education should optimally be provided in the language most likely to be neglected within the community at large and, in some cases, even in the home. Thus, he argued convincingly that for many immigrants to the United States, the home language (Spanish or Chinese or Haitian Creole) would likely be neglected with a push to immerse children in English—a move that would result in "subtractive" bilingualism with the ultimate loss of the home language and the accompanying cognitive and social benefits. For such children, additive bilingualism would result from immersing them initially in instruction in their first language and gradually adding the second language (English) to their repertoire, whereas for English-speaking children, early immersion in the second language with the gradual introduction of

English would produce optimal benefits. This distinction, and the programmatic consequences, were acknowledged by many and led, in part, to the growth of “bilingual education” for many students for whom English would become an additional language and for immersion education for others for whom English was the first language.

Immersion Programs Today

Over time, the original St. Lambert program’s popularity spread and now similar programs exist in every Canadian province and in at least 28 states. In the mid-1980s, a slightly different type of program was begun in the United States—so called two-way or dual-immersion programs. In these programs, any given class is a composite of approximately 50% English-speaking children who wish to learn *xxx* (let us say Spanish) and 50% Spanish-speaking children who wish to learn English and develop academic language proficiency in their first language, Spanish, as well. In these programs, as children progress through the curriculum at various grade levels, they study English (or Spanish) language arts, English (or Spanish as a second language), and then together study some content material in Spanish (e.g., geography) and some content material in English (e.g., history). These programs have proven popular in many parts of the country. The Center for Applied Linguistics, a nonprofit organization in Washington, D.C., maintains a publicly accessible, up-to-date, informative database of immersion programs.

STRUCTURED ENGLISH IMMERSION

See ENGLISH IMMERSION

T

TANTON, JOHN H. (1934–)

John H. Tanton, population control activist and conservationist, is also a well-known figure in anti-immigration and English-only advocacy. A retired ophthalmologist, he is the oldest among the three children of Hannah and John Tanton, born on February 23, 1934, in Detroit, Michigan.

Before he became an advocate and supporter of anti-immigration issues, Tanton initially focused his attention on public policy concerning the environment and population issues. His early passion for the environment was greatly influenced by his life growing up on a farm. He considered his life to be ordinary until the family moved from the city to the country when he was nearly 10 years old. During that time, while many people were trying to escape the rigidity of farming, the Tantons did the opposite, trading their life in the city for a more laid-back and comfortable farm setting. While in high school, Tanton and his future wife, Mary Lou Brown, whom he married in 1958, were already involved in natural resource conservation. He continues to be actively involved in conservation, for which he received the Chevron Conservation Award in the Citizen Volunteer Category in 1990.

In 1960, Tanton graduated from the University of Michigan medical school, finishing seventh in a class of 200 students. The Tantons moved to Petoskey, Michigan, where he got his first job as an ophthalmologist in 1964 at Burns Clinic. He continued to actively participate in organizations like Northern Michigan Planned Parenthood, Zero Population Growth (ZPG), and Sierra Club Population Committee, which

advocates population minimization and control. In the mid-1970s, while president of ZPG, he suggested a national dialogue on immigration but was declined by some board members, who refused to make a crusade of immigration restrictions. This led to the establishment in January 1979 of the country's first anti-immigrant policy institute, called the Federation for American Immigration Reform (FAIR), in Washington, D.C., which he cofounded and assumed the chairmanship of.

In the early 1980s, together with other members of the FAIR board, Tanton founded a White nationalist organization called WITAN, a name derived from the Old English *witenagemot*, which means "meeting of wise men." A controversial WITAN memo written by Tanton (as reported in the Web site <http://www.tolerance.org>), included derogatory references to Latinos. Tanton warned the United States of the threat that Hispanics represent to the land because of their high birthrates. In the memo, Tanton stated, "Perhaps this is the first instance in which those with their pants up are going to get caught by those with their pants down!" Upon learning of the controversial memo, Linda Chávez, a former high-ranking official in the Reagan administration and a well-known Republican conservative columnist, immediately resigned from her post as the president of U.S. English organization. Chávez considered the memo to be anti-Hispanic and anti-Catholic. Tanton had helped to found U.S. English when he shifted his interest from immigration to language. He cofounded the group with the late Senator S. I. Hayakawa of California, who proposed the establishment of English as the official language of the United States.

In 1994, Tanton resigned from U.S. English, although he continued to maintain his interest in opposing the movement toward multilingualism in the United States. He and former board members of U.S. English created another organization, called ProEnglish, whose purpose is to ensure that English be declared as the official language of the United States.

Currently, Tanton is the publisher of *Social Contract Press*, which he founded in 1990. He served as the editor for the first 8 years of this quarterly journal, which was well-known for its promotion of the highly racist book *The Camp of Saints*, by French author Jean Raspail. This book, according to the *Right Web* Web site, influenced Tanton's thinking about immigration, culture, national sovereignty, and population control. *Right Web* also considered Tanton to be the founder of the modern anti-immigrant movement in the United States.

state's department of education. However, there are some common characteristics related to teacher licensure across the country. This entry describes the historical development of bilingual certification in the United States and outlines the requirements in content and procedures across states today.

To be licensed to teach in any state, teachers must have a bachelor's degree, complete a state-approved teacher preparation program, and pass state examinations. Most, but not all, states have bilingual certification for teachers who work with English language learners (ELLs), and the number continues to grow as the population of ELLs spreads throughout the country. A bilingual teaching credential may consist of a license for that specific purpose or an endorsement to an existing license that expands the teacher's scope of licensure, adding the bilingual dimension. In actual practice, there is no functional difference between the two processes.

According to the National Clearinghouse for English Language Acquisition (NCELA), 28 states and the District of Columbia offer bilingual/dual-language teacher certification or endorsements. Seventeen of these states have legislative requirements or state board requirements that teachers in bilingual classrooms must have bilingual certification. The remaining states carry out the credentialing process through administrative regulations.

Bilingual teachers generally are certified elementary or secondary teachers who complete regular teacher preparation programs and subsequently complete additional requirements to obtain a bilingual certificate or endorsement. Depending on the state, candidates for the bilingual endorsement generally take 12 to 21 university credits in addition to the regular elementary or secondary requirements. The additional study includes coursework in foundations of bilingual education, bilingual teaching methods, and second-language acquisition. Most states also require a language proficiency test in the language in which the candidate intends to teach. Because English as a Second Language (ESL) is a component of bilingual education and is included in the course of study, bilingual education teachers are usually credentialed to teach ESL as well. Hence, in most states, the requirements to become a bilingual education teacher exceed those of traditionally credentialed monolingual teachers.

Because state requirements dictate the program offerings at colleges and universities that prepare teachers for certification, this entry includes a brief

TEACHER CERTIFICATION BY STATES

In the United States, each state has the authority and responsibility for issuing and upgrading teacher licenses at the elementary and secondary levels and for special student populations. Because this function is decentralized, licensure varies from state to state and changes occur frequently. The most accurate and current information regarding specific certification requirements in a particular state is best obtained from each individual

discussion of teacher preparation programs across the country. The intent is to show how bilingual credentialing and teacher preparation fit in the national context and respond to societal needs and events.

Historical Background

During the 20th century, teacher preparation and credentialing in the United States grew more variegated and complex as educators responded to societal needs and demands for quality control in teaching. As public expectations for teacher knowledge and skills became more sophisticated, teacher preparation evolved from local apprenticeships through normal schools to bachelor's degree programs, including liberal arts, subject area specializations, and pedagogy. The states' oversight increased with codified requirements and assessments for those who wanted to teach. Credentialing was intended to assure districts and the public that teachers had good knowledge of subject matter, pedagogy, and child or adolescent development. In the case of bilingual certification, which didn't appear on scene until the 1970s, the credentials were intended to ensure that teachers were prepared to teach a particular population as well, namely, the population of ELLs, also known as limited-English-proficient (LEP) students.

Bilingual programs as they are configured in today's public schools started appearing in the 1960s. Prior to that time, speakers of languages other than English used their native languages in American schools to varying degrees and according to local tolerance levels at any given time. Things began to change in the early 1960s following the arrival of Cubans fleeing the Castro revolution. The goal of the first bilingual schools in Florida in the 1960s was to produce bilingual/biliterate students whose families were expecting to return to their native country. These initial instances of bilingual schooling were quickly followed by other bilingual education programs that had goals different than the production of biliteracy.

Bilingual Program Goals

As bilingual programs developed in the late 1960s and early 1970s, the first large-scale efforts to establish bilingual schools were made possible by Title VII of the Elementary and Secondary Education Act of 1968. These programs sprang from a desire to remedy schooling for language minority children who had

been left to "sink or swim" in English-only classrooms, so programs took on a remedial purpose. They were seen as a way to overcome language barriers that had led to chronic lack of academic achievement on the part of language minority students. Advocates also stressed valuing the cultural and linguistic heritage of students and allowing children to use their native languages to learn content areas and literacy concurrently with learning English. The idea of promoting bilingualism and biliteracy was valued by bilingual educators but not necessarily by policymakers. In fact, federal and state legislation framed bilingual education as the most expedient way of teaching content to students who didn't know English and having them become proficient in English as quickly as possible. Everyone acknowledged the importance of learning English in the United States, and so the programs took on the role of transitioning students from using their native languages to becoming proficient in English. As numerous programs emerged, they were classified as *transitional*, *maintenance*, or *dual-language programs*, depending on their goals: transitioning to English; maintaining native languages; or developing bilingualism in two student populations, native English speakers and speakers of a language other than English. Today, the vast majority of programs are of the transitional type, but dual-language programs have become more and more popular.

Issues in Certification and Licensure

The sudden demand in public schools for bilingual teachers resulted in a wide range of qualified teachers staffing bilingual classrooms. Fully certified teachers who were also bilingual were difficult to find, and no one really knew what should constitute teacher preparation for bilingual classrooms. At the outset, there was no established body of research and content for preparing teachers to teach in the new programs. There was a scramble among classroom teachers and teacher educators to determine what bilingual teachers should know and be able to do. Teachers who staffed those early bilingual programs essentially pioneered the content of teacher training, and in the 1980s, more research about how children learn a second language, about methods for teaching content in a second language, and about bilingualism became available. In somewhat of a chain reaction that included demands from public schools for bilingual teachers that pushed institutions of higher education to develop bilingual

teacher certification programs, states began to adopt certification requirements and regulations for bilingual teachers. Today, all states that require bilingual certification programs also have college- and university-based bilingual teacher preparation to support those programs with appropriate personnel. The National Clearinghouse for English Language Acquisition, funded by the Office of English Language Acquisition in the U.S. Department of Education, offers the most comprehensive listing on its Web site of institutions with bilingual teacher preparation programs, by state and degree. For specific information on each state's certification programs and teacher preparation information, the best sources are the respective official Web sites of the various state departments of education. States with the highest numbers of ELLs, such as California, Texas, New York, and Illinois, tend to have the most options for bilingual teacher preparation programs in their respective colleges and universities. In some cases, certificates and licenses from one state may be accepted in other states. In *Certification and Endorsement of Bilingual Education Teachers: A Comparison of State Licensure Requirements*, Eva Midobuche compared credential requirements of states with large ELL populations. Some portions of that report are still valid, although some of it is now obsolete.

Bilingual Teacher Education

The 1968 Title VII legislation supporting bilingual education programs in the nation's schools did not speak to teacher preparation or certification. By the reauthorization of 1974, however, it was clear that states needed to establish teacher preparation programs. Funds were therefore allocated to public schools and to colleges and universities for teacher education. Some universities in states with significant numbers of language minority student populations began offering courses in bilingual education in the early 1970s, eventually offering full programs for certification as their own capabilities in this area matured.

Because of the transitional orientation and the expressed goals of federal legislation, training and teacher preparation for teachers in bilingual programs also stressed knowledge of and valuing the cultural heritage of children and stressed teaching ESL, but with uneven emphasis on developing biliteracy and bilingualism. The civil rights mandates of the 1960s and the court support for language minority rights in

the 1970s and early 1980s also influenced the content and goals of bilingual programs in public schools and therefore of teacher preparation programs as well. The mandate from the courts to remedy the situation for LEP students gave bilingual teacher preparation a remedial orientation. More often than not, teachers approached their jobs with this orientation. It should be noted that certification requirements and teacher preparation programs are the same regardless of what kind of bilingual programs are in school districts or what language populations are served. The only difference tends to occur in the language proficiency examinations. Historically, much of the demand for bilingual teachers has been for Spanish/English, but programs in other languages, such as Chinese, Vietnamese, Hmong/Lao, Korean, and indigenous Native American languages, are also needed and offered in various states.

A survey of member institutions conducted in 2001 by the American Association of Colleges for Teacher Education (AACTE) found that 22% of member institutions (93) offered bilingual certification programs and the majority of those programs were at the bachelor's-, postbachelor's-, or master's-degree levels (58%). The study also concluded that state requirements dictated program/course offerings. A comparison of these results with an analysis of state licensure requirements by the former National Clearinghouse for Bilingual Education (formerly NCBE, now NCELA) showed that teacher preparation programs emphasized the areas of pedagogy and cultural foundations, while linguistics received less emphasis. The study found that most universities do not require a demonstration of language proficiency in languages other than English but most states do require passing language proficiency examinations, chiefly Spanish, for credentialing teachers in bilingual education.

Emergency/Provisional Licenses

Given the difficulty of finding teacher candidates who were proficient in English and in the native language of ELLs, many teachers assigned to bilingual classrooms were not fully certified teachers. In those situations, school districts have often resorted to hiring people with bilingual skills but with no preparation for teaching. In short, they do not distinguish between *bilingual* teachers and *bilingual education* teachers. In some areas, states have been slow to require bilingual certification and have allowed school districts to hire

people with “emergency” or provisional licenses. The ranks of bilingual teachers have historically included an inordinately high percentage of teachers who were hired provisionally and then required to complete teacher preparation programs.

“Highly Qualified” Teacher Status

After passage of the No Child Left Behind Act (NCLB) in 2002, with its requirement for highly qualified teachers, states are now under pressure to do away with emergency licenses. In general, under NCLB, a highly qualified teacher must have a bachelor’s degree, full state certification, and demonstrate competency in each core academic subject taught. States are charged with assessing competency in core subjects and in professional knowledge. According to NCLB, core subjects are English, reading/language arts, mathematics, science, history, civics/government, geography, economics, the arts, and foreign languages. Bilingual teachers are basically elementary and secondary classroom teachers who teach all of these subjects and therefore must be fully qualified per NCLB. The pressure is on for bilingual teachers to be certified in the subjects and grade levels they teach but not necessarily in bilingual methodologies or second-language acquisition. NCLB outlines minimum requirements related to content knowledge and teaching skills but gives states the option to develop their own definitions of “highly qualified” as long as those definitions are consistent with NCLB. This leaves states some leeway to determine highly qualified status for bilingual teachers.

As the new century moves into high gear, states are in such a bind to fully qualify their teachers that they are not yet ready to let go of emergency licensure. The struggle to obtain “highly qualified” status is exemplified by states, like Illinois and Texas, that have provisions allowing bilingual teachers to continue working on provisional licenses in core subjects but in which there is continued debate about the quality of bilingual teachers who cannot pass language proficiency assessments. Further, other than language proficiency examinations in Spanish, most states have not developed assessments specifically for bilingual certification. California was the first state to adopt specific assessments for language testing and bilingual content for certifying bilingual teachers.

At this writing, most states have not yet attended to what “fully qualified” means, specifically for bilingual teachers and teachers who teach English to students

who do not speak it as a first language. However, because states with large bilingual programs are likely to have high numbers of emergency-licensed teachers, they are under pressure to upgrade the qualifications of bilingual teacher population in core subjects. This, in turn, puts pressure on teacher education programs to address certification in core subjects, but not necessarily in the bilingual certification specialization.

Effect of Increase in ELLs

Besides the NCLB legislation, which profoundly affected assessment of academic achievement in schools and whose definitions for highly qualified teachers now impact state licensure and teacher preparation efforts, other trends and legislation since 2000 have affected credentialing for bilingual teachers. The rapid increase in the numbers of language minority students and in the numbers of different languages represented throughout the country has increased the demand for bilingual teachers. States that used to have relatively few ELLs now need to deal with certifying teachers to work with bilingual and ESL programs. The five states with the greatest growth in ELL populations since 1995 are South Carolina (714%), Kentucky (417%), Indiana (408%), North Carolina (371%), and Tennessee (370%). All have ESL certification, and Kentucky and Indiana have bilingual certification requirements as well. The numbers alone have resulted in a scramble to learn about teaching second-language learners, and states in the South are developing programs to address their needs. Whether these programs turn out to be bilingual programs or strictly English development programs will be determined by the highly political debates over immigration and the use of languages other than English in classrooms. This, in turn, will determine what states require in terms of teacher certification and what institutions of higher education will offer in teacher preparation coursework.

Effects of Antibilingual State Legislation on Bilingual Certification

Another phenomenon affecting bilingual teacher certification is that of state propositions that limit bilingual instruction in public schools. California, Arizona, and Massachusetts have all passed such legislation. This may cause prospective teachers to question the need or usefulness of going through bilingual teacher preparation programs. It is still not clear what the long-term

effects of these propositions will be on bilingual teacher certification. No state has eliminated the bilingual credentialing requirements, nor have universities done away with the teacher preparation programs. School districts continue to need and demand teachers with training in teaching a linguistically and culturally diverse population, so teachers with bilingual certification are in very high demand. Further, with the elimination of many bilingual classrooms after the passing of the propositions, ELLs are now more dispersed and assigned to “regular” classrooms, in which teachers are not likely to be bilingual certified. This has enormous implications for teacher preparation programs. In Arizona, for example, the state requires that all teachers have an endorsement in structured English immersion, so teacher preparation programs now have to include training for teaching ESL through structured English immersion in programs for all teachers.

This can be problematic, as can be seen in the 2001 survey of the AACTE mentioned above. Survey results indicated that less than one-sixth of the colleges of teacher education studied required preparation for mainstream teachers regarding the education of ELLs. The possibility of more legislation limiting bilingual instruction and the increasing numbers of ELLs may result in the expansion of training that was once reserved for bilingual teachers to all mainstream teachers.

Alternative Bilingual Certification

Even though most bilingual teacher preparation programs have been offered at state or private colleges and universities, there are a growing number of alternative paths to teacher certification, including bilingual certification. Programs are now being offered by community colleges, distance learning agencies, state departments of education and for-profit institutions. More professional organizations and credentialing agencies are also beginning to address standards for quality bilingual and ESL teachers. For example, the National Association for Bilingual Education (NABE) and Teachers of English to Speakers of Other Languages (TESOL) have developed a set of standards that universities and states can use in setting requirements. National certification groups such as the National Council for Accreditation of Teacher Education (NCATE) also are including knowledge about second-language acquisition as a requirement for teacher education programs.

To summarize, bilingual credentialing was not something that was well researched and then followed by teacher preparation programs with established knowledge about what bilingual teachers needed to know and be able to do. Instead, it developed by trial and error, and the first bilingual teachers were essentially “swimming or sinking” in terms of learning about effective practice in bilingual classrooms. The growing cadre of researchers in bilingualism, second-language acquisition, and instructional methodologies contributed to the knowledge base and helped inform teacher preparation.

The bilingual/ESL credentialing in the United States developed to address specific needs of LEP student populations. For bilingual and ESL teachers, their certification has historically been directly tied to that group of students. However, this is not necessarily the way it has to be, since bilingual teaching could be a way of teaching all students a second language regardless of their native languages. Native English speakers could learn a second language in bilingual classrooms taught by bilingual certified teachers, and this could expand the scope of bilingual programs to include everyone. This idea is becoming more popular through dual-language bilingual programs, though colleges and universities are short of teaching personnel who can develop and implement such programs on a wide basis.

TEACHER PREPARATION, THEN AND NOW

Researchers have found that the single most important factor in academic achievement and student learning is the quality of instruction students receive. Because teachers are directly responsible for instruction, teacher preparation is critically important. To keep pace with new knowledge concerning the needs of diverse learners, teacher preparation programs must change periodically. This entry traces some of the changes undergone by teacher preparation programs from a historical perspective and then focuses on one state, California, to illustrate the enormity of the task faced by nearly every other state.

At an earlier point in U.S. history, teaching was considered temporary employment, and teachers were generally male. Industrialization and the growth of the nation in the 1800s affected all institutions, including

schools. Teaching became a full-time endeavor, and as men moved to the factory floor, women soon dominated the schools in every capacity. Almost concurrently, a new era for teacher preparation began. Teachers were required to attend *normal colleges*, whose sole function was to educate prospective teachers.

Educational history evidences that what teachers should know and be able to do is highly dependent on the social contexts and economic conditions of communities and even of the country. Furthermore, teacher preparation is highly sensitive to political groups and other forces in society, including businesspeople, politicians, professional organizations, and interest groups.

Lau v. Nichols and Teacher Education

The use of political power to influence educational policy has been well documented. Unfortunately, interest groups do not necessarily lobby for educational changes that benefit all young people or promote democratic principles, social justice, or ensure equal access to learning. Changes in teacher education requirements reflect this reality in many ways. Until the 1974 Supreme Court decision in *Lau v. Nichols*, the assumption within the educational system was that children and their families bore most of the responsibility to learn English. Their failure to do so, it was assumed, meant that they would not be able to participate fruitfully in the experience of formal schooling. The *Lau* decision turned that assumption on its head. The Court was clear that if the schools were to require English for graduation, as is the case in California, then the schools had a responsibility to teach that language to its students. Only in this way could it be ensured that English language learners (ELLs) would have a chance at learning the content of instruction, not merely the language of the dominant group.

Lau did little to affect the preparation of teachers around the nation. Although it was eventually realized that the intent of the Court could not be met without changing the ways teachers are trained, it has taken time to change the highly regulated undergraduate programs that future teachers must undergo before they enter the classroom as credentialed teachers. The No Child Left Behind Act of 2001 and its requirements calling for “highly qualified teachers” has also contributed to this realization, if not directly to the structure of teacher education. Still, there remains some

distance to go before the “sink or swim” imperative is eliminated from schools that serve ELLs.

At the turn of the 20th century, teaching moral and civic values was considered a major responsibility of the teacher, and using English properly (in its verbal and written forms) was a skill emphasized in both teacher preparation and performance. Child labor laws and compulsory education, along with immigration, impacted schools with English learners of European descent. Schools and teachers focused on cultural assimilation of students, with the rapid acquisition of English as a primary goal. Teacher preparation courses thus reflected the importance of converting impoverished European immigrants (English learners) into English-speaking citizens ready to work in the nation’s shops and factories. For the most part, early teacher preparation models did not include or focus on techniques to best teach English learners and, like today’s methods, did not incorporate or use the children’s home languages or cultures in their instruction. English, as mentioned previously, was learned by the “sink or swim” method, and often students drowned academically as a result.

Decentralized Licensing and the Rise of the Emergency Teaching Credential

Many education historians and scholars today suggest that schooling practices and teacher preparation models have remained fundamentally unchanged over the past century. First, normal schools and colleges disappeared altogether or merged into the rapidly growing American system of higher education. Colleges of education took their place, and graduate schools of education ensured that the research function of the major universities was also embraced by teacher education institutions. Second, teaching now requires licensure or credentialing, resulting in teachers having to meet specific requirements. The United States, unlike most industrialized countries, does not require of teachers a uniform test for licensing. The decentralized system of education allows each state to serve as the authority for licensure and certification. Most states require a bachelor’s degree, whereas some states require a fifth year or master’s degree. The completion of an approved, accredited education program, a minor or major in education (particularly for prospective teachers in elementary education), a major in the subject area they plan to teach (for middle or high school

teaching), a strong liberal arts preparation, and passing a state-approved test that states use as part of the teaching licensure certification process) are common requirements in most states.

Most states do not require teachers to have a foreign-language background or to speak the same language their students speak. Prior to the passage of antibilingual legislation in California, teachers were required to have a minimum exposure to a second language and had approximately 17 ways in which to meet this requirement. Today, adaptation or differentiation of instruction replaces communication and rests on the basic assumption that a teacher is prepared to teach English learners without using their language as long as the delivery of the instruction is modified in some way.

The high demand for teachers results in emergency hiring to staff classrooms and the need to develop and justify the numerous alternative teacher preparation and certification models that are intended to address the teacher shortage. These alternative schemes allow individuals to enter classrooms and teach without any prior knowledge, experience, or preparation. The expectation is that the teacher will eventually obtain the necessary education to become fully certified. In the 1990s, a dark side of this alternative teacher preparation emerged. California became one of the states in which emergency credentialing was rampant, and there were estimates that more than 10% of teachers were issued emergency credentials during the 1990s. Researchers described those schools, staffed predominantly with emergency-credentialed teachers, as dysfunctional, and this organizational dysfunction gravely affected English learners. Districts and schools dominated by teachers with emergency credentials tend to be those with significant populations of ELLs and children from low-socioeconomic backgrounds (frequently the same children). Emergency credentialing thus exempts teachers from teacher preparation prior to teaching, and there is ample evidence to suggest that teachers, students, and communities fall short when this alternative route is used. Emergency credentialing was not just a California problem, as teaching without preparation became a pervasive norm throughout the nation.

The No Child Left Behind Act of 2001 (NCLB) aimed to eliminate this lack of adequate teacher preparation by requiring “highly qualified teachers” in all classrooms by 2005–2006. Federal law requires teachers to document that they have subject matter

competence in the areas to which they are assigned, and school districts are accountable when hiring teachers who are not qualified. NCLB defines “qualified teachers” narrowly, as it requires teachers to know only the subject area they will be teaching. Despite the fact that a growing proportion of students in the United States are English learners, there is nothing in the legislation that requires teachers to be qualified to teach English to this student population or to know other pertinent pedagogical information related to teaching (e.g., cultural background, family/community, and effective pedagogy). According to NCLB, anyone who can demonstrate knowledge in science, for example, is qualified or prepared to teach science.

Current Teacher Preparation Models

Today, most teacher preparation models are based on research and share common goals. These goals are grounded in educational research and include specifying what teachers should know in order to teach and identifying what teachers should be able to do:

- Have knowledge of the subject(s) they are teaching
- Have pedagogical knowledge and the ability to teach, including the use of technology
- Plan, differentiate, monitor, and assess student learning
- Perform as professional colleagues
- Participate in ongoing professional growth opportunities

Teacher preparation models are more specific in articulating, describing, and providing examples for new teachers of what “quality teaching” entails.

Contemporary models are also more inclusive, acknowledging that teachers must be prepared to teach a heterogeneous population of students with mixed academic abilities. This includes diversity in socioeconomic background, linguistic background, ethnicity, race, religion, and sexual orientation. Increasingly, teaching is recognized as a complex process whereby the teacher must also know about the child, the family, and community. These ideas redefine the classroom, school, and community as one learning community in which teachers, students, and families teach and learn together. Ethical principles of the profession are also discussed in many teacher education models, as teachers are held to moral and ethical practices in their work. Finally, learning and human growth are part of a life process, and the education of teachers is viewed in a similar way.

In California, the standard certification model also includes successful passing of the CBEST (California Basic Educational Skills Test), a standardized examination of basic skills; the completion of coursework in the teaching of reading; passing the RICA (Reading Instruction Competency Assessment), a standardized examination for elementary level teachers emphasizing phonic instruction; and coursework in the U.S. Constitution. These general requirements satisfy the criteria to receive a 5-year preliminary credential. Embedded within this teacher model are specific expectations for teaching performance and preparation. California’s Commission on Teacher Credentialing (CCTC) developed the California Standards for the Teaching Profession (CSTP) and legislated a standardized set of expectations about the expertise and preparation that are to be required of beginning teachers. These standards include (a) engaging and supporting all students in learning, (b) creating and maintaining effective environments for student learning, (c) understanding and organizing subject matter for student learning, (d) planning instruction and designing learning experiences for all students, (e) assessing student learning, and (f) developing as a professional educator. These standards cover broad domains of teaching and are each further divided into indicators to demonstrate the facets of each standard.

More recently, California’s Senate Bill 2042 legislated teacher preparation requirements by legislating teachers to complete Teaching Performance Assessments (TPA) that are composed of four tasks. Each task, as part of a prospective teacher’s preparation requirement, expects a teacher to design instruction for all students, including two focus student groups (e.g., ELLS and special education students). Based on NCLB legislation, however, teachers are not required to be bilingual (in any language), eliminating the possibility of using primary language and cultural resources children may bring to the classroom.

Major factors influencing instruction include the standards-based movement and high-stakes testing. Accountability in the quality of instruction is measured exclusively on gains in standardized scores, and this emphasis on testing is having a major impact on how teachers teach and ultimately on the quality of instruction. Instruction that revolves around standardized testing implies regressing to a curriculum emphasizing facts, memorization, little or no problem solving, and basically teaching to the test. This type of instruction also assumes all students know English, learn the same

way, and have similar academic backgrounds. Needless to say, this has major implications for the relevance of teacher preparation models grounded in educational research. Unless fundamental and permanent changes take place in school policies, instruction, and the purpose of education, we can expect continuing changes in teacher preparation as we move deeper into the 21st century. For now, these changes continue to ignore the specific needs of more than one fifth of the student population—those of ELLs.

María V. Balderrama

Editor's Note: For specific information on teacher preparation requirements in your state, contact your state's commission for teacher credentialing or the Web site of the respective state Department of Education.

TEACHER QUALIFICATIONS

Several decades of practical experience in implementing bilingual education programs and research into bilingual teacher effectiveness have provided rich and detailed descriptions of the knowledge, skills, and abilities of competent bilingual teachers. The field of bilingual teacher education has achieved status as a legitimate field of academic study and research. Policy analyses and studies by Patricia Gándara, Julie Maxwell-Jolly, Anne Driscoll, Eva Midobuche, Kate Menken, and Beth Antunez, investigating the academic needs of language minority students, have consistently

found that bilingual teachers are the most highly qualified to advance their learning toward meeting academic standards in language, literacy, and content learning. Gándara and Russell Rumburger concluded that bilingual teachers provide the most cost-effective instruction in staffing schools with populations of English language learners (ELLs) because this classroom configuration reduces the need for ancillary instructional and support staff to supplement or augment the teaching abilities of monolingual teachers. The demand for highly qualified bilingual teachers and the availability of teacher education and alternative teacher education programs to license them have been subject to the ongoing tensions between changing demographics and the political viability of bilingual education.

The purpose of this entry is to describe the ideal characteristics of bilingual teachers and to examine, in a general way, the congruence between these qualifications and the content of bilingual teacher education programs.

As bilingual certification programs are accredited under new laws and policies, controversies arise regarding standards for preparation and institutional accountability for teacher quality, especially in regard to teachers' proficiency in the language of instruction. The California Commission on Teacher Credentialing (CCTC) claims these issues are debated within the context of changes in the availability and demand for bilingual programs implemented according to different theoretical and pedagogical models of program design and classroom instruction. In other words, standards attempt to define and describe what knowledge, skills, abilities, and attitudes bilingual teachers must possess in order to effectively address the academic needs of students in classrooms in which two languages are used as media of instruction.

Domains of Bilingual Teacher Competencies

Research drawn from Diane August, Kenji Hakuta, María Brisk, Ana María Rodríguez, and others, including theoretical and school-based research and professional judgment, establishes a relationship between bilingual teachers' qualifications and bilingual programs' effectiveness. There are three areas of learning that schools are responsible for in educating language minority students: language, literacy, and content learning. Teachers' levels of expertise with bilingual

learners either support or impede the potential of schools to implement bilingual programs through a progressive, sequential curriculum that is theoretically coherent and well-grounded in how bilingual learners utilize their primary language (L1), acquire a second language (L2), and progress through the grades in learning academic skills and subject matter. Effective bilingual classroom teaching requires a high level of theoretical and technical knowledge of approaches, strategies and techniques for designing appropriate curricula, planning a sequence of lessons, organizing the classroom, utilizing and developing instructional materials, and grouping students for learning tasks.

Menken and Antunez state that various sets of standards for bilingual teacher certification and lists of competencies have been compiled by institutions and organizations with a stake in the professional development of bilingual teachers. According to CCTC, the analyses of bilingual teachers' attributes and competencies attempt to be comprehensive and thorough in categorizing and defining the knowledge, skills, abilities, and attitudes of effective bilingual teachers for

purposes of teacher-credentialing program design and/or examination. These standards and competencies are based on the premise that bilingual teachers share a set of "generic" competencies that are foundational to effective teaching in any and all contexts. Generally, a second tier of competencies is outlined for all teachers of ELLs without regard to whether the teacher is bilingual in the students' primary language (L1) or monolingual in English (L2) or whether teachers instruct linguistically homogeneous groups of students using their L1 as a medium of instruction. A third tier of competencies is articulated for teachers who use the students' L1 as a medium of instruction in any of several bilingual education (dual-language) programs targeted for students who speak the same L1 and share common cultural characteristics. The three-tiered approach to bilingual teacher credentialing is evidenced in the California Bilingual Cross-Cultural Language and Academic Development credential structure (BCLAD) (see Table 1).

Bilingual teacher competencies are categorized into general areas of theoretical knowledge and

Table 1 California Commission on Teacher Credentialing (CCTC) and Bilingual/Cross-Cultural Language and Academic Development (BCLAD) Credential Requirement

<i>Common Core BCLAD and CLAD Credential Requirements</i>	<i>Competencies Acquired and Demonstrated Through:</i>
1. Language structure and first- and second-language development	Linguistics courses, including first- and second-language acquisition and structure of the English language

technical/pedagogical skills. Although there are common elements specific to bilingual teaching that appear consistently in these standards and competency documents, there are areas of bilingual teacher effectiveness identified in the research that are less frequently addressed or omitted from these analyses. Brisk hypothesized that an additional goal of bilingual education is to achieve sociocultural integration of language minority students. In general, standards focus predominantly on the technical knowledge required for effective bilingual instruction and less on the areas within the sociocultural, affective, and philosophical domains of bilingual schooling within the context of the American public schools. Karen Cadiero-Kaplan concludes the ideological or philosophical dimensions of teaching language minority students are emerging in compilations of bilingual teacher competencies, although their inclusion or exclusion depends largely on political exigencies that govern bilingual education in particular states.

The following domains of teacher competencies appear consistently in the research literature: (a) primary-language (L1) proficiency, (b) bilingual education program structure and design, (c) L1 and English linguistics, (d) bilingualism/L2 acquisition and L2 language pedagogy, (e) biliteracy/L2 literacy pedagogy, (f) L1/L2 academic content pedagogy, and (g) L1 culture and cross-cultural knowledge.

Menken and Antunez found that over 50% of bilingual teacher credential programs included coursework in these areas: (a) second-language acquisition and teaching and linguistics, (b) bilingual teaching methods, and (c) cultural and linguistic diversity. However, less than half of the teacher education programs included courses in (a) bilingual assessment, (b) literacy and biliteracy instruction, and (c) methods in teaching in the content areas in L1 or L2. The standards proposed in California in 2006 for credentialing teachers of ELLs and phasing out the BCLAD credential focus heavily on these less frequently developed areas of competencies. Gándara and colleagues consider that the greater emphasis on competencies for teaching academic content reflects changes in the levels of responsibility of monolingual teachers for the academic achievement of ELLs in English-only classrooms, particularly at the upper-elementary and secondary levels. James Crawford maintains the increased focus on bilingual teacher abilities in biliteracy and L2 literacy teaching may be the result of growth in enrollments in dual-immersion programs. Diane August and Timothy Shanahan argue that another factor in the

inclusion of more standards and course content related to the literacy learning of bilingual students is the expanding body of research in cross-linguistic and second-language reading. Although these are often omitted from descriptions of bilingual teacher competencies, philosophical, ideological, and attitudinal factors are also addressed in the theoretical research. The term *ideological clarity*, claim Cadiero-Kaplan and Christina Alfaro, appears in the research literature to describe the philosophical predisposition of bilingual teachers related to effective advocacy for language minority learners. Below is an analysis of the essential domains of knowledge, skills, and abilities of bilingual teachers in relationship to effective program implementation and classroom practices.

Bilingual Teacher Language Proficiency

There is a consensus in the field that bilingual teachers must be fluent in the primary language of the students to a degree where they can communicate effectively with students and teach the academic curriculum with confidence and ease in the students' primary language as well as in English. Most frequently, the primary language of ELL students is Spanish. Michael Guerrero asserts that the language proficiency of bilingual teacher candidates can be assessed either through a Spanish language proficiency test completed at their credentialing institution or through state examination. In California, for example, Domain 6 of the BCLAD credential and certificate requirements is satisfied by passing an examination in "the language of emphasis" in listening, speaking, reading, and writing.

A vital component of overall language proficiency is the bilingual teacher's abilities in "academic Spanish" and the ability to read and write accurately and fluently in the language. There is less agreement in the field about minimal levels of language proficiency that should be required for bilingual teacher licensure. The greater the amount and academic level of Spanish required in a bilingual program, the higher the levels of academic language proficiency demanded of bilingual teachers. Proficiency tests are designed to validate pre-service and in-service teachers' competencies in academic Spanish or other languages for imparting instruction in transitional models of bilingual education in which instruction in students' L1 is phased out as they become proficient in English. The CCTC claims characteristics of higher levels of proficiency include knowledge of the history, civilization, and

literature of countries in which the target language is spoken. Standards of language proficiency are highest for dual-immersion and bilingual maintenance programs, while lower levels of proficiency are deemed acceptable for transitional bilingual programs, testify Jill Kerper Mora, Joan Wink, and Dawn Wink. Generally, an advanced-intermediate level of proficiency, equivalent to a level 3.5 on the 5-point Foreign Service Institute scale, is considered minimal. Language proficiency examinations test for bilingual teachers' competence in the language of the classroom and basic content area vocabulary, as these are related to students' academic achievement in L1 literacy and subject matter knowledge. According to Kerper, there is evidence that second-language learners of Spanish can be as effective as native-Spanish-speaking bilingual teachers if they are well-versed in the academic language needed for classroom instruction.

In 2006, the licensure agency in California, CCTC, proposed the restructuring of the bilingual teacher language proficiency examination, combining some aspects of bilingual teacher competency testing with the California Teacher of English Learners (CTEL) test for teachers of other languages as academic subjects. This policy action was controversial because, in essence, it established through the rigor of the qualifying examination an equivalent standard of language proficiency for bilingual teachers who use the language as a medium of instruction in predominantly K–6 classrooms as the standard for teachers of foreign languages. Since there is limited research to support specific levels of language proficiency for bilingual teachers, declares Guerrero, the outcome of policies to raise standards for bilingual teachers is uncertain. The determining factor may be the impact of language proficiency policies on the availability and supply of bilingual teachers for transitional and dual-immersion programs and classrooms.

Bilingual Education Program Design

There are many models of bilingual education programs, which vary in linguistic and academic goals and objectives and the purposes and extent of use of two languages as mediums of instruction. Bilingual teachers know the means of implementation of different models of dual-language instruction at the program and classroom levels. These teachers are instrumental in the design of comprehensive and theoretically sound curricula with guidelines for teachers as to the functions and roles of L1 and L2 at each grade level and recommendations as to the amount of time

devoted to instruction in each language. Programmatic planning also involves decisions about appropriate student groupings based on assessments of language levels and academic needs to target instruction. To achieve programmatic goals, bilingual teachers must also make myriad pedagogical decisions regarding language use during classroom instruction and in interaction with students. Bilingual teachers know the implications of teachers' and students' language choices and apply principles of learning that lead to high levels of bilingualism and academic achievement in L1 and L2. This expertise requires a thorough understanding of the relationship and interactions between academic content and skills learned in students' L1 and their growth in language proficiency in L2 over time. Bilingual teachers also know how and when to modify their language use to adapt to students' learning styles and levels of comprehension.

L1 and English Linguistics

Knowledge of applied linguistics is critical for bilingual teachers because they teach language directly and indirectly through English as a Second Language (ESL) or English Language Development (ELD) instruction and through literacy teaching. For example, bilingual teachers teach phonics or word formation in reading instruction based on knowledge of the structure of English. They also utilize comparative and contrastive linguistics to instruct bilingual learners in comparing and contrasting their L1 and English, which leads to students' enhanced awareness of how languages function. Bilingual teachers also apply knowledge of linguistics in designing activities for transferring skills from L1 to L2 in biliteracy instruction.

Bilingualism/L2 Acquisition and L2 Language Pedagogy

Expert bilingual teachers know the progression of L2 acquisition in terms of increments of growth toward full proficiency in the second language and factors that promote or impede bilingual development. They apply these principles in developing appropriate learning activities that are targeted and modified according to students' actual levels of proficiency and the goals of instruction. This requires knowledge of instructional approaches and methods for direct language teaching for listening, speaking, reading, and writing. Mora maintains that bilingual teachers' repertoires for addressing language pedagogy include

English as a second language or foreign language and ELD approaches.

Biliteracy/L2 Literacy Pedagogy

Bilingual teachers teach reading and writing in students' L1 and L2 through sequential or concurrent models of dual-language instruction. The underlying premise is that L1 literacy skills transfer to literacy in L2 and are enhanced by cross-linguistic interaction in literacy learning in both languages. Mora also states that highly effective bilingual teachers know how to make transference explicit and systematic and to design instruction considering the impact of L2 oral language proficiency and levels of literacy in students' L1 or L2 literacy achievement. Skilled bilingual teachers also coordinate different grouping patterns and the use of L1 and L2 instructional materials so that ELLs achieve full literacy in two languages.

L1/L2 Academic Content Pedagogy

Bilingual teachers are responsible for teaching academic content predominantly in students' L1 in the early grades in transitional and dual-immersion models of bilingual instruction and increasingly in L2 as students' L1 instruction is phased out and they transition into all-English instruction. In most program models, content learning in L2 is not delayed until students achieve full L2 proficiency or bilingual teachers teach all academic subjects in structured immersion classrooms. The challenge for teachers is to make abstract and complex concepts and vocabulary comprehensible for ELLs with low levels of English proficiency and to integrate language, subject matter knowledge, and critical thinking skills, termed *academic English*, declares James Cummins. According to Mora, bilingual teachers are equipped to utilize an approach called Specially Designed Academic Instruction in English (SDAIE) or sheltered instruction to modify and adjust subject matter through, for example, visuals, graphic organizers, and realia (objects from real life used in the classroom) to differentiate instruction for students with different levels of L2 proficiency.

L1 Culture and Cross-Cultural Knowledge

Bilingual teachers possess general knowledge of cultural concepts and perspectives as well as specifics about the cultural backgrounds and historical and

contemporary practices of the students they teach. The function of this knowledge base is to place bilingual education in its sociocultural and political context in such a way as to enhance students' academic achievement and social integration. This includes an understanding of the dynamics of cultural power and status and the interactions among and between cultural groups based on inter- and intragroup commonalities and differences. Cummins alleges that good bilingual teachers act as cross-cultural role models and mediators to support language minority students' formation and negotiation of their bicultural identities, termed *transformative pedagogy*. Cultural knowledge is also vital for bilingual teachers to carry out the role of liaison between students' parents and communities and the schools.

There is ample consensus in the academic discipline of bilingual education regarding the qualifications of effective bilingual teachers. The relative value placed on different domains of competence has evolved and shifted as policies regarding bilingual programs and dual-language instruction have altered the roles and influence of bilingual teachers in the context of language minority education in the public schools. Bilingual teacher licensure programs can be expected to respond to these trends, while maintaining the knowledge base and body of sound pedagogical practices that have been validated through research.

TECHNOLOGY IN LANGUAGE TEACHING AND LEARNING

Technologies of various kinds have been used to support the teaching and learning of a second language, the preservation of heritage languages, and research that provides new insights into how to best teach in more than one language, as is the case in bilingual education. Every week, it seems, another new advanced interactive technology appears that renders some of its predecessors obsolete. Advanced interactive technologies of interest to researchers and practitioners in bilingual education include computer-assisted language learning (CALL), Internet-based applications (e.g., e-mail, World Wide Web applications, telephony, multimedia, streaming video), and digital and analog audio and video.

Because of the rapid introduction of new technology tools, it is nearly impossible to keep up with the various features of specific technologies. It is even more difficult to report on them in an encyclopedia such as this one before they have been replaced by other even more advanced technology. This article focuses on the ways advanced technologies support bilingual education research and practice, rather than on the technologies themselves.

Technology in Second-Language Acquisition Research

Second-language acquisition researchers are not generally known to rely heavily on technology to serve their research. Nonetheless, there are a few instances of computer technologies used to elicit data for research on cognitive and linguistic dimensions of bilingualism. Technology has not generally played a large role in other linguistic research dimensions, though some sociolinguistically oriented studies show that CALL provides for more language production than is normally the case in many face-to-face second-language learning environments. In addition to typical statistical research software applications, researchers rely on a number of specialized software applications to analyze *interlanguage*, the name given to a linguistic system devised by a language learner who is not yet proficient and is attempting to approximate the target language. Interlanguage preserves some of the features of the first language and incorporates these features into the target language. It also reflects the status of the learner's heritage language as a resource to learning the second language and reveals possible causes of errors experienced in the second-language acquisition process.

The sources of many technologies used in second-language acquisition research are psychology, acoustic linguistics, and psycholinguistics. Psycholinguists have employed various technologies to manage and measure a variety of tasks and techniques to elicit language-related behaviors, for example, eye movements, or other behaviors associated with human language production or processing. These tools have been adapted to serve other purposes, including, for instance, data collection regarding the ability of language learners to judge grammatical correctness, recognize similar meaning between sentences, respond orally to various language prompts, and recognize words.

Technology has also been used to support experimental research in second-language learning. In tightly controlled laboratory studies, computers have been used to present input and to elicit and register responses, with or without noting subject reaction times. In applied second-language-acquisition research, the computer has replaced traditional audio and video collection systems in the language laboratory because of the ease with which digital audio and video data can be managed and analyzed with computer-based software applications. This emerging use of technology is itself an opportunity for more extensive investigation

of multimedia technology's efficacy in applied linguistic research.

As new tools enter the market, technology will become an ever more useful tool for research, evaluation, and assessment of bilingual learner characteristics. Technology-supported assessments can provide an account of what the bilingual student is learning, both in language and in academic content areas. Technology also provides for flexible assessment systems with multiple indicators to assess student progress through all four modes of communication (speaking, listening, reading, and writing). In addition, these systems can be useful in diversifying assessment from a comparative orientation between students to one that also includes a focus on individual students' progress over time.

Technology in Bilingual Education Practice

Researchers, such as Daniel Villa, have investigated culturally and linguistically appropriate uses of various technologies in conjunction with the education of language minority groups for language teaching, preservation, and maintenance. For instance, preserving an oral history in ancestral indigenous languages in searchable digital audio or video is a powerful first step to providing authentic artifacts to support the transmission of the ancestral language from one generation to the next. Such a practice affirms the speakers of the language by mining from local resources instead of relying solely on imported artifacts from sources that may denigrate local cultural norms. Examples of the latter include importing Spanish as spoken in Spain and Latin America to the exclusion of Spanish as it is spoken in U.S. immigrant communities or importing technologies to record the indigenous language of people whose cultural norms oppose the writing down or recording of their language without carefully negotiating with the local community who will do the work and for what purpose. Though technology is a useful tool in bilingual education, these examples show the importance of acknowledging local cultural norms in decision making for integrating technology into bilingual education, so that the intended outcomes are consistent with the desired outcomes for the community.

Jean Leloup and Robert Ponterio also report affective and other benefits of the use of advanced technologies in reducing anxiety and increasing motivation among language learners. For example, the use of e-mail for interaction has been found to improve student

attitudes toward learning a second language as reflected by measures of lower anxiety, higher interest, and greater student participation. The use of CALL tools has been found to help learners become more aware of their errors and better equipped to self-monitor and correct them in the future. These authors also suggest that language produced in CALL environments is of better quality than what language learners produce orally in face-to-face classroom settings. The research literature is not unanimous, however, with respect to the effectiveness of advanced technologies in the development of writing skills in a second language.

For second-language learners, using technology to engage in authentic learning experiences may lead to improved language skills, increased vocabulary, and the ability to share feelings and feel accepted in a new environment. Activities pursued by second-language learners with their parents deepen children's thinking. Multilingual Web- and computer-based technologies are helpful in breaking down the barriers to multilingual communication among schools, families, and students. For example, online machine translation services, though not perfect, offer enough support to help schools, families, and students collaborate more effectively. Other online Web-based tools provide for connections with others and access to additional educational resources across the globe. For instance, English language learners (ELLs) in the United States can use the Internet to explore and reconnect with people in their countries of origin, while increasing their knowledge of their new country. It should be noted, however, that these tools assist but do not necessarily replace face-to-face interaction and communication.

Asta Svedkauskaite, Laura Reza-Hernández, and Mary Clifford report that some have raised questions about physical and developmental effects on students, such as posture and eye problems, and possible "addictive effects" of technology that some maintain may lead to social isolation. Critics also point out high equipment expenses and question the wisdom of diverting resources from other materials and programs to buy new technologies. Nonetheless, many critics point out that quality software with bilingual support supplements skills development activities for language learners. However, constant use of drill-and-practice approaches for skill development does not necessarily ensure English language acquisition. Technology applications for content-based English language learning are better candidates for ensuring that

ELLs not only learn English but also to acquire it for practical and academic purposes.

What tends to confuse our understanding about technology and language learning is the variety of ways in which both are conceptualized. For example, what may be considered an appropriate use of technology from a psychologically oriented linguistic perspective with a primary focus on cognitive processes may be interpreted differently from a sociologically oriented linguistic perspective that takes a more group-oriented view. The use of educational technology for drill and practice may be useful for some students, but not necessarily for all. Technologies that support collaboration and provide students with access to content and other local and global resources may be useful in addition to drill-and-practice applications for other students. Hence, it is important to consider the particular need of the language learner and match that need with a technology that addresses it.

The North Central Regional Educational Laboratory, now known as REL Midwest, based in Chicago and Naperville, Illinois, and Washington, D.C., has devised a multidimensional taxonomy that provides insights into relationships between complexity in learning, engagement in learning, authenticity, and various technologies for teaching and learning with ELLs. It also provides for consideration of the breadth and depth of learning activities that technology can support in bilingual education settings (see Figure 1).

Technology applications for drill and practice support the development of basic skills and fit with normally accepted didactic instructional approaches for this purpose, with little regard to connecting instruction with real-world applications for the skills. Whereas this level of learning may be helpful in developing fundamentals that will support more complex learning activities later, it is not the only technology application of value to learners in bilingual education settings. Nonetheless, in many schools with large numbers of language minority students, drill and practice is the extent to which advanced technologies are used to support learning.

Diversifying advanced technologies and matching an increased range of technologies with specific educational purposes will also increase the level of engagement of students in language learning, preservation, and maintenance. The use of online research tools places language learners in touch with content, frequently in their heritage language, that will help them increase content knowledge while learning a second language and maintaining their heritage language

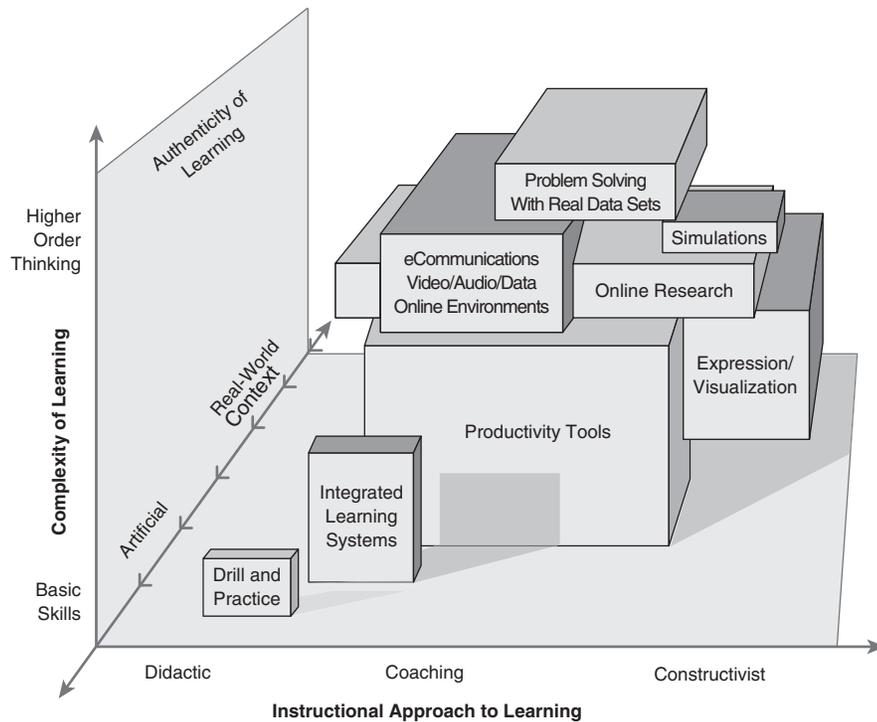

Figure 1 Range-of-Use Technology Chart

as well. The use of telecommunications technologies (e.g., e-mail, voice-over-Internet-protocol telephone with or without video, data), productivity tools (e.g., word processors, spreadsheets, presentation software), and expression/visualization tools (e.g., mind mapping and graphic organizing software) will appeal to students' affective development, and computer-based simulations and problem-solving tools with real data sets (e.g., games and secondary research), develop higher-order thinking skills in ELLs in real contexts. Because the technology has the capacity to incorporate learners' heritage languages from their homelands, not only is their acquisition of a second language for academic purposes accelerated, but their familiarity with the heritage language is also maintained and affirmed. Technology also helps the teacher (a) share responsibility for student learning with colleagues in other countries and (b) participate in local, national, or international online and other computer-mediated professional development options well tailored to their needs. When carefully orchestrated to serve particular curricular and instructional purposes, second-language learners and their teachers

can benefit from the full range of technology applications, especially when technologies have the authentic multilingual capacity to enable learners to draw from content matter in their native languages, while joining in academic discourse using English.

