Other advocacy organizations, many of them Internet based, include National Youth Advocacy Coalition; OutProud, the National Coalition for Gay, Lesbian, Bisexual & Transgender Youth; Parents, Families, and Friends of Lesbians and Gays (PFLAG); Young Gay America (YGA); Youth Guardian Services, offering safe cyber spaces for LGBTQ youth; and Youth Resource, providing sexual health information to LGBTQ youth. Ambiente Joven is an advocacy organization for Spanish-speaking LGBTQ youth, and Gender Public Advocacy Coalition (Gender PAC) advocates rights of transgender students.

LESBIAN, GAY, BISEXUAL, AND TRANSGENDERED STUDENTS AND TEACHERS: RIGHTS OF

The rights of lesbian, gay, bisexual, transgendered, and queer (LGBTQ) students and teachers are not defined in any federal law and vary widely from state to state and school district to school district. Courts are often left to decide on a case-by-case basis where the rights of LGBTQ teachers and students begin and end. This topic holds relevance for educational law makers and policy makers and the many students and teachers in America's schools who face discrimination based on their real or perceived sexual orientations and gender identities. This entry summarizes civil rights statutes and policies and discusses their impact on LGBTQ students and teachers.

State, Local, and District Policies

According to the Human Rights Campaign, eight states (California, Connecticut, Massachusetts, Minnesota, New Jersey, Vermont, Washington, and Wisconsin) and the District of Columbia prohibit sexual orientation discrimination in schools. Three states (California, Minnesota, and New Jersey) and the District of Columbia prohibit gender identity discrimination in schools. Private and religious schools are often exempted from such laws, as are the Boy Scouts of America, which uses public schools for meetings. Many state and district boards of education have policies prohibiting discrimination based on sexual orientation, but few explicitly prohibit discrimination based on gender identity, which would protect transgender students.

Five states (Alabama, Arizona, Mississippi, South Carolina, and Texas) prohibit any discussion of homosexuality in schools or mandate that homosexuality be referred to only in a negative manner (also known as

No Promo Homo laws). The Utah State Board of Education prohibits the "advocacy" of homosexuality.

LGBTQ Students

The most prominent court case serving as a wakeup call to school districts that antigay harassment must be taken seriously is *Nabozny v. Podlesny* (1996). Jamie Nabozny, an openly gay high school student who was tormented by his peers and severely beaten, sued several school administrators in federal court for failing to protect him from antigay peer abuse and was awarded \$900,000. Jamie was treated differently not only because he is gay (sexual orientation discrimination) but also because he is male (sex discrimination). When he complained about the abuse, he was told to fight back, whereas girls who reported harassment were not told to fight back. Schools that discriminate on the basis of sex risk losing their federal Title IX funding.

Similar cases around the United States—for example, *Henkle v. Gregory* (2003), in which Nevada student Derek Henkle was awarded \$451,000—are affirming the rights of LGBTQ students to safety and inclusion in America's public schools. The increasing popularity of Gay-Straight Alliance (GSA) student clubs, and the lawsuits that result when districts try to prevent them, are also helping to define the rights of LGBTQ students.

Schools have the right to set dress codes in accordance with community standards, but in at least one case, *Doe v. Brockton School Community* (2000), the Court ruled that a school could not prevent an eighth-grade male-to-female transgender student from wearing girls' clothes. In *Fricke v. Lynch* (1980), a federal court ruled that students can bring same-sex dates to prom. With an emerging population of transgender middle and high school students, the courts may soon be ruling on their right of access to gender-neutral bathrooms and locker rooms, where the presence of ambiguously gendered students in the "boys" or "girls" bathroom or locker room could create an uncomfortable and threatening environment.

LGBTQ Teachers

Changes in state civil rights laws, coupled with recent legal precedents strengthening individuals' and

employees' rights to privacy and due process, are making it more difficult for school districts to dismiss teachers based solely on their sexual orientation. In California, Dawn Murray, a teacher who suffered harassment and discrimination because she is lesbian, was awarded \$140,000, and her district was ordered to provide sensitivity training to its employees on issues of sexual orientation. *Merrick v. Rio-Bravo Greeley Union School District* (1999) and *Kavanaugh v. Hemet Unified School District* (2000) ruled that schools violated California state law banning discrimination based on sexual orientation when they transferred students out of certain teachers' classrooms because those teachers were perceived to be gay.

Some districts are proactive and adopt policies, provide training, and support the rights of their LGBTQ teachers. In 2006, for instance, officials of Batavia School District near Rochester, New York, supported the right of a male-to-female transgender high school teacher to retain her job and held informational meetings for concerned parents. In 1999, however, Dana Rivers, a transgender high school teacher in Sacramento, California, was dismissed by her school board.

Previous case law has established that teachers cannot be fired for commenting on matters of public concern that are related to their school (in Letters to the Editor, for example) or because of their membership in various organizations. Likewise, LGBTQ teachers may be able to publicly comment on matters of public concern that have to do with sexual orientation and gender identity issues and their school, and they may be able to belong to LGBTQ organizations, but as of yet, there are no cases that address this. Likewise, just as heterosexual teachers "come out" to their students when they discuss their spouses and families, LGBTQ teachers may be able to be open about their sexual orientation, gender identity, partner, and families. But again, there are no cases that directly address these free speech issues, and as long as federal, state, and local laws and district policies do not explicitly prohibit discrimination based on sexual orientation and gender identity, LGBTQ student and teacher rights will remain ambiguous.

LIBRARIES, HISTORY OF

Libraries developed soon after the development of writing itself. Although the first libraries were primarily storehouses of government records, they quickly expanded to include religious texts, reference materials, and literature. Libraries require not only the support of both religious and secular authorities, but also a literate populace to create and use the items located in them. This entry provides a brief historical overview.

Ancient Libraries

The Sumerian civilization in Mesopotamia developed the cuneiform method of writing, with clay tablets as the preferred medium for the creation of written

documents. The earliest Mesopotamian libraries date to 2,500 BCE, as in the examples of collections of tablets found near Nippur.

Ancient Greece introduced the first libraries open to public use. The impetus for the creation of public libraries in ancient Greece was the alteration of the plays of Aeschylus, Sophocles, and Euripides by performers and copyists in the years after their deaths. The Athenian tyrant, Lycurgas, decreed that written copies of the plays would be maintained as public records to ensure that the plays were accurately performed and reproduced.

The most famous Greek library of antiquity was located in Egypt. The Alexandrian library was founded as part of the Museum, a temple that served as a home for intellectuals who were recruited by the Ptolemies. A key function of the Library of Alexandria was the maintenance and reproduction of accurate copies of important Hellenic works. To track the library's vast collection, the poet Callimachus created a 120-volume catalog, called the *Pinakes*, which listed the most eminent scholars and their writings in alphabetical order. The *Pinakes* was not a comprehensive catalog of the entire library but a bibliography of the most important works.

Before the Roman conquest of Macedonia and Greece in the second century BCE, Roman library collections were limited to public records. However, after Paulus Aemilius brought back the library of Perseus of Macedonia as the spoils of war in 168, it became common for Roman generals to seize libraries as spoils. Some, like Cornelius Sulla, provided access to these private libraries to other intellectuals.

Julius Caesar planned the first public library of Rome after visiting the Library of Alexandria, but the creation of this library was delayed by his assassination. Gaius Asinius Pollio established the first public library in Rome around 37 BCE, using the spoils of the Illyrian War. Augustus established additional Roman public libraries starting in 28 BCE with the Palatine Library.

European Libraries

Medieval libraries were much smaller than their predecessors in the Roman world, frequently only a few hundred books stored in trunks or locking wardrobes. These libraries were housed in monasteries and churches for

the use of monks and priests. Libraries housed in the great cathedrals of Europe were larger and more diverse, as their purpose was to provide educational material for clergy and laity. An important exception was the libraries created by Emperor Charlemagne. Charlemagne procured texts from Europe and the Byzantine Empire and had them copied for use in monasteries and schools throughout his empire. He also pushed monasteries to create rooms for copying books to distribute to other monasteries.

Johannes Gutenberg's development of movable type in Germany radically altered book production by reducing the time and labor required to make books, which translated into greater availability of books and lower costs. These factors led to rapid growth in the size and complexity of library collections in early modern Europe and required the development of more sophisticated methods to organize libraries.

British public libraries developed during the eighteenth and nineteenth centuries in the form of subscription and circulating libraries. Circulating libraries were established in most British cities by 1800. These libraries rented books to anyone who could pay an extremely small monthly subscription fee and focused on providing leisure reading materials. Subscription libraries developed at the end of the eighteenth century and sold shares to members to fund the purchase of common library collections, which focused on more serious materials than the circulating libraries. A final British precursor to the modern public library was the mercantile institutes, which were established by charities for the use of workers and focused on vocational materials.

Modern public libraries began to appear after the passage of the Public Libraries Act in 1850, which allowed cities to use taxes in order to establish and support public libraries. Despite economic depressions and two world wars in the twentieth century, Great Britain pioneered public library services such as bookmobiles, branch libraries, and service to hospitals.

U.S. Libraries

During the eighteenth century, colonists such as Benjamin Franklin founded society libraries based on the model found in Great Britain. Over time, some

society libraries offered nonmembers the option of paying an annual fee, known as a subscription, for the privilege of using the collection.

The drive to establish public libraries grew during the nineteenth century out of the belief that governments had the responsibility to regulate society and that public education was the best means to teach new immigrants how to take part in American democracy. In 1846, the New Hampshire state legislature authorized local governments to use taxes to establish public libraries; it was quickly followed by other states.

Public library use expanded during the twentieth century as new immigrants and unemployed workers tried to gain the skills to find better employment. During the 1950s and 1960s, state officials and the American Library Association worked to secure federal assistance to meet the needs of patrons. Economic difficulties during the 1970s and 1980s led to library closures in some areas. At the same time, library use and the cost of library technology and materials increased through the 1990s. As a result, public libraries have increased their efforts to secure private funding.

LIFE ADJUSTMENT MOVEMENT

The life adjustment movement was a short-lived effort following World War II to provide a high school curriculum that was more practical for what was then a

majority of high school students who did not go on to college or other postsecondary training. To understand the purpose and impact of the movement, it is first necessary to look at the educational situation following the war. Then, in looking at the response to that situation, it is important to examine the relationship between what was intended by advocates of life adjustment education and what ultimately happened in schools. With those events in mind, the criticisms of the movement and the resulting calls for reform might make more sense.

In 1944, in response to poor working conditions for teachers, glaring inequities in the funding of schools, and an almost 40 percent high school dropout rate, the Educational Policies Commission of the National Education Association suggested that public education move toward a curriculum better suited to the needs of students, especially in Grades 10–12, most of whom had no intention of going on to college. Soon after, in 1945, at a meeting of vocational educators, Charles Prosser put forth a resolution calling for a functional curriculum that came to be called life adjustment education. The life adjustment curriculum included guidance and education in home life, citizenship, use of leisure, health, tools of learning, and work experience. Although it was assumed that this curriculum would be important for disadvantaged, poorly motivated, or low-achieving students, supporters of the movement also believed it would be better for all youth.

The movement enjoyed support from both educators and the public in the beginning, but soon the focus had been turned to money problems, and critics used the excesses of the movement to launch effective criticisms that brought the demise of life adjustment education. The most vocal and persuasive critics came from academia, but other reactionary groups joined the attack by connecting the movement to everything from John Dewey to communist infiltration. Critics pointed out the worst examples of life adjustment education—for example, classes in hypnotism and contract bridge—and argued that the schools had become anti-intellectual, secular, and subversive institutions. Defenders of life adjustment continued to argue that the new curriculum better met the needs of students and a changing society, but despite having the support of a

significant segment of the public, it had mostly lost the battle by the mid-1950s and all but disappeared with the response to the launch of the Soviet satellite, *Sputnik*, in 1957.

LIFE HISTORIES

Telling life stories is a form of learning and knowing about one another, be it a couple getting to know one another, a child and parent building their lives together, siblings sharing lived experiences, classmates sharing their thoughts, or strangers looking for conversation. Furthermore, life stories are the substance for fictional stories that are all around us, in print, audio, and visual media. Thus, the conversations/dialogs/stories/narratives that surface regarding education must bring individual lives to the forefront; through those lived experiences, alternate ways of thinking about the meaning of school may emerge. Life history research is an interdisciplinary cluster of approaches that use life stories—whether written, oral, or in other forms—as a primary source for social, cultural, and historical research.

Where does life history research fit? It fits everywhere there is a life story to be discovered, told, and heard. How can life history methods be part of education research? They can be part of it when education is viewed as dealing with lives. How researchers view

life histories often depends on their academic discipline and orientation; their profession; and their own life stories, both personal and scholarly. The method of life history is rooted in the sociological underpinning of individuals being part and parcel of the society at large. The University of Chicago sociology department promoted this perspective vigorously during the 1920s, with almost every study making some use of personal documents.

Following the University of Chicago's pioneering life history work, social science research turned toward the positivist framework, relying on more quantitative measures or qualitative measures used to construct universal truths. Nonetheless, life history research continued to be sprinkled in the fields of anthropology and sociology throughout the twentieth century. It was not until the 1980s that the field of education became more and more receptive to qualitative methods, such as life history. Social science researchers, including educational researchers, are gradually abandoning their search for the one great truth.

More recently, education scholars have begun to explore the necessity of using qualitative research methods to gather and interpret rich data regarding lived experiences unfolding in schools. Many qualitative studies in education explore the inequities in education that have existed since the inception of public schooling in the United States. Highlighting the experiences of students, teachers, parents, and the larger school community can humanize the stories of struggle and resistance and push these life histories to the forefront of educational research.

Much of the research dealing with the meaning of schooling for children of color as well as children in lower socioeconomic strata is rooted in a cultural deficiency framework. Thus, life history research is one way to counter this stockpile of research that tends to overlook the complexities of lived experiences. Many educators believe that the body of knowledge that students bring with them to the classroom should be an integral part of the teaching/learning unfolding in schools. As they see it, the current system often views these personal experiences as irrelevant and unimportant. Life history methodology within the area of education research is still getting its feet wet, and of

the emerging, groundbreaking projects, most use the life histories of teachers, and not of students.

LITERACY IN AMERICAN CULTURE

The uses of literacy and the spread of books and schools are a reflection of a society's values and attitudes. Each society must determine the answers to value-laden questions such as, Who should learn to read? What should be the content of available reading material? Who has the responsibility for creating and maintaining places of

learning? American culture has come up with different answers to these questions at different moments in time. As American culture has changed and evolved, as different concerns have developed, the uses of literacy have been transformed as well. What has remained constant, though, is that Americans employ a variety of methods in interacting with the written word. This entry offers a definition of literacy.

Literacy is a mosaic of socially constructed written language practices that vary according to use. People participate in literacy events in an assortment of ways depending on their knowledge of reading and writing, their previous experiences with texts, their interpretive practices, and their cultural resources and representations. Power relations among individuals and groups determine who and what people can read. Investigating the answers to these concerns in the past has been the goal of historians of literacy and those working in the field known as the history of the book. Understanding these concerns in the contemporary world has been the goal of policy makers and literacy scholars, as well as parents, news reporters, and business leaders. This entry explores both.

Literacy in Colonial British North America

The voluntary emigrants from England and the coerced emigrants from Africa who came to British North America in the seventeenth and eighteenth centuries brought values and traditions from their former homes, including ideas about literacy and schooling. Although most of the European colonists were from the British Isles, they still brought different conceptions about the purpose of their life in the New World, just as they differed in Britain about the accessibility and availability of literacy.

The starkest contrast was between the settlers of Massachusetts and the settlers of Virginia. The difference in attitudes was exemplified by the declarations and actions of the leaders of the Virginia and Massachusetts Bay colonies, respectively.

Virginia's governor, William Berkeley, coming from the conservative English tradition that viewed scholarly skills among the poor to be a threat to social stability, famously noted in a report to the colony's overseers

in Britain his supreme joy that schools for the poor and a printing press were nonexistent in Virginia.

In contrast, New England colonial leaders valued literacy for all because of the great importance placed on direct access to the word of God. For the leaders of New England and their followers, the Bible, literally, was the embodiment of truth and God. In support, the civil government in Massachusetts in 1642 required parents and masters to take responsibility for instructing children and servants to read. Five years later, the General Court passed a law requiring every town of fifty families to create a basic school where reading and writing were taught. Towns of one hundred families were compelled to set up a more advanced grammar school. The “Old Deluder Satan Act,” as this legislation came to be known, focused on the need for widespread literacy to support religion and to foster a godly kingdom here on earth.

The introduction of slavery to Virginia, and the enduring prevalence of a stratified, patriarchal society that favored cash wealth over spiritual wealth, ensured that the influence of the written word remained relatively weak in that colony. Three out of every four people in Virginia at the beginning of the eighteenth century were either nonliterate or largely confined to the oral medium. Over the next seventy years, in both northern and southern colonies, inroads in commercial capitalism and fissures in political relations between the colonies and Britain led to an important shift in the use of literacy.

On the eve of the American Revolution, rudimentary literacy among Whites in the colonial South had increased dramatically. For New Englanders, the relationship between literacy and religion grew weaker. In the new era of the late eighteenth century, people wrote and read for commercial and political reasons. At the conclusion of the Revolution, the new country found yet another use for literacy—the promotion of republican discourse.

Literacy in the Early Republic

After the United States won its independence from Britain, maintaining a republican spirit in the fledgling country became a primary concern for many Americans. Political rhetoric increasingly suggested

that literate culture could facilitate the maintenance of a republic. In Pennsylvania, Benjamin Rush called on schools to develop people into “republican machines” who would operate for the betterment of the state. In Virginia, Thomas Jefferson argued that liberty would be safe only in the hands of an educated people. And in Georgia, the president of the University of Georgia, Josiah Meigs, argued that liberty and peace required education to be diffused widely through the general population.

Accordingly, in the decades immediately following the Revolution, literacy was used to support nationalism in the newly formed United States, a dramatic departure from the religious and traditional orientation of the seventeenth century. “Friends of Education” generated proposals to develop state-supported systems of education. Noah Webster and like-minded authors developed dictionaries, spellers, and schoolbooks celebrating the new republic and its distinctiveness. Schools opened their doors to girls, the future mothers of the republic responsible for nurturing the next generation of citizens.

Over time, the republican emphasis in public discourse dissipated. By the middle of the nineteenth century, the purposes of literacy increased in number. Americans in both the North and South continued to rely on traditional texts and political monographs, of course. Literate culture, however, expanded to include popular fiction, journals, farm magazines, and high-brow literature.

Personal writing in the early republic served a practical function and focused on the commonplace. Three types of everyday writing predominated in this world: straightforward accounts of events and expositions of opinion; practical, do-it-yourself advice on nearly every conceivable aspect of daily life (from exorcising spirits to killing worms); and letters written for personal or professional reasons. Most citizens were utilitarian in their use of writing and saw no need to link writing to literature or literary appreciation.

Nevertheless, citizens believed they were fulfilling their civic responsibility when they authored simple reports or penned do-it-yourself advice. Literate individuals were expected to be aware of the larger world. Writing was to benefit and instruct others. Articles in periodicals of the era frequently reminded their

readers that common men reflecting insights and truth had produced the great inventions and ideas of their generation. All classes were expected to participate in literate civic culture. Working-class people in the United States produced sophisticated political and economic treatises of their own and commented on those of others in newspapers and periodicals.

Literacy Before and After the Civil War

As the North became more industrialized, and as the South increasingly produced staple crops for world markets, literacy became more useful in commercial enterprises. In the United States, as in most of the rest of the transatlantic world, population density and commercial and manufacturing activity were variables associated with the promotion of an ideology of literacy. Areas with greater density obtained a social concentration that led to the development of institutions promoting literacy—schools, churches, and libraries. Commercial and manufacturing activities usually, but not always, were associated with increases in population density. These economic developments in turn advanced publishing, book printing, and newspapers, and subsequently advanced a particular type of literacy.

The purpose of literacy in the South in the antebellum and postbellum years remained distinct from that of the North. Republicanism and economic development were present in the South, of course. Southerners saw the need for republican values and for literacy to maintain the values required to continue their form of democracy. Some Southerners encouraged efforts to increase manufacturing and envisioned a commercial purpose for literacy. In the handful of urban areas in the South, schools and libraries were supported as wholeheartedly, and for similar reasons, as in the urban centers of the North.

Yet these two concerns, republicanism and commercial activity, played a secondary role. Literacy in the South was controlled by, and most prevalent among, a White elite that sought to maintain its status above all else. This single fact was the driving force behind the uses and purpose of literacy in the South. The consequences for literate culture of the South's hierarchical society manifested themselves in three ways.

First, elites either directly or indirectly limited schooling and literacy for others. The most blatant limitation on literacy occurred prior to the Civil War. Slaveowners believed that the written word threatened their society from within. Antiliteracy laws aimed at slaves were passed by southern legislatures in the 1820s and 1830s. Prohibitions against Whites or Blacks owning and/or distributing abolitionist literature developed in the 1850s. All of these laws were enforced more carefully as the sectional conflict between North and South worsened.

A second, related point is that in a world where literacy is limited, oral culture and tradition necessarily predominate. Some Southerners claimed that the South's oral tradition revealed Southern superiority in intellectual concerns. Others, although not going that far, recognized the value in the spoken word in the patriarchal and hierarchical world of the South. In a world where orality predominates, reading is a social activity. Writing and reading are reliant on shared interpretations arrived at through talk.

The third and final point to keep in mind is that immediately after the Civil War, freed Blacks fought the literacy limitations placed on them by Whites. Blacks shared an intense desire for education and literacy and saw schooling as a cure to their troubles. In the first years of the Reconstruction era, it seemed to the former slave and renowned educator Booker T. Washington that an entire race was attempting to go to school. For newly emancipated slaves to be able to read and write was to obtain power.

School systems created by and for Black Americans after the Civil War signified the ex-slaves' intent to regain jurisdiction over their own lives. Whites seeking political, economic, and social subordination of Blacks eventually undermined initial Black triumphs in this enterprise, and Whites won control of Black educational institutions. By the end of the nineteenth century, Black schooling and literacy in the South was controlled and limited by Whites.

Literacy in the United States Since 1880

There are three key trends in literacy since 1880. The first is the striking, albeit uneven, expansion of literacy

among people living in the United States. The latter half of the twentieth century, in particular, witnessed a substantial increase in access to schooling for previously restricted groups. The second trend is the continuing divergence of the uses and purposes of literacy, with a concurrent development of a wide array of reading publics. The third trend is the increasing entanglement of literacy ability, corporate profitability, and national productivity.

The Expansion of Literacy

In an era that witnessed an acceleration of technological, economic, and social change, literacy became increasingly important in people's lives. In response, schools enrolled greater percentages of students for longer periods of time. Early in the twentieth century, very few Americans graduated from high school or even reached the eighth grade. By the end of the century, virtually all adults had at least an eighth-grade education, and the median level of education was more than twelve years of schooling.

As a consequence, the median level of education for Americans rose dramatically throughout the twentieth century. With the increase in schooling, individuals became less likely to self-report illiteracy to census officials and other authorities.

The Uses of Literacy

Along with an increase in both the number and percentage of literate Americans, the United States saw an increase in the book-buying public. In the latter half of the twentieth century, Americans participated in the growth of a leisure society in which increasing amounts of household income were consigned to recreational activities. Reading—both a work-related and recreational activity—joined in that growth.

Book buying spread to a majority of the American population in these years, making strong inroads in lower-income groups. It was at the higher income levels, though, in a reading elite of well-educated, active readers, where reading became more diverse and intense. Yet, at the same time, the percentage of the American public purchasing newspapers and magazines declined in that period, likely because of inroads made by radio, television, and eventually, digital technology.

The Entanglement of Literacy in Modern American Life

To an unprecedented extent, literacy has become integral to economic competition in the modern Western world. American workers have come to be viewed as the raw materials, the human capital, of national and corporate wealth. The modern workplace puts a premium on the ability of individuals to manipulate and understand abstract symbols. Because of the enhanced role of literacy, a number of contradictions have developed.

First, even as literacy and educational attainment have increased in the population, American political and business leaders have become more vocal in their complaints of a lack of advanced literacy skills among Americans. The value of literacy, it seems, has increased even more than the diffusion of advanced literacy in the American public.

Second, because of the enhanced value of advanced literacy skills, the potential cost of not attaining those skills is even higher. Advanced literacy serves a gate-keeping function to opportunity and reward. The ability to read and write allows individuals access to higher levels of income and to social privilege. Those who do not attain the advanced levels required in modern American life, however, may find themselves on the periphery of both.

Finally, the rewards from literacy are so great, for individuals and large institutions, that American governments and businesses have created elaborate bureaucracies to test and sort individuals. As a consequence, although the potential rewards are great, the potential for injustice and exploitation is equally present.

LITERACY IN THE COLONIAL ERA

Literacy in the American colonies was a constant preoccupation of European settlers. Geographical location influenced access to instruction, but in most colonies, by the 1770s, White men had achieved nearly 90 percent signing rates, and White women's signatures on deeds ranged from 50 to 85 percent. This entry looks at the development of literacy during this period, its methodology, and its missionary links.

Early Immigrants

The first English immigrants brought with them their own literacy, schoolbooks, and a printing press. In 1642, the Massachusetts colony passed a "Poor Law" decreeing that all heads of families and masters of apprentices should have the children under their roof taught to read as well as acquire a practical skill. Later, laws legislated that boys (but not girls) must also learn to write. In 1647, Massachusetts passed a schooling law requiring towns of over fifty families to support a schoolmaster to teach writing and reading to all who attended (in practice, boys). By 1712, legislators in all the New England colonies except Rhode Island had passed similar laws.

These seventeenth-century Congregationalist New Englanders agreed upon the purposes of literacy instruction. Reading was essential, mainly for religious reasons. In a culture that believed in infant depravity, it was crucial to teach children to read the Bible by

themselves in hope of achieving their salvation. In contrast, writing (defined as penmanship, not composition) was vital for economic reasons: good handwriting was a practical asset for men from blacksmiths to ministers. The corresponding economic skill for women was sewing; elite girls were taught writing, but only as a genteel accomplishment.