Future Directions

A rich array of research literature on relationships between advanced technology and language learning is now taking shape in many professional journals in the areas of bilingual education, English as a second language (ESL), and second-language learning, including an online journal, *Language Learning & Technology*. A challenge will always exist for a meaningful enough body of research literature to be useful to subsequent generations of

researchers and practitioners who use ever-advancing technology to support bilingual education research and practice.

The rapid pace at which more powerful technologies replace older ones makes it important to analyze not only differences in student performance, bilingual education, and ESL teacher preparation but also differences in the technology tools used to mediate teaching and learning in more than one language. Tending to this additional level of complexity in the research arena will provide for clearer insights that can be useful to bilingual educators and learners, as yet-to-be-discovered interactive technologies give rise to thinking about currently unimaginable educational possibilities in classrooms and other educational settings.

TESOL, INC.

The acronym TESOL (Teachers of English to Speakers of Other Languages) can have three different meanings: It can refer to the professional association based in the United States, to the specific profession of practitioners that provide English language instruction to students of diverse linguistic backgrounds, or to the field of study itself. This entry

focuses on the description, historical background, and status of TESOL, Inc., the organization.

Headquartered in the state of Virginia, TESOL was founded in 1966 in New York and established its mission to ensure excellence in English language teaching to speakers of other languages. Practitioners, scholars, policymakers, administrators, and publishers in the field of English instruction are part of the TESOL membership audience. TESOL also has affiliations with 97 associations at the national and international levels and state affiliate organizations with the same or similar names in 47 states. Among international affiliates, 18 are in North, Central, and South America; 20 are in Europe and Eurasia; 9 are in Asia and Oceania; and 6 are in Africa and the Middle East. As indicated by its slogan, “A global education association,” TESOL was established with the purpose of reaching members from all over the world.

Through its activities and resources, TESOL supports and fosters improvements in different aspects of teaching English. It provides space for discussion, interaction, and the production of knowledge for researchers and practitioners through various publications and its annual convention. *TESOL Quarterly*, a research-oriented, peer-reviewed journal, has been in print since the organization was founded and has made a significant contribution to the field. TESOL also publishes newsletters and magazines aimed at diverse audiences. TESOL's annual convention is usually held in March and provides opportunities for members to interact, discuss, and share ideas on research and practice and to assess the implications of their work in policy making.

TESOL's functions also include the support, development, and regulation of the profession itself. One of TESOL's initial aims was to ensure that there were guidelines and steps toward the certification and professional quality of practitioners in the field. It has published a wide variety of materials on professional preparation, reference, classroom practice, and assessment and has developed resources for teaching English worldwide. TESOL has also provided space in publications, conventions, and its Web site for career services and employment resources. Special programs such as TESOL's summer institutes also contribute to the professional development of English instructors. TESOL continues to play a key role in advocacy on issues that affect practitioners and students in the profession.

The impulse to create this organization arose from concerns about the education of culturally and

linguistically diverse populations around the world. Many of the founders of TESOL worked in government agencies and in the academy. This tradition continues. Often, members participate in policy-making forums. Its officers and members provide information and testimony to the U.S. Congress concerning laws that impact bilingual and English as a Second Language (ESL) education. Position statements and papers are developed that address issues related to English language teaching, such as support for language rights and multiculturalism, and professional quality for students and teachers.

Historical Background

James E. Alatis, of Georgetown University, served as executive secretary and director for TESOL from its establishment until 1987. His involvement and leadership in the development of the organization positioned him as a renowned historian and record keeper of TESOL's evolution. In a series of published papers Alatis has described TESOL's early history, growth, and challenges over three decades. Alatis explains that TESOL was created out of three main concerns discussed by members of several organizations in the early 1960s: the need for an organization that addressed the issues of English instruction practice for linguistically diverse students in the United States, a publication for practitioners and scholars in the field, and a roster or national register of qualified teachers in the field. The collaborating organizations joining forces to create TESOL were the National Council of Teachers of English (NCTE), the Center for Applied Linguistics (CAL), the Modern Language Association of America (MLA), the National Association of Foreign Student Affairs (NAFSA, now Association of International Educators), and the Speech Association of America. All of these institutions were in some way related to English instruction and study, but none was exclusively dedicated to an audience of nonnative English speakers.

After a series of planning conferences and meetings, the association was established at its first annual conference in New York in March 1996. Participants in these meetings included representatives of the organizations mentioned above, along with scholars from several linguistics departments, such as the University of Minnesota; the University of Michigan; Princeton; Georgetown; and Teachers College, Columbia University.

Personnel from U.S. government agencies were also involved, such as the New York City Board of Education, the California State Department of Education, and the Bureau of Indian Affairs.

The coining of the organization's name took into consideration several aspects of TESOL's aims and interests. Alatis clarified that the chosen name did not include the words *American* or *National*, as some of its founding organizations did, because it wanted to provide an international scope and reach in its membership. It also used the term *English to speakers of other languages* (ESOL) to refer to the students it aimed to reach. This term incorporated both ESL students, those learning English in countries where English is spoken as a native language, and English as a foreign-language (EFL) students, those learning English in countries where English is an additional, nonofficial language. TESOL functioned as an umbrella term for national and international audiences.

In the first 20 years of the organization's life, its growth and involvement in several aspects of ESOL education were remarkable. In 1966, the association started with 37 members; by 1975, 5,000 members were registered. By 1986, TESOL members numbered about 11,000. There was an increase in members from abroad, largely from Canada and Japan (22.7% in 1975, increasing 2% more in 1986), along with a growing list of affiliates within and outside the country.

During TESOL's first 10 years, the development of bilingual education in the United States was one of the areas in which TESOL practitioners and officers played a key role. In 1967, testimony was presented by the TESOL office at the congressional hearings leading to the enactment of Title VII of the Elementary and Secondary Education Act (ESEA): the Bilingual Education Act. In this way, TESOL initiated important collaborations with key political figures interested in language issues and programs. Several publications addressing professional practice in bilingual and bicultural education had been part of TESOL's commitment to bilingual education, along with position papers establishing the organization's stance in support of bi- and multilingualism.

As the organization continued to grow, its publications, conventions, and participation of members and officers in events with important implications for language instruction gained a significant place for the TESOL profession. However, as Alatis remarked, the challenge of TESOL's international role was clear by

the end of the 1980s in terms of financial and administrative resources to reach all members across borders.

TESOL in the 21st Century

After its 40th anniversary in 2005/2006, reflection and analysis of the state of the art in the association and profession indicated the following: Some trends remained from the organization's foundation in terms of membership and structure. Most of the members registered by June 2006 were from the United States (77.8%), with 147 countries represented in the remaining 22.2%. Japan and Canada still held the largest percentages of TESOL's memberships abroad, and the United States, California, Florida, and New York were the states with the largest number of members.

TESOL members can join several special interest groups (SIGs), which meet in the annual conventions and publish periodical newsletters. Some SIGs address ESL instruction at the elementary, secondary, and higher-education levels; adult education; and bilingual education. Other SIGs include applied linguistics, the group with most members in 2006; refugee concerns; teacher education; and material writers. Groups with more specific needs in English instruction are also included in areas such as English as a foreign language and English for specific purposes. Some classroom methodologies have also been considered in their own sections, such as second-language writing or speech, pronunciation, and listening. TESOL communities also include a group of caucuses, sharing social, linguistic, and cultural identities. These include a caucus on part-time employment concerns; lesbian, gay, bisexual, transgender, and friends; and nonnative English speakers in TESOL.

The publication of position statements and papers on several issues concerning the TESOL profession remains one of the association's main commitments. Since the enactment of the No Child Left Behind Act of 2001, TESOL has published several statements addressing its impact on the academic achievement of ESOL students, fair assessment practices, and teacher qualification. Position statements also advocate for professional treatment and equity for TESOL practitioners, focusing on employment conditions and the opposition to discrimination practices or exploitation based on race, ethnicity, and/or having a native language other than English.

Regarding issues that have international implications, TESOL advocates for immigration services and

policies that ensure a respectful and efficient treatment of international students. It also supports a comprehensive immigration reform that respects human rights and does not penalize immigrant families and the professionals that provide support and assistance to them. TESOL's values and statements reflect its position in support of multilingualism, language rights, and the value of language varieties and dialects, such as African American Vernacular and world Englishes.

In an era of globalization and increasing use of communication technologies, challenges continue to arise in the internationalization of the association. In 2006, Suresh Canagarajah, editor of *TESOL Quarterly*, pointed out some directions needed for TESOL to become a global institution in the transition to and acceptance of new paradigms and frameworks. He called for the need to teach English for global purposes, taking into consideration local languages, needs, and interests. With new varieties of English being recognized worldwide, the notions of competence or correctness do not necessarily depend and belong only to countries in which English is the native language. Collaboration and negotiation need to take place across borders, validating the voices of those involved in TESOL in diverse contexts.

TEXAS LEGISLATION (HB 103 AND SB 121)

The Bilingual Education and Training Act (also known as Senate Bill 121) was enacted by the 63rd Texas Legislature and signed into law by Governor Dolph Briscoe in June 1973. Although not the first of its type in the United States, this legislation was a turning point in the education of Mexican American students and other language minority children in the state of Texas. The groups targeted for special intervention were students from a population who had suffered decades of educational neglect and underachievement in the public schools because of their inability to compete in the traditional English-only system. Although a portion of the act carried provisions for adult education, the legislative language requiring K–12 bilingual education was new and unprecedented. The centerpiece of the law was the mandate requiring bilingual (mainly Spanish-English) instruction in any Texas public elementary school enrolling 20 or more children of limited English ability in any grade level. The provision in the law that a language other than English could be used to provide subject matter instruction was especially significant because it effectively eliminated the long-standing English-only teaching requirement imposed by a 1918 Texas law.

Even though Senate Bill 121 provided the legal mandate for bilingual education, at least two districts, the Laredo United Consolidated Schools (now Laredo United Independent School District) and the San Antonio Independent School District (SAISD), had begun to experiment with bilingual education several years prior to the approval of the formal mandate. SAISD had also experimented with a form of vocational bilingual education at Lanier High School aimed at developing bilingual secretaries for the fast-growing international marketplace. The designers of the Lanier project were Josué M. González and Abelardo Villarreal. In addition, the district had been the main venue of the University of Texas Oral Language Research Project spearheaded by university professors from the Austin campus. The research project applied the audio-lingual method to the teaching of English and science in the elementary schools. The method proved only partially successful and resulted in important modifications to the knowledge base for teaching English to English language learners (ELLs).

Fueled by the alarming 80% to 90% drop-out rates among Mexican American students and by studies at

the St. Lambert school in Canada showing the value and utility of bilingual education, the nascent models of dual-language instruction also began to take form in Texas. Leading the state's pioneering efforts were United Consolidated Schools superintendent Harold C. Brantley and innovative teachers Dolores Earle, of Laredo, and Gloria Zamora, of San Antonio. Spanish was used in these early programs, as in later programs of bilingual education, essentially to build the self-concepts of children and to facilitate their learning of English as the eventually exclusive medium of learning. Subsequently, under the leadership of superintendent José A. Cárdenas, the Edgewood Independent School District launched the first districtwide effort to teach bilingually.

Other programs evolved in various school districts and in various pedagogical forms across the state before the enabling legislation authorized them: Corpus Christi, Kingsville, McAllen, Del Rio, and El Paso all operated without legal support and in violation of the 1918 English-only law. By 1968, approximately 10 programs had been implemented in the state. Faced with the urgency to legitimize these early programs, Texas State Representative (later Senator) Carlos Truán and Senator Joe Bernal banded together in support of the first bilingual education bill in the state. The bill labeled HB 103 became law in 1969. It provided "that bilingual instruction may be offered or permitted in those situations when such instruction is educationally advantageous to the pupils." In retrospect, HB 103 was designed as a purely enabling piece of legislation. It did not contain the special provisions for mandatory bilingual education and funding requirements found in the later SB 121. Nevertheless, it served a useful purpose not only in affording school officials the opportunity to design special language programs for ELLs in the schools but, equally important, in providing them with the administrative clearance necessary to tap into the newly authorized federal funds available under Title VII of the Elementary and Secondary Education Act (ESEA).

A convergence of several social, legal, and political factors enabled Senator Truán and other state proponents of bilingual education to secure the needed support from the 61st and 63rd Legislatures for special programs for language minority children. The civil rights movement of the 1960s and the Great Society programs promulgated by President Lyndon B. Johnson, for example, greatly altered many people's perceptions of ethnic minorities in the United States. It was also during this period that institutionalized

segregated schooling ended, political mechanisms designed to obstruct minority group voting collapsed, and it became unpopular to be publicly ethnocentric. Very significantly, equality of educational opportunity for linguistically and culturally diverse learners was recognized as a worthy and highly desirable goal for public education. It was within this national context that bilingual schooling emerged as an alternative approach to the conventional English-only and culturally monolithic system of education. Political events in Texas continued to evolve in ways that were favorable to the continued development of bilingual education.

The legal support and need for bilingual education were further established by the ruling issued on January 8, 1981, by Judge William Wayne Justice in the *United States v. Texas* federal court case. This case, filed by the G.I. Forum and the League of United Latin American Citizens, challenged the adequacy of the state's efforts to respond to the needs of limited-English-proficient (LEP) children. After hearing expert testimony from educators and others across the state and reviewing numerous court documents regarding school programs for Mexican American children, Judge Justice ordered the Texas Education Agency "to take further steps, including further bilingual education, if needed, to satisfy . . . their affirmative obligation . . . and enforce the right of these linguistically deprived children to equal educational opportunity."

Senator Carlos Truán used the *United States v. Texas* ruling as the primary catalyst to solidify and augment the basic legislative provisions of the state's bilingual education program. His efforts culminated in the passage of SB 477 in the 1981 session of the Texas Legislature. In addition to the requirement allowing the use of native-language instruction in a more expanded form, the revisions in the new and updated law included language similar to that of Judge Justice's decision requiring the Texas Education Agency to monitor the quality of bilingual and ESL programs offered to the state's ELLs.

Although the Texas bilingual education legacy has been associated with Spanish speakers, the most widespread language community in Texas, the state's programs have more recently expanded to include the needs of other language groups, such as the Vietnamese, Korean, and Pakistani (Urdu language) communities. Although limited funding for the growing number of programs and second-language learners persists as a major concern for advocates of bilingual education, interestingly, new and different forms of

dual-language education continue to emerge. Guided by the state policies and flexibility encouraged in federal education laws to experiment with a variety of program designs, many school districts in the state are creating new forms of bilingual education promoted as two-way or one-way immersion bilingual programs. These programs, few in number but quickly expanding, involve both traditional populations of LEP children along with proficient English speakers, each group learning a second language in an enrichment school environment. Many of these programs have been able to shed the pejorative transitional, remedial, or compensatory characterization typical of the original generation of bilingual programs.

In general, Texas has experienced a relatively positive response to bilingual education during the same time that other states, such as Arizona, California, and Massachusetts, have experienced language restrictionism. As a result of a Texas court case, *Castañeda v. Pickard* (1981), a compliance order crafted for one school district in South Texas was later adopted by the Office for Civil Rights as the compliance standard to be used throughout the country in Grades K–12.

THRESHOLD HYPOTHESIS

The threshold hypothesis was originally introduced by James Cummins in 1976 and Pertti Toukomaa and Tove Skutnabb-Kangas in 1977 as a theoretical model for explaining the effects of bilingualism on academic success in children, and it was later popularized by Cummins's further work in the United States. It has been shown that bilingualism has numerous positive cognitive effects for bilingual individuals, although these effects do not always translate into school success. The threshold hypothesis suggests that the effects of bilingualism are actually mediated by the degree of age-appropriate competence in each language, rather than the state of being bilingual. In practical terms, this suggests that children who are developmentally competent in both languages, often termed *balanced bilinguals*, would experience positive cognitive advantages of being bilingual, whereas children who are developmentally competent in only one of their two languages, often termed *dominant bilinguals*, would experience neither positive nor negative effects. Finally, children whose competence in both languages is neither developmentally nor age appropriate, often termed *limited bilinguals*, would experience negative cognitive effects.

Cummins subsequently expanded his threshold hypothesis by proposing the concept of *developmental interdependence* to explain the relationship between attainment levels in the first and second languages. According to this theory, the level of a bilingual individual's development of the first language—and literacy skills in the first language in particular—ultimately affect ability and literacy in the second language.

Degrees of Bilingualism

The threshold hypothesis, as noted above, relies on the concepts of limited, dominant, and balanced bilingualism. A *balanced bilingual* individual is someone who is more or less equally competent in both languages and whose competence in each language reflects that of a similarly-aged monolingual individual. For instance, a student who is able to complete a third-grade curriculum in both English and Spanish would be identified as a balanced bilingual. A *limited bilingual*, on the other hand, is a person who does not have age-appropriate, nativelike competence in either language. Children who are designated as limited

bilinguals are sometimes referred to as *non-nons* or *semilinguals*, having been identified by a school assessment as speaking neither their home language nor English. There are problems with these simplistic definitions. The identification of non-nons and the concepts of limited bilingualism and semilingualism have been disputed as overly simplistic and inaccurate. Similarly, it is unlikely that exact equality of fluency in two languages can be determined in a practical way in order to ascertain that a person is balanced in the use of two languages. Finally, a *dominant bilingual* is a person who has achieved nativelike, age-appropriate competence in one language but not the other. This is a broad category with limited utility, since it covers such a broad band of speakers.

According to Cummins and others, balanced bilinguals are frequently the products of education programs that supports *additive bilingualism*. An additive approach to bilingualism entails the maintenance of the first language so that the second (or subsequent) language is acquired in addition to the home language. Bilingual education programs such as two-way immersion/dual-language and heritage language programs are useful in promoting additive bilingualism. Conversely, limited bilinguals are frequently involved in education programs that promote *subtractive bilingualism*, whereby the second (or subsequent) language is acquired as a replacement of the first language and no education resources are provided for the maintenance of the first language. Examples of subtractive bilingual programs include submersion, sheltered English immersion, and transitional bilingual education programs.

Though bilingualism is frequently seen as an absolute state in which a speaker is as competent in each language as a monolingual speaker, this ideal is rarely realized in practice. Bilingual individuals tend to be dominant in one of their languages, and this dominance can change over time, depending on changing social situations or the subject matter being discussed. For instance, a Mandarin-English bilingual who is dominant in English may become dominant in Mandarin after working in Beijing. A young Hispanic immigrant to the United States is likely to become bilingual first in “school talk” than in other areas. Bilinguals tend to use each of their languages in different contexts, which often necessitate different vocabulary and interaction styles. One example of this in the United States would be a child whose home language is Vietnamese but who attends school in an

all-English program. The child would need to develop academic language along with surface fluency in English but would not naturally develop academic language in Vietnamese unless enrolled in an academic program in Vietnamese. Cummins does somewhat address this phenomenon as it relates to school through his basic interpersonal communication skills/cognitive academic language proficiency (BICS/CALP) distinction, although BICS/CALP focuses on development in the school language.

The Hypothesis

Research has shown that bilingualism often has positive cognitive outcomes, such as enhanced metalinguistic awareness and cognitive flexibility. Despite these positive effects, becoming or being bilingual does not necessarily guarantee academic success, and the threshold hypothesis attempts to account for the relationship between degrees of bilingualism and cognitive/academic effects. According to the theory, the cognitive effects of bilingualism are a product of the type of bilingualism achieved, as shown in Figure 1, from Cummins's 1979 article. In further exploring the threshold hypothesis, it is important to realize that nativelike competence should be age appropriate, such that the language abilities of a 5-year-old Spanish-English bilingual are equivalent to the language abilities of monolingual Spanish and English 5-year-olds.

When only the lower threshold of bilingualism is reached, meaning that a bilingual individual does not have nativelike competence in either language (see discussion of semilingualism above), then the cognitive effects of bilingualism would be negative. At this point, school assessments would likely identify the child as a non-non, and the child would likely have difficulty in school in either language. When the second threshold is reached, the bilingual individual is dominant in either one of his or her languages but has not achieved nativelike competency in both. The cognitive effects of bilingualism at this point would be neither positive nor negative. In this case, the child should be able to succeed in the classroom in the dominant language. Finally, when the second threshold is surpassed, the bilingual has become a balanced bilingual with nativelike competence in both languages and would enjoy the positive cognitive effects of bilingualism. A child at this level is able to attend to school tasks in either language and is considered to have gone through a process of additive bilingualism.

Educational Implications

The educational implications of the threshold hypothesis are fairly clear, as the theory indicates that becoming a balanced bilingual is the only way to achieve the positive cognitive effects of bilingualism, which entails an additive bilingual education program

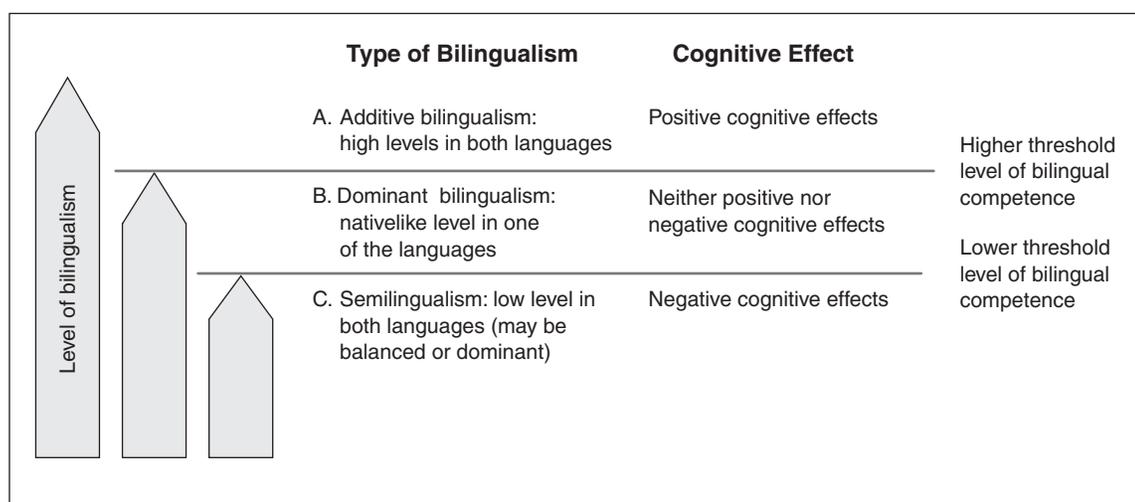

Figure 1 Cognitive Effects of Different Types of Bilingualism

Source: Cummins (1979, p. 230); adapted from Toukoma & Skutnabb-Kangas (1977). Reproduced with permission of Sage Publications.

(also known as *maintenance* or *developmental model*) that supports development of both languages and their constant use. In the case of language minority children, this means that schools should offer sustained, high-quality content and literacy instruction in the child's first language alongside academic and language development instruction in the child's second (or subsequent) language. It also suggests that education programs that foster development of only one of a bilingual individual's languages are not acting in the best interest of the bilingual child, since only a state of balanced bilingualism provides positive cognitive effects. The threshold hypothesis clearly advocates for additive bilingual education programs for minority language children that support the maintenance and development of the home language as well as rigorous development of the school language.

Developmental Interdependence Hypothesis

Cummins further elaborated the threshold hypothesis with the introduction of the *developmental interdependence hypothesis*, which offers an explanation for discrepancies in academic achievement and second-language (L2) development between language minority and language majority students in immersion programs. Studies have repeatedly shown that first-language (L1) development and academic success of language majority students are not adversely affected by an L2 immersion environment, whereas language minority students tend to experience greater academic success in an educational environment that promotes both L1 and L2 maintenance and development. In a 1979 article, Cummins argued that this was a result of the degree of L1 attainment, specifically in terms of literacy readiness skills, which are defined as vocabulary concept knowledge, metalinguistic insights, and decontextualized language. Essentially, Cummins argues that students who are more prepared to read in their first language will be more prepared to start reading in their second (or subsequent) language, once heavy exposure to that language, such as in an immersion program, begins.

It is important to note that the developmental interdependence hypothesis is stated in the general terms of L2 attainment levels being partially affected by L1 attainment levels at the time that L2 is introduced for study by a particular student. However, attainment levels in language learning refer very specifically to

literacy readiness skills, not overall language ability or surface fluency. One reason for this is that children, barring a language delay or impairment, have achieved an adultlike grammar by the time they start school at the age of 5 or 6, though their vocabulary is still growing. It follows that the level of L1 language ability at a particular age should not differ across languages and therefore could not affect L2 attainment, which does not explain the differences in academic success between language minority and language majority students in immersion programs. To a great extent, literacy readiness skills are a product of the home and prekindergarten environments, so that middle-class language majority students generally enter school with more reading readiness skills than other groups, such as language minority children who have experienced interruptions to their schooling. Even though both groups enter immersion programs, language majority students receive more support in learning to read in their L1 through school, home, and media environments and generally succeed more academically than their language minority counterparts, who typically enter school with fewer literacy skills in an environment that does not support incipient L1 literacy levels. For these reasons, the developmental interdependence hypothesis also suggests that language minority students are best served by educational programs that develop L1 literacy ability before focusing on L2 literacy.

Criticisms of the Threshold Hypothesis

One clear criticism of the threshold hypothesis is the reliance on the notion of semilingualism in defining the lower threshold. Not only is this a deficit approach to understanding a bilingual's abilities, but semilingualism is usually determined by a young child's performance on a standardized language assessment, which reflects many other issues beyond language ability, such as educational, cultural, and personality factors and variations. Semilingualism itself is disputed on a theoretical and policy level, especially since being identified as a semilingual can have long-lasting repercussions in a child's academic career.

In addition, the threshold hypothesis does not account for the known fluidity of bilingualism and instead relies on absolutes such as balanced and dominant bilingualism, as discussed above. For the same reasons, the implementation of the threshold hypothesis

is problematic, as the thresholds themselves are not clearly defined. The path from monolingualism to bilingualism appears to be a continuum, not a set of discrete stages, so that establishing concrete boundaries between different thresholds becomes somewhat arbitrary. To determine which threshold a bilingual individual has reached, researchers would need to assess something beyond cognitive effects, since cognitive effects are the outcome rather than the indicator. However, no clear set of criteria has been established for determining degrees of bilingualism, as bilingual ability is influenced not only by cognitive and language factors but also by broader social, political, economic, and educational circumstances.

TITLE VII, ELEMENTARY AND SECONDARY EDUCATION ACT, FUNDING HISTORY

See OFFICE OF BILINGUAL EDUCATION AND MINORITY LANGUAGES AFFAIRS; APPENDIX F

TITLE VII, ELEMENTARY AND SECONDARY EDUCATION ACT, KEY HISTORICAL MARKER

The law known as the Bilingual Education Act of 1968, or Title VII of the Elementary and Secondary Education Act (ESEA) of 1965, was without a doubt the most important state or federal legislation in support of bilingual education in the United States. Over the 30 years of its existence, Title VII was the vehicle for distributing federal funds for bilingual education in all states plus Puerto Rico; Washington, D.C.; and American territories. In addition to funding public schools, Title VII also provided support for research, teacher training and retraining, technical assistance, a national information clearinghouse, curriculum materials development, and other aspects of program design and implementation. Little wonder that the work of this funding program received much attention and scrutiny by critics of bilingual education almost from its inception.

While initial funding was small, Title VII offered grant makers great flexibility over what to fund, provided by statutory language allowing funds to be distributed for program operations but also for “planning and taking other steps” to support innovative programs of education. The record shows that the act was used, imaginatively, for a number of important improvements. The same flexibility was used by administrations of both parties to slow down or accelerate aspects of the program that were preferred or disdained by the various commissioners and secretaries of education over the life of the program, an example being the hostility toward the program that prevailed during the years William J. Bennett served as secretary of education. During this period, programs of English-only instruction were favored over those that relied on home languages other than English. Conversely, during the Clinton administration, funding decisions

avored programs in which the non-English home language was used in a program design known as *dual-language immersion* or *two-way bilingual*.

Background

At the time the U.S. Congress took up the Title VII amendment to the ESEA, only a few projects in bilingual education existed around the country. Arguably, widespread experience with the concept of bilingual education was not what motivated the Congress to action. The concept had yet to prove itself on a large scale, and other factors were at play. First, state administrators of the major funding source for poor children, Title I of ESEA, were often inattentive to the language barrier between schools and ethnic minority children. Title I, a formula-driven source of federal funds, tended to focus on the needs of African American children in urban areas and poor White students in small towns and rural Appalachia. Latino and other language minority children did not receive much attention, even though the primary requirement of poverty was often met by those children and the schools they attended.

An important factor that may have contributed to the passage of Title VII as a focused discretionary program was the beginning of political activism by Latinos in California, Florida, New York, and Texas. “Viva Kennedy” clubs had delivered large numbers of votes for the Democratic Party in 1960. President Johnson had a strong base of support among Mexican Americans in Texas, and his party was losing support due to the mishandling of the war in Vietnam. It was time to return to “the base” of the party. Lyndon Johnson had befriended many political leaders in South Texas for years. His closeness to Mexican American voters was a factor that had led to his election to the U.S. Senate in 1948. Johnson had won the Democratic primary, in which vote fraud in a Mexican American town gave him an 87-vote margin over his opponent. “Box 13,” as the scandal came to be known, had allowed Johnson to move from the House of Representatives into the U.S. Senate. Overall, support for the Title VII bill was good, and the sponsoring senators had strong support in their respective states. In short, passage of the bill was not difficult because there was no organized opposition. There is no evidence that the bill was an attempt to repay political favors by one party or the other. But the bill’s bipartisan sponsorship was an indication that the bill was meant to appeal to the growing minority

constituency in the three states with the largest numbers of Latino voters.

Concern over low school attainment and the high drop-out rates of language minority children also contributed toward the legislative push that resulted in Title VII of the ESEA. Education leaders in Washington, D.C., had been looking for viable programmatic initiatives they could promote that would allow Title I to remain focused on poor schools in rural areas and inner cities. In 1966, the National Education Association (NEA) sponsored a symposium in Tucson, Arizona, ostensibly to look into better ways of teaching Spanish to students with Spanish surnames in the Southwest. Much of the discussion seems to have focused on successful examples of bilingual education as a way to continue the development of the home language of Hispanic students. It was to be the first of many such conferences devoted to bilingual education. The NEA put bilingual education on its legislative agenda, and within 2 years, the federal government had adopted it as a new program initiative under ESEA.

Provisions

During the period in which ESEA was the primary funding mechanism for the federal government, financial support for education occurred at one of three levels. Small programs were regarded as *demonstration programs*, designed to show the possibilities in particular ideas or approaches. The next-higher level of funding was for *capacity-building* efforts, chiefly in states and school districts. Programs in this category were appropriated at a higher level on the premise that the innovations they offered had proven themselves to be effective. They were considered worthy of replication and therefore targeted to reach more of the eligible children who could benefit from them. Concurrently, such programs were expected to build the schools’ capacities to deliver special services effectively and efficiently. Finally, large programs such as Title I, which distributed billions of dollars annually, were said to be *full-service* or *entitlement programs*, and all eligible clients were assumed to be covered. Title VII never reached the level of funding needed to serve all eligible children. It did, however, move from being a demonstration program into the category of capacity building. From a modest beginning of \$7.5 million, the program’s appropriation level grew to well over \$200 million by the time the program ended in 2002. A separate effort known as the Stanford Working Group

project was launched in the 1990s to improve the delivery of Title I services to English language learners (ELLs), including financial support for bilingual instruction.

While Title VII was enacted in 1968, no funds were appropriated at the time of enactment. Only a small appropriation of \$7.5 million was made available for the subsequent fiscal year. In its initial form, the Title VII legislation was simple and uncomplicated. The act gave the secretary of health, education, and welfare and the U.S. Commissioner of Education wide discretion to fund schools and projects that held the promise of improving the education of ELLs. In many of these projects, non-English languages were used, but this was not always the case because the legislation did not require it. Generally, the nation's schools approached bilingual education cautiously. From the outset, the emphasis was on overcoming the perceived disadvantage that was assumed to accompany the use of languages other than English at home. The goal of maintaining and improving children's home languages was rarely actively promoted. Title VII grants were critically important in promoting the adoption of bilingual education in hundreds of schools nationwide, but they were most effective in promoting transitional bilingual education (TBE) at the expense of language preservation, which the legislation implicitly allowed. Grants were also made to support the development of curriculum materials in languages other than English, a concept not yet embraced by commercial publishers of that time. Major research efforts and large programs of teacher education followed after changes were made to the legislation in the reauthorization of 1974.

Early Years

Title VII was signed into law by President Lyndon Johnson on January 2, 1968. For the federal fiscal year that followed, no funds were appropriated. Beginning with the 1970 fiscal year, Congress made \$7.5 million available to be distributed chiefly to school districts. As programs of various types were launched under Title VII auspices, it soon became apparent that the knowledge base needed to create successful programs was insufficient. University-based researchers, who often work ahead of the wave to generate new knowledge, were, generally speaking, caught unprepared. Initially, practitioners relied mostly on research support from the field of linguistics, but as research efforts

broadened, research began to trickle in from other social science disciplines. None of the research seemed to contradict the wisdom of using two languages in teaching these children. But practitioners soon realized that the supposed "language barrier" between schools and certain language groups was much more complex than had been assumed.

Critics of the program were quick to point out that the goals of the Title VII program were unclear. Noel Epstein, a journalist who wrote one of the early criticisms of bilingual education generally and Title VII specifically, asserted that the program suffered from "the Columbus syndrome," which Epstein described as sailing forth without maps or charts, in hopes of running into something.

Retrospectively, and viewed from the knowledge base of the 21st century, it appears that expectations for these early programs may have been too high, given an approach that was not yet mature and often operated in hostile environments. The interventions (treatment variable) inherent in those programs were not dramatically different from what had taken place before in those classrooms. The same teachers taught in the new programs, often without additional preparation. Low expectations for language minority students had not changed. Most important, the schools had little effect on one of the greatest causes of poor achievement: poverty. Many immigrant and second-generation students suffered then, as they do now, from the effects of multigenerational poverty and low education levels of parents. Transitional bilingual education was necessary but not sufficient to cure the deep-seated problems of inequity protracted over several generations. Early program evaluations did not explore those effects and causes of poor achievement.

There were vocal critics of the program from among the language minority groups themselves, who were unhappy that Title VII did little to encourage children to continue to develop and improve their ancestral languages. Indeed, the opposite sentiment seemed to prevail. To avoid challenges from Congress, administration personnel promoted the concept that participation in programs funded by Title VII should be limited in time to the shortest periods possible. At the time the Title VII legislation was reauthorized by Congress in 1974, the idea of rapid exit was incorporated into the legislation. While the program was still in its infancy, a major evaluation of its effectiveness was commissioned to the American Institutes for Research (AIR). Not surprisingly, the results of the

AIR evaluation were mixed, and the critics of bilingual education used the findings to argue for a quick end to the program or, at minimum, a quick exit by participating students. This caused proponents to argue that this policy sent the wrong message to students and families that their various home languages were good enough to use in schools, but only for a short time.

National Politics and Title VII

Opponents of bilingual education had long been resentful of the role of Title VII in promoting bilingual education in the nation's schools. Epstein, an early critic, spurred the debate with his book *Language, Ethnicity, and the Schools*. Epstein revived the nativist idea that ethnic and language groups did not have the right to ask the public schools to promote their languages and cultures by including them in school practices and curriculum. English, they claimed, was the only language that should be promoted in school, ignoring the fact that instruction in and through other languages had been the norm rather than the exception in other periods of American history.

The debate over mandating, funding, or even tolerating instruction in languages other than English intensified in 1980 with the publication by the U.S. Department of Education of a "Notice of Proposed Rulemaking" (NPRM) aimed at a cogent and enforceable implementation of the Supreme Court ruling in *Lau v. Nichols* (1974). Secretary of Education Shirley Hufstедler had been involved with the *Lau* litigation starting in the early 1970s, when she served on the U.S. Appellate Court for the Ninth Circuit in California. This was the panel of judges who had reviewed and upheld the original district court ruling in *Lau*. Hufstедler had been the only judge on the review panel who had voted to reverse the ruling, but two other judges had refused. Later, Hufstедler's position was vindicated by the Supreme Court in its reversal of the lower court in 1974. Now, as the newly appointed first U.S. Secretary of Education, Hufstедler ordered that an NPRM be published in the *Federal Register* by the department's Office for Civil Rights.

Administrative hearings were held, and the NPRM was published in August 1980, 3 months before the presidential election in which Ronald Reagan unseated Jimmy Carter. A firestorm of protest erupted because the *Lau* NPRM mandated the use of bilingual instruction under certain circumstances for correcting the problems identified by the Supreme Court in *Lau*.

Because bilingual education had been prescribed in the original remedies ordered for the San Francisco schools on remand, the proposal to use bilingual education was in keeping with antecedents in the case. The NPRM was issued at a time when the presidential campaign by Ronald Reagan was focusing on deregulation by the federal government as a campaign pledge. School districts that had happily accepted Title VII funding to operate programs of bilingual education now strongly objected to having the program mandated. Title VII, because it was so intimately connected to the *Lau* enforcement effort, was seen as part of the problem rather than part of the solution.

Through the Reagan years, the program limped along with little support from the administration. It was strongly supported once again by President Clinton but fell out of grace under the administrations of both President George H. W. Bush and President George W. Bush. With the exception of the presidency of Richard Nixon, Title VII fared poorly under Republican presidents. With the creation of President George W. Bush's initiative known as the No Child Left Behind Act of 2001 (NCLB), Title VII ceased to exist, and federal support of bilingual instructional programs ended. Under NCLB, federal funding flowed through the states to local schools, as distinguished from direct grants as was the case under Title VII. Decisions to fund bilingual education were decentralized and authority given to the chief state school officers as to whether or not to continue to support such programs.

Impact and Legacy

For 30 years and at a rate of several million dollars annually, Title VII provided incentives to school boards, universities, and nonprofit organizations to adopt bilingual education as an alternative to English-only education. A generous doctoral fellowship program and master's-level training funds allowed many of the professors working in bilingual teacher education to complete their studies. A small but important program known as the Deans' Grant Program allowed universities to place graduates of doctoral programs into faculty positions at a time when universities were finding it difficult to make new hires. Research and technical assistance centers established with Title VII support later broadened their scope and funding sources to continue to provide services to school districts even after Title VII itself had passed into history. A valuable clearinghouse on bilingual education

served the information needs of practitioners for years and continues to provide services today, albeit with a narrower focus on English language acquisition. In all of these activities, a generation of program managers, evaluators, policy analysts, researchers, and trainers honed their skills.

Conclusion

Without Title VII of the ESEA, it is unlikely that bilingual education would have become as common or controversial as it did in the 1980s and 1990s. The legislation clearly met its capacity-building goal. Only once before, through the National Defense Education Act (NDEA) of 1958, had the federal government invested sizable sums to promote the study of languages other than English. That act, however, had very different purposes. While NDEA actively sought to improve the teaching of languages other than English, Title VII often deemphasized the retention of those same languages if they were not learned in school. Thus, while critics such as Epstein accused the program of promoting “affirmative ethnicity,” others bemoaned its unabashed efforts to teach English without actively safeguarding the languages that ethnic and immigrant children brought with them from home. This bifurcation of goals and objectives plagued the program until its ultimate demise in 2002. At that point, its English teaching thrust was integrated into the NCLB legislation, and the goal of maintaining minority languages ended, at least for the moment.

TITLE VII, ELEMENTARY AND SECONDARY EDUCATION ACT, 1967 SENATE HEARINGS

On January 17, 1967, Senator Ralph Yarborough, Democrat from Texas, introduced the Bilingual American Education Act in the U.S. Congress. The introduction of Senate Bill 428 led to the first congressional hearings on bilingual education and the passage of the Bilingual Education Act, an amendment to the Elementary and Secondary Education Act (ESEA) of 1965. Title VII, ESEA, was meant to provide federal assistance to local education agencies for the development of bilingual education programs. While few people could have guessed it at the time, it was to become the largest and most important funding source for bilingual education in the history of the nation. This entry summarizes some of the topics that were discussed at these hearings and the knowledge base and background of the hearings’ participants.

Senator Yarborough’s introduction of Senate Bill 428 came just 3 years after the passage of the Civil Rights Act of 1964 and marked an expanding focus of the civil rights battle to include national origin alongside race and color. With an initial seven bipartisan cosponsors joining Senator Yarborough, S. 428 gained cosponsors once the hearings began before the Special Subcommittee on Bilingual Education, on May 18, 1967, in Washington, D.C.

The senators backed S. 428 in hopes of improving educational outcomes for Spanish-speaking children and youth. But the original bill was sharply focused on Mexican Americans in the Southwest and Puerto

Ricans in New York. It was not intended to cover all language groups. It is likely that the chief sponsors of the bill—senators from Arizona, California, Texas, and New York—saw some political advantage in voting for a measure that would be warmly welcomed by increasingly active Latino voters in their respective states. Not surprisingly, the hearing record indicates a lack of specificity on what could be accomplished through bilingual education. Given the limited research available on that subject, that too came as no surprise.

Testimony and Provisions

At the hearings, which were also held in Texas, California, and New York throughout the spring and summer of 1967, the merits of bilingual education were not significantly put into question; but the value of bilingual education was also not recognized beyond improving communication between teachers and non-English-speaking students. Most witnesses were connected with advocacy organizations, most notably Mexican American and Puerto Rican advocacy interests, or came from the school establishment, namely, school administrators interested in improving the education of language minority students. A number of witnesses were local and state-level politicians, chiefly Democrats who had supported John F. Kennedy and Lyndon B. Johnson, the liberal wing of the party to which Yarborough also belonged.

By today's standards and given today's knowledge base concerning bilingual education, many of the witnesses showed little understanding of what was being forged via the legislation, a lack of vision of what bilingual education could accomplish, and even how the proposed funds might be used. For example, absent from the hearings was testimony on the knowledge base of what was known about language incompatibility, how language incompatibility could be overcome, and the educational infrastructure needs. There were notable exceptions. Dr. A. Bruce Gaarder, Chief of the Modern Language Section of the U.S. Office of Education, presented powerful testimony about research that revealed a link between bilingualism and low marks on intelligence tests and that this relation was widely supported by governing, academic, and school establishments in the United States. He drove home his point by saying "there is a 5-foot shelf of books developed in this country bearing upon that point." However, he added that research never showed that bilingualism was the cause of low marks on

intelligence tests. He and other academics reported that more accurate research, which accounted for key variables such as household income, showed that bilingualism was a great asset and that bilingual students could be expected to outperform monolingual students. While some witnesses were lukewarm in their support, witnesses and members of the subcommittee showed clear support for the following ideas throughout the hearings: (a) The best way to teach children is through the language they understand best, presumably their mother tongue; (b) literacy in one language facilitates literacy in another; (c) knowing two languages is superior to knowing one; and (d) the debasing or rejecting of a student's native tongue, not the language itself, works negatively on self-esteem and promotes dropping out and low educational attainment. Gaarder touched on this latter idea when he mentioned that research "shows the unfortunate consequences when the child's mother tongue is ignored or deplored and otherwise degraded" (S. 428, p. 48).

While the merits of bilingual education were not fully expressed nor seriously challenged, the goals and objectives of bilingual education were somewhat disjointed. Some witnesses, including Senator Yarborough, said that Spanish was a great national treasure, but rather than being maintained through efforts such as bilingual education, Spanish was being squandered. According to Yarborough, Spanish speakers represented a neglected segment of the U.S. population who should be invested in through quality schooling. Several witnesses reported that much effort was being wasted on attempts to erase Spanish from U.S. youth, while at the same time money was being spent to teach or reteach adults Spanish for work in which the use of Spanish was needed. Some pointed out that the Spanish of those who learned the language as adults was inferior to those who developed it from childhood and that this detail accentuated the wastefulness of current practice.

For other persons, including cosponsoring Senator Paul J. Fannin of Arizona, bilingual education in Spanish could be a stepping-stone for the acquisition of English and eventual suppression of Spanish. According to that idea, bilingual education should have the objective of teaching Spanish-speaking students in Spanish when they first enter school, so that they do not fall behind on school subjects, but Spanish-speaking students should be expected to become English dominant after a few years. Senator Fannin offered that it was his belief that only after becoming English dominant

would Spanish speakers be in a position to fully contribute to society, implying that the acquisition of English was more essential for positive social and economic outcomes, an idea that was uncontested at the hearings. Senator Fannin further suggested that English was the only language of the United States, to which Senator Yarborough retorted that when he and his staff visited areas south of San Antonio, Texas, it was clear to them Spanish was pervasive, as evidenced by the dominance of Spanish on the radio waves. Several witnesses added that if Spanish were pervasive in parts of the United States, full participation in society would call for English speakers to gain a mastery of Spanish in addition to Spanish speakers gaining a mastery of English. While perhaps well intended in their support for S. 428, Senator Fannin and others were establishing the legislative history that would eventually brand the federally funded version of bilingual education as a transitional program.

Despite uncertainty regarding the goals and objectives of bilingual education, there was general agreement that bilingual education was a good cause. Indeed, it was regarded as such a good idea that there was pressure to expand the bill's focus to other language groups and regions of the country. Given its broad support, bilingual education was seen as having the potential to garner higher levels of federal funding in the future. There was pressure from witnesses providing testimony but also from cosponsoring senators to expand the recipients of federal assistance from local education agencies to other entities, such as universities, vendors of educational goods and services, and state education agencies.

Senator Yarborough, chief sponsor of the bill, initially refused the call to expand the bill. Throughout the hearings, he pointed out the impracticality of expanding the bill given the tight budget constraints caused by the war in Vietnam. To increase the chance for passage of the bill, Yarborough argued, the dollar figures had been set small, at \$5 million for the first year, \$10 million for the second, and \$15 million for the next 2 years. Yarborough maintained that including all speakers of non-English languages throughout the United States would render the bill unfeasible, since the funding would potentially have to serve a population of several million persons and their first-generation descendants. He recommended that Spanish speakers, primarily Mexican Americans and Puerto Ricans in the United States, should remain as the primary focus of the proposed legislation.

Subsequently, other Spanish speakers and language groups could be added as additional funds became available. Yarborough stated that Spanish speakers were selected because they represented the largest number of non-English-language speakers, were mostly concentrated in certain areas, and based on education attainment figures were the most in need. Further, Yarborough and several witnesses claimed, Spanish speakers preceded English speakers in some parts of the country and were entitled to special consideration since they did not choose to shed their land and culture, including their language.

In resisting the request to expand the bill from local school districts to include other recipients, namely, state education agencies, Yarborough pointed out that existing laws already allowed state education agencies to invest in bilingual programs but that the testimony by several witnesses showed that state education agencies had invested very little in such programs. Yarborough likewise fought off other efforts to expand the bill, and the groundbreaking S. 428 was reported to the full Committee on Labor and Public Welfare on August 8, 1967. Congress ultimately did not resist the temptation to expand bilingual education, choosing instead to adopt the Bilingual Education Act of 1968, a House of Representatives version of the Bilingual American Education Act that included other languages besides Spanish, other Spanish speakers besides Mexican Americans and Puerto Ricans, and other regions of the country. Dropping the word *American* in the adopted act, as well as changing the focus from Spanish-speaking students to “children of limited English-speaking ability” resulted in a continued favored status for English and was vague on the activities that could be funded under the bill.

Postscript

The Title VII amendment to the ESEA was to last from 1968 to 2001, when it was replaced by Title III of the No Child Left Behind Act of 2001. For the rest of his life, even after retiring from the Senate, Ralph Yarborough pointed to the Bilingual Education Act and the law creating the Padre Island National Seashore as the two most significant legislative accomplishments of his career.

TITLE VII, ELEMENTARY AND SECONDARY EDUCATION ACT, SUBSEQUENT AMENDMENTS

The enactment of Title VII, Elementary and Secondary Education Act (ESEA), in 1968 was not the last word in establishing bilingual education policy for the nation. In fact, the original bill was modified several times in subsequent reauthorizations. Between 1968 and 2001, Title VII, ESEA (also known as the Bilingual Education Act), was reauthorized five times: in 1974, 1978, 1984, 1988, and 1994. The reauthorizations included additions and changes to the original legislation, which reflected the ambivalent political climate surrounding civil rights and language diversity. Both the use of the native language and the type of bilingual education programs offered were controversial issues since the inception of Title VII. The initial Bilingual Education Act of 1968 was intended to create experiments that promised to further the equity of educational opportunity for linguistically diverse children living in poverty. The core of the measure was a supplemental grant program for local education agencies to utilize for their non-English-speaking student population. No specific type of bilingual program was promoted. Indeed, the terminology describing the various types extant today did not exist in 1968. The subsequent reauthorizations of Title VII offered more delineated guidelines and eventually established a pattern of promoting greater local control over program implementation. Prior to it being replaced by the No Child Left

Behind Act of 2001, Title VII appropriations had risen to \$296 million and funded 1,095 programs, which accounted for 12% of all bilingual education programs in the United States.

1974 Reauthorization

Title VII was first reauthorized under Public Law 93–380, the Education Amendments of 1974. This reauthorization addressed most of the controversy that was occurring in the federal government over bilingual education. Although appropriations for Title VII, ESEA, had been increasing each year since 1968 (see Table 1), because of the lack of guidelines and voluntary participation, civil rights activists argued that an equal educational opportunity was not being offered to *limited-English-proficient* (LEP) students, also referred to as *English language learners* (ELLs). Two of the biggest influences on the 1974 reauthorization were the decision in the *Lau v. Nichols* court case and the Equal Educational Opportunity Act of 1974 (EEOA). The Supreme Court decision in *Lau* and its subsequent enactment as a separate act of Congress through the EEOA clearly established that language barriers foreclose meaningful instruction and that special programs were required to remedy the problem. Advocates promoted bilingual education as one of the preferred designs for such interventions.

The 1974 reauthorization of Title VII continued the federal government's assistance for bilingual education, but a tighter definition of bilingual education was crafted. Students in these programs continued to be labeled as having limited-English-speaking ability (LESA). Bilingual education programs were specified to include instruction in both the native language and English to allow students to receive meaningful instruction and progress through school. Whereas transition to English was promoted, maintenance programs were not precluded. Program funding eligibility was extended through high school, although the primary focus remained on the elementary school level. Full bilingual/bicultural approaches became the priority for grants. Programs that offered only English as a Second Language (ESL) instruction were deemed to be insufficient. The poverty requirement was dropped, and the law was extended to incorporate all LEP students, regardless of home language. Native American languages were specifically incorporated into this authorization, and funding would be provided to the Secretary of the Interior to provide bilingual education to Native American

children. The federal government also took on a role in providing resources, such as teachers, curricula, and research, to aid local agencies in providing bilingual education.

Specific changes to Title VII in 1974 included establishing a variety of grants for bilingual education programs: establishment and operation programs and auxiliary and supplementary programs, such as adult education. Training programs were another significant addition to the reauthorization. Grants allowed for training teachers and paraprofessionals, technical assistance, and the operation of short-term training institutes. The reauthorization also allowed for the award of at least 100 fellowships in the field of education of teachers of bilingual education. The objective of this provision was to increase the number of professors in teacher training programs that could help reduce the nation's shortage of bilingual education teachers.

Administrative changes included adding an Office of Bilingual Education (OBE) within the Office of Education to handle the administration of Title VII grants. The National Advisory Council on Bilingual Education was established as a 15-appointed-member committee, and the National Clearinghouse for Bilingual Education (now known as the National Clearinghouse for English Language Acquisition) was created to develop, collect, and disseminate research and instructional material. Specific grant programs were provided for promoting research to enhance the effectiveness of bilingual education programs in schools.

In 1974, 383 school district projects, 15 training resource centers, 5 centers for material development, and 3 dissemination and assessment centers were funded. Funding appropriations increased to \$68 million. Compared with the 80 programs funded in 1969, there was a significant increase in the number and type of programs attributable to the changes in the 1974 reauthorizations. The 1974 reauthorization contained many additions and specifications at both the program and administrative levels. This particular legislation reflected the government's response to the demands of minority rights groups and the special needs of LEP students.

1978 Reauthorization

The Bilingual Education Act was again reauthorized in 1978 as part of Public Law 95-561. The act was extended, but the political climate threatened some of the programs that had been established in 1974.

Because of the *Lau v. Nichols* Supreme Court ruling, schools were required to establish programs to meet the English language needs of their LEP students, today known as *English language learners* (ELLs). Staff guidelines were written by the Department of Health, Education and Welfare to facilitate *Lau*-related compliance reviews, which were conducted by its Office for Civil Rights. In a subsequent iteration and expansion, the guidelines became known as the "*Lau Remedies*." A number of problems arose over the *Lau Remedies* because critics objected to the fact that (a) the remedies appeared to favor bilingual education over other designs and (b) the Office for Civil Rights did not take the important step of publishing the remedies in the *Federal Register*, which would make them subject to congressional review. The guidelines also prohibited language-oriented segregation of LEP students, which some school districts felt was necessary. In a period of recession, school budgets were being cut at the same time costly bilingual programs were being established. Complaints concerning "unfunded mandates" were growing. Ever present was the criticism that federal dollars were being used to promote native-language maintenance instead of forcing students to learn English.

Unlike the 1974 act, the 1978 reauthorization established more clearly that bilingual education was to be *transitional* in nature. Programs funded by Title VII were expected to move LEP students to classrooms in which teaching was done in English and to do so as rapidly as possible. The use of the native language would be allowed in funded programs only "to the extent necessary" for students to acquire English. The ideal "extent necessary" was not specified in the act. Maintenance programs for the native language were not to receive funding. Another important step taken in the 1978 reauthorization was to expand the definition of LESA into "limited English proficiency," or LEP. Prior to this, students were identified as eligible for the program on the basis of speaking ability alone. The change to LEP was meant to include the written language as a basis of consideration for eligibility by a student. Under the new definition, many additional students became eligible for bilingual education programs funded by the act. The change in definition also meant that many more students would henceforth be designated as deficient in English.

Total funding in 1978 was \$135 million to 565 school districts, bilingual education service centers, graduate student fellowships, and teacher training programs for undergraduate students preparing to become

bilingual teachers. Dissemination and assessment centers (DACs) were changed to evaluation, dissemination, and assessment centers (EDACs) and were now required to assist school districts in evaluating the bilingual education programs funded under the act. Funding to school districts was limited to a period of 1 to 3 years, and school districts were required to provide assurances that programs would be continued with local funding after federal support ended under Title VII. These changes enacted in 1978 revealed that the attitude toward bilingual education was shifting. While important changes from 1974 remained in place, in the area of teacher training and research the emphasis was now clearly placed on transitional programs instead of maintenance. The federal government would also play a role in program evaluation, which had initially been provided by local and state education agencies.

1984 Reauthorization

Debates surrounding bilingual education and the role of the federal government were widespread in the late 1970s and early 1980s. The *Lau* Remedies lacked the legal basis of a federal regulatory document and were subsequently challenged. This led the Department of Education to propose a set of regulations that were to be published by the end of 1980. The proposed rules pushed for bilingual classrooms that transitioned students to English as quickly as possible. Questions concerning who was responsible for bilingual education, the state or the federal government, also surrounded these regulations. Another major issue surrounding bilingual education included school districts that often had LEP students who spoke any of more than 20 different languages. Compliance with the *Lau* Remedies, which were published in the *Federal Register* as a "Notice of Proposed Rulemaking" (NPRM), in August of 1980, could potentially require vast increases in spending for LEP students. This provoked a groundswell of protest from local school districts and state governments.

The presidential elections of 1980 intervened, and candidate Ronald Reagan used as his platform a reduction of federal rule making and "getting the government off our backs." The *Lau* NPRM fell victim to campaign promises and was abandoned by the new secretary of education. That year, the federal government reduced bilingual education funds by 25%. Clearly, the furor over the proposed *Lau* regulations influenced funding for Title VII of the ESEA.

The reauthorization of Title VII in 1984 attended to the need of local agencies to have greater power and flexibility in operating their bilingual education programs. The emphasis was on the states and local school districts building enough capacity to support programs for LEP students without having to rely on federal funds. The initial Title VII prohibited grants for teaching foreign languages, which meant that English-speaking children could not be incorporated into these programs. This policy changed in 1984. Grant programs were established that used a variety of teaching strategies. School districts had three types of grants available for use with LEP students: (1) transitional bilingual programs that allowed the use of their native language as necessary (these programs allowed up to 40% non-LEP students in them), (2) developmental bilingual programs that would support English acquisition as well as native-language maintenance, and (3) special alternative instructional programs that did not require their native language and implemented special services for English competency. The biggest change to Title VII during this reauthorization was the funding approved for these special alternative instructional programs, which could consist of an English-only environment. Four percent of funding could be allocated to these programs (10% would be allocated if appropriations reached \$140 million). Other additions to the act included a stipulation that parents play a bigger role in LEP students' education. Grants for academic excellence were also made available to support excellent programs that could serve as models. The reauthorization also called for at least 16 multifunctional resource centers to provide training, resources, technical assistance, and other services related to bilingual education.

Total federal funding for Title VII programs in 1984 was \$135 million. This amount was consistent with the 1974 appropriation but was a significant decrease from the 1980 amount of \$167 million. Funding was apportioned in the following way: 60% of total funding was to be set aside for financial assistance for instructional programs, 75% of this set aside was reserved for transitional bilingual education programs, and 4% to 10% was designated for special alternative instructional programs. The remaining 40% of the total funding was to be used for research, training and technical assistance, and administration.

1988 Reauthorization

In 1988, Title VII was reauthorized in the Hawkins-Stafford Elementary and Secondary School Improvement

Act. This reauthorization made changes that addressed the growing public awareness concerning the diverse population of LEP students. Continuing with the policies established in 1984, it was decided that Title VII would be best utilized to provide initial support and then leverage state or local education agency funding to continue the program. Many of the changes in the 1988 reauthorization came out of the Bilingual Education Initiative of 1985 (BEI). Secretary of Education William J. Bennett, a nonsupporter of bilingual education, proposed the initiative. Based on the high drop-out rates of LEP students, the current systems in place were not meeting their educational needs. The BEI suggested allowing schools to determine the amount of native language employed in their programs, require a greater parental role in the form of advisory councils, require schools to demonstrate the feasibility of continuing their programs without federal funding, and remove the 4% to 10% cap on special alternative instructional programs. The BEI also stressed transitional programs that promoted fluency in English as quickly as possible.

The reauthorization of 1988 adopted many of the provisions of the 1985 BEI. Funds for instructional grant programs were disbursed as follows: 75% toward transitional bilingual programs and 25% toward special alternative instructional programs (SAIPs) (an increase from the 4% to 10%). A 3-year limit was also placed on LEP students in transitional or special alternative instructional programs, although under special circumstances, the student could remain in the program an extra 2 years. The legislation also required that parents be given information about their children's programs in a language they could understand, and family English literacy programs were made available to noncitizens who qualified for temporary resident status. New provisions placed a greater emphasis on training personnel and research; therefore, these areas received 25% of all appropriations. In addition, at least 500 graduate fellowships were to be awarded each year. Schools could also use the first 12 months of their grants toward pre-service activities. Other significant changes under this reauthorization included the termination of grants for instructional materials. Funding to support the National Advisory and Coordinating Council on Bilingual Education was also dropped.

In 1989, appropriations were set at \$152 million. The act specified that 60% of the total funding would be reserved for instructional programs (this included the 25% toward SAIPs). In addition, 25% of funding

was reserved for training activities. Finally, the minimum grant for state education agencies was raised from \$50,000 to \$75,000.

1994 Reauthorization

The final reauthorization of Title VII occurred in 1994 as part of the Improving America's Schools Act. The reauthorization was influenced by another legislative initiative, Goals 2000: Educate America Act. Goals 2000 developed national goals for LEP students but continued to place the control and responsibility for implementing and accounting of these programs in the hands of local education agencies. Again, this legislation was meant to provide more flexibility for programs. Based on initiatives from the National Education Goals of 1990, Goals 2000 provided resources for states to develop broad consensus standards. Both Goals 2000 and the Improving America's Schools Act aimed to provide equitable and quality education for all students.

Major changes to this reauthorization included establishing new bilingual education grant programs, removing mandatory research projects, and developing new categories for training grants. This legislation again promoted the use of native languages in funded programs, and funding applications that incorporated developmental bilingual programs were given priority. In particular, Native Americans were given special attention and were encouraged to develop language maintenance and preservation programs. Funding for SAIP remained capped at 25% unless there were special circumstances. This particular reauthorization demonstrated the temporary nature of the shift in the political atmosphere whereby maintenance bilingual programs were again promoted as the most effective instructional program for LEP students.

The appropriations for 1994 were \$201 million. By 2001, the last year of Title VII, the Bilingual Education Act, appropriations totaled \$296 million. Sixty percent of funds went toward 691 instruction programs, and 25% of funds were allocated to 361 grants awarded for professional development services. During this last reauthorization, which supported the maintenance of native languages, appropriations were drastically reduced, even as percentages for SAIP remained high (see Table 1).

The five reauthorizations of Title VII and the changes that occurred at every turn demonstrate the changing positions in the United States between assimilation and multiculturalism. While the initial changes to

Table 1 Appropriations by Year for Title VII (Reauthorization Years in Bold)

<i>Year</i>	<i>Appropriations</i>	<i>%s for SAIPs*</i>
1968	0

1998	\$199,000,000	25+%
1999	\$224,000,000	25+%
2000	\$248,000,000	25+%
2001	\$296,000,000	25+%

Note: SAIP: Special alternative instructional program.

Title VII in 1974 established developmental programs that maintained native language, economic and societal pressure caused the tide to shift toward transitioning to English. Title VII complied with the generalized support for transitioning and was never able to shift back again. Although the latest version of Title VII in 1994 promoted the use of native languages, a high percentage of funding was still allocated to programs that would incorporate English-only methods. The English-only movement has gained considerable strength in the United States as the country becomes more and more linguistically diverse. Funding for bilingual education programs was a struggle to maintain each time the funding legislation has needed to be reauthorized.

Title VII of the Bilingual Education Act now exists in a very different form, as Title III, the English Language Acquisition Act, under the reauthorized ESEA of 2001, No Child Left Behind Act of 2001 (NCLB). Advocates of bilingual education tend to believe that with the advent of NCLB, bilingual education was left behind because NCLB does not specifically fund bilingual instruction programs directly to school districts. Support centers, fellowships, and training grants for bilingual teachers have all disappeared. In three states, Arizona, California, and Massachusetts, legislation has been passed, following vigorous promotional efforts by the organization English for the Children, that limits or eliminates bilingual education in those states. In several other states, mandatory bilingual education has ended, and only voluntary participation in such programs is allowed. In most of these cases, parents must be given the choice to have their children involved in bilingual education.

TITLE VII, ELEMENTARY AND SECONDARY EDUCATION ACT, TEXT

See APPENDIX B

TITLE VII, ELEMENTARY AND SECONDARY EDUCATION ACT BECOMES TITLE III, NO CHILD LEFT BEHIND ACT OF 2001

On December 18, 2001, the 107th Congress passed the No Child Left Behind Act of 2001 (NCLB), reauthorizing the Elementary and Secondary Education Act of 1965 (ESEA) through fiscal year 2007. President George W. Bush signed the bill into law on January 8, 2002. NCLB incorporated and strengthened the standards-based reform effort begun under the 1994 amendments to the ESEA and added an accountability system requiring that all students become “proficient” by the year 2013.

Perhaps no program was changed as dramatically by this seventh reauthorization of ESEA as what was

known from the time of its enactment in the 1968 ESEA amendments as “Title VII, the Bilingual Education Act.” NCLB reflected a fundamental transformation in the relationship between the federal government and the states with regard to the education of English language learners (ELLs). As a result, not only did the number of students served and the funding mechanisms change, but the manner in which services to these students were to be planned, delivered, and evaluated also changed.

The passage of NCLB replaced Title VII with Title III, the centerpiece of which is a formula grant program to the states. While the ultimate goal of Title III is similar to that of its predecessor—improving “the education of limited English proficient children, by assisting the children to learn English and meet challenging State academic content and student academic achievement standards” (Section 3115(a))—Title III changes the manner in which this is to be accomplished.

Title VII was a competitive grant program that provided “seed” money for states, districts, and institutions of higher education to design and implement new and innovative programs for ELLs. In the 2000–2001 school year, for example, under this “demonstration” program, approximately \$449 million was distributed through 1,500 grants issued under 12 different grant programs. The bulk of these funds went toward capacity-building functions at the local and state level, including universities. Only a small fraction of the total ELL population—approximately 15%—received supplemental services through these Title VII programs.

Participation in Title VII was optional; school districts, community-based organizations, and institutions of higher education were eligible to submit proposals for seed money under Subpart 1 of the 1994 version of the law. This was done in order to develop and enhance their capacity to provide high-quality instruction to ELL children and youth and to help these children develop proficiency in English and, to the extent possible, in their native language. Another goal was to meet the same challenging state content standards and challenging state student performance standards expected for all children and youth.

Projects designed to develop, enhance, improve, reform, and/or upgrade relevant programs and operations were meant to increase the capacity of the school district to serve ELLs, and the districts were expected to continue the services after federal funding ended. Title VII programs were intended to demonstrate effective and innovative educational practices, not to

serve all ELLs in the nation. Grant amounts varied based on the proposed activities of individual projects; a small district with little experience with ELLs might receive a large grant to develop a new program employing a new approach, whereas a large district with many ELLs might receive a small Title VII grant to add a new component to an existing program.

In contrast, Title III is a formula grant program distributing funds to states based on the number of ELLs and immigrant students in each state. Although not every ELL in the United States is served under this “service” program, the number has increased significantly, and districts that had never received funding for language instruction educational programs are now doing so.

Goals and Purposes of Title III

The overall goals of Title III are to ensure that ELLs attain English language proficiency, develop high levels of academic attainment in English, and meet the same challenging state academic content and student academic achievement standards set by each state for all of its students. To accomplish these goals, each state must develop an integrated system of English-language-proficiency standards, assessment(s), and objectives that are linked to its state academic content and student academic achievement standards. More specific purposes of Title III include the following:

- Develop and provide high-quality language instruction educational programs to assist all ELLs in meeting the state-established Annual Measurable Achievement Objectives (AMAOs)—making annual progress in learning English, attaining English proficiency, and making adequate yearly progress (AYP) in reading/language arts and mathematics
- Assist state education agencies (SEAs) and local education agencies (LEAs) to develop their capacity to serve ELLs immigrant children and youth
- Promote parental and community participation in language instruction educational programs for parents and members of the community
- Streamline language instruction educational services into a program carried out through formula grants to states and LEAs
- Hold SEAs, LEAs, and schools accountable for annual increases in English proficiency and the core academic content knowledge of ELLs
- Provide SEAs and LEAs with the flexibility to implement scientifically based language instruction

educational programs that the agencies believe to be most effective for teaching English.

Part A of Title III, the English Language Acquisition, Language Enhancement, and Academic Achievement Act, is composed of the following:

- *Subpart 1—Grants and Subgrants for English Language Acquisition and Language Enhancement*, covering formula grants to the states and subgrants from the states to eligible entities at the local district level
- *Subpart 2—Accountability and Administration*, including regulations regarding evaluations, achievement objectives and accountability, and reporting requirements
- *Subpart 3—National Activities*, providing for a national professional development program of competitive grants
- *Subpart 4—Definitions of “eligible entity”* within the Title III framework

Title III, Part A, Subpart 1, provides for the distribution of formula grants to states in allotments determined by the numbers of ELLs reported in the 2000 U.S. Census (80% of the formula) and the state-reported numbers of immigrant children and youth enrolled in U.S. schools (20% of the formula). States, in turn, make subgrants to local LEAs by allocating funds based on the ELL and immigrant student populations served in those LEAs. In addition, states are required to set aside a portion of their allotments, up to 15%, for subgrants to LEAs that have, when compared with the two preceding fiscal years, experienced a significant increase in the number of immigrant students.

The change from competitive, discretionary grants to performance-based formula grants means that many local districts that had never before received federal funding for ELL programs are now receiving such funding from states. In fiscal year 2003, states served more than 4 million ELLs through subgrants to local educational agencies using \$477 million distributed through the Title III State Formula Grant program. States served ELLs through more than 4,800 Title III subgrants. Based on data from the states, in the school year 2003–2004, there were approximately 5.1 million ELLs nationwide. Title III services reached approximately 80% of these students.

As a service program, rather than a demonstration program, Title III requires states to be accountable for the educational system addressing the needs of ELLs.

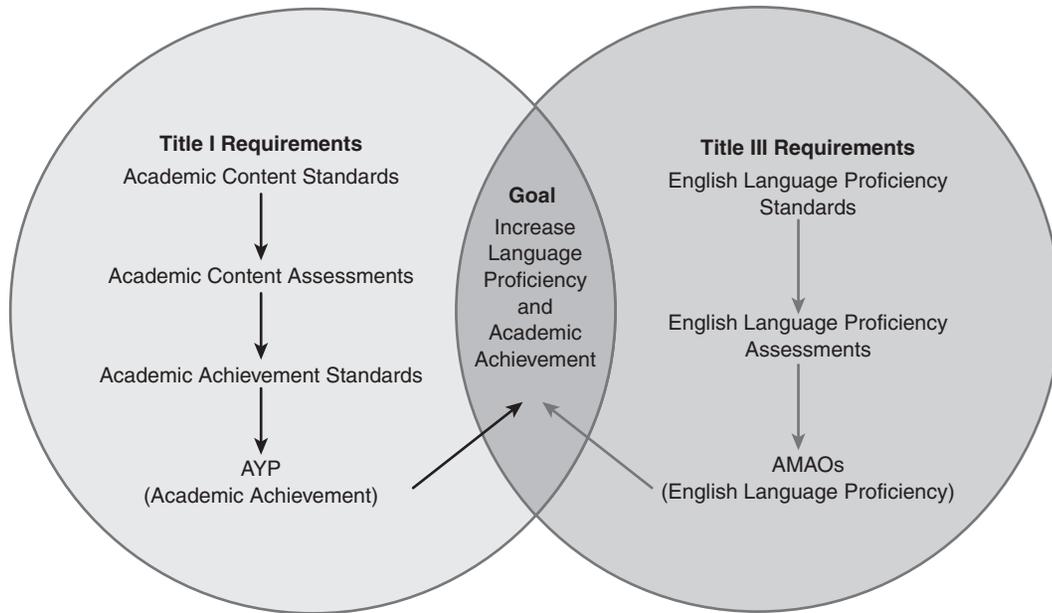

Figure 1 Separate and Common Goals of Title I and Title III

States and districts must not only develop integrated comprehensive educational systems that include ELLs but must also develop the infrastructure that allows them to collect and analyze achievement data on ELLs. Title III requires detailed plans and assurances, as well as new accountability measures to ensure that ELLs meet AMAOs in making progress in learning English and attaining English proficiency. Measurements of progress in these areas must be conducted annually, and biennial evaluation reports are required.

Under NCLB, the academic progress of ELLs is addressed under Title I, Improving the Academic Achievement of the Disadvantaged, while their language needs are specifically addressed within Title III, Language Instruction for Limited English Proficient and Immigrant Students. The two titles are tied together by accountability provisions: The third AMAO under Title III is the AYP provision of Title I. ELLs are a subgroup under Title I for whom AYP targets and scores must be disaggregated from student performance reporting.

Because NCLB mandates the inclusion of ELLs for accountability purposes, these students may be exempted from annual content assessments only during the first year of their entry into U.S. schools. ELLs are to be assessed in a valid and reliable manner and provided reasonable accommodations on content assessments including, to the extent practicable, assessments in the language and form most likely to

yield accurate data. However, after 3 years in the United States, they must take the English language arts assessment in English.

Challenges of Implementing NCLB

States have encountered significant challenges in implementing NCLB. While off-the-shelf commercial English language proficiency tests may be satisfactory for the purpose of identifying ELLs, they are not acceptable as measures of progress toward attaining full English proficiency. Under NCLB, each state is required to develop its own set of English-language-proficiency standards aligned to the state's English language arts standards. The English-language-proficiency standards also needed to be tied to the academic content standards in math and science. Consequently, assessments of English language proficiency in each state must be aligned to the specific state standards. States were supposed to submit evidence of this alignment in early 2006, but many have requested an extension of this deadline to be able to validate new assessments and determine how to tie the new language assessments to original baseline data.

The strength of NCLB lies in its requirement that ELLs be given full access to the curriculum and that there be accountability for their attaining proficiency in English and progressing academically. It is significantly different from its predecessor, Title VII. The

change signals a movement away from a focus on methodology of instruction for a special group of students to one of accountability for all students, including ELLs being successfully included in the educational system. Readers are advised that substantial changes may be made to NCLB during its first reauthorization after the 2008 presidential election.

TRANSFORMATIVE TEACHING MODEL

Essay

Editor's Note: The author of this entry was invited to submit an article reflecting a mix of information and expert opinion. Hence, parts of it could be disputed or given an alternative interpretation. In this case, we found this approach helpful in more realistically portraying certain aspects of the history and current status of bilingual education in the United States.

Teaching English language learners (ELLs) for overall success in school and society is a complex task. At first glance, it appears that bilingual education teachers face two major challenges in teaching ELLs: having their students keep up with the same schoolwork and graduation requirements as their native-English-speaking classmates and, of course, becoming literate in English

to the same level as their counterparts who have a native command of the language. But tough as they are, these two challenges do not reveal what may be the toughest job for bilingual teachers: to create a learning environment that supports their work and enables language minority students to succeed in an era of linguistic restrictionism. This entry summarizes some of these challenges arguably unique to bilingual educators.

The Challenge

For bilingual education to succeed, it should be unfettered by hostility to language diversity and anti-immigrant sentiment. The school and classroom environment should provide a welcoming climate for immigrant children, a spirit of equal opportunity, a belief that all children can learn, and the use of teaching processes that make the experience of learning English a positive and pleasant one. This climate must be pervasive, not limited to what happens in one or two bilingual classrooms while the rest of the school continues to do business as usual. Because these conditions are not universally found in many schools, bilingual teachers have a much bigger job than the two instructional tasks mentioned above. To have maximum impact on the teaching environment, bilingual teachers must be critical thinkers and practitioners acting as advocates for dual-language development and, where necessary, engage in changing policies that deny social justice and equity. Effective and successful teaching in bilingual schools and classrooms requires a critical perspective whereby teachers examine the local, state, national, and global contexts in which they work and act upon them. María Balderrama and Lynn Díaz-Rico posit that teachers must look within, around, and beyond educational issues, asking probing questions about the educator's role in the struggle to attain fairness, justice, and equal opportunity.

Teaching and Its Discontents

In 2002, the National Commission on Teaching and America's Future reported that nearly half of new teachers leave their jobs after 5 years. In low-income communities with high populations of English learners, the rate is higher. Dissatisfaction with the passive role of teaching is often the cause of abandoning the profession. In addition, many teachers in America's schools are middle-class, monolingual English speakers who have limited experiences in working with students

whose cultures, languages, and socioeconomic statuses differ from their own. This poses a unique challenge in teacher preparation, as the lack of experience in working with student diversity results in classroom environments that are not responsive to students' academic needs. Teachers who are ill-prepared burn out, give up, and ultimately leave the profession. Regrettably, returning to school for an advanced degree may not resolve the problem, since many graduate courses in education are often more of the same as what the teachers have already traversed. Even in some programs of bilingual teacher education, colleges and universities often do not make sufficient changes and adaptations in the way they prepare teachers to become transformative engaged leaders. The 2002 study conducted by the Center for Research on Education, Diversity & Excellence, "A National Study of Teacher Education Preparation for Diverse Student Populations," revealed that all but one of the nine case studies had a "negative sociopolitical environment with regard to diversity." The study also reported great variation in the intensity of focus on language and culture in the programs offered to ELLs in those states. The report provides recommendations suggesting that teacher education standards need to better reflect the needs of schools and children. To that end, teacher education program curricula should be substantially broadened.

Bilingual Teacher Preparation

Because many professors in teacher education are not themselves bilingual or experienced in working with the populations in question, critical matters of language are often not given a sufficiently high profile in those programs. Such program components cannot be left to chance. The preparation of high-quality bilingual teachers must explicitly address academic language development and content area teaching. Importantly, language and subject matter knowledge should be taught in classroom environments that are culturally responsive, democratic, and humane. Teachers must learn how to create such classroom environments, in which students' linguistic and cultural knowledge are viewed as assets to learning and the English learner's background knowledge is strategically integrated in all facets of learning. Finally, well-prepared bilingual teachers not only embrace their students' prior knowledge but also actively involve the student in dual roles of learner and teacher in their educational experience together.

There are historical reasons for the shallow interpretation of how bilingual education teachers should be prepared. Beginning with enactment of Title VII of the Elementary and Secondary Education Act (ESEA), also known as the Bilingual Education Act, teacher preparation received scant attention and little funding. According to Francesco Cordasco, in 1967, Senator Ralph Yarborough, from Texas, introduced Senate Bill 428, which eventually evolved into Title VII. A fraction of the bill called for "efforts to attract and retain as teachers promising individuals of Mexican or Puerto Rican descent." This section of Senator Yarborough's proposal, however, was not included in the final legislation. It could be argued that the language of the legislation gave grantees ample flexibility to create new and more effective programs of teacher preparation to implement the new programs to be developed under Title VII. Title VII envisaged the preparation of bilingual teachers as a straightforward and clear mission. However, even the most supportive legislators could not have foreseen how difficult the task of implementing bilingual education would be and that many schools would openly resist implementing those programs with the support necessary to guarantee success.

JoAnn Canales and José Ruiz-Escalante contend that even though the federal government had a role in funding bilingual teacher preparation, it was minimal at best. They report that federal allocations to support bilingual education were approximately \$2.7 million between 1969 and 1992, which included funding in the category of grants to local education agencies, support services, and teacher training. Bilingual teacher training received approximately 21% of these funds. The authors estimate that during an 18-year period, 1974 to 1992, the average in Title VII dollars spent on teacher training totaled less than \$1.50 per student served. During an important part of the historical development of bilingual education in the United States, states relied on federal monies to train teachers, but even so, the total amounts spent on developing and producing effective new models of teacher education were inadequate.

In a new century, some 40 years after the birth of Title VII, the sociocultural and political context for bilingual education is generally less supportive, and with few exceptions, the inactive nature of the role of the federal government in ensuring educational equity is no better. The population of English learners continues to grow, and the federal government's role in bilingual

teacher preparation has all but ended. Few states are allocating the necessary funding to reform and upgrade bilingual teacher education. There is a widespread lack of interest in the subject among policy-makers at a time when important reforms are needed more than ever. This has significant implications for the future of high-quality bilingual education.

Title VII has now run its course, to be replaced in part by the No Child Left Behind Act of 2001 (NCLB) legislation. NCLB has a provision calling for highly qualified teachers in every classroom. This law defines “effective teachers” as those who have subject matter knowledge. While this definition is somewhat narrow, this initiative recognizes the need for highly qualified teachers in underperforming and high-poverty schools. ELLs are frequently the majority populations in these settings, yet being a highly qualified teacher does not include the ability to address English language development issues, if we are to judge by the stress on subject matter and the lack of attention in the new law to issues specific to language minority children.

Ample research supports the positive relationship between inclusive, equitable, culturally responsive teaching practices and mastery of subject matter knowledge. Common sense and research support the idea that teachers cannot teach what they do not know. It is difficult, if not impossible, for teachers to teach English learners academic content when they have not been given the knowledge, skills, and pedagogical tools. In the context of NCLB, knowledge on the part of the teacher of English, or any other school language, is not enough. *Bilingual teacher* and *bilingual education teacher* are not synonyms. As advocates have emphasized, adequate bilingual teacher preparation is imperative and should be considered a top priority given the increases in English learner populations and the schools’ widespread lack of success in educating them properly.

In recent years, antibilingual education legislation has been passed in three important states: California, Arizona, and Massachusetts. Similar measures aimed at reducing services to immigrants and immigrant children have been introduced in several states. These anti-immigrant, antibilingual measures introduced a new model of language teaching known as *structured English immersion* (SEI). This method implies that bilingual teacher preparation is irrelevant and ineffective. The SEI approach denies the importance of primary-language development and literacy, suggesting that it interferes with learning English, the opposite

of what scientific research findings have shown time and again. The consequences of ill-informed and politically motivated language policies in education contribute to a growing number of English learners lacking literacy and leaving school.

Transformative Pedagogy

Bilingual teachers in the 21st century have complex roles in challenging, dynamic contexts. Adequate bilingual teacher preparation models require transformative teaching strategies informed by sound theory and research in human learning; English language development; dual-language literacy; and academic, or content area, instruction. Effective teaching of bilingual students also demands advocacy for students’ linguistic and educational rights and respect for the native languages spoken by their families.

Transformative pedagogy is somewhat difficult to implement because it often requires changes and alters existing paradigms, expectations, and practices for teaching, as well as the school environment. Given today’s contexts for teaching, it is imperative to extend the more traditional skills-based model of teacher and bilingual preparation into a realm that drastically redefines the roles, actions, praxis, and work of teachers and their students. Transformation requires teachers to be clear as to their role as agents of change and advocacy, while planning and implementing classroom environments that equalize power and status so that all students have access to English language development and advanced academic knowledge. This preparation incorporates linguistic, pedagogical, affective, cognitive, and technological competencies and suggests that in order for these competencies to support English learners, they must be grounded in sociopolitical action. Bilingual, transformative teaching is grounded in critical theory, recognizing that the majority of English learners have working-class origins and membership in historically subordinated groups. Bilingual teachers need to understand the implications of systemic disempowerment and interrupt the vicious cycle of school failure by actively transforming their curricula and planning lessons that include and view English learners and their cultures with respect. Good teachers are able to select, use, and develop antibias curriculum, create student-centered classrooms that promote language usage and development, while designing activities and lessons that integrate critical thinking and problem-solving learning opportunities in two languages.

In this model of teacher preparation, bilingual teachers learn how to resist being relegated to technical roles characterized by standardized curricula and high-stakes testing that systematically punishes and stifles their students' natural and intellectual growth, while undermining their own professional and creative efforts. Transformative teachers are actively and routinely engaged in reflective practice. They look back on their teaching and students' progress with a critical eye. This model of bilingual teacher preparation is characterized by high expectations of students; expertise in teaching English and subject matter knowledge; honoring and integrating students' home languages in all classroom activities; being an ethical professional; actively modeling intercultural communication; and being ideologically clear about the role and process of schooling, including why advocacy and transformative pedagogy are fundamental elements of an effective teacher.

In addition, bilingual teacher preparation should include specific elements essential to effective instruction, including (a) knowing the students, including their personal and academic backgrounds; (b) understanding and applying learning theories; (c) understanding and implementing primary- and second-language acquisition and learning theories; (d) choosing humane, effective pedagogy, including lesson planning, development of democratic teaching environments, and addressing state and national curriculum standards; (e) integrating English language development, including English language standards, language assessment and the strategic inclusion of the four dimensions of language (listening, speaking, reading, and writing) in all lessons; (f) using primary language as a pathway to dual language development and biliteracy; (g) assessing student progress, including standardized and authentic modes; (h) collaborating with families and communities to promote and support English language development; and (i) being accountable and using information to focus on assessing and monitoring student progress and to inform teaching practices.

The need for capable teachers specializing in teaching English learners is growing, and despite efforts to undermine bilingual teacher preparation, employability prospects for adequately prepared teachers has never been better. The demand for bilingual professionals who can teach English is growing steadily not only in the United States, but throughout the world. According to Balderrama and Díaz-Rico, English is being taught or studied somewhere in the world at any given time. But the pandemic urgency to learn and teach English should not blind educators to

the need to respect and honor the first-acquired languages students bring with them to school. These are the only linguistic tools with which they can engage in formal learning in the school environment. What bilingual education adds to transformative teaching is the idea of not only capitalizing on home languages as tools for learning but also respecting them for the important part of learner culture they represent.

TRANSITIONAL BILINGUAL EDUCATION MODEL QUESTIONED

The early sponsorship of bilingual education by the federal government in the form of Title VII of the Elementary and Secondary Education Act (ESEA) in 1968 did not elicit negative public reaction. As the appropriations increased, however, the concept of bilingual education came under scrutiny. Many observers of the Washington scene saw its connection with the equity objectives of the Civil Rights Act enacted only 4 years earlier. The program went forward, and the government annually increased its funding to schools to support bilingual education. This period of acceptance did not last long. By the time the Bilingual Education Act came up for reauthorization in 1974, important modifications were proposed. Some of these changes were suggested by practitioners who saw weaknesses and gaps in the original legislation that needed attention, among them funds for teacher education, technical assistance, and research. Criticism also came from social observers who saw aspects in the program that they considered threatening to the sociocultural traditions of the country. An early critic was Noel Epstein, a journalist who argued that the program was poorly thought out and that it was being used to support programs of "affirmative ethnicity" in certain schools.

Sociopolitical Reactions Emerge

For most of its history, and with few exceptions, American public educators had become comfortable with the use of only one language for instruction: English. German language schools were the prime exception, but most of these had disappeared by the time Title VII arrived on the scene. Many universities had eliminated the foreign-language requirement for graduation. In the 1970s, most of the remaining universities did the same, and many had eliminated the foreign-language reading requirement even for doctorate degrees. Doubtless, most educators who became involved with bilingual education early on had had little or no experience with other languages in their own education. Many had taken one or two courses in another language in college, far different from sustained instruction in another language. The objective of most introductory college courses in French or Spanish was cultural exposure; the languages were studied as part of a liberal arts orientation, and fluency was rarely the goal. Bilingual education arrived as

American education solidified a commitment to monolingualism in school and society.

In the education profession, bilingual education was often treated as an unproved innovation, one that did not enjoy strong support of the powerful education organizations in Washington, D.C. There is no single factor that fully explains the timid embrace of bilingual education by the American education establishment other than the fact that the legislation had not originated with the American education establishment. Some of these powerful education organizations were the National Association of School Boards, Council of Great City Schools, American Federation of Teachers, and so on. Among the large education organizations based in Washington, only the National Education Association (NEA) had actively supported the new legislation. In addition to limited scholarly literature on the subject and variations in goals and expectations, other factors in and outside the education world have had an influence, directly or indirectly, on the nation's ambivalence, then and now, regarding state-sponsored bilingual education.

Doubts Increase Concerning Transitional Bilingual Education (TBE)

Factors contributing to resistance against bilingual education spring from several sources. Individually, none of these is powerful enough to withstand scrutiny in a direct cause-and-effect relationship. In the aggregate, however, they combine to form a powerful barrier to the enthusiastic adoption of bilingual education. Below is a sampling of these complicating factors:

- A lack of political clout, attributable to the weak integration of bilingual education into the agendas of the large and politically powerful education associations that dominate education policy making in Washington, D.C. (e.g., the American Federation of Teachers, Council of Great City Schools, elementary and secondary principals' associations, Council of Chief State School Officers).
- The slow entry of bilingual education advocates into top policy-making positions, such as large-city superintendencies, chief state school officers, and state boards of education.
- The idea, strongly held by many in the profession, that English is a unifying factor in U.S. society and the parallel fear that the use of more than one language may cause social divisiveness.
- The common belief that discarding immigrant languages is part of the price for gaining admittance into

the mainstream of American life. Those who believe this see the use of the home language in school as sending the wrong signal.

- The belief that using other languages delays the learning of English. Children should be forced to use English early on to ensure mastery.
- The concern that using another language in the classroom takes away instructional time that could be used by students to practice and repeat English lessons.
- The idea that previous generations of immigrant families did not have bilingual education and seemed to succeed in school without it.
- The opinion that compared with previous generations, today's immigrants demand too much and that previous generations of immigrants did not insist that services be provided in their home languages and understood that adapting to a new language was their responsibility.
- The belief that other societies, notably Canada and Belgium, have experienced social divisiveness because they promoted bilingualism and that to ensure national unity among different groups, a single national language is desirable.
- The notion that that according to American notions of fairness, an accommodation made for one language group (e.g., Latinos) with respect to use of their language in school will have to be made for all other language groups, which would be impractical, even impossible, in many schools and communities.
- The idea that common sense suggests that it is easier to learn a language when one concentrates time and energy on that language, rather than continuing to use another.
- The notion that English is the closest thing to a true World Language and because it is spoken all over the world, it is probably the only language that anyone needs to master in the 21st century.

Limitations of space and purpose preclude a full examination of each of these objections to the use of languages other than English in schools. Most are examined in other entries in this encyclopedia. The central point here is not to challenge each of these statements individually, but to suggest that in the aggregate, concerns such as these undermined bilingual education in the perception of the general public and perhaps in the minds of educators as well. When these beliefs and assumptions are viewed in the context of the antibilingual voter initiatives of recent years, it seems clear that the voting public was poorly informed concerning the questionable bases of these seemingly logical ideas.

Starting in the 1980s, these fears began to create a backlash against bilingual education. The once easy support for bilingual education among legislators began to weaken. By the 1990s, a strong movement against bilingual education took hold in several states.

Program Effectiveness Questions

Evaluations of the early programs of TBE did not fully support the claim that the programs were effective in teaching English to children who came to school speaking other languages. The cause-and-effect relationship was modest. This subject also is discussed extensively in a separate entry in this encyclopedia. Some of the early studies only claimed that bilingual education does no harm, but they failed to satisfy critics and advocates alike who expected more. In later years, improvements were made in program design, as well as in the methods for evaluating their impact. Together, these improvements have produced more positive results. However, the damage done to the credibility of TBE in the eyes of the public and political leaders was not easily overcome. Today, evaluation methods in bilingual education are often superior to what is done in many other school programs.

Transitional Aspect Loses Support

In many language communities, including the Spanish-speaking groups that make up the largest clientele for bilingual education, the idea of transitioning children out of their language(s) began to fall out of favor with parents and community leaders. At issue was the realization that TBE was premised on the idea that children would be better off if they stopped using other languages and transitioned to English on a permanent basis. This was an unvarnished return to older ideas about the Americanization role of the schools. Timing was once again a factor. The idea of cultural pluralism as a positive concept had found its way into schools under the banner of multicultural education. In the case of bilingual education, transitioning was uncomfortably close to assimilation as a government-sponsored objective of schools. In the minds of many parents and teachers, TBE represented assimilation and the harsh Americanization programs of previous generations. Because TBE was not proving itself as a way to teach English efficiently and because it sought the abandonment of Spanish, the program lost support among many Latino families and advocates. In most Latino communities, the concept of learning in two

languages continued to be favored, but only when the explicit goal was the continued development of the home language.

Mexican Immigration

Another important factor lurks behind the loss of support for bilingual education: rapid immigration from Mexico. Many Americans resist government programs that appear to support or encourage immigration or actions that bestow benefits on those immigrant groups that were not given to previous generations of immigrants. This is especially true of so-called illegal aliens, an unfortunate term that does not exist in law but has gained common currency in the culture. Although the presence of undocumented immigrant workers is helpful to most Americans and required by many businesses, there is little support among voters for anything that improves the education or social conditions of these families. Cultural conservatives have expressed fear that rapid increases in Latino immigration may cause the country to move away from a commitment to English as the undisputed national language. By the end of the 20th century, strong sentiments against bilingual education had taken root on the grounds that special school programs should not be made available to children whose families were in the country illegally. This punitive sentiment against undocumented immigrant children has been extended in some states to the denial of health and social service programs.

The topic of Latino immigration and its impact on the society is extremely broad and cannot be covered adequately here. It should be noted that its full impact has not yet been felt and the polemics will continue for some time to come. Suffice it to say that programs to improve educational opportunities cannot be denied to immigrant children because their parents immigrated without the benefit of legal documents. All immigrant children, including the children of undocumented workers, are guaranteed access to public education in the United States under the Supreme Court's edict in *Plyler v. Doe* (1982).

Conclusion

The peculiar mix of factors came together in the 1980s and 1990s in a way that could not have been anticipated by those who worked for the enactment of federal legislation to support bilingual education. Equity concerns, driven home by the Supreme Court ruling in *Lau v. Nichols*, may have contributed to fears that the

nation had gone too far in adapting its prime engine of citizenship and Americanization to the needs of immigrants rather than insisting that the immigrants themselves should adapt to the country's social and cultural institutions. Bilingual education was a litmus test for this idea. As the 21st century moves into high gear, none of these matters have achieved finality. They are likely to continue into the indefinite future.

TRANSITIONAL BILINGUAL EDUCATION PROGRAMS

Transitional bilingual education (TBE), one of several instructional approaches used in the education of English language learners since 1968, uses both students' native language and English for content instruction, along with instruction in English as a Second Language (ESL), either as part of the classroom program or as pull-out instruction. A certain percentage of time is dedicated to each language, according to time factors established by the school or school district, the needs and philosophy of the population, and the type of staffing and instructional materials available in both languages. The program typically begins with 90% first-language use, reducing the

percentage after 3 or 4 years to 0%, while the second language, English, begins at 10% and gradually increases to 100%. This type of program requires that teachers are proficient in the minority or primary language and the second language (English) or that there is a team teaching arrangement with a primary and second-language teacher.

During the heyday of federal support, TBE was the instructional model favored by federal funding legislation. Toward the waning years of Title VII of the Elementary and Secondary Education Act (ESEA), 60% to 75% of federal funding was mandated to be used for this type of program, while the other 25% to 40% could be used for alternate approaches. The design of TBE ideally involves a maximum of 40% minority language speakers in the classroom and a maximum of 60% majority language speakers (English), although this ratio is not always possible. This approach is primarily used at the elementary school level. There are mixed perceptions as to the effectiveness and desirability of a program that focuses for 3 to 6 years on the use of the native language when students in the long term need to incorporate themselves into mainstream (all-English) classrooms.

Purpose and Theory

The purpose of TBE is the rapid transition of students to mainstream all-English classrooms, where they can work at the same levels as their English-speaking classmates. The first language is used as a bridge (mostly when there are 20 or more students at a particular grade level who speak a particular language), providing students with literacy and content skills in the primary language until they are ready to move on to English. TBE does not promote the maintenance of the primary language or culture as a goal. As opposed to immersion programs, which use only English right from the start, and maintenance programs or dual-language programs, which promote the development of English and the minority language for both minority and majority students, TBE is seen as a “subtractive” model, as it works toward removing the first language gradually and replacing it with English.

The philosophy behind TBE can best be represented by the theories of Steven Krashen and James Cummins. Krashen talks about the use of the primary language as a base to develop reading skills. He maintains that once one knows how to read, one can easily transfer those reading skills to another language. He also believes that when students learn content (for example, math or

science) in one language, they do not need to relearn it in another language; the knowledge is implanted. Krashen is also well-known for his theory regarding comprehensible input. If students are instructed in English without using special techniques or modifications, there is no comprehension and no learning, either in the content itself or in English. James Cummins talks about the difference between *common underlying proficiency* (CUP) and *separate underlying proficiency* (SUP), emphasizing that learning in different languages does not go into different compartments; it stays in the same common bank of knowledge. Another theoretical aspect of TBE is that students learn by going from the known to the unknown, hence using their primary language and culture as a base, a “known” to start instruction. Working in a TBE setting allows students to feel supported and able to learn and gradually gives them the tools they need to transfer to another context, which is learning in English.

TBE started “officially” with Title VII of the 1968 Elementary and Secondary Education Act (also known as the Bilingual Education Act). That legislation provided federal funding to help schools meet the needs of limited-English-speaking students through program development, teacher training, materials, and parent involvement projects. Support came from other legal decisions as well, such as *Brown v. Board of Education* in 1954 (“separate but not equal”), the 1964 Civil Rights Act, the 1974 *Lau v. Nichols* decision (Chinese students in San Francisco did not have access to education because they did not speak English, even though they received the same treatment as English speakers), the 1975 “*Lau Remedies*” and 1980 *Lau* regulations, and a number of amendments to the original Bilingual Education Act.

The original act demanded that schools provide services to limited-English-speaking students so that they might take full advantage of learning opportunities, although it was not very specific in terms of how to do so. With each adjustment, the act became more prescriptive, including information on the following factors: (a) percentages of language use in different types of programs, (b) measures for the identification of students, (c) creation of regional support centers, (d) placement in appropriate settings, (e) notification and involvement of parents, (f) inclusion of the primary culture in the curriculum, (g) teacher qualifications and training, and (h) the use of *limited English proficient* as opposed to *limited English speaking* (a more limited term when determining who needed services). The federal law placed great

importance on the following factors in assessing the appropriateness of services provided to limited-English-proficient students: (a) research-based programs, (b) adequate resources, and (c) standards and procedures to evaluate and modify the program.

The TBE Classroom

In a typical TBE classroom, there are one or two teachers, depending on whether the teacher is bilingual or monolingual; the other language would need to be complemented by an additional staff member. Sometimes there is a teacher who is supported by a bilingual assistant or paraprofessional who speaks the students' language. In the first year, the instructional ratio is usually 90% in the minority language and 10% in English. For example, students take reading, mathematics, social sciences, and natural sciences in their own language and take computers, physical education, and art in English in a sheltered approach; this means using specific techniques and materials to ensure that students comprehend and can respond to and take advantage of instruction. In the second year, the percentage changes to 70% of instruction time in the minority language and 20% in English; students possibly start taking science in a sheltered mode, in addition to the other subjects mentioned above. In the third year, 50% of the time is dedicated to the minority language and 50% to English. Math in a sheltered mode is most likely added at this point. In the fourth year, the students are expected to work 100% of the time in English, transitioning from primary-language reading to English reading and adding social sciences to the other subjects in a sheltered or mainstream mode (with no special modifications). Generally, the subjects first taught in English require less language focus and are more "context embedded" (material rich, more "hands-on," less text utilized). There is a need to have materials in the first language available for subjects like math, reading, social sciences, and sheltered materials in English for subjects like science, physical education, music, or art. Materials for ESL instruction are also needed. Finally, if students are able to transition smoothly to English, the program has been effective.

Program Effectiveness and Other Issues

A common assumption of TBE program planners is that children move together, as a group, from one

program year to the next and that the percentages of time noted above can be expected to work equally well for all of them. In fact, this is hardly the case. Families in the United States, particularly poor families, move often. This means that children who were in a TBE program 1 year may not be in the same program the following year because they have moved to another school, another city, or even a different state, where the rules and program models are different.

There is no definitive evidence regarding the effectiveness of TBE programs. Some studies have shown that long-term bilingual programs tend to be more effective than quick-exit transitional programs, although research is not conclusive due to questionable methodologies or faulty data analysis, complications of comparing very different instructional contexts (primary language, size of school, philosophy of school district, state or district regulations, etc.), different interpretations and applications of each type of program, and an unavoidable political tilt. Some studies say that there is no significant difference when students are involved in bilingual programs, which may be interpreted to mean that bilingual education is effective or at least it does no harm. Major studies include those conducted by David Ramírez, Virginia Collier and Wayne Thomas, and the U.S. Department of Education. In 1997, the National Research Council sponsored a major study of program results. They asked investigators to focus on the well-being of children, not on politics.

There are a number of controversial issues related to TBE programs. To date, these issues do not appear to have been totally resolved to everyone's satisfaction. The percentage of each language to be used remains an issue. Is 90% of instructional time in the minority language too much? The time students spend in TBE concerns some investigators. When using the primary language for instruction, is English learning delayed? Will students have difficulty transitioning? Are there cognitive setbacks when the student is not exposed to learning in English soon? Should there be a limit on how many years a student can be in a TBE program?

Teacher preparation is another concern. It is not always easy to find qualified teachers who need to meet these basic criteria: knowledge of bilingual teaching strategies, content knowledge, and dominance in the primary language of the students (and ideally in English as well). Sometimes students are placed in "bilingual" settings that are, in fact, not very bilingual. The teacher does not speak both languages, or the bilingual paraprofessional does most

of the instruction without benefit of formal training. Lack of quality materials seems to be another issue in terms of primary language, quality of content, inclusion of dialects used by the students, and aligning with curriculum expectations of the school or school district, and also regarding English materials, in terms of sheltered materials of high quality that may be used in subject teaching, and well-rounded ESL materials.

The composition of the student population in the classroom is another issue. If language minority students are isolated, they do not have language models in English and are essentially segregated. Efforts are made to cluster students in a 60% to 40% ratio, with majority language students being the greater percentage. This is not always possible due to the number of language minority students who speak a certain language; there may not be enough language minority students to fill 40% of the class(es), or there may be just enough bilingual students to create a certain number of full bilingual classrooms without including majority language students. Creating 60% to 40% ratios throws off the number of classes that are needed per grade level. Other factors include the desire of families to have their children participate, number of qualified teachers available, and availability of classrooms.

Some critics of TBE feel that the use of more than one language confuses students. They also question the use of public money to teach in the first language. Others question whether bilingual education, including TBE, goes against national interest, encouraging minorities not to learn English. More high-quality, rigorous research is needed in order to have more definite results regarding effectiveness under particular conditions.

Supporters of TBE have acknowledged that the issues of percentages and number of years in the program are important but state that the most important factor is the quality of experiences students have, in terms of teachers, materials, strategies, teacher-student ratios, facilities, parent involvement, and administrative support. The debate regarding bilingual education continues, and TBE continues to be the primary approach utilized to provide services to limited-English-proficient populations.

TRANSNATIONAL STUDENTS

Transnational students lead lives immersed in two different countries. These students are immigrants themselves or have one or two immigrant parents, and as a family, they remain connected to both their new country of settlement and their country of origin. Transnational students have experiences, perceptions, and social relationships that span two nations and may be quite different from those of the “traditional” immigrant. In fact, a number of transnational students may forego some of the normal life experiences of immigrants and live comfortably for years between two countries and two cultures. Some transnational students, however, do not differ markedly from immigrant students and may gradually adopt life patterns associated with being immigrants. This entry, however, highlights differences rather than similarities.

A Growing Phenomenon

The lifestyle known as *transnationalism* has grown rapidly due to (a) the globalization of the world economy, (b) new technologies that allow for ease of communication between families in faraway countries, and (c) transportation that is now more affordable and accessible to all levels of society. As more countries become linked economically, their citizens also create links. Thus, immigrants who settle in new parts of the world are able to maintain contact with citizens from their original country of origin. In the United States, this is now quite common with today's new wave of immigrants, who arrive primarily from Africa, Asia, India, and Latin America. Previous waves of immigrants to the United States did not experience the level of transnationalism that is exhibited today. While technology has made these communication and transportation systems more efficient, quick, and affordable, the infrastructure of many developing countries has also greatly improved over the last 20 years to support these systems. These developments may be regarded as the effects of globalization or as the process of globalization itself.

As globalization and capitalism spread to every corner of the world, more regions and their citizens are able to maintain their connections. Research by Linda Basch, Nina Glick Schiller, and Christina Szanton Blanc on transnationalism suggests that in an increasingly globalized world, many immigrants have the ability and desire to stay connected to their countries of origin via economic, political, religious, and/or a familial manner while still becoming members of a new country. The phenomena associated with this new freedom may also be stated negatively. For instance, new immigrants do not feel the need to abandon native languages and cultures to the same degree as previous waves of immigrants, who were forced to leave much of their cherished cultures behind as the price for obtaining the "American dream."

Some researchers, such as those below, argue that the households of transnational students tend to exhibit certain qualities. A study by Marjorie Orellana and her colleagues examined the role children have in decisions about migration in their transnational households and also reviewed child-rearing strategies of families from Central America, Korea, Mexico, and Yemen once they settle in the United States. According to Orellana, for transnational immigrant families "sending children back" to their country of origin works as a distinct discipline strategy when raising sons and daughters in the

United States. Some immigrant parents may also decide to send their children back to their home country to live with relatives because they find some urban areas of the United States too dangerous to raise children in, especially during the adolescent years. On the other hand, some families use return trips as rewards for good behavior and exceptional grades in school.

Orellana also maintains that recently immigrated families maintain close ties with primary and extended family members in the original country and these households tend to experience an exchange of money, goods, information, and support for each other. Items can flow in either direction, from the country of origin to a new place of settlement, or vice versa; the transnational network facilitates this movement. For example, a transnational student living in the United States and keeping ties to Pakistan may have attachments to film stars from both the United States and Pakistan because his or her family has close ties with the "old country" and has access to Pakistani movies they can rent from local Pakistani grocery stores. Research by Carmina Brittain explains that a transnational student originally from the Guangdong Province in southern China had extensive knowledge about schools in the United States before her entry into the country because of information she received by the way of transnational messages sent by cousins already living in the United States. Some transnational students' homes have a constant flux of family and fictive kin who live with them, because members from their communities of origin continue the pattern of "chain migration" to this country that was developed by previous cycles of immigrants.

Income levels and legal status are also important factors in determining how households and students participate in transnationalism. Some students may live lives of transnationalism because of the constant flow of items from their families' home countries to which they maintain a great emotional attachment; because these students either do not have the monetary or legal means to travel, they may actually never physically set foot in their community of origin again. In their research, Elizabeth Aranda and Diane Wolf define this experience as *emotional transnationalism*. Wolf's work discusses the impression Filipino American children have of their families' homeland and how they feel about it, although they do not have frequent or any contact with this country. According to Peggy Levitt and Glick Schiller, children who do not return to their parents' places of

origin are raised in homes where the value systems, people, and goods from those places are present in their everyday lives. Aranda's work on the Puerto Rican diaspora supports the position that life for Puerto Ricans in the United States and in their homeland—which is not an independent nation-state but feels like one to many *puertorriqueños*—are culturally very similar, and many transnationals from Puerto Rico believe there is no difference.

Different kinds of transnational household arrangements involve a range of diverse socioeconomic levels, from the elite to the working class. Aihwa Ong describes a group of elite ethnic Chinese families whose businessmen fathers, sometimes referred to as “astronauts,” work in Hong Kong and other parts of the Pacific Rim, while the mothers and children have relocated to the United States, for the purpose of securing greater educational opportunities for their children. Min Zhou studied “parachute kids” of primarily elite Asian backgrounds in Southern California, where the separation has been quite difficult and traumatic. Unlike the families studied by Ong, these children do not have day-to-day contact or care by even one parent. Instead, they are “dropped off” with relatives or are boarded with other families in order to get a high school education, thereby later enabling them access to the U.S. system of higher education. These families believe the knowledge and networks their children develop will eventually ensure the family's gain of permanent residency or citizenship in the United States. It is, however, not clear what the psychological effects of these arrangements may be to these youth and their families.

Carmina Brittain and Cecilia Menjívar looked at Asian and Latino working-class families in which one parent lived with some of his or her children in the United States, while the other parent remained in the home country with the rest of the children. Another configuration of transnational families includes both parents living in the United States with some of their children, while the other children remained in the home country. These researchers have found that many of these children experience many stressors over family separation and reunification in this type of household arrangement. Alec Gershberg, Anne Danenberg, and Patricia Sánchez report that many teachers who are aware of these family arrangements express concern over students' adaptation to parents they have not seen in a long time or to step-parents they have just met who suddenly become authority figures in the students' lives.