Instruction After 1750

The town-supported schools of New England were exceptional. In the middle colonies, White children attended schools sponsored by various Protestant denominations, including Presbyterians, Baptists, Methodists, and Mennonites. In the South, poor families joined together to pay for a schoolmaster, and wealthier ones hired a male tutor.

Schooling continued to be denominational or private across the colonies, but around 1750, literacy instruction began to improve, thanks in part to a rapidly improving standard of living and an influx of imported goods. Minimal literacy standards were raised: Between 1748 and 1771, Virginia, New Jersey, North Carolina, and Massachusetts all revised their Poor Laws to require that poor girls as well as boys be taught to write.

Spelling books, which offered more explicit reading instruction than primers, were imported from England in the 1730s and reprinted on American presses, becoming the child's introduction to reading. The most successful of these was Thomas Dilworth's *A New Guide to the English Tongue*, first printed in England in 1740 and in America in 1747. After 1750, children could read a wider range of books: Genres expanded from religious and courtesy books to advice books and even the new children's books being printed by the London printer John Newbery, designed to amuse children rather than convert them. Access to writing instruction improved: Imported stationery materials became widely available, and nonelite fathers, as part of their aspirations for gentility, paid for private writing instruction for their daughters.

Methodology and Texts for Literacy

Literacy was taught through the "alphabet method." Reading, writing, and spelling all proceeded from the smallest units (letters) to the largest units (sentences).

Children learned to recognize words by spelling them aloud, “M-A-N, *man*,” in cumulative syllables. In this oral approach, reading proceeded without writing. Indeed, writing instruction presumed a partial mastery of reading. This methodology was embodied in a series of imported Christian texts.

These began with the hornbook (a small paddle of wood with a page tacked onto it that showed the alphabet, a truncated syllabary, and the Lord’s Prayer); a primer; the Psalter (the prose version of the Psalms); the New Testament; and finally, the entire Bible. Different denominations offered their own locally printed primers, but the Congregationalist *The New England Primer*, in its second Boston edition in 1690, was popular everywhere.

Gender affected teachers as well as students. It was assumed that reading was easy to teach, so women, believed to have weak minds in weak bodies, were preferred for introductory reading instruction. In contrast, writing instruction was challenging and the province of writing masters who had, ideally, undergone lengthy apprenticeships. Whereas texts for reading instruction were easily obtained and relatively inexpensive, copybooks (books exhibiting different scripts) were owned only by writing masters, who used them to set copies for schoolboys. Only in the single-sex Quaker schools of Philadelphia was access to literacy instruction equal for both sexes.

Missionary Context

Native Americans’ introduction to alphabetical literacy occurred within the context of missionary efforts by European settlers. These varied by denomination but were all funded from England. On the island of Martha’s Vineyard, Thomas Mayhew, Jr., began converting the Wampanoags in 1642, and on mainland Massachusetts, another Congregationalist, minister John Eliot of Roxbury, began preaching to the Massachusetts Indians in 1646. Both missions involved teaching literacy in the Indians’ native language, Massachusett.

With Indian assistance, John Eliot began to translate and publish, on the local press, texts in Massachusett, printing the entire Indian Bible in Massachusett by 1663. His primer appeared in 1669. Beginning in 1704, the Anglican, London-based Society for the Propagation

of the Gospel attempted to convert the Mohawks of New York. Successive Anglican clergy preached to Mohawks near Albany, opened schools, and translated sections of the Book of Common Prayer (rather than the Bible) into Mohawk. Other missions involving literacy instruction include the Moravians among the Mahicans and Delawares, and, in English, instruction at Moor’s Indian Charity School, Connecticut, organized by Eleazar Wheelock.

Few Africans were able to acquire literacy unless they were taught by sympathetic slaveholders or, clandestinely, by literate slaves. However, from 1758 to 1776, London missionary organizations funded schools for young Africans in Philadelphia, New York City, Newport (Rhode Island), and Williamsburg (Virginia). Schoolmistresses taught at these schools rather than schoolmasters because writing instruction was never offered; writing was considered a dangerous skill for slaves. Other African children learned to read in Philadelphia, taught by the Quaker Anthony Benezet, and in Charles Town (South Carolina).

LITERACY IN THE SOUTH

In the United States today, being literate—having the ability to interact with, understand, and produce written texts—is considered a fundamental right of all people. Americans expect their political and economic leaders to work to increase literacy so that everyone can enjoy the benefits that literacy can bring. Americans would be shocked to hear public proclamations that children should not be allowed to attend school, or that books should be limited in circulation. Yet, in the nineteenth-century South, it was commonplace to hear public

figures talk about the need to prevent children from learning to read or write and to limit access to written materials to adults.

It was more than mere talk, however. Southern politicians used a variety of methods to limit literacy and its benefits in the antebellum era. Most significantly, an entire race was legally prevented from learning to read and write as states throughout the region prohibited the teaching of literacy to African Americans. In addition, public schools were grossly underfunded because the well-to-do largely decided to support an alternative set of private educational institutions and to send their children to schools outside the region.

State legislators held lengthy debates about how to prevent the spread of printed materials and in several instances passed legislation banning books and broadsides. State governments ordered federal postal officials to stop the delivery of books perceived as harmful. In the 1850s, missionaries from the northern United States offering religious tracts to Southerners were greeted with hostility and threatened with violence by sheriffs and armed patrollers. In the face of such opposition, the American Tract Society eliminated its once-thriving missionary service and pulled from the region virtually every individual charged with the duty of circulating these religious pamphlets.

Political and economic decisions also led to Southerners having restricted access to published materials because of an underdeveloped infrastructure. Books, journals, and newspapers were more difficult to obtain in the South than in the North. Southern publishing houses were virtually nonexistent. Consequently, throughout the nineteenth century, southern children were less likely to have attended school, and southern adults were less likely to be able to read or write than their counterparts in the North or West.

The initial aims of the efforts against literacy were relatively simple. Prevent the enslaved population of the South—African-born slaves and their descendants—from acquiring literacy so that they would be unable to either initiate revolts or flee to other regions. Whites in the antebellum South constantly were aware of the threat to their well-being by slaves seeking to end their oppression. Slaves frequently outnumbered Whites on

the remote and isolated farms and plantations of the rural South.

Slaveowners throughout the Atlantic world were mindful of the experience of slaveowners of the French colony of Saint Domingue. The bloody revolution that slaves began in the colony in 1791 ended with the creation of an independent and free Haiti in 1804, forever reminding wary slaveowners and eager slaves of the possibility of a captive people rising in fury and successfully transforming a slave society into one that was free.

That southern Whites restricted literacy among slaves is well known. Less renowned, but executed with equally tragic effectiveness, were efforts to restrict literacy among Whites. Planters and policy makers in the antebellum South did not fear personal violence from their less wealthy neighbors, of course, but the elites were wary of the threat of a lessening of their grip on their hierarchical and patriarchal society. Consequently, policy decisions at state and local levels in the South ensured that poor Whites had limited schooling opportunities. Literacy among these particular Southerners was quite low prior to the 1860s, at least when the group is compared to those of similar social status in the North.

After the Civil War, the poor of the South, both White and Black, again suffered from educational limitations. A failure to provide adequate schools ensured a docile workforce, a stagnating economy, and limited cultural and economic opportunities. Later, when literacy tests came to be used as a method of restricting voting opportunities, the failure of southern schooling restricted participation in political life.

Beginning in the early twentieth century, other policy makers tried to modify earlier arrangements as they sought to develop educational reforms for middle-class Whites. Concern for the educational well-being of the poor of both races remained unaddressed. Eventually, however, in the late twentieth and early twenty-first centuries, education was seen as a solution to a wide array of social ills specific to the legacy of the earlier efforts to limit literacy.

The widespread operation against literacy in the South challenged the very core of American national identity, and its consequences—cultural, economic, and political—continue to reverberate through the nineteenth and

twentieth centuries and into the twenty-first. Southerners today are struggling with both the memory and consequences of the past. When compared to those in other regions of the United States, Southerners have a lower standard of living, remain less educated, and are less likely to own a computer. Historical educational practices, in other words, continue to have an impact.

LOCAL KNOWLEDGE

Local knowledge is generally defined as a community's shared understanding of its sociocultural, political, linguistic, economic, and intellectual relations across space and time, and the implications for the everyday regulating and rearranging of society. It is also described variously as knowledge that is place-based, situated, or regional. Local knowledge is what people use to construct meaning, so the ways of knowing generated and maintained within a given community or organization make up the members' social reality. Researchers attempting to understand social and cultural phenomena focus their attention on the actions that take place on a local level within the sphere of specific traditions, languages, and competencies. Arguments existing within the field of cultural

anthropology influence how educators regard the role and usefulness of local knowledge. This entry provides an insight into the current debate and then compares and contrasts three forms of local knowledge with the aim of clarifying its purpose for educators.

What Are the Limits of "Local"?

Researchers who seek to understand the socially constructed reality revealed in their studies of the local knowledge of a community recognize the need to use qualitative, often participatory, methods of data collection. However, the method of interpretation of these data is a matter of debate. Those who claim that science can identify human laws or universals normally interpret their data through the application of global tenets.

Clifford Geertz, a cultural anthropologist who coined the term in 1984 with the title of his seminal text, *Local Knowledge*, brought researchers' attention to the limitations inherent in applying universal principles when analyzing social phenomena. His interpretive methods, while acknowledging the constraints inherent in diversity and decentralization, are based on the purpose of the human sciences: to clarify and draw some conclusions about what is going on among various people at various times.

The current debate is influenced by postmodern views that have developed in the context of a movement to promote global thinking. Contemporary realities are globalized when scholars from different localities collaborate in the reframing of their own traditional knowledge and negotiate new meanings collectively. The challenge is to determine ways to demonstrate local authenticity. Power is exercised through the ways in which knowledge constructs the substance that serves as the basis for community members' daily problems and practices. Knowledge is powerful because it provides people with the rules of reason.

What Counts as Knowledge?

The ancient Greek classification of knowledge is useful in revealing the limited modern conception of what it means to know. Greek knowledge included

three forms: theoretical (epistēmē), technical (technē), and moral (phronēsis). Western epistemology has reduced moral knowledge and technical knowledge to one form, practical knowledge, because of its modernist emphasis on the distinction between theory and practice. Unexamined assumptions about the nature of knowledge not only interfere with a researcher's ability to select appropriate methods of interpreting social phenomena, but also render imperceptible the forms of knowledge that enable moral decision making.

Controversies associated with prevailing views of local knowledge are rooted in differing beliefs about how knowledge is constructed, accessed, and used. Briefly presented here are three terms that represent a range of descriptions and explanations of how local knowledge is interpreted.

Intergenerational Knowledge

Knowledge shared across generations is the foundation for sustaining the shared resources (e.g., land, water, air) and relationships (e.g., language, traditions, daily practices) that support community life. Intergenerational knowledge produces and is produced by the mutual support systems that maintain what characterizes the community. Those who recognize the need for critical examination of the ideological influences on the interpretation of social phenomena prescribe continual evaluation of it. For example, within an ecojustice framework, C. A. Bowers proposes studies of concrete situations that take account of place, existing arrangements of cultural self-sufficiency, and impacts on natural systems.

Indigenous Knowledge

Similar to intergenerational knowledge, indigenous ways of knowing come about through forms of sharing such as family interactions, storytelling, and demonstrations. Traditional cultural practices, like modern educational practices, generate content knowledge as well as fundamental worldviews. Because this is another form of knowledge that is typically undervalued, even those who possess it often don't recognize its potential power. Educators, managers, and policymakers can increase the status of this kind of knowledge by

allowing it to inform decisions that affect the community members. Using local knowledge allows inclusion of the moral dimension, resulting in prescriptions of *how* an interpretation ought to take place.

Cultural Knowledge

Cultural knowledge takes broad forms. It may be mythic, or it may reinforce views. It may be associated with a particular line of work (e.g., food preparation, textbook selection) or particular locations in time and/or spaces (e.g., faculty lunchroom, a latch-key childhood). Socialization processes create the interpretations, which are embedded in the language of native speakers. An examination of meanings expressed in metaphors can reveal knowledge that is common to a particular culture. Participatory research methods provide a way of learning a second way of life, without forsaking reverence due to one's primary group.

Uses of Local Knowledge

Recognition of the valuable uses of local knowledge can raise its status. Accessing the knowledge of those affected by its use in policy formation legitimizes its value in the decision-making process. It also enhances personal understanding between individuals and cross-cultural understanding between groups. Accessing local knowledge can serve to inform policy makers of the impact of global forces; it also allows participants a view of the ecological impact of their cultural beliefs and practices.

LUNCH PROGRAMS

They are now considered a fundamental part of the school day, but school lunch and other meal programs have been offered on a national scale only since 1946. With growing attention to the link between nutrition, health, and learning, they are increasingly becoming a part of the efforts to improve education outcomes for students. This entry describes the gradual development of school lunch programs, their links to helping poor children, and the recent concern with nutrition.

Early Programs

School meal programs have been in existence since the 1790s, when the first programs were started in Europe; the first programs in the United States began in the 1890s. What all of these early programs had in common was the desire to provide poor and malnourished children with at least one significant and healthy (by the standards of the time) meal. One of the earliest programs was started in Munich, Germany, by Benjamin Thompson (also known as Count Rumford), an American. He created the Poor People's Institute, which provided clothing and food in exchange for work for adults and children. The children were required to work in the morning and afternoon; between work hours, they received lessons. While seeking to provide nutritious meals, the program also sought to operate at the lowest possible cost. Based on the success of this program, Thompson went on to found feeding programs in other European countries.

In the United States, the earliest programs appear to have been started in 1853 in New York City by the Children's Aid Society. This program specifically served children in vocational education programs. However, it was not until the end of the nineteenth century and the beginning of the twentieth that other

school feeding programs began to appear. Among the first cities to have programs were Philadelphia, Boston, and Milwaukee. These early programs often were based on an explicit link between hunger and the inability of children to learn and do the work required of them.

From the beginning of the twentieth century until the Great Depression, programs continued to be created. These programs were all locally run, and some were managed by a charitable group in cooperation with a local board of education. For example, in Cleveland, the program started in 1909 with the Cleveland Federation of Women's Clubs serving breakfasts to nineteen children at a single school. By 1915, the program had expanded to reach 710 children. In the case of the Cleveland program, the Board of Education provide the space and equipment with the charitable groups providing the food and hiring a woman to prepare and serve the food.

In other cities such as New York, the programs started out being run by charitable groups but were then taken over by the board of education. When the St. Louis Board of Education determined that it was not legal to spend public funds for food, the programs were required to be self-supporting (minus the cost of equipment), a policy that continues to the present. Regardless of how the program was run or funded, though, the prevailing reason for the program was to promote health and improve the readiness to learn.

Although many of the early programs were in urban school systems, some rural school systems also sought to provide a hot lunch for their students. With little to no public money available, teachers had to find alternatives. One strategy included having children bring contributions of meat and vegetables that were then combined and shared by all.

The Depression Years

As programs expanded, states started to pass legislation to authorize local school systems to run lunchrooms. Most states required the programs to cover the cost of food, but some states provided the resources for poor children to be provided with free meals. With the Great Depression, the federal government began

to take on a role in these programs. Some of the first aid came through employment support programs. These programs helped to pay the costs of employing women to prepare and serve the food, and as the Depression continued, these programs expanded under the Works Progress Administration.

During the Depression, farm prices were extremely depressed, and there were growing surpluses of agricultural products. At the same time, the high unemployment rates meant that many children could not pay for their meals in schools. The risk of malnutrition for large numbers of children attracted national attention. In 1936, Congress passed legislation that authorized the U.S. Department of Agriculture to purchase surplus food, removing it from the market, and then donate it in ways that would not interfere with regular commerce. This type of commodity purchase continued until World War II.

With the war, federal aid started to decline, and many programs shut down. However, Congress continued to support the program through legislation in 1943 and 1944 that authorized subsidy payments to local sponsors to pay for food and also set standards for how the federal aid could be spent. As the amounts authorized grew, the program expanded, and by 1946, 6.7 million children were being served each day.

Federal Legislation

In 1946, Congress enacted and President Truman signed the National School Lunch Act. At this time, three meal options were created: Type A, which provided a complete lunch; Type B, which had smaller portions and fewer items; and Type C, which provided a half pint of milk. (Type B was dropped in 1958.) Since then, the program has been continually reauthorized but has changed and expanded.

In 1962, the program changed from a grant to states to a guaranteed meal reimbursement and additional funding for schools that had a high percentage of low-income children. In 1966, the School Breakfast Program was created as a pilot that was then extended in 1968. That year also saw the creation of the Summer Food Program and for the first time provided funding for states to administer all the programs. In 1970, additional amendments created guidelines for

providing free or reduced price meals and prohibited discrimination, as well as overt identification of children receiving subsidized meals.

In 1980, changes provided increased flexibility and encouraged school food services to offer a greater variety of foods. Throughout the 1980s and 1990s, additional program changes occurred as greater attention was paid to nutrition. In 1996, the program required school lunches to conform to the Dietary Guidelines of 1996. With the 1998 reauthorization, the program included an expanded After School Snack Program with complete reimbursement for schools in the neediest areas. Additionally, the “Meals for Achievement” pilot research program was implemented that year.

By the end of the 1990s and the beginning of this century, greater public attention was being paid to the link between good nutrition and children’s ability to learn. Additionally, national concern was growing about the number of children and adults who are overweight or at-risk overweight. With these twin concerns, the most recent reauthorization in 2004 brought a number of additional changes, including the requirement that local school districts create local wellness policies to address nutrition and physical activity. In 2005, new dietary guidelines were introduced by the U.S. Department of Agriculture (USDA) to help stem the tide of overweight. According to the USDA, more than 26 million children receive free or low-cost meals each day. However, many eligible children still do not participate, and many school districts are now expanding their programs as they seek to improve academic achievement.

LYCEUM MOVEMENT

Taking its name from Aristotle's Lyceum school for the youth of Athens, the lyceum movement in the United States mobilized support for popular adult education in the United States and during its most active years—the 1830s to the 1860s—played an important role in promoting public schools, libraries, and museums. Growing from the Enlightenment ideal of education for the general population, lyceums disseminated information on the arts, literature, sciences, history, public affairs, and other sorts of “useful knowledge” via lectures and concerts, scientific demonstrations and dramatic performances, and participation in debates and discussion groups.

Josiah Holbrook, a traveling lecturer and teacher, founded the first American lyceum in Millbury, Massachusetts, in 1826. Local lyceums sprang up so rapidly following Holbrook's model that by 1834, there were approximately 3,000 active lyceum associations in the Northeast and Midwest. They organized as far south as Florida and as far west as Detroit. Lyceum activity never caught on with the same fervor in the South, however, because southern aristocrats feared that educating poor Whites and slaves would damage the economy.

Lyceum speakers were initially members of the local communities, but by 1840, professional institutions emerged that hired and promoted freelance lecturers to travel the lyceum circuit. Several New England Transcendentalists were closely and actively associated with the lyceums, which were seen as a powerful medium for communicating Transcendental philosophy to parts of the country outside New England. Lectures presented by Ralph Waldo Emerson and Henry David Thoreau, for instance, were honed on the lyceum circuit, then later revised for publication. Many of the best known artists, writers, politicians, and journalists of the

day appeared as lyceum speakers, including Frederick Douglass, Daniel Webster, Nathaniel Hawthorne, Abraham Lincoln, Wendell Phillips, Frances Wright, Walt Whitman, Mark Twain, Oliver Wendell Holmes, William Lloyd Garrison, Susan B. Anthony, and Charles Dickens. Several lyceums were established for particular parts of the public such as women, seamen, and teachers.

The momentum of the movement was spent by the onset of the Civil War in 1861, and most lyceum activity immediately ceased. After the war, lyceums reemerged, but they were of a fundamentally different character from their antebellum counterparts. Although they were still used for speeches by notable public figures, the educational influence of the lyceums waned as they were used increasingly as a venue for traveling musicians and other entertainers, as well as vaudeville and minstrel shows. When the first continental railway was completed in 1869, these traveling performers also went West.

Only a handful of lyceums lasted into the early 1900s, but the legacy of bringing education to the general public through contact with great speakers, teachers, musicians, entertainers, and specialists of the day was carried on in the Chautauqua movement of the 1870s and lyceums built upon America's continuing interest in adult education and lifelong learning.

M

MAINSTREAMING

Mainstreaming is a legal policy mandated by the Individuals with Disabilities Education Act (IDEA) that addresses the placement and participation of students with disabilities in general education classes to the degree appropriate to meet their needs. Students with disabilities are integrated with their nondisabled peers for all or a portion of the school day and for all or only a few classes, depending on the students' characteristics and the accommodations required. Previously, mainstreaming was invoked primarily when moving students from special education classrooms to general education classrooms, typically for nonacademic portions of the school day, such as art, music, and physical education. More recently, it has included reintegration into content area (e.g., science, social studies) and even core academic subjects (e.g., reading, math). Notwithstanding this focus on the return to more inclusive, normalized settings, the special educator has principal responsibility for the mainstreamed exceptional child and works collaboratively with the general educator to ensure that curricular and/or behavioral modifications are implemented effectively.

In actual practice, the terms *mainstreaming* and *inclusion*, and to some extent, *least restrictive environment*, are used interchangeably; however, they can have very different meanings, and at a minimum are not synonymous concepts. Least restrictive environment, a principle mandated by IDEA, states that students

with disabilities must be educated with their nondisabled peers to the maximum extent appropriate. Inclusion refers to the notion that placement of students with disabilities in the general education setting (alongside their nondisabled counterparts) is a right of all students, with special education support services being provided within the general education setting as needed. Advocates of full inclusion believe students with disabilities should be educated only in the general education setting. The courts have expanded on the notion of mainstreaming by stating that it should be pursued as long as it is consistent with providing students with disabilities an appropriate education; that is, students should receive educational services with nondisabled peers as appropriate, but not necessarily exclusively in general education.

The law does not require inclusion. It requires that children with disabilities be educated in the least restrictive environment, which, for the majority of students, includes at least partial inclusion in the general education classroom. The most recent reauthorization of IDEA uses language that favors inclusion of students with disabilities in general education settings; however, most in the field of special education concur that this should not eliminate the continuum of services (range of placement and service delivery options) available to students. The educational needs and characteristics of some students with disabilities are such that separate classes and/or pull-out services are required for part or all of the school day. Although there is debate in the field among advocates of full

inclusion and those who favor maintaining the range of placement options, there is definitive agreement that students with disabilities need to be educated in the most normalized environment available and that extensive experiences with nondisabled peers are critical to their overall social and academic growth. The guiding principle in this decision-making process should be the extent to which these types of normalizing experiences can be provided while not compromising needed special education support services for the special needs child.

Educators may employ several strategies to implement mainstreaming effectively. Three of the most commonly used strategies in the schools include prereferral teams, collaborative consultation, and cooperative teaching. Although definitive research confirming their effectiveness is still in the investigational stage, authorities in the field of special education do recommend their use.

Prereferral teams refer to groups made up of a variety of school personnel (including the special educator, school psychologist, school counselor, administrator, reading specialist, etc.) who work with general educators by observing children who are manifesting cognitive or behavioral problems in the general education classroom and then devising strategies for working with them. The goal is to reduce the number of premature and/or inappropriate referrals to special education by emphasizing that general education teachers attempt as many alternate strategies as possible before deciding that challenging students categorically require special education services.

Collaborative consultation is an approach to meeting the needs of students with disabilities wherein a special educator (or psychologist/specialist) and general educator collaborate to develop strategies targeted toward addressing a student's academic or behavioral difficulties and capitalizing on his or her strengths. The child may see the special educator in a resource room setting, or the student may receive consultative services within general education. Although the special educator/psychologist serves as the expert in recommending accommodations for the student, the relationship between the professionals is based on the notion of shared responsibility for the child and parity in decision making.

Cooperative teaching (i.e., co-teaching) occurs when general and special educators team-teach in a general education class comprised of students with and without disabilities. This approach takes the collaborative consultation model a step further in that the educators teach in tandem. As a result, the special educator becomes more aware of the academic and social demands for students with disabilities in the general education setting. Moreover, there is variation in terms of how cooperative teaching is delivered. The general educator (as the content-area expert) may assume primary responsibility for instruction, whereas the special educator may provide needed academic survival skills, compensatory strategies, and behavioral modification techniques. In other cases, the special and general education teachers may jointly plan and teach the curriculum to students.

When it is deemed appropriate that a student return to the general education setting through the process of mainstreaming, one principle to consider is that of natural proportions. This concept suggests that students with disabilities should be placed in general education classes in proportion to the incidence of the exceptionality in the general population. A school district serving students with disabilities at a rate of 10 percent should have the schools and classes within it including such students at similar rates. Therefore, a class of thirty would contain no more than three students identified as exceptional. Others in the field have recommended that not more than 20 percent of the total class should have disabilities, which, in a class of thirty, would mean six students. Furthermore, the overall number of students with disabilities included should be reduced if some of those students manifest more severe impairments and require more extensive support services. As the field continues to embrace the notion of students with disabilities becoming the responsibility of *all* educators, it is likely that the debate over how mainstreaming is conceptualized, operationalized, and actualized will continue.

MANUAL AND INDUSTRIAL TRAINING

Models of manual training or industrial education were created in Europe and imported to the United States in the nineteenth century. The first U.S. implementation of this training was at the Massachusetts Institute of Technology, and it quickly became a dominant paradigm in secondary education. The idea was that it would produce skilled but compliant workers for growing U.S. businesses. This entry looks at the history of this type of education in the United States.

Beginnings

Johann Heinrich Pestalozzi (1746–1827), a Swiss educator and reformer, is considered to be the father of manual training (industrial education). In his system of education for children, he combined manual training and work with a general education. Interest in manual or industrial training, however, didn't develop in the United States until the 1870s, when manual training was seen as a potentially important curriculum for use in secondary schools.

The breakthrough came at the 1876 Philadelphia Centennial Exposition, where materials were exhibited from the Moscow Imperial Technical School that included theoretical training in specialized fields such as drafting, chemistry, and civil and mechanical

engineering, as well as practical courses in carpentry, metal turning, forging, and wood turning. The materials on exhibit included drawings, tools, and models, and they were based on the curriculum of Victor Della Vos, the school's director, which stressed that students learn the principles of design involved in the manual arts rather than learning only through an apprenticeship and copying the work of others.