Need for Research

Though some teachers may recognize transnational students in their classrooms, schools in general do not acknowledge this lifestyle. There is, however, an exception in certain school districts, particularly those with large Mexican immigrant populations: These districts have adjusted their school calendars to accommodate the large exodus of transnational students each winter during the holiday break, because the annual pilgrimage depletes classrooms and affects attendance at many Southern California schools that would otherwise lose state funds for each student's absence. Although schools have begun to recognize transnational movement among their students and the numbers indicate that many children and youth in the United States potentially lead transnational lives, there is still an absence of literature on students who engage in this movement. The transnational practices of adult males in the public sphere, particularly those involving entrepreneurship, political participation, and community infrastructure projects have been reported by Luis Escala-Rabadán, Luis Guarnizo, Alejandro Portes, and others. Scholars have also recently studied Hometown Associations (HTAs), fund-raising organizations based in the United States and formed by members from the same community of origin who send money back to the community to improve schools, roads, churches, sewers, and energy systems, or other projects.

The private sphere, including the family and the socialization of children, has remained less of a focus by scholars who examine issues of transnationalism. However, such research could help us learn more about transnational children. In addition, more research would be helpful in examining the ways in which bilingualism and biculturalism are strengthened and reshaped within this context. Because transnational students are part of a critical mass of immigrants in the United States, it stands to reason that maintenance forms of bilingual education would serve the needs of these families much more than the transitional variety, with its emphasis on learning English and eventually abandoning the use of the home language in schools.

TROIKE, RUDOLPH C., JR. (1933–)

Rudolph C. Troike, Jr., is a long-time proponent of bilingual education and champion of the rights of language minority children. Trained in anthropology and linguistics, Professor Troike has inspired a generation through his scholarly writings in professional journal articles, presentations at professional meetings, and academic leadership.

Troike was born on January 11, 1933, in Brownsville, Texas. He attended elementary through high school there, graduating from Brownsville High School in 1950. He received a BA from the University of Texas in 1954, where he majored in anthropology and history. In 1957, he completed an MA degree at the University of Texas, majoring in anthropology and English. During this time, he had the opportunity to spend 2 years as a graduate student in Mexico City on the E. D. Farmer International Fellowship, at the Escuela Nacional de Antropología e Historia (National Anthropology and History School), where he studied anthropology and linguistics. He received a PhD degree in German linguistics and anthropology from the University of Texas in 1959.

Troike's academic career began with his appointment as an English as a Second Language (ESL) instructor in Ankara, Turkey, in a program organized by Georgetown University. His 3-year association with the program ended in 1962, when he was hired by the English Department at the University of Texas at Austin. By 1971, he had been promoted to professor of English and linguistics. His writings of this period place a major emphasis on indigenous languages (Tonkawa, Coahuilteco, Nahuatl, Uto-Aztecan) but also the beginnings of the application of linguistics to language teaching and eventually to bilingual education. Over the years, Troike has embraced both bilingual education and Amerindian language study with equal zeal and great success.

In 1972, Troike was named director of the Center for Applied Linguistics (CAL), located in Rosslyn, Virginia. Among other roles, CAL serves as a clearinghouse for languages, language resources, and applied linguistics. In its early days, the main thrust of CAL was in the area of teaching English internationally and the teaching of foreign languages in the United States. Under Troike's leadership and guidance, CAL underwent a change in priorities: Bilingual

education and minority language issues moved from the periphery to center stage. CAL recruited new staff to reflect the change, and individuals familiar with minority language issues were appointed to the board of trustees. CAL's national visibility and reputation gave increased credibility to a new pedagogical approach called bilingual education. It provided a national face to what had been separate and fragmented efforts to address issues of relevance to language minority students. It gave educators concerned with such issues a voice in the identification and implementation of solutions.

The 1974 reauthorization of the Bilingual Education Act of 1968 occurred during Troike's tenure as CAL's director. Under his direction, a group of leaders was called together to provide input for the new legislation by identifying needed changes and new initiatives. The resulting legislation made far-reaching changes to Title VII and, indirectly, to bilingual education. CAL is also credited with developing a set of guidelines for eligibility for bilingual education teacher training funds, a document that was subsequently used by many states in designing their own criteria for teacher certification in bilingual education. CAL also developed the design for the National Clearinghouse for Bilingual Education (currently known as the National Clearinghouse for English Language Acquisition and Language Instruction Educational Programs), and Troike served as deputy director from 1978 to 1980.

Troike was convinced that the key to gaining popular support for bilingual education lay in developing programs of high quality. He was instrumental in the dissemination of research evidence favorable to bilingual education in his own writing and through CAL's 1975 publication of a series of papers on the subject. The 1977 publication of *Bilingual Education: Current Perspectives* not only laid the groundwork for the 1978 reauthorization of Title VII but also provided an invaluable resource to institutions of higher education in areas such as the law, linguistics, and education.

Troike's efforts in bilingual education have not been limited to the Spanish speaking. While director of CAL, he also focused on Navajo, Chinese, and Vietnamese. Following his tenure at CAL, Troike became a professor of Educational Policy Studies, Anthropology, and Linguistics at the University of Illinois at Champaign-Urbana. In 1989, after 9 years at Illinois, he accepted a position as professor of English at the University of Arizona. He served as acting head of the English

department for 3 years and as head for another 3 years, and he currently serves as professor and director of the English language/linguistics program.

Troike's background, interests, and training have enabled him to write for a number of audiences, including policymakers, anthropologists, teachers, and researchers. His articles have appeared in such journals as *TESOL Quarterly*, *International Journal of American Linguistics*, *American Anthropologist*, *NABE Journal*, *Language Arts*, and *Educational Leadership*, as well as in a number of anthologies. Since returning to academe, he has supervised 19 dissertations.

TRUÁN, CARLOS (1935–)

Carlos Truán is a former Texas senator who wrote House Bill 103, which became the Texas Bilingual Education Act of 1969, one of the first state bilingual measures in the country. He was born in Kingsville, Texas, on June 9, 1935, during the Great Depression; his single mother raised him and his siblings. The family was among the earliest settlers of the community. With his mother's encouragement, Truán worked hard at attaining an education in a segregated environment. As a young man, he held various jobs to contribute to the support of the family and pay for his college education. In 1959, he graduated from Texas A&I (now Texas A&M) University with a bachelor's degree in business administration.

After graduating from college, Truán moved to Corpus Christi and started a career in the insurance

industry. There, he became active in the community, which led to an appointment on the Texas Advisory Committee to the U.S. Commission on Civil Rights. His participation in hearings about discrimination, employment, education, and unfair treatment of migrant farmworkers by the Texas Rangers attracted him to further human rights work and also led him to run for elected office as a Democrat.

First elected to the Texas House of Representative in 1968, Truán served four terms, including service as the chairman of the Committee on Human Resources. As a state representative, the legislation he became involved in included the Texas Child Care Licensing Act of 1975, the Texas Public Housing Authority Act (1969), the Texas Education Act (1973), and the Interstate Placement of Children Act (1975). In 1976, Truán was elected to the Texas Senate, where he served for 25 years and distinguished himself as a supporter of public and higher education, environmental protection, and mental health care issues.

Beginning with the 69th Legislature, Truán was elected and reelected to the post of Senate President pro tempore during the first, second, and third called sessions. The 74th Legislature saw him become the first Hispanic legislator to serve as Dean of the Texas Senate in 1995.

Carlos Truán has been identified by some as one of Texas's most influential supporters of public education. In his first year as a House member, Truán wrote House Bill 103, which became the Texas Bilingual Education Act of 1969. It was passed on May 22 of that year. However, before passing the bill, legislators also had to repeal the "English only" statute of 1918, which made it a misdemeanor for any teacher or administrator to use a language other than English in school or to use books not printed in English, except those used in high school foreign-language classes. Prior to the passage of this bill, Hispanics had an 80% school drop-out rate. Truán remembered being spanked on his first day of school by his elementary principal for speaking Spanish. Senator Truán's House Bill 103 began by acknowledging English as the primary language of instruction in school but went on to emphasize that "instruction in the earlier years which includes the use of language the child understands makes learning easier." The legislation allowed but did not require a school district to provide bilingual instruction through Grade 6. Texas Education Agency approval was required before a district could offer bilingual education in the secondary grades.

The State Board of Education was then able to revise the Statewide Design for Bilingual Education. Owing to Senator Truán's efforts, each bilingual program was required to (a) introduce the school environment using the child's first language, (b) develop the child's language skills in both the first language and English, (c) teach subject matter and concepts using both languages, and (d) help the child develop a positive self-image through an appreciation of his or her cultural heritage.

Senator Truán's efforts also resulted in the passage of Senate Bill 477, which was signed by the governor on June 12, 1981. The bill required bilingual instruction for English language learners in school districts throughout the elementary grades; bilingual education, English as a Second Language (ESL), or other transitional methods of language support in middle school; and ESL instruction at the high school level.

After serving for 34 years in the Texas Legislature, Senator Truán retired and joined the Texas A&M University System Health Science Center School of Rural Public Health as a special adviser to the dean. He also serves as an adjunct lecturer, continuing to serve as a major resource to students and faculty in public policy issues specific to Texas. The Natural Resources Center at Texas A&M University at Corpus Christi was renamed after Senator Truán. The center houses numerous scientific and research entities, including the university's Harte Research Institute for Gulf of Mexico Studies and the General Land Office.

TRUEBA, ENRIQUE (HENRY) (1931–2004)

Anthropologist, critical ethnographer, educator, and activist, Enrique (Henry) T. Trueba throughout his life instilled in his students cultural pride and a desire for public service. His contributions to the fields of educational anthropology and multicultural education highlight a career dedicated to serving people of color, racial and ethnic minority students, and immigrant populations. Speaking out against the political and educational inequalities governing their mistreatment, Trueba sought to empower people through his commitment to student intellectual growth.

Trueba was born in Mexico City in 1931. In his youth, he was educated in a Jesuit school, which marked the beginning of a spiritual path that would culminate in his ordination into the priesthood as an adult. This path would lead Trueba to work with the poor in Mayan communities. Researchers working in the same communities in Mexico introduced Trueba to anthropology, a field he would subsequently pursue in the United States. Leaving behind the priesthood and learning to function in a new language, Trueba embarked upon a new career of service to others using an anthropological lens. This led to a master's degree from Stanford University in 1966, and in 1970, under the guidance of George Peter Murdock, Trueba received his doctorate in anthropology from the University of Pittsburgh.

Through the Chicano anthropologist Steve Arvizu, Trueba discovered Chicano communities, schools, and

culture. He quickly envisioned a political bridge linking Mexican and Mexican American ideologies, dismissed Mexican pejorative stereotypes of Chicanos, and embraced the Chicano movement, or *movimiento*, which was then under way. These interests profoundly impacted the first decade of his career as an anthropologist and developed an enduring commitment to the academic improvement of poor and minority children.

During his stay at the University of Illinois, Urbana, as director for the doctoral program in bilingual education and of the Multicultural Materials Development Office, he edited his first books on bilingual education. Through them, he offered a compendium of his own work with students as the director of the bilingual education program. In subsequent essays, he reverted to his academic roots in anthropology, defining educational ethnography for bilingual educators as well as promoting the ethnographic study of bilingual classrooms.

In the early 1980s, Trueba returned to California as a professor and leading anthropologist, collaborating with George and Louise Spindler, cofounders of educational anthropology. It was also during Trueba's years at the University of California, Santa Barbara, that he met the Brazilian education theorist Paulo Freire and was influenced by his body of work on the pedagogy of oppressed peoples. In time, George Spindler and Freire would become Trueba's spiritual and intellectual leaders.

Spindler's view of education involved a process of socialization into a particular social group to achieve full participation within it. This approach greatly departed from Freire's view of education as political in nature. Spindler considered the acquisition of the society's cultural and social norms as essential for true belonging, while Freire viewed education as a political expression of power within a system, requiring critical political awareness (*conscientization*) of that system to translate oppression into justice. Trueba found a parallel between Freire's conscientization and Spindler's cultural reflectivity. Fully cognizant of their differences, Trueba arrived at an intersection where both theories must meet for transformation and belonging to occur. Knowledge of sociocultural norms alone does not give poor immigrant groups access to mainstream institutions, unless the groups understand the politics of participation within those mainstream institutions.

Toward the later stage of his academic trajectory, understanding the culture and politics of participation, Trueba obtained prominent administrative positions in

academia as dean of the School of Education at the University of Wisconsin, senior vice president of academic affairs at the University of Houston, the Rubén Hinojosa distinguished chair at the University of Texas, and member of the National Academy of Education. He was the recipient of many awards, including the George and Louise Spindler Award of the American Anthropological Association Council on Anthropology and Education. He served as chief editor of two journals, *Anthropology and Education Quarterly* and *Educational Researcher*, and senior editor of an education series, *Immigration and the Transitional Experience*. Close to the end of his career, Trueba continued to write and edit numerous books and to publish his work in journals. He was relentless in his mobilization of students to become critical thinkers and ethnographers and remained a staunch advocate of multicultural diversification in academia. In 2004, Trueba succumbed to cancer; he is survived by his wife and two grown children.

U

UNDERLYING LINGUISTIC PROFICIENCIES

In the 1980s, Canadian linguist James Cummins advanced the theory that persons who are learning a second language are not faced with a completely unmapped territory. They possess a common framework of language structures and functions that can be described as a common underlying proficiency drawn from their knowledge of one language to help them learn the second or additional language. The theory holds that there is an *interdependence* factor between languages: To the extent that instruction in the first or native language (L1) is effective in promoting proficiency in L1, transfer of this proficiency to another language (L2) will occur provided there is adequate exposure and motivation to learn L2.

On the basis of the interdependence hypothesis, the first and second languages have a *common underlying proficiency* (CUP), discussed in this entry. Although the surface features of any two languages (e.g., pronunciation, fluency) may be different, the underlying cognitive and academic proficiency skills are common across languages. Cummins represented this concept of bilingual proficiency as a “dual iceberg” in which CUP skills (e.g., semantic and functional meaning) underlie the surface-level language (e.g., pronunciation and vocabulary) differences of L1 and L2. The CUP principle implies that linguistic exposure and experience in two languages can promote the cognitive academic skills underlying both languages. Although the theory is difficult to prove, it provides excellent support to the advocacy for bilingual education, especially with

respect to the positive use of L1 to learn L2. Common underlying proficiency is also linked to the cognitive academic language proficiency (CALP) that Cummins believes should be the goal of high-quality bilingual education because this is the type of language that allows the transfer of academic skills (e.g., literacy development) from one language to another.

Bilingual or multilingual individuals who have meaningful exposure and experience with two languages in school or another environment develop CUP skills, which enable the development of cognitive and academic skills in both languages. With enough time and good instruction, the individuals’ two languages become interdependent and come to exist within one central processing system. The development of CUP skills assists with transferring of cognitive, academic and linguistic competencies from the native language (L1) to another language.

The *separate underlying proficiency* (SUP) premise suggests that no such relationship exists between the first and other languages and that languages work independently in the central processing system. Bilingual individuals would require two separate components for language processing. The SUP theory has mostly not been supported within bilingual education or bilingualism research.

Within the bilingual proficiency framework, Cummins posited a distinction between basic interpersonal communication skills (BICS) and cognitive academic language proficiency (CALP). Language proficiency used in everyday communication or informal settings is defined as BICS. CALP was conceptualized as language proficiency needed for decontextualized academic situations, or the language skills

needed in the classroom. The iceberg metaphor has been used to describe BICS (surface level) and CALP (deeper levels) in language proficiency. Cummins expanded the framework by explaining the range of contextual support and the degree of cognitive involvement required within a communication task along both of these continuums. Academic critiques notwithstanding, the connection between language proficiency of the CALP variety and academic achievement has been widely accepted by school personnel who work with culturally and linguistically diverse students in many different capacities.

A bilingual individual does not need to wait until a certain level of L1 proficiency is achieved to begin acquiring skills in the second language because of the central processing system. An important implication for bilingual education is that students with conceptual knowledge in their first language do not have to relearn the same concepts in a second language. Based on the CUP, the student would transfer the concept to the second language and only be required to learn the "label" in the second language for that concept.

Individuals acquiring a second language are said to develop BICS within 2 to 3 years, in which they may be able to produce single-word or short-phrase responses in social situations or informal settings (e.g., playground, grocery store, and cafeteria). CALP, on the other hand, has been determined to require 5 to 7 years of educational exposure for development. Individuals with CALP skills are able to analyze information, provide conclusions, and make inferences about academically challenging (decontextualized) material and tasks. School personnel are cautioned not to make instructional decisions based on a student's demonstrated conversational or surface-level language skills (BICS).

In the U.S. education system, culturally and linguistically diverse students are placed in classrooms that require understanding of cognitively demanding and context-reduced material or situations. For culturally and linguistically diverse (CLD) students in the United States, developing cognitive academic skills in their native language has been suggested as best practice for future educational attainment. The theory holds that the cognitive and academic underlying proficiencies developed will facilitate the transfer of skills to learning English. Research on bilingual education programs over the years has supported the concept of additive bilingualism and development of students' cognitive and academic proficiency in the native language as an effective way of

facilitating the acquisition of English skills and educational achievement.

Bilingual education programming for CLD students also plays a role in psycho-educational evaluations for special programs. The nature of bilingual language development and the amount of time needed to develop BICS and CALP have significant implications for the bilingual special education evaluation process. Students who enter bilingual education programs based on the home language survey (completed at initial school enrollment) and other data required by the state are monitored yearly on their language gains of English or English proficiency. Based on Cummins's theory school personnel need to use caution when interpreting evaluation results for reclassification of students for bilingual education or program exit because many of the tests used are measures of BICS rather than of CALP.

During the past 15 to 20 years, the number of standardized evaluation instruments developed for bilingual education and special education evaluations has increased. In particular, the Bilingual Verbal Ability Tests (BVAT) are the first evaluation instrument that represents an estimate of the common underlying proficiency theory proposed by Cummins. The BVAT, published in 1998, provides a standardized measure of bilingual verbal ability (BVA) that combines the verbal cognitive skills in L1 and L2 in the same instrument. Based on the bilingual proficiency framework (dual iceberg), which indicates that a common crosslingual proficiency underlies the surface manifestations of each language, the BVAT was designed to assess the combined linguistic and cognitive skills that the individual has acquired regardless of his or her educational exposure or environmental experiences. The BVA score can provide a better indicator of the student's abilities compared with tests administered only in English or the first language. The BVAT is one of the instruments within the Woodcock-Johnson and Woodcock-Muñoz family of tests for use with multilingual individuals. The test is available in English and more than 15 languages that are widely used in the United States.

UNDOCUMENTED STUDENTS' RIGHTS

On June 15, 1982, the U.S. Supreme Court ruled that states must admit undocumented elementary and secondary students to school on the same terms as citizens. The Court ruled in the case of *Plyler v. Doe*, striking down a Texas statute that had permitted school districts to exclude or charge tuition to undocumented students. Those practices were deemed unconstitutional under the Equal Protection clause of the Fourteenth Amendment. This entry describes undocumented students' rights to an education in the United States.

The following year, the Court distinguished resident undocumented students from those who reside in Mexico and cross the border only to attend school in a U.S. school district. Although the Court ruled in *Plyler* that school districts could not avoid educating undocumented students who live in their district by confounding residence with immigrant status, it did hold that a school district was only obligated to educate those who actually live in the district. Thus, legal residence in the United States and residence in the district are two distinct concepts that must be looked at differently by school officials. Residence in the district may be required, whereas legal residence in the country is not.

The Court reasoned as follows: "Today's undocumented residents are tomorrow's legal residents and citizens." Accordingly, it makes no sense to deny children an education that will help them become better citizens later in life. The Court also noted that

the situation carries with it mutual responsibilities. Schools have a responsibility to educate undocumented children, and students have a responsibility to attend and participate. The Court noted that undocumented children and youth should abide by mandatory attendance laws and stay in school until the legally required age in the state in which they reside.

There have been several unsuccessful challenges to *Plyler*. In 1994, California passed Proposition 187, which would have excluded undocumented students from school. It was immediately enjoined by both state and federal courts (see, e.g., *LULAC v. Wilson*) and was not appealed. In 1996, as part of a stream of federal anti-immigrant legislation, the Gallegly Amendment (named after its author, Representative Elton Gallegly) was introduced and would have been used to attempt to overturn *Plyler*. It was ultimately defeated and did not become part of the law. In Arizona, in a ballot initiative, voters passed Proposition 300 in 2006, which limited the rights of undocumented persons to a number of public services. Because the proposition was a state measure, it does not have the same force as *Plyler*, which was decided by the U.S. Supreme Court. Although Proposition 300 did not influence *Plyler* rights, it does affect the rights of adults to certain public services such as English language classes that are publicly supported.

In sum, since 1982, the right of undocumented elementary and secondary students who reside in the United States to free public schools has remained inviolate. This extends to the right to participate in federal and state categorical programs such as those under the Elementary and Secondary Education Act of 1965 and, later, the No Child Left Behind Act of 2001.

A recurring enforcement issue has been triggered by requests from some schools that children provide a Social Security number to be admitted. Such a requirement violates *Plyler*; although school districts may use a Social Security number as a student identification, they cannot condition admission on having a number. Most school districts assign an alternative ID number to those without a Social Security card (many citizen children also lack Social Security cards). In a related note, school districts that learn of the immigrant status of *Plyler* students must maintain the information as confidential. To do otherwise would constitute interference with the student's *Plyler* rights under the U.S. Constitution, as well as violate the Family Educational Rights and Privacy Act (FERPA). According to John Carrera (as cited in Samway &

McKeon), if the schools discover that a child is not in the country legally, they may not disclose that information to another government agency including Immigration and Customs Enforcement.

The reach of *Plyler* only extends to elementary and secondary school students. There have been ongoing efforts to extend in-state tuition benefits to resident postsecondary undocumented students. Although there was one short-lived state court order (*Leticia A. v. Regents*) in California holding that undocumented students should have the right to establish in-state residence, most efforts have been legislative. Federal laws passed in 1996 (8 U.S.C. 1621 and 8 U.S.C. 1623) allow states to grant in-state tuition to undocumented students and grant equal benefits to citizens. To date, 10 states, including California, Texas, and New Mexico, have availed themselves of the opportunity provided by federal law. There have been two challenges to state laws by the anti-immigrant group Federation for American Immigration Reform (FAIR). Neither has been successful, though each is on appeal.

Most of the state acts granting in-state tuition opportunities do not grant access to state financial aid. It is possible, however, as Texas has done, to grant state financial aid to undocumented university students, but it must be done affirmatively. Undocumented students are not eligible for federal grants or loans. Thus, these students generally have to look to private sources for assistance. During the past several years, some federal bills would fast-track undocumented students with college degrees to legalization. Such a provision is in the immigration bill expected to be considered by Congress in the future. Even if no omnibus immigration bill is passed by Congress in the near future, these so-called “Dream Acts” may be plausible in the future. They have had unlikely bipartisan support.

UNZ, RON (1961–)

Ronald Keeva Unz, a theoretical physicist by training, made his multimillion-dollar fortune with Wall Street Analytics, a software company he founded in 1988. In the 1990s, he set his sights on the political arena, resulting in a couple of failed attempts at political office. Unz is best known for his political attacks on bilingual education. He sponsored, and bankrolled, voter initiatives in several states that sought the dismantling of bilingual education programs, as discussed in this entry.

Unz was born September 20, 1961, in Los Angeles, California. He was raised by his grandmother and mother, whose family had emigrated from Russia in the 1920s and 1930s. He grew up in a low-income household that sometimes depended on the welfare system to make ends meet. Unz learned Hebrew by attending a synagogue with his grandmother, even though he did not identify himself as Jewish or practice religion. He attended public schools in the San Fernando Valley, a suburban area of Los Angeles, where he excelled as a student.

In 1983, Unz graduated from Harvard with a double major in theoretical physics and ancient history. He went on for graduate work at Cambridge University, where he studied theoretical physics with well-known professors, including the notable scientist Stephen Hawking. After being enrolled in the doctoral program at Stanford University for 2 years, Unz left without completing his degree. In 1987, he founded the software company Wall Street Analytics.

Unz entered the political scene in 1994, when he made an unsuccessful bid (with less than 35% of the vote) to be the Republican gubernatorial nominee in California's primary elections. He also entered, and subsequently dropped out of, the race for the U.S. Senate seat in California in 2000. Unz gained notoriety because of his staunch opposition to bilingual education. He has been accused of involving himself with initiatives against bilingual education to increase his name recognition for possible future political aspirations. In 1997, he founded an organization called English for the Children, which claims as its sole mission to "end bilingual education nationwide in the near future."

Between 1998 and 2002, Unz sponsored and financially backed four English for the Children initiatives seeking to dismantle bilingual education programs and to replace them with short-term Structured-English Immersion (SEI) programs. Unz has asserted that special language support is not necessary beyond one year of English as a Second Language (ESL) instruction; however, he has not presented research-based evidence that this belief can be confirmed empirically. Research has actually shown the opposite: that special language support for language learners should be offered for several years to ensure complete mastery of the language.

Lack of research evidence notwithstanding, the Unz-inspired initiatives succeeded in three of the four states where they were launched:

- In 1998, Proposition 227 in California passed with 61% of the vote.
- In 2000, Proposition 203 in Arizona passed with 63% of the vote.
- In 2002, Question 2 in Massachusetts passed with 70% of the vote.
- In 2002, Amendment 31 in Colorado failed, with 56% voting against the initiative.

In addition to contributing his own funds, Unz successfully raised millions of dollars to support his initiatives. Subsequent analyses showed that he won over many voters through a number of factors such as well-funded political and effective media campaigning, claims that bilingual education is a "colossal failure," ambiguous wording of initiatives, and selecting assimilated antibilingual education Latinos to serve as local chairpersons in each state.

Unz has been criticized for having anti-immigrant and anti-Latino attitudes or, at minimum, for appealing

to voters who harbor those feelings. The *Los Angeles Times* reported that in a 3½-page letter to collect funds for Proposition 227 in California, Latinos were the only ethnic group mentioned, and Spanish was the only language mentioned other than English. In Arizona, when questioned about the effect of his proposition on Native American languages, Unz replied that it was not his intention to limit the study of Native American languages by native peoples, although the Arizona initiative, Proposition 203, did not exclude Native Americans from the ban on bilingual education.

Because he had devoted so much of his time to the English for the Children campaign, Unz said he felt he had neglected his business interests and returned to those matters after the 2002 Massachusetts campaign. He has not run again for public office since.

URQUIDES, MARÍA (1908–1994)

María Legarra Urquides, whose career is discussed in this entry, played a pivotal role in the passage of the federal Bilingual Education Act in 1968. In 1965, Urquides organized an important survey of programs serving Mexican American students in the Southwest, cowrote the report of survey findings, and helped

convene a national symposium in Tucson, Arizona, to publicize the report. The report and symposium encouraged Congress to enact Title VII of the Elementary and Secondary Education Act.

Urquides was born on December 8, 1908, in Tucson, Arizona, to Hilario Urquides and Mariana Legarra. María was the youngest of eight children and the only one to make education a career. As a child, she attended segregated “Mexican only” schools, but always maintained that she did not feel overt discrimination, partly because of excellent and caring teachers throughout her school career. Her teachers encouraged her to work hard and attend college. After graduating from Tucson High School in 1926, Urquides attended Arizona State Teachers College (now Arizona State University). Completing college was an economic struggle for the young woman, if not an academic one. In 1928, she graduated with a teaching certificate as valedictorian of her class.

Urquides’s first teaching assignment was at Davis Elementary School, a segregated school in Tucson with a population of nearly 100% Latino and Yaqui students. At Davis, Urquides was remembered both as a strict disciplinarian and as a teacher who encouraged her students to be proud of their Mexican heritage.

In the early 1950s, Urquides began to study secondary school curriculum at the University of California, Berkeley. She later transferred to the University of Arizona and completed a master’s degree in education in 1956. She began teaching at Tucson’s newly constructed Pueblo High School the same year and taught English and reading to the school’s large Spanish-speaking population. By then, Urquides had been teaching for 40 years. At Pueblo, her own gradual political and ideological transformation fueled her growing advocacy on behalf of students. She worked tirelessly to make the school’s curriculum and teaching methodologies more responsive to students’ needs.

She was particularly troubled that Mexican students fluent in Spanish were nonetheless unable to read and write it. As a consequence, she began to work closely with Adalberto Guerrero, a Pueblo colleague who was attempting to create a Spanish honors class for Spanish-speaking students. The class became so popular and its students so successful that in 1965 the school received the National Education Association’s (NEA) Pace Maker School Award, as reported by Patricia Preciado Martin. Urquides strongly supported the Spanish for Spanish-speakers classes, and when

Pueblo received the award, she lobbied the NEA concerning the need to address other difficulties faced by Latino students. In a very real sense, this was an early program of bilingual instruction although it did not bear that designation at the time.

The NEA agreed to fund a study on constructive approaches to educating Mexican students and asked Urquides to direct it. The teachers who were surveyed saw Spanish and Mexican culture as assets rather than as deficits. They believed that the Spanish language could facilitate the acquisition of English and that there were many benefits to becoming bilingual and bicultural. Urquides became the chair of the study group, ultimately called the NEA Tucson Survey on the Teaching of Spanish to the Spanish Speaking.

The team members visited schools across the American Southwest and compiled a report concerning what they learned about the most inspiring and successful programs. *The Invisible Minority* report was issued in the summer of 1966, and in October of the same year, the group organized a symposium on bilingual education in Tucson. Urquides reported that the group had initially approached the University of Arizona about holding the symposium on campus, but officials denied that request because they did not regard bilingual education to be a significant issue. For this reason, the group selected a downtown hotel in Tucson as the venue for the symposium. Senator Ralph Yarborough of Texas was one of the elected officials present at the event; he was so inspired, he said, by what he learned at the symposium that he introduced the Bilingual Education Act in Congress in 1967 (Title VII of the Elementary and Secondary Education Act).

Urquides retired from the Tucson Unified School District (TUSD) in 1974. The recipient of numerous awards during her long career, she was honored by TUSD with an elementary school named after her the same year. In 1983, she received an honorary doctor of law degree from the University of Arizona, and in 1984, the rarely bestowed Arizona Medallion of Merit from Arizona State University (ASU). Previously, only four other individuals in the 100-year history of ASU had been so honored. In 1990, along with Adalberto Guerrero, Hank Oyama, and Rosita Cota, Urquides received the National Association for Bilingual Education Pioneer Award. She died in 1994, at the age of 86.

We acknowledge that parts of it could be disputed or given an alternative interpretation. In several instances, we found this approach helpful in more realistically portraying the history and current status of bilingual education in the United States.

When children arrive at school with a language other than the school language, immigrant or indigenous, education systems throughout the world respond by ignoring or subjugating that language, allowing a transitional phase from the home to the school language, or using both languages in school for a prescribed period. The United States, like most countries of the world, provides education for immigrant and indigenous bilingual children. It has also experimented with schools that turn monolingual English language children into bilinguals, but to a much lesser extent than does its neighbor, Canada.

Whereas bilingual education is nearly universal, North America generally has the most precisely defined methods and approaches, models, and systems of bilingual education. Canada has internationally exported the French-language immersion model, but from the United States, models such as mainstreaming (submersion), transitional bilingual education, and dual-language education (two-way immersion) have been publicized internationally. However, the United States has since the late 1990s received worldwide attention for its politicization of bilingual education and for moving to an increasingly subtractive, assimilationist form of education for immigrant children. In short, more than other societies, the United States has tended to view bilingualism and multilingualism as liabilities rather than as assets. What makes the United States internationally distinct in the early 21st century is its fierce political debates about bilingual education, and the official discouragement of the prolonged study of languages in schools, in a shrinking world that needs bilingual education more than ever.

In this entry, particular dimensions of bilingual education reveal the positioning of the United States within international conversations concerning this subject. These dimensions are neither independent nor comprehensive, but illustrate where the United States has separately influenced, provoked, and become estranged from international movements in bilingual education.

U.S. BILINGUAL EDUCATION VIEWED FROM ABROAD

Essay

Editor's Note: *The authors of this entry were invited to submit an article reflecting a mix of information and expert opinion.*

History of Bilingual Education

Within every country, bilingual education needs to be understood against the political, economic, and social

history of that region. In Canada, for example, one root of bilingual education in that country was initiated by the St. Lambert experiment that launched Canadian immersion education in the 1960s. In Wales, bilingual education is often traced to the first elementary bilingual school in Aberystwyth in 1939. In the United States, bilingual education is variously historically contextualized in terms of the fate of Native American languages, responses to European immigration in the 18th to 20th centuries, as an offshoot of the civil rights movement, and in response to the immigration of Cuban exiles following Fidel Castro's revolution in the 1960s. The historical contextualization of bilingual education in the United States is frequently framed by federal legislation from the 1965 Elementary and Secondary Education Act, and the role played by different administrations (e.g., Reagan, Clinton, Bush Senior and Junior) in the last part of the 20th century.

The tendency is for all countries to contextualize their forms of bilingual education solely within their own country's recent history. This is unfortunate because it fails to promote the understanding that bilingual education has a much longer international history. Bilingual education is not just the product of immigration, 20th-century politics, or experimentation in Canada with immersion or with dual-language education in the United States. E. Glyn Lewis reminds us that bilingual education has existed for many centuries, if not millennia, in most countries and continents. Bilingualism and bilingual education, multilingualism and multilingual education became a necessity, or at least desirable, wherever language groups came into contact. The ancient Greeks and Romans were not the first to need bilingual education. Primitive societies would also have needed their children to be inculcated into more than one language for the purposes of trade, peaceful coexistence, espionage, and marriage.

Bilingual education can be traced back to the time of Jesus and earlier. The biblical figures of Jesus' time would have been native speakers of Aramaic, and then, by some form of bilingual or multilingual education, learned Hebrew, Latin, and Greek. It could not have been otherwise because that part of the world was a crossroads for many visitors and conquerors. Bilingual education, far from being a recent invention, has a history that reveals its cultural, economic, social, and political value in bridging different language groups and societies. In most cases, except

when extraneous factors have muddled the context, language diversity has been about peace and harmony rather than about creating internal strife or external war. The historical record concerning the period in which Jesus lived reveals that part of the world was then highly multilingual and multiliterate. Other regions were probably similar in that regard because there were no nation-states and various sociopolitical and cultural bodies often had extensive contact with other cultures.

Experimentation With Models of Bilingual Education

Since the 1960s, the United States and Canada have experimented with well-defined bilingual education models (e.g., dual language, French immersion, transitional bilingual education). In contrast, in other parts of the world, developments in bilingual education have tended to be more ad hoc, piecemeal, and less well defined. For example, in the allocation of two or more languages in the classroom, many worldwide bilingual education implementations are not well thought out, rationally justified, or shown to be operationally successful. In Celtic countries, for example, a school can employ a mixture of immersion and heritage language approaches, contain an assortment of first- and second-language Irish/Gaelic/Welsh children, with teachers inadequately trained for any form of bilingual teaching methodology, and a dearth of research to ascertain the relative effectiveness of such schools or programs. (There are exceptions, such as the European Schools movement.)

The United States has predominantly given sharp precision to strategies and styles in bilingual education. For example, dual-language education has become a relatively well-defined form of bilingual education relative to the language mixture of students, the allocation of languages across the content curriculum, the balance of the two languages in a school, and the use of two languages in the school ethos.

In the 1970s and 1980s, the Canadian immersion evaluations were the most cited to support and extend bilingual education, particularly in Europe. In the past decade, these immersion evaluations have been reinforced by the large-scale research of Kathryn Lindholm-Leary, Wayne Thomas, and Virginia Collier. Internationally, the positive evaluations of dual-language education in the United States have become the most quoted, most important support for

varied forms of bilingual education, and increasingly widely cited as showing that bilingual education is a highly effective form of schooling, as Lindholm-Leary and Graciela Borsato report. Using large samples and rigorous research analyses, such U.S. evaluations have demonstrated that bilingual education can be as successful as, if not more successful than, monolingual education. Thus, the United States has gained a high international reputation for its bilingual education effectiveness research. Paradoxically, such research is more influential elsewhere in the world than in the United States where it was conducted. Indeed, U.S. bilingual education effectiveness research has been used to support and spread bilingual education across continents. Its effect on U.S. education has been comparatively small.

Dual-language education is not the only model of bilingual education for which the United States has international visibility. The United States is also internationally known for its experimentation with forms of education that are transitional (transitional bilingual education or TBE). Wherever there are immigrants in countries throughout the world, their languages tend to be treated in a transitional manner. The tendency is mostly for education systems to promote the national language at a high cost to the immigrants' heritage language and for education to act as a vehicle for linguistic, cultural, and ideological assimilation and social control. Whether it be late-exit or early-exit TBE, the United States stands out internationally as being the most experienced and expert in forms of TBE. For example, the U.S. research of David Ramírez, Sandra Yuen, and Dena Ramey stands out as the most thorough evaluation of TBE in the world.

The recent history of TBE in United States is a signal internationally that politicians and some sectors of the public prefer a faster track to political, cultural, and linguistic assimilation than is offered by transitional bilingual education. With increasing support in United States for mainstreaming English language learners (ELLs), the signal to other countries with older and newer immigrants is that less linguistically gentle forms of education than transition may secure the vote.

Exporting Dual-Language Schools

The specification of the balance between two languages in a dual-language school (e.g., students, content curriculum time, teachers, and ancillary staff) that is a valuable part of the U.S. dual-language literature

has spotlighted for foreign administrations some key language decisions that affect success. An example of exporting such a defined pedagogy is the use of the dual-language model in Peace schools in Macedonia and Israel, which can be contrasted with the origins of dual-language schools in the United States.

In the United States, dual-language education derives from the politics of the Cuban exile in the 1960s. Starting in 1963 in Dade County, Florida, Cuban exiles from Castro's regime wished to maintain their Spanish, believing they would soon return to a more peaceful Cuba. Thus, the origins of dual-language education are partly about politics, empowerment, and community building. Where dual-language education has been exported, so have similar political, empowering, and societal foundations. In Macedonia, as Dawn Tankersley reports, and in the South Pacific, as Heather Lotherington reports, bilingual education is often located within attempts to effect social, cultural, economic, or political change, for example, in working for peace and humanity amid hostilities, hunger, and hatred.

Two particular examples (Macedonia and Israel) link such dual-language schools with peace initiatives. Tankersley illustrates the role of such schools in aiding concord in her article pertinently entitled, "Bombs or Bilingual Programmes?" Situated within the recent Balkan ethnic conflict, she examines a Macedonian-Albanian dual-language program. This program demonstrated success in aiding community rebuilding after the war and helped the growth of cross-ethnic friendships. It helped develop students' respect for different languages and cultures, traditions and customs.

A similar dual-language (Arabic-Hebrew) program aimed at breaking down barriers of distrust and building concord is portrayed by Grace Feuerverger in a village in Israel (Neve Shalom/Wahat Al-Salam). Jews and Palestinians have attempted to live together harmoniously, maintaining mutual respect for the culture, identity, and languages of each group. Two dual-language schools aim to install among children a sense of cooperation, respect for diversity, and a willingness to coexist peacefully. Such dual-language education attempts to create bilingual Hebrew-Arabic bilinguals who are sensitive to each others' histories, religions, and lifestyles. Instruction in which Jewish children learn through Arabic and Palestinian children learn through Hebrew becomes a medium to increase mutual understanding and integration.

Zvi Bekerman's work, and publications in collaboration with Nader Shhadi, similarly portray initiatives

in Palestinian-Jewish dual-language education. Two schools in Jerusalem and the Upper Galilee aim at building cooperation based on equality and mutual respect. Such initiatives symbolize that bilingual education can include a vision that goes beyond language, and beyond a troubled past, to build peace and harmony in a troubled world.

This indicates that, within local traditions, political ideologies, and curriculum approaches, the concept of dual-language schools has been generalized from the United States. In turn, the purpose of securing peace and harmony in such foreign schools brings back a message to the United States. Bilingual education can help deliver a different political ideology than assimilation—that of mutual respect and cooperation between speakers of different languages, of living harmoniously and sympathetically between different ethnic and cultural groups—and a celebration of linguistic diversity in dual-language education can raise self-esteem, tolerance, and mutual respect among children.

Role of Research in Bilingual Education

Two countries stand out as preeminent in research on bilingual education: the United States and Canada. Following the establishment of immersion education in Canada in the mid-1960s, the volume and quality of research on immersion made Canada the world leader in providing the academic, evidence-based foundation for supporting bilingual education. Although immersion is still researched in Canada, the volume has decreased considerably.

In contrast, since the 1960s, research on different forms of bilingual education in the United States has been continuous and controversial. Various U.S. studies and meta-analyses have contrasted different forms of bilingual education, whereas other studies have engaged one particular model, as Colin Baker reports. The use of large samples, careful (but not highly controlled) experimental design, and rigorous statistical analysis has produced research of international value. Although such research is not easily generalizable across oceans and traditions, nevertheless, broad generalizations are frequently made about what forms and components of bilingual education are effective.

Despite the varied forms of bilingual education throughout the world, there is a paucity of research not conducted in the United States to demonstrate the relative effectiveness of different styles of bilingual

education. Other countries and continents have frequently failed to learn from the U.S. and Canadian experiences: If a program is evaluated as successful, this can be used for publicity and expansion. Although such research is not motivated by such publicity, at least overtly, the growth of the Canadian immersion and U.S. dual-language movements from the 1960s to the present seems partly explained by the publicity following effectiveness research. Such research provides support for bilingual education, but it is often contested or ignored.

Support for Bilingual Education

In the United States, the politics of assimilation tends to accent the English language, and the supposed cultural, economic, and identity disadvantages of bilingual education, as Ronald Schmidt reports. Many U.S. politicians and policymakers believe that bilingual education is not self-evidently valuable, desirable, or successful. Much of the U.S. populace needs convincing that bilingual education provides any kind of advantages. For those who support bilingual education in the United States, one issue is how to market bilingual education.

In Europe, one recent approach has been to market the advantages of bilingual education at the individual level. The reasoning behind this is partly that ideological and political arguments will always be present in debates on bilingual education and will always be powerful. At a societal level, when the discussion is about immigration, integration, and social and political cohesion, deep-seated political fears and values, xenophobia, and “linguaphobia” can become enshrouded in irrationality, emotion, prejudice, and distrust. In contrast, at an individual level, when discussing the social, educational, and career development of children and students, it is easily possible to portray bilingualism and multilingualism as strongly advantageous. To attempt to address the fears of politicians, the anxieties of parents, the skepticism of the press, bilingual education as containing advantages for the individual student seems increasingly regarded as the route to valuing and evolving bilingual education. Accenting communicative and cognitive factors, culture, curriculum, character and cash gained through bilingual education for individual children may help redress the current imbalance in the U.S. political critique of bilingual education.

Support for bilingual education tends to circle around eight interacting advantages of bilingual education that

are claimed for individual students, as Baker and Sylvia Prys Jones describe. First, bilingual education typically enables a student to attain higher levels of competency in both languages. This potentially enables children to engage in wider communication across generations, regions, and cultural groups. Second, bilingual education ideally develops a broader enculturation, a more sensitive view of different creeds and cultures. Bilingual education can deepen an engagement with the cultures associated with the languages, fostering a sympathetic and more tolerant understanding of differences. Third, “strong” forms of bilingual education frequently lead to biliteracy. Accessing literacy practices in two or more languages adds more functions to a language (e.g., using it in employment), widening the choice of literature for enjoyment, giving more opportunities for understanding different perspectives and viewpoints, and leading to a deeper understanding of history and heritage, traditions and territory, as Lucy Tse explains.

Fourth, research on dual-language schools, Canadian immersion education, and heritage language education suggests that classroom achievement is increased through content learning occurring via dual-language curriculum strategies, as James Cummins reports. Fifth, Baker reports that plentiful research suggests that children with two well-developed languages share various cognitive benefits, for example, in cultivating creative thinking. Sixth, children’s self-esteem may be raised in bilingual education for minority language students (as Cummins reports). The opposite occurs when a child’s home language is replaced by the majority language. Then, the child, the parents and relatives, and, not least, the child’s community may appear as inadequate and disparaged by the school system. In contrast, when the home language is used in school, children may feel themselves, their home, family, and community to be accepted, thus elevating their self-esteem.

Seventh, bilingual education can aid the establishment of a more secure identity at a local, regional, and national level. Welsh, Māori, or Native American Indian identities may be enhanced by the heritage language and culture being celebrated and honored in the classroom. Developing a Korean American, Bengali British or Greek Australian identity can be much aided by “strong” forms of bilingual education, and challenged or even negated by “weak” forms. Eighth, in some regions (e.g., Catalonia and Scandinavia), there are economic advantages for having experienced bilingual (or trilingual) education. Being bilingual can

be important for securing employment in many public services, particularly when a customer interface requires switching effortlessly between two or more languages. To secure a job as a teacher, to work in the mass media, to work in local government, and increasingly, in the civil service in locations such as Canada, Wales, and the Basque Country in Spain, bilingualism has become important. Thus, bilingual education is increasingly seen as delivering relatively more marketable employees than monolingual education does, as Nadine Dutcher explains.

To this list may be added the potential societal, ethnic group, or community benefits of bilingual education that Stephen May describes, such as continuity of heritage; cultural transmission; cultural vitality; empowered and informed citizenship; higher school and state achievement standards; social and economic inclusion; socialization, social relationships, and networking; and ethnic identity, group self-determination, and distinctiveness.

The previous list of individual advantages of bilingualism and bilingual education for individual students is mostly based on U.S. research; however, the dominant debate in United States is about society rather than individuals, about political ideology rather than personal empowerment, about governable and cohesive citizens rather than about maximizing talent and individual opportunity. Mainland Europe has increasingly emphasized the value of bilingualism and multilingualism for a united, economically strong, and politically powerful Europe and, therefore, an increasingly important role for bilingual and multilingual education. Africa, India, and much of Asia have traditionally regarded multilingualism and multilingual education as de facto normal and desirable. The United States is one of a small minority of countries where the communication, cultural, curriculum achievement, cognitive, character, and economic advantages of living bilingually and multilingually have yet to be recognized and where politics is currently more powerful than the persuasiveness of the individual advantages of bilingualism.

Political Involvement in Decisions About Bilingual Education

At the national level, research rarely has the last word, and politics is often more powerful than pedagogy. If evaluations of bilingual education demonstrate great success, the politics surrounding bilingual education can preach failure. Even if research fairly uniformly

reveals preferable models of bilingual education, the politics of bilingual education becomes the dominant voice. By criticism or spreading confusion, through ignoring or ignorance, by prejudice and presumption, the evidence of research is overcome by politics. Evidence-based policy making is seen as desirable only when it fits dominant political preference.

The United States has taught the world this lesson: Bilingual education cannot be understood without understanding the surrounding politics. Perspectives on bilingual education that are pedagogic, linguistic, sociolinguistic, or historic are all partial unless there is also political understanding.

Historically and symbolically, Proposition 227 in California possibly marks a new international era in the relationship between politics and bilingual education, as James Crawford explains. No longer can any country, scholar, or administrator be naive enough to believe that the *raison d'être* of bilingual education rests solely on educational, linguistic, economic, social, or cultural advantages at either an individual or a societal level. No longer can any person or organization that wants to support bilingual education believe that the justifications for bilingual education are self-evident, can be proclaimed from research, or are in any way permanent. Proposition 227 in California announced that, irrespective of the demographics of a region and even with democratic public ballots, political argument and xenophobia can win the day.

When Proposition 227 was passed on June 2, 1998, it was not just a message to California or even the United States. It was a proclamation to the world that bilingual education is surrounded by prickly politics, persuasive politicians, and powerful polemic. Since that day, as Susan Dicker points out, no one can argue for bilingual education without discussing the politics of assimilation of immigrants and language minorities, ethnic and linguistic integration, social and political cohesion, citizenship and social order, and sometimes cultural pluralism and linguistic diversity. Bilingual education is not just about becoming bilingual, biliterate, and bicultural, but about the political and national identity of individual children and the fate of language groups from which they derive.

Bilingual education at one level has been about conferring the following advantages: wider communication, broader enculturation, access to two or more literatures, deeper understanding of different traditions and histories, higher achievement through the richness of learning in two languages, and higher self-esteem

through the home or heritage language being recognized and valued in school. It also shares the cognitive advantages of bilingualism such as creativity and sensitivity to communication, empowered and informed citizenship, economic inclusion and employment, self-determination and distinctiveness. The United States in the past decade has taught the world that there is another dimension to bilingual education; namely, that dominant political ideology is stronger than any individual argument for bilingual education or even than the largest combination of arguments. In the United States, such political ideology places the English language at the forefront of debates.

English Use in the United States and at a Global Scale

An international perspective on U.S. bilingual education necessarily includes some reflection on the role of English in the United States and globally. On the surface, that education in the United States has moved so strongly toward English language competence reflects the global rise of English. English has become the international language. That U.S. education has placed increasing emphasis on all children being assessed in English may, in some small part, reflect the increasing dominance of English in the world. The decline of transitional bilingual education (TBE), and the rise in mainstreaming language minority children in the United States seems to mirror English as having become the global language.

Braj Kachru divides the international landscaping of the English language into three broad categories: the "inner circle countries" where English is the first language of the majority of the population (e.g., the United States); "outer circle countries," where English is spoken widely as a second language and enjoys official status (e.g., South Africa, India); and "expanding circle" countries (e.g., China) where English has no official status but is increasingly taught and used (in business, multinational communications). The world preeminence of English lies in that it is a first, second, and foreign language and is found across the globe in all three categories, as Viv Edwards reports. The preeminence of English also rests with the only world super power (the United States) having English as its unofficial national language, its predominant means of internal and international communication, and using English as one vehicle to attempt to obtain assimilation, national cohesion, and unity.

Through political domination, the subordination of vernacular languages, trade, colonization, emigration, education, religion, and the mass media, the English language has penetrated to the furthest reaches of the globe. Approximately 375 million people in the world speak English as a first language, as David Graddol reports, with the number of English second-language speakers estimated by David Crystal as 350 million. The numbers who have learned English as a foreign language varies widely, with estimates ranging from 100 million to 1,000 million depending on how much "learning" has occurred. In all, Crystal's middle-of-the-road estimate is 1,200 to 1,500 million English speakers in the world. In this context, the increased emphasis on English in U.S. education seems understandable.

The number of speakers of English is paralleled by the prestigious domains into which English has spread and often dominates, explains Janina Brutt-Griffler. The international prestige and popularity of U.S. English has given the English language associations of status, power, and wealth. Access to English means access to valued forms of knowledge, and to affluent and prestigious social and vocational positions. As a global language, U.S. English tends to dominate international communication, science, technology, medicine, computers, research, books, periodicals, transnational business, tourism, trade, shipping, aviation, advertising, diplomacy, international organizations, mass media, entertainment, news agencies, the Internet, politics, youth culture, and sports. In this context, stressing the importance of English in U.S. education is understandable. But the recent U.S. emphasis on English language dominance in education is more perplexing. It needs to be balanced against two different international contextualizations for English. First, there is the additive nature of bilingualism. One language is not learned at the cost to another. It is not English *or* German in Germany; Mandarin Chinese *or* English in China. Bilingual education in many countries emphasizes English plus: German and English as additive; Mandarin and English as more beneficial than owning one language; addition rather than subtraction.

Second, a critical perspective sees English as part of linguistic imperialism, as a vehicle to achieve world dominance by the United States, a means of reproducing structural, cultural, educational, and economic inequalities in the world, maintaining capitalist economic advantages and control, and oppressing weak societies and their peoples, as Robert Phillipson reports. Other languages are then portrayed as confining,

hegemonic, ethnocentric, divisive, alienating, and anti-nationalistic. Asserting the dominance of English can become a means by which power elites justify exclusion and sustain inequality. This skewed discourse prevents a true exchange of ideas.

In this more critical English language perspective, there are dangers of a country such as the United States advocating English as the only valued language of education. When English is identified internationally as transmitting U.S. values and traditions, as historically creating inequality and perpetuating disadvantage, as a means of dominance and division, then English-only education risks such attributes. Bilingual education in comparison may signal the value of different languages and diversity in international (foreign) cultures, religions, and traditions.

Conclusion

Although parts of the world have either a strong tradition of trilingualism (e.g., Africa, India, Scandinavia) or are moving from bilingualism to trilingualism (e.g., parts of Spain and Eastern Europe), the United States has moved away from bilingual education to more monolingual education. In its politicized move against bilingual education and toward English language monolingual education, the United States is somewhat atypical in an increasingly multilingual world.

History shows that languages are never static either in corpus or status. Several thousands of years of bilingualism and bilingual education show that what is current in the United States is temporary. Language shift is not easily predictable, nor is the future of bilingual education.

There are positive signs on the horizon. As world economics changes, so may the currency value of languages within that economy. As strategies for getting votes and gaining political victory in the United States changes, so may the climate for bilingual education. As the pendulum of peace and war swings again, so may the place of languages in a rapidly shrinking world. Where there are calls for peace and not war, and votes to be gained from internationalism rather than isolation, then bilingual education becomes a language for harmony in diversity.

U.S. CENSUS LANGUAGE DATA

The U.S. Census Bureau collects information on language use to help governmental agencies meet statutory obligations. For instance, under the Voting Rights Act of 1965, information on language use is needed by the Justice Department to ensure that voting materials are being made available in languages other than English where required. Today, Census Bureau language data constitute the primary and most important source of national language use statistics, as described in this entry.

Although inadequate and limited in describing language use in many ways, the sheer magnitude of the Census Bureau's language use collection efforts provide the most comprehensive data coverage. Beginning with 2005, the Census Bureau's new American Community Survey gathers information annually from about 3 million households covering the entire

geography of the United States. So although the Census Bureau does not collect key language data that would describe language more fully (e.g., the extent of speaking ability in the other language, for those who speak a language other than English at home; reading or writing ability in any language including English; and language spoken at work), Census Bureau data nonetheless provide an unmatched portrayal of national language use figures, including estimates for areas down to the block level.

Moreover, because other information is collected alongside the language use data, Census Bureau data typically allow for the cross tabulation of figures to provide a wide range of comparisons related to language use in the United States. For example, language use figures from the decennial censuses and the American Community Surveys can be cross tabulated by age, across different ancestry groups, or by some other variable of interest to researchers. Limited cross-tabulated figures are readily available through the American FactFinder function in the Census Bureau Web site (<http://www.census.gov>). Alternatively, researchers can select variables that are of interest to them and run their own analyses by using the American Community Survey's or decennial census's Public Use Microdata Sample (PUMS) The PUMS files contain individual records of responses to questionnaires representing a sample of the occupied and vacant housing units and the persons in the occupied units.

Insightful researchers can successfully approximate other measures of language and literacy by creative use of variables included in the PUMS files. For instance, researchers can use educational attainment figures along with variables on English-speaking ability and year of U.S. arrival for those foreign-born to approximate Spanish-English biliteracy rates. However, researchers must remain mindful of the limitations of Census Bureau data. Reviewing the exact format used by a Census Bureau collection instrument can offer insight into the possibilities and limitations of the data. Figure 1 shows how the 2000 census presented the language use questions in the census long-form questionnaire. From this figure, it can be deduced that bilingualism is roughly estimated because persons who are fluent in two or more languages are classified as English-only speakers if they only speak English at home. A construction site supervisor who speaks Spanish at work with his or her workers is classified as an English-only speaker if this person speaks only English at home. Further limiting

determinations on bilingualism, Figure 1 shows that it is not possible to determine how well a respondent speaks the "other" language, for those who speak a language other than English at home. Also, Figure 1 shows that the collection method does not allow persons to report speaking more than one "other" language. A person who does not speak English but speaks Spanish and another language runs the risk of being classified as a monolingual speaker.

11 a. Does this person speak a language other than English at home?

Yes

No → Skip to 12

b. What is this language?

| | | | | | | | | | | | | | | | | | | | | |

(For example: Korean, Italian, Spanish, Vietnamese)

c. How well does this person speak english?

Very well

Well

Not well

Not at all

12 Where was this person born?

In the United States — Print name of state.

| | | | | | | | | | | | | | | | | | | | | |

Outside the United States — Print name of foreign country, or Puerto Rico, Guam, etc.

Figure 1 Question 11 on Language Use From the 2000 Census Long-Form Questionnaire.

Source: U.S. Census Bureau, 2000.

Two final reasons why Census Bureau data constitute the primary source of language use figures are the historical availability of the data and the Census Bureau's innovations to remain current with advances in technology and statistical methods. Although the

language information collected has varied throughout the decades, enough consistency over certain periods allows approximations of important language use changes. Indeed, changes in the language use information that gets collected by the Census Bureau forms part of the historical record—such as early censuses' questions on “mother tongue” (the language spoken when the person was a child) and questions on the language used by foreign-born persons; questions on literacy, as was the case in the 19th and early 20th centuries; and current questions on oral English language proficiency.

The current language use format has been used since the 1980 decennial census. Although the current focus will remain the same throughout at least the early part of the 21st century, methods to collect information will drastically change. Since 1940, supplementary data, such as language use data, have been collected on a decennial long-form census questionnaire. But the need for a decennial long-form questionnaire has been eliminated with the advent of the American Community Survey. Beginning with the census in 2010, the decennial census will only use a short form to collect the following information: age, gender, Hispanic origin, race, relationship, and tenure. Instead of collecting supplementary information using a decennial long-form questionnaire, the Census Bureau's American Community Survey will collect the supplementary information annually, including language use data and will additionally make available for the first time a 5-year estimate of neighborhoods' changes over time. The American Community Survey marks the latest Census Bureau innovation to remain current with contemporary technology and statistical methods.

U.S. COMMISSION ON CIVIL RIGHTS REPORT

This entry reviews an important publication of the U.S. government that helped stimulate the dialogue and policy climate for bilingual education nationally. Published by the U.S. Commission on Civil Rights (USCCR) in 1975, *A Better Chance to Learn: Bilingual-Bicultural Education* was the first statement of a government agency to link bilingual education and civil rights. It was the first clearly pro-bilingual education message issued by a federal agency after enactment of Title VII of the Elementary and Secondary Education Act (ESEA) in 1968. The report by the USCCR systematically examines the elements of bilingual education as that concept was understood at the time and explains in an advocacy modality how bilingual-bicultural education increases educational and life opportunities for language minority students. The publication consists of three chapters. Chapter 1 reviews the educational conditions for language minorities before the 1970s. Chapter 2 discusses the advantages of bilingual-bicultural education over English as a Second Language (ESL) approaches from the perspectives of psychology, sociology, and anthropology. Chapter 3 describes the structures of bilingual-bicultural programs based on four existing successful models, and makes suggestions for program evaluation.

The publication of the report took place during a period of favorable support by the federal government for bilingual education, but it was soon followed by the first critical report on bilingual education. This critique, published by the Institute for Educational Leadership in 1977, was titled *Language, Ethnicity and the Schools*, authored by Noel Epstein. This juxtaposition of publications, one critical and one favorable, helped fuel the debate about bilingual education among Washington groups involved. Federal funding for bilingual education had increased dramatically since 1968, from zero funding to \$75 million annually, within 5 years of enactment. Many advocates took the position that Title VII of ESEA, in combination with

the U.S. Supreme Court ruling in *Lau v. Nichols*, were indications that the schools would be required to make deep changes with respect to the education of limited-English-proficient (LEP) students, the term in use at the time. Others feared that education policy would be changing too fast, and that the society was not prepared to support the deep changes that were on the horizon. Given this context, it is not surprising that the USCCR report would be given great weight by proponents of bilingual education.

Only 4 years earlier, in 1970, the Office for Civil Rights in the then-Department of Health, Education and Welfare, had issued its much-anticipated May 25th Memorandum, which was regarded as a precursor of the *Lau* decision. The combined message to school districts was clear and could not be ignored. The message was that the time had come to focus intently on the problem of language incompatibility between schools and students, and to close the attainment gap between English-speaking students and those who came to school speaking other languages.

When it was first enacted in 1968, Title VII of ESEA was meant to create demonstration and pilot projects that would eventually be funded from local and state resources. The USCCR report was very much in concert with federal efforts to broaden the goals and scope of bilingual education. It covers important themes that lent support to bilingual-education advocates. However, because of a lack of empirical data, and its “transitional” orientation, this historic document left many gaps in the knowledge base of the field.

The report begins with a historical picture of how unsatisfactorily U.S. public education had met the needs of language minority populations. Despite the influx of immigrants from Mexico, Central America, and Asian countries between 1920s and 1970s, instruction in U.S. public schools remained monolingual. Minority-language students’ inability to understand English instruction kept their drop-out rate high and achievement levels low and blocked their opportunities for social-economic betterment through education.

In Chapter 2, the report points out the perceived inadequacy of the ESL approach: The low English language ability students were attending regular classrooms, while learning English in pull-out or intensive ESL programs. The assumption was that students were not able to acquire content matter through reading and writing while they were still struggling with rudimentary English skills, such as listening and speaking. ESL might temporarily stunt students’

cognitive-area development and self-esteem, to a point that they might never be able to recover later. According to the report, the ESL approach has minimal advantages over English immersion programs, despite its promise of offering more systematic training in English learning.

The report endorses a form of bilingual-bicultural education with two basic components: subject area instruction in students’ native language and formal language instruction in both native language and English. Given the important relations between language and thought, students continue intellectual development through the mastery of vocabulary and grammar, and manipulation of complex concepts in their native language. Meanwhile, students are developing English proficiency until they are able to receive instruction in English. The report reiterated the belief of advocates that bilingual-bicultural education attends to minority-language students’ psychological well-being. It fosters students’ continuous cognitive development, and the formation of positive self-concept through successful learning experiences and interactions with teachers and peers that recognize their cultural and linguistic backgrounds.

Furthermore, the report argues from a sociological point of view that bilingual-bicultural education bridges the gap between students’ home and school experiences. All of these are elements that are still promoted by advocates of transitional bilingual education. With parents and community liaison persons invited to visit, teach in, and advise on the programs, the authors believed there would be minimal discrepancies between children’s socializing processes at home and school. Finally, the report maintains an anthropological view that cultural transmission across generations is fundamental to children’s healthy development among all social-cultural groups. By including a minority group’s traditions, values, cultures, and history in an otherwise “ethnocentric” curriculum and using minority-language teachers to reinforce children’s linguistic and cultural backgrounds, bilingual-bicultural education helps maintain cultural values that may otherwise be lost. Otherwise, the experiences with exclusion and discrimination may instill in a student resistant attitudes toward the dominant group, which is detrimental to his or her second-language learning.

Chapter 3 of the USCCR report describes the structure and design of four existing programs and proposes ways to appropriately assess their effectiveness.

It stresses the importance of developing appropriate evaluation instruments so that children's language proficiency and academic achievement are not distorted by instruments designed principally for English-monolingual students.

A Better Chance to Learn was one of the early attempts to explain the basics of bilingual education to a reluctant public. It appears, however, that many of the fears and criticisms of bilingual education at that point in history do not differ markedly from the fear of being overrun by non-English-speaking people in U.S. society, and the strong movement to promote English-only instruction in the schools. The popular view that learning two or more languages simultaneously would confuse the children is still heard, even in the face of strong research evidence to the contrary.

At the millennium, increasing pressures for ethnic assimilation and forging a monoglot national identity have contributed to outlawing bilingual education in several states. This is a policy reversal not envisaged in the USCCR report. Given the contrast between the insightful analysis of the linguistic, socioeconomic and cultural conditions in the mid-1980s and the contemporary emphasis on high-stakes testing in the No Child Left Behind age, it appears that little has been learned from history and the public schools have not changed to incorporate language minority populations. The arguments on the value of multiculturalism in the report lend powerful support to the call for bilingual education, but public policy has not kept pace and may be headed in the opposite direction.

The report's endorsement of bilingual education is limited in its essential substance. It defines bilingual education as the use of "the native language and culture as a basis for learning subjects until second-language skills have been developed sufficiently" (p. 3). This language suggests a transitional orientation even though its descriptions of existing programs are comprehensive. They include transitional and maintenance types as well. This blurring of terms suggests divergent thinking among the authors regarding the ideal goals of bilingual education: Should it promote English fluency and assimilation or bilingualism and multiculturalism? Critics of transitional bilingual programs are not uncommon even though such programs appear to promote the academic achievement of LEP students. An essential difference, however, is that such programs

depart from the spirit of multiculturalism that initiated bilingual education in the first place.

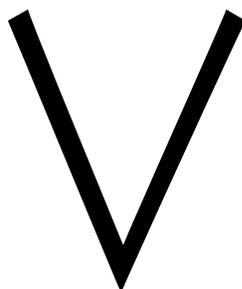

Colin Baker maintains that, when bilingual education programs that follow a submersion or transitional approach are used, the power differential between majorities and minorities is likely to be perpetuated. The dispute about these divergent goals of bilingual education remains. A wide range of program types is subsumed under the term *bilingual education*. They compete for legal support and funding: submersion, structured immersion, withdrawal classes, sheltered English immersion, dual-language/two-way immersion, and so on. Today, programs that have a clear assimilative function (e.g., shifting students to English quickly, raising students' performance on standardized tests, etc.) are more likely to receive societal and governmental support.

VALDÉS, GUADALUPE (1944–)

Inspired by the work of her sister Guillermina, a social psychologist and activist, Guadalupe Valdés discovered her passion for the people of the towns along the U.S.-Mexico border and their struggle for existence and equality. Valdés has striven to enlighten not only educators but also the general public through her research and work in the fields of bilingual education and the acquisition of English as a second language. Broadly, her work addresses the culturally diverse populations of the United States and their schooling.

Not since the immigration of the Irish to the United States in the mid-19th century has a population so impacted U.S. society as have Mexican immigrants and the people living along the U.S.-Mexico border. To better understand this population and its needs, Valdés has conducted research into how these families and population influence schools in the United States. James Banks, in his introduction to *Learning and Not Learning English*, authored by Valdés, points out that Valdés's childhood and her own acquisition of a second language helped her to share knowledge and offer suggestions for the education of immigrant students. As Banks states, Valdés has contributed to the social sciences in a significant way.

Valdés was born in El Paso, Texas. Her family home was in Juárez, Mexico, where she grew up. Her father was a doctor with a medical practice in Juárez. Her family has been in the field of medicine for several generations; they never immigrated to the United States. Guadalupe attended parochial school in the United States during the day, returned home to Mexico in the

afternoon, and was then tutored by master teachers in Mexico for two additional hours. She believes she experienced the best of both worlds and considers it a “geographical accident” that she has attained a high level of bilingualism and biliteracy in two national contexts. She is able to move easily between the two languages in both a personal and professional context.

As a teacher in kindergarten and middle school, Valdés began to hone her craft and accumulate valuable insights that would help her in her later quest for knowledge in the areas of language diversity and the education of bilingual students. Her studies in the Spanish language and in philosophy gave her knowledge not only of linguistics and the study of language but also the thought processes and belief systems that shape opinions and prejudices regarding social diversity. After teaching in the elementary and middle school setting, she moved on to the university level and taught in Florida, New Mexico, and California. She completed her undergraduate studies in 1968 at the University of West Florida. She later attended graduate school at Florida State University, where she was granted an MA in 1970, and completed a PhD degree in 1972. She is presently a professor at Stanford University.

Valdés's research is extensive and covers many components of bilingualism, including socioeconomic status and the home environment. Her works include not only research publications, but textbooks as well. In an effort to educate native speakers of Spanish in their own language, Dr. Valdés has coauthored two Spanish language textbooks. Her current work is in the area of what she deems “linguistic isolation,” including residential segregation of students. This project involves children who are paired with Stanford

undergraduates to examine language acquisition through storytelling and the development of language. She is also involved in the development of a young interpreters' and translators' group. Her most recent work, written in conjunction with Joshua A. Fishman, Rebecca Chávez, and William Pérez, is *Developing Minority Language Resources*.

Valdés perseveres in her efforts to improve social policies for second-language learners and to promote public awareness of the issues surrounding bilingual education. Throughout a career marked by tenacious scholarship, she has been a strong supporter of the rights of linguistically diverse populations around the world in their struggle against language-based discrimination.

VIETNAMESE IMMIGRATION

Vietnamese immigration began soon after the end of U.S. involvement in the Vietnam War in April 1975. There were four different waves of immigration from Vietnam, and each had distinct characteristics. Some of these groups could be considered refugees, while others could be considered immigrants. In general, *refugees* are defined as those who fled Vietnam owing to fear of political or religious persecution; *immigrants* were those wanting to leave Vietnam for better economic and life opportunities. Although the distinction between refugee and immigrant is important, it should be noted that the motivation to emigrate could involve more than a single factor, as explained by Nazli Kibria. She also mentions that the official labels given to these groups are not chosen by them, but rather imposed.

As mentioned, the first wave of Vietnamese immigration to the United States began in 1975. Approximately 125,000 refugees fled Vietnam because they had been affiliated either with the United States or with the South Vietnamese government and military. Immigrants from this period tended to be well educated, came from a middle-class background, and were residents from urban areas.

The second wave of Vietnamese immigration occurred between 1976 and the early 1980s. Owing to the outbreak of hostilities with China during this period, the Vietnamese government had an unofficial policy of allowing ethnic Chinese to leave Vietnam via boats in exchange for large sums of money. Many ethnic Chinese from Vietnam fled this way. Hence, this group of immigrants were also known as “Boat People.” Many immigrants from the second wave were business owners and merchants.

The third wave occurred in the mid-1980s and ended in the late 1980s. Policies such as the Amerasian Homecoming Act of 1987 allowed Amerasians and their families to immigrate to the United States. Amerasians were the children of American servicemen and Vietnamese women. This wave of immigration also included political prisoners from reeducation camps and their families. Many of the political prisoners were religious leaders, former government officials, and members of the military.

The fourth wave occurred in the late 1990s. Vietnamese immigrants who had become American citizens were able to sponsor family members to the United States. Currently, there is limited immigration by Vietnamese because they are no longer accepted under refugee status, but now must go through the usual immigration and naturalization procedures with the U.S. consulate in Vietnam. This process tends to be very long and expensive.

Vietnamese Resettlement

The number of Vietnamese people in the United States has grown tremendously. According to the U.S. Census of Population of 2000, the Vietnamese population increased by 99% since 1975, and there is currently a Vietnamese population of 1,418,334 in the United States. The majority has settled primarily in the West (694,860) and in the South (425,220), with smaller numbers in the Northeast (162,700) and Midwest (135,520). According to the 2005 American Community Survey conducted by the Bureau of the Census, these are the five states with the highest populations of Vietnamese:

1. California: 539,150
2. Texas: 159,107
3. Washington: 60,543
4. Florida: 55,555
5. Massachusetts: 48,583

According to the U.S. 2000 Census, the five U.S. metropolitan areas, consolidated metropolitan statistical area (CMSA) or primary metropolitan statistical area (PMSA), with the largest Vietnamese populations are as follows:

1. Los Angeles-Riverside-Orange County, California, CMSA: 233,573

2. San Francisco-Oakland-San Jose, California, CMSA: 146,613
3. Houston-Galveston-Brazoria, Texas, CMSA: 63,924
4. Dallas-Fort Worth, Texas, CMSA: 47,090
5. Washington, D.C. (Virginia-Maryland-West Virginia), PMSA: 43,709

In areas with large concentrations of Vietnamese, such as Orange County, California, it is not uncommon to find areas called “Little Saigon,” shopping centers with a plethora of businesses, restaurants, and signs in which the Vietnamese language is used. It is possible to carry out transactions entirely in Vietnamese in these establishments—anything from ordering food, going grocery shopping, and buying books, music, and videos to arranging transportation and sending money to Vietnam.

Mode of Incorporation

How are the Vietnamese adapting to life in the United States? America seems to have conflicted views of this community. On one hand, Vietnamese often tend to be labeled as “model minorities.” Ronald Takaki mentions several portrayals of Asian Americans in news segments on the *NBC Nightly News* or CBS’s *60 Minutes*, along with articles in magazines such as *Time* and *U.S. News & World Report*. These portrayals have highlighted Asian Americans’ success in school and ability to excel. Newspaper headlines often refer to “Asian whiz kids” who are good at math and science or valedictorians in their high schools. Nawn V. Chu stresses how the model minority stereotype now includes various Asian groups, including the Vietnamese, who are often held up as an example of the quintessential American immigrant success story. Reasons often cited for the Vietnamese success are their values of family, education, thrift, hard work ethic, and willingness to sacrifice. In contrast to the “model minority” stereotype, some Vietnamese have become a part of gangs in cities such as Chicago, Illinois, and Garden Grove, California. A statistic that is not well-known is that Vietnamese adolescents rank second-highest among racial/ethnic groups to be in correctional facilities: 210 youths per 100,000, as reported by Min Zhou and Carl Bankston. This figure is higher than for all other Asian groups.

Overall, the reception and mode of incorporation of the Vietnamese into American society has been

somewhat mixed. Because many of the first wave of Vietnamese to immigrate to the United States were classified as refugees, the government provided resources such as Medicaid, job employment programs, and food stamps to help them settle in the United States. However, Vietnamese have faced resentment in some communities because they are perceived as competition for scarce jobs and public resources and because to some, they are a painful reminder of U.S. involvement in an unpopular war.

Vietnamese Heritage Language Maintenance

According to the U.S. 2000 "Census Special Report on Asian Americans," prepared by Terrance Reeves and Claudette Bennett, approximately 7% of the Vietnamese Americans surveyed reported that only English was spoken at home, whereas 93% reported that a language other than English was spoken at home. Of the homes in which a language other than English was spoken, 30.6% reported speaking English "very well," and 62.4% reported speaking English "less than very well." While these statistics may paint a portrait of strong Vietnamese language maintenance, it is important to note that these percentages reflect overall language proficiency within a household that may include multiple generations. Older members of the family may speak less English and thus inflate the number speaking English "less than very well." It is also important to note that the quality of English spoken as revealed by the census questions says little or nothing about the quality of the heritage language spoken, especially by the young.

While various studies have examined Vietnamese socialization and adaptation to the United States and academic achievement, such as those conducted by Kibria, Bankston and Zhou, and Chuong Hoang Chung, limited research has been done that looks at Vietnamese heritage language maintenance. Two studies on the subject provide additional insight, beyond the reports of the Bureau of the Census, on the status of language use within and between generations of Vietnamese Americans. Russell Young and My Luong Tran surveyed over 100 Vietnamese parents regarding language use in their families and among their children. Of the parents surveyed, 84.6% reported that Vietnamese was the sole home language, and 15.4% reported that both Vietnamese and English were spoken in the home. Interestingly, although some members of these families came here

in the mid-1970s, none of the families reported speaking only English at home. Parents reported that approximately 33% of the children spoke both languages and 21.6% of the children spoke only English among themselves. Based on their study, Young and Tran conclude that there is a rapid rate of shift from Vietnamese to English in this population.

A key factor that researchers believe to significantly affect Vietnamese language maintenance and/or the shift to English is length of time residing in the United States. Young and Trang found that the longer a family lives in the United States, the greater the shift toward English use. This is in keeping with the language shift experienced by other immigrant groups. Another interesting trend from their study is that the longer families lived in the United States, the more the parents encourage the children to retain Vietnamese. A similar study conducted by Anne Nguyen, Fay Shin, and Stephen Krashen that surveyed over 500 Vietnamese elementary school students found that while 67% reported speaking Vietnamese well, only 23% reported being able to read and write in Vietnamese well, and 58% reported that they had little to no literacy skills in Vietnamese. Eighty-four percent reported speaking English very well. The students in this sample reported speaking Vietnamese with their parents, Vietnamese and English with their siblings, and primarily English with their friends. When asked about the students' attitudes toward Vietnamese, most felt it was important to speak, read, and write Vietnamese and to maintain their Vietnamese culture. They also stated that they would like to learn Vietnamese in school.

Overall, the literature regarding heritage language maintenance among immigrant groups reveals that there is a three-generation model of language shift at work. The first generation is dominant in the heritage language and slowly acquires the second language (English); the second generation speaks English in school and other public domains and speaks the heritage language at home with family members; and the third generation becomes dominant in English with little, if any, proficiency in the heritage language (as reported by scholars like Joshua A. Fishman and Calvin Veltman). This three-generation model appears to be generally true for Vietnamese immigrants and their children.

Vietnamese Heritage/Community Language Schools

Unlike the Korean and Chinese populations in the United States, the Vietnamese have not been as

organized in developing a national association for teaching Vietnamese as a heritage/community language. In the course of research by the author of this entry, a national association of Vietnamese language schools was not found, unlike the case of the Chinese, where two associations exist: the National Council of Associations of Chinese Language Schools, which teaches traditional Chinese characters, and the Chinese School Association in the United States, which teaches simplified Chinese characters. There is also one national association for Korean language teaching, the National Association of Korean Schools.

In areas where there are a large number of Vietnamese, some communities teach Vietnamese through a local community Vietnamese organization designed to promote the Vietnamese language and culture. Other places and organizations that teach Vietnamese are churches, colleges, and universities. A key difference between heritage/community language schools that teach Vietnamese and those of Korean, Chinese, and Japanese is the resistance of the Vietnamese American community to using any materials from Vietnam due to concerns that they may contain Communist propaganda. In contrast, many Korean language schools receive free textbooks from the Korean government in an effort to promote Korean language learning for Koreans abroad.

It is important to distinguish the complex historical background of the Vietnamese community to understand their status in the United States today as a unique ethnic and linguistic group. Under the umbrella term for "Asian communities," each subgroup has undergone different migration patterns and adaptation to life in the United States, patterns that should not be oversimplified or generalized.

VIEWS OF BILINGUAL EDUCATION

Assuming that state and federal policies concerning bilingual education are somewhat uniform in purpose and priority, what other viewpoints exist concerning

programs of bilingual education in the public schools today? The aim of this entry is to document existing ideological and pedagogical differences and views in the field of bilingual education. This analysis is the result of a series of interviews of high-ranking public school personnel and school board members. The sample included persons who are prominently involved in bilingual education, some who are involved only peripherally, and some who are not connected with any program but stated they were open to the concept. The objective was to document underlying concepts and ideologies in the professional sector. Differences concerning rationale, clientele, outcomes, and corresponding views of the role and use of home language provide useful insights to those who study the socio-cultural context of education policy in the United States. It is further assumed that the national conversation over the purposes of bilingual education is likely to continue.

This entry does not address the evolution of state or federal policy for bilingual education. That topic is examined elsewhere in this encyclopedia. The program categories presented are based on the author's synthesis of explanations given by interviewees regarding their own views of bilingual education, as these may differ from public policy.¹ At the very least, these are representative positions that serve to expose the embedded values and priorities of different sectors of U.S. society.

An additional point of explanation is needed to more accurately reflect the values and priorities extant among school people. The vast majority of people who are directly involved with bilingual education in the schools embrace the policies inherent in state and federal guidelines, which, directly or otherwise, flow from current policies in the U.S. Department of Education and in the units responsible for English language learning programs at the state departments of education. For purposes of this analysis, we do not consider it significant that this concordance exists. The reason is that schools and school districts obtain funding from state and federal agencies for only certain types of programs. It may be more important and certainly of interest given our purposes to understand the points of view of persons who are less directly involved or who are not involved at all, since they are not as likely to echo the policies of funding agencies at the state or federal level.

In juxtaposition to design patterns that have emerged from the policies of federal and state governments, a number of other perspectives have coexisted

within and outside the programs of bilingual education that have been supported or encouraged by these agencies. Advocates of bilingual education sometimes support these alternatives even though they themselves may be involved in the more common transitional programs. Some of these approaches, which embody discernible differences on one or more aspects of program elements, are summarized below.

Aesthetic/Enrichment/Pragmatic Approach

Programs of this type fall squarely within the traditional humanities or liberal arts approach to education. Its advocates believe that knowledge of more than one language is a sound educational goal for all students. Programs based on this philosophy are similar in structure to traditional foreign-language classes. The principal features of this program design are summarized as follows:

Orientation: To be well educated, individuals should have exposure to languages and cultures other than their own.

Goals: To prepare students to function professionally or vocationally in bilingual or non-English environments. To enrich education experience through the study of languages with the aim of helping students develop greater understanding of other peoples and cultures.

View of non-English home language: Languages are viewed as a valuable human and national resource. Not to maintain and improve the nation's languages is considered a waste of resources. Languages are seen as marketable resources with utilitarian value to the individual and to the nation.

Program participants: This view holds that bilingual education is good for all children, although in practice it is usually the more affluent parents who are the strongest proponents. Participation is open to all students. Little or no stress is placed on using non-English home languages to assist language minority children in a remedial or compensatory modality.

View of linguistic diversity: Multilingualism is seen as positive although, arguably, it is based on a somewhat elitist view of cosmopolitan values, such as international travel as a desirable aim among members of the upper classes. Usually, there is little concern among advocates of this approach for promoting or reducing cultural and linguistic pluralism. Pluralism tends to be viewed as normative and benign.

Duration or scope of bilingual instruction: Among advocates of this approach to bilingual education, opinions vary from the more traditional study of languages as school subjects, one period per day, to less common international and immersion approaches. Usually, there is little or no desire to limit the number of years of language study. Often, proponents suggest program duration sufficient to produce students who are biliterate and/or multilingual.

Civil Rights Orientation

Some advocates of bilingual education appear to view it within the broader framework of protected cultural diversity. Many believe it should be a right protected by official policy. This view is partially grounded on a broad interpretation of freedom of speech, a high valuing of cultural heritage, and the right to participate in one's ancestral culture, of which language is an integral part. This view of bilingual education as a cultural human right may be summarized as follows:

Orientation: Individuals should have the legally protected right to maintain family cultures and traditions, including language, and to seek help from social institutions in doing so.

Goal: The ultimate goal is to assert and maintain the right of individuals to use their home languages freely in and out of school. This may extend to the formal acceptance of some form of "official" bilingualism. An exemplar often cited is the case of official bilingualism in the province of Québec, Canada.

View of non-English home language: A mother tongue is a cherished entitlement, an inheritance that should be protected as a civil and human right.

Program participants: Under this conception, children who come from non-English-speaking backgrounds have highest priority in being afforded a bilingual education. Others could be included on a voluntary basis, depending on availability of resources. Some proponents would require bilingual schooling of all children living in areas having substantial numbers of residents who are from non-English backgrounds.

View of linguistic diversity: Multiple languages exist because different cultures exist; they are a societal reality that should be recognized and legally sanctioned.

Duration or scope of language instruction: Persons who embrace this philosophy tend to see little or no need to

limit participation. Opportunities to be educated bilingually throughout the public school experience should be made available to any family who wishes to have their children participate.

Psychological/Human Development Orientation

Some advocates of bilingual/bicultural education base their rationale for this type of instruction largely on the developmental needs of children. In this view, bilingual education is far more than a temporary linguistic adjustment. It should embody the human development concepts and principles that underlie multicultural education. Its advocates suggest that in much the same way that children move from the known to the unknown in subject or content areas, they should do the same in the acquisition of the national language and culture. Thus, considerable emphasis should be placed on learning the history and heritage of the child's own ethnolinguistic group and the many facets of the learner's native culture. Proponents of this emphasis in bilingual education claim that cultural differences may harbor incompatibilities between learners and their schools that cannot be resolved unless a bicultural approach is used. They believe these culture-based differences may create a need for a multicultural and "multicognitive" approach to instruction. This view of bilingual education stresses the need to develop and maintain a healthy concept of self and of one's group membership. In this view, the development of the affective domain is a prerequisite to effective functioning in cognitive areas.

Orientation: Strong base in psychological theory and based on expanded application of child development theory.

Goals: (a) To develop in the child healthy perceptions and feelings of self through positive reinforcement of home language and cultural heritage and (b) to assist minority children to succeed in school by providing a healthy climate of respect for home language and culture.

View of non-English home language: The child's home language is seen as a valuable tool for helping the learner adjust psychologically to his or her environment and succeed in school through the development of a healthier self-concept.

Program participation: Emphasis for participation is on people "of color" who, because they live in a hostile

society, are placed at a psychological disadvantage and cannot participate effectively in school. Under this view, there may be differences between various immigrants and other language groups with respect to the strength of their claims to bilingual education based on a history of discrimination.

View of linguistic diversity: Multilingualism is seen as a reality to which schooling must adjust itself not only linguistically but also sociologically, culturally, and psychologically. These dynamics are seen to occur within a broader context of a dominant society that is characterized as ethnocentric.

Scope and duration of language instruction: Bilingual schooling should continue throughout the public school years because the task of developing positive feelings of self-esteem and school efficacy continue throughout the schooling experience. Throughout childhood and adolescence, children are continually exposed to negative experiences that undermine their images of themselves and their ability to succeed in school.

Cultural Assertiveness Orientation

To some minority group activists, the maintenance of strong linguistic and cultural identification among racial/ethnic groups is a necessary strategy for political empowerment. They see a need to keep minority group children from being “swallowed up” by an amorphous “American culture” or way of life that weakens their commitment to their own groups. In the United States, advocates of this view are not political extremists who advocate separatism. They nonetheless perceive distinct social, economic, and political advantages for groups who are able to maintain a strong group identity. In their view, schools should reinforce all forms of ethnic identification in children rather than seeking to assimilate them into a mainline national culture. In this view, the development of peoplehood is paramount. Group identity and self-respect are tools for empowerment and survival in a monolithic or hostile cultural environment.

Goal: To recognize and utilize, with the support of the schools, the ethnolinguistic differences that exist in the society, as a way of enhancing the capability of these groups to participate effectively in the social, economic, and political processes of the country.

View of non-English home language: Home language differences are seen as assets that language minorities

should protect and maintain because they promote the collective strength and solidarity of one’s group within a culturally monolithic society.

Program participation: This view stresses the provision of opportunities for language maintenance among children of language minority groups, which typically have a lower social and economic standing in the society.

View of non-English home language: Linguistic identity and language loyalty are seen as essential tools for building a healthier and more respectful society. They are also tools for building political, social, and economic participation and representation of excluded minorities.

Duration and scope of language instruction: Most advocates of this model would not limit participation to any specific time. Some would establish parallel programs and even alternative institutions at all levels, including university studies.

Cultural Pluralism Orientation

This view of bilingual education is based on a valuing and promotion of linguistic diversity and multiculturalism. It differs from the cultural assertiveness idea, which emphasizes the benefits that accrue to the ethnolinguistic groups, in that the cultural pluralism view is based on a perception of societal advantages; that is, the greatest good for the greatest number. The position rejects the need for a single official language and would instead maintain a laissez-faire linguistic policy that is more democratic and has a greater potential for creating harmony in a pluralistic society.

Orientation: All cultures and languages are valuable. The concept of a cultural and linguistic “melting pot” society is rejected, to be replaced by that of a “fruit salad” that preserves group differences and cultural textures.

Goal: To create and maintain a linguistic and cultural democracy within the society, reduce the hegemony of English, and decrease the feelings of alienation and subservience of other language groups.

View of non-English home language: Language diversity is seen as a positive sociolinguistic reality that should be accepted because it can serve as a positive force for individual and group identities, security, and an easier and more comfortable adaptation by language minorities into the society.

Program participation: All children, but particularly those from non-English backgrounds, would be encouraged to participate.

View of linguistic diversity: The existence of different language groups is viewed as a positive phenomenon, a vital asset, and an aesthetic improvement over a monoglot and ethnocentric society.

Scope or duration of language instruction: The view is similar to that of the civil rights and cultural assertiveness schools of thought. Cultural pluralists are often political activists as well, although they usually limit themselves to modest levels of advocacy. In the latter case, they may be relatively passive in promoting a change that they regard as attractive but not urgent.

Pragmatic/Utilitarian/ Work-Related Orientation

This ideology is an extension of the cultural pluralism view, although it has a nationalistic tinge. Proponents of this view stress the need for U.S. citizens and workers to be prepared to interact in work situations (both domestically and internationally) with other language groups in the languages of those groups. The emphasis is clearly on utilitarian and instrumental uses of language for international and intercultural understanding, especially in business, commerce, politics, and the professions.

Orientation: Languages should be regarded as valuable and marketable skills. The ability to speak more than one language makes Americans more valuable to themselves and their country.

Goal: To prepare students to function professionally or vocationally in multilingual or non-English environments domestically and internationally.

View of non-English home language: Bilingualism, whether inherited or acquired, is an asset that improves an individual's marketability in work situations in which there is contact with other language groups.

Program participation: Proponents of this approach to bilingual education would not restrict participation to language minority students. An almost equal emphasis is usually given to participation by native English speakers.

View of linguistic diversity: The existence of multiple national and world languages is recognized as an enduring and challenging reality to which everyone must adjust by becoming bilingual.

Scope and duration of language instruction: No limits are generally specified. Participation continues until prescribed levels of fluency and literacy are reached.

Conclusion

This entry has summarized several alternative views or ideologies regarding bilingual education. The first is the traditional and transitional modality favored by most legislation, court actions, and government agencies in the United States. It should be noted that in practice, few programs of bilingual education adhere exclusively to one or another of the orientations listed above. Most programs follow an eclectic approach that encompasses more than one ideology. In many programs of bilingual teaching, the underlying emphasis that guides the elaboration of specific learning objectives, materials selection, and staffing patterns is not always apparent. As José Angel Cárdenas and his colleagues have noted, it is not uncommon for schools to embark on a bilingual education venture without a clear mission or purpose. At times, schools may apply the nomenclature of bilingual schooling to programs that use the home language infrequently, indifferently, or informally.

While they are interesting and telling, it is not necessary or helpful to attempt to analyze bilingual education programs with a view to determine what ideologies they favor. In different communities, different types of bilingual education may have wider acceptance and support. Similarly, the home language that is used varies and may influence the program's ideology. For that reason alone, a uniform national ideology may not be realistic. The tailoring of programs to fit local climates and needs will probably continue. It is probably wise for program architects and administrators to make explicit the goals and underlying ideologies of their programs and to make them known to the public. No program can long succeed unless everyone connected to it is clear about its motivations and foundations. Similarly, teacher training institutions should clarify the orientations(s) on which the learning experiences of future bilingual teachers will be based. The anxiety and ambivalence that develop in the absence of a clear philosophy can have detrimental effects on the morale and confidence of future teachers.

It should be noted that the ideological positions described above are simplifications that may not adequately account for everything that matters. There are

a great number of complex issues that are interrelated and interdependent. The perspectives that have been described cannot be easily separated from the dynamics and pressures of the cultural and political environment in which they operate. This is true from the local to the federal levels. Politics, personal convictions, group values, nationalistic idiosyncrasies, and other such phenomena will continue to play important roles in future policy as they have in the past.

Josué M. González

Editor's Notes: 1. It is possible that another researcher, upon hearing the same responses, would organize the composite scenarios differently, although the overall picture would be very similar. Consideration of the author's experience working in this field for more than 35 years may add to the validity and plausibility of his reconstruction of the interviewees' accounts.

VIEWS OF LANGUAGE DIFFERENCE

In a separate entry on views of bilingual education, we point out the range and variety of beliefs that exist concerning its purposes, designs, and conceptual

foundations. This range of opinions about the nature of bilingual education is rooted in equally diverse views of languages and what we choose to believe about them. These ideas determine the type of bilingual education schools select. Everything, including teaching materials, teacher preparation, testing programs, and instructional practices, is driven by cultural, political, and ideological assumptions. This occurs in most educational programs and is not unique to bilingual education, although the polemics in the latter are sometimes starker.

Richard Ruiz, in an article published in 1984, has explained how orientations and prejudgments are expressed in the specific case of bilingual education. He has identified three distinct "orientations" that shape program designs, especially with respect to the role of the home language: language as resource, language as problem, and language as right. Whether we regard the various perspectives as assumptions, hidden biases, or philosophies of education, his explanation is useful. According to Ruiz, orientations influence what schools choose to do with and about the child's home language in the context of bilingual schooling. He argues that the three starting points for language planning are not always present at the conscious level. But they may be embedded in the subconscious assumptions of planners and policymakers. Orientations in the manner used by Ruiz are similar to what other authors refer to as "dispositions" or "ideologies." They are, according to him, pre-rational in that they do not stem from rational thought or the findings of researchers.

It is not uncommon for policymakers, whether for a country or a school, to make decisions that are not based on research evidence. Legislators and other policymakers are just as likely to respond from the base of their own ideas of what is best or most appropriate for a given situation at a particular moment in time. In short, we make decisions or embrace policies based on what we think the world is like; on values and beliefs inherited from others or widely shared with peers; or absent a precedent, what seems, intuitively, to make sense. The adoption of policies for bilingual education and other curricular areas follows a similar pattern. Ruiz's conception of orientations or language ideologies is useful in understanding important differences that creep into program designs, sometimes consciously and sometimes otherwise.

Following is a summary of the three orientations proposed by Ruiz.

Language as Problem

When school people discuss the problems of schools among friends and family, it is not uncommon to hear concerns about a number of things lumped under the category of *diversity*. Among these problems are the presence of several languages in the community, along with gangs, violence, drugs, and dysfunctional families. The view that language differences are problems of the same type and magnitude as other problems in school and community is all too common among school personnel. Once language is assumed to be part of the problem matrix of certain communities, in this view there is little reason to doubt that the best plan for these schools is one that seeks to remediate, diminish, or eliminate the problems, and sometimes those who enact them, from the school environment.

In the context of bilingual schooling, such sentiments often lead to an emphasis on English mastery as the preferred goal, while devaluing the goal of maintaining community languages. Knowing the role of orientation in language planning, we may wonder why *language as problem* is so often the salient orientation among education policymakers. It appears that language issues become closely linked to the larger problem set associated with a group of people who speak a given language. In time, there is little distinction made between language difference and the problems of poverty, low educational achievement, and limited social mobility. It is not only the language difference that is regarded as a problem but also the people who speak that language. This snowball effect turns the negative view of language into a more generalized negativity that breeds low expectations for success by members of that group. The effects of language as problem are powerful. They can result in a decision to cast aside community languages, completely replacing them with English or with more prestigious varieties of the language(s) in question.

Much of the legal framework that supports bilingual education today exists within the language-as-problem perspective. Authors like Betsy Levin and Bernard McFadden have explored some of the legal issues in bilingual education and language planning. Their discussions highlight the mind-sets behind the decisions. These authors claim that several important court cases regard community languages other than English as problems. In the case of *Guadalupe Organization, Inc. v. Tempe Elementary School District*, decided in 1978, the Ninth Court of Appeals

decided against the plaintiffs, who had argued that they had a right to bilingual education as a means of preserving and maintaining their community languages, Spanish and Yaqui. The court ruled that the district's program was adequate for the critical purpose of teaching English, the principal concern of the court. It sidestepped the issue of the school's responsibility to preserve the language rights of the Hispanic and Yaqui plaintiffs. The view of the court was that children's home language is a problem when they start school speaking a language other than English. Denial of the opportunity for communities to have their languages used in school comes from a belief that community languages have little value to English language learners in U.S. schools.

McFadden reaches the conclusion that language exclusion is part of a pattern of historical discrimination that appears to be benign, but victimizes speakers of community languages, in this case Spanish and Yaqui, a Native American language. Curiously, McFadden's own language-as-problem orientation peppers his own lexicon. He uses terms such as *deficiency*, *remediate*, and *remedial language program*, all of which suggest a need to change the language used in these communities. In an award-winning book titled *Learning to Divide the World*, John Willinsky suggests that even terms that appear neutral, such as *native speaker*, are biased in that they privilege one form of the language over others.

Language as Right

Language as right is a reaction to practices that emerge from a language-as-problem position. Building community support for bilingual education is often the motivation for asserting a right to use a particular language in schools. Advocates for this view challenge the assimilationist goal implicit in the language-as-problem ideology. When communities adopt the language-as-right position, they make a statement that rejects the notion that they are somehow made better by giving up the use of their language of origin. Language as right is a policy preference that puts policy planners on notice about other alternatives they may wish to consider. Language as right is different from the other two language orientations in this way. While language as right rarely translates into program design in the United States, it is a form of protest by language minority communities against unilateral policy making on language matters. It is a statement that

such policies should be participatory rather than being handed down without consultation with the people who speak the languages in question. Advocates of language diversity argue, for example, that in a democracy like the United States, linguistic democracy—the right to use one’s home language in school—should be recognized and publicly supported.

Internationally, the language-as-right concept is protected by the UN’s “Universal Declaration of Human Rights.” It was adopted by the General Assembly in 1948 but was never signed by the United States. Article 2 in the declaration states that all persons are entitled to all rights and freedoms without distinction based on race, color, or language, among other characteristics. The “Declaration on the Rights of Persons Belonging to National or Ethnic, Religious, and Linguistic Minorities,” adopted in 1992, provides further elaboration on the rights for minority groups to use their home language(s) without any restriction in public and private settings. The Convention on the Rights of the Child, adopted in 1990, also states that the education of children should develop respect for the child’s home language and values and that in their communities, children should not be denied the right to participate in cultural and religious practices and in the use of their language(s). Within the United States, Native American communities have been the strongest advocates of this position.

From the point of view of language planning, a language-as-right orientation is problematic because U.S. courts offer little or no standing to those who wish to preserve their languages by having the schools teach those languages to children in public schools. Language as right can therefore be exercised only in limited settings, such as tribal schools on reservations, private schools, or charter schools in those states that permit them. Because there are few government provisions at any level to safeguard ancestral languages, language as right tends to put the onus of language protection on the community language speakers themselves.

It should be noted that in limited ways, language rights have been protected in the courts but only in certain key sociopolitical arenas (e.g., the Voting Rights Act) and by requiring interpreters in some courts. Importantly, these rights exist only when other legal rights are threatened, such as the right to vote or the right to a fair trial. Accommodating non-English speakers in these situations is an effort to establish a level playing field, not necessarily establishing general rights to the use of languages other than English. In this view, it is necessary to show that without bilingual

services, the protection of civil rights is diminished. Non-English-speaking plaintiffs must premise language discrimination claims on the preservation of established rights, not on demands for sanctioned bilingualism. In bilingual education, no other rulings guaranteeing the right to use other languages in schools have been issued in the more recent past. (But see *Meyer v. Nebraska*, 1923, and *Farrington v. Tokushige*, 1927, older rulings of the U.S. Supreme Court that are not well-known today.) Finally, while it may be of limited applicability in a legal context, it should be noted that a language-as-right orientation remains open as a social or cultural issue. These are arenas where it may eventually play out, rather than in the courts.

Language as Resource

A closer look at the idea of *language as resource* has promise for alleviating some of the conflicts emerging out of the other two orientations. It can have an impact on enhancing the language status of subordinate languages, and it can help to ease tensions between majority and minority communities. Ruiz explains that it can serve as a more consistent way of dealing with non-English languages in United States society; and it underscores the importance of cooperative language planning.

This orientation avoids the harsh restrictionism of language as a problem and the polemics of language as a right. It does not seek to replace the home languages of students at all costs and without regard for family preferences. If the bilingual education plan is additive, rather than subtractive, and it allows students access to the core curriculum in the home or community language and promotes proficiency in the learner’s first-acquired language along with English, the plan and practices derive from a language-as-resource orientation. Oddly, while this orientation is not common in many programs, the philosophy it represents is highly compatible with the reasons why American families urge their children to study a foreign language. It is also compatible with the language-as-liberal-studies perspective, which has characterized the study of languages in the United States for most of its history.

Conclusion

The idea that pre-rational assumptions of language exist and that they are influential is well accepted among practitioners today. Some programs are quite transparent in this regard. If the primary concern of

the community is to enable language minority children to learn English and use the native language only insofar as it enables them to reach that goal, then transitional bilingual programs are selected. If there is value placed on bilingual proficiencies and a desire to develop the capability of students to become international citizens by becoming biliterate, then maintenance, enrichment, or developmental bilingual education will be favored. If schools and policymakers regard language—all languages—as assets or resources that are vital to intergroup harmony, language-as-asset ideologies are likely to be favored.

It is apparent in reviewing the modern history of bilingual education in the United States that “language as problem” is the most common view in the polity. Historically and with few exceptions, educators tend to regard children who are competent in a language other than English as children with a deficiency when that language was learned at home. There is little question that this outlook is more political than educational in origin and that this orientation leads to programs that are designed to remediate a problem rather than nurture a resource. The German-speaking bilingual schools of yesteryear were early models for language preservation. Similarly, the early bilingual education programs in Dade County, which served primarily Cuban refugee families waiting to return home, were good examples of language preservation goals in the late 20th century. Today, the most interesting thrust is for so-called dual-language and two-way programs, provided they can avoid a remedial compensatory bias.

VOTER INITIATIVES IN EDUCATION

Bilingual education policy is governed chiefly at the state level through the legislative and regulatory processes of state government. In the late 1990s and early 2000s, a highly orchestrated effort was made to eliminate bilingual education through the use of voter initiatives as an alternative mechanism to legislation. The initiative process consists of citizens collecting signatures on petitions to place questions, statutes, or constitutional amendments on the ballot for citizens to adopt or reject. Voters vote for or against the proposition. Although voter initiative processes vary somewhat from state to state, it is generally the case that these measures become law once they have been approved by voters. This entry discusses the history of the initiative process; its historical use in the U.S. representative democracy; its use in shaping public policy; and its implications, to date, for bilingual education.

Voter Initiatives in History

The initiative process has its roots in Ancient Rome and Greece. Citizen lawmaking began about 449 BC in ancient Rome and lasted for approximately 400 years, to the death of Julius Caesar in 44 BC. The ancient Greeks made the most extensive use of what is sometimes referred to as “direct democracy” during the period 600 BC to 400 BC. Today, representative

democracy is more common and better understood than direct democracy. In the Athenian model, people did not elect representatives to vote on their behalf, but voted on legislation directly. Participation was not open to all, especially to slaves or other subjugated groups.

Perhaps the strongest example of the initiative process in modern history is Switzerland. Citizen law-making began in Swiss towns in the 13th century. In the Swiss model, “double majorities” are required on constitutional matters: Both the majority of people and the majority of states, *cantons* in the case of Switzerland, must approve an initiative. At the local level, a simple majority of the voters is sufficient. The Swiss copied the double-majority concept from the U.S. Congress, in which House votes were to represent the people and Senate votes were to represent the states. Today, this is a distinction that is not always adhered to faithfully because of the increased reliance on partisan, party-line voting. Alexander Trechsel has noted that observers tend to view the Swiss political system as an oddity, although it may become an important element in the European Union integration.

Voter Initiative Usage in the United States

The voter initiative process has existed in some form in the United States since the 1600s, when citizens in New England placed ordinances and other concerns on agendas for discussion and voting in town meetings. Many of the framers of the U.S. Constitution, however, were opposed to direct democracy because of the danger they saw in majorities forcing their will on minorities. They advocated for a representative democracy in the form of a constitutional republic and elected representation to make and amend laws. Richard Ellis adds that supermajority requirements, such as requiring two-thirds majority or including a bicameral legislature in the political system, not only protects the minority from the majority but also saves the majority from itself. It also requires that open discussion and airing of differences take place, followed by negotiation of any remaining differences between the two houses. The voter initiative process, on the other hand, can be implemented quietly and without a healthy airing of relevant issues. According to David Broder, who has studied the topic in depth, the voter initiative process has evolved into a tool for “derailing democracy” because well-financed efforts to enact initiatives can be used by careless majorities to trample the rights of minorities.

Despite the framers’ intentions at the beginning of the Republic, voter initiative processes have not been used consistently in the United States throughout its history. In the 1890s and early 1900s, there was an increase in the use of voter initiatives by the Populists and Progressives, who imported the process from Switzerland. Voter initiatives were established out of the people’s dissatisfaction with government and its inability to address the political issues of the time. It was a way to correct situations in which the people were denied access to the mechanisms of government.

Populists and Progressives were outraged that special interest groups controlled government and the general public lacked the ability to break this control. They felt that direct voter participation through the use of the initiative process would solve this problem. By 1918, 24 states and many cities had adopted the initiative process. Most of these states were in the West, where the process fit with the belief that the people should rule the elected and not allow the elected to rule the people. Those in power in the East and the South were generally opposed to the expansion of the initiative for fear that African Americans and immigrants would use the process to effect change inconsistent with prevailing values and practices. The Populist and Progressive phase of initiative development waned with the advent of World War I, which diverted people’s attention to an outside threat in the form of German militarism. This fear gave rise to flag-waving expressions of patriotism, and Americans began to look at problems abroad along with internal or domestic issues. The result was a shift away from combating internal inequities and lack of access to ensuring that everyone appreciated the international threat posed by Germany’s militarism.

In 1959, the initiative issue reemerged when Alaska was admitted to the Union with a voter initiative provision in its founding constitution. A new battle was also being waged during this period: to keep the initiative from being taken away from states where it already existed. Today, the voter initiative process is an important mechanism for shaping and influencing public policy, especially at the municipal level. According to the Initiative and Referendum Institute, thousands of American cities have some form of voter initiative participation. Supporters of initiatives argue that it is a form of equal opportunity process. Since its inception, it has influenced a number of statewide reforms related to the right of women to vote, how politicians are elected, the funding of abortions, and campaign finance, among others. As an expression of

citizen anger at federal policies that have not stopped illegal immigration, the initiative process has been used in some states and communities to limit benefits to immigrants and to punish those who hire or do business with them. Some of these attempts have been ruled unconstitutional.

The current phase in the use of the initiative process began in 1978 in California with the passage of Proposition 13, aimed at cutting property taxes. After the California initiative, similar measures were adopted through initiatives in Michigan and Massachusetts. Professional influence shapers, ward heelers, and others who were accustomed to delivering the vote in state houses were forced to take stock of the initiative process as a way of doing political business in the states. Since Proposition 13, use of the initiative process has escalated. Some of the most prolific years with respect to the use of the voter initiative process since 1978 have been 1981 to 1990 (271 initiatives) and 1991 to 2000 (389 initiatives), as reported by the Initiative and Referendum Institute. The states with the greatest number of statewide initiatives on the ballot from 1904 to 2002 were all in the West: Oregon, California, Colorado, North Dakota, and Arizona.

The Initiative Process and Public Policy

There is no doubt that the voter initiative process does influence state-level policy making. For instance, with respect to finance, John Matsusaka documented three significant differences between initiative and noninitiative states since 1970: (1) Overall government spending was less in initiative states, (2) spending was more decentralized to local level in initiative states, and (3) initiative states relied more on user fees and charges than on taxes.

Matsusaka also noted that demographic and technological developments are fueling an unprecedented expansion of voter initiative and other direct democracy mechanisms and that legislatures are gradually being eclipsed as primary creators of public policy. This is due in part to a decline in public confidence regarding government in recent decades. He suggests that two forces are at work in this regard: a more highly educated population and a digital revolution that has made more and better information available to ordinary citizens than at any other time in human history. Voting via the Internet will probably make voter initiatives even more prevalent in the future.

In the past, citizens may have felt that important policy decisions should be left to legislators, who possessed a superior education and access to information. Now ordinary citizens feel competent to make policy decisions and no longer believe that elected officials are wiser or better informed. A particular concern about this viewpoint is that though the general citizenry may be better informed, they are not necessarily better informed about policy, nor are they always motivated by benign aspirations toward others. The NIMBY (not in my backyard) concept is one example. It may find expression in voter initiatives at the risk of ignoring unexpected consequences; people are tempted to vote self-interestedly.