In his system, it was essential that students learn how to properly use the tools involved in each of the manual arts and that they learn the mechanics of each area. Thus, as an example, students were introduced in their woodworking course to every type of joint that could be made. The idea was that they would learn the mechanics of the joint and then be free to make and create things on their own—not just slavishly copy the work of others.

John D. Runkle (1822–1902), president of the Massachusetts Institute of Technology (MIT), immediately realized the importance of the exhibit when he saw it at the exposition. When he returned to Boston, he proposed setting up a shop at MIT for training engineering students as well as a School of Mechanic Arts for secondary students. The training would be based on the Della Vos method.

Secondary School Adoption

Calvin M. Woodward (1834–1915), dean of the polytechnic faculty at Washington University in St. Louis, Missouri, who had experience as a secondary school teacher and principal, picked up on Runkle's notion of establishing mechanic arts schools at the secondary level. Some believed that if secondary students were trained under the Della Vos method, national production levels could double and wages would increase.

Woodward felt that manual training should be part of the general curriculum, not just at polytechnical schools but in the public schools as well. In 1880, the Manual Training School, a secondary school connected to Washington University and under Woodward's supervision, began offering a three-year program that combined the basics of a high school curriculum (mathematics, English, drawing) with training in how to use tools. Woodward adapted the project method (in which practical problems were solved during a specific period of time). At the school, students actually designed and

then produced a project. Students could take a foreign language as prep for entering a college, but most entered the workforce directly after graduation.

The immediate success of the school encouraged public schools in cities such as Chicago, Baltimore, Philadelphia, and New Orleans to open their own publicly supported manual training high schools. Not everyone was impressed with manual training; both educators and labor organizations opposed Woodward's methods. Some in organized labor felt that manual training schools threatened traditional apprenticeship programs. When extended down into the elementary grades, many believed that manual training programs preempted the study of more traditional subjects.

Perhaps the most prominent educator to criticize the manual training movement was William Torrey Harris, who was superintendent of the St. Louis Public Schools (1868–1880) and then U.S. Commissioner of Education (1889–1906). Harris believed that the manual training curriculum emphasized the physical development over the spiritual development of the student. By spiritual development, Harris meant the tools that would make it possible for the child to learn about the mysteries of the human mind and of nature. He said that grammar, literature and art, mathematics, geography, and history were the “five windows of the soul” necessary for children, particularly the children of the working classes, to successfully participate in culture and to learn more about themselves and nature.

In spite of such opposition, the manual training movement continued to grow into the late nineteenth and early twentieth centuries. At the 1893 World's Columbian Exposition, manual training methods based on the Swedish Sjölyd system—a craft model based on Swedish folklore and craft traditions—were introduced. Significantly, the Sjölyd system extended manual training to children at the elementary level.

Ultimately, manual training received wide support because it was believed that these schools would provide the technical training necessary for workers in modern factories, while at the same time instilling a sense of industriousness and pride in one's work. In doing so, the needs of the industrial system were reinforced, along with the creation of compliant workers and citizens.

MARXISM

An “if-then” supposition is helpful in considering Marxist thought in relation to schooling and education. If one thinks that it is possible to construct effective modes of inquiry in spite of the difficulties human beings confront as they seek to understand themselves, each other, communities, societies, the world, and beyond, then Marx and some Marxists may be relevant to students of teaching and learning. As a child of the Enlightenment, Marx believed that the quest for certainty conducted by religionists and their secular allies was ineffective and even dangerous. Instead, his position was that it is possible to use critical rationalism that is grounded in concrete empirical inquiry to form hypotheses that can then be translated into practice. His emphasis was on collective action. Although there are important differences between American pragmatist philosophy and Marx, John Dewey's term *warranted assertibility* describes Marx's position with regard to human abilities to understand “facts,” if not “truths,” about themselves and their environment. This entry looks at how Marxist philosophy viewed human agency and the role of capitalism, as well as the views of some Marxist thinkers on education.

Capacity for Change

Marx's philosophy is central to bona fide education because the latter must be based upon trust that students' cognitive abilities are not just so many

words and ideas that have little or no correspondence to what is being described, if not mastered. In these postmodernist times, many philosophers and educators insist that words and ideas are just opinions that are not connected to *what* is talked and thought about. In their view, people are reduced to participating in dominant discourses based on power, not on any superior correspondence to what they seek to describe.

As a philosopher, Marx belongs to a tradition whose contributors hold that systematic inquiry enables people to understand systemic and structural phenomena. Marx believed that finding underlying structures assists in understanding the everyday occurrences that people experience. Similar to other humanists, Marx placed human beings and their welfare at the center of his concerns.

Although some charge that Marx was a determinist, he viewed history as open to human volition. In fact, his version of “historical materialism” can be described quite simply. If people make their own histories through human agency—perhaps neither under conditions of their own choosing, nor just as they like—then this position, or fact, is relevant to contrasting claims made in today’s society and schools. The radical conservative claim is that whatever conditions people face, it is possible and necessary to pull themselves up by their bootstraps. A radical determinist view—perhaps epitomized by B. F. Skinner—asserts that environment is everything; in other words, there can be no successful agency or volition against these odds.

Marx’s middle position is useful to educators who realize that environment, social class, race, ethnicity, gender, sexual orientation, and other factors make it difficult for some students to succeed, in contrast to others who have inherited advantages. These teachers understand that the school and society must become level playing fields. Some of them act on their convictions both within the schools and out in the larger society.

Marx’s conception of correspondence is not similar to idealist or even realist philosophers’ version of it. The Marxist view is based on humans’ ability to change what they study as well as themselves as they do it. There is no correspondence to alleged supernatural constructions of reality; instead, Marx insisted that the human and physical world has been created through people’s labor. If this is the case, then the status quos

into which people are born can be overcome as a result of critical analyses, hypothesis formations, and collective human action.

The Role of Capitalism

In the Marxist view, the capitalist system is historical, not a universal given; it was constructed by the labor of many people over time. It is logical to assume that what has been constructed can be deconstructed and replaced by a new, more equitable, democratic society and school. Education is central to these liberating actions. Moreover, this kind of education is possible only if it is assumed and corroborated that educability and intelligence are widespread in every population. Because Marx believed that human consciousness and ideas were developed through labor as people wrestle with seemingly recalcitrant matter and structure, he concluded that history is not just about the rich and powerful, but instead about ordinary people who have struggled to overcome injustices in the name of “bread and roses” for all.

If Marx’s philosophy is credible, then social and material structures and barriers that are encountered need not be viewed as “just the way it is.” Hegemony is used by the powers that be to convince subaltern and oppressed people that the status quos are not only good for everyone but also part of the very nature of things. It is proclaimed that there are no alternatives to these “natural” and “universal” laws and conditions. During these times of economic, political, social, and educational reaction, some seek to convince people that poverty as well as massive school failure represents natural and even inevitable occurrences. Marx and the best Marxists—among others—disagree. They argue that the capitalist *system* is the most causal with regard to the state of the U.S. government, civil society, culture, and schools. As a result of this argument, Marxists insist that the system itself must be overcome in order to achieve education aimed at more democratic empowerment for everyone, social justice, respect for and even embracing diversity—and the potential for more people acting altruistically, if not “caringly.”

Marx saw modernism—in which capitalism is embedded—as a problem to be solved. Although he despised the capitalist system, he is somewhat comfortable with the dynamics it projects into roiling

modernist societies. Marx, through his writings, is a great portrayer of modern times. Many Marxists do not accept the term *postmodernist* because capitalism is still dominant. Marx is comfortable with keeping various and even contradictory ideas, beliefs, and desires in mind instead of retreating to absolutes and indefensible certainties.

Marx wrote little about education because he realized that in the capitalist countries during his lifetime, it would be virtually impossible to have schools that were responsive to the democratic imperative because of the capitalist imperative's overwhelming power.

Secular public schools might seek to establish facts that are warranted to assert, rather than so-called truths. In doing so, Marxist thought would provide valuable tools. Marx's great "energizing myth" was developed from his theoretical and empirical studies. It is characterized by verbal pictures of the working-class's emergence onto the historical stage. This occurred because of its wresting power from oppressors—the capitalist-based ruling class. This possible victory was presented as the fulfillment of bona fide democracy as the proletariat endured and overcame the fierce contradictions that capitalism forced on the modernist period.

Marxist Thinkers

Antonio Gramsci

Antonio Gramsci, Marxist theoretician and activist, did focus more on formal education in the Italy of his time. He understood well the role of schooling in assisting nondemocratic capitalist hegemony in his country and elsewhere; however, he realized education's liberatory potential. His life is an example of how even one who is wretchedly poor can use hegemonic schooling to figure out how things could be different and better. Gramsci's political-educational project sought to develop "organic intellectuals" from among the working class who would have the ability and determination to provide leadership so that working people could see through the hegemony under which they suffered. He and his comrades' goal was to deconstruct the capitalist order and rebuild a new one that would be deeply democratic and based on a "new humanism."

As a member of the working class, Gramsci knew that studying was hard work. However, most Italian youth were already working hard on job sites; therefore, if it could be demonstrated that there are continuities between physical and mental labor, then the deprived youth could become more confident of their abilities and potential. Gramsci sought to demystify academic work so that it would no longer be viewed as an activity that only upper-class students could accomplish.

Gramsci knew that everyone has a culture and intellectual prowess; moreover, people all operate in various contexts that are comprised of ideas and portrayals of how things became and are and how they might/should be changed. He respected what working-class youth already knew. Gramsci started from the student perspective and, like Dewey, viewed the learning process as movement toward self-realization within the actual social and physical worlds. Gramsci's belief in people's abilities and further educability is crucial to his insistence that the main goal of education should be self-governance in a democratic, just society. Democracy means rule by the people. Gramsci held that the capitalist system and its class-state governance made bona fide democracy impossible.

Marshall Berman

Marshall Berman writes about the "Popular Front" in the United States during the 1930s and 1940s. He suggests that its greatest achievement was creating images of genuine democratic community. Berman refers to Studs Terkel, an American leftist critic, as living in and epitomizing the vast mural. This ideal community was not like the New Jerusalem of the Puritans or the Populist ideal of an agrarian past. Instead, it was modern, industrial, and ethnically and racially diverse, and it had room for even more people who wanted to join those who had already pushed their way onto the historical stage—one that had formerly been occupied by their self-appointed "betters."

As Berman interprets him, Marx views the worldwide working class as a community waiting to happen. Creating and joining unions is portrayed not just a feature of special-interest politics but as a necessary—if

not sufficient—activity that helped to educate the human race. This education would help people discover who they are and to confront the descriptive “what is” with the normative “what could/should be.” Marx and Gramsci believed that the vast working class of the world would understand—would get it—“by and by.”

MEDIA LITERACY

Media literacy is a new and important area within the interdisciplinary movement of new literacy studies (sociolinguistics, mass media, curriculum, and cultural studies, etc.). In this context, media literacy goes beyond reading and writing texts to also include (in a Freirian sense) reading and writing the world. As a new area of inquiry, media literacy involves (a) understanding how corporate for-profit media work, and their impact on educational, social, political, cultural, and linguistic practices; (b) understanding that educators, parents, and citizens need to be media literate to be able to participate in and for a democratic society; and (c) developing strategic abilities for searching, supporting, and/or creating independent, nonprofit alternative media.

There are several approaches to media literacy. Some draw on theoretical frameworks (cognitive, moral, ideological, etc.), and some on media analysis (advertising, news, content). The lack of media literacy potentially prevents citizens from effective participation in democratic systems. Democracy, as a freely elected and responsible government by popular consent, cannot exist without informed citizens.

Therefore, the existence of independent media is a *sine qua non* for maintaining a democracy.

Evidence suggests that in the United States, corporate media are, in fact, becoming adjuncts of government to advance their common agendas and to develop policy that favors their interests. Consequently, corporate media are becoming unprecedentedly large (five major conglomerates) and diverse in their media businesses (many media modalities: radio, TV, film studios, magazines, etc.). The obvious consequence is that democracy becomes poorer—what some term a “capitalist ‘democracy,’” one involving consumer choice more than genuine democratic participation. Chomsky sees this process as an “assault on democracy” in which powerful corporate and essentially totalitarian entities linked to powerful states function in ways that are largely unaccountable to the public.

In this context, the technological revolution in communications is paradoxical. It provides the possibility for facilitating communication among people but also makes possible forms of domination and control by facilitating the hegemonic conjunction of market, military, and political interests through the creation of consensus and dissensus.

More than just “representing” reality, corporate-controlled media increasingly construct reality—a reality convenient to their interests and their corporate and political allies. Ben Bagdikian points out that today, in the age of the communications superhighway, people live in two worlds: a “flesh-and-blood” world and a media-constructed world. As the latter becomes more ubiquitous, the first world becomes more illusive.

Understanding how media work implies also that we are aware of the psychological impact of media programming. In this context, authors such as Carlos Cortés document how media teach about cultural diversity and how consumers learn not only content information, but values, attitudes, sentiments, looks, perceptions, and culture. Noam Chomsky has pointed out in much of his work that a critical understanding of corporate media requires “intellectual self-defense” in which we become aware of our susceptibility to be influenced by propaganda and ideological control.

In the era of corporate media, TV and the Internet in particular are shaping students’ minds and learning

experiences, both inside and outside the school. Chomsky argues that TV works in tandem with schools to indoctrinate students and therefore prevent them from asking questions that matter in their lives. Nonetheless, most of the media's curriculum remains hidden and unrecognized. But this is not an obstacle for affecting the consumer. Actually, as Lilia Bartolomé and Donaldo Macedo point out, mass media educate more than teachers and parents combined.

Television as a media form is not limited to commercial broadcast programming. Alex Molnar, for example, has documented how Channel One has entered schools, often against the will of teachers and parents. He shows how the imposition of Channel One is largely unfavorable for schools and inappropriate for students who become *captive* consumers. This type of contract leads researchers such as Molnar to argue that the real purpose of Channel One is not to serve students but to indoctrinate them in a mercantilist and materialist mentality under the guise of "curriculum improvement."

David Sholle provides several guidelines for relevant, local, and effective critical media literacy: (a) unwrapping the myths and excluding discourses; (b) placing media analysis into a theoretical and historical context to confront market-driven production and consumption; (c) connecting text and imagery with students' experiences so as to allow them to express their allegiances, pleasures, and understandings; (d) helping teachers to operate as facilitators of critical media literacy by steering discussion to students' literacy practices and targets of media propaganda; (e) facilitating students' active engagement in remapping and expanding their views and positions for the purposes of strengthening democracy; and (f) building counterhegemonic strategies for oppositional practices.

In conclusion, media literacy is a pedagogy of questioning that is indispensable to democracy. To be media literate is to read critically and understand the texts and reality constructed in media sources, and in turn the power relations, myths, and types of control they assume. Not to have our students become media literate is ultimately undemocratic and contradicts the likelihood of a sustainable and just society.

MEDICAL EDUCATION

The major features of contemporary medical schools took shape in the late nineteenth and early twentieth centuries. What occurred at that time thoroughly transformed medical education. Subsequent developments rarely had the same far-reaching effects as the changes put in place from the 1870s through the 1920s.

Early Medical Schools

Before the 1870s, most U.S. medical schools supplied only part of the education necessary to be a competent physician. The typical curriculum featured one year of courses in six to eight subjects. The instruction was didactic. A lecturer occasionally demonstrated procedures for the class to watch, but few instructors let their pupils carry out the tasks. Students spent little, if any, time in laboratories or with patients. To learn by doing required securing an apprenticeship, summer schooling, European study, or private instruction. What the medical school offered was a series of lectures from faculty who usually owned the school, concentrated on their private practices, and saw research and writing as optional rather than mandatory.

In contrast, medical education in France and Germany was more rigorous. In those countries, medicine was studied as an experimental science best grasped through investigation in the laboratory and service on the hospital ward. In exchange for free care, impoverished patients filled the hospitals where faculty undertook research and taught students. A year or two of European study capped the education of many ambitious American doctors, and they brought home the conviction that their colleagues should emulate the spirit of painstaking experimentation that pervaded the great medical centers of Paris, Berlin, and Vienna.

Another source of dissatisfaction with the patchy American medical curriculum stemmed from the surge of discoveries in the late nineteenth century. Advances in medical knowledge made the short course of study seem wholly inadequate to understand the germ theory of disease, vaccines and anti-toxins, precise tests of bodily fluids and tissues, and other diagnostic and therapeutic breakthroughs. Medicine as a profession acquired a firmer and deeper knowledge base, even if many diseases were not yet fully understood. The greater authority and prestige of the profession elevated the standing of the better schools and pressured the weaker ones to improve or close.

The rise of research universities offered a third reason for revamping traditional medical education. As several dozen prominent colleges added graduate

divisions and professional schools in order to become universities, they reassessed their relationships with local proprietary medical schools. What had been a casual connection often became a formal affiliation. Mergers appealed to the cadre of medical reformers who believed that the profession would never flourish in the absence of research careers for talented physicians. For the universities, the link was another way to establish their legitimacy as the best regional sources of theoretical and practical knowledge.

Turn-of-the-Century Transformations

By the 1880s, several medical schools stood apart from others as models of what was possible. At Harvard, Michigan, and Pennsylvania, the three-year curriculum included extensive hands-on work in laboratory science courses taught by full-time faculty. The clinical courses took small groups of students to the bedside and to outpatient dispensaries. Written examinations replaced perfunctory oral exams, and instructors gradually began to test students on the practical work they did in laboratories or with patients. Entrance requirements also stiffened, with graduation from a good high school expected and some college coursework encouraged.

In the 1890s, the new standard bearer, Johns Hopkins, adopted a four-year curriculum and required a bachelor's degree for admission. Above all, Hopkins led the way by virtue of extensive clinical opportunities in its teaching hospital. The senior faculty in the school controlled the major divisions of the hospital, where students served as clerks responsible for many aspects of patient care. In most hospitals, the board of trustees limited faculty involvement and instructional activity. Often, they regarded educational work with suspicion, and understandably so in an era when most medical students were meagerly trained. Hopkins and then other schools demonstrated that well-taught students and their faculty mentors enhanced patient care. Academic physicians were increasingly respected as the best physicians, and properly supervised students were desirable assistants. Previously seen as a branch of public welfare, the hospital redefined itself as the best place for anyone to receive state-of-the-art treatment.

Lack of money slowed the pace of change at many schools. The vision of good medical education was in sight long before the funding was in hand. Learning by doing cost much more than learning by listening. The student/teacher ratios fell markedly whenever large lecture classes gave way to small group instruction. Unlike part-time and adjunct faculty, full-time faculty were expensive. The space and equipment necessary for laboratory science were also costly. Without the support of local donors, state legislators, and rich philanthropists like J. P. Morgan, John D. Rockefeller, Edward Harkness, and Cornelius Vanderbilt, the transformation of American medical education would have been impossible. Benefactors shunned the proprietary schools, and by 1930, all for-profit medical schools had either closed or affiliated with a university.

Another ongoing challenge was the shape of the curriculum. There were constant discussions of how much time each subject deserved and when it should be taught. Those debates intensified as new fields such as biochemistry, immunology, and preventive medicine emerged. State licensing boards often stipulated how many hours to allocate each subject, but that rigidity provoked outcries about overburdened students with no free time to read, write, or study. How to link the first two years of basic science with the final two years of clinical study also baffled most instructors, as did the matter of special provisions for the very best students. Over time, most medical educators acknowledged the impossibility of covering everything and sought instead to cultivate habits of mind that would equip the young doctor to continue to learn after graduation. Through learning by doing, cross-disciplinary connections, and lifelong education, medical education embodied central tenets of progressive education, the vision of active learning designed to enliven American elementary and secondary schools.

By the 1920s, the enduring features of the modern American medical school had taken hold. No one questioned the value of teaching hospitals, university affiliations, faculty research, and hands-on learning. Medicine had become one of the most respected professions in the country, and the public no longer tolerated third-rate schools where an unprepared student could graduate quickly and easily.

The Price of Prosperity

Not everyone benefited from the improvements in medical education. The longer course of study excluded some working-class youth who could not afford four years of tuition as well as an unpaid fifth year for a hospital internship, which became common after World War I. As the medical schools' budgets soared, only one women's medical school survived, and female enrollments elsewhere rarely exceeded 5 percent until the 1960s. The two schools for blacks barely stayed alive. Jewish students also suffered. When applications exceeded spaces in the 1920s, many schools discriminated against Jewish applicants, accepting only a few each year. Furthermore, as the number of medical schools declined from 1900 to 1930, the number of doctors per capita fell, with rural areas unable to attract as many new doctors as the cities, where lucrative practice as a specialist drew many graduates.

Even so, medical schools became one of the strongest branches of the university, and throughout the 1930s and 1940s, they flourished. Enrollments and endowments held up despite the economic and military turmoil in those decades. Research generated a steady flow of useful discoveries, including antibiotics and vitamins. Faculty salaries were far below what talented physicians could earn in private practice, but academic careers continued to attract many of the best doctors.

As support for research continued to rise throughout the 1950s and 1960s, the composition of the faculty changed. There were more specialists, including many PhDs. The size of the typical faculty expanded more rapidly than the student population, with some departments larger than the entire school had been twenty years earlier. Because promotion and tenure hinged on excellent research, many instructors gave less time to teaching. The overall shape of the curriculum remained unchanged, although a few schools created new courses around particular organs and diseases, and several others either shortened (the six-year BA/MD) or extended (Stanford's five-year MD) the traditional four-year time span.

What also altered the nature of faculty work was the dramatic increase in third-party payments for patient care. Private insurance as well as federal

Medicare/Medicaid dollars reimbursed teaching hospitals for patient care that had been pro bono work. As a result, the fraction of faculty time devoted to patients rose sharply. The prosperity enlarged the size of the typical faculty, with nearly all the growth in the clinical ranks. From 1965 to 1990, patient care revenues rose from 6 percent to nearly 50 percent of medical schools' annual income. Faculty salaries increased rapidly, approaching the earnings of colleagues in private practice. The size and scale of most medical schools, from the 1970s on, was immense, with annual revenue often more than \$100 million. In contrast, only nine schools in 1910 had budgets over \$100,000. Although cost containment efforts by insurance companies from the 1980s on, coupled with less robust growth in federal funds, forced modest retrenchments here and there, the overall financial health of medical schools usually matched or exceeded that of other professional schools in the university.

With research projects and patient care burgeoning, the task of teaching students became less central to the school's work. Many senior faculty preferred teaching postdoctoral students and research fellows, delegating other instruction to adjuncts, interns, and the growing number of residents pursuing a specialty. The camaraderie between professors and students that marked turn-of-the-century schools diminished; the heavy workload and ensuing sense of exhaustion and stress did not. The rigorous expectations did not discourage a wider range of applicants from seeking and winning admission. The old restrictions on Jewish students ended after World War II, and in the 1970s, the number of female and minority students increased sharply. Financial aid allowed more working-class students to attend. Foreigners served as interns and residents, and some college seniors who were denied admission went abroad to inferior schools and then reapplied to an American school.

Counterbalancing the lower priority of teaching was renewed interest in curricular reforms. The familiar challenges of an overburdened curriculum, endless memorization of facts, and weak articulation of the basic sciences with the clinical work sparked a variety of innovations: fewer hours devoted to laboratory exercises, more emphasis on problem solving, and new opportunities to see patients and their families in the

first two years. Many schools added instruction on interpersonal relations to encourage empathic concern for all aspects of patients' well-being. As another sign of interest in educational improvement, most schools established divisions charged with the evaluation of teaching. Throughout their history, medical schools benefited from the keen American faith in science. The respect for physicians extended to physicians in training and their instructors. A good medical school was cherished by the community as a reliable sign of local vitality, not weakness. The ability of the profession to retain that trust will be necessary in the future to sustain the remarkable record achieved since the 1870s.

MENTAL RETARDATION AND EDUCATION

A press release dated February 20, 2007, announced that the American Association for Mental Retardation (AAMR) was changing its name to the American

Association for Intellectual and Developmental Disabilities (AAIDD). Proponents of this change have argued that preference for the term *intellectual disability* over *mental retardation* echoes the preference in the organization to embrace a social-ecological rather than a medical/individual-deficit framework, one that they claim is less offensive to persons with intellectual disabilities.

The term *mental retardation* has thus joined the ranks of other pejorative terms such as *imbecile*, *idiot*, *moron*, *feeble-minded*, and *retard*—terms that nevertheless still persist in contemporary culture to refer to individuals who are perceived as lacking intelligence, autonomy, and personhood. For students with intellectual disabilities, it still remains to be seen how this change in terminology will affect their educational and social experiences in U.S. public schools, where the almost century-old debate over how and where to educate these students still persists. This entry recalls the history of the debate and summarizes current thinking.

Historical Record

Although disability studies have offered different ways to conceptualize difference in educational and other contexts, intellectual disability continues to be theorized via a deficit model where persons with intellectual disabilities are characterized as having significant limitations both in intellectual functioning and in adaptive behavior as expressed in conceptual, social, and practical adaptive skills (the AAMR definition). On the other hand, sociologists such as Bogdan and Taylor, Braginsky and Braginsky, and Mercer have argued that the term *mental retardation* is a defective and crude metaphor that tends to club together disparate and amorphous behaviors and conditions to define in absolute terms the pathology of mental retardation. Although not denying that there may be “real” differences in intellectual ability among individuals, they argue that measures of these intellectual differences, such as IQ and adaptive behavior scales, offer only an imprecise and often restricted sample of the wide range of intellectual functions and behaviors. Moreover, they argue that linking the social construct of intellectual disability with biological inferiority is a modern myth derived from social practices that draw

on pathological/behaviorist discourses to exert social control on bodies and minds that refuse such control.

To explain why Western society, unable to effectively regulate difference, has sought to expunge or at least distance itself from it, philosopher Etienne Balibar uses the term *prophylaxis*—the need to preserve one’s own identity from all forms of mixing, interbreeding, or invasion; this creates the icon of the “other body,” which must be excluded from “normal” life. Thus, since the early twentieth century, people with intellectual disabilities—often described as morons, imbeciles, and the feeble-minded—were sometimes exposed to the violence of eugenics, seen as a parasitic and predatory class that was a menace and danger to the community. These same ideologies interpenetrated the educational discourses of the early twentieth century, when the enforcement of compulsory education laws forced common schools to educate immigrant children who were not so easily socialized into accepting the prevailing norms. Rather than explaining these difficulties as societal (e.g., poverty, illiteracy, etc.), the schools located these difficulties in the child, who was described as physically, morally, or intellectually defective.

Thus, the first special education classes contained over-age children, so-called naughty children, and the dull and stupid children for whom school had little or nothing to offer. The introduction of special education classes constructed a bifurcated school system—one for “special” students with educational handicaps and one for “normal” students—what can be seen as a thinly disguised way to preserve the status quo. Those students with moderate to severe intellectual disabilities, unable to effectively transform themselves into what society saw as productive citizens, were often segregated in large, state-run institutions situated on self-sustaining campuses.

The 1954 *Brown* decision and 1960s civil rights legislation made disabled people, their families, and their advocates increasingly aware of the injustice of exclusion based solely on physiological/intellectual differences. They contended that educational segregation on the basis of disability was also an unconstitutional practice. Similar to *Brown*, two landmark cases of 1972, *Pennsylvania Association for Retarded Citizens (PARC) v. Commonwealth of Pennsylvania* and *Mills v. Board*

of Education, were instrumental in gaining passage of the Education of All Handicapped Children Act (EAHCA) in 1975, also known as P.L. 94-142. The law said that students with intellectual disabilities have a right to a free and appropriate education in the least restrictive environment. In 1990, P.L. 94-142 was reauthorized as the Individuals with Disabilities Education Act, a more comprehensive law that not only provides supportive funding to the states but also governs how students with disabilities will be educated.

Current Debate

More than twenty-five years after the passing of EAHCA, the debate about how best to educate students with intellectual disabilities still persists and is represented by two camps loosely defined under the rather misleading labels of “positivists” and “post-modernists.” Scholars such as Kaufmann, Sasso, and Gerber are among those described as the positivists; they have argued that the most valuable knowledge about pedagogical practices for students with intellectual disabilities resides within the social science-based disciplines and should be based on scientifically validated research before widespread distribution. They are critical of postmodernist scholars, describing them as “dangerous” and accusing them of espousing bad education reforms and ineffective professional practices that include inclusive education, whole-language literacy, and constructivist instructional practices.

Disability studies scholars, in concert with the disability rights movement, have steadfastly supported inclusive policies and have argued that the perceived problems in special education have more to do with how the concepts of disability and inclusion have been interpreted than with anything else. Danforth and Rhodes, Brantlinger, Taylor, and Gallagher, among others, have argued that the failure to question and deconstruct the category of intellectual disability contributes to the devaluation and stigmatization of students with disabilities. They argue that most special education programs operate from a deficit model, where the consumer (i.e., the student with a disability) is perceived as having some inadequacy, shortcoming, failure, or disease; using this model limits the educational possibilities for students with disabilities.

Taylor rejects even a progressive concept like the least restrictive environment, which holds that special education students should be educated in an environment as close as possible to the mainstream classroom. That standard does, in fact, legitimize restrictive environments, sanctions infringements of the rights of people with disabilities, and directs attention to physical settings rather than to the services and supports people need to be integrated into the community, he says.

Therefore, in the current context of the continuing debate, interpretation of the social construct of intellectual disability and the least restrictive environment determines the form of educational experiences and social possibilities for students with intellectual disabilities.

MENTORING, YOUTH

Youth mentoring is practiced in a wide range of social institutions, such as schools, churches, local

businesses, and community organizations. It is commonly described as a relationship where a nurturing, nonparent adult (mentor) provides social and/or academic assistance to a youngster (mentee) who may be at risk. Programs are both community- and school-based, using both professionals and volunteers. This entry describes various mentoring programs and summarizes assessments of their impact.

What Is Mentoring?

Mentors can be aunts, uncles, clergy, coaches, teachers, and other adults. Mentors share one of two types of bonds with mentees. The first is described as emotionally open and committed. In this arrangement, the mentor is like a family member and is engaged in multiple aspects of the mentee's life. In the second bond, the mentor is more of a friend, with more limited openness and involvement. Regardless of the type of bond, youth mentoring is a form of social interaction that has a give-and-take quality, whereby both mentor and mentee learn from one another.

Traditionally, youth mentoring has focused on those children and adolescents who are considered to be at risk or "underserved." Associated with these categories are academic failure, dropout, limited parental involvement, drug and alcohol abuse, and high exposure to violent surroundings. These deficits, combined with limited community resources (e.g., youth facilities, athletic clubs, and violence prevention programs), as well as the breakdown of the traditional family unit, have been thought to produce a feeling of social detachment among youth. Sociological research has noted that the absence of loving and supportive families negatively affects children's behavioral development, leading to antisocial, aggressive, and even violent outcomes. Mentoring seeks to address this by fostering meaningful relationships with youngsters that enable them to thrive despite the daily obstacles that they encounter.

Many mentoring programs are geared toward helping youth cope with difficult social and economic circumstances. Programs like Community for Youth (Washington), Mentor/Mentee (Arkansas), Project 2000 (Washington, D.C.), and Youth Outreach Services (Illinois) reach local populations, whereas larger

organizations such as the National Mentoring Partnership, America's Promise, and Big Brothers/Big Sisters of America (BIGS) operate on a national scale. BIGS, established in 1904, is America's largest youth mentoring association, operating in forty-one states and matching 70,000 young people with adult mentors.

Content and Structure

Most programs, depending on the needs of their population, employ curricula and resources that emphasize academic achievement, social competency, rites of passage, child rearing, career training, health education, spiritual development, and arts education. Despite this mixture of programming, the main objectives of youth mentoring are to enhance academic performance, build parental and peer relationships, and promote self-esteem and self-worth.

Mentoring can be highly structured or loosely arranged depending on the format under which it occurs. There are generally two kinds of mentoring formats: the community-based model or the school-based approach. Organizations like BIGS typically use the classic community-based model, which brings mentors and mentees together one-on-one. Mentors and mentees will often engage in some form of recreational activity that also provides them a time to discuss pertinent life issues. These interactions may occur on the weekend when mentors have free time. Volunteer adults are usually matched with youngsters based on shared cultural background, gender, economic status, life experiences, and spoken language. Mentors undergo an intense screening process because much of their time with the child or adolescent goes unsupervised. One-on-one interactions can be long- or short-term, depending on the bond and chemistry between mentor and mentee.

As youth mentoring programs have proliferated over the years, the school-based approach has become an increasingly popular alternative to the community-based model. The primary advantages of school-based mentoring are that it is cost-effective and can operate in a peer group format. These programs, and the schools with which they collaborate, often share classroom space, photocopying materials, audio-video equipment, and staff assistance in order to

minimize expenses. Furthermore, because young folks spend a significant portion of their day in schools, a school-based mentor (or a team of mentors) is able to connect with a larger group of students within a single space and time. Unlike volunteers in the one-on-one method, school-based mentors have the option of working as a group dynamic, where a single student or a small number of students can find support, advice, and guidance in a mentoring session.

Outcomes

Youth mentoring outcomes vary and depend on the longevity of the mentor-mentee involvement. Mentoring research has observed that children and adolescents in mentoring relationships, lasting twelve months or longer, show improvements in both academic and behavioral outcomes. Those in more brief interactions report a smaller degree of impact. On the whole, youth matched with mentors show a decrease in the following behaviors: stress, alcohol and illegal drug use, truancy, peer violence, and recidivism among juvenile offenders. Youth mentoring has also demonstrated an influence in building resiliency; character and competence; and a sense of connectedness with school, peers, and family.

Although youth mentoring is widely praised for its positive impact on the lives of young folks, it has also been criticized for the moralistic approach that it takes in trying to “fix” the deficits of socially detached, and even socially excluded, youngsters. Terms like *at risk*, *high risk*, and *underserved* focus more on stigmatizing and grouping individuals rather than addressing the larger structural forces that create these prescribed categories. This facet of youth mentoring is frowned upon as it does not seek to truly empower young people or contest the status quo.

Critics of this deficit model suggest that, in addition to passing on knowledge of how to be resilient, mentoring must also engage youth in examining human rights and social inequalities, as well as becoming agents of social change. A number of smaller, less-recognized youth mentoring programs have been established with this goal in mind: The Free Child Project (Washington); The REAL Youth Program (Illinois); Youth Serve (California); and Youth Service

Project (Illinois). These organizations implement a variety of curricula that explore race and ethnic identity; sexual minority adolescents (gay and lesbian); and socially and culturally relevant issues related to social justice, democracy, and antiracism.

MEXICAN AMERICANS AND ACCESS TO EQUAL EDUCATIONAL OPPORTUNITIES

In the early 1900s, large numbers of people crossed the border from Mexico into the United States. These new immigrants found a country where brown skin and lack of skills were not welcome. Public swimming pools were closed to them, education was separate and not equal, punishment was common for speaking Spanish in school or on the playground, and Mexican culture was denigrated. Access to equal educational opportunities for Mexican American children has been the subject of many court cases since that time. This entry describes the initial situation and the court cases that have sought to gain equity.

Historical Background

In the period from 1921–1930, when 3 percent of Mexico's population had moved to the United States, the strains of the Depression in the rural areas where

the immigrants sought work influenced the attitude of communities already so burdened financially that they had difficulty supporting their own children. As in John Steinbeck's novel, *The Grapes of Wrath*, the Mexicans came to the United States as did the Okies going to California—looking for a better life, but they found just the opposite.

Education for the Mexican American children stressed “Americanization,” cleanliness, vocational skills, and learning English, although there were some bilingual classes. The number of Spanish-surnamed children in the graduating classes continued to be significantly less than the numbers of that same cohort in the first grade. Until the latter three decades of the twentieth century, Mexican American schools existed. Separate classrooms were also common. The abuse of IQ tests led to segregating Mexican American children in special education classes. The few who reached high school were not encouraged to go to college. Although there has been improvement in the number of Mexican Americans graduating from high school, the dropout rate is still high.

Court Action

After World War II, litigation began that would start to force equity in educational opportunities to these children. The ruling in California's *Mendez v. Westminster* (1946) stated that Mexican Americans could not be segregated in school. In 1943, Sylvia Mendez was denied admission to a White school because she was Mexican American. By law, schools for Mexican Americans were separate. Also, they were not equal. The Westminster school district superintendent stated during the court hearing that Mexican Americans were segregated because of their lack of English and because of their lack of personal hygiene. In the final decision, the judge ruled that the children had been denied due process and equal protection under the Fourteenth Amendment. After this ruling, legislation was passed repealing all segregation laws affecting Mexican Americans. The legislation was signed into law by Governor Earl Warren, who later served as Chief Justice of the U.S. Supreme Court when *Brown v. Board of Education* was decided.

This case influenced attorney Gus Garcia and Dr. George I. Sanchez, who had written about the use of IQ tests to segregate Mexican American children. Dr. Sanchez and James DeAnda visited the schools in the Colorado Common School District in Texas, where they found such inequities between Anglo and Mexican American schools as busing for Anglos but not for Mexican Americans, separate and inferior schools or classrooms for Mexican Americans, and band only for Anglos. An agreed judgment was reached whereby the Texas State Board of Education passed a formal policy, giving credit to Garcia and Sanchez, that stated that children could not be segregated on the basis of their Spanish surnames. This policy was used in later court cases.

In the early 1950s, another case strengthened the cause for equity. This case involved a jury selection case. *Hernandez v. Texas* (1954) argued that over a period of twenty-five years, the community had never had a Spanish-surnamed person on the jury list; they charged that this was denying equity. This inequity would naturally expand to include all aspects of the community, including education. The case was lost on the local and state appeals level but was won unanimously when it was decided by the U.S. Supreme Court two weeks before *Brown v. Board of Education* (1954). *Hernandez* was the first case concerning Mexican American rights to go before the U.S. Supreme Court.

Throughout the 1950s, court cases continued to be fought on local levels to provide equity. During the latter part of the twentieth and early part of the twenty-first centuries, equitable treatment for Mexican American children has been sought by the American GI Forum, The League of Latin American Citizens, the Civil Rights Act, the Bilingual Education Act, *Lau v. Nichols* (1974), the United Farm Workers organization, the Mexican American Legal Defense Fund, and the increasing numbers of Mexican Americans holding public office and sitting on school boards. The voting power that Mexican Americans now have as the largest minority group may strengthen their position in matters of equity.

United States. These workers represent a large percentage of the overall farm labor pool, accounting for an estimated 56 percent of all U.S. farm workers. Despite the fact that this agricultural workforce is a vital source of labor for this industry, nearly 75 percent earn less than \$10,000 per year, a level well below the poverty line. In addition, these workers receive extremely limited employer benefits, and many receive none. This entry looks at the problem and some efforts to address it.

Lacking Education

The majority of migrants enter the United States with low levels of education. The median educational level of migrant workers from Mexico is at the sixth-grade level, and only 15 percent reported as graduating high school. In addition, only 21 percent of these workers reported receiving an education in the United States. Small numbers of these workers (approximately 3 percent) attend college or a university, or receive any vocational training. Research indicates that the possibility of a migrant attending classes in the United States at a college or university is directly related to the level of education he or she achieved in Mexico; the higher the level of education achieved in Mexico, the greater the chances that the individual will seek educational training in the United States. Because of the low levels of education achieved in their home country, many migrant workers (approximately 20 percent) are rated as completely illiterate, and another 38 percent are functionally illiterate.

Like their adult counterparts, the children of this population sector are also at risk for achieving low levels of education. Although the majority of the children of these farm workers were born in the United States (approximately 73 percent), they are more likely to drop out of school or lag behind their peers. For those children of migrant workers who followed in their parents' footsteps and worked on farms, the prospects of educational success are even more dim. Among this group, nearly one third fall behind or drop out of school. Because of the combined effects of poor or nonexistent health care, poor nutrition, poverty, and high absenteeism from school, the

MIGRANT EDUCATION

With the continued and increasing growth of the immigrant population in the United States, the education of migrants has been an area of increased attention among various sectors of the U.S. educational system. The majority of migrants in the United States are seasonal agricultural workers from Mexico with their primary residences outside of the

children of migrants are considered one of the most disadvantaged populations in the country.

Although for many years the location of migrant work was primarily located in states along the U.S.–Mexico border, many migrants are now entering and working in regions that are deep within the country. Migrant populations deal with significant discrimination, and because of their lack of education and permanent residence, they often have difficulty in terms of being treated equitably.

Offering Help

To assist this population, the U.S. Department of Education developed the Office of Migrant Education to provide services and other forms of assistance to the children of families who migrate to the United States. Some of these services include Title I Migrant Education Program, which provides grants to state educational agencies specifically for migrant children; Migrant Education Even Start, which is designed to improve overall family literacy through a unified program; High School Equivalency Program, a program that helps the children of migrant farm workers receive their General Education Development certificate.

The rules for benefit eligibility are restrictive. As an example, in order for migrant children to receive U.S. government services, the child must have relocated from one school district to another in the United States within a three-year time frame to obtain seasonal or temporary work in fishing or agriculture, or they had to accompany a guardian or parent seeking this type of work.

Other recent efforts to minimize the marginalization of migrants and their children include the tracking of students and their school records across different school districts and regions as parents move to seek new work, as well as the development of stronger labor and advocacy groups that address migrant needs.

In spite of these efforts, the situation is still problematic as this sector continues to grow. As recently as 2002, an estimated 819,000 migrant children lived within U.S. borders.

MINORITY DISPROPORTIONALITY IN SPECIAL EDUCATION

In the United States, minority disproportionality refers to a pattern in which certain minority groups are placed in special education programs at rates disproportionately higher or lower than their presence in the student population as a whole. Special education programs are conceptualized as specialized instructional programs designed to meet the needs of students with disabilities. Thus, minority disproportionality suggests that certain ethnic groups display disabilities in unexpectedly high proportions. This pattern has been seen as problematic because it raises concerns about equitable conditions and/or educational treatments for children from historically oppressed or marginalized groups. This entry examines the data and their social and cultural context.

Representation Data

Both over- and underrepresentation patterns have been noted in special education, indicating that some groups may be at particular risk for being falsely identified as having a disability (false positives), and others may be at risk of having disabilities that go unnoticed and untreated (false negatives). For example, whereas African American students are overrepresented in programs for mental retardation and emotional disturbance, and Native Americans in programs for learning disability, Asian students have

been underrepresented in all disability categories and overrepresented in programs for the gifted. White students are underrepresented in programs for mental retardation but generally proportionately represented across the other disability categories. Although both over- and underrepresentation may indicate inequitable circumstances, overrepresentation has generally received more attention because of its potential for undue stigmatizing of already stigmatized groups and because special education programs have not consistently proven to be effective.

There are two kinds of scores used in determining disproportionality—a composition index and a risk index. The composition index compares the group's proportion in the entire population with its proportion in special education programs. For example, as African American students represent approximately 17 percent of the entire school population, they represent approximately 33 percent of the population of programs for mental retardation. The risk index examines the rate of placement within an ethnic group and compares it to the rate of placement within another group. For example, 2.64 percent of all African American students are in mental retardation programs, compared with 1.18 percent of all White students.

There are two key aspects of disproportionality that present importance nuances of the overall picture: Variability in patterns of placement across disability categories and variability across place and time.

Variability in placement rates across disability categories highlights the role of professional judgment in disproportionality. Of thirteen disability categories used in the United States, minority overrepresentation has been noted consistently in three categories—mental retardation at the milder end of the spectrum, learning disability, and emotional disturbance. These categories are determined mainly by the clinical judgment of psychologists and educators, as opposed to those categories that represent verifiable biological anomalies or physiological impairments. The latter types occur much less frequently, for example, hearing, visual, or physical impairments, and multiple disabilities marked by severe cognitive limitations. The subjective nature of the clinical judgment categories suggests the possibility of biases resulting from historically based negative stereotypes of marginalized

groups, which may be compounded by continuing inequities in educational opportunity.

The validity of the categories themselves is called into question by the widely varying rates of disability designation over time and across school districts and states. For example, in the learning disability category, the risk index for African Americans in 1998 ranged from 2.33 percent in Georgia to 12.19 percent in Delaware, whereas the index for Hispanic students in these two states ranged from 2.43 percent to 8.93 percent. In a similar vein, the overall use of these disability categories for all students has changed dramatically over time. For example, the risk index for a designation of learning disability increased from 1.21 percent in 1974 to 6.02 percent in 1998, while the risk index for mental retardation diminished from 1.58 percent to 1.37 percent. To summarize, there is considerable overlap in the definitions of these disabilities and much room for ambiguity and variable interpretation.

Social and Cultural Context

The issue of disproportionality in special education reflects both historical and geographical dimensions. In many developed societies, the low educational achievement of historically oppressed or marginalized minority groups is notably problematic. In these educational systems, a pattern of low performance often intersects with the line drawn for the designation of disability. In other words, for those disabilities that have no biological proof and that are manifested mainly in academic achievement and behavioral patterns that lie outside of the society's norms, the line between low performance and disability is elusive. Nevertheless, a designation of disability, no matter how socially constructed, can seriously limit children's educational and social careers and can do irreparable damage to their sense of identity.

Cross-cultural comparisons suggest that in societies where specialized services are based on a strictly categorical framing of disability, disproportionality may be more likely. For example, it is much more noticeable in the United States than in Spain, where the categories are more fluid. Nevertheless, what is consistent is that overrepresentation generally occurs in regard to ethnic minorities with a history of explicit

marginalization. One such group is Gypsies, whose history of exclusion across Europe is well known. Identified in Eastern European countries as the Roma, these groups have charged educational authorities in the Czech Republic and Slovenia with discriminatory placement of their children in special education programs. In the former case, in 1995, although the Czech courts ruled that discrimination could not be proven, it was established that 50 percent of Romani children were in special schools as compared with 1.80 percent of non-Roma students.

The concept of disability seems to be a human universal by which individuals are compared to normative patterns of development and learning. However, societies vary in their cut-off points for normalcy and in the social value accorded to individuals who fall outside the norms. In the United States, the centrality of schooling for individual success and social status has resulted in a form of disability categorization that is likely to affect those at risk of academic failure. It is not surprising that those who have been the most disenfranchised are at the greatest risk. Indeed, the intersection of minority status and school-based disabilities represents but one of many detrimental arenas in which minorities are overrepresented in the United States. Disparities in health care, housing, and employment are all part of the portrait of inequity of which special education is but one slice.

MINORITY STUDENT ACCESS TO HIGHER EDUCATION

Although college enrollment rates have swelled over the past thirty years, minority students tend to be less likely to matriculate and persist in college. As the relationship between college degree attainment and economic mobility continues to strengthen, it becomes imperative to understand the accessibility of higher education, especially for underrepresented minority groups. This entry explores factors affecting minority student participation and opportunity in the higher education arena.

Roots of Access

Tracing back to its beginnings, higher education in the United States was reserved for an elite few, typically White males from privileged backgrounds. As a result, minority students found alternate paths to higher education through such initiatives as the White House Initiative on Historically Black Colleges and Universities. Although the 1954 landmark case *Brown v. Board of Education* focused on elementary and secondary public school education, it underscored the inequity of educational opportunities for students based on race.

Campaigns such as the civil rights movement and public pressures pushed colleges and universities to address racial concerns on their campuses. Over time, the doors of higher education slowly opened to include a more diverse population. Today, however, some

colleges and universities still continue to struggle with diversification of their campuses. As such, the U.S. Department of Education's Office of Civil Rights functions as an agency to ensure and enforce nondiscriminatory educational practices.

To support and encourage minority student participation in higher education, affirmative action policies were designed to counteract the past effects of racial discrimination and recruit underrepresented groups of students to colleges across the country. These policies, however, were met with much controversy. Over time, the public tested the authority of affirmation action in the courts. In the 1978 case, *Regents of the University of California v. Bakke*, the Supreme Court determined that race could be a factor taken into consideration when assembling a student body. The Court, however, rejected the use of quotas to implement affirmative action policies.

In 2003, the Supreme Court upheld the decision that race could be a factor considered for admission purposes in a case against the University of Michigan Law School, *Grutter v. Bollinger*. That same year, the Supreme Court also ruled in *Gratz v. Bollinger* that the University of Michigan's Undergraduate Admissions Office could not award students admissions points simply based on race. Ultimately, the Supreme Court's message encouraged colleges and universities to assemble a diverse student body without using formulaic methods.

Choice and Benefits

According to the College Board, students who graduate with a bachelor's degree earn annual salaries that average \$20,000 a year more than high school diploma recipients. Current literature also suggests that attainment of a bachelor's degree is associated with lower unemployment rates, fewer incarcerations, increased voter participation, greater tax contributions, and positive health-related behaviors. The benefit of higher education extends not only to individuals, but also to the greater society. That is, investment in higher education is both a private and a public endeavor.

Inadequate academic preparedness and/or lack of opportunities for college preparation in high school

can inhibit minority students from transitioning into college. Governmental support and outreach programs that address these issues, however, tend to be subject to cutbacks and elimination every budget year. Especially for minority students from urban areas, the accessibility of guidance counselors is low, and these students often do not have the necessary information regarding the college process when making their future career and educational goals. According to the National Center for Education Statistics, in 2004, 35.6 percent of the high school dropouts were Hispanic and Black students compared to 6.8 percent of White students. Conversely, 72.2 percent of bachelor's degree recipients were White, non-Hispanic in 2003–2004. This achievement gap also persists at the graduate and professional school level.

For a large proportion of college-going students, escalating tuition and costs present a barrier to enrollment and persistence. The Higher Education Act of 1965 attempted to relieve some of the financial strain that students and their families faced. After its peak in 1976, however, governmental funding for low-income students weakened. That is, the percentage of tuition covered by the Pell Grant dropped over time as the government could not keep pace with rising tuition prices. In its report, titled "Empty Promises," the Advisory Committee on Student Financial Assistance found that a high-achieving, low-income student was as likely to attend college as a low-ability, high-income student. The data in their report largely underscore the inequity in opportunity based on family income. In addition to inadequate academic preparation and insufficient funding, critics also point to admissions policies that favor students from White, privileged backgrounds (i.e., early decision/admissions programs) as barriers to access.

Future Trends

The authors in D. H. Heller's *Condition of Access* predict that the population of potential college-going students will continue to grow and include a greater number of low-income and minority students. Today's job market requires a more skilled and credentialed workforce. Students who do not have equal access to educational opportunities will be at a disadvantage.

In a democratic society, all students should have the opportunity to succeed in the academic arena. Fundamentally, access to higher education is a reflection of societal values and attitudes. Investment in access not only supports the cause of social justice, but also is a path to secure the future of our country, both financially and socially.

MISEDUCATION

The term *miseducate* was coined by African American historian and educator Carter G. Woodson with his 1933 classic work, *The Mis-Education of the Negro*. His premise was built around the notion that one's education should have redemptive value, for both the individual and the group with which the individual identifies. Miseducation is particularly problematic for oppressed groups, who are led to believe that an education will help them overcome their oppressed status. The fact of the matter, he thought, is that the (mis)education they receive from the oppressor tends to reinforce their oppression, alienates them from

their communities, and has more redemptive value when used in service to the oppressor. The effect of receiving a (mis)education is continued oppression and suppression of individual and group agency and self-determination.

If the word *miseducation* is considered more broadly, beyond Woodson's conceptual interpretation of the term to indicate its effects on oppressed people, then the word can be defined in more conventional terms. When major dictionaries such as Webster's do not formally define terms like *miseducation*, then the meaning of the prefix *mis* can be attached to the word *education* to indicate an education gone bad or wrong. This type of education is one that misleads the student to believe erroneous and inaccurate information or fail to acquire requisite literacy. Curricula designed to minister to various social, political, and religious agendas with minimal focus on social or scientific research evidence are more inclined to miseducate students. However, when members of the dominant group are miseducated, their dominance is reinforced. The redemptive value of such an education is that it serves their interests and allows them to continue to enjoy the privileges and benefits of a hegemonic social order.