Matsusaka points out, however, that a primary justification for the initiative process has been to empower the majority: to allow the public to counteract disproportionate influence of special interests in the legislature. Broder maintains that the initiative process has had the opposite effect: Wealthy individuals and special interests who once may have been the targets of the Populists and Progressives, who brought about the initiative process a century ago, have learned to subvert the process to their own advantage.

A clear example of this was the English for the Children series of voter initiative actions aimed at eliminating bilingual education. The campaign was supported financially by Ron Unz, a wealthy businessman who sought to eliminate bilingual education in four targeted states: Arizona, California, Colorado, and Massachusetts. In this example, paid canvassers, who had no motivation other than being paid for each signature collected, amassed enough signatures to get the antibilingual education initiative on the ballots in all four states. If paid canvassers had not been used, it is possible that the initiatives might not have been on the ballots of those states. The result was that bilingual education was declared illegal through the initiative process in three of the four states. Only the Colorado initiative failed.

Some observers of the process hold that the wisdom of using the voter initiative process to push through curricular decisions is questionable at best and dangerous at worst. They prefer to focus on improving the regulatory and legislative processes that have historically been used to shape the curricula of public schools. But the use of the voter initiatives to end bilingual education went a step further than a simple tweak to the curriculum in the three states involved. Because it involves a cultural rather than a purely political choice, it is important that the teaching

and learning of languages be a decision left to families and their respective boards of education. Statewide voter initiatives on sensitive issues such as those related to culture have the danger of imposing cultural preferences by the majority over minorities. Furthermore, in a society where a large percentage of families no longer have children in school, curricular voter initiatives are undemocratic, empowering voters who are not affected by their decisions—for example, monolingual, English-speaking voters making decisions for those who are actually touched by the curriculum in question. Finally, the initiative process opens up the curriculum to the influence of the same voter persuasion techniques used in elections, including the use of exaggeration, alarmist interpretations, and less-than-truthful representations.

Matsusaka reports anecdotal evidence of voter initiatives that have been passed at the expense of minorities. For instance, Black citizens were denied voting rights in Oklahoma, and California voters restricted the property rights of Japanese. However, Matsusaka also points out that minority rights have also been undermined by legislative action. No form of government is perfect. The initiative process does bring about policies that the majority wants. What the initiative process does not guarantee is that what the majority wants is the wisest policy for the rest of the population. An unchecked majority can abuse its power and threaten minority rights. Because the initiative process does not have a majority-check component that considers the opinions of the minority, it is difficult to distinguish between majority rule and majority tyranny. Zoltan Hajnal and his associates recommend an approach to make the problem more transparent: Determine how often minorities are overruled by the majority and publicize the results widely in order to educate the voting population of the danger.

Conclusion

Daniel Smith and Caroline Tolbert argue that the initiative process educates citizens, special interests, and political parties and increases participation in the political process, civic engagement, and confidence in government. Overall, they found a positive correlation between the presence of voter initiatives on ballots and (a) voter turnout, (b) people's political knowledge, (c) people's interest in politics, (d) frequency of discussion of political issues, (e) the level of social capital in a state, and (f) likelihood of people contributing money to interest groups. Not surprisingly, these positive

correlations occurred to a greater degree in settings homogenous with respect to race, ethnicity, gender, socioeconomics, and educational attainment. What the initiative process lacks is an equitable distribution of its effects, both positive and negative, across social, educational, racial, ethnic, or gender lines. With respect to issues of language policy, the record is clear. Of the voter initiatives from 1904 to 2006 regarding the English-only movement, Matsusaka reported that 10 of 11 initiatives (91%) resulted in an outcome in support of language restrictionism.

It is also clear that the voter initiative process will not render representative democracy obsolete. When and for what purposes the process is best suited is a subject for continued debate. Voter initiatives may be useful in controlling the agenda and reducing the monopoly of legislators in determining what the agenda is, but a legislative agenda is not inherently bad, nor is a voter-initiated agenda inherently good. The initiative process may be useful when legislators are unable to reflect voter preferences. What is not always evident is how the initiative process represents and benefits the majority of all and not merely the majority of some.

VYGOTSKY AND LANGUAGE LEARNING

Lev Vygotsky (1896–1934), a Russian developmental psychologist, originated a theory of the development of thought that has had a significant international impact on psychology, particularly the relation between thinking and speech. Vygotsky posited that higher-level thinking originates from social activity between two or more individuals. In these social interactive behaviors, speech is the means toward the development of independent, self-directed problem solving. The “talking” that takes place during these interactive experiences becomes the aid children use to internalize problem-solving strategies. Vygotsky’s notion of the development of children’s interactive talking and its relation to the acquisition of higher-level thinking is a significant one. The importance of this dynamic relationship between talking and thinking is magnified when taken into the context of bilingualism in the development of cognitive processes in children. Several studies by James Wertsch, David Wood, and others have concentrated on the role of interactive talking as an instrument toward the development of higher cognitive processes in English-speaking children, via the use of Vygotsky’s zone of proximal development, from social talking to higher-level problem solving.

Zone of Proximal Development

According to Vygotsky, a child’s *zone of proximal development* is the conceptual and psychological area where the most fruitful learning can take place. It is the place where the known touches the unknown. Vygotsky hypothesized that the zone of proximal development is determined by the interactive relationship between a child and an aide during problem-solving situations. By observing the child engaged in set activity, one can see the actual developmental level

of the child’s thinking process and its movement toward a higher level, with the aid of a person/peer who is more knowledgeable in the process. The knowledgeable teacher is able to detect when learners have entered their zones of proximal development and are ready to learn something new based on their prior learning. David Wood and Laura Berk, who have studied this process, refer to this as *scaffolding*. This scaffolding process, provided by the teacher, is conceptually very close to Vygotsky’s zone of proximal development. The adult, or more knowledgeable person, invites the child (learner) to the task at hand, controls the task at the child’s present level of comprehension, and introduces challenges and complexities in the task to promote higher-level thinking. According to Laura Berk and Adam Winsler, the scaffolding process is a support system in which the adult or more knowledgeable person provides support by way of prompts, cues, and the needed assistance to complete the task. The relation that the concept of scaffolding has with the zone of proximal development is in how the support system is built to keep the child engaged in the problem-solving process.

Thinking and Talking

Within the zone of proximal development, interactive speech plays a key role as mediator between social activities and higher-level thinking. Vygotsky proposed that three types of speech take place: social (interactive talking), private (self-directed and audible), and inner (self-directed and hidden), which can be seen as an observable behavior. In *social speech*, the child and adult are engaged in “interactive talking.” They converse about the activity or problem they are solving. Within their interaction, words are exchanges and procedures that are suggested for solving the problem. This type of speech is initially provided by the adult or person with more knowledge. *Private speech* refers to audible language/directives children use to guide themselves through a problem. Children actually talk to themselves to guide and support their own actions. Several studies conducted by Adam Winsler, Rafael Díaz, Ignacio Montero, and James Wertsch have shown that the private speech children use comes directly from social speech (interactive talking). The main difference is that in this type of talk, the two interlocutors are one and the same person.

From the onset, children use language to communicate with others. In regard to the child/adult interaction, the adult’s intention is to direct, control, and guide

the child's behavior with respect to a whole range of life's events, from learning how to ride a bike to learning long division. Gradually, children begin to use language not only for the sole purpose of communicating but also to guide, plan, and monitor themselves in the activities at hand. Children use private (self-directed) speech to talk themselves through a problem-solving activity. The private speech precedes the behavior and eventually submerges into thought and behavior. Within the interactive process, a connection occurs between language and mutual regulation. Regulation develops in both parties: The adult learns to regulate his or her actions and language to allow the child to gain mastery of the task, and the child learns how to be regulated by the adult. It is during this process that private self-directed speech emerges. The zone of proximal development is not static. It is flexible and mobile, an ever-changing phenomenon. Children involved in the process of social speech (interactive talking) can assume the role of capable peers and pass on their knowledge and thinking to others. In summary, children's thinking and use of interactive talk is crucial to the development of higher-level thinking within the zone of proximal development.

Bilingualism and Vygotsky's Theory

In regard to Vygotsky's theory and bilingualism, it is quite natural to consider the effect of two languages on the development of cognitive processes. Studying the relationship between bilingualism, interactive talking, and thinking provides the next question as to whether being bilingual is an advantage or handicap to cognitive operations. Sydney Segalowitz speculates that there is no evidence that the human brain of a bilingual person is different from the brain of a monolingual person. This is an important statement, because research studies from the 1920s to the 1960s on bilingualism tended to show a negative view of the effect of two languages on the human brain. These studies particularly focus on the relationship of intelligence and bilingualism. Findings from several of these early studies show that bilingual children scored low on intelligence tests and performed poorly in school. Conclusions made from these studies were that bilingual students were poor students in academic areas, did not have normal IQ scores, were mentally retarded, and/or had no true language because they were not proficient in either language. Looking back

at several of these findings, it should be noted that children were not tested with contemporary sophisticated measures, and erroneous labeling was common practice during this period.

Research from the 1960s to the present day shows quite the contrary. A pivotal study in the research was conducted by Canadian researchers Elizabeth Peal and Wallace E. Lambert in 1962. They studied French Canadian bilingual children of the same age and socioeconomic status and compared them with monolingual counterparts in the areas of verbal and non-verbal intelligence testing. The bilingual children performed significantly better than their monolingual counterparts on most of the cognitive tasks and verbal intelligence. These researchers suggested that the children's experience with two language systems was positive, since they appeared to perform on a superior level. Follow-up studies based on intelligence testing and concept formation were conducted by William W. Liedtke and L. Doyal Nelson in 1968. Studies of bilingual children and their development of cognitive processes have continued to be conducted up to the present day by several experts in this field, such as Ellen Bialystok, James Cummins, Rafael Díaz, Sylvia Joseph Galambos and Susan Goldin-Meadow, Kenji Hakuta, Paul Paradis, and Aneta Pavlenko, among others. Since the 1960s, a significant number of studies show that bilingual children's knowledge of two languages raises their cognitive development to a higher level. The results of these research projects have at times been thoroughly positive, at other times, less so. Part of the reason may be that not all researchers control well for partial or incomplete bilingualism. In those research efforts that do control effectively for level of bilingualism, the results tend to be more positive.

Vygotsky's view on the role of language as the decisive component of the development of thought has been tested further with bilingual children. Several of these studies, as seen in the work of Rafael Díaz and Marni H. Frauenglass, Anita Ianco-Worrel and Adam Winsler, Jesue Rene De Leon, Beverly Wallace, Martha Carlton, and Angela Wilson-Quayle, are based on investigating the role of private speech in bilingual children while solving a problem. Compared with their monolingual counterparts, bilingual children used private speech at the same level. Interestingly, children of higher-level proficiencies in their two languages relied more heavily on private speech while solving higher-level problems, therefore proving that they function at higher levels of thinking.

Subsequent studies have been done in the areas of *cognitive flexibility*, which is loosely defined as the ability to think in two different language systems. One important aspect of cognitive flexibility is *code switching*, the ability to switch from one language to the other in the course of conversation. It is usually carried out by bilinguals without faltering or significant pause in the flow of language. Other areas of research have included bilingualism and its effects on linguistic and cognitive creativity, bilingual memory, and bilingualism and divergent thinking.

An important consideration for educators who work with bilingual children is the use of instructional language. The aforementioned studies prove that the “interactive talking” that takes place when children are engaged in learning from a peer or adult (teacher) eventually becomes the internalized strategies they use in their problem-solving repertoire. Therefore, it is crucial for educators and others involved in the teaching process to be able to communicate strategies to children in a coherent manner. For bilingual children especially, strategies promoted within the zone of proximal development should be introduced, presented, and demonstrated within the child’s level of comprehension in the appropriate language.

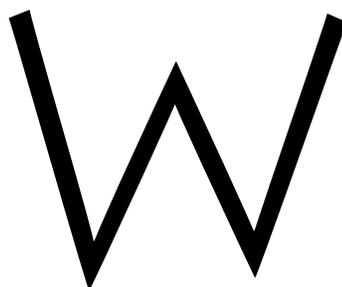

Vygotsky’s contribution to the understanding of the bilingual mind is derived chiefly from his concept of the zone of proximal development. This concept, with particular emphasis on the role of interactive talking and private speech, provides an excellent developmental framework that can be used to study and analyze how bilingual students use their two languages in their thinking.

WHOLE LANGUAGE

Whole language is a philosophical perspective about how language is acquired. The premise of this perspective is that acquiring language is easy when it is kept whole and meaningful and it is hard when it is broken down into a series of discrete, isolated skills that are abstract and meaningless to the language learner. Anyone who has watched toddlers acquire language knows it happens in contexts in which children need language to serve their purposes and are treated as competent language users before they actually are. Most of us have engaged in conversations with infants as young as 1 month old, asking questions of them (“Are you sleepy?”), pointing out things of interest (“Look at the kitty!”), or explaining some phenomenon (“We had better get in the house before those dark clouds shower us with rain!”). In each case, language was used to communicate and inform, not to teach the child about language; yet we know it is through these meaningful interactions that children become competent language users.

Few of us try to teach infants language by breaking it into parts, moving from abstract sounds to more meaningful use. It would not be natural; it would not be successful. Yet in schools, teachers often do just that. Rather than keeping language whole, they break it down, instructing children letter by letter, syllable by syllable, and sentence by sentence. Whole-language teachers prefer to support students in the same way they have been supported before entering school. They create meaningful contexts in which students need language to get things done. They assess each student’s language ability and build on it in meaningful ways.

Much like a parent who responds “Oh, so you want a drink of water” to a very young child who points to the kitchen faucet and says “Waa,” a teacher writes “Your monster scares me!” in response to a child’s written words “Da mnstrs s mn” (the monster is mean). The teacher’s response, like the parent’s, focuses on the meaning the language conveys and expands on it by providing the child with a demonstration of a more conventional way of stating the meaning. And just like parents who trust that with enough interaction and guidance, their children will become competent language users, whole-language teachers trust that with the same type of rich language and literacy experiences and support, their students will continue to develop and grow as language learners.

The role of the whole-language teacher is critical to students’ language acquisition. In these settings, the teacher is a close observer of their students, noting strengths and needs and creating a curriculum based on these observations to support students’ development. If children enter kindergarten already reading, the teacher makes note of this and matches them to books that will inspire them to keep reading, rather than having them sit through endless experiences geared toward emergent readers. When a middle school student who does not like to read enters a whole-language classroom, the teacher patiently works to match books with the student’s interests, so reading becomes something the student wants to do, not something he or she has to do. Once students choose to read because they want to and like to, the potential for growth is much greater.

Whole-language philosophy also argues that language acquisition is a social process. In other words, students learn best when they have others around

them with whom they can talk about and sort out new understandings. The thinking behind this concept is that one must use language to learn language. Having students sit in isolated areas, filling out worksheets whose content is irrelevant to their lives does little to encourage or support language development.

Last, whole-language proponents recognize the political dimensions of language. Rather than devaluing nonstandard languages or dialects that some children bring to school, whole-language teachers deliberately promote these learners' home languages. Chants and songs written in various dialects are learned, and children's meanings, not grammatical structure, are recognized and celebrated. Whole-language teachers know children need to acquire standard English, the language of power and prestige; but they also know this process is best achieved by first recognizing and valuing the home language, and then building on it to develop new and different competencies in other variants of English.

Whole-Language Pedagogy and Bilingual Education

Proponents of bilingual education in the United States argue that learning subject matter through one's first language facilitates language and literacy development in English. They also argue that learning subject matter through the first language helps make content learning in English more comprehensible. Even though bilingual education provides students opportunities to read, write, speak, and listen in their native language at the same time they are learning English, competency in English is only one goal of bilingual education. As bilingual students progress through school, they further develop academic knowledge in both languages, thus becoming bilingual and biliterate. Bilingual education also provides an environment in which students who are learning in two languages are understood and cared for in very special ways because their teachers, who are speakers of the same non-English language, can advocate for and interact with them for instructional and noninstructional purposes.

Whole-language pedagogy supports bilingual education because it emphasizes the relationship that exists between students' language and culture and their learning, regardless of the language or content being learned. Students in these classrooms are immersed in literacy events and texts in two languages. This allows

them to use knowledge from their first language to develop understandings of language and the world in their second language. Bilingual, whole-language educators understand that when students acquire a second language, it is important to keep the language whole. Similar to how children learn their first language, the new language is not broken apart into words or sounds that hold no meaning for the learner. This view of language learning contradicts what many of us experienced when we were learning a new language. Most often, it was broken down into discrete parts, and we were expected to memorize grammatical rules and repeat verbal exercises, which left most of us unable to engage conversationally in the language. It is not surprising, today, to find whole-language practices used in many foreign-language and bilingual classrooms.

Bilingual whole-language teachers perceive students as active participants in their own learning. Therefore, they approach new topics, whether about language or content, by building on what students already know and understand. They view students' approximations or risk-taking attempts made in their new language as evidence of growth, not errors. They also closely examine these approximations to better understand how students are making sense of the new language. A nice example of this was provided to one of the authors by a pre-service teacher who had just completed a bilingual and biliteracy teaching methods class. This young woman wrote the following e-mail message to her instructor:

I was grading tests on Friday, and one question on the test was: List 4 things the Chinese invented.

One of the student's answers was "Yum rop." I was like hmmm, but I decided not to mark it wrong and went on to the next test thinking—oh, I will come back to that.

Next test, the same thing. Yum rop, and I thought, What? So I started flipping through all the tests and kept seeing Yum rop.

Then I thought—wow, there has to be something here . . . so I began trying out possibilities, like, Yoom rop, Yoom rop? Yoom Rope? Yoom Rope?

Then I thought about the sound of the letter "Y" in Spanish—Juh, Juh. Joom ROPE. Jump Rope! Jump rope! (which was something the Chinese had invented).

This soon-to-be teacher understood that students acquiring a new language use linguistic knowledge

from their first language to make sense of the new language. She also understood that learning is an activity shared between teachers and students. In the example above, we see her participating in her students' literacy experience as a more knowledgeable language user and using this knowledge to step back and analyze what the students were doing as language users. She interpreted the students' work as logical, but not conventional. Rather than having a predetermined standard for evaluating all students' work, this teacher used her knowledge of Spanish to figure out how students were making sense of English. Based on her close observations and her willingness to consider how students were making sense of English, she can give them credit for correctly answering a text question and at the same time create curriculum that will help the students distinguish between particular sounds in the two languages.

Bilingual, whole-language teachers also understand that acquiring a language, whether a first or a new language, is a social process. That is, students acquire oral and written language competencies through interactions with other people. Therefore, these teachers carefully structure social conditions in their classroom communities. Collaborative group work is one way to do this. When bilingual students are grouped specifically to explore and generate new understandings with each other, they have access to both languages to do this work. For example, if students are new to English and need content clarification, they can rely on their first language to explore ideas. If they risk using their new language, they have the teacher and other students to help them work through what they are trying to communicate. And, perhaps most important, they have a range of language models whereby they can be immersed in the new language with people who are already proficient in that particular language.

Finally, acquiring a language other than English in the United States is political. In schools and classrooms in which languages other than English are not valued or understood as a resource to literacy and content learning, classroom practices are neither equitable nor productive for students learning English as a new language. Rather than students' bilingualism being understood as a resource for expanded learning opportunities, it is seen as a deficit and reason for student failure. It is crucial, therefore, that educators have substantive knowledge about ways in which whole-language pedagogy supports bilingual education, language acquisition, and language minority

students' learning processes. And it is equally important for teachers to bear some of the responsibility of getting the word out that bilingual education is not only helpful for English language development: It is every student's human right to have access to his or her native language as a resource to learn a new language.

Myths Surrounding Whole-Language Practices

Myths about whole-language education and bilingual education abound. Whole-language pedagogy is often criticized for failing to provide direct instruction and teaching of phonics. Critics of bilingual education claim that when time is spent teaching the students' native language, valuable time is lost in developing English and therefore students never learn this language. Others argue that bilingual education is un-American, causing disloyalty to the very country providing these students a free education.

Whole-language teachers often provide direct instruction to their students, but this instruction is presented at points of need, rather than being determined by suggestions of the authors of textbooks who do not know certain students or their needs. Bilingual, whole-language teachers carefully observe students' work and behavior to identify strengths and weaknesses and then prepare lessons based on these observations. In one situation, a teacher noticed several students using code-switching techniques in writing, but she did not see them using criteria for how or when to use it. She therefore discussed with the students what was meant by code switching, prepared information on criteria authors use when incorporating code switching into their writing, provided examples of how professional authors use it, and had the students speculate on why these authors did what they did.

Whole-language instruction is sometimes criticized for not including the teaching of phonics (the relation between letters and their sounds). This too is a myth. Ken Goodman's work on whole language is based on the belief that written language consists of three language systems: *graphophonics* (sound/sight relationship), *syntax* (language structure), and *semantics* (the language meaning). By observing thousands of children reading, Goodman and his colleagues discovered that effective readers use all three of these language systems, not just phonics, to make sense of what they read. For example, a group of first graders

were asked to read the following sentence: “The _____ barked at the cat.” Most students read, without a moment’s hesitation, “The dog barked at the cat.” They did not notice the absence of the word *dog* because they were using their knowledge of what sounds right (syntax) and what makes sense (semantics) to read the text. These language systems were very helpful to the readers. Of course, if the word *dog* had been included, the third language system, graphophonics, also would have been helpful. Goodman notes that students often over-rely on phonics when they are unaware of how to strategically use all three systems and how the use of one system can and should support the use of the others. So, while Goodman and whole-language proponents recognize phonics as crucial to a reader’s success, they argue that it should be used in conjunction with the other two language systems, not independently of them.

The belief that students in bilingual programs do not learn English is another myth. The goal of bilingual education is to provide students an education whereby they become bilingual and biliterate. Students’ first languages and cultural experiences are indeed used as resources to their acquisition of a second language, but never at the expense of acquiring English. Because students’ first language and knowledge of how the world works is valued in the classroom, students are able, with increasing sophistication, to develop competency, acquire English, and build on the resources they bring to the classroom. Bilingual education also ensures that students’ home language continues to be supported and used in increasingly sophisticated ways. This is encouraged, however, not to cause divided loyalties between students’ home language and English. Rather, it is promoted because as a means for students learning English to maintain their home identities, while at the same time creating new identities and new understandings about their world.

WONG FILLMORE, LILY (1934–)

Lily Wong Fillmore is a noted sociolinguist and researcher of language minority communities and second-language learning. She attributes the genesis of her keen and lifelong interest in the role of language in schooling to her childhood as an English learner and 12 years of volunteer work with migrant workers. Wong Fillmore was born in 1934 in Northern California and grew up in Watsonville, California. Her parents were recent immigrants from China, and she started school knowing no English, only Cantonese. She attended school with many children from immigrant backgrounds, including Chinese, Japanese, Mexican, and children of Dust Bowl families. From her peers and teachers, she learned English and the importance of schooling. From helping her parents run the family restaurant, she learned the value of hard work.

Wong Fillmore recounts that the years between 1956 and 1965 were “12 glorious years,” which she spent in south Santa Clara Valley working with families in migrant camps. Observing that the language and societal situations were not always fair in educating this population, she helped locate bilingual materials from anywhere she could, including schools,

public libraries, health department offices, and churches. A natural activist, Wong Fillmore with no formal preparation or training, worked to help the local migrant farmworkers and community.

In 1965, Wong Fillmore enrolled at San Jose State University. At the same time, she was hired as a consultant by the Santa Clara County superintendent of schools, who had noticed her work with the migrant communities. She pursued her studies seriously, choosing English and linguistics as her major and emphasis, respectively. She attributes her use of ethnographic methods in research to her study of anthropology and sociology at the time. In 1969, she graduated with a BA in English, with an emphasis in linguistics.

Between 1965 and 1974, Wong Fillmore worked in various capacities with Santa Clara County Office of Education, Union City School District, and Santa Clara School District. In one of her earlier positions, she secured funding for Santa Clara County Office of Education in 1968, the first year of federal bilingual education grants. Dubbed the “Spanish Dame Project” by Superintendent Glen Hoffman, the grant was an at-home early education project, with mothers serving as teachers and different homes serving as the learning space each day of the week. The project successfully nurtured home teachers/mothers to gain confidence in their abilities, and many went on to complete high school and college. It was a model of early education and bilingual education that valued community knowledge and settings and the role of the mother tongue in teaching and learning.

The late 1960s and early 1970s was also a critical period for the development of bilingual education programs. Wong Fillmore visited, on her first trips by air, pioneer bilingual education programs in Dade County, Florida; Wallace Lambert’s programs in Montreal; and Susan Gray’s programs in Nashville, Tennessee. She returned and designed bilingual early education programs in Santa Clara, featuring the role of Spanish-speaking mothers.

In addition to playing a critical role in developing early bilingual education programs, Wong Fillmore also spent the years from 1969 through 1976 pursuing her PhD in linguistics at Stanford University. She worked with the late linguist Charles Ferguson and completed her dissertation on social and cognitive strategies in second-language acquisition in 1976.

In 1974, Wong Fillmore was appointed as the assistant dean for student affairs for the University of

California, Berkeley, Graduate School of Education. She also served as lecturer until 1976 when, after completing her PhD, she was hired as assistant professor in the School of Education. Wong Fillmore spent her entire academic career at UC-Berkeley and retired in 2004 after 30 years. During her tenure at the university, she was instrumental in developing the Language and Literacy program. She also spoke out in strong support of the American Cultures undergraduate requirement, which was passed by the Academic Senate in 1989.

Wong Fillmore’s major areas of research include literacy and the socialization of children in second-language contexts. Specifically, she has examined the role of individual social and cognitive differences in mediating access to learning. She has also investigated the role of teaching practices on children’s language learning. In her work, Wong Fillmore has found that language shift can lead to various types of consequences for both families and societies. She has examined literacy development, language loss, and language shift among various populations, including Spanish speakers, Cantonese speakers, the Navajo, and the Y’upik Eskimo. She has conducted research and worked to help preserve languages, including “Village English” and academic English in Alaska, and has worked with American Indian tribes in the Southwest to assist with native-language revitalization efforts.

Other areas of research have included the study of academic language in California’s High School Exit Examination, the SAT-9, and other high-stakes tests, as well as the types of support needed by English learners and English dialect speakers (e.g., African American Vernacular English, Alaskan Village English, Chicano English, etc.) for testing and academic success. Her publications include “When Learning a Second Language Means Losing the First”; “Language Learning in Social Context: The View From Research in Second Language Learning”; and “Does Teacher Talk Work as Input?” Among her recent publications are “Language in Education”; “What Teachers Need to Know About Language,” with Catherine Snow; and “The Loss of Family Languages: Should Educators Be Concerned?”

For Wong Fillmore, it is a serious tragedy that we as a society do not value language diversity. She notes that individuals have to fight their own battles and take on the challenge of maintaining their mother tongues. She urges everyone to notice that people who

are learning English need help from society and that learning English is not a guarantee of bilingualism.

Wong Fillmore has been a beloved mentor to many young scholars. One of her graduate students noted that she is the warmest, funniest, wisest (as well as most visionary) academic in the world of bilingual education. Clearly, she continues to live out her philosophy of grounding her work in the lives of people.

Wong Fillmore is the mother of three children, two daughters and one son, and the wife of theoretical and computational linguist Charles Fillmore.

of English as a second or a foreign language outnumber those who acquired it as a mother tongue. In response to this scenario, issues arise involving the ownership of the English language, the need for standards, better assessment methods, and intelligibility. Amidst these discussions in the field, the concept of *world Englishes* was coined in the mid-1980s as an approach to describe, analyze, and explain the spread and use of the language in diverse contexts. British linguist Kingsley Bolton, former president of the International Association for World Englishes, explains that the concept has three possible meanings. The first one refers to all of the existing approaches to the study of English around the world, whether the concept implies the singular form of one “international” or “global” English or sticks to the plural “Englishes.” The second meaning relates to the description of varieties of English found in former British or U.S. colonies in Asia, Africa, or the Caribbean, also known as “new Englishes.” The third meaning refers to the specific pluricentric approach to world Englishes developed by Braj B. Kachru, professor in the Department of Linguistics at the University of Illinois at Urbana-Champaign, and colleagues. Under the Kachruvian approach, the functions of English for international and intranational purposes are considered, and the study of English varieties is not limited to linguistic description: It extends to theoretical, functional, pragmatic, pedagogical, and political implications.

Pluralization of English

The contemporary study of the spread of English began in the 1960s to early 1970s and focused on the differences between the nonnative English varieties (e.g., Malaysian English) and “standard English,” referring to British norms for the most part or to American norms. These norms were also regarded as a “common core” of the English language, from which any deviations were considered erroneous.

A shift in this paradigm is documented by two conferences that took place in 1978. One of them was held at the East-West Center in Honolulu, Hawai‘i, and the second one at the University of Illinois at Urbana-Champaign. At the end of the Hawai‘i conference, a statement was endorsed among participants from 20 countries in which the distinction was made between countries that used English primarily for *international* communication and those that used it for *intranational* purposes, providing a broader perspective than the one established by the terms *English as a foreign language*

WORLD ENGLISHES

The rapid spread of English around the world is a topic that prompts discussions related to the effects of globalization, increased use of communication technologies, cultural imperialism, and language teaching and learning. Population growth trends indicate that users

(EFL) or *English as a second language* (ESL). The conference at Urbana-Champaign continued conversations begun in the Hawai'i conference. The participants, coming from a variety of disciplinary, linguistic and cultural backgrounds, used cross-cultural perspectives to understand language variation, bi- and multilingualism, and the use of English around the world.

Kachru played a key role in both conferences. Having conducted research on nonnative varieties of English in South Asia, he developed a sociolinguistic profile model on the spread, patterns of acquisition, and functional allocation of English in different countries. This model is depicted in three concentric circles: (1) the *Inner Circle*, which represents the countries in which mother tongue varieties of English are based (United States, England, Canada, Australia, and New Zealand); (2) the *Outer Circle*, referring to countries in which English has been institutionalized through their colonial heritage from England or the United States (e.g., India, Nigeria, Malaysia, and the Philippines); and (3) the *Expanding Circle*, which refers to the rest of the countries in which English does not have an official status and its use is restricted to certain domains, such as tourism, commerce, or international transactions (e.g., China, Israel, Japan, and Egypt).

If the standards for English proficiency are based on how close the language learner is to “nativelike” mastery, the situation of learners who have little or no opportunity to interact with native speakers is one of disadvantage. Kachru argues that such a criterion is too narrow, considering the following factors: (a) English has spread globally in a unique fashion, in culturally and linguistically diverse societies; (b) English plays different roles when it comes to language planning and policy; and (c) historically, the postcolonial heritage that promoted the use of English in certain regions has an impact on the purposes the language serves for the nation's internal matters. This is the situation depicted by Kachru's Outer Circle; he described the different roles and purposes that English has within nations' borders as the means for intranational communication across groups from different ethnicities, religious, or local languages.

Nonnative varieties of English have developed in the Outer Circle to become *institutionalized*. Once this takes place, the variety's functions may be used as a medium for learning in the educational system, a means of regulation in the legal system, a “bridge” language for speakers of different native dialects within a country, or a creative space for multicultural literary genres. The English nonnative variety undergoes a

process of *nativization*: new linguistic features in terms of pronunciation, grammatical structure, or vocabulary, which are culturebound. The phases of this process could be, but are not limited to, the following: At first, an imitation model that identifies the local population with the colonizer is used. Then, the localized variety might be widely used but not recognized as such; as Kachru puts it, a local can speak Indian English, but if that person were told he was doing so, that would be considered an offensive remark to this person's ability to speak English. In the last stage, there is recognition of the institutionalization of the variety: for example, when teaching materials are adapted to local purposes or when postcolonial writers get past the canon of “English literature” to create a variety of styles that reflect their cultural identities and heritage.

In 1985, Kachru and Larry Smith, who had organized the conferences mentioned above, assumed the editorship of the journal *World Language English: The International Teacher's Journal of English as a World Language*, which had been in print since 1981. To reflect the paradigm shift toward the plurality and diversity of the language, the journal was renamed *World Englishes: Journal of English as an International and Intranational Language*. This journal, along with *English Today* and *English World-Wide*, has devoted itself to topics and reports related to the approaches and issues related to the global spread of English and its varieties.

Issues and Implications

As the approaches to world Englishes extended to the functional and sociolinguistic analysis of new varieties, several questions and debates have taken place. Norms, ideologies, and power issues in regions in which English is used as a native and nonnative language are matters of scholarly discussion.

One of the earliest assumptions that still inform challenges against nonnative varieties is conceptualizing them as a transitional form that reflects the interference of the user's mother tongue. In response to this explanation, scholars have carried out sociolinguistic analysis of nonnative varieties, focusing on the contextual functions of the variations (interference/errors). Kachru makes a distinction between mistakes—acquisitional deficiencies—and deviations and innovations, which are nativized, systemic forms that can be explained within the sociocultural setting of the nonnative variety.

This explanation helped to address the remarks made by British linguist Randolph Quirk in the early 1990s about the growing number of varieties and their implications in language classrooms. He referred to the low levels of performance in nonnative English speakers as being a result of relying on the use of a certain variety of English. He also considered not looking at the possibility of local varieties to be a result of the failure of educational systems. Kachru regarded some of these remarks as taking a deficit approach that rejects innovation and variation situated within certain sociolinguistic and cultural contexts. It is not the case that in nonnative varieties, “Anything goes,” he explained, as varieties conform and adapt to local norms, gaining a sense of ownership in the region.

Quirk also touched on the subject of intelligibility, a concern that has been addressed by other scholars. If students are not exposed to standard English, he stressed, this will limit their possibilities of communication with English speakers outside their countries—since nonnative varieties are used only for internal purposes. Questions arise as to whether all English users should necessarily have to communicate with native speakers or whether that should be decided according to regional and national terms. The urge to keep a common core is also reflected in English instruction and assessment development.

The scenario in which only native speakers can provide instruction and exposure to a standard and appropriate variety of English has also been the subject of debates. These matters were brought to discussion after the publication of Robert Phillipson’s *Linguistic Imperialism*, in 1992. He addressed the role of language-teaching institutions from countries in which English is a native language, which he labels *core countries*, in maintaining the hegemony of English as a global language. Having worked in the British Council for several years in Europe and North Africa, Phillipson looked at the asymmetrical status between native languages and English as a language for international communication. He observed that if English mastery were associated with participation in economic and technological development, the demand of instruction would increase in countries in which English is not a native language (*periphery countries*). Since these may not possess the infrastructure and training to teach English, the English language teaching industry in the United States and England would benefit.

These proposals resulted in criticism, praise, and mixed responses from scholars in the field in different

countries. Some regard characterizing the role of the United States and England in the promotion of English abroad as “imperialism” to be an overstatement, while others stress the need to rethink the hegemony of English worldwide and its impact on the speakers of other languages. Joshua A. Fishman, a sociolinguist whose publications address the spread of English, argues that English has perhaps become a multinational tool instead of a venue for imperialism. However, the debate continues to touch on the implications of the need for a language for international communication or the need to interact with native speakers of countries in a more powerful and desirable economic positioning.

An ongoing discussion in the field has developed around the concept of *English as a lingua franca* (ELF), which has been studied by scholars such as Barbara Seidhofer and Jennifer Jenkins. Jenkins defines ELF as the language used for communication between speakers who do not speak English as a native language, for example, in business meetings in which Chinese and Mexican speakers interact through the use of English but have different native languages. ELF researchers recognize the existence and use of multiple English varieties, Jenkins explains, while also observing the need for speakers to be familiar with language features that are intelligible across communities of ELF speakers.

Taking a stance on any of the issues mentioned above will impact practice, attitudes, and policy in English language use and instruction. Should varieties of English be taught in Outer Circle and Expanding Circle regions, or should a standard variety of English be supported? How should users of nonnative varieties be linguistically assessed? Supporters of a pluricentric approach consider that students and teachers need to be aware of the existence of a variety of Englishes; be given the opportunity to compare them; and learn about their range of functions in different contexts, including their own sociolinguistic realities. Ultimately, they should pass down these opportunities for discussion to their own students.

The impact of a world Englishes approach to language learning in the United States may relate to several issues in language ideologies and practice. Cultural and linguistic diversity have contributed to the development of English varieties within the country (e.g., African American Vernacular, Chicano English), which, as world Englishes scholars point out, are also looked down upon as deficient varieties even though they have structures of their own.

Research, description, and analysis of these varieties can contribute to their codification—the establishment of dictionaries and reference publications describing the norms of each variety—along with the growing recognition of literary multicanons. This knowledge also becomes useful in the acknowledgment of linguistic varieties of immigrants who come to the United States from regions of Kachru's Outer Circle, for example, where Indian English or Nigerian English are spoken. World Englishes provide a useful framework to get past monolingual views of language in the world. If English is indeed spreading worldwide, it does not belong exclusively to *native speakers*—a term that may need to be redefined—but to all users for their particular, local, and regional purposes. The discussion and even arguments relating to all of the issues mentioned here are far from over. Indeed, there is little prospect that a widely shared consensus will soon be reached on any of these points, and academics are not likely to be the final arbiters.

YARBOROUGH, RALPH (1903–1996)

Ralph Webster Yarborough was born in Chandler, Texas, on June 8, 1903. The Texas politician was a leader in the liberal wing of the Democratic Party and was the U.S. Senator who introduced the Bilingual Education Act in 1967. Yarborough attended West Point Military Academy in 1919 and left in 1920 to become a teacher. He taught for 3 years and attended Sam Houston State Teachers College and went on to graduate from the University of Texas Law School in 1927.

After his admission to the bar, Yarborough practiced law in El Paso, Texas, until 1931, when the state attorney general, James V. Allred, hired him to be assistant attorney general. With an expertise in land law, he prosecuted oil companies that failed to pay royalties for drilling on public lands, in violation of production limits. Yarborough drew public attention for winning a million-dollar judgment against the Mid-Kansas Oil and Gas Company for oil royalties. In 1938, he ran for state attorney general but was defeated. During World War II, he served in army ground forces and attained the rank of lieutenant colonel in 1946. Yarborough ran for the gubernatorial nomination in 1952, 1954, and 1956. In a 1957 special election, he was elected U.S. Senator as a liberal Texas Democrat.

As a senator, Yarborough was revered by progressive Texans as “the people’s senator.” He was the only senator representing a former Confederate state who voted for every major piece of civil rights legislation, and he was a major supporter of Johnson’s Great Society programs in education, environmental preservation, and health care. Notably, Yarborough was one of a handful of southern senators who refused to sign the “Southern Manifesto,” a pledge by legislators to resist forced integration. He also voted in favor of the Civil Rights Act of 1964, legislation that proved to be enormously important in cases of education civil rights, including *Lau v. Nichols* (1974). In addition, he defied political convention by opposing powerful political interests as well as speaking out against the Vietnam War.

In 1967, Yarborough became the lead sponsor of the Bilingual Education Act, the first federal legislation concerning minority language students. Its purpose was to provide federal funding to school districts to provide innovative programs, including bilingual instruction to children with “limited-English-speaking ability” (LESA). Originally intended for Spanish-speaking students, the bill recommended that Spanish be taught as a native language and English as a second language and that programs to augment Spanish-speaking students’ appreciation of ancestral languages and cultures be designed. To increase political support in Congress, Yarborough and the other sponsors broadened the bill to include other language groups in addition to Spanish.

Political opposition from those who feared that federal funds would support the maintenance of a

language other than English led to the bill's amendment, while Yarborough assuaged the opposition by noting as follows:

It is not the purpose of this bill to create pockets of different languages throughout the country. It is the main purpose of the bill to bring millions of school children into the mainstream of American life and make them literate in the national language of the country in which they live: namely, English. Not to stamp out the mother tongue and not to make their mother tongue the dominant language, but just to try to make these children fully literate in English, so that the children can move into the mainstream of American life. (*Congressional Record*, 1967, p. 34703)

The bill eventually became the core of the Bilingual Education Act, or Title VII of the Elementary and Secondary Education Act (ESEA). School districts were provided the opportunity to offer bilingual education programs that would not violate segregation laws. Yarborough's efforts in part made it possible for the Bilingual Education Act to pass as part of the ESEA.

Yarborough and other supporters of the original Bilingual Education Act linked poor educational practices to high drop-out rates among U.S. Latinos and intended for bilingual education to be a remedy for the problem of low educational achievement among students whose first language is Spanish. However, as Abdul Karim Bangura and Martin Muo note, the act moved from originally being conceived as an enrichment effort for U.S. Latinos to becoming a compensatory education program by the time it was signed into law as part of the ESEA.

Texas voters were becoming increasingly conservative. President Kennedy's trip to Texas in November 1963 was intended to help patch a widening rift between liberals and conservatives in the state. Senator Yarborough, because he was out of favor with the current governor, was assigned to ride in a car behind the president's, which may have saved him from being shot. Yarborough left the Senate when

Texan businessman Lloyd M. Bentsen Jr. defeated him in the 1970 Democratic primary. Bentsen ran a campaign that played on fears of social unrest and urban riots. He also took issue with Yarborough's opposition to the war in Vietnam. After leaving the Senate, Yarborough returned to Texas to practice law in Austin, where he died in 1996.

Z

ZAMORA, GLORIA L. (1935–2001)

Gloria L. Zamora, born in San Antonio, Texas, in 1935, was a national leader and pioneer in the field of early childhood bilingual education. Upon completing her BS degree in elementary education at Incarnate Word College in 1956, Zamora taught first grade in San Antonio's Westside barrios for 14 years, at a time when Texas law forbade the use of a language other than English in the classroom. Zamora later wrote that upon realizing that her mostly Spanish-speaking students needed understandable instruction in their native language in order to learn, she decided to just "close the classroom door and break the law!"

In the absence of established guidelines for bilingual and English as a Second Language teaching, Zamora created developmentally appropriate dual-language approaches that were effective in helping students achieve academically. Her unique success in teaching English language learners led to her selection by the Southwest Educational Development Laboratory as a demonstration teacher for a pilot bilingual education program in the San Antonio Independent School District from 1964 to 1968. Following this, Zamora drew on lessons learned from her classroom experience to help create and disseminate proven models for early childhood bilingual education. From 1968 to 1970, Zamora served as staff development specialist within this same district, being responsible for developing a pilot bilingual education program 5 years prior to the passage of the first bilingual education law in Texas. In 1969, Zamora was selected as demonstration teacher

for a summer training institute cosponsored by the University of Texas and Trinity University. From 1970 to 1973, she directed the bilingual education and kindergarten programs in the Edgewood Independent School District, leading efforts to create innovative bilingual approaches that would set the standard for others in the state and nation seeking to improve educational outcomes for language minority students.

Zamora's impact on the emerging field of bilingual education deepened as she pursued advanced graduate studies and began to teach at the university level. From 1969 to 1974, she taught courses in curriculum development for bilingual education as an adjunct at Our Lady of the Lake University, in San Antonio. Upon completing her PhD in Curriculum and Instruction at the University of Texas at Austin in 1974, she accepted a faculty position in early childhood education at the University of Texas at San Antonio. In 1977, she began a long association with the Intercultural Development Research Association in San Antonio, serving first as director of a bilingual preschool curriculum development project and later as director of the LAU Technical Assistance Center, a position that raised her profile as a national leader in the field of bilingual early childhood education.

Because of her unique perspective as a curriculum specialist with expertise in both early childhood and bilingual education, Zamora clearly understood the critical need for appropriate curriculum materials for young bilingual learners. In response to this need, she coauthored *Amanecer*, a bilingual early childhood curriculum that was adopted by preschool and Head Start programs throughout the United States. She later served as editorial director for the Santillana Publishing

Company, a major publisher of bilingual materials in the United States, and authored numerous articles on the subject.

Zamora became widely known as a passionate advocate for the right of linguistic minority children to receive equal educational opportunity. She served on the founding board of directors for AVANCE (Spanish for “to advance” or “to progress”), a pioneer in the field of parent education and school readiness that serves predominantly poor Latino families. From 1978 to 1981, she served as chair of the Multilingual/Multicultural Early Childhood Education Commission for the National Association for the Education of Young Children. On numerous occasions, she provided expert testimony before the U.S. Congress and the Texas Legislature and conducted research for the Mexican American Legal Defense and Educational Fund for key court cases dealing with bilingual education. From 1979 to 1981, Zamora served on the National Advisory Council on Bilingual Education, and from 1983 to 1984, she served as president of the National Association for Bilingual Education.

In recognition of her substantial contributions to the education and welfare of young bilingual children, Zamora received numerous awards from professional associations, civic organizations, and advocacy groups. In her final position prior to retirement in 1996, Zamora served as executive director of Educational Collaboratives, Programs, and Research for the Hispanic Association of Colleges and Universities.

ZELASKO, NANCY (1951–)

Nancy Zelasko is well-known for two very public roles in the field of bilingual education: her service as deputy director of the National Association for Bilingual Education (NABE), from 1989 to 1999, and, subsequently, as director of the National Clearinghouse for Bilingual Education (NCBE), later renamed the National Clearinghouse for English Language Acquisition (NCELA).

Zelasko was born in New York City, on June 4, 1951, and grew up on Long Island and in Signal Mountain, Tennessee. She attended elementary school in both communities. From Grades 7 through 12, she and her family lived in White Plains, New York. Zelasko attended Georgetown University, where she received a bachelor's degree in language and teaching in 1973. She studied French extensively and later added Spanish to her language skills. She also earned master's and doctoral degrees in sociolinguistics from Georgetown University.

Zelasko became a certified French teacher, but her first job was the start of a career in bilingual education. When a friend mentioned to her that the Washington, D.C., public schools were in need of linguists, she applied for a position and was hired 2 days later. Her first official duty for the District of Columbia Public Schools (DCPS) was to write a position paper for the district superintendent on multilingual/multicultural education. According to Zelasko, “That first job made me destined to work in bilingual education.” During her tenure with the DCPS, she accepted voluntary responsibilities in bilingual education that gave her a national view of the field. She assisted every president of NABE until she joined the association as its deputy director in 1989.

In 1974, Zelasko became an educational research assistant in the Division of Bilingual Education of the DCPS. In 1977, she became the project director for the Title VII Bilingual Teacher Training Project of the DCPS. In this role, she helped to prepare teachers and developed and conducted the first home language survey for the Washington, D.C., public schools. Zelasko continued to help shape education policies for English

language learners in her district. This effort resulted in the design of the first bilingual and English as a Second Language teacher license for Washington, D.C., public schools.

Zelasko left the Washington, D.C., public schools in 1980 to become the assistant director of the Georgetown University Bilingual Education Service Center. Helping to direct a nine-state regional service center gave her a broader view of the needs in bilingual education and of the many constituencies that needed attention. During these early formative years, she continued her voluntary association and assistance at the national level by working with all of the NABE presidents and volunteering her time to the organization.

Although she had started as a volunteer in the NABE Washington, D.C., office in the early 1970s, Zelasko did not officially work for the organization until she became deputy to director James Lyons in 1989. One of her first roles in NABE was to produce the annual conference on bilingual education. She took on this effort and brought NABE attendance from approximately 1,000 educators to more than 5,000 each year. In so doing, she standardized the processes and procedures for how the national conference is convened yearly. Zelasko was also the second editor of the *NABE News*, the official newsletter of the association. She prepared the first manual of operational procedures used by the NABE organization. As deputy director of NABE, she also represented the association on the National Board for Professional Teaching Standards Committee on English as a New Language. She left NABE in 1999 to become deputy director of the NCBE.

During her association with bilingual education, Zelasko wrote several important publications, including *If Your Child Learns in Two Languages: A Parent's Guide for Improving Educational Opportunities for*

Children Acquiring English as a Second Language. She also participated in the NABE publication *Professional Standards for the Preparation of Bilingual/Multicultural Teachers*. Zelasko has been a member of the editorial policy board for the *Bilingual Research Journal* since 1999 and has served as a board or committee member of over 20 organizations or associations involved in bilingual education.

In 2003, Zelasko became director of the NCELA (formerly the NCBE). In that role, she oversees an annual budget of more than \$2 million and a staff of 10 professionals and other support staff.

For over 20 years, people throughout the nation have come to know Zelasko as a valued professional colleague. She has collaborated with some of the most noted people in the field of bilingual education and is known for her intense support and advocacy for English language learners.

Appendix A

Policy Landmarks in U.S. Bilingual Education

1923—*Meyer v. Nebraska* decided by the U.S. Supreme Court (262 U.S. 390). The Court overturned a Nebraska state law that made it illegal for schools, private and public, to teach in any language other than English. The case involved a private school in which a teacher used a German Bible to teach reading. *Meyer* affirmed English as the primary language of instruction in Nebraska. It also held that elective learning, in this case learning a language, is among the rights protected, implicitly, by the Constitution.

1927—*Farrington v. Tokushiga*, decided by the U.S. Supreme Court (273 U.S. 298). This U.S. Supreme Court ruling struck down excessive regulation of private nonsectarian schools by the territorial legislature of Hawai'i prior to it becoming a state. The major issue in the case was the degree of parental control of the curricula in private schools. The court overturned the level of regulation over private, nonsectarian schools, finding it to be excessive, including the requirement that the curricula must be in English. In striking down the law and regulations, the Court found that a high degree of regulation was an unreasonable intrusion and that parents can legally exercise greater control over their children's education through curriculum choices.

1958—*National Defense Education Act (NDEA)* enacted. As a reaction to the launching of the Soviet Union's satellite, *Sputnik*, the U.S. government made substantial funding available to promote the teaching of modern languages. The driving motivation was to overtake the Soviet Union in space exploration. The presumed reason for the launching of a Soviet satellite

ahead of the United States was better education in Soviet schools that included greater emphasis on the study of mathematics, science, and modern languages.

1960—*Cuban refugees begin arriving in Florida after Fidel Castro's takeover*. The arrival of refugees in Florida helped establish bilingual education programs at Coral Way and Coral Gables elementary schools. Their objective was to preserve the Spanish language in anticipation of their eventual return to Cuba. The Ford Foundation and the U.S. government provided funding to support these language preservation efforts.

1964—*Congress enacts the Civil Rights Act (CRA)*. This law was meant to protect the rights of racial and ethnic minorities. Title VI of the act became a powerful tool for fighting discrimination cases because it eliminated the necessity to prove intent to discriminate, as required by the Fourteenth Amendment's Equal Protection Clause. Although CRA was subsequently eroded by an increasingly conservative Court, it was vitally important in the last quarter of the 20th century, in civil rights litigation.

1965—*Congress passes the Elementary and Secondary Education Act (ESEA)*. This was the first piece of legislation providing major funding for K–12 schools. Title I, aimed at better serving the nation's poor, was the largest of the various parts of the act. It was meant to leverage improvements in the education of minorities and the poor. There were no earmarks or set-asides for bilingual education in the original ESEA, but the act sparked interest in creating a possible federal

role to assist children and youth who were not fluent in English.

1966—*The National Education Association (NEA) sponsors a national conference in Tucson, Arizona.* This conference focused on the needs of the Spanish-surnamed population of the country. The primary theme of the conference was bilingual education and other programs aimed at resolving the “language barrier” faced by non-English-speaking students. NEA’s involvement helped raise the visibility of this issue in professional educator circles.

1968—*Congress enacts Title VII of the ESEA, the Bilingual Education Act.* This addition to the Elementary and Secondary Education Act of 1965 had several goals for the development and implementation of bilingual education in U.S. schools. Funding from this source included research, teacher training programs, technical assistance centers, and fellowships for graduate students. In its heyday, Title VII, ESEA, was the largest funding source for bilingual education. With the passage of the No Child Left Behind Act of 2001 (NCLB), Title VII was not reauthorized and discretionary funding for bilingual education by the federal government ended almost entirely. NCLB focused on English language instruction without a home language component.

1972—*Massachusetts becomes the first state to enact legislation to support transitional bilingual education in K–12 for English language learners.* The Massachusetts legislation inaugurated the use of the term *transitional* to signal the use of the home language for limited purposes. The term gained wide currency as other states adopted the Massachusetts legislative model to their own needs.

1974—*U.S. Supreme Court rules on Lau v. Nichols (414 U.S. 563).* This case was brought by Chinese families against the San Francisco schools. Plaintiffs alleged that San Francisco Unified School District violated Title VI of the Civil Rights Act by failing to teach English effectively to these children and subsequently requiring that the children pass a high-stakes graduation test in that language. The High Court overturned a lower-court decision favoring the school district and ruled that schools must take “affirmative steps to open their instructional program” to all students. *Lau v. Nichols* did not mandate bilingual education but acknowledged that a bilingual approach

is one of the options available for complying with Title VI.

1974—*Enactment of the Equal Educational Opportunity Act (EEOA).* This legislation codified the findings of *Lau v. Nichols* into federal law. Since the weight of *Lau v. Nichols* and the authority of Title VI of the Civil Rights Act were diminished by subsequent cases decided by the Supreme Court, the EEOA, which prohibits states from denying equal educational opportunity to all students, has become an important tool for suits against school districts in cases similar to *Lau*.

1981—*Castañeda v. Pickard decided by U.S. Court of Appeals (648 F.2d 989 5th Cir.).* A South Texas school district was ordered to adopt an instructional program that satisfied the requirements of *Lau v. Nichols* and Title VI of the Civil Rights Act. The process ordered by the court, now widely known as “the Castañeda three-part test,” was subsequently adopted by the Office for Civil Rights of the U.S. Department of Education as a template to judge the adequacy of compliance efforts throughout the country. It constitutes current *Lau* enforcement policy.

1981—*Education Consolidation and Improvement Act (Part of Public Law 97–35) enacted to create block grants in education.* The act consolidated 42 funding programs, most of them discretionary grant programs, into 7 block grants that would allow funds to flow directly to state education agencies or to school districts on the basis of formulas. This obviated the need for competitive program proposals to access federal funds. Title VII of the ESEA was among the 7 programs that were not consolidated at this time.