Since the appearance of Woodson's work, anyone wishing to challenge the value of various types of education, especially those who use top-down curricula sanctioned by powerful bureaucratic structures, adopt the term *miseducation* to express their dissatisfaction with such systems. For example, Noam Chomsky views schools as tools of miseducation and refers to them as institutions of indoctrination and obedience. Instead of schools creating independent thinkers, Chomsky believes they have been used historically as institutional systems to promote control and coercion among the citizenry.

Jane Roland Martin takes a "cultural wealth" approach to the issue by challenging cultures to preserve and transmit their cultural assets but not their cultural liabilities. Violence; racism; ethnocentrism; and religious, gender, and nonconformist sexual orientation hatred are cultural liabilities that hinder movement toward development of a more inclusive, democratic definition of culture and citizenship. Should society expand the concept of educational

agency to include all groups and institutions, then the miseducated oppressed can be educated for first-class citizenship. Conversely, miseducated dominant groups can then be expected to denounce false notions of inherent superiority and advocate equal educational opportunity for everyone.

Others who weigh in on the miseducation phenomenon include David Elkind, who finds that early instruction is often miseducation, not because it attempts to teach but because it attempts to teach the wrong things at the wrong time, that is, at too early an age. Indeed age-inappropriate instruction can be problematic, especially when it involves matters of sex and sexual orientation. Activist Laura McPhee voiced her concern about sexual miseducation; because it omits vital information in its curriculum, it can leave children at risk for sexually transmitted diseases, pregnancy, and abuse.

James D. Koerner disparaged teacher education courses as another form of miseducation, calling them intellectually unchallenging and professionally useless. He advocated that pre-service teacher preparation place more emphasis in academic content areas. This is an ongoing controversy that has expanded to include the educational preparation of school and district leadership. Arguably at the center of scholarly debate is the importance of the right knowledge, skills, and dispositions for effective teaching and leadership. Paul Goodman's 1964 critique of American education admonishes a school system for being too cozy with mass media. He observes students who appear systematically conditioned to follow the train of others' thoughts and never come to learn or know anything about themselves or how to creatively construct knowledge from elemental learning tools.

Finally, pop culture's most celebrated testament to American miseducation was music artist Lauryn Hill's 1998 debut solo album, *The Miseducation of Lauryn Hill*, which received five Grammy awards, including Best Album, and was named by the television network VH1 as the thirty-seventh greatest album of all time. It also made *Rolling Stone* magazine's list of the 500 greatest albums of all time at number 312. Hill, who confesses much respect for academia, says the title should not be taken too literally. The songs reflect things learned outside of school and outside of

what society deems appropriate and mandatory. School systems that favor blind patriotism over critical discourse run the risk of miseducating oppressed as well as dominant groups, because both fail to get an education that encourages service to our collective best human potential.

MIXED METHODS RESEARCH

Mixed methods research is based on systematically combining qualitative and quantitative research methods. Mixed methods have a long history of use in sociology and, perhaps to a lesser degree, in anthropology and are thus relevant to the study of social and cultural foundations of education. This entry describes several principles of mixed methods research; contrasts qualitative and quantitative data; notes several paradigms attributed to mixed methods research; sketches the process of mixed methods research design; details one kind of design; and provides a simple, yet illustrative, example.

Several Principles of Mixed Methods Research

The potential complexity of mixed methods research makes it necessary here to merely present several principles of mixed methods research. A first principle is to mix quantitative and qualitative methods in a way that makes their strengths complementary and their weaknesses nonoverlapping. Mixing alone is not enough.

Assume that a typical research study involves three stages: specifying research objectives, collecting data, and analyzing the data. In mixed methods research, there is a qualitative phase and a quantitative phase; within each phase, the methods used are of the same type, either qualitative or quantitative. The two phases can be carried out sequentially or concurrently.

Practitioners sometimes assume that the methods selected for data analysis dictate the type of data that must be collected. A second principle is that how data are collected is not logically dependent on how data are analyzed. If the phases of a mixed methods research study are sequential, which is often the case, then the data analysis stage of one phase will serve as input to the data collection stage of the other; that is, the qualitative (quantitative) phase will provide input to the quantitative (qualitative) phase.

Quality control procedures should ensure that the data collected are not contaminated. Once the data are collected, it is necessary to ask how accurately and how reliably they represent the phenomena of interest. A third (obvious) principle is that if the data collected are of poor quality, no amount of subsequent analysis can extract meaningful results.

Data: Both Qualitative and Quantitative

Oddly enough, many accounts of mixed methods do not explicitly distinguish between quantitative data and qualitative data. The former are most broadly defined as categorical in nature: that is, each datum is assigned to a category and can thus be counted. Qualitative data can be defined as textual in nature; written and spoken words, utterances, and even images can be regarded as qualitative data. Although this distinction is helpful, the illustrative example given below suggests that it is not as precise as one might think.

Combatants during the “paradigm wars” of educational research history could declare their allegiance monosyllabically: QUAL or QUAN. For some methodologists, and many practitioners, the two paradigms were incommensurable. Those accepting the possibility of mixing advanced either foundational or pragmatic justifications of mixed methods research. The widening acceptance of pragmatism in mixing has led to a wide array of mixed methods research designs.

Designing Designs

The phrase “research design” refers to a plan for addressing a set of research questions. In the context of mixed methods research, such a plan identifies the emphasis given to the phases and their ordering in time. If the qualitative (quantitative) phase is emphasized and is first, we have a QUAL → quan (QUAN → qual) design. Other combinations are possible depending on whether either paradigm is emphasized and whether the phases are carried out concurrently. Despite their usefulness, such taxonomies can distract researchers from the creative act of designing, which involves recognizing how purposes, conceptual frameworks, methods, issues of validity, and research questions interact.

The purposes of a study can be practical, intellectual, and personal. If the purpose of a study is to test a theory, this will constrain the kind of research question that the study can address. If the study purpose is to determine how strongly two variables are related, this will also constrain the types of admissible research questions. The purpose(s) of a study also constrain the kinds of conceptual framework that can inform the study.

Some theory or collection of theories provides a conceptual framework for the study. Broadly speaking, the conceptual framework for a QUAL study is likely to involve a process-oriented theory, whereas a QUAN study is likely to involve a variance-oriented theory. Whereas process-oriented theories aim at causal explanation, variance-oriented theories aim at causal description.

There is, of course, the question of which methods and procedures will actually be used. Will the data collected be categorical or textual? Will the data be analyzed using qualitative or quantitative methods? Will qualitative (quantitative) data be “quantitized”

(“qualitized”)? How these questions are answered can affect the accuracy/reliability of the results produced in response to the research questions of the study.

Unfortunately, the conclusions of a study can be wrong. Various types of validity (and, therefore, invalidity) have been enumerated for both QUAL and QUAN research methods. These standards can be summarized in the form of questions: Do the data meet the minimum criteria of acceptability/trustworthiness? Do the data adequately represent the theoretical phenomena being studied? Do the inferences made based on the data meet minimum standards of credibility/defensibility? The standards appropriate to each phase should be considered separately.

Research questions mediate the other four components of a mixed methods research design. By itself, a research question pertaining to the variability of the data may not shed much light on the processes that generated the data. Similarly, a research question pertaining to the meaning that an individual assigns to an utterance may by itself do little to explain why some individuals generate more utterances than others. For a sequential mixed methods research study, which is the focus of this entry, the research questions for the second phase should logically presuppose those of the first phase.

A Simple Design

The purpose of this section is to illustrate a relatively simple QUAN → qual design. In almost any small, task-oriented group, some members initiate conversation, and some respond to a conversational prompt, more often than others. Perhaps frequent initiators (responders) express particular kinds of speech acts such as commands (agreements). Perhaps there is a relationship between the social status of group members and the types of speech acts they employ in conversation. The remainder of this section is a sketch of a possible mixed methods research plan.

The *purposes* of the research are twofold. First, evaluate a model of social status and task participation in small, task-oriented discussion groups. Second, explore ways in which that model might be improved using conversational data. These purposes might be regarded as QUAN and qual, respectively.

The *conceptual framework* has two components: the theory of status characteristics and the theory of conversational analysis. The former describes a social psychological process by which people come to hold performance expectations. When people interact, they bring with them status characteristics such as education level, gender, age, and native language. People use status characteristics in evaluating their work and that of others; they form expectations for their performance and that of others. Status characteristics theory is most readily labeled as a kind of QUAN theory because of its quantitative form and previous testing in an experimental setting. Conversation analysis, which is usually regarded as a kind of QUAL theory, focuses on the conversational mechanisms by which turns are allocated in various types of speech interaction. Thus, the conceptual framework has both a QUAN and a qual component.

Several *methods* are employed. Previously collected conversational data from each of twenty-three group meetings will be used. In the QUAN phase, each actual conversation is compared to several simulated conversations. Each simulated conversation is generated using a computational model that reflects the status characteristics of the meeting participants. The computational model controlled by several quantitative parameters that shape how often simulated social ties form between simulated participants. With different parameters, each simulation of a meeting is likely to generate different simulated conversations. The “best” parameter values are those that result in simulated conversations “most like” the actual conversation. A simulated conversation that involves the same sequence of speakers addressing responders as the actual conversation is “most like” the actual conversation. An automatic search process finds the best model parameters for each meeting, which concludes the QUAN phase. In the qual phase, those conversational turns associated with the formation of a simulated social tie are examined to see which types of speech acts actually occurred.

The design makes use of speech data obtained from a naturalistic setting. Such data are often considered to have high causal *validity* because they have the potential to better represent the processes involved in the situation under study. Hence, the speech data

provide a firm foundation for quantitative analysis. That analysis is based on a simulation model that itself generalizes findings of status characteristics theory previously obtained in experimental settings. Hence, the simulation provides a moderately high level of generalizability. Finally, because the (simulated) social networks evolve over (simulated) time, it is possible to represent for each meeting the process by which a status order emerges (in which a social tie has formed for each pair of actors) and a conversation develops within a small, task-oriented group. The design offers moderately high generalizability and high causal validity, which neither the QUAN nor the qual components can provide alone.

These four design components are organized around the following *research questions*. For each meeting, what parameter values produce the closest match between the actual conversation and simulated conversations? Does the model represent some meetings better than others? What types of speech acts accompany the formation of simulated social ties? Clearly, these research questions are linked to the purposes, conceptual framework, methods, and validity issues pertinent to the study.

Those who write mixed methods research plans must take care to state as early and as clearly as they can that mixed methods research is involved. Otherwise, the reader may make inferences about the clarity and value of the research design based on an assumption that the research methods involved are either quantitative or qualitative. Similarly, readers of research plans should be sensitive to the possibility that indicators of methods often seen in QUAL or QUAN research may simply be components of a mixed methods research design.

Pros and Cons

Of course, mixed research has its own weaknesses. It can be time consuming, expensive, and difficult for a single researcher to execute, and it can present difficulties concerning how to carry out the data analysis task in a phase-one type using data obtained in a phase of a different type. Set against these weaknesses is the claim that a broader and deeper set of research questions can be addressed and potentially answered. Methodological

correctness aside, mixed research methods may also aid in the discovery of new meanings and new relationships, presumably one of the aims of those interested in the cultural and social foundations of education.

MODELS AND METHODS OF TEACHING

From the educational practices of Mesopotamia to current interest in technology infusion, a variety of ways to teach have been developed over the centuries. Models and methods often reflect the society's goals for education and its other values. Whether the student is an active partner in the process also varies over time. This entry summarizes the history of teaching methods and examines more closely two primary strands: traditional teaching and progressive teaching.

Historical Record

Models and methods of teaching, or different educational practices, date back to the preliterate societies

in ancient Mesopotamia (present-day Iraq). As city-states flourished (c. 3000–500 BCE), three major civilizations—the Sumerians, Akkadians, and Babylonians—developed the framework for the teaching of literature, writing, mathematics, and astronomy. Indeed, it was in the ancient Babylonian city of Ur that the tenets for the “traditional” or didactic model of teaching and learning are evident. Clearly, the Babylonian school curriculum centered on the memorization of literary works, emphasis on cuneiform script, and the focus on mathematical achievement; the teaching methodology was one of drill and practice reflecting the basic levels of what modern-day educators will identify as Bloom’s Taxonomy—knowledge, comprehension, and application.

Around the sixth century BCE, the Greeks established questioning and experimentation as educational practices in their quest for the foundations of a democratic system of government. In China (c. the fifth century BCE), Confucius focused his teaching methods on ritual and discipline toward formulation of ethical conduct and a cohesive social structure. Socrates, the Greek philosopher, affirmed the art of questioning as the essence of intellectual reasoning or *logos* (Greek for logic). The Socratic model became the catalyst for two eminent building blocks in the history of teaching and learning—empiricism and critical thinking. These constructs were to constitute the higher-order thinking skills in the Western mind and, thus, align with Bloom’s higher-order thinking skills—analysis, synthesis, and evaluation. Aristotle emphasized empiricism and critical thinking in his Lyceum (school), and his legacy transcended through the Middle Ages, the Renaissance, and the Enlightenment to the present day.

The methods of teaching in the twenty-first century are grounded in the classical or traditional practices of the ancient world and the modern-day progressive theories of Bloom, Dewey, Freire, and Perry, to name a few.

Classical or Traditional Methods

Examples of classical education include that of the Egyptian school, the rhetorical school during the last period of the Roman Empire, and the Confucius school. In Egypt, education and writing (hieroglyphs) were interdependent as the aim of societal literacy

was the preservation of religious texts by the scribes (priests). In this context, teaching was focused on the writing of moral essays in preparation for the development of a disciplined mind. In Roman education, participatory citizenship was the main objective of a teaching methodology where students learned the art of rhetoric through speech exercises that focused on the recitation of poetry and the characterization of historical figures such as Ulysses. In China, Confucius focused his teachings on the symbiotic relationship between ethical conduct toward an acceptable social order and political philosophy and the individual’s existence. Confucius promoted the idea of relying on classical works and influenced the development of comprehensive assessment that was to transcend through centuries.

In essence, the classical or traditional methods of teaching, then, focused on an integrative framework, where a “didactic” in lieu of a “critical” theory prevailed, through a teacher-centered learning environment in an effort to produce good citizens. In this context of teaching practices in the ancient world, it is worthy to note that these societies were homogeneous within themselves, notwithstanding the salient dichotomy between an upper and lower class structure and, thus, the absence of an egalitarian system of education.

A Progressive Pedagogy

In the *Yale Report of 1828*, Jeremiah Day, president of Yale University, launched the campaign to uphold the classical curriculum as an imperative for the “discipline and furniture” of the mind. Albeit the content of the Canon—great works of literature throughout the ages—serves as the knowledge base for the understanding of the human experience, the context of “how” and not necessarily “what” to teach is the topic of debate among all educators—from K–12 to post-secondary levels. Terminology such as “a constructivist approach to teaching,” “critical literacy,” “experiential learning,” “service learning,” and “student-centered learning” (to name a few) is commonplace as educators work to identify those methods of teaching that will develop critical thinking skills in all students in spite of a diversified student population across schools, colleges, and universities.

Whereas the didactic model of education tends to place the teacher at the center of the learning process, teaching that is “critical” focuses on the construction of a learning environment where students are active members through stimulation of intellectual curiosity, while respecting each other’s cultures as well as learning styles. Within this context, the teacher’s or professor’s repertoire of methodology or practices should be one where there is a balance between memorization of facts, as necessary, and the evaluation of constructs.

Some examples of critical theory teaching methodology include active learning, technology infusion, and experiential learning.

Active Learning. As in the schooling of ancient Roman times, poetry may be a powerful teaching tool toward conveying the relationship between the human experience and/or culture and a democratic society. In a critical theory or critical literacy platform—one where the teacher takes into account the diversity of learners—selected works (poems or prose) may be identified that allow students to connect their personal experiences to the work. In this context, students can work in small groups and analyze the issues behind the literary work, given a specific period in history. Such a methodology is reflective of John Dewey’s philosophy of progressive education, rooted in hands-on learning, as well as Paulo Freire’s pedagogy, which stresses dialogue.

Case study analysis calls for a collaborative, action-learning environment whereby the balance between knowledge base (content) and its application through discussions, vis-à-vis analytical writing, become essential for the ultimate evaluation of a problem or situation. Within this scenario, students must consistently practice Socratic questioning as they engage in individual as well as group reflection. Indeed, case study analysis can take the place of a formative-type assessment or continuous learning experience, while emphasizing student engagement, oral and written communication skills, and higher-level thinking.

Technology Infusion. Modern-day technology may be used effectively at the K–12 and postsecondary levels toward maintaining the balance between the “what” and the “how” to think. In the elementary

grades, for example, visual images serve to stimulate intellectual curiosity about different ethnic groups, forms of artwork, and so on. These images may provide the introduction to cultural awareness, which will later translate to questioning and reflecting about students’ own communities and, ultimately, the world around them.

At the university level, the use of “discussion forums,” where students must post questions in response to others within a synchronous (limited time-frame) context, will provide opportunities for prompt analysis, synthesis of information, and evaluation of an issue or problem. Such an exercise will require all students, in spite of the diversity in learning styles, to become active learners and think holistically about the role of technology as one of several interdependent factors that frame today’s global arena.

Experiential Learning. Perry’s theory of contextual relativism—the connection between an individual’s experience and the intellectual realm—is evident in experiential learning opportunities. The portfolio development approach used by some colleges and universities enables students to reflect on prior learning or work experience through comprehensive journal writing. This exercise calls for students’ self-reflection as they analyze, synthesize, and evaluate information.

MORAL EDUCATION

Adult moral agency encompasses several distinct capacities. *Moral discernment* is recognition of right and wrong. *Moral responsiveness* is the ability to feel moral emotions such as remorse, empathy, and admiration under appropriate conditions. *Moral judgment* is the ability to weigh conflicting moral claims and make reasoned choices in specific circumstances. *Moral action* is putting one's convictions into practice. Competing theories of moral development differ in how these capacities are conceptualized, the relative weights assigned them, and how they are studied. These differences generate distinctive educational implications.

The theories discussed in this entry represent two major intellectual traditions: the cognitivist tradition, which focuses on mental representation and evaluation, and the behaviorist tradition, which focuses on moral action and external influences on the agent. Although these research programs are different in emphasis, everyone concerned acknowledges that a full account of moral agency must include both action and judgment. For both traditions, the challenge is to address the aspect of moral agency that is not its primary focus.

The Cognitivist Tradition

The cognitivist tradition originates in Jean Piaget's study of children's moral reasoning in the mid-1930s. Beginning in the late 1950s, Lawrence Kohlberg extended and elaborated Piaget's model. Kohlberg's five-stage developmental theory has spawned a rich research literature, but it has attracted widespread criticism as well, especially for its alleged overemphasis on moral judgment at the expense of action.

Piaget: Moral Development as an Aspect of Cognitive Growth

In the 1930s, Jean Piaget questioned children about invented rules for marbles. Younger children, he reported, objected that the new rules weren't part of the game. This moral orientation he characterized as heteronomous: Morality and obligation were imposed from outside. Older children, by contrast, were autonomous in orientation. They did not regard rules as sacrosanct. They considered new ones and evaluated them based on their fairness.

Piaget attributed these differences to two factors. First, interacting with peers and settling disputes without adult aid helps children understand the function of rules and recognize that they are negotiable. Second, older children have developed more complex cognitive structures. Whereas younger children see rules in terms of rewards and sanctions applied to themselves, older children are able to consider effects on other people and consequently can evaluate social arrangements in light of participants' interests.

Piaget's work challenged Émile Durkheim's influential view that moral development is the assimilation of a society's norms. In contrast to Durkheim's transmission model, Piaget conceptualized moral development as an active process in which the child begins to question rules and social expectations. This account anticipates constructivist learning theory and is widely reflected in current educational practices—for example, explicit teaching of sharing and turn-taking in preprimary settings and group problem solving by older children.

Kohlberg: Stages in the Development of Moral Reasoning

In the 1950s, Lawrence Kohlberg extended Piaget's approach by constructing a series of moral dilemmas and analyzing subjects' response to them (see Table 1). Kohlberg identified five stages of reasoning that he claimed characterized all moral development regardless of a person's beliefs. A sixth stage, proposed as an ideal endpoint of development, has not been verified empirically. The stages are holistic, encompassing all of a person's judgments, and invariant, with no possibility of regression or skipping stages.

Table 1 Kohlberg's Stages of Moral Development

Preconventional (egocentric morality)	Stage 1	Rules obeyed because they are rules or through fear of punishment
	Stage 2	Morality of self-interest (cost-benefit analysis of actions)
Conventional (transactional morality)	Stage 3	Morality as a fair compromise of competing interests
	Stage 4	Societal rules endorsed because and to the extent that they benefit all
	Stage 5	Societal rules measured against abstract values (justice, humanity, freedom)
Postconventional	Stage 6 (unverified)	Societal rules measured against hypothetical ideal society based on equality and justice

In educational contexts, Kohlberg's work has prompted efforts to help students advance to higher levels of reasoning. Class discussion of moral dilemmas has indeed been shown to accomplish this, particularly if it is accompanied by extensive peer interaction. Kohlberg, however, became dissatisfied with the discussion approach. He concluded that a context of shared values and democratic procedures would foster development. In the late 1980s, he developed the "just communities"—small schools run democratically—which became a model for a variety of experiments in democratic education.

Gilligan's Critique of Kohlberg

In the 1980s, Carol Gilligan pointed out that Kohlberg's scale was derived from an all-male sample and that female subjects tend to score lower on it. She proposed that girls followed a different developmental path that emphasized care and attachment rather than the abstract principles of justice, which the moral dilemmas elicit.

Gilligan's claim has received little empirical support. When results of Kohlberg's studies are controlled for intelligence and educational levels, gender differences disappear. Gilligan's argument, however, could be reconstructed as a challenge to Kohlberg's claim that moral development is content-neutral. Even if women's reasoning is structurally similar to men's, they might reach different conclusions because of the priority they place on maintaining relationships. Nel Noddings's ethic of care and Mary Belenky's

connected teaching reflect the popularity of this view among educators.

Kohlberg's Model: Pro and Con

Other critics have questioned both the cross-cultural validity and the holistic character of Kohlberg's model. Although cross-cultural studies generally confirm the universality of stages, members of isolated, homogeneous communities score lower than cosmopolitan subjects, leading some scholars to charge ethnocentricity.

With regard to holism, there is substantial evidence that an individual's reasoning level varies in different contexts. Kohlberg's defenders have suggested that stages are additive: A subject can still reason at lower levels after progressing to higher levels. This response, however, raises the question of what role reasoning plays in moral agency. If two people act on the same Stage 2 reason, is the one who gives Stage 4 reasons in another context more highly developed? There is, indeed, some evidence that higher-stage thinking is as likely to be associated with rationalization as with moral decision making.

Cognitive developmental theory, in short, provides an excellent account of people's capacity for moral reasoning, but because of its neglect of action, Kohlberg's stage model is unsatisfactory as an account of overall moral development.

The Behaviorist Tradition

Behaviorism focuses on observable factors that affect how someone acts. The salient influence is usually

other people's behavior, particularly their positive or negative responses to an agent's conduct. This system of rewards and punishments, known as reinforcement, could explain transmission of society's norms, the process that Durkheim envisioned.

This is a constricted view of moral development. If behavior is conditioned by others, then people are like Piaget's young children—heteronomous, controlled from outside, not truly moral agents at all. They cannot exercise moral judgment. Theories in the behaviorist tradition all confront this challenge.

Bandura and Social Learning Theory

Social learning theorists acknowledge that reinforcement shapes conduct, but they contend that not all learning can be explained in this way. Many grade-school students, for example, learn and follow classroom rules without individual punishment or reward.

Albert Bandura introduced the term *observational learning* to explain this phenomenon. Observational learning includes two elements: first, modeling of behavior by another person and imitation by the learner; second, vicarious experience through reinforcement directed at others. Teachers rely on observational learning when they demonstrate classroom procedures and when they praise attentive children to encourage others to emulate them.

Does observational learning involve moral judgment? The agent must select which behavioral models to imitate and by which vicarious experience to be influenced—a freedom not afforded by direct reinforcement. But does selection involve moral evaluation?

According to Bandura, the selection process involves coding: the reduction of complex events to a few essential features for storage in long-term memory. So, for example, the experience of knowing one's friend cheated might be remembered as an event involving dishonesty, friendship, and some kind of effect (e.g., anxiety or relief). Depending on the effect, this memory would reinforce either honest or dishonest behavior.

Does coding entail moral judgment? Not necessarily. When a friend cheats, reinforcement effects are influenced by such nonmoral factors as whether the friend is caught, the friend's emotional state, and what punishment is applied. If the friend pays no penalty,

the effect on future behavior might be the exact opposite of what moral judgment would dictate.

Social learning theory explains behavior better than cognitive developmental theory. Research shows that vicarious experience does influence cheating, whereas the role of moral reasoning is unclear. Similarly, a study of people who rescued Jews during the Holocaust found that rescuers did not exhibit more advanced moral reasoning than nonrescuers; what distinguished them was that they lived in "embedded relationships" in which altruistic values were strongly reinforced.

The problem remains, however, that social learning theory explains moral action as the effect of social influence. It shows why people do the right thing, but not why someone would do the right thing for the right reason. Internalization research has attempted to fill this gap.

Internalization Research

Research on internalization of values builds on social learning theory but differs in several important respects. First, unlike learning, internalization occurs only when the agent acts independently, without surveillance or reinforcement. Second, internalization research is not content neutral. Correct, desirable, or worthwhile values are the primary focus. Third, the role of moral judgment is preserved. Social pressure alone can produce compliance, but not willing compliance.

Several different research programs contribute to this field. Attachment research investigates the bond between infant and mother and its effect on development. Parenting-style research examines the effects of authoritarian, authoritative, and permissive parenting on children's social behavior. Self-determination research focuses on the different ways people adopt beliefs and commitments and how these contribute to healthy functioning. Although the family is a primary unit of interest in this field, research has also been conducted in schools, colleges, churches, and other settings.

Internalization during childhood can be described as a two-person interaction in two stages. In Stage 1, a mentor (parent or teacher) communicates a value to the subject (the child). In Stage 2, the subject decides whether or not to adopt the value and behave accordingly. The factors affecting internalization are characteristics of the mentor, the child, and their interaction.

To communicate effectively, the mentor must be clear, consistent, and sincere and must convey the importance of the issue. Modeling can contribute to the process, but the main emphasis is on explicit teaching and persuasion. Deciding whether or not to act on the value involves two factors: the subject's motivation and the subject's judgment of the propriety of the mentor's intervention.

Motivation can be negative or positive. Threats and power assertion by the mentor provoke resistance; humor and reason assuage it. The mentor can generate positive motivation through warmth, reciprocity, and stimulation of empathy for those affected by the behavior. Judgments of propriety turn on whether the mentor's value assertion is believable and whether it is perceived as well-intentioned.

Moral judgments appear in Stage 2 of the internalization process. Empathy, an element of motivation, contributes to moral judgment because it focuses on others' feelings and how one's action affects them. Deciding whether to believe a value assertion is a judgment about the rightness or wrongness of the action in question. To determine whether the mentor is well-intentioned, one must decide whether it really is important to consider others' interests rather than only one's own.

An excellent illustration of how internalization works in a school is Jane Elliott's brown-eyes blue-eyes experiment, documented in the PBS film *A Class Divided*. Elliott conducted a role-play exercise to teach third-graders the injustice of racial discrimination, an exercise based on eye color. All of the elements of the model—clarity, sincerity, warmth, reason, and empathy, among others—are clearly visible in the film. In a follow-up discussion, the participants, now adults, reported having acted throughout their lives on lessons learned in that exercise.

This simplified model describes internalization from toddlerhood through early adolescence. Beginning in middle adolescence, the focus shifts from whether to how values are internalized. Self-determination research has identified three distinct styles of internalization. Introjected values are experienced as internal compulsion, a feeling of obligation that is not welcomed and not felt as part of oneself. Values with which one identifies are felt as part of oneself, but not as an essential part, because they are

not integrated with other aims. Integrated values are experienced as an essential part of oneself, values one could not reject and still be the same person. Integrated values are most stable and conducive to healthy functioning. In general, with appropriate developmental adjustments, the factors that promote internalization in childhood promote integrated internalization in adolescence and adulthood.

Internalization, in short, maintains the focus on moral action characteristic of the behaviorist tradition, yet also makes a place for moral judgment. In this respect, it is the most comprehensive of the accounts of moral development reviewed here. Not surprisingly, it is also the most complex. The child's moral development depends not just on reasoning capacity or environmental cues, but also on relationships, social context, and the child's sense of independence and self-efficacy.

Does internalization offer a complete account of moral development? Does integrated internalization—the adoption and consolidation of values—represent achievement of moral agency? Some might object that integrated internalization places values beyond critical scrutiny and thus represents a restriction of agency rather than its culmination. One could argue, however, that the model does require scrutiny of values before internalization and also that adult moral agents do face restricted options, because they do not allow themselves to act contrary to conscience.

Research Support

The behaviorist and cognitivist traditions both have empirical support. Their central tenets—that reasoning and external influences contribute to moral development—could both be true at the same time. Convergent tendencies in these traditions reinforce their compatibility. Kohlberg's just community experiments tacitly concede that external influences shape moral reasoning, and thus social learning affects moral development. The prominence of reason in internalization models concedes that Kohlberg's research is not irrelevant to moral behavior.

The competing theories and heterogeneous research clearly establish that achievement of full moral agency is a complex process. The journey begins early in life and takes a long time to complete.

A great many institutions and aspects of education affect the outcome. Much is known about some of these influences on education, such as parenting styles, attachment, and effects of discussion on levels of moral reasoning. About others, knowledge is rudimentary. Internalization research, building on Bandura's work and borrowing from Kohlberg's, has given us a very general and somewhat tentative model of moral development, but even a cursory review of the educational applications makes clear that there is a great deal more to be learned.

MORRILL ACT

The Morrill Act of 1862 was originally proposed by Congressman Justin Morrill of Vermont in 1857. Opposed by the southern states, this act passed both

houses of Congress in 1862, when the southern states had seceded from the Union. Abraham Lincoln signed the Act into law on July 2, 1862.

The Morrill Act gave each state 30,000 acres for each member of their congressional delegation based on the Census of 1860, guaranteeing each state at least 90,000 acres to sell. The intent was that states would sell the land and invest the money in order to use the profits to support the land-grant schools; sixty-nine colleges were funded as a result of this original Act. Military training was required of all male students at institutions funded by the Act.

Originally, the Act specifically excluded the southern states. The Morrill Act of 1890 provided for greater funding for the schools established by the 1862 Act and included the southern states. The Morrill Act of 1890 also led to the establishment of land-grant colleges for African Americans. This was important, because in the southern states, African Americans were excluded from the land-grant colleges.

Today, there are more than 100 land-grant schools in the United States and U.S. territories worldwide.

MULTICULTURAL EDUCATION

Multicultural education is a relatively new and evolving field in American education. Although the major theorists in this field differ slightly in their approaches, there is a general consensus that multicultural education attempts to revise the mainstream curriculum to include diverse perspectives and education in the United States and posits that schools must be constantly reexamined to see that they are

properly serving all students. This is particularly true of those populations that have been historically underserved.

As a relatively new and distinct area in educational scholarship, multicultural education can have a variety of meanings even to educators in schools. This entry will give the reader a broad overview of the field of multicultural education and outline its major dimensions.

Historical Perspectives

Long before the term *multicultural education* was coined in the lexicon of American education, there were individuals such as George Washington Williams, W. E. B. Du Bois, Carter G. Woodson, and George Sanchez, who realized and publicized the lack of equity in American education. These historians/philosophers advocated that the United States needed to provide high-quality education for all of its youth, particularly its poor children and children of color. They also realized that the content of education was significantly different depending on society's views for the future of these children. These historians/philosophers realized that the education received by poor children and children of color in their generations did not allow them to examine their position in American society nor give them the academic tools to analyze equity issues in education or society at large.

Could Williams, Du Bois, Woodson, and Sanchez be regarded as early multicultural educators? Perhaps this is not true in the most literal sense, because multicultural education had not yet been defined as a distinct academic field. However, their ideas of an equitable and democratic education provided much of the intellectual foundation for a movement in U.S. education that would follow decades later.

All of these authors realized that the education available to most African American and/or Latino students of their day was not commensurate with the knowledge and critical thinking skills provided to most mainstream students. A question that they pondered was, Why? Public education, like any other aspect of public policy that has a cost attached to it, is directed by elected public officials according to the values they hold and the extent to which they see all

students as worthy of high levels of education. The decision to provide a high-quality education is affected by officials' views of race and ethnicity as well as the role they saw for students of different racial/ethnic backgrounds in American society.

For the latter part of the nineteenth and the first half of the twentieth century, most African American and Latino students who were provided with a public education (some were not) received one that envisioned them as blue-collar or domestic workers in American society. W. E. B. Du Bois called for the top "talented tenth" of African Americans to be responsible for the socioeconomic movement of the race. However, opportunities for African Americans of the day to get elite educations like Du Bois's own Harvard Ph.D. were rare indeed. Carter G. Woodson's insightful questioning of public education is seen when he questioned the curriculum in the 1930s. Woodson argued that when African Americans were taught with a curriculum that portrayed them in inferior positions in society, they would find those places and stay in them.

When Woodson observed this in 1933, he knew the immense power of an educational system that viewed African Americans as second-class citizens, rationalized that view, and educated them to accept the prevailing social hierarchy of the time. In questioning that prevailing orthodoxy and asking that education value all of this nation's students, Woodson was acting in a similar role as that played by multicultural educators today.

In the 1940s and 1950s, other African American scholars, such as Allison Davis, followed Woodson and critiqued many of the prevailing views of the nature of intelligence testing and its implications about the abilities of African American students. After devoting a career to studying culture-fair intelligence and achievement tests, Davis observed that racial and ethnic differences in standardized tests were due to the tests themselves. Davis realized that lower average scores posted by African American students were not a result of innate differences, but of differences that arise from discrepancies in experience.

Another scholar whose early work influenced multicultural education was George I. Sanchez. Professor Sanchez, a native New Mexican, devoted his career to removing educational obstacles for Mexican

Americans. In 1932, Sanchez published an article attacking the notion that Mexican American children were inherently intellectually inferior to native English-speaking American children. Sanchez argued that environmental and linguistic factors were associated with the IQ scores of Mexican American children. This was not widely recognized at the time.

Sanchez continued his distinguished career researching African American education and headed a Rosenwald Fund project at Louisiana's Grambling University to equip teachers with the tools to incorporate the traditions and experiences of the local community in the education of rural African American students. Thus, Sanchez married the fields of Mexican American, African American, bilingual, and rural education.

Another group of progressive educators in the 1940s and 1950s concerned with equity issues were those involved in intercultural and intergroup education. Scholars such as Rachel Davis Du Bois, John Granrud, and Hilda Taba were key figures among intercultural and intergroup educators and promoted programs that linked schooling to the community. Intercultural educators focused more on immigrant cultures and the need to have immigrant children comfortable with their cultures of origin. Intergroup education sprung from race riots that occurred during World War II in Detroit, St. Louis, Los Angeles, and Beaumont, Texas. The goal of this movement was to increase tolerance in the nation, and intergroup educators enacted prejudice reduction programs in many schools. Although intercultural and intergroup education did not directly convert to multicultural education a few years later, these movements show other concerted efforts to bring about greater equity and social justice in American education.

A goal shared by many of the early scholars was to establish accurate information about ethnic groups and incorporate it into the school curriculum. In doing so, they hoped that this would help to dispel many of the myths and stereotypes that abounded about ethnic minority groups. Although these early scholars may not have exactly envisioned the contemporary field of multicultural education, their ideas of equity and social justice are core concepts of multicultural education today.

In the 1960s, the civil rights movement created some changes in American public education. Many civil rights activists and educators noted that the histories and contributions of American minority groups were largely absent from the mainstream curriculum. In many schools, these pressures resulted in courses focusing on one ethnic group (such as African American history or Hispanic literature) being added to the curriculum. However, these monoethnic or monocultural courses were almost always regarded as electives to provide an opportunity for students of a particular background to learn about themselves.

The incorporation of multicultural content into courses taken by all students did not begin in a significant way for another decade or two. True multicultural curricular change does not prevent specialized monoethnic or monocultural courses. However, multicultural curricular integration looks closely at the cultural, racial, ethnic, and gender perspectives presented to all students in the required core curriculum. This form of curricular change, although more far-reaching than monocultural courses, is more difficult to achieve because it requires an entire faculty to be prepared to deliver it instead of just a few specialists. It also affects all students, which means that more parents could potentially question curricular changes.

Dimensions of Multicultural Education

The major dimensions of multicultural education have been defined by James A. Banks, one of the leading contemporary scholars in multicultural education. He provides the following:

- Curriculum transformation
- The knowledge construction process
- Equity pedagogy
- Prejudice reduction
- Reforming school culture

Most topics relating to multicultural education may be subsumed under one of these categories.

Curriculum Content Integration

A school superintendent once observed that "it is easier to move a graveyard than it is to change the

school curriculum.” Many people are understandably vigilant of changes in the public school curriculum because there have been numerous attempts in American education to use the public school curriculum to influence young minds with hidden, and not-so-hidden, agendas. Meaningful integration of multicultural content into the school curriculum is a difficult task. The first problem is that many teachers lack academic backgrounds with a solid multicultural knowledge base. Thus, many high school English teachers have strong grasps of the writing of Hemingway, Faulkner, and Poe, but often lack a similar knowledge base regarding African, Asian, or Hispanic American authors.

Although this situation is improving, there is always the natural tendency for teachers to gravitate toward topics they know best. In elementary schools, Hispanic content is emphasized in late October and November, women’s content is the focus in March, and African American content is examined in February. This is in keeping with the designated months for teaching each of these subjects. The “one month in a school year” emphasis is an effort to highlight the content, but it also suggests that women and African and Hispanic Americans are not well integrated within the mainstream curriculum. A key concept in multicultural curricular change is whether change is occurring at the core or at the periphery of knowledge. Are central concepts in a subject being examined through various cultural, ethnic, and gender perspectives, or is the multicultural material confined to boxed inserts in textbooks? How is multicultural information related to the mainstream narrative?

Using the example of African American troops fighting for the Union in the Civil War, peripheral inclusion is given when teachers or texts mention that President Lincoln approved their use for combat in 1863. Lincoln had originally taken the opposite view. Teaching this event as a core concept in the Civil War would explain to students that White reserves for the Union Army were nearly exhausted when President Lincoln changed his mind. This infusion of African American troops bolstered the Union Army to the extent that the preservation of the Union was greatly advanced by Black men in blue. Most teaching about the Civil War does not emphasize the significance of this event.

Many schools include multicultural content in peripheral or cultural additive ways. Occasional heroes and holidays are mentioned in ways that are totally disconnected from the curriculum and certainly from evaluation. A multicultural curriculum guarantees that multiple perspectives will be included in how students see knowledge. This curriculum discourages binary thinking and encourages critical thinking skills. However, multicultural content is rarely found on standardized tests in schools today. Emphasis on standardized tests tends to marginalize any curricular content that is not on the standardized test. Material not covered by standardized tests may be viewed as superfluous, or perhaps worthy, but many schools may spend little time on multicultural content because it is not perceived as helping the school’s position when standardized test scores are compared across the school district or state. Thus, evaluative trends that tend to emphasize skills instead of knowledge create an academic climate where multicultural literacy is devalued. This could be changed if multicultural literacy became an integral part of basic literacy expected and evaluated in all students.

Knowledge Construction

In all societies, the public school curriculum is a sample of the universe of knowledge in each subject. Because it is impossible to teach all students all literature, mathematics, history, or science, it is very important to examine the decision-making process in every society. What determines the information, concepts, and perspectives taught to all students in the public school curriculum, and what facts, concepts, and perspectives are omitted and remain in libraries only to be discovered by the truly curious? This process is clearly guided by societal values. Often, societies minimize or omit from the public school curriculum knowledge that is not complimentary to a positive societal image.

It is understandable that people of any nation do not like to see themselves portrayed in a negative light, but omission from the curriculum of uncomplimentary topics can generate feelings of distrust among students if or when they learn about these matters later in life. A common reaction is, “If my schools and teachers kept this information from me, how can I completely

trust what I was taught?" Another reaction from students could be, "If my teachers didn't teach me this, was it that they didn't know, or they knew but kept it away from us on purpose?" Neither reaction by students toward schools and teachers is particularly flattering. The net result of these forces is that the stories of all American ethnic and cultural groups are not included in the narratives shared with all students.

This lack in information about some Americans, while information abounds in the curriculum about others, creates many misconceptions. Information voids are often filled with rumor, innuendo, and misinformation. To bring home this point, ask some people how much they learned about Hispanic Americans from the K–12 school curriculum. If they respond with Spanish explorers or early colonizers, remind them that these individuals were Spaniards, not Hispanic Americans. Four hundred years of the history of Hispanic Americans in the United States is hardly mentioned in the core curriculum. This is true in spite of the fact that Hispanic Americans are the largest minority group in the United States today. Their "story" is largely absent from what U.S. students learn.

In the United States, the process of analyzing which knowledge is worthy of being included in the school curriculum is a complex one. This process takes place largely in the political arena. The No Child Left Behind (NCLB) legislation injected the national government into the curricular process. Prior to NCLB, curriculum, testing, and accountability were largely state and local school board affairs. Since the law was passed, adequate yearly progress (AYP) has become the major goal of schools, and those areas of the curriculum that are measured in AYP (largely verbal and quantitative skills) receive a major share of time, resources, and attention.

All states set curricular standards for high school graduation that may be enhanced by local school boards. The resulting public school curriculum generally may be found in a state's curricular standards for subjects in K–12 education. National publishers, who create the textbooks and materials for nearly all U.S. students, take this information to create textbooks and other materials for the various markets for K–12 public and private education. John Goodlad, an eminent researcher in education, found that textbooks

provide about 90 percent of the curricular content in the average U.S. classroom.

There is little doubt that the values in a society are largely responsible for determining curriculum. As those values change, the curriculum may change to include topics that earlier values may not have supported. The converse may also happen. Values may change and cause a society to delete from the curriculum what was previously taught. One example of the latter might be "Americanism versus Communism" classes, which were common in the Cold War era.

American values in the twenty-first century are more receptive to having students achieve multicultural literacy about the United States than the values that were prevalent in the 1950s to support this concept. When educators take on the challenge to present viable multicultural concepts and information throughout the curriculum, they are automatically giving voice to many perspectives that previously were found only outside of formal schooling. Understanding how racial/ethnic groups have fared, how women have tried to gain an equal footing in this society, gives voice to struggle and perseverance. This suggests to students how recent some rights are; how difficult it has been to achieve them; and that citizens need to be vigilant and knowledgeable, but not complacent.

A common critique among those who oppose multicultural topics in the curriculum is that this change is injecting a political element into what students learn. This view assumes that the existing curriculum was adopted without any political considerations. This is very rarely the case because the decision of what to include or exclude in the curriculum could be interpreted as a political act. The position of most multicultural educators regarding knowledge construction and curricular change is that the curriculum should move toward greater inclusion, and the stories of all groups of Americans need to be known by the rest of the nation so they may be perceived as part of the "unum" and not simply the "pluribus."

Equity Pedagogy

This dimension of multicultural education speaks to what educators do in schools and the degree to which these activities provide maximum opportunities

for students to learn. Research in education has shown that the quality of the teacher is a significant variable in how much students learn. Therefore, which students have access to the highest-quality teachers is of great importance. Some school districts today are paying high-quality teachers bonuses to teach in low-income schools. However, the general pattern is that teacher turnover in low-income schools is much higher than in schools in more affluent communities. Although there are thousands of high-quality teachers in this nation who have chosen to remain in low-income schools to help the neediest students, the distribution of high-quality teachers in this nation's schools favors middle- and higher-income students. This is doubly ironic when one considers that children who start life with considerably less are expected to catch up to those who are more advantaged and to do so with less access to high-quality teachers.

In addition to the overall distribution of high-quality teachers, equity pedagogy also addresses what takes place in the classroom. Wait time, or the time that elapses between a teacher asking a question and recognizing a student for an answer, has been estimated at around one second. In this one second, the average English-language learner in the class is still processing the question, rather than thinking of an answer. Numerous studies on classroom discourse patterns indicate that teachers (most of whom are female) tend to favor male students over female students in recognizing them to speak in class as well as in giving high-quality feedback. Other studies have shown that teachers prefer middle- and upper-middle-class students over lower-class students. This shouldn't be entirely surprising, because most teachers come from middle-class backgrounds and are more familiar with middle-class culture.

When courts have had to get involved in the provision of equity pedagogy and equitable learning opportunities for students, they have almost always intervened on behalf of poor or minority students or students with disabilities. Students in these categories were not able to get appropriate redress through the political process that governs schools, so they resorted to the courts. Cases such as *Brown v. Board of Education*, *Lau v. Nichols*, *Swann v. Charlotte-Mecklenburg*, and *Larry P. v. Riles* illustrate this point.

Rarely, if ever, have parents of middle- and upper-middle-class majority students had to resort to the courts to see that their children had access to equitable education in this nation's public schools.

It is important that teacher preparation, as well as teacher in-service activities, focus on elements of classroom practice where the reality falls short of the ideal. Teachers who are engaging in classroom practices that do not fully reach their students, typically do so unintentionally. Teaching is very demanding, and teachers develop habits that may go unexamined without careful reflection and continuing dialogue with students.

Practices such as girls receiving less feedback and fewer chances to speak in front of the class, inner-city students being rebuffed when they ask questions in class that are seen as "too direct," are but some of the many examples of how a student's background may affect the instruction and attention he or she receives from teachers. Multicultural education suggests that issues such as these, which are well documented by research, should be presented in teacher preparation and addressed in the daily operation of schools.

Prejudice Reduction

Understanding this dimension of multicultural education is critical in order to improve school climates. As mentioned earlier, during World War II, the intergroup education movement was begun to improve race and intergroup relations through public schools. One of the reasons for the demise of this movement was that it was seen as only for schools with "racial problems." Today, school administrators still may be reluctant to actually test the waters of their schools' racial and ethnic climate. It is not unusual for a principal to begin the first schoolwide meeting with parents by welcoming them and saying, "At this school, we treat all of our students equally." Yet how many schools have actual data to support this assertion? In how many cases is the principal's statement an assertion of what he or she wishes to be the case?

All learning environments have an "affective filter" that students must address in order to learn. This affective filter may have two students in the same classroom with widely different notions of how comfortable

they are. Likewise, students may experience a variety of academic climates as they change classes or environments during the school day. The fact that a school may have a multicultural student population does not mean that school is integrated. It may simply be desegregated. A frequent pattern in U.S. high schools is seeing students sitting together for lunch in the cafeteria in ethnically/racially homogeneous groups. Research into this pattern suggests that minority students are using this time to create a homogeneous and comfortable space where they can relax in an accepting atmosphere in order to face the rest of the school day.

Because educators know that a comfortable school and classroom climate is critical for optimal learning, why don't more schools make an effort to measure this and include these data in school accountability reports? It is not surprising that these data are rarely gathered in a systematic manner. Once these data are gathered, educational leaders must commit to addressing any problem areas found or face the criticism that the survey was an exercise in futility. If there isn't a serious commitment to address these issues, the safest path to take is not to document any potential problem areas and to underscore a commitment to diversity by citing numbers that document diversity in the student body, faculty, and staff.

There are serious consequences to ignoring the affective dimension of schooling. One of the most obvious is that many students react to feeling devalued in schools by resolving not to learn from those who are in charge. Even though it can be argued that students are only hurting themselves by refusing to learn from those who they feel do not value them, the desire for human dignity often trumps the need for knowledge. When students direct racial, ethnic, gender, or religious epithets to other students, those being slandered expect teachers or other school professionals to protect them. This often happens, but at times it does not. Students who know that a teacher heard the insult, but did nothing, generally assume that the teacher is in accord with the comment. Even when the teacher disagrees with the remark, but does nothing, students often conclude that they are not important enough for the teacher to intercede. It is not surprising that students in this situation would not be eager to learn from such teachers.

In extreme cases, lack of attention to classroom and school climate can have drastic consequences. A few years ago, a Haitian honor student in a Miami, Florida, high school was "passing" as an African American. Shortly before his high school graduation, a fellow student publicized that the Haitian honor student was indeed Haitian and not African American. Unable to deal with the revelation, the honor student committed suicide.

At the end of twelve years of public or private schools, students have been tested and graded in a manner that largely determines their academic futures. Grade-point averages are calculated, standardized test scores are collected, and students present their academic profiles to colleges, universities, or other institutions of postsecondary education. Implicit in this profile, although never explicitly stated, is that students all learned in a school that had highly qualified teachers, an advanced curriculum available, and a safe environment, and all students were treated with equal dignity. There are usually no allowances for students who felt like guests in their respective schools, while others felt like owners because the school culture was synonymous with their own. Equal academic performance is expected after twelve years from students who faced hostile school climates, as well as from those who felt quite comfortable during their school years.

In short, multicultural education asserts that careful attention to school and classroom climate is not an irrelevant frill. It is an integral part of providing an equitable education for all students and should be regarded as such in teacher preparation as well as in the daily running of this nation's schools.

Reforming School Culture

The term *school reform* can have multiple meanings. To some, it is a euphemism for more external testing and constraints on teachers in the name of raising educational standards. To others, including most multicultural educators, it means raising academic performance for all students, presenting a holistic curriculum that includes multicultural and global perspectives, as well as examining schools for equity. The concepts of quality and equity in education are complementary, not antagonistic.

Reforms that measure product, but ignore equity in processes, are frequently flawed. Some states have reported improvement in student scores in the state's high-stakes test but neglected to point out that the state's high school dropout rate was increasing. Thus, perceived gains reported by the test may simply be the results of a better prepared, but smaller, group of test takers. This is an example of a supposed educational gain that lacks equity.

At the level of individual schools, many use school advisory committees (composed of administrators, teachers, and parents) to make decisions involving school resources, events, and policies that were previously made solely by the principal. This is a step toward more democratic decision making, but not a guarantee that all constituencies of a school will be heard. Teacher representatives could be selected by their colleagues or appointed by the principal. Parents on these committees may come mostly from business and professional backgrounds. Rarely would one find parents of English-language learners as members of such important school committees.

Multicultural education advocates that the voices of all school constituents be represented in meaningful ways. Clearly, when multiple voices are heard, there is a potential for conflict to be resolved that isn't present when a school is run by a single autocratic voice that guarantees consensus. When schools are run by consensus, the question is, "Whose consensus?" More democratic decision making may always be criticized by pointing out that it is slower and more tedious than making autocratic decisions. But in the end, decisions in which the entire school community has participated through a transparent process have much more legitimacy and lasting value. Genuine school reform must take into account not only outcomes, but also equity in reaching those outcomes.

Another dilemma for educators who want school reform with equity is how to respond to situations where current school practices are not serving the best interests of students. Just because a practice is required by a district or state does not mean that the practice is sound, supported by research, or in the best interests of students. Many states require English-language learners to take the high-stakes test if they have been in U.S. schools for one year. They may be

allowed accommodations such as a bilingual dictionary. However, no research supports the contention that academic English can be learned in only one year, or that a bilingual dictionary appropriately compensates for this disadvantage, yet these students are still required to sit for the test. What does an educator say to a parent of an English-language learner who has to cope with a daughter or son who comes home crying after hours of frustration created by an invalid test given in order to satisfy a bureaucratic imperative?

Do educators who question the validity of this test risk being viewed as disloyal to the institutions that employ them? Should educators admit to parents that even average performance on the test is highly unlikely after only one year of learning English? Meaningful school reform must allow professional opinions that differ from current practices to be taken seriously. When critiques are offered, they should be regarded as honest efforts to improve school practices, rather than discounted as being outside the boundaries of the current political climate for educational decision making.

Genuine school reform must involve an honest dialogue about all issues, including material and intellectual resources. In most school districts in the United States, teachers with temporary or emergency credentials are concentrated in schools that serve predominantly low-income youth. Because a quality teacher is the single most important variable that society controls that affects student learning, how well does this pattern bode for students who are the most underprepared having the least access to high-quality teachers? How do school district or state policies support or combat this pattern? This situation is exacerbated during periods where demand for teachers exceeds supply. Issues involving the distribution of material and intellectual resources in public schools must be at the core of the dialogue if true multicultural school reform is to take place.