1982—*Plyler v. Doe decided by U.S. Supreme Court (457 U.S. 202).* The Supreme Court held that public schools are prohibited from denying immigrant children access to public education. According to *Plyler*, undocumented children have the same right to a free public education as the children of citizens and permanent residents. The decision also requires that undocumented students obey mandatory attendance laws of the states and remain in school until they reach the age mandated by such laws.

1991—*Native American Language Preservation Act passed.* Through this legislation, the federal government provides funding to assist Native American

peoples to teach and learn their ancestral languages. Previous government actions, such as the creation of Indian boarding schools, contributed to the erosion of native languages among Native American children and youth.

2002—No Child Left Behind (NCLB) Act enacted by Congress. The act replaced the Elementary and Secondary Education Act of 1965 and the Education Consolidation and Improvement Act of 1981. The legislation seeks to increase accountability by schools and school districts by imposing a stringent testing program before students may graduate from high school. It threatens penalties for schools in which students fail to make “adequate yearly progress.” Critics charge that taken together, these provisions place the burden of accountability on students rather than on failed policies and practices. NCLB ended the practice of discretionary funding to school districts for bilingual education. It allots the bulk of K–12 federal funds to state departments of education to use at their discretion.

1998/2002—Antibilingual education voter initiatives approved in three states. Under the slogan of “English for the Children,” Arizona, California, and Massachusetts approved initiatives severely curtailing bilingual education in the public schools of those states. A similar measure failed at the polls in

Colorado. Yet another failed to be included on the ballot in New York. (Note: Most states do not have provisions in their constitutions that permit voter initiatives and referenda.)

2006—Report of the National Literacy Panel on Language Minority Children and Youth. This study, financed by the U.S. Department of Education, assessed the value, impact, and effectiveness of various components and approaches to the education of English language learners. The National Literacy Panel was made up of leading authorities in the field appointed by the Education Sciences Institute, an arm of the U.S. Department of Education. The study reported favorably on the use of bilingual instructional methods. Inexplicably, the U.S. Department of Education refused to issue the panel’s report. After a 2-year delay, the panel’s report was published by the contractor through a commercial publisher.

2006—National Security Language Initiative announced by President George W. Bush. This initiative was designed to promote the teaching of languages needed for national security by civilian agencies and the military. Only small levels of funding under this initiative were directed toward public schools. Most of the funds were used to support programs in the military and in national security agencies.

Appendix B

Title VII, Elementary and Secondary Education Act of 1968

Title VII— Bilingual Education Programs

Findings of Congress

Sec. 701. The Congress hereby finds that one of the most acute educational problems in the United States is that which involves millions of children of limited English-speaking ability because they come from environments where the dominant language is other than English; that additional efforts should be made to supplement present attempts to find adequate and constructive solutions to this unique and perplexing educational situation; and that the urgent need is for comprehensive and cooperative action now on the local, State, and Federal levels to develop forward-looking approaches to meet the serious learning difficulties faced by this substantial segment of the Nation's school-age population.

Amendment to Elementary and Secondary Education Act of 1965

Sec. 702. The Elementary and Secondary Education Act of 1965 is amended by redesignating title VII as title VIII, by redesignating Sections 701 through 707 and references thereto as Sections 801 through 807, respectively, and by inserting after title VI the following new title:

"Title VII— Bilingual Education Programs

"Short Title

"Sec. 701. This title may be cited as the 'Bilingual Education Act'.

"Declaration of Policy

"Sec. 702. In recognition of the special educational needs of the large numbers of children of limited English-speaking ability in the United States, Congress hereby declares it to be the policy of the United States to provide financial assistance to local educational agencies to develop and carry out new and imaginative elementary and secondary school programs designed to meet these special educational needs. For the purposes of this title, 'children of limited English-speaking ability' means children who come from environments where the dominant language is other than English.

"Authorization and Distribution of Funds

"Sec. 703. (a) For the purposes of making grants under this title, there is authorized to be appropriated the sum of \$15,000,000 for the fiscal year ending June 30, 1968, \$30,000,000 for the fiscal year ending June 30, 1969, and \$40,000,000 for the fiscal year ending June 30, 1970.

"(b) In determining distribution of funds under this title, the Commissioner shall give highest priority to States and areas within States having the greatest need for programs pursuant to this title. Such priorities shall take into consideration the number of children of limited English-speaking ability between the ages of three and eighteen in each State.

"Uses of Federal Funds

"Sec. 704. Grants under this title may be used, in accordance with applications approved under section 705, for—

- “(a) planning for and taking other steps leading to the development of programs designed to meet the special educational needs of children of limited English-speaking ability in schools having a high concentration of such children from families (A) with incomes below \$3,000 per year, or (B) receiving payments under a program of aid to families with dependent children under a State plan approved under title IV of the Social Security Act, including research projects, pilot projects designed to test the effectiveness of plans so developed, and the development and dissemination of special instructional materials for use in bilingual education programs; and
- “(b) providing preservice training designed to prepare persons to participate in bilingual education programs as teachers, teacher-aides, or other ancillary education personnel such as counselors, and inservice training and development programs designed to enable such persons to continue to improve their qualifications while participating in such programs; and
- “(c) the establishment, maintenance, and operation of programs, including acquisition of necessary teaching materials and equipment, designed to meet the special educational needs of children of limited English-speaking ability in schools having a high concentration of such children from families (A) with incomes below \$3,000 per year, or (B) receiving payments under a program of aid to families with dependent children under a State plan approved under title IV of the Social Security Act, through activities such as
- “(1) bilingual education programs;
- “(2) programs designed to impart to students a knowledge of the history and culture associated with their languages;
- “(3) efforts to establish closer cooperation between the school and the home;
- “(4) early childhood educational programs related to the purposes of this title and designed to improve the potential for profitable learning activities by children;
- “(5) adult education programs related to the purposes of this title, particularly for parents of children participating in bilingual programs;

- “(6) programs designed for dropouts or potential dropouts having need of bilingual programs;
- “(7) programs conducted by accredited trade, vocational, or technical schools; and
- “(8) other activities which meet the purposes of this title.

“Applications for Grants and Conditions for Approval

“Sec. 705. (a) A grant under this title may be made to a local educational agency or agencies, or to an institution of higher education applying jointly with a local educational agency, upon application to the Commissioner at such time or times, in such manner and containing or accompanied by such information as the Commissioner deems necessary. Such application shall—

- “(1) provide that the activities and services for which assistance under this title is sought will be administered by or under the supervision of the applicant;
- “(2) set forth a program for carrying out the purpose set forth in section 704 and provide for such methods of administration as are necessary for the proper and efficient operation of the program;
- “(3) set forth a program of such size, scope, and design as will make a substantial step toward achieving the purpose of this title;
- “(4) set forth policies and procedures which assure that Federal funds made available under this title for any fiscal year will be so used as to supplement and, to the extent practicable, increase the level of funds (including funds made available under title I of this Act) that would, in the absence of such Federal funds, be made available by the applicant for the purposes described in section 704, and in no case supplant such funds;
- “(5) provide for such fiscal control and fund accounting procedures as may be necessary to assure proper disbursement of and accounting for Federal funds paid to the applicant under this title;
- “(6) provide for making an annual report and such other reports, in such form and containing such information, as the Commissioner may reasonably require to carry out his functions under this title

and to determine the extent to which funds provided under this title have been effective in improving the educational opportunities of persons in the area served, and for keeping such records and for affording such access thereto as the Commissioner may find necessary to assure the correctness and verification of such reports;

- “(7) provide assurance that provision has been made for the participation in the project of those children of limited English-speaking ability who are not enrolled on a full-time basis; and
- “(8) provide that the applicant will utilize in programs assisted pursuant to this title the assistance of persons with expertise in the educational problems of children of limited English-speaking ability and make optimum use in such programs of the cultural and educational resources of the area to be served; and for the purposes of this paragraph, the term ‘cultural and educational resources’ includes State educational agencies, institutions of higher education, nonprofit private schools, public and nonprofit private agencies such as libraries, museums, musical and artistic organizations, educational radio and television, and other cultural and educational resources.

“(b) Applications for grants under title may be approved by the Commissioner only if—

- “(1) the application meets the requirements set forth in subsection (a);
- “(2) the program set forth in the application is consistent with criteria established by the Commissioner (where feasible, in cooperation with the State educational agency) for the purpose of achieving an equitable distribution of assistance under this title within each State, which criteria shall be developed by him on the basis of a consideration of (A) the geographic distribution of children of limited English-speaking ability, (B) the relative need of persons in different geographic areas within the State for the kinds of services and activities described in paragraph (c) of section 704, and (C) the relative ability of particular local educational agencies within the State to provide those services and activities;

“(3) the Commissioner determines (A) that the program will utilize the best available talents and resources and will substantially increase the educational opportunities for children of limited English-speaking ability in the area to be served by the applicant, and (B) that, to the extent consistent with the number of children enrolled in nonprofit private schools in the area to be served whose educational needs are of the type which this program is intended to meet, provision has been made for participation of such children; and

“(4) the State educational agency has been notified of the application and been given the opportunity to offer recommendations.

“(c) Amendments of applications shall, except as the Commissioner may otherwise provide by or pursuant to regulations, be subject to approval in the same manner as original applications.

“Payments

“Sec. 706. (a) The Commissioner shall pay to each applicant which has an application approved under this title an amount equal to the total sums expended by the applicant under the application for the purposes set forth therein.

“(b) Payments under this title may be made in installments and in advance or by way of reimbursement, with necessary adjustments on account of overpayments or underpayments.

“Advisory Committee

“Sec. 707. (a) The Commissioner shall establish in the Office of Education an Advisory Committee on the Education of Bilingual Children, consisting of nine members appointed, without regard to the civil service laws, by the Commissioner with the approval of the Secretary. The Commissioner shall appoint one such member as Chairman. At least four of the members of the Advisory Committee shall be educators experienced in dealing with the educational problems of children whose native tongue is a language other than English.

“(b) The Advisory Committee shall advise the Commissioner in the preparation of general regulations

and with respect to policy matters arising in the administration of this title, including the development of criteria for approval of applications thereunder. The Commissioner may appoint such special advisory and technical experts and consultants as may be useful and necessary in carrying out the functions of the Advisory Committee.

“(c) Members of the Advisory Committee shall, while serving on the business of the Advisory Committee, be entitled to receive compensation at rates fixed by the Secretary, but not exceeding \$100 per day, including traveltime; and while so serving away from their homes or regular places of business, they may be allowed travel expenses, including per diem in lieu of subsistence, as authorized by section 5703 of title 5 of the United States Code for persons in the Government service employed intermittently.

“Labor Standards

“Sec. 708. All laborers and mechanics employed by contractors or subcontractors on all minor remodeling projects assisted under this title shall be paid wages at rates not less than those prevailing on similar minor remodeling in the locality as determined by the Secretary of Labor in accordance with the Davis-Bacon Act, as amended (40 U.S.C. 276a–276a-5). The Secretary of Labor shall have, with respect to the labor standards specified in this section, the authority and functions set forth in Reorganization Plan Numbered 14 of 1950 and section 2 of the Act of June 13, 1934, as amended (40 U.S.C. 276c).”

Conforming Amendments

Sec. 703. (a) That part of section 801 (as so redesignated by section 702 of this Act) of the Elementary and Secondary Education Act of 1965 which precedes clause (a)⁷ is amended by striking out “and VI” and inserting in lieu thereof “VI, and VII”.

(b) Clause (j) of such section 801 as amended by this Act⁸ is further amended by striking out “and VI” and inserting in lieu thereof “VI, and VII”.

Amendments to Title V of the Higher Education Act of 1965

Sec. 704. (a) The third sentence of section 521 of the Education Professions Development Act (title V of the Higher Education Act of 1965)⁹ is amended (1) effective for the fiscal year ending June 30, 1968 only, by inserting after “a career of teaching in elementary or secondary schools” a new phrase as follows: “a career of teaching children of limited English-speaking ability”, and (2) effective with respect to subsequent fiscal years, by inserting “and including teaching children of limited English-speaking ability” after “including teaching in preschool and adult and vocational education programs”.

(b) Effective for the fiscal year ending June 30, 1968, only, section 522(a) of such Act¹⁰ is amended by striking out “ten thousand fellowships for the fiscal year ending June 30, 1968” and inserting in lieu thereof “eleven thousand fellowships for the fiscal year ending June 30, 1968”.

(c) (1) Section 628 of such Act¹¹ is amended, effective with respect to fiscal years ending after June 30, 1967, by striking out “\$275,000,000” and inserting in lieu thereof “\$285,000,000”; striking out “\$195,000,000” and inserting in lieu thereof “\$205,000,000”; striking out “\$240,000,000” and inserting in lieu thereof “\$250,000,000”; and striking out “July 1, 1968” and inserting in lieu thereof “July 1, 1970”.

(2) The amendments made by this subsection shall, notwithstanding section 9(a) of Public Law 90-35, be effective with regard to fiscal years beginning after June 30, 1967.

(d) Section 531(b) of such Act¹² is amended by redesignating clauses (8) and (9) thereof as clauses (9) and (10), respectively, and by inserting immediately after clause (7) the following new clause:

“(8) programs or projects to train or retrain persons engaging in special educational programs for children of limited English-speaking ability”.

Amendments to Title XI of the National Defense Education Act of 1958

Sec. 705. (a) Section 1101 of the National Defense Education Act of 1958 is amended by striking out “and

⁷ 20 U.S.C.A. § 881.

⁸ 20 U.S.C.A. § 881(1)

⁹ 20 U.S.C.A. § 1111.

¹⁰ 20 U.S.C.A. § 1112(a).

¹¹ 20 U.S.C.A. § 1118.

¹² 20 U.S.C. A. § 1119.

for each of the two succeeding fiscal years” and inserting in lieu thereof “and for the succeeding fiscal year and \$51,000,000 for the fiscal year ending June 30, 1968”.

(b) Such section is further amended by striking out the period at the end of clause (3) and inserting in lieu thereof a comma and the word “or”, and by inserting after such clause a new clause as follows.

“(4) who are engaged in or preparing to engage in special educational programs for children of limited English-speaking ability.”

Amendments to Cooperative Research Act

Sec. 706. Subsections (a) and (b) of section 2 of the Cooperative Research Act 14 are each amended by inserting “and title VII” after “section 503(a) (4)”.

Approved January 2, 1968.

Appendix C

Lau v. Nichols and Related Documents

Department of Health, Education, and Welfare

Office of the Secretary
Washington, D.C.

May 25, 1970

Memorandum

TO: School Districts With More Than Five Percent
National Origin–Minority Group Children
FROM: J. Stanley Pottinger, Director, Office for Civil
Rights
SUBJECT: Identification of Discrimination and
Denial of Services on the Basis of National Origin

Title VI of the Civil Rights Act of 1964 and the Departmental Regulation (45 CFR Part 80) promulgated thereunder require that there be no discrimination on the basis of race, color or national origin in the operation of any federally assisted programs.

Title VI compliance reviews conducted in school districts with large Spanish-surnamed student populations by the Office for Civil Rights have revealed a number of common practices which have the effect of denying equality of educational opportunity to Spanish-surnamed pupils. Similar practices which have the effect of discrimination on the basis of national origin exist in other locations with respect to disadvantaged pupils from other national origin-minority groups, for example, Chinese or Portuguese.

The purpose of this memorandum is to clarify DHEW policy on issues concerning the responsibility of school districts to provide equal educational opportunity

to national origin minority group children deficient in English language skills. The following are some of the major areas of concern that relate to compliance with Title VI:

1. Where inability to speak and understand the English language excludes national origin-minority group children from effective participation in the educational program offered by a school district, the district must take affirmative steps to rectify the language deficiency in order to open its instructional program to these students.
2. School districts must not assign national origin-minority group students to classes for the mentally retarded on the basis of criteria which essentially measure or evaluate English language skills; nor may school districts deny national origin-minority group children access to college preparatory courses on a basis directly related to the failure of the school system to inculcate English language skills.
3. Any ability grouping or tracking system employed by the school system to deal with the special language skill needs of national origin-minority group children must be designed to meet such language skill needs as soon as possible and must not operate as an educational dead-end or permanent track.
4. School districts have the responsibility to adequately notify national origin-minority group parents of school activities which are called to the attention of other parents. Such notice in order to be adequate may have to be provided in a language other than English.

School districts should examine current practices which exist in their districts in order to assess compliance with the matters set forth in this memorandum. A school district which determines that compliance problems currently exist in that district should immediately communicate in writing with the Office for Civil Rights and indicate what steps are being taken to remedy the situation. Where compliance questions arise as to the sufficiency of programs designed to meet the language skill needs of national origin-minority group children already operating in a particular area, full information regarding such programs should be provided. In the area of special language assistance, the scope of the program and the process for identifying need and the extent to which the need is fulfilled should be set forth.

School districts which receive this memorandum will be contacted shortly regarding the availability of technical assistance and will be provided with any additional information that may be needed to assist districts in achieving compliance with the law and equal educational opportunity for all children. Effective as of this date the aforementioned areas of concern will be regarded by regional Office for Civil Rights personnel as a part of their compliance responsibilities.

**Syllabus
Supreme Court
of the United States**

414 U.S. 563

Lau v. Nichols

**Certiorari to the United States
Court of Appeals for the Ninth Circuit**

No. 72-6520

Argued: December 10, 1973

Decided: January 21, 1974

The failure of the San Francisco school system to provide English language instruction to approximately 1,800 students of Chinese ancestry who do not speak English, or to provide them with other adequate instructional procedures, denies them a meaningful opportunity to participate in the public educational program, and thus violates § 601 of the Civil Rights Act of 1964, which bans discrimination based “on the ground of race, color, or national origin,” in “any program or activity receiving Federal financial assistance,” and the implementing regulations of the Department of Health, Education, and Welfare. Pp. 565–569.

483 F.2d 791, *reversed and remanded*.

Edward H. Steinman argued the cause for petitioners. With him on the brief were Kenneth Hecht and David C. Moon.

Thomas M. O’Connor argued the cause for the respondents. With him on the brief were George E. Krueger and Burk E. Delventhal.

Assistant Attorney General Pottinger argued the cause for the United States as amicus curiae urging reversal. With him on the brief were Solicitor General Bork, Deputy Solicitor General Wallace, Mark L. Evans, and Brian K. Landsberg. *

DOUGLAS, J., delivered the opinion of the Court, in which BRENNAN, MARSHALL, POWELL, and REHNQUIST, J., joined. STEWART, J., filed an opinion concurring in the result, in which BURGER, C. J., and BLACKMUN, J., joined, *post*, p. 569. WHITE, J., concurred in the result, in which BURGER, C. J., joined, *post*, p. 571.

DOUGLAS, J., Opinion of the Court

MR. JUSTICE DOUGLAS delivered the opinion of the Court.

The San Francisco, California, school system was integrated in 1971 as a result of a federal court decree, 339 F. supp. 1315. *See Lee v. Johnson*, 404 U.S. 1215. The District Court found that there are 2,856 students of Chinese ancestry in the school system who do not speak English. Of those who have that language deficiency, about 1,000 are given supplemental courses in the English language.¹ About 1,800, however, do not receive that instruction.

This class suit brought by non-English-speaking Chinese students against officials responsible for the operation of the San Francisco Unified School District seeks relief against the unequal educational opportunities, which are alleged to violate, *inter alia*, the Fourteenth Amendment. No specific remedy is urged upon us. Teaching English to the students of Chinese ancestry who do not speak the language is one choice. Giving instructions to this group in Chinese is another. There may be others. Petitioners ask only that the Board of Education be directed to apply its expertise to the problem and rectify the situation.

The District Court denied relief. The Court of Appeals affirmed, holding that there was no violation of the Equal Protection Clause of the Fourteenth Amendment or of § 601 of the Civil Rights Act of

* Briefs of amici curiae urging reversal were filed by Stephen J. Pollak, Ralph J. Moore, Jr., David Rubin, and Peter T. Galiano for the National Education Assn. et al.; by W. Reece Bader and James R. Madison for the San Francisco Lawyers’ Committee for Urban Affairs; by J. Harold Flannery for the Center for Law and Education, Harvard University; by Herbert Teitelbaum for the Puerto Rican Legal Defense and Education Fund, Inc.; by Mario G. Obledo, Sanford J. Rosen, Michael Mendelson, and Alan Exelrod for the Mexican American Legal Defense and Educational Fund et al.; by Samuel Rabinove, Joseph B. Robison, Arnold Forster, and Elliot C. Rothenberg for the American Jewish Committee et al.; by F. Raymond Marks for the Childhood and Government Project; by Martin Glick for Efrain Tostado et al.; and by the Chinese Consolidated Benevolent Assn. et al.

¹ A report adopted by the Human Rights Commission of San Francisco and submitted to the Court by respondents after oral argument shows that, as of April 1973, there were 3,457 Chinese students in the school system who spoke little or no English. The document further showed 2,136 students enrolled in Chinese special instruction classes, but at least 429 of the enrollees were not Chinese, but were included for ethnic balance. Thus, as of April 1973, no more than 1,707 of the 3,457 Chinese students needing special English instruction were receiving it.

1964, 78 Stat. 252, 42 U.S.C. § 2000d which excludes from participation in federal financial assistance, recipients of aid which discriminate against racial groups, 483 F.2d 791. One judge dissented. A hearing en banc was denied, two judges dissenting. *Id.* at 805.

We granted the petition for certiorari because of the public importance of the question presented, 412 U.S. 938.

The Court of Appeals reasoned that

[e]very student brings to the starting line of his educational career different advantages and disadvantages caused in part by social, economic and cultural background, created and continued completely apart from any contribution by the school system. (483 F.2d at 797.)

Yet, in our view, the case may not be so easily decided. This is a public school system of California, and §71 of the California Education Code states that “English shall be the basic language of instruction in all schools.” That section permits a school district to determine “when and under what circumstances instruction may be given bilingually.” That section also states as “the policy of the state” to insure “the mastery of English by all pupils in the schools.” And bilingual instruction is authorized “to the extent that it does not interfere with the systematic, sequential, and regular instruction of all pupils in the English language.”

Moreover, § 8573 of the Education Code provides that no pupil shall receive a diploma of graduation from grade 12 who has not met the standards of proficiency in “English,” as well as other prescribed subjects. Moreover, by § 12101 of the Education Code (Supp. 1973), children between the ages of six and 16 years are (with exceptions not material here) “subject to compulsory full-time education.”

Under these state-imposed standards, there is no equality of treatment merely by providing students with the same facilities, textbooks, teachers, and curriculum, for students who do not understand English are effectively foreclosed from any meaningful education.

Basic English skills are at the very core of what these public schools teach. Imposition of a requirement that, before a child can effectively participate in the educational program, he must already have acquired

those basic skills is to make a mockery of public education. We know that those who do not understand English are certain to find their classroom experiences wholly incomprehensible and in no way meaningful.

We do not reach the Equal Protection Clause argument which has been advanced, but rely solely on § 601 of the Civil Rights Act of 1964, 42 U.S.C. § 2000d to reverse the Court of Appeals.

That section bans discrimination based “on the ground of race, color, or national origin,” in “any program or activity receiving Federal financial assistance.” The school district involved in this litigation receives large amounts of federal financial assistance. The Department of Health, Education, and Welfare (HEW), which has authority to promulgate regulations prohibiting discrimination in federally assisted school systems, 42 U.S.C. § 2000d-1, in 1968 issued one guideline that

[s]chool systems are responsible for assuring that students of a particular race, color, or national origin are not denied the opportunity to obtain the education generally obtained by other students in the system. (33 Fed.Reg. 4956.)

In 1970, HEW made the guidelines more specific, requiring school districts that were federally funded “to rectify the language deficiency in order to open” the instruction to students who had “linguistic deficiencies,” 35 Fed.Reg. 11595.

By § 602 of the Act, HEW is authorized to issue rules, regulations, and orders² to make sure that recipients of federal aid under its jurisdiction conduct any federally financed projects consistently with § 601. HEW’s regulations, 45 CFR § 80.3(b)(1), specify that the recipients may not:

(ii) Provide any service, financial aid, or other benefit to an individual which is different, or is provided in a different manner, from that provided to others under the program;

....

(iv) Restrict an individual in any way in the enjoyment of any advantage or privilege enjoyed by others receiving any service, financial aid, or other benefit under the program.

² Section 602 provides:

Each Federal department and agency which is empowered to extend Federal financial assistance to any program or activity, by way of grant, loan, or contract other than a contract of insurance or guaranty, is authorized and directed to effectuate the provisions of section 2000d of this title with respect to such program or activity by issuing rules, regulations, or orders of general applicability which shall be consistent with achievement of the objectives of the statute authorizing the financial assistance in connection with which the action is taken. . . .

42 U.S.C. § 2000d-1.

Discrimination among students on account of race or national origin that is prohibited includes “discrimination . . . in the availability or use of any academic . . . or other facilities of the grantee or other recipient.” *Id.*, § 80.5(b).

Discrimination is barred which has that effect even though no purposeful design is present: a recipient “may not . . . utilize criteria or methods of administration which have the effect of subjecting individuals to discrimination” or have the effect of defeating or substantially impairing accomplishment of the objectives of the program as respect individuals of a particular race, color, or national origin.” *Id.* § 80.3(b)(2).

It seems obvious that the Chinese-speaking minority receive fewer benefits than the English-speaking majority from respondents’ school system, which denies them a meaningful opportunity to participate in the educational program—all earmarks of the discrimination banned by the regulations.³ In 1970, HEW issued clarifying guidelines, 35 Fed.Reg. 11595, which include the following:

Where inability to speak and understand the English language excludes national origin minority group children from effective participation in the educational program offered by a school district, the district must take affirmative steps to rectify the language deficiency in order to open its instructional program to these students.

Any ability grouping or tracking system employed by the school system to deal with the special language skill needs of national origin minority group children must be designed to meet such language skill needs as soon as possible, and must not operate as an educational dead-end or permanent track.

Respondent school district contractually agreed to “comply with title VI of the Civil Rights Act of 1964 . . . and all requirements imposed by or pursuant to the Regulation” of HEW (45 CFR pt. 80) which are “issued pursuant to that title . . .” and also immediately to “take any measures necessary to effectuate this agreement.” The Federal Government has power to fix the terms on which its money allotments to the States shall be disbursed. *Oklahoma v. CSC*, 330 U.S. 127, 142-143. Whatever may be the limits of that power, *Steward Machine Co. v. Davis*, 301 U.S. 548, 590

et seq., they have not been reached here. Senator Humphrey, during the floor debates on the Civil Rights Act of 1964, said:⁴

Simple justice requires that public funds, to which all taxpayers of all races contribute, not be spent in any fashion which encourages, entrenches, subsidizes, or results in racial discrimination.

We accordingly reverse the judgment of the Court of Appeals and remand the case for the fashioning of appropriate relief.

Reversed and remanded.

MR. JUSTICE WHITE concurs in the result.

STEWART, J., Concurring Opinion

MR. JUSTICE STEWART, with whom THE CHIEF JUSTICE and MR. JUSTICE BLACKMUN join, concurring in the result.

It is uncontested that more than 2,800 school children of Chinese ancestry attend school in the San Francisco Unified School District system even though they do not speak, understand, read, or write the English language, and that, as to some 1,800 of these pupils, the respondent school authorities have taken no significant steps to deal with this language deficiency. The petitioners do not contend, however, that the respondents have affirmatively or intentionally contributed to this inadequacy, but only that they have failed to act in the face of changing social and linguistic patterns. Because of this *laissez faire* attitude on the part of the school administrators, it is not entirely clear that § 601 of the Civil Rights Act of 1964, 42 U.S.C. § 2000d standing alone, would render illegal the expenditure of federal funds on these schools. For that section provides that

[n]o person in the United States shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance.

On the other hand, the interpretive guidelines published by the Office for Civil Rights of the Department of Health, Education, and Welfare in 1970, 35 Fed.

³ And see Report of the Human Rights Commission of San Francisco, Bilingual Education in the San Francisco Public Schools, Aug. 9, 1973.

⁴ 110 Cong.Rec. 6543 (Sen. Humphrey, quoting from President Kennedy’s message to Congress, June 19, 1963).

Reg. 11595, clearly indicate that affirmative efforts to give special training for non-English-speaking pupils are required by Tit. VI as a condition to receipt of federal aid to public schools:

Where inability to speak and understand the English language excludes national origin minority group children from effective participation in the educational program offered by a school district, the district must take affirmative steps to rectify the language deficiency in order to open its instructional program to these students.¹

The critical question is, therefore, whether the regulations and guidelines promulgated by HEW go beyond the authority of § 601.² Last Term, in *Mourning v. Family Publications Service, Inc.*, 411 U.S. 356, 369, we held that the validity of a regulation promulgated under a general authorization provision such as § 602 of Tit. VI.³

will be sustained so long as it is “reasonably related to the purposes of the enabling legislation.” *Thorpe v. Housing Authority of the City of Durham*, 393 U.S. 268, 280-281 (1969).

I think the guidelines here fairly meet that test. Moreover, in assessing the purposes of remedial legislation, we have found that departmental regulations and “consistent administrative construction” are “entitled to great weight.” *Trafficante v. Metropolitan Life Insurance Co.*, 409 U.S. 205, 210; *Griggs v. Duke Power Co.*, 401 U.S. 424, 433-434; *Udall v. Tallman*, 380 U.S. 1. The Department has reasonably and consistently interpreted § 601 to require affirmative remedial efforts to give special attention to linguistically deprived children.

For these reasons I concur in the result reached by the Court.

BLACKMUN, J., Concurring Opinion

MR. JUSTICE BLACKMUN, with whom THE CHIEF JUSTICE joins, concurring in the result.

I join MR. JUSTICE STEWART’s opinion, and thus I, too, concur in the result. Against the possibility that the Court’s judgment may be interpreted too broadly, I stress the fact that the children with whom we are concerned here number about 1,800. This is a very substantial group that is being deprived of any meaningful schooling because the children cannot understand the language of the classroom. We may only guess as to why they have had no exposure to English in their preschool years. Earlier generations of American ethnic groups have overcome the language barrier by earnest parental endeavor or by the hard fact of being pushed out of the family or community nest and into the realities of broader experience.

I merely wish to make plain that, when, in another case, we are concerned with a very few youngsters, or with just a single child who speaks only German or Polish or Spanish or any language other than English, I would not regard today’s decision, or the separate concurrence, as conclusive upon the issue whether the statute and the guidelines require the funded school district to provide special instruction. For me, numbers are at the heart of this case, and my concurrence is to be understood accordingly.

Source: National Clearinghouse of English Language Acquisition (n.d.). *Lau v. Nichols* Supreme Court Decision [Online]. Available from <http://www.ncela.gwu.edu/pubs/lau>

¹ These guidelines were issued in further clarification of the Department’s position as stated in its regulations issued to implement Tit. VI, 45 CFR pt. 80. The regulations provide in part that no recipient of federal financial assistance administered by HEW may

Provide any service, financial aid, or other benefit to an individual which is different, or is provided in a different manner, from that provided to others under the program; [or]

Restrict an individual in any way in the enjoyment of any advantage or privilege enjoyed by others receiving any service, financial aid, or other benefit under the program.

45 CFR § 80.3(b)(1)(ii), (iv).

² The respondents do not contest the standing of the petitioners to sue as beneficiaries of the federal funding contract between the Department of Health, Education, and Welfare and the San Francisco Unified School District.

³ Section 602, 42 U.S.C. § 2000d-1, provides in pertinent part:

Each Federal department and agency which is empowered to extend Federal financial assistance to any program or activity, by way of grant, loan, or contract other than a contract of insurance or guaranty, is authorized and directed to effectuate the provisions of section 2000d of this title with respect to such program or activity by issuing rules, regulations, or orders of general applicability which shall be consistent with achievement of the objectives of the statute authorizing the financial assistance in connection with which the action is taken:

The United States as amicus curiae asserts in its brief, and the respondents appear to concede, that the guidelines were issued pursuant to § 602.

Task Force Findings Specifying Remedies Available for Eliminating Past Educational Practices Ruled Unlawful Under *Lau v. Nichols*

Department of Health, Education, and Welfare
Office of the Secretary

Washington, D.C. 20201
Office for Civil Rights
Summer 1975

Editor's Note: *This document is more commonly known as "Lau Remedies."*

I. Identification of Student's Primary or Home Language

The first step to be included in a plan submitted by a district found to be in noncompliance with Title VI under *Lau* is the method by which the district will identify the student's primary or home language. A student's primary or home language, for the purpose of this report, is other than English if it meets at least one of the following descriptions:

- A. The student's first acquired language is other than English.
- B. The language most often spoken by the student is other than English.
- C. The language most often spoken in the student's home is other than English, regardless of the language spoken by the student.

These assessments (A–C, above) must be made by persons who can speak and understand the necessary language(s). Then the district must assess the degree of linguistic function or ability of the student(s) so as to place the student(s) in one of the following categories by language.

- A. Monolingual speaker of the language other than English (speaks the language other than English exclusively).
- B. Predominantly speaks the language other than English (speaks mostly the language other than English, but speaks some English).
- C. Bilingual (speaks both the language other than English and English with equal ease).

D. Predominantly speaks English (speaks mostly English, but some of the language other than English).

E. Monolingual speaker of English (speaks English exclusively).

In the event that the student is multilingual (is functional in more than two languages in addition to English), such assessment must be made in all the necessary languages.

In order to make the aforementioned assessments the district must, *at a minimum, determine the language most often spoken in the student's home*, regardless of the language spoken by the student, the language most often spoken by the student in the home and the language spoken by the student in the social setting (by observation).

These assessments must be made by persons who can speak and understand the necessary language(s). An example of the latter would be to determine by observation, the language used by the student to communicate with peers between classes or in informal situations. These assessments must cross-validate one another (Example: student speaks Spanish at home and Spanish with classmates at lunch). Observers must estimate the frequency of use of each language spoken by the student in these situations.

In the event that the language determinations conflict (Example: student speaks Spanish at home, but English with classmates at lunch), *an additional method must be employed by the district to make such a determination.* (for example the district may wish to employ a test of language dominance as a third criterion). In other words, two of the three criteria will cross-validate or the majority of criteria will cross-validate (yield the same language).

Due to staff limitations and priorities, we will require a plan under *Lau* during this initial stage of investigation when the district has 20 or more students

of the same language group identified as having a primary or home language other than English. However, a district does have an obligation to serve any student whose primary or home language is other than English.

II. Diagnostic/Prescriptive Approach

The second part of a plan must describe the diagnostic/prescriptive measures to be used to identify the nature and extent of each student's educational needs and then prescribe an educational program utilizing the most effective teaching style to satisfy the diagnosed educational needs. The determination of which teaching style(s) are to be used will be based on a careful review of both the cognitive and affective domains and should include an assessment of the responsiveness of students to different types of cognitive learning styles and incentive motivational styles (e.g., competitive versus cooperative learning patterns). The diagnostic measures must include diagnoses of problems related to areas or subjects required of other students in the school program *and* prescriptive measures must serve to bring the linguistically/culturally different student(s) to the educational performance level that is expected by the Local Education Agency (LEA) and State of nonminority students. A program designed for students of limited English-speaking ability must not be operated in a manner so as to solely satisfy a set of objectives divorced or isolated from those educational objectives established for students in the regular school program.

III. Educational Program Selection

In the third step the district must implement the appropriate type(s) of educational program(s) listed in this section (III, 1–5), dependent upon the degree of linguistic proficiency of the students in question. If none seem applicable check with your *Lau* coordinator for further action.

1. In the case of the monolingual speaker of the language other than English (speaks the language other than English exclusively).

A. At the Elementary and Intermediate Levels:

Any one or combination of the following programs is acceptable.

1. Transitional Bilingual Education Program (TBE).
2. Bilingual/Bicultural Program.
3. Multilingual/Multicultural Program (see IX, Definition of Terms).

In the case of a TBE, the district must provide predictive data which show that such student(s) are ready to make the transition into English and will succeed educationally in content areas and in the educational program(s) in which he/she is to be placed. This is necessary so the district will not prematurely place the linguistically/culturally different student who is not ready to participate effectively in an English language curriculum in the regular school program (conducted exclusively in English).

Because an ESL program does not consider the affective nor cognitive development of students in this category and time and maturation variables are different here than for students at the secondary level, an ESL program *is not* appropriate.

B. At the Secondary Level:

Option 1: Such students may receive instruction in subject matter (example: math, science) in the native language(s) and receive English-as-a-Second Language (ESL) as a class component (see IX, Definition of Terms).

Option 2: Such students may receive required and elective subject matter (examples: math, science, industrial arts) in the native language(s) and bridge into English while combining English with the native language as appropriate (learning English as a first language, in a natural setting).

Option 3: Such students may receive ESL or High Intensive Language Training (HILT) (see IX, Definition of Terms), in English until they are fully functional in English (can operate equally successfully in school in English) then bridge into the school program for all other students.

A district may wish to utilize a TBE, Bilingual/Bicultural or Multilingual/Multicultural program in lieu of the three options presented in this section (III.I.B.). This is permissible. However, if the necessary prerequisite

skills in the native language(s) have not been taught to these students, some form of compensatory education in the native language must be provided.

In any case, students in this category (III.1.B.) must receive such instruction in a manner that is expeditiously carried out so that the student in question will be able to participate to the greatest extent possible in the regular school program as soon as possible. At no time can a program be selected in this category (III.1.B.) to place the students in situations where the method of instruction will result in a substantial delay in providing these students with the necessary English language skills needed by or required of other students at the time of graduation.

NOTE: You will generally find that students in this category are recent immigrants.

2. In the case of the predominant speaker of the language other than English (speaks mostly the language other than English, but speaks some English).

A. At the Elementary Level:

Any one or combination of the following programs is acceptable.

1. TBE
2. Bilingual/Bicultural Program
3. Multilingual/Multicultural Program

In the case of a TBE, the district must provide predictive data which show that such student(s) are ready to make the transition into English and will educationally succeed in content areas and the educational program in which he/she is to be placed.

Since an ESL program does not consider the affective nor cognitive development of the students in this category and the time and maturation variables are different here than for students at the secondary level, an ESL program *is not* appropriate.

B. At the Intermediate and High School Levels:

The district must provide data relative to the student's academic achievement and identify those students who have been in the school system for less than a year. If the student(s) who have been in the school system for less than a year are achieving at grade level or better, the district is not required to provide additional educational programs. If, however, the students who have been in the school system for a year or more are underachieving (not achieving at grade level) (see

IX, Definition of Terms), the district must submit a plan to remedy the situation. This may include smaller class size, enrichment materials, etc. In either this case or the case of students who are underachieving and have been in the school system for less than a year, the remedy must include any one or combination of the following (1) an ESL, (2) a TBE, (3) a Bilingual/Bicultural Program, (4) a Multilingual/Multicultural Program. *But* such students may not be placed in situations where all instruction is conducted in the native language as may be prescribed for the monolingual speaker of a language other than English, if the necessary prerequisite skills in the native language have not been taught. In this case some form of compensatory education in the native language must be provided.

NOTE: You will generally find that students in this category are not recent immigrants.

3. In the case of the bilingual speaker (speaks both the language other than English and English with equal ease) the district must provide data relative to the student(s) academic achievement.

In this case the treatment is the same at the elementary, intermediate and secondary levels and differs only in terms of underachievers and those students achieving at grade level or better.

- A. For the students in this category who are underachieving, treatment corresponds to the regular program requirements for all racially/ ethnically identifiable classes or tracks composed of students who are underachieving, regardless of their language background.
- B. For the students in this category who are achieving at grade level or better, the district is not required to provide additional educational programs.

4. In the case of the predominant speaker of English (speaks mostly English, but some of a language other than English) treatment for these students is the same as III, 3 above.

5. In the case of the monolingual speaker of English (speaks English exclusively) treat the same as III, 3 above.

NOTE: ESL is a necessary component of all the aforementioned programs. However, an ESL program may not be sufficient as the *only* program operated by a district to respond to the educational needs of all the types of students described in this document.

IV. Required and Elective Courses

In the fourth step of such plan the district must show that the required and elective courses are not designed to have a discriminatory effect.

A. Required courses

Required courses (example: American History) must not be designed to exclude pertinent minority developments which have contributed to or influenced such subjects.

B. Elective courses and co-curricular activities

Where a district has been found out of compliance and operates racially/ethnically identifiable elective courses or co-curricular activities, the plan must address this area by either educationally justifying the racial/ethnic identifiability of these courses or activities, eliminating them, or guaranteeing that these courses or co-curricular activities will not remain racially/ethnically identifiable.

There is a prima facie case of discrimination if courses are racially/ethnically identifiable.

Schools must develop strong incentives and encouragement for minority students to enroll in electives where minorities have not traditionally enrolled. In this regard, counselors, principals and teachers have a most important role. Title VI compliance questions are raised by any analysis of counseling practices which indicates that minorities are being advised in a manner which results in their being disproportionately channeled into certain subject areas or courses. The school district must see that all of its students are encouraged to fully participate and take advantage of all educational benefits.

Close monitoring is necessary to evaluate to what degree minorities are in essence being discouraged from taking certain electives and encouraged to take other elective courses and insist that to eliminate discrimination and to provide equal educational opportunities, districts must take affirmative duties to see that minority students are not excluded from any elective courses and over included in others.

All newly established elective courses cannot be designed to have a discriminatory effect. This means that a district cannot, for example, initiate a course in Spanish literature designed exclusively for Spanish-speaking students so that enrollment in that subject is designed to result in the exclusion of students whose native language is English but who could equally

benefit from such a course and/or be designed to result in the removal of the minority students in question from a general literature course which should be designed to be relevant for all the students served by the district.

V. Instructional Personnel Requirements (see IX, Definition of Terms)

Instructional personnel teaching the students in question must be linguistically/culturally familiar with the background of the students to be affected.

The student/teacher ratio for such programs should equal or be less than (fewer students per teacher) the student/teacher ratio for the district. However, we will not require corrective action by the district if the numbers of students in such programs are no more than five greater per teacher than the student/teacher ratio for the district.

If instructional staffing is inadequate to implement program requirements, in-service training, directly related to improving student performance is acceptable as an immediate and temporary response. Plans for providing this training must include at least the following:

1. Objectives of training (must be directly related to ultimately improving student performance).
2. Methods by which the objective(s) will be achieved.
3. Method for selection of teachers to receive training.
4. Names of personnel doing the training and location of training.
5. Content of training.
6. Evaluation design of training and performance criteria for individuals receiving the training.
7. Proposed timetables.

This temporary in-service training must continue until staff performance criteria has been met.

Another temporary alternative is utilizing para professional persons with the necessary language(s) and cultural background(s). Specific instructional roles of such personnel *must be* included in the plan. Such plan must show that this personnel will aid in teaching and not be restricted to those areas unrelated to the teaching process (checking roll, issuing tardy cards, etc.).

In addition, the district must include a plan for securing the number of qualified teachers necessary to fully implement the instructional program. Development and training of paraprofessionals may be an important source for the development of bilingual/bicultural teachers.

VI. Racial/Ethnic Isolation and/or Identifiability of Schools and Classes

A. Racially/ethnically isolated and/or identifiable schools

It is not educationally necessary nor legally permissible to create racially/ethnically identifiable schools in order to respond to student language characteristics as specified in the programs described herein.

B. Racially/ethnically isolated and/or identifiable classes

The implementation of the aforementioned educational models do not justify the existence of racially/ethnically isolated or identifiable classes, per se. Since there is no conflict in this area as related to the application of the Emergency School Aid Act (ESAA) and existing Title VI regulations, standard application of those regulations is effective.

VII. Notification to Parents of Students Whose Primary or Home Language Is Other Than English

A. School districts have the responsibility to effectively notify the parents of the students identified as having a primary or home language other than English of all school activities or notices which are called to the attention of other parents. Such notice, in order to be adequate, must be provided in English and in the necessary language(s) comprehensively paralleling the exact content in English. Be aware that a literal translation may not be sufficient.

B. The district must inform all minority and non-minority parents of all aspects of the programs designed for students of limited English-speaking ability and that these programs constitute an integral part of the total school program.

VIII. Evaluation

A “Product and Process” evaluation is to be submitted in the plan. This type of evaluation, in addition to stating the “product” (end result), must include “process evaluation” (periodic evaluation throughout the implementation stage). A description of the *evaluation design* is required. Time-lines (target for completion of steps) is an essential component.

For the *first three years*, following the implementation of a plan, the district must submit to the OCR Regional Office at the close of sixty days after school starts, a “progress report” which will show the steps which have been completed. For those steps which have not been completed, a narrative from the district is necessary to explain why the targeted completion dates were not met. Another “progress report” is also due at the close of 30 days after the last day of the school year in question.

IX. Definition of Terms:

1. *Bilingual/Bicultural Program*: A program which utilizes the student’s native language (example: Navajo) and cultural factors in instruction maintaining and further developing all the necessary skills in the student’s native language and culture while introducing, maintaining and developing all the necessary skills in the second language and culture (example: English). The end result is a student who can function, totally, in both languages and cultures.
2. *English-as-a-Second Language (ESL)*: A structured language acquisition program designed to teach English to students whose native language is not English.
3. *High Intensive Language Training (HILT)*: A total immersion program designed to teach students a new language.
4. *Multilingual/Multicultural Program*: A program operated under the same principles as a Bilingual/Bicultural program (X, 1) *except* that more than one language and culture, in addition to English language and culture, is treated. The end result is a student who can function, totally, in more than two languages and cultures.

5. *Transitional Bilingual Education Program (TBE)*: A program operated in the same manner as a Bilingual/Bicultural Program, except that once the student is fully functional in the second language (English), further instruction in the native language is no longer required.
6. *Underachievement*: Underachievement is defined as performance in each subject area (e.g., reading, problem solving) at one or more standard deviations below district norms as determined by some objective measures for non-ethnic/racial minority

students. Mental ability scores cannot be utilized for determining grade expectancy.

7. *Instructional Personnel*: Persons involved in teaching activities. Such personnel includes, but is not limited to, certified, credentialized teachers, paraprofessionals, teacher aides, parents, community volunteers, youth tutors, etc.

**United States
Department of Education**

**Office of the Assistant
Secretary for Civil Rights**

April 6, 1990

TO: OCR Senior Staff
FROM: William L. Smith, Acting Assistant Secretary
for Civil Rights
SUBJECT: Office for Civil Rights Policy Regarding
the Treatment of National Origin Minority
Students Who Are Limited English Proficient

I have recently received a number of inquiries regarding the Office for Civil Rights' (OCR) policy related to making determinations of compliance under Title VI of the Civil Rights Act of 1964 as regards the treatment of national origin minority students who are limited English proficient (language minority students). In responding to these inquiries, I am aware that our existing policy and procedures were issued several years ago and may be in need of updating. In fact, the Policy and Enforcement Service (PES) will issue such an update during the third quarter of FY 1990.

Until that document is available, you can, of course, continue to follow our current policy documents available to you. The May 25th Memorandum, as affirmed by the Supreme Court in the *Lau v. Nichols* decision, 44 U.S. 653 (1974), provides the legal standard for the Education Department's Title VI policy concerning discrimination on the basis of national origin. The procedures OCR follows in applying this legal standard on a case-by-case basis are set forth in a document issued to OCR staff on December 3, 1985, entitled, *OCR's Title VI Language Minority Compliance Procedures* (copy attached).

In developing its policy update, PES staff will review the cases we have investigated over the past few years, in addition to examining the case law, to determine where additional guidance may be needed. It will be helpful for PES attorneys to discuss various aspects of these cases with some regional staff who have had substantial recent experience in applying our case-by-case approach. I understand that there have been some excellent investigations carried out under this policy. You will be consulted prior to any discussions on these matters with members of your staff. In the meantime, I urge you to continue to investigate complaints of discrimination against national origin minority students and to conduct compliance reviews on this issue where appropriate.

If you have questions about the application of current policy, or if you have suggestions for policy modifications, you may call Cathy Lewis or send your information to me in writing.

Secretary for Civil Rights**

**The Office for Civil Rights' Title VI
Language Minority
Compliance Procedures**

Issue

This discussion provides a description of the procedures followed by the Office for Civil Rights (OCR) in making determinations of compliance with Title VI of the Civil Rights Act of 1964, as regards the treatment of national origin minority students with limited-English proficiency (language minority students) enrolled in educational programs that receive Federal financial assistance from the Department of Education.

Background

As part of the Civil Rights Act of 1964, Congress enacted Title VI, prohibiting discrimination on the grounds of race, color or national origin in programs or activities that receive Federal financial assistance. In May 1970, the former Department of Health, Education and Welfare (DHEW) published a memorandum to school districts on the *Identification of Discrimination and Denial of Services on the Basis of National Origin* (the May 25th Memorandum, 35 *Fed. Reg.* 11595—Tab A). The purpose of the May 25th Memorandum was to clarify OCR's Title VI policy on issues concerning the responsibility of school districts to provide equal educational opportunity to language minority students. The May 25th Memorandum stated in part:

Where inability to speak and understand the English language excludes national origin minority-group children from effective participation in the educational program offered by a school district, the district must take affirmative steps to rectify the language

deficiency in order to open its instructional program to these students.

In 1974, the Supreme Court upheld this requirement to take affirmative steps in the *Lau v. Nichols* decision, 414 U.S. 653 (1974). The May 25th Memorandum, as affirmed by *Lau*, continues to provide the legal standard for the Education Department's (the Department) Title VI policy concerning discrimination on the basis of national origin. The *Lau* decision did not require school districts to use any particular program or teaching method. The opinion of the Court states:

No specific remedy is urged upon us. Teaching English to the students of Chinese ancestry who do not speak the language is one choice. Giving instruction to this group in Chinese is another. There may be others. *Id.* at 565.

In 1975, the former DHEW promulgated a document designed to describe appropriate educational steps that would satisfy the Supreme Court's *Lau* mandate (*Task Force Findings Specifying Remedies Available for Eliminating Unlawful Under Lau v. Nichols*). These "*Lau Remedies*" evolved into *de facto* compliance standards, which allowed undue Federal influence over educational judgments that could and should be made by local and state educational authorities.

In August 1980, the newly-formed Department of Education published a Notice of Proposed Rulemaking (NPRM) that sought to replace the unofficial "*Lau Remedies*" with a document that would have set forth requirements for all schools enrolling language minority students. The 1980 NPRM proposed bilingual education as the required method of instruction in schools with sufficient numbers of language minority students of one language group.

Subsequently, the Department determined that the proposed regulations were intrusive and burdensome. They were withdrawn on February 2, 1981, and OCR put into effect nonprescriptive interim procedures pertaining to the effective participation of language minority students in the educational program offered by a school district. Under these procedures, OCR reviews the compliance of school districts on a case-by-case basis. Any educational approach that ensures the effective participation of language minority students in the district's educational program is accepted as a means of complying with the Title VI requirements.

Since this compliance approach has been successful, OCR has determined that these procedures

provide sufficient guidance for OCR staff and school districts. Accordingly, OCR will continue to follow procedures which allow for a case-by-case determination of a district's compliance status. Set forth below is an updated statement of OCR's current procedures, and a discussion of the analysis applied by OCR in assessing a district's efforts to meet the requirements of Title VI and the May 25th Memorandum.

OCR's Current Procedures

OCR conducts investigations of the educational services provided for language minority students either as a result of a complaint allegation or through a compliance review. Although the May 25th Memorandum and *Lau v. Nichols* decision require school districts to "take affirmative steps" to open their instructional programs to language minority students, OCR does not require the submission of a written compliance agreement (plan) unless a violation of Title VI has been established.

The affirmative steps required by the May 25th Memorandum have been interpreted to apply to national origin minority students who are learning English as a second language, or whose ability to learn English has been substantially diminished through lack of exposure to the language. The May 25th Memorandum does not generally cover national origin minority students whose only language is English, and who may be in difficulty academically, or who have language skills that are less than adequate.

In providing educational services to language minority students, school districts may use any method or program that has proven successful, or may implement any sound educational program that promises to be successful. Districts are expected to carry out their programs, evaluate the results to make sure the programs are working as anticipated, and modify programs that do not meet these expectations.

OCR considers two general areas in determining whether a school district that enrolls language minority students is in compliance with Title VI. These are:

- whether there is a need for the district to provide an alternative program designed to meet the educational needs of all language minority students; and
- whether the district's alternative program is likely to be effective in meeting the educational needs of its language minority students.

The question of need for an alternative program is resolved by determining whether language minority

students are able to participate effectively in the regular instructional program. When they are not, the school district must provide an alternative program. In cases where the number of these students is small, the alternative program may be informal (i.e., no formal program description is required).

The second major area of consideration is whether the district's alternative program is likely to be effective in meeting the educational needs of its language minority students. There is considerable debate among educators about the most effective way to meet the educational needs of language minority students in particular circumstances. A variety of factors influence the success of any approach or pedagogy. These factors include not only individual student characteristics, such as age and previous education, but also school characteristics, such as the number and the concentration of different language groups. OCR staff is not in the position to make programmatic determinations and does not presume to make those decisions.

OCR's deliberations are appropriately directed to determining whether the district has addressed these problems, and has developed and implemented an educational program designed to ensure the effective participation of language minority students. The following sets forth an analytical framework used by OCR in determining whether a school district's program is in compliance with Title VI in this area:

I. Whether there is a Need for an Alternative Program.

The determination of whether all language minority students in need have been served may be made in a number of ways. For example, a district may establish cut-off criteria for the placement of language minority students in either the regular or alternative programs based on the English language proficiency levels required for effective participation in their regular instructional programs. Alternatively, past academic records of language minority students may be used to predict, for example, which new students are likely to require the assistance provided by the alternative program.