Misconceptions

Like other relatively new fields, multicultural education has become legitimized and accepted in American education over an extended period of time. The field is not without its critics, and some educators still have incomplete or erroneous notions of the goals of multicultural education.

A number of misconceptions about multicultural education abound in schools. When asked how she was implementing multicultural education, one teacher replied, "Last week I taught a unit on Mexico and Central America." This interpretation suggests that anything cultural is multicultural education. Indeed, this teacher may have taught a fine unit. However, she was engaging in global education. If she had taught a unit on Salvadorean, Guatemalan, and/or Mexican Americans, she would have been engaging in multicultural education because this is domestic content to a U.S. student. It is clear, however, that good teachers should engage in both global and multicultural education so that students may see the relationships between the two areas.

Another common misconception about multicultural education is that it is opposed to the Western canon of knowledge. Teaching about the United States accurately requires multicultural educators to be competent in, as well as teach about, the traditions, accomplishments, and history of European Americans. When this segment of the population represents about three quarters of the population of the United States and has been the major force in its history, ignoring or minimizing its influence would be nothing short of providing a fraudulent education. For example, multicultural education does not propose to replace Benjamin Franklin in the curriculum with Frederick Douglass. Rather, it proposes that U.S. students of all backgrounds should be knowledgeable about both historical figures. Multicultural education does not oppose literacy in the Western canon of knowledge, it suggests that all students need "Western literacy plus."

Just as American students learn about the role of Ellis Island in processing European immigrants, they should know that there is an Angel Island in San Francisco Harbor that did the same for Asian immigrants. Students learn that the United States was populated in an east-to-west fashion. This is accurate when describing the European immigrant migration across this nation. However, this concept does not explain Asian immigrants' migration, which was west to east, nor Hispanic immigration, which was mostly south to north. When multicultural educators suggest that concepts be explored from the perspectives of all participants in an event, a common critique is that this

exploration is "anti-West," and that these perspectives are "balkanizing."

Multicultural educators counter this critique by admitting that new concepts may be slightly disorienting at first, when contrasted with students' prior knowledge. However, when taught in the appropriate context, students benefit from having multiple perspectives rather than a single one. In short, multicultural education is not a subtractive model of education; it advocates that more knowledge is better than less knowledge. It also rejects the perspective that simple discussion of cultural and ethnic groups is inherently divisive. On the contrary, ignoring different cultural, racial, and ethnic group perspectives, when they are germane to a topic, could be regarded as a form of academic censorship through omission.

Any time students are taught anything that was not taught to their parents' generation, the potential for controversy exists. However, if strict generational precedent were followed by all schools, the school curriculum could never change. Another critique leveled at multicultural education is that it doesn't help students receive better scores on state or national standardized tests. Because nearly all standardized tests focus almost strictly on verbal and quantitative skills, this critique essentially says that building these skills is the sole purpose of education. Although these skills are important, it is also critical that U.S. students understand the diversity in their nation and the world.

Future Outlook

Many areas need to be addressed if multicultural education is to become more fully realized in U.S. schools. Institutionalization of multicultural education has been uneven at best. Only a few universities offer degrees or areas of concentration within degrees in this field. Most of the seminal scholars in multicultural education (Banks, Gay, Sleeter, Nieto, McGee Banks, Grant) are persons who earned degrees in other areas of education and developed expertise in multicultural education by devoting their careers to research and writing in this area.

Certain changes, like preparing multiculturally literate teachers, require considerable time to revamp

the teacher education curriculum and to place those teachers in schools. A policy change, like the National Council for Accreditation of Teacher Education diversity standard, has caused many teacher preparation programs to review their curricula to see if they were properly preparing teachers to work with diverse learners. Ensuring that teachers have a strong multicultural background in their subject areas is a topic that will take considerably more time. However, without a strong multicultural content background, curricular changes are likely to be superficial and confined to pedagogy. Teachers need to be able to apply multicultural perspectives to core concepts in various subjects before students can realize the power of commanding a topic through a multicultural lens.

In addition, advocates of multicultural education need to realize the fears and concerns of the opponents of multicultural education. When teachers present multicultural perspectives, many concepts that were previously ignored take on the legitimacy of curriculum. This new curriculum, although more inclusive, provides information, raises questions, and presents equity issues that were previously ignored. Such a curriculum has been criticized by opponents of multicultural education as possibly being polemic, so it is critical that multicultural education uses excellent scholarship when it raises new topics in the curriculum. To do less is to open efforts to broaden the curriculum to the critique that multicultural education subscribes to less rigorous academic standards.

Finally, multicultural education must be viewed as an effort that aims to improve the education of all students. As this is more widely understood, those who receive a truly multicultural education will be far better prepared to understand their diverse society and world as well as become full participants in democracy.

MULTICULTURALISM, PHILOSOPHICAL IMPLICATIONS

Historically, multiculturalism is a forty-year movement for social equality of subcultural groups based on race or ethnicity, class, gender, religion, sexual orientation, and physical disability. Beginning in the educational sector in the 1970s and expanding to the social and political arenas, multiculturalism has progressively challenged the dominance of racially White, Anglo-Saxon culture and raised questions about the meaning and significance of pluralism in American society. Questions raised by multiculturalism about equality and parity of culture have strong implications in philosophical areas of political philosophy and epistemology. In political philosophy, justly accommodating culture within liberal, democratic theories of government is the vexing puzzle that multiculturalism poses. For epistemology, multiculturalism calls into question the privileging of the Enlightenment epistemic norms of truth and universality of reason. This entry briefly describes the concept and its implications for politics and epistemology.

An Evolving Concept

Throughout its history, multiculturalism has been an evolving social phenomenon. At its earliest arrival into the American lexicon in the early 1970s, the term *multicultural* was typically used in conjunction with, or related to, education. Multicultural education began the 1970s as a series of ethnic/cultural pedagogical and curricular reforms in K–12 education. In addition to its presentation in the context of education, initially, multiculturalism was also a label for sociopolitical policies, practices, and initiatives foregrounding racial equality. In the next decades, multiculturalism underwent a series of adaptations.

In the 1980s, promoting diversity among subcultures rather than solely racial and ethnic groups was the focus of multiculturalism. This technical use of the word *diversity* refers to any group consisting of members different from the mainstream, defined as White, male, fully able-bodied, Anglo-Saxon people.

Multiculturalism as a movement became the voice of those arguing for a more inclusive society. Throughout the decade of the 1990s, multiculturalism promoted empowerment of members of society who were socially and economically disadvantaged. Social justice principles were generally the basis on which such demands were made.

Most recently, multiculturalism has come of age as constitutive of a series of guiding considerations in rethinking the foundations of American life and society for the broadest possible inclusion. Additionally, there are now clearly formal, academic, and theoretical strands of multiculturalism and informal, populist, and practical ones.

Multiculturalism is used here as the umbrella concept for policies, practices, and initiatives not only in education but also in various domains of civic and political life. It is the academic discourse of multiculturalism that is addressed here and within which one may identify clear theoretical implications of multiculturalism for both political philosophy and epistemology.

Implications for Political Philosophy

In political philosophy, there have been two definitive assertions of multiculturalism that are significant. One is that membership in a given subcultural group is salient to political relations in a way that merits recognition and support of identity beliefs and practices. This assertion conflicts with the dominant liberal political tradition of Western political philosophy. Premised upon the social contract as the inception of civil society, liberalism holds that political associations and the authority that attends them are legitimate to the extent that they allow a range of common liberties to which all citizens tacitly consent. The bases of the contract are conclusions implied by reason.

Because putatively neutral, socially naked persons enter into the contract, liberalism privileges the range of rights and duties accruing to persons in virtue of shared universal qualities. On the principled grounds of universal rationality, liberalism subsumes group practices and beliefs within the realm of individual rights, consigning expressions of cultural difference to the private realm. Within the political framework of individual rights, there are mutual constraints upon

persons' rights to freedom of expression. However, the rights of the others are not the only basis for limiting recognition of cultural beliefs or practices in liberalism; also salient are the interests of the cultural group member for whom the individual right of exit always supersedes the right of the cultural group to impose its tenets. Amy Gutmann, in *Identity and Democracy*, defends this conception of the relationship between group membership and democracy.

Multiculturalism challenges the specifications of liberalism in general and the nature of democracy in particular by questioning the firm separation between an individual and his or her cultural group membership in the realization of the social contract. This problem is one of pluralism, which raises questions about how difference should be treated in democratic society. Members of some cultural groups argue that an equal and inclusive society mitigates for the burdens of minority status.

In *Politics in the Vernacular*, Will Kymlicka offers a liberal defense of minority rights and also appeals to a valued liberal concept of human flourishing as the basis for special recognition of minorities. Multiculturalism maintains that educational institutions should accommodate cultural beliefs in some way. One specific example of such an accommodation is making allowances for more local religious influence in schools where the minority population so warrants. William Galston, in *Liberal Pluralism*, argues that liberal democratic society can allow a greater range of freedoms with regard to the public expressions of religious beliefs.

Whereas the first assertion questions the specifications of liberalism, the second definitive assertion of multiculturalism calls into question rationality discourse as the primary basis for the political. This challenge frames political claims within binary oppositions such as the oppressed versus the oppressor, the dominant versus victimized, and so on. Influenced by neo-Marxist critical political theory, these oppositions foreground well-entrenched social patterns of injustice that perpetually consign minority cultural groups to the social and economic periphery. Only by empowering the marginalized can a just state of affairs ensue. The implications of multiculturalism for epistemology are along similar lines of contesting well-established norms and meta-standards.

Implications for Epistemology

The philosophical discipline of epistemology concerns the criteria for knowledge and related concepts such as justification and belief. Epistemology, traditionally conceived, rests upon foundational premises of modernity. These premises include the knower as an objective, neutral enquirer reasoning from basic beliefs of perception, memory, or reasoning. Basic beliefs, which can be infallible, certain, or self-evident, logically support derived ones. Multiculturalism's thesis of inclusivity raises the issue of the significance of groups and group membership for standards of belief and truth.

One proposal of multiculturalist scholars is that inclusivity is a critique of traditional epistemological standards and suggests that there are multiple ways of knowing. If multiculturalism is correct, there would be culture-specific epistemologies. However, this proposal faces two disjunctive options. Either standards of belief and truth are relative to culture, in which case there could not be universal truth, or claims to epistemological plurality are actually moral claims couched in traditional epistemological discourse.

In the first case, multiculturalism would be subject to self-refutation of the general assertion that there are multiple ways of knowing. In the case of the latter, multiculturalism claims for equality, respect, and liberation from the hegemonic Western tradition are actually framed within liberal and modernist presuppositions about truth and the equality of all human beings. Harvey Siegel makes this argument in a seminal article, "'Radical Pedagogy' Requires 'Conservative' Epistemology."

Although multiculturalism claims were given further credibility as the movement incorporated post-modernist theories, in the later work of James Banks, a leading multiculturalism theorist, its scholarship has recently begun to distance itself from the logically refutable position on epistemological relativism. In contrast, at the level of practice of education, cultural relativistic presuppositions are still being made. One example is in the work of Donna Gollnick and Phillip Chin, *Multicultural Education in a Pluralistic Society*.

The discourse surrounding the epistemological implications of inclusivity has had several offshoots into emerging disciplines. For example, women's

studies and feminist epistemology have addressed the gender-specific aspects of inclusion. There has also been an ongoing discussion about the implications of race in particular as well as the nexus of race and gender. Also, the field of social epistemology explores the bearing of social phenomena on epistemology.

The advent of multiculturalism has fundamentally advanced the promotion of equality across American society, transforming social and political norms. Its transformative role is exemplified in its impact on political philosophy and epistemology.

MUSEUMS

In most countries, and especially in the United States, museums are a reflection of society. Usually, the buildings exemplify civic pride, serving as examples of architectural accomplishments. The public and political importance of a museum is signified by how it is funded and to what degree, as well as by the scope of its collections. The collections also provide evidence of the curiosity of the community's citizens to know and experience not only American culture, but the societies of other people, lands, and eras.

Today, more than any other time in its history, the museum in the United States is a place for education for everyone. This was not always so; early museums had exclusive private collections that were owned by and open only to the wealthy—those of the same race and social class. In this entry, this history of museums and their educational role is briefly described.

An Educational Role

Many early museums were viewed as sacred places for collectors where visitors would speak in whispers as they wandered from one gallery to another. Museums were largely for the wealthy, the cultured, and the elite. Thus, early museums reflected American society in their lack of openness to new ideas and new people. As the country became industrialized and welcomed new citizens, museums struggled to find a place within the changing society.

Over the past 200 years, the educational role of museums has been subject to considerable debate. From their earliest inception, there has been no consensus by those running American museums as to whom they should teach, or even for what reasons. But from their outset, museums have always undertaken to teach someone something. By the beginning of the twentieth century, the major objective of an increasing number of American museums was to educate, inform, and inspire the general public. More and more museums were open to those who did not have the benefit of an extended education. Through lectures, objects, and pictures, museums could teach an increasingly diverse population. This tradition of teaching from and learning with original objects continues to be a major emphasis of most museum education.

Fostering Equality

Museums are considered ideal institutions because they offer a type of social equality achieved through learning for all patrons. During the post-Civil War period, the museum movement's primary motivation was a need to instill literacy in the American public; growing numbers of immigrants did not know or appreciate the story of Western civilization, it was thought. Indeed, civic leaders depended upon public

schools and museums to promote a cohesive set of moral values for the community.

Working in the early decades of the twentieth century, John Cotton Dana, director of Newark Free Public Library and Museum, and Henry Watson Kent, the supervisor of museum instruction at the Metropolitan Museum of Art (both trained as librarians), saw museums as a powerful instrument for self-improvement, and in their work, each tried to reach all parts of his community. Seeing museums as places of active interpretation, the two men believed that it was the duty of these institutions to be proactive in inspiring popular interest.

By the end of the 1920s, the educational role of museums was de-emphasized, as was the goal of social equality. Increasingly, collecting was seen as an end in itself, and the completion and care of collections became the major professional concern for directors. Special staff members were appointed to develop educational services for schools and for adult visitors. The museum teacher arranged for loan services and school visits, while a guide lecturer provided adult services. Withdrawing from relationships with the public, museum directors relied on exhibitions as their main form of communication.

Recent Trends

By the mid-1940s, the horrors of the war and the threat of obliteration from the nuclear bomb helped museums to refocus on their educational responsibilities toward the public. Prosperity after the war also brought expansion. The social upheavals of the 1960s and 1970s produced another set of demands for educational services from museums, resulting in hands-on learning in children's museums and science centers. Display methods became the focus of research and development for museums. Another outcome of the social turmoil of the 1960s was to put museums in the center of the cultural wars, a trend that continues into the present as traditionalists and multiculturalists fight over collections and their interpretations. Native Americans, along with African Americans and other historically disenfranchised groups, have increasingly come to demand a voice in

museum policies and practices and ownership of artifacts collected from their communities, as well as the right to have their historical and cultural stories told.

By the 1990s, the educational role of museums was once again emphasized—a direction that is expected to continue and grow in the future. The philosophy of lifelong learning, and the recognition that learning does not end with formal schooling, provides a theoretical framework for the role of museums and education into the twenty-first century. It is clear that in the future, museums must be increasingly responsive to the complex and diverse populations of the United States, responding to their needs through innovative educational programs and community engagement.

Museums are complex institutions, even more so today than in their early history. How and what they do is open to considerable controversy and debate. Among museum professionals, the essentialists decry the shift in focus away from scholarship and preserving and collecting; in opposition are the pragmatists, who understand that for museums to survive, they must embrace change.

Working to survive in a marketplace economy as largely nonprofit institutions, museums are forced to adopt the contradictory roles of being a place of memory in a country that thrives on immediacy and being an advocate for tradition in a nation of innovation. Accountable to more constituents than in the past, museums must operate as cost-effective businesses while also serving as educational resources, civic centers, and community partners.

MUSLIM STUDENTS IN U.S. SCHOOLS

The population of American schools includes learners whose educational experiences are diverse by variables such as race, gender, culture, and social class. Students who are observant Muslims in American schools introduce religion as an additional analytical variable. For Muslim students, the central presence of God in the individual's mind and heart is an important factor in shaping one's life.

The Western worldview might be problematic for Muslim youth and their families because a Muslim considers civil life to be embedded within a spiritual realm. In some cases, Muslim students face the challenge to maintain their religious identity in American schools. The conflict between the value system of the home and that of the school becomes more important when dealing with issues of regulating gender relations, dating, physical education, and sex education classes. Muslim students may be uneasy about sharing changing-room space, for example, because modesty is a major theme in Islamic teachings. Muslim female students who choose to wear the head cover (*hijab*) will be looking for a culturally sensitive educational environment.

Some other areas where religious values and the school environment may clash include school menus. For example, pork is included in most districts' menus. Because Muslims are prohibited from eating any pork product, labeling those items would help students to be aware of their choices. The month of Ramadan, when Muslims fast, occurs during the school year; many schools allow Muslim students to sit in the library during lunchtime so they won't be around food. In some districts, students are given a

time and space to perform their prayers while at school without disrupting their class schedule.

Some Muslims also have concerns about how American textbooks deal with the history of Muslims, the history of colonialism, and the Third World. Poor or inaccurate coverage of Muslims in textbooks disturbs Muslim communities in the West. Teachers may also have misconceptions regarding Muslim homelands that reflect negatively on students' pride in their heritage.

Helping teachers to eliminate their own stereotypes will have a domino effect on all the students who pass through their classrooms. Teachers should know that Muslim families generally consider education important, although because they vary in socioeconomic status, they also differ in educational experiences. Moreover, Muslim parents also want their daughters to be educated as a means of social mobility, growth, and financial independence.

The presence of young Muslims in American schools can have a positive impact on the school culture. For example, Muslim students have started school clubs that are geared not only toward serving their needs but also toward educating non-Muslims about Islam. Clubs such as Muslim Learning club, Muslim Student Association, and Islamic Culture club are but a few examples of Muslims creating their own space within public space. American schools tend to have pervasive cultures, allowing Muslim students to develop an educational identity and explore different meanings of the self, values, and an imagined future. These multilayered identities are fluid and dynamic, responding to the social context in which these young Muslims function.

NATIONAL DEFENSE EDUCATION ACT

The National Defense Education Act of 1958 (NDEA) is federal legislation that was passed primarily to stimulate the advancement of education in the sciences, mathematics, and modern foreign languages during the Cold War era. While providing funding at all levels, the primary focus of the NDEA was on postsecondary education. The act provided institutions of higher education with funds for granting low-interest loans to students. The NDEA also gave federal support for improvement to elementary and secondary science, mathematics, and foreign language education.

In the aftermath of the launch of the Soviet *Sputnik I* satellite on October 4, 1957, the U.S. Congress declared the existence of an educational state of emergency requiring action by the federal government. The purpose of the act was to provide federal assistance to help develop those skills deemed essential to the national defense.

The federal system of the U.S. government does not allow for national control over curriculum, instruction, administration, or any other aspect of school policy. Thus, the federal role in education is largely limited to issues of funding. One key component of the NDEA was to enhance student loan funding at colleges and universities. Specifically, these funds were to be allocated preferentially to students who wished to teach in elementary or secondary schools and to students engaged in preparation in science, mathematics, engineering, or a modern foreign language.

Additional funding was given to strengthen science, mathematics, and modern foreign language instruction at the K–12 level, with funds to be made available to private as well as public schools.

NATIONAL EDUCATION ASSOCIATION

The National Education Association (NEA) is the largest professional employee organization and one of the most powerful labor unions in the United States. It works to improve public education and attain higher salaries and better working conditions for educators and school employees through political activism, research, professional development, contract negotiations, and awards. The NEA represents over 2.8 million teachers, administrators, education support professionals, faculty members, education students, and retirees. It is a staff-supported, volunteer-based association with affiliates in all fifty states and in over 13,000 communities.

Headquartered in Washington, D.C., the NEA influences the political process at the local, state, and national levels. For example, the NEA seeks to “fix and fund” the No Child Left Behind Act of 2001; supports free, universal preschool; and opposes efforts to reduce public school funding through privatization (educational choice and voucher programs). It conducts large-scale research projects and provides access to comparative data on teachers, students, and schools. Members use this information to improve educational practices and promote increased funding for public education.

NEA professional staff members assist affiliates engaged in the contract negotiation process through which employee salaries, benefits, and working conditions (e.g., class size, school safety, preparation periods, grievance and transfer policies) are determined. The NEA’s Web-based Legislative Action Center highlights pending legislation likely to impact education. The NEA Fund for Children and Public Education, a political action committee, is funded by voluntary member contributions (not dues). The fund uses these contributions for political purposes, supporting candidates whose platforms and voting records reflect the association’s principles. Critics argue that the NEA impedes educational reform efforts, wields too much political power, and promotes causes that do not reflect members’ professional values and interests.

Organized in 1857, the NEA was first called the National Teachers Association. Zalmon Richards of Columbian College, George Washington University, was the association’s first president. The NEA was incorporated under a Special Act of Congress in 1906. Ella Flagg Young of the University of Chicago was the association’s first female president (1911–1912). The NEA was a “professional association” for nearly a century, opposing collective bargaining and the use of strikes to settle labor disputes. However, the NEA became a teachers’ union in the 1960s, after losing ground to a rival organization, the American Federation of Teachers, in large urban school districts.

The main policy-making group of the NEA is the Representative Assembly, comprised of more than 9,000 elected delegates. When the Representative Assembly convenes each year, it constitutes the largest democratic decision-making body in the world.

Noteworthy publications of the NEA include the *NEA Code of Ethics of the Education Profession*, *NEA Today*, and *The NEA Handbook*.

NATION AT RISK, A

Historians specializing in the field of American education agree that the report *A Nation at Risk*, prepared by the National Commission on Excellence in Education, has had a significant influence on schools since 1983. This entry describes how the report was prepared, what it said, and how its impact has been felt for more than two decades.

Background

The Commission on Excellence in Education was created by Ronald Reagan’s Secretary of Education, Terrel Bell, in 1981. Bell believed that because of the low test scores of American students in international examinations and because of an apparent public uneasiness with schools, the time was right for a study that would provide recommendations for improving our schools and colleges. Despite a lack of enthusiasm for the project by the Republican administration, he was allowed to proceed with the study.

The commission contained representatives of business, colleges, and universities; teachers; school administrators; and school board members. In his

charge to the group, Secretary Bell instructed them to “review and synthesize the data and scholarly literature on the quality of learning and teaching in the nation’s schools, colleges, and universities, both public and private, with special concern for the educational experience of teenage youth.” They were also instructed to identify problems facing schools and seek successful programs to remedy the current educational deficiencies.

Contents

After their report was unanimously agreed upon by all the members of the commission, it was introduced to the public by President Reagan. The document began with an introduction that was widely quoted in the media, which stated that

Our Nation is at risk. Our once unchallenged prominence in commerce, industry, science, and technological innovation is being overtaken by competitors throughout the world. . . . If an unfriendly foreign power had attempted to impose on America the mediocre educational performance that exists today, we might well have viewed it as an act of war. . . . We have even squandered the gains in student achievement made in the wake of the Sputnik challenge. . . . We have, in effect, been committing an act of unthinking, unilateral, educational, disarmament.

Following this introduction, the report identified the following failures of the American education system:

- Our student test scores compare unfavorably with other nations
- Twenty-three million Americans are functionally illiterate
- The college entrance SAT scores have been declining since the 1960s
- Test scores of college graduates are dropping
- Businesses and the military are spending millions of dollars retraining employees and recruits
- American students are deficient in their knowledge in the field of science

The recommendation section of the report suggested the need to return to an emphasis on what the authors called the “new basics.” Specifically, the commission

called for a high school curriculum that includes four years of English, three years of mathematics, three years of science, three years of social studies, and a half year of computer science.

This section of the report also referred to the need for “rigorous” curriculum standards. It recommended that these standards be written in such a way that they are measurable and clearly articulate what students should know and be able to do. To ensure that the standards are being effectively taught, meaningful or high-stakes examinations should be administered to measure student learning.

The report also argued that schools and colleges should raise their expectations of students by having students increase time spent in the classroom and on homework. Another way of improving student achievement that the report emphasized is to improve the teaching profession. Better training and higher salaries for teachers were suggested. The authors also included sections addressing the importance of the role played by parents, school administrators, and school boards.

Ongoing Impact

For the most part, the media coverage after the issuance of the report was positive. After seeing the positive reaction to the report, President Reagan used school improvement as one of the major issues in the campaign for his reelection in 1984. Because of the impetus provided by the report, state governments were encouraged to seek ways to strengthen their education programs.

Not all of the reactions to the report were positive. Some critics suggested that blaming our nation’s economic problems on schools was unfair. Others charged that the commission was selective in its use of the data in order to justify a negative assessment of our schools. Despite the critics, states developed curriculum standards, high-stakes testing programs, and increased accountability for schools during the next twenty years.

Even with these and other reforms, as the nation entered the twenty-first century, test scores, especially in our cities, were not showing great improvement. During his campaign in the year 2000, George W. Bush

called for more vigorous federal leadership in the field of education. During the debate over reauthorization of Title I of the Elementary/Secondary Act of 1965, a new law was born. Called No Child Left Behind, the bill can be seen as a continuation of the reform begun by the *A Nation at Risk* report. Although it did not occur until twenty years after the report, it incorporated many of the recommendations offered by the commission. The law mandates state curriculum standards, high-stakes testing, school accountability, and improvement in the preparation of teachers. School districts that fail to make adequate progress in carrying out the objectives of the law will be faced with serious consequences.

It is impossible at this point in time to judge the effectiveness of the various reforms called for in the *A Nation at Risk* report. The testing required by the No Child Left Behind Act has just begun. Whether or not U.S. schools will be more successful in the twenty-first century remains to be seen, but it is clear that current reform efforts were in large part a result of the *A Nation at Risk* report.