Many school districts screen students using information such as a language assessment test, information from parents, or structured interviews, to determine which language minority students may need further assessment and possible placement into an alternative program. The appropriateness of assessment methods and procedures depends upon several variables, such as the number of language minority students in each

language group, the ages of these students, the size of the school district, and the availability of reliable assessment instruments in the different languages.

The district may show that the academic performance of language minority students in the regular instructional program indicates that these students do not require the assistance provided by the alternative program. The district may also show that language minority students who need assistance can readily transfer from the regular to the alternative program for the portion of the school day during which assistance is needed.

OCR will find a violation of Title VI if language minority students in need of an alternative program are not being provided such a program. However, the mere absence of formal identification and assessment procedures and of a formal program does not, per se, constitute a violation of Title VI. Regional staff is cautioned to review carefully the school district's reasons for not having such procedures, and the effectiveness of any informal methods that may be used. For example, a school district that has received a recent influx of language minority students may not be reasonably expected to have in place the type of procedures and programs that other districts with more predictable language minority student populations should have. Similarly, a school district with only a small number of language minority students, may not need the formal procedures and programs necessary in districts with much larger numbers of such students. In the past, OCR has worked with such districts, in conjunction with State education agencies, to provide technical assistance in an effort to prevent future Title VI problems.

II. Whether the Alternative Program is likely to be Effective.

- A. Is the alternative program based on a sound design?

School districts must demonstrate that the alternative program designed to ensure the effective participation of language minority students in the educational program is based on a sound educational approach.

OCR avoids making educational judgments or second-guessing decisions made by local education officials. Instead, OCR looks at all the available evidence describing the steps taken to ensure that sound and appropriate programs are in place. Example of factors that would be considered are:

- Whether the program has been determined to be a sound educational program by at least some experts in the field.

An expert in the field can be defined as someone whose experience and training expressly qualifies him or her to render such judgments and whose objectivity is not at issue.

- Whether there is an explanation of how the program meets the needs of language minority students.

Such an explanation would normally include a description of the program components and activities, along with a rationale that explains how the program activities can be reasonably expected to meet the educational needs of language minority students.

- Whether the district is operating under an approved state plan or other accepted plans.

Plans that have previously been accepted by OCR as being in compliance with Title VI continue to be acceptable. These plans may be modified by school districts at any time. When comprehensive programs are mandated by state law, OCR will approve such plans, upon request, where it can be demonstrated that the plans provide a sound educational program that will meet the educational needs of language minority students. When a plan applies only to certain grade levels, the acceptance memorandum is limited to those grades covered under the state plan.

- B. Is the alternative program being carried out in such a way as to ensure the effective participation of the language minority students as soon as reasonably possible?

Districts are expected to carry out their programs effectively, with appropriate staff (teachers and aides), and with adequate resources (instructional materials and equipment).

- Appropriateness of staff

The appropriateness of staff is indicated by whether their training, qualifications, and experience are consonant with the requirements of the program. For example, their appropriateness would be questioned if a district has established an English-as-a-Second-Language (ESL) program, but the staff had no ESL training and there was no provision for ESL teacher training.

- Adequacy of resources

The adequacy of resources is determined by the timely availability of required equipment and instructional materials. Limited financial resources do not justify failure to remedy a Title VI violation. However, OCR considers the extent to which a particular remedy would require a district to divert resources from other necessary educational resources and services.

Similarly, districts faced with a shortage of trained teachers, or with a multiplicity of languages, may not be able to meet certain staffing requirements, such as those needed for an intensive ESL program or a bilingual program. OCR does not require a program that places unrealistic expectations on a district.

- C. Is the alternative program being evaluated by the district and are modifications made in the program when the district's evaluation indicates they are needed?

A district will be in compliance with Title VI when it has adopted an alternative educational program that, when viewed in its entirety, effectively teaches language minority students English, and moves them into the regular educational program within a reasonable period of time. A more difficult compliance determination arises when a district implements an educational approach which, by all available objective measures, does not provide language minority students with the opportunity for effective participation.

For the reasons discussed earlier in this document, OCR approaches this compliance issue with great caution. Since OCR does not presume to know which educational strategy is most appropriate in a given situation, the failure of any particular strategy or program employed by a school district is more properly addressed by school officials. OCR looks to local school officials to monitor the effectiveness of their programs, to determine what modifications may be needed when the programs are not successful after a reasonable trial period, and to implement such modifications. A school district's continued or consistent failure to improve an ineffective alternative program for language minority students may lead to a finding of noncompliance with Title VI.

There are no specific regulatory requirements regarding the data a district must keep on its alternative programs for language minority students. OCR's current approach to determining compliance with Title VI on this issue does not require that new, additional,

or specifically designed records be kept. It is expected that a sound educational program will include the maintenance of reasonably accurate and complete data regarding its implementation and the progress of students who move through it.

Conclusion

In viewing a school district's compliance with Title VI regarding effective participation of language minority students in the educational program, OCR does not require schools to follow any particular educational approach. The test for legal adequacy is whether the strategy adopted works—or promises to work—on the basis of past practice or in the judgment of experts in the field. OCR examines all the available evidence

within the analytical framework described, and determines whether the preponderance of evidence supports the conclusion that the district is implementing a sound educational program that ensures the effective participation of its language minority students.

Washington, D.C. 20202

Memorandum

Sep. 27, 1991

TO: OCR Senior Staff
FROM: Michael L. Williams, Assistant Secretary for
Civil Rights
SUBJECT: Policy Update on Schools' Obligations
Toward National Origin Minority Students With
Limited-English Proficiency (LEP students)

This policy update is primarily designed for use in conducting *Lau*¹ compliance reviews—that is, compliance reviews designed to determine whether schools are complying with their obligation under the regulation implementing Title VI of the Civil Rights Act of 1964 to provide any alternative language programs necessary to ensure that national origin minority students with limited-English proficiency (LEP students) have meaningful access to the schools' programs. The policy update adheres to OCR's past determination that Title VI does not mandate any particular program of instruction for LEP students. In determining whether the recipient is operating a program for LEP students that meets Title VI requirements, OCR will consider whether: (1) the program the recipient chooses is recognized as sound by some experts in the field or is considered a legitimate experimental strategy; (2) the programs and practices used by the school system are reasonably calculated to implement effectively the educational theory adopted by the school; and (3) the program succeeds, after a legitimate trial, in producing results indicating that students' language barriers are actually being overcome. The policy update also discusses some difficult issues that frequently arise in *Lau* investigations. An appendix to the policy discusses the continuing validity of OCR's use of the *Castañeda*² standard to determine compliance with the Title VI regulation.

This document should be read in conjunction with the December 3, 1985, guidance document entitled, "The Office for Civil Rights' Title VI Language

Minority Compliance Procedures," and the May 1970 memorandum to school districts entitled, "Identification of Discrimination and Denial of Services on the Basis of National origin," 35 Fed. Reg. 11595 (May 1970 Memorandum). It does not supersede either document.³ These two documents are attached for your convenience.

Part I of the policy update provides additional guidance for applying the May 1970 and December 1985 memoranda that describe OCR's Title VI *Lau* policy. In Part I, more specific standards are enunciated for staffing requirements, exit criteria and program evaluation. Policy issues related to special education programs, gifted/talented programs, and other special programs are also discussed. Part II of the policy update describes OCR's policy with regard to segregation of LEP students.

The appendix to this policy update discusses the use of the *Castañeda* standard and the way in which Federal courts have viewed the relationship between Title VI and the Equal Educational Opportunities Act of 1974.

With the possible exception of *Castañeda*, which provides a commonsense analytical framework for analyzing a district's program for LEP students that has been adopted by OCR, and *Keyes v. School Dist. No. 1*, which applied the *Castañeda* principles to the Denver Public Schools, most court decisions in this area stop short of providing OCR and recipient institutions with specific guidance. The policy standards enunciated in this document attempt to combine the most definitive court guidance with OCR's practical legal and policy experience in the field. In that regard, the issues discussed herein, and the policy decisions reached, reflect a careful and thorough examination of *Lau* case investigations carried out by OCR's regional offices over the past few years, comments from the regional offices on a draft version of the policy, and lengthy discussions on the issues with some of OCR's most experienced investigators. Specific recommendations from participants at the Investigative Strategies Workshop have also been considered and incorporated where appropriate.

¹ *Lau v. Nichols*, 414 U.S. 563, 94 S.Ct. 786 (1974).

² *Castañeda v. Pickard*, 648 F. 2d 989 (5th Cir. 1981).

³ These and other applicable policy documents can be located through OCR's automated Policy Codification System (PCS) by selecting "current" policy and the keywords "Limited-English Proficient (LEP) Student" (F054). Documents not listed as "current" policy in the PCS should not be used.

I. Additional guidance for applying the May 1970 and December 1985 memoranda

The December 1985 memorandum listed two areas to be examined in determining whether a recipient was in compliance with Title VI: (1) the need for an alternative language program for LEP students; and (2) the adequacy of the program chosen by the recipient. Issues related to the adequacy of the program chosen by the recipient will be discussed first, as they arise more often in *Lau* investigations. Of course, the determination of whether a recipient is in violation of Title VI will require a finding that language minority students are in need of an alternative language program in order to participate effectively in the recipient's educational program.

A. Adequacy of Program

This section of the memorandum provides additional guidance for applying the three-pronged *Castañeda* approach as a standard for determining the adequacy of a recipient's efforts to provide equal educational opportunities for LEP students.

1. Soundness of educational approach

Castañeda requires districts to use educational theories that are recognized as sound by some experts in the field, or at least theories that are recognized as legitimate educational strategies. 648 F. 2d at 1009. Some approaches that fall under this category include transitional bilingual education, bilingual/bicultural education, structured immersion, developmental bilingual education, and English as a Second Language (ESL). A district that is using any of these approaches has complied with the first requirement of *Castañeda*. If a district is using a different approach, it is in compliance with *Castañeda* if it can show that the approach is considered sound by some experts in the field or that it is considered a legitimate experimental strategy.

2. Proper Implementation

Castañeda requires that "the programs and practices actually used by a school system [be] reasonably calculated to implement effectively the educational theory adopted by the school." 648 F. 2d at 1010. Some problematic implementation issues have included staffing requirements for programs, exit criteria, and access to programs such as gifted/talented programs. These issues are discussed below.

Staffing requirements. Districts have an obligation to provide the staff necessary to implement their chosen program properly within a reasonable period of time. Many states and school districts have established formal qualifications for teachers working in a program for limited-English-proficient students. When formal qualifications have been established, and when a district generally requires its teachers in other subjects to meet formal requirements, a recipient must either hire formally qualified teachers for LEP students or require that teachers already on staff work toward attaining those formal qualifications. *See Castañeda*, 648 F. 2d at 1013. A recipient may not in effect relegate LEP students to second-class status by indefinitely allowing teachers without formal qualifications to teach them while requiring teachers of non-LEP students to meet formal qualifications. *See* 34 C.F.R. § 100.3(b)(ii).⁴

Whether the district's teachers have met any applicable qualifications established by the state or district does not conclusively show that they are qualified to teach in an alternative language program. Some states have no requirements beyond requiring that a teacher generally be certified, and some states have established requirements that are not rigorous enough to ensure that their teachers have the skills necessary to carry out the district's chosen educational program.⁵ Discussed below are some minimum qualifications for teachers in alternative language programs.

⁴But *cf. Teresa P. v. Berkeley Unified School District*, 724 F. Supp. 698, 714 (N.D. Cal. 1989) (finding that district had adequately implemented its language remediation program even though many of its bilingual and ESL teachers did not hold applicable credentials; court noted that district probably could not have obtained fully credentialed teachers in all language groups, district was requiring teachers to work toward completion of credential requirements as a condition of employment, record showed no differences between achievement of students taught by credentialed teachers and achievement of students taught by uncredentialed teachers, and district's financial resources were severely limited).

⁵*Cf. Castañeda*, 648 F. 2d at 1013 (court of appeals remanded for determination as to whether deficiencies in teaching skills were due to inadequate training program [100-hour program designed to provide 700-word Spanish vocabulary] or whether failure to master program caused teaching deficiencies).

If a recipient selects a bilingual program for its LEP students, at a minimum, teachers of bilingual classes should be able to speak, read, and write both languages, and should have received adequate instruction in the methods of bilingual education. In addition, the recipient should be able to show that it has determined that its bilingual teachers have these skills. *See Keyes*, 576 F. Supp. at 1516-17 (criticizing district for designating teachers as bilingual based on an oral interview and for not using standardized tests to determine whether bilingual teachers could speak and write both languages); *cf. Castañeda*, 648 F. 2d at 1013 (“A bilingual education program, however sound in theory, is clearly unlikely to have a significant impact on the language barriers confronting limited English speaking school children, if the teachers charged with the day-to-day responsibility for educating these children are termed ‘qualified’ despite the fact that they operate in the classroom under their own unremedied language disability”). In addition, bilingual teachers should be fully qualified to teach their subject.

If a recipient uses a method other than bilingual education (such as ESL or structured immersion), the recipient should have ascertained that teachers who use those methods have been adequately trained in them. This training can take the form of in-service training, formal college coursework, or a combination of the two. In addition, as with bilingual teachers, a recipient should be able to show that it has determined that its teachers have mastered the skills necessary to teach effectively in a program for LEP students. In making this determination, the recipient should use validated evaluative instruments—that is, tests that have been shown to accurately measure the skills in question. The recipient should also have the teacher’s classroom performance evaluated by someone familiar with the method being used.

ESL teachers need not be bilingual if the evidence shows that they can teach effectively without bilingual skills. *Compare Teresa P.*, 724 F. Supp. at 709 (finding that LEP students can be taught English effectively by monolingual teachers), *with Keyes*, 576 F. Supp. at 1517 (“The record shows that in the secondary schools there are designated ESL teachers who have no second language capability. There is no basis for assuming that the policy objectives of the

[transitional bilingual education] program are being met in such schools”).

To the extent that the recipient’s chosen educational theory requires native language support, and if the program relies on bilingual aides to provide such support, the recipient should be able to demonstrate that it has determined that its aides have the appropriate level of skill in speaking, reading, and writing both languages.⁶ In addition, the bilingual aides should be working under the direct supervision of certificated classroom teachers. Students should not be getting instruction from aides rather than teachers. 34 C.F.R. § 100.3(b)(1)(ii); *see Castañeda*, 648 F.2d at 1013 (“The use of Spanish speaking aides may be an appropriate interim measure, but such aides cannot . . . take the place of qualified bilingual teachers”).

Recipients frequently assert that their teachers are unqualified because qualified teachers are not available. If a recipient has shown that it has unsuccessfully tried to hire qualified teachers, it must provide adequate training to teachers already on staff to comply with the Title VI regulation. *See Castañeda*, 648 F. 2d at 1013. Such training must take place as soon as possible. For example, recipients sometimes require teachers to work toward obtaining a credential as a condition of employment in a program for limited-English-proficient students. This requirement is not, in itself, sufficient to meet the recipient’s obligations under the Title VI regulation. To ensure that LEP students have access to the recipient’s programs while teachers are completing their formal training, the recipient must ensure that those teachers receive sufficient interim training to enable them to function adequately in the classroom, as well as any assistance from bilingual aides that may be necessary to carry out the recipient’s interim program.

Exit Criteria for Language Minority LEP Students. Once students have been placed in an alternative language program, they must be provided with services until they are proficient enough in English to participate meaningfully in the regular educational program. Some factors to examine in determining whether formerly LEP students are able to participate meaningfully in the regular educational program include: (1) whether

⁶Aides at the kindergarten and first-grade levels need not demonstrate reading and writing proficiency.

they are able to keep up with their non-LEP peers in the regular educational program; (2) whether they are able to participate successfully in essentially all aspects of the school's curriculum without the use of simplified English materials; and (3) whether their retention in-grade and drop-out rates are similar to those of their non-LEP peers.

Generally, a recipient will have wide latitude in determining criteria for exiting students from an alternative language program, but there are a few basic standards that should be met. First, exit criteria should be based on objective standards, such as standardized test scores, and the district should be able to explain why it has decided that students meeting those standards will be able to participate meaningfully in the regular classroom. Second, students should not be exited from the LEP program unless they can read, write, and comprehend English well enough to participate meaningfully in the recipient's program. Exit criteria that simply test a student's oral language skills are inadequate. *Keyes*, 576 F. Supp. at 1518 (noting importance of testing reading and writing skills as well as oral language skills). Finally, alternative programs cannot be "dead end" tracks to segregate national origin minority students.

Many districts design their LEP programs to temporarily emphasize English over other subjects. While schools with such programs may discontinue special instruction in English once LEP students become English-proficient, schools retain an obligation to provide assistance necessary to remedy academic deficits that may have occurred in other subjects while the student was focusing on learning English. *Castañeda*, 648 F. 2d at 1011.

Special Education Programs. OCR's overall policy on this issue, as initially announced in the May 1970 memorandum, is that school systems may not assign students to special education programs on the basis of criteria that essentially measure and evaluate English language skills. The additional legal requirements imposed by Section 504 also must be considered when conducting investigations on this issue. This policy update does not purport to address the numerous Title VI and Section 504 issues related to the placement of limited-English-proficient students in special education programs. Although OCR staff are very familiar with Section 504 requirements, additional guidance on the relationship between Section 504 and *Lau* issues that arise under

Title VI may be helpful. A separate policy update will be prepared on those issues.

Pending completion of that policy update, *Lau* compliance reviews should continue to include an inquiry into the placement of limited-English-proficient students into special education programs where there are indications that LEP students may be inappropriately placed in such programs, or where special education programs provided for LEP students do not address their inability to speak or understand English. In addition, compliance reviews should find out whether recipients have policies of "no double services": that is, refusing to provide both alternative language services and special education to students who need them. Such inquiries would entail obtaining basic data and information during the course of a *Lau* compliance review regarding placement of LEP students into special education programs. If data obtained during the inquiry indicates a potential problem regarding placement of LEP students into special education, the regional office may want to consult headquarters about expanding the time frames for the review to ensure that it can devote the time and staff resources to conduct a thorough investigation of these issues. Alternatively, the region could schedule a compliance review of the special education program at a later date. In small- to medium-sized school districts, regional offices may be able to gather sufficient data to make a finding regarding the special education program as part of the overall *Lau* review.

Gifted/Talented Programs and Other Specialized Programs. The exclusion of LEP students from specialized programs such as gifted/talented programs may have the effect of excluding students from a recipient's programs on the basis of national origin, in violation of 34 C.F.R. § 100.3(b)(2), unless the exclusion is educationally justified by the needs of the particular student or by the nature of the specialized program.

LEP students cannot be categorically excluded from gifted/talented or other specialized programs. If a recipient has a process for locating and identifying gifted/talented students, it must also locate and identify gifted/talented LEP students who could benefit from the program.

In determining whether a recipient has improperly excluded LEP students from its gifted/talented or other specialized programs, OCR will carefully examine the recipient's explanation for the lack of participation by

LEP students. OCR will also consider whether the recipient has conveyed these reasons to students and parents.

Educational justifications for excluding a particular LEP student from a specialized program should be comparable to those used in excluding a non-LEP peer and include: (1) that time for the program would unduly hinder his/her participation in an alternative language program; and (2) that the specialized program itself requires proficiency in English language skills for meaningful participation.

Unless the particular gifted/talented program or program component requires proficiency in English language skills for meaningful participation, the recipient must ensure that evaluation and testing procedures do not screen out LEP students because of their limited-English proficiency. To the extent feasible, tests used to place students in specialized programs should not be of a type that the student's limited proficiency in English will prevent him/her from qualifying for a program for which they would otherwise be qualified.

3. Program Evaluation

In return for allowing a school's flexibility in choosing and implementing an alternative language program, *Castañeda* requires recipients to modify their programs if they prove to be unsuccessful after a legitimate trial. As a practical matter, recipients cannot comply with this requirement without periodically evaluating their programs. If a recipient does not periodically evaluate or modify its programs, as appropriate, it is in violation of the Title VI regulation unless its program is successful. *Cf. Keyes*, 576 F. Supp. at 1518 ("The defendant's program is also flawed by the failure to adopt adequate tests to measure the results of what the district is doing. . . . The lack of an adequate measurement of the effects of such service [to LEP students] is a failure to take reasonable action to implement the transitional bilingual policy").

Generally, "success" is measured in terms of whether the program is achieving the particular goals the recipient has established for the program. If the recipient has established no particular goals, the program is successful if its participants are overcoming

their language barriers sufficiently well and sufficiently promptly to participate meaningfully in the recipient's programs.

B. Need for a formal program

Recipients should have procedures in place for identifying and assessing LEP students. As the December 1985 memorandum stated, if language minority students in need of an alternative language program are not being served, the recipient is in violation of Title VI.

The type of program necessary to adequately identify students in need of services will vary widely depending on the demographics of the recipients' schools. In districts with few LEP students, at a minimum, school teachers and administrators should be informed of their obligations to provide necessary alternative language services to students in need of such services, and of their obligation to seek any assistance necessary to comply with this requirement. Schools with a relatively large number of LEP students would be expected to have in place a more formal program.

Title VI does not require an alternative program if, without such a program, LEP students have equal and meaningful access to the district's programs. It is extremely rare for an alternative program that is inadequate under *Castañeda* to provide LEP students with such access. If a recipient contends that its LEP students have meaningful access to the district's programs, despite the lack of an alternative program or the presence of a program that is inadequate under *Castañeda*, some factors to consider in evaluating this claim are: (1) whether LEP students are performing as well as their non-LEP peers in the district, unless some other comparison seems more appropriate;⁷ (2) whether LEP students are successfully participating in essentially all aspects of the school's curriculum without the use of simplified English materials; and (3) whether their dropout and retention-in-grade rates are comparable to those of their non-LEP peers. *Cf. Keyes*, 576 F. Supp. at 1519 (high drop-out rates and use of "levelled English" materials indicate that district is not providing equal educational opportunity for LEP students). If LEP students have equal access to the district's programs under the above standards,

⁷ For example, when an overwhelming majority of students in a district are LEP students, it may be more appropriate to compare their performance with their non-LEP peers county- or statewide.

the recipient is not in violation of Title VI even if it has no program or its program does not meet the *Castañeda* standard. If application of the above standards shows that LEP students do not have equal access to the district's programs, and the district has no alternative language program, the district is in violation of Title VI. If the district is implementing an alternative program, it then will be necessary to apply the three-pronged *Castañeda* approach to determine whether the program complies with Title VI.

II. Segregation of LEP students

Providing special services to LEP students will usually have the effect of segregating students by national origin during at least part of the school day. *Castañeda* states that this segregation is permissible because "the benefits which would accrue to [LEP] students by remedying the language barriers which impede their ability to realize their academic potential in an English language educational institution may outweigh the adverse effects of such segregation." 648 F. 2d at 998.

OCR's inquiry in this area should focus on whether the district has carried out its chosen program in the least segregative manner consistent with achieving its stated goals. In other words, OCR will not examine whether ESL, transitional bilingual education, developmental bilingual education, bilingual/bicultural education, structured immersion, or any other theory adopted by the district is the least segregative program for providing alternative language services to LEP students. Instead, OCR will examine whether the degree of segregation in the program is necessary to achieve the program's educational goals.

The following practices could violate the anti-segregation provisions of the Title VI regulation: (1) segregating LEP students for both academic and nonacademic subjects, such as recess, physical education, art and music;⁸ and (2) maintaining students in an alternative language program longer than necessary to achieve the district's goals for the program.

APPENDIX: Use of the *Castañeda* standard to determine compliance with Title VI

In determining whether a recipient's program for LEP students complies with Title VI of the Civil Rights Act of 1964, OCR has used the standard set forth in *Castañeda v. Pickard*, 648 F. 2d 989 (5th Cir. 1981). Under this standard, a program for LEP students is acceptable if: (1) "[the] school system is pursuing a program informed by an educational theory recognized as sound by some experts in the field or, at least, deemed a legitimate experimental strategy"; (2) "the programs and practices actually used by [the] school system are reasonably calculated to implement effectively the educational theory adopted by the school"; and (3) the school's program succeeds, after a legitimate trial, in producing results indicating that the language barriers confronting students are actually being overcome." *Id.* at 1009–10.

The *Castañeda* court based its standard on the Equal Educational Opportunities Act of 1974 (EEOA), P.L. No. 93-380, *codified at* 20 U.S.C. §§ 1701–1720, rather than on Title VI or its implementing regulation (20 C.F.R. Part 100). The relevant portion of the EEOA (20 U.S.C. § 1703(f)) is very similar to OCR's May 1970 memorandum describing the obligations of districts toward limited-English-proficient students under Title VI of the Civil Rights Act of 1974.⁹ In *Lau v. Nichols*, 414 U.S. 563, 94 S.Ct. 786 (1974), the Supreme Court upheld OCR's authority to establish the policies set forth in the May 1970 memorandum.

In view of the similarity between the EEOA and the policy established in the 1970 OCR memorandum, in 1985 OCR adopted the *Castañeda* standard for determining whether recipients' programs for LEP students complied with the Title VI regulation. Several courts have also treated Title VI and the EEOA as imposing the same requirements regarding limited-English-proficient students. *See Heavy Runner v. Bremner*, 522 F. Supp. 162, 165 (D. Mont. 1981); *Rios v. Read*, 480 F. Supp. 14, 21–24 (E.D.N.Y. 1978) (considered Title VI, §

⁸ For an example of a program exclusively for newly-arrived immigrants consistent with Title VI, see OCR's Letter of Findings in Sacramento City Unified School District, Compliance Review Number 09-89-5003, February 21, 1991.

⁹ Section 1703(f) of the EEOA states, in pertinent part, "No State shall deny equal educational opportunity to an individual on account of his or her race, color, sex, or national origin, by . . . the failure by an educational agency to take appropriate action to overcome language barriers that impede equal participation by its students in its instructional programs." The pertinent section of the OCR 1970 memorandum states, "Where inability to speak and understand the English language excludes national origin-minority group children from effective participation in the educational program offered by a school district, the district must take affirmative steps to rectify the language deficiency in order to open its instructional program to these students."

1703(f), and Bilingual Education Act of 1974 claims together; used 1975 *Lau Remedies*¹⁰ to determine compliance); *Cintron v. Brentwood Union Free School Dist.*, 455 F. Supp. 57, 63–64 (E.D.N.Y. 1978) (same); see also *Gómez v. Illinois State Bd. of Educ.*, 811 F.2d 1030 (7th Cir. 1987) (used *Castañeda* standard for § 1703(f) claim; remanded claim under Title VI regulation without specifying standard to be used in resolving it, except to note that proof of discriminatory intent was not necessary to establish a claim under the Title VI regulation); *Idaho Migrant Council v. Board of Education*, 647 F.2d 69 (9th Cir. 1981) (Idaho state education agency had an obligation under § 1703(f) and Title VI to ensure that needs of LEP students were addressed; did not discuss any differences in obligations under Title VI and § 1703(f)).

Castañeda itself did not treat Title VI and the EEOA interchangeably, however. Instead, it distinguished between them on the ground that a showing of intentional discrimination was required for a Title VI violation, while such a showing was not required for a § 1703(f) violation. *Castañeda*, 648 F.2d at 1007. See also *Keyes v. School Dist. No. 1*, 576 F. Supp. 1503, 1519 (D. Colo. 1983) (court found that alternative language program violated § 1703(f) and elected not to determine whether it also violated Title VI; questioned continuing validity of *Lau* in light of *Bakke* and noted that remedying § 1703(f) violation would necessarily remedy any Title VI violation).

Castañeda and *Keyes* were decided before *Guardians Association v. Civil Service Commission of New York*, 463 U.S. 582, 607 n.27, 103 S. Ct. 3221, 3235 n.27 (1983). In *Guardians*, a majority of the Supreme Court upheld the validity of administrative regulations incorporating a discriminatory effect

standard for determining a Title VI violation.¹¹ Thus, *Castañeda* and *Keyes* do not undermine the validity of OCR's decision to apply § 1703(f) standards to determine compliance with the Title VI regulation.

A recent California case, however, distinguished § 1703(f) and the Title VI regulation on other grounds. *Teresa P. v. Berkeley Unified School Dist.*, 724 F. Supp. 698 (N.D. Cal. 1989). In analyzing the § 1703(f) claim in *Teresa P.*, the court used the three-part *Castañeda* standard and determined that the district's program was adequate under that standard. *Id.* at 712–16. In addressing the claim brought under the Title VI regulation, however, the court stated that plaintiffs had failed to make a *prima facie* case because they had not alleged discriminatory intent on the part of the defendants, nor had they “offered any evidence, statistical or otherwise,” that the alternative language program had a discriminatory effect on the district's LEP students. *Id.* at 716–17.

In *Teresa P.*, the district court found that the district's LEP students were participating successfully in the district's curriculum, were competing favorably with native English speakers, and were learning at rates equal to, and in some cases greater than, other LEP students countywide and statewide. 724 F. Supp. at 711. The court also found that, in general, the district's LEP students scored higher than the county- and statewide average on academic achievement tests. *Id.* at 712. Given these findings, the dismissal of the Title VI claim in *Teresa P.* can be regarded as consistent with OCR's May 1970 and December 1985 memoranda, both of which require proof of an adverse impact on national origin minority LEP students to establish a violation of the Title VI regulation.¹²

¹⁰OCR's 1975 *Task Force Findings Specifying Remedies Available for Eliminating Past Educational Practices Ruled Unlawful Under Lau v. Nichols*.

¹¹The applicable Department of Education regulation is 34 C.F.R. § 100.3(b)(2).

¹²A Ninth Circuit case also treated § 1703(f) and Title VI claims differently, but in such a terse fashion that it cannot be determined whether these differences would ever have a practical effect. See *Guadalupe Org. v. Tempe Elementary School Dist. No. 3.*, 587 F. 2d 1022, 1029–30 (9th Cir. 1978) (court found that maintenance of bilingual/bicultural education was not necessary to provide students with the “meaningful education and the equality of educational opportunity that [Title VI] requires”; court also found that districts did not have to provide maintenance bilingual/bicultural education to be deemed to have taken “appropriate action to overcome language barriers that impede equal participation by its students in its instructional program” (quoting § 1703(f)).

Neither *Teresa P.* nor any other post-*Castañeda* case undermines OCR's decision to use the *Castañeda* standard to evaluate the legality of a recipient's alternative language program. OCR will continue to use the *Castañeda* standard, and if a recipient's alternative language program complies with this standard the

recipient will have met its obligation under the Title VI regulation to open its program to LEP students.

Appendix D

The Challenge of a Multicultural America (Speech by Senator Joseph M. Montoya)

Editor's note: *The following is the text of the speech delivered by Senator Joseph M. Montoya (D-NM) at the conference "A Re-look at Tucson '66." (November, 1973. Albuquerque, New Mexico.)*

1966: Commitment

The National Education Association Symposium of 1966 was a challenge to those of us who lived in the Southwest, where the need was greatest for a change in the way we taught Mexican American children. It was in Tucson that we first determined to build what we called "bridges of understanding" for the people in this country so that America would become the truly united nation it should be: a nation, which valued its own variety and could speak and understand its own languages.

We left that meeting determined to generate interest in new kinds of schools wherever language-minority children needed them. We wanted to generate new ideas in colleges and universities where teachers were preparing for the future. We wanted to generate concern in governments at every level.

Senator Yarborough and I returned to Washington with your words reinforcing our own awareness of the needs in our states and in the nation. The first Bilingual Education Act was the result.¹ That was

seven years ago—a time when new and progressive ideas about education were welcome in Washington, and when many of us thought it was enough to spotlight a need, develop a program to meet that need, provide federal help to get things going—and then settle back to wait for good results.

1973: Reappraisal

That was naive, of course. Things didn't work out quite the way we planned. We have helped some children, produced some teachers, funded some programs. But somehow, in these last seven years we have failed to do the job we pledged to do.

We have not been able to help the millions of students who entered our schools in those years since 1966—children who were poor and spoke a language other than English. We called them "bilingual" children. But they were not bilingual. They were monolingual—but in the wrong language. Wrong for most Americans, that is. We encouraged that "wrong" definition by calling them children of "limited English speaking ability." We offered them, at best, remedial education as a temporary measure—and we found that "remedial" education was expensive, difficult, and unpopular.

These children brought to their schools the language and culture of their homes, and in kindergarten

¹ Bilingual Education Reform Act of 1973—Companion Bills S. 2552 and 2553. introduced by Senators Montoya, Kennedy, and Cranston.

or the first grade they were asked to forget all that they had learned in their first six years, to sacrifice their heritage, their individual worth, their unique talents, their pride in their communities and homes—all so they could be taught to think and read and write in English and lose that definition of being limited.

At six or seven years of age they were asked to perform a kind of mental miracle—and when that miracle didn't happen those around them, too, often pretended it was the children's failure, instead of ours. Of course it was our failure, because we did not understand the values of the languages and cultures we were asking those children to leave behind. Most of the programs we offered did not have the goal of real bilingualism, but simply offered a change in the brand of monolingualism the children used. We tried to turn a child with "limited English-speaking" ability into a child with "limited Spanish-speaking" ability or "limited Indian-language" ability.

In all the years between that first meeting in Tucson and this one in Albuquerque, we have only managed to provide programs for a few hundred thousand children—a tiny 2 percent of those who needed our help. And most of the programs we offered were transitional programs designed to change one limiting handicap for another.

Even now, seven years later and six years after the legislation which was supposed to solve the problem, the federal government is helping only 217 programs in the whole United States. Some states have joined in the effort to help, and some local schools have begun to think about the problem—but very few places have faced the depth of the need or the realities of the problem.

For most children who spoke a language other than English in 1966, the reality of the last seven years has been not bilingual or bicultural education, but instead the gradual loss of learning potential; the frustration and indignity of falling further and further behind other children every year; the anger at a system which refused to teach them in a language they understood, and demanded instead conformity in a language they could not comprehend.

Those children who entered school in 1966, when we first pledged to provide a better kind of education for them, should be in the eighth grade today. For those who did not speak English we know statistically what has happened. Ten percent of them have dropped out of school already. Of those who are still in school, 64 percent are reading below grade level and 10 percent are at least two years behind, in the fourth or fifth

grades. And by the time they should be in the twelfth grade—just four years from now—40 percent of these students will have dropped out of school. Only 5 percent of them will ever complete college.

What those statistics mean to the dropouts is painfully clear. They will always face the handicaps of higher unemployment, less income, less opportunity. All the fringe benefits of poverty will be theirs: more illness, harder and less rewarding work, and earlier death.

The truth is that we failed those children who entered school in 1966—and we may be going to fail their children, too.

What went wrong?

We *did* pass the legislation. But we failed to make it live up to its promise. Other priorities were greater in Washington, and in 1968 we elected a president who did not share our belief in this new kind of education. By 1970 we heard the rumblings of discontent from the White House about money we were "wasting"—and finally this year we heard the requests that no money at all be budgeted for bilingual education.

In addition to our failures in government, educators themselves were discovering that the problem was more complex than we thought. Even if the money and support had been available, you educators were not really ready. You did not have the teachers trained, the textbooks written, the testing materials and teaching techniques developed.

Lessons of Experience

But all of us know more today than we did in 1966. We know that:

- We need not only bilingual but also bicultural programs and one without the other is meaningless.
- Not just Spanish children or Indian children, children who speak any language other than English, will benefit from bilingual and bicultural education, all children would benefit from that kind of opportunity in our schools.
- In the few places where bilingual education has been tried, the results have been a sharp increase in achievement, not only for the child who speaks a language other than English, but for the English speaking child who shares the program.
- Literacy in two languages is better than literacy in one and if children are allowed to read and write first in the

language they know best they can soon learn to read and write in a second language at a faster pace. They can become literate in the language they bring to school and in the language they find in school instead of becoming illiterate and nonfunctioning in both.

- The teachers for successful bilingual programs are not just people who speak Spanish or French or Chinese or Indian—but are people who are bilateral (sic) and have been trained to teach in two languages, not one.
- We have very few universities or colleges which are prepared to train that special kind of teacher—that is why we do not have enough teachers even for the few programs in existence. (A recent survey shows that only about one-fourth of the teachers listed as being “bilingual” actually are trained to teach bilingually.)
- It will take us many years to produce the teachers in the numbers needed, or the books and histories, the testing materials, the counseling and administration for these new programs. We are not ready yet—and we know that.
- Bilingualism means more than just getting through the transition period from kindergarten to third grade—and then being transformed overnight into a “normal” student who works only in English. It means instead learning in two languages steadily right on through high school and college—so that in the end the language you bring to school and the language you find in school are tools you can use all your life.

Most challenging of all, we know that there are still many American citizens who don’t share our concern and don’t understand the valuable resources that our multicultural population represents. In the crisis world of 1973, with inflation and shortages and world environmental problems pressing from every side, it is going to be even more difficult to make bilingual education a first priority. What can we do?

Legislative Proposals: Promises and Constraints

The Title VII Amendments now being considered by the Senate Education Committee will provide more money, more teacher training, a greater emphasis on biculturalism and on expansion into adult and vocational education, better supervision and administration, research into innovative techniques, and cooperation with state and local governments and with families and communities.

The most important change in this legislation is that it presents the bilingual child as “advantaged and not disadvantaged” and it offers opportunities to the monolingual English-speaking child as well as to the child who is monolingual in another language.

However, the money that we can honestly promise to appropriate will not be enough to do the job—not nearly enough. Before we can provide that kind of money from government at any level we are going to have to convince other Americans that bilingual education is not remedial or a program to help handicapped children.

Bilingualism—Resource Education

We are going to have to make all Americans understand that bilingual education is resource education—that it will provide better education for children who come to school speaking *only* English.

We must somehow make sure that our neighbors and friends who are handicapped by not being able to speak any language except English understand the great gift which children who speak another language bring to the schools—a “gift” they can share with all children if they are talked to in that language.

We must find a way that every child is allowed to learn about the many kinds of people who have written the history of America, and about the treasure of many cultures that are now ignored.

People from many nations came here to find freedom—and brought with them the stored knowledge of their many homelands. Today, as a result of that rich heritage, we should be the focal point of understanding and progress.

Knowing that, and understanding the thousands of ways in which America would be better today if we had taught our children about the riches of history and language and culture which were present in the Native Americans who were here first and in every group that came later, we can see now how foolish it was to try to melt people down into something homogeneous so that all Americans would be limited and identical.

Multicultural Understandings: A Future Imperative

The challenge we must take from this meeting is not only the challenge of increasing and improving

bilingual education for minorities. We must also accept the challenge to provide for our country the multicultural knowledge which the twenty-first century will demand.

We must see that every citizen in the United States understands that when children are asked to forget their own identity and their own traditions they do not miraculously turn into something better—instead, they shrink inside, and when that happens our whole nation shrinks too. As these small citizens are diminished, so the opportunities and knowledge and future of this nation are diminished too. The dollar loss is monstrous. For every child who only graduates from the eighth grade when he could have graduated from high school, the lifetime income loss is more than \$100,000. Multiply that by the millions who drop out of the schools that fail to provide the education they need, and the gross productivity loss to the nation is staggering.

But even more important to average Americans must be the loss of education *their* children could

have had, but missed—the chance to learn two languages instead of one, the chance to expand into many cultures, instead of one, the opportunity to be ready for the many-cultured world of the twenty-first century instead of being forever handicapped by being both monolingual and monocultural.

When we talk about bilingual education in the last 10 years, we have to say that in many ways we have failed. But in trying to solve the problem, we have learned; and we know enough now to be able to enlarge our own horizons and the horizons of every American.

If we can leave this meeting in Albuquerque understanding that opportunity, we can more easily open the doors to rapid expansion of bilingual and bicultural education. But we will have done more—we will have started on the road to a multicultural America, a place of leadership in the multicultural world in which we must all learn to live harmoniously if we are to survive.

Appendix E

Official English Legislation, Opposed

Editor's note: *This statement summarizes arguments against making English the official language of the United States through Congressional action and/or by an amendment to the Constitution of the United States. It was originally prepared as testimony by Mr. James Crawford to a committee of the U.S. House of Representatives in 2006 and titled "Official English Legislation: Bad for Civil Rights, Bad for America's Interests, and Even Bad for English." It is reprinted here with permission of the copyright holder. The opposing view is presented in the entry "Official English Legislation, Favored."*

**Testimony Before the House
Subcommittee on Education Reform
by James Crawford, Director,
Institute for Language and Education Policy**

July 26, 2006

Mr. Chairman and members of the subcommittee:

My name is James Crawford. I am director of the Institute for Language and Education Policy, a newly formed nonprofit organization dedicated to research-based advocacy for English-language and heritage-language learners. We represent professionals in the field of language education who are working to promote academic excellence and equity for these students.

I want to thank Chairman Castle and Representative Woolsey for the opportunity to present testimony regarding proposals to designate English as the official language.

We at the Institute believe that such legislation is ill-advised: harmful to individuals, to the nation, and to the goal of language learning. We are concerned that the U.S. Senate recently passed a "national language"

amendment without holding a single hearing to consider its potential impact and with only limited debate. So we commend the Subcommittee on Education Reform for convening today's hearing in the House.

In our view, "official English" is:

- (1) *Unnecessary*—The overwhelming dominance of English in the United States is not threatened in any way. Newcomers to this country are learning it more rapidly than ever before. Our language does not need "legal protection."
- (2) *Punitive*—Restricting government's ability to communicate in other languages would threaten the rights and welfare of millions of people, including many U.S. citizens, who are not fully proficient in English.
- (3) *Pointless*—Official-English legislation offers no practical assistance to anyone trying to learn English. In fact, it is likely to frustrate that goal by outlawing programs designed to bring immigrants into the mainstream of our society.
- (4) *Divisive*—The campaign to declare English the official language often serves as a proxy for hostility toward minority groups, Latinos and Asians in particular. It is exacerbating ethnic tensions in a growing number of communities.
- (5) *Inconsistent with American values*—Official-English laws have been declared unconstitutional in state and federal courts, because they violate guarantees of freedom of speech and equal protection of the laws.
- (6) *Self-defeating*—English Only policies are foolish in an era of globalization, when multilingual skills are essential to economic prosperity and national security. Language resources should be conserved and developed, not suppressed.

Language and Liberty

Our nation has gotten by for more than 200 years without adopting an official language. So the obvious question arises: *Why do we need one now?*

Proponents of official English have responded with platitudes (“A common language is what unites us as Americans”) or truisms (“In this country it’s essential to know English”) or anxieties (“Spanish is spreading at unhealthy rates”) or unsupported claims. (“Bilingual programs discourage people from learning English”.) These are not compelling arguments. They also reflect an ignorance of history.

Language has been far less central to American identity than to, say, French or Greek or Russian identity. From its infancy the United States was conceived as a nation that newcomers could join, whatever their ethnic background,¹ simply by swearing loyalty to the *democratic principles* on which it was founded. To be sure, there have been ugly episodes of language-based discrimination, such as the English Only school policies that once targeted Native Americans and Mexican Americans. Unlike many other countries, however, we have seldom passed laws to repress or restrict minority tongues. Language has usually been taken for granted here—as a practical rather than a symbolic issue—despite the diversity that has historically prevailed.

Today there are more non-English languages spoken in America than ever before, owing to the ease of travel, which has brought immigrants from all over the world. But the *proportion of minority language speakers* was certainly as large, if not larger, in 1776, 1865, and 1910. Where immigrant groups were numerous and enjoyed political clout, they were often accommodated in their own vernaculars. Until the early 20th century, state and local governments provided documents and services in languages such as German, French, Spanish, Swedish, Norwegian, Welsh, and Czech. Bilingual education was more widespread in German and English in 1900 than it is today in all languages.²

Despite or—more likely—because of these tolerant policies, immigrant groups gradually adopted English and stopped speaking their ancestral tongues. Sociologist Nathan Glazer has noted the irony: “Languages shriveled in the air of freedom while they had apparently flourished under adversity in Europe.” Except in a few periods of nativist hysteria, such as

the World War I era, laissez-faire policies made language conflicts relatively rare in the United States.

Is there any reason to abandon our tradition of tolerance now? Certainly there is no threat to English in America, no challenge to its status as the language of educational advancement, economic success, and political discourse. According to the 2000 census, 92% of U.S. residents speak English fluently; 96% speak it “well” or “very well”; and only 1.3% speak no English at all.

Language Spoken at Home and English-Speaking Ability, 2000

All speakers, age 5+	262,375,152	100.0%
English only	215,423,557	82.1%

“not at all”	3,366,132	1.3%

Source: 2000 Census of Population.

Demographic research also shows that, while the number of minority language speakers is increasing, largely because of immigration, the *rate of Anglicization* is also on the rise. Immigrants at the turn of the 21st century are learning English—and losing other languages—more rapidly than those at the turn of the 20th.

Official English is truly a “solution in search of a problem.”

All Stick and No Carrot

While official-English proposals vary, those now pending before Congress take a radical, restrictionist approach. They would not merely celebrate “our common language.” In addition, they would prohibit most uses of other languages by the federal government—whether to communicate information, provide services, or enable limited-English speakers to exercise rights they would otherwise enjoy.

The assumption is that English Only policies would create an incentive to learn English by making life as

¹ Except in a few shameful cases, such as the Chinese Exclusion Act of 1882.

² For more details, see “Frequently Asked Questions About Official English,” an attachment to this testimony.

difficult as possible for those who have yet to do so. Yet where is the evidence that the current patchwork of basic services in other languages provides a *disincentive* to English acquisition? How many immigrants say to themselves, for example, “If I can read pamphlets about Social Security in Spanish or visit a bilingual health clinic or rely on a court interpreter if I’m charged with a crime, why should I worry about learning English?” Don’t limited-English speakers face language barriers in countless other situations on a daily basis? It would be irresponsible for Congress to legislate without empirical data in this area, considering that millions of people could be adversely affected.

English-as-a-second-language instruction, by contrast, has proven quite effective in helping adult immigrants learn the language. Yet, to date, no official-English bill has included any provisions to address the chronic shortage of such classes in most parts of the country. Coercion, not empowerment, is the operative principle here.

A major target of official-English bills, including the Senate’s national-language amendment, is Executive Order 13166, “Improving Access to Services for Persons with Limited English Proficiency.” The order, issued by President Clinton in 2000 and reaffirmed by President Bush in 2001, is grounded in Title VI of the Civil Rights Act of 1964, which prohibits discrimination on the basis of national origin in federally supported activities. It requires federal agencies and, equally important, programs that receive federal funding to “provide meaningful access” for those whose English is limited. These long-overdue efforts have just barely begun. Yet Official-English legislation would halt them in their tracks by overriding EO 13166, prohibiting assistance for limited-English-proficient persons in numerous areas. The national-language amendment in particular would instruct federal courts to disregard language as a factor in national-origin discrimination.³

Federally funded programs include school districts, which currently have an obligation to communicate with parents, “to the extent practicable,” in a language they can understand. This right of access is mandated

by the No Child Left Behind Act and by Title VI regulations enforced by the U.S. Office for Civil Rights. Official-English legislation would eliminate the requirement, making it difficult for the parents of English-language learners to assist in these students’ education or to advocate for their children with school officials. This is just one of numerous ways in which English Only policies would be harmful not only to individuals but also to national priorities such as school reform.

Sponsors of official-English measures have typically responded to such criticisms by carving out exceptions. Some bills would allow government to use other languages for purposes of national security, trade and tourism promotion, public health and safety, census activities, and so forth. The proposed loopholes are narrow, however, and would no doubt keep government lawyers busy trying to interpret their meaning. Could the Department of Veterans Affairs continue to publish pamphlets in Spanish to explain disability benefits for U.S. soldiers wounded in Iraq? Probably not. Could the Department of Labor keep funding state efforts to inform workers about wage-and-hour regulations in Chinese? Doubtful. Would the White House have to shut down the Spanish-language section of its web site? *¿Quién sabe?*

The constitutionality of such restrictions is questionable at best. The most draconian official-English laws at the state level, in Alaska and Arizona, were struck down under the First and Fourteenth amendments. State and federal courts ruled that, while advancing no compelling public interest, these measures violated free-speech and equal-protection guarantees.⁴

Without exception, the bilingual assistance programs now provided by government are designed to safeguard the rights and serve the needs of limited-English speakers so as to help them *acculturate*. Those who are thereby brought into the mainstream are more able and more inclined to learn English than those remaining on the margins of society, unable to access government services. While English Only advocates seem intent on making a symbolic statement,

³ Senator Inhofe, chief sponsor of the amendment, inserted a “legislative history” into the *Congressional Record* (18 May 2006, pp. S4754-55) that explicitly addresses these points.

⁴ In 1997, federal district and appeals court decisions in *Yñiguez v. Arizonans for Official English* were vacated as moot by the U.S. Supreme Court on a technicality (the lead plaintiff, an Arizona state employee, had found another job). A year later the Arizona Supreme Court struck down the English Only law as unconstitutional. An Alaska district court reached the same result in 2002.

their proposals would have very practical consequences in areas such as education, social services, civil rights, and government efficiency. Among other things, their proposals are bad for English acquisition.

A Message of Intolerance

The symbolic statement itself has consequences that are as damaging as the direct legal effects. English Only bills say, in effect, that the principles of free speech and equal protection apply only to those who are fully proficient in English; that discrimination on the basis of language is legitimate, even laudatory in America; and ultimately, that those from non-English backgrounds are unwelcome here.

Whatever “message” the sponsors believe they are sending with this legislation, the message received is a message of intolerance. This phenomenon is evident in the *language vigilantism* that occurs every time the issue flares up, as local officials and individuals seek to impose their own English Only rules. Here are a few of the mean-spirited incidents that occurred after the House passed a “language of government bill” in 1996:

- Tavern owners in Yakima, Washington, refused to serve patrons who conversed in Spanish, posting signs such as: “In the U.S.A., It’s English or Adios Amigo.”
- A judge hearing a child-custody case in Amarillo, Texas, accused a mother of child abuse for speaking Spanish to her five-year-old daughter.
- Police in Yonkers, New York, ticketed a Cuban American truck driver for his inability to answer questions in English.
- In Huntsville, Alabama, the county assessor refused to approve routine tax exemptions for Korean property owners whose English was limited.
- Norcross, Georgia, authorities fined the pastor of a Spanish-speaking congregation for posting placards that allegedly violated an English Only sign ordinance.

These acts are deeply offensive, not only to recent immigrants, but also to a broader population: persons who are proud of their heritage both as Americans and as ethnic minorities. As Senator Mel Martínez, a Cuban immigrant and a Republican from Florida,

recently explained: “When they start saying that it’s un-American to have ballots printed in Spanish, it sends a message that we’re not wanted, not respected.”

No doubt this is the message that some extremists *intend* to send—or to exploit—in hopes of building support for a restrictive immigration policy. In doing so, they are dividing communities across the nation. Two weeks ago the city council of Hazleton, Pennsylvania, coupled an official-English ordinance with harsh penalties for businesses that hire or landlords who rent to undocumented immigrants. The result has been to exacerbate tensions between long-time residents and recently arrived Latinos who are clearly being targeted. Similar proposals are fueling race hatred in municipalities from Avon Park, Florida, to San Bernardino, California.

It’s ironic that official-English legislation, promoted as a way to “unite Americans,” is having precisely the opposite effect: igniting ethnic conflicts. Congress should refuse to fan these flames.

Instead of English Only . . . English Plus

The aftermath of September 11 highlighted a long-standing concern of national security officials: the United States remains an underdeveloped country where language skills are concerned. When our military invaded Afghanistan to hunt down al Qaeda, five of that country’s seven major languages—including Pashto, spoken by 8 million Afghans—were not even taught in U.S. colleges and universities.⁵ Meanwhile, the FBI was so desperate for translators of Arabic and the languages of South Asia that it was forced to place want-ads in newspapers, with problematic results.

Monolingualism, for which Americans are justifiably notorious, is also an economic handicap. While English is indisputably dominant in global commerce, it is spoken by only a small minority of the world’s population. As globalization increases, competitors who are proficient in other languages will have an increasing advantage.

The President’s National Security Language Initiative, designed to fund programs in critical languages such as Arabic, Chinese, Hindi, Russian, and Farsi, is a positive step. His proposed investment,

⁵ According to the National Foreign Language Center at the University of Maryland, about 600 U.S. students were learning Farsi, the dominant language of Iran, which is a relative of Dari, spoken by about 5.6 million Afghans. There were just four U.S. students studying Uzbek, which has 1.4 million speakers in Afghanistan.

however – \$114 million in FY07, including just \$24 million at the K–12 level—is ludicrous. If approved, it would have a limited impact relative to the nation’s growing needs.

Yet this is not just a funding problem. More important, it is an *attitude problem*. While a language learned in the classroom is valued in this country, a language learned by growing up in a minority community is likely to be considered a liability, not an asset. “Ethnic bilingualism” has enormous potential to supply the multilingual skills that America needs. Rather than cultivating it, however, we rush language-minority children into all-English classrooms as soon as possible. Most never get the chance to develop advanced skills, including literacy, in their native tongue. Although *developmental bilingual education* does exist, it is getting much harder to find. High-stakes testing in English for these students and, in some states, English Only instruction laws have forced schools to dismantle many bilingual programs.

Instead of English Only, the United States needs a language policy that could be described as *English Plus*. This approach begins with the recognition that, of course, we should pursue the goal of English proficiency for all Americans. But while English is necessary, it is not sufficient in today’s world. To prosper economically and to provide security for our people, we need well-developed skills in English, plus other languages. Step one is to conserve and develop, not destroy, the language resources we already have. Rather than treating bilingualism as a nuisance or a threat, we should exploit our diversity to enrich the lives of individuals and foster the nation’s interests, while encouraging ethnic tolerance and safeguarding civil rights.

We believe that a policy of English Plus would advance these important goals. Official English would be a step backward for the nation.