NATIVE AMERICAN EDUCATION, HISTORY OF

The history of Native American education began before contact with European settlers, as tribes had their own traditions of passing knowledge through the

elders to the youth. This entry reviews the history of Native American education after contact with Europeans, focusing on schooling through the high school level. Education of Native Americans has included missionary schools, off-reservation boarding schools, reservation day schools, and finally public schools. Throughout this history, the purposes of schools were to Christianize, “civilize,” and assimilate Native American children and their families.

Missionary Schools

The Jesuits began establishing missions within Indian territories in the Northeast and Midwest beginning in 1611. Protestants sent missionaries to Indian territories in the early 1600s. Father Junipero Serra began establishing the twenty-one California missions in 1769. The purposes of the missionary work were Christianizing, civilizing, and assimilating Native Americans into the European way of life, religion, work patterns, and language.

In 1819, the U.S. government decided to assist the missionary efforts by establishing the Indian Civilization Act, which funded Christian missionary schools within Indian territory. Christian denominations involved in setting up missionary boarding schools included Presbyterian, Methodist, Episcopalian, Baptist, and Catholic, among others. By 1884 they had created missionary schools in seventy-three different Indian territories.

The federal government was also involved in Native American education through writing education into many of the treaties set up with the various tribes. During the 1800s, the Senate approved nearly 400 treaties, of which 120 contained provisions for education. In exchange, the tribes gave almost a billion acres of land to the U.S. government. The government responded by passing the Dawes Act of 1887, which created a system of allotments for Native Americans. By dividing up the Indian territory into parcels, each Native American was able to receive land of his or her own, which encouraged an individual rather than tribal view of the land. The act turned out to be just another method of taking land from Native Americans, as it resulted in 60 million acres being opened up to non-Indians for settlement.

When students arrived at the missionary schools, they faced treatment designed to “de-Indianize” them. Their hair was cut, they were not allowed to speak their native languages, they were not allowed to practice their own religions, they could not use their known ways of practicing medicine, and they were most often not allowed to keep their own names. The belief on the part of the U.S. government and the educators at the schools was that if children were stripped of their sense of Indian identity and their memory of their religion, language, and sense of community, then their tribal customs would disappear, and the communities would become more like the White communities.

Off-Reservation Boarding Schools

In 1865, a congressional committee recommended the creation of boarding schools away from Indian communities for the education of young children. According to proponents, this would remove the Indian child further from the influences of the family and tribe. By 1873, the federal government had repealed funding for missionary schools, instead appropriating money to off-reservation boarding schools for Indian children that emphasized industrial labor training.

The most famous of the off-reservation boarding schools, Carlisle Indian School, was opened by Richard Henry Pratt in 1879. This was a model for the government’s forced assimilation policy, engaging in many practices to separate students from their Indian identities. Opened in old army barracks, Carlisle was an industrial labor school, which in addition to various types of work also included sports teams, bands, and a school newspaper. With word spreading of the “success” of Carlisle in assimilating Indian children, Congress funded more boarding schools. By 1902, there were twenty-five governmentally funded boarding schools in states across the United States. These schools were intended to be sites for elementary education, although some students were in their teens. Additional boarding schools that gained attention include Haskell Institute, in Lawrence, Kansas; Sherman Institute, in Riverside, California; and Phoenix Indian School in Arizona.

Industrial Education and Labor

The boarding schools operated as manual labor training arenas, with under a half-day of academics and a half day of labor—industrial, agricultural, or domestic work. Students were assigned to one of these areas of work, which had the purpose of teaching children to be industrious laborers. In many cases, the boarding schools were only able to remain open due to the labor provided by the students. An additional type of practice practiced by some of the boarding schools was the “Outing” system, in which Indian students would live with families on nearby farms. While living with the families, they would do the work of harvesting or domestic work and get paid for their labor. They would then return to the boarding school during the school year, where they would continue with their labor as well as their schooling.

As part of the rigor that school leaders thought would create more moral, patriotic, and willing workers, the schools often were organized as military units. Students had marching drills, militaristic rules, harsh discipline, and compulsory attendance. In the records of one boarding school, students who ran away from the school to go back home were recorded in the roster documents as “deserters.”

Taking the Children

Since one stated purpose of off-reservation boarding schools was to bring Native American children off of the reservation, there had to be a system for getting the children away from their homes. Accounts of how the children were taken to boarding schools show that some children desired to attend the boarding schools, with their parents’ consent, hoping to gain an understanding of the “White man’s world.” Many children, though, were taken by government agents through force, bribery, or threats. At the end of the 1800s, one method of taking children away from homes was to withhold rations as a way to get parents to send their children to the schools. This practice was prohibited by a congressional act in 1894, which blocked the sending of Indian children to schools outside their state or territory without consent of parents or guardians.

Upon arriving at the missionary or boarding schools, many Indian students were renamed by their White teachers. Among most tribes, a young person is given a name based on an event or a characteristic that has been associated with that person. Those responsible for Indian education policy in the late 1800s and early 1900s believed that traditional Indian names were “unsuitable for civilization.” Further, they thought that the traditional practice of naming a child was an undesirable link to the tribe’s culture, heritage, and traditions. Examples of names being changed by the teachers at the boarding schools include Bear Chief having his name changed to Harold Gray, and Ah-nen-la-de-ni, which meant “Turns the Crowd,” being changed to Daniel La France.

An Era of Indian Schools

Several tribes worked to overcome forced assimilation into European values and beliefs, with some starting their own schools, taught by Native American teachers teaching in their own languages. In 1818, the Choctaw opened the Choctaw Academy, a high school for Indian children. The Cherokee opened male and female “seminaries” in 1851, which were basically high schools for Indian children, run by Indian teachers. And by 1870, there were eighty-four neighborhood schools in Choctaw territory. Most of these teachers were Choctaws.

After forty years of the federal off-reservation boarding school policy, public attention turned to criticizing the educational treatment of Native Americans. One of the critiques was that the boarding schools off-reservation were too expensive to maintain, while another was that students were not being assimilated into White culture well enough to justify the expense. A series of increasingly complex critiques of government policy toward Native Americans was seen in the 1920s and 1930s.

In 1923, the Committee of One Hundred was formed to analyze Indian policy and recommend any needed changes. The committee included a wide range of members, including several influential Native American delegates. The committee’s report called primarily for greater funding for Indian schools, specifically with a call for more adequate school facilities, higher

salaries for Indian teachers in order to draw more qualified teachers, an increased number of Native American students in public school, and an increase in scholarships.

In 1928, the Meriam Report was published, providing an extended investigation and critique of the services and education provided by the Department of the Interior’s Indian Office. The report condemned the care of Indian children in boarding schools, challenged the use of Indian students as laborers to keep the boarding schools operating, and criticized the philosophy and curriculum of the boarding schools, which focused on “civilizing” the Indian child. In 1930, the key author of the report, Dr. Carson Ryan, became the director of Indian education, striving to put into place community-based schools, to bring more Indian children into public schools, and to gradually reduce the number of boarding schools.

John Collier, Commissioner of Indian Affairs from 1933 to 1945, continued the quest to improve the treatment of Native Americans by the government and improve the education of students in schools. As a leader behind the 1934 Indian Reorganization Act, or Wheeler-Howard Act, Collier helped the public and the government to focus on strengthening Indian cultures and communities by encouraging tribes to create tribal governments and constitutions, funding more education access for Indian students, and halting the loss of more Indian land through the allotment system of the Dawes Act.

Education in the Late Twentieth Century

Several reports, congressional acts, and new types of schools opened in the latter half of the twentieth century, helping to solidify a period of Native American self-determination. The Rough Rock Demonstration School, established in 1966, is an example of a school that was opened as a joint undertaking by the U.S. government and the Bureau of Indian Affairs at the Navajo Nation. The school was an experiment in teaching, which used Navajo leadership, teachers, and curriculum.

This initiative was coupled with emerging critical reports on Native American education. The 1969

Kennedy Report, titled “Indian Education: A National Tragedy, a National Challenge,” helped bring attention to issues in Indian education such as lack of Native American teachers and high dropout rates. In 1972, the Indian Education Act provided funds for supplemental programs for Native American children both on and off the reservation. This funding was used to create culturally relevant curriculum and to involve families and communities in Indian education. The Native American Languages Act of 1990 allowed tribes to teach in their own languages, and in addition encouraged the saving of these “unique” languages. Acts and reports such as these were an outgrowth of Native American activism to address what has been called the miseducation of Indians over four centuries.

NATIVE AMERICAN HIGHER EDUCATION

Native American college students make up only about 1 percent of the nation’s college students. Such statistical analysis is often problematic because an individual college or university may have only a small number

of Native students. As a result, Native students are often excluded in statistical reporting. Yet, statistically, between 1976 and 2002, the number of Native Americans attending college almost doubled. The potential number of Native students is also increasing as, according to the 2000 Census, 33 percent of the Native population is under the age of eighteen. The reported graduation rate of Native American college students is 36.5 percent, compared to 58 percent of White students. These percentages are based on federal reported cohort data, which counts a student in a cohort as a full-time student who enters as a freshman in the fall semester and graduates within six years of enrollment.

American Indian college students come from the most diverse ethnic group within the borders of the United States (there are over 500 federally recognized tribes). American Indian college students do not attend a single institution or attend college in the same manner. This entry will begin with an introduction of the historical colleges’ attempts to educate the indigenous population and the residential school period, which continues to have an impact today. A discussion of tribal colleges and Native American Studies programs is followed by a look at the challenges American Indian students face in blending their culture with that on a typical campus, and the elements these students say are important to their success.

Colonial Colleges

Almost from the moment of contact, the colonists considered educating the indigenous population in the European style as a matter of great importance, almost a duty. Early efforts were intended to “civilize” and “Christianize,” an effort to make indigenous people “European.” The Spanish established schools and colleges, and the Jamestown settlement had plans for Henrico, a college in the classical style, for natives in that area. Starting in 1649, three societies were established in Great Britain to support education and missionary work in the colonies. Including Indian youth in its college charter enabled an institution to gain access to those funds.

Harvard was founded in 1636. Its charter, however, was changed in 1649 to include “Indian youth,” to take

advantage of funds from England. William and Mary's charter was drafted in 1691. Their final charter was altered to include "Western Indians" in 1693. Dartmouth was established in 1769 for "Indian youth." Few American Indians graduated during this Colonial Period. The education they received was not practical for the people of the time, and illness took a toll on a number of students. American Indian graduates could not find work among the White population.

Residential Schools

The failure of the early colleges to educate the indigenous population led to the false conclusion that American Indian people were not educable. Educational policy then took a decidedly vocational purpose after the Revolutionary War. Many treaties included provisions for education. Because American Indians were on lands wanted by White settlers, American Indians were viewed as a "problem," and a federal policy of residential schools, often located off native territory, was developed. The purpose of these schools, which were first developed after the Civil War, was to assimilate the population by removing them from family and community and by forbidding use of native languages and traditions. Few of these schools offered an education past the sixth- or eighth-grade level. Residential school survivors have reported that they were physically punished for speaking their language, and many have reported physical and sexual abuse.

Residential schools began to be phased out in 1920. American Indian students then attended public schools, but always under a deficit ideology. Native cultures, families, and languages were considered inferior and blamed for student failure.

Tribal Colleges

Tribal colleges have played an important role in bringing a college education to American Indian communities. Many native nations experienced high unemployment rates and a loss of culture and language due to the boarding school era. Tribal colleges were developed to address that issue and the difficulties that young American Indians face in going to

distant universities with very different cultures. The first was created by the Navajo Nation (now Diné College) in 1968 as part of the self-determination movement. Other colleges soon followed, mostly in the Midwest and West. There now exist twenty-eight tribal colleges (mostly two-year institutions) and universities. The American Indian Higher Education Consortium (AIHEC) was formed in 1972 as the governing body of the tribal colleges.

According to AIHEC, common characteristics of tribal colleges are that they formed less than twenty-five years ago; have a small student population, typically located on remote territories; are chartered by one or more nations; and have an open admission policy. Most are commuter institutions, and even if they are universities now, such as Haskell Indian Nations University, they were, at one time, two-year colleges.

Tribal colleges offer a modern education within a Native framework, incorporating the chartering nation's language and culture into the curriculum as well as in the architecture, art, student activities, and approach to learning. Since tribal colleges are closely linked to Native communities, they can offer assistance and experiences specific to a community's needs and resources. An example provided by AIHEC is the offering of a course on a specific nation's economic history and partnering with a neighboring four-year institution for teacher preparation. Tribal colleges play an important role in offering a post-secondary education and also in providing a space for dynamic academic scholarship in Native Studies and preserving and developing Native culture.

Native Studies Programs

Native American Studies (NAS) programs provide community for American Indian students and serve as centers of indigenous scholarship within predominantly White institutions. NAS programs tend to be interdisciplinary, as American Indian issues are interdisciplinary by nature. In addition to academic endeavors including courses, research, and faculty, NAS programs provide community service to native communities. These programs are typically engaged with nation communities and consider community involvement as part of their mission.

NAS programs also provide student support. For example, Cornell University's American Indian Program has a house, Akwe:kon (which means "all of us" in the Mohawk language), where Native students can live along with nonnative students. The architecture of the building reflects Haudenosaunee (Iroquois) heritage, as Cornell sits in Cayuga territory. Programming occurs in Akwe:kon as well as in the American Indian Program located in an academic building on the main campus. The program uses a "full circle" approach to student success: recruitment, retention, and reintroduction to the student's community. The program employs four full-time staff members, including a director and a student development specialist. Students are encouraged to use the program's services as well as student services across the campus. Students are also guided so that they can bring their education back to their communities. Researchers have found that Native students want to give back to their communities. Cornell's American Indian Program capitalizes on that desire.

Native Culture and the College Student

In the Native American tradition, children generally learn by observation. Children are included in community and family activities and learn by witnessing and imitating behavior. Therefore, even today, a Native American college student may feel more comfortable in a class where listening or observing is expected than a class with a trial-and-error focus. In American Indian culture, learning is not separated from the rest of the day's events, nor is it sorted into distinct disciplines, making the compartmentalized nature of the academy uncomfortable for some students.

Native American students' cultural norms and core values affect their college performance. One such core value is respect for elders. It therefore can be very difficult for a native college student to question a college professor who is seen as the authority or elder in the classroom. Students will offer personal information when ready and may share only what they wish a professor or college student personnel to know. Overt questioning by the professor may be interpreted as being intrusive. Native speech patterns tend to be slower.

There is an expectation the other party is listening and will be provided the time necessary to reflect on what is said. Showing off is frowned upon. An individual does not brag; others are expected to compliment and acknowledge an individual's achievements. Women often play key roles in the community. Success is often defined within the context of the community, not an individual's personal gain.

Given all this, there is also great diversity within the American Indian/Alaska Native population. There are over 500 indigenous nations, and not all Native people have grown up on a reservation, although, one researcher has found that two thirds will either live or remain closely connected to a reservation. Even some students who have grown up on the reservation may not practice their traditions, may not speak a native language, or may practice Christianity. Other students may speak their language in the home, practice traditional ceremonies, and never have set foot in a city. Thus, student personnel professionals and college professors will need to increase their personal knowledge about the history of the surrounding Native community if they hope to respond appropriately to Native students.

Native College Students

Native college students are still, by and large, first generation. Almost two thirds attend a community or tribal college. Research also indicates that many are parents. Ceremonial practices, community participation, and employment outside of college mean there are complex demands on these students. Some researchers have found that students may miss class to attend ceremonies, fully realizing the impact this may have on their grades. Ceremonies are not practiced on college campuses. Students may go home if their families need their help. The fact that students return home for these reasons is an indication of how highly valued ceremonies and families are to native students.

Overt assimilation attempts are no longer practiced; however, most colleges and universities are predominantly White, and are Eurocentric in design and curriculum. Researchers have found that students often resist assimilation by not engaging in campus activities. Professors are rarely diverse, and native faculty

at most institutions are few and far between. In the western United States, a college or university can be distant from the tribal territory.

Successful American Indian students have reported that having a safe haven on campus where students can congregate is important to student success. Students also have reported that the American Indian faculty and staff were important for mentorship and for having someone on the campus who understood them. But students also noted the importance of honest and sincere non-American Indian faculty and staff who understand the indigenous worldview, relate to them as people, and appreciate the importance of indigenous spirituality.

NATURAL DISASTERS

Natural disasters can come in the form of hurricanes, floods, wildfires, tornadoes, and earthquakes. While such events are challenging and frightening for adults, the effect on children can be even more devastating as familiar routines, seemingly safe environments, and stable relationships are seriously disrupted. Schools potentially play a critically important role in the recovery process after a natural disaster, by providing shelter, counseling, continuity, and help to parents by caring for their children as they cope with the task of rebuilding their lives and their community. This entry looks at some research on the impact of

disasters on schools and provides some guidelines for response.

Hurricanes

Disasters such as hurricanes are not as sudden or as terrifying as earthquakes or tornadoes, but their impact is often much more widespread. Hurricane Andrew, which hit South Florida on August 24, 1992, was a natural disaster experienced by virtually everyone in the southern half of Miami-Dade County. Storm winds were recorded as high as 169 miles per hour. Approximately 250,000 people were left homeless and 1.4 million people were left without electricity. Total damages were estimated at over \$30 billion.

Hundreds of thousands of children experienced the terror of the storm—many barely survived its winds. For several years after the hurricane hit, teachers reported how students would be visibly agitated in their classes if the wind suddenly rose or there was a heavy rain. Parents, teachers, and community leaders were faced with the problem of how to help traumatized children after the storm.

Eugene Provenzo and Sandra Fradd, in the 1995 book *Hurricane Andrew, the Public Schools and the Rebuilding of Community*, explored at length the role the schools played in the recovery process after the storm. Besides providing critical shelter to members of the community when the storm hit, and a refuge for people after they lost their homes, the schools also were central to the rebuilding process and the reestablishment of a normal environment. By simply opening several weeks after the storm, the schools conveyed the message, “We are returning to normal. Life goes on.”

Fradd and Provenzo’s research concluded that a natural disaster such as a hurricane should be understood as an event that affects the entire community, not just those who experienced the main destruction. Ripple effects such as traffic, a shortage of housing, and the destruction of commercial and public buildings and services all shape and affect the larger community. Teachers and schools, because of their high visibility and their sheer numbers, are particularly important in the recovery process. Schools, and the teachers, counselors, and administrators who work in them, also have the ability to identify the children in

greatest need and provide them with appropriate counseling and help in recovery.

After Hurricane Andrew, Annette La Greca and her colleagues at the University of Miami developed a manual for working with elementary school children following a natural disaster. The manual emphasized the importance of the children's being able to discuss and share their experiences, to develop coping skills, and to maintain and strengthen friendships and networks of peer support. This last point is particularly important, since children often lost friends from before the storm when families moved to new neighborhoods, or even permanently left the region.

The lessons learned after Hurricane Andrew about the role of the schools in the recovery of a community applied in much the same way to the recovery process after more recent storms such as Hurricane Katrina, which struck South Florida first and then New Orleans in late August 2005.

Response Guidelines

Other types of disasters require their own unique responses. For example, earthquakes and tornadoes provide very little predictability. Victims may be traumatized by massive destruction, during which what had seemed like a safe and stable environment a few minutes before is turned into chaos. Flash floods can work in the same way. While wildfires sometimes take people by surprise, they are more like hurricanes in being somewhat predictable.

Philip J. Lazarus and his colleagues have suggested that immediately following a natural disaster, a school crisis team should (a) identify children and youth who are at high risk and plan appropriate interventions, (b) provide support for teachers and other school staff, and (c) engage in postdisaster activities that facilitate healing. Recovery is frequently a long and drawn-out process. Communities are not rebuilt immediately, nor are damaged psyches quickly healed. Eugene Provenzo and Asterie Baker Provenzo (2002) noted that after Hurricane Andrew, individuals who, for whatever reason, were already stressed before the hurricane faced increased problems after the storm. Thus, people's problems were exacerbated by the disaster.

Also worth noting is the fact that caregivers in many natural disasters are also victims of the disaster. This is particularly the case in a situation such as a hurricane, which can strike a very large area. As a result, caregivers, including teachers and other school personnel, may need special help and assistance as they deal with not only the needs of their students, but their own needs as well.

In general, natural disasters and their effect on school systems and children is an underresearched subject. It is one which deserves greater attention in light of the fact that such events appear on a regular basis, and cannot be avoided, and have a tremendous effect on the functioning and effectiveness of schools and the lives of their teachers and students.

NEW ENGLAND PRIMER, THE

The New England Primer was the first textbook published in the American colonies, and the most popular elementary textbook for generations of American schoolchildren in the eighteenth and early nineteenth centuries. The book is believed to have been the work of the English printer Benjamin Harris, author of the anti-Catholic *Protestant Tutor* (1679), who left England for Boston after the accession of the Catholic monarch, James II, in 1685. In Boston, he opened a bookstore and coffeehouse, and published the first newspaper printed in the Colonies, *Publick Occurrences, Both Foreign and Domestick*, which was suppressed after a single issue of September 25, 1690.

The first notice of *The New England Primer* was in an advertisement placed by Harris in 1690. The earliest extant copy of the book, in the collection of the American Antiquarian Society, dates from 1727. The book itself is roughly eighty-pages long and measures approximately 4½ x 3 inches. It begins with an alphabet, a syllabary, and lists of easy words for children to learn. One of its most famous features is an illustrated alphabet in which each letter is accompanied by a woodcut and a brief religious verse:

- A In Adam's Fall,
 We sinned all.
- B Thy Life to mend,
 This Book attend.

The alphabet sets the Puritan tone of the entire primer, which is focused on religious instruction and informed with a Puritan emphasis on sin, obedience, and the inevitability of death.

The New England Primer is not an original work but a compendium of selections from other sources,

including the illustrated alphabet (copied from an anonymous English text published in 1667), hymns by Isaac Watts, a poem by the sixteenth-century Protestant martyr John Rogers (taken from Foxe's *Book of Martyrs*), the Westminster Catechism, and John Cotton's shorter catechism, *Spiritual Milk for Boston Babes*. The primer also contains the first known printing of the famous children's bedtime prayer that begins, "Now I lay me down to sleep. . . ." The book concludes with a lengthy dialog between Christ, Youth, and the Devil.

Eighteenth-century children were expected not only to read *The New England Primer*, but also to recite and to memorize its contents. The emphasis was on instilling Christian discipline along with the fundamentals of literacy. In the 1727 edition, the illustrated alphabet is followed by the injunction: "Now the Child being entered in his Letters and Spelling, let him learn these and such like Sentences by Heart, whereby he will be both intrusted in his Duty, and encouraged in his Learning."

NEW HARMONY

New Harmony, Indiana, was the site of two utopian communities, the second and more noteworthy one

founded by educational pioneer Robert Owen, who gathered a group of scholars to work on educational reform. New Harmony was the site of the first kindergarten, the first infants' school, the first distinctive trade school, the first school system offering the same educational advantages to both sexes, and the first self-governing or "free" school. This entry recounts its history and achievements.

The town of Harmonie (1814–1825) was founded by a group of religious Separatists led by Father Johann Georg Rapp. After the Harmonists returned to Pennsylvania, Welsh-born industrialist and social reformer Robert Owen purchased the town and surrounding land that would become New Harmony for his communitarian experiment. In 1826, a group of scientists, educators, and artists arrived aboard the keelboat *Philanthropist*, which was dubbed the "Boatload of Knowledge."

Owen's philanthropic idealism provided an opportunity for a number of educational reformers to start work of considerable importance. The group included William Maclure, the first American geologist. An advocate of the Pestalozzian system of education, Maclure believed in reform by education alone, whereas Owen believed in the reform of the entire environment. Maclure was placed solely in charge of education. It was the most ambitious educational experiment that had yet been attempted in the United States.

Others who arrived in the Boatload of Knowledge were geologist Thomas Say, geologist Gerard Troost, French naturalist Charles Alexander Lesueur, and artist and engraver John Chappelsmith. Frances (Fanny) Wright, the abolitionist and women's rights advocate, also spent time at New Harmony. Among Maclure's educationists were Marie Duclos Fretageot and Joseph Neef, who had been associated with Johann Pestalozzi's school in Switzerland. In 1808, Neef published *Sketch of a Plan and Method of Education*, the first book on pedagogy written in the United States. New Harmony not only introduced the Pestalozzian system of teaching to the United States, but also contributed directly to its eventual success by acting as a training center for teachers who popularized the system when they left the community. The Pestalozzian system emphasized that the child is guided to learn through the natural use of the senses.

Perhaps confirming Owen's belief in systemic reform, the community gradually disintegrated due to factional divisions, while the educational experiment soared. Many of the scientists and other intellectuals, however, remained in residence, and Owen's sons enhanced the family legacy. Robert Dale Owen became the most notable advocate in the country of free, equal, and universal schools and the legislative father of the Indiana free-school system, which was eventually adopted throughout the Midwest. In 1839, David Dale Owen established the headquarters of the U.S. Geological Survey at New Harmony, where it remained until the Smithsonian Institution was completed in 1846. New Harmony was also responsible, through the example and industry of its Working Men's Institute and Library (established in 1838), for the growth of 144 public libraries in Indiana. As a result, Maclure could be considered the first founder of free libraries in the United States.

NO CHILD LEFT BEHIND ACT

The No Child Left Behind Act of 2001 (NCLB) is the most significant and controversial change in federal education policy since the federal government assumed a major role in education in the 1960s. It expands the federal role in education, requires states to develop and implement a test-based accountability system based on criteria established by the federal government, and specifies a timeline for when students must demonstrate proficiency as measured by reading and mathematics

assessments. For those schools not meeting the state-defined proficiency criteria, the law contains funding set asides and sanctions based on theories of competition as a strategy for school reform. To meet these requirements, it promises large increases in federal aid.

NCLB reauthorized the Elementary and Secondary Education Act (ESEA). Since its inception in 1965, Title I of the ESEA has embodied the federal government's commitment to providing compensatory educational services for economically disadvantaged schools and districts and has served as the primary vehicle for improving educational opportunities for low-income students. NCLB continues this commitment and intends to close "the achievement gaps between high- and low-performing children, especially the achievement gap between minority and nonminority students, and between disadvantaged children and their more advantaged peers" (NCLB, 2002, Sec. 1001 [3]). In this regard, NCLB differs from previous reauthorizations of ESEA by requiring all schools and districts to implement a single statewide accountability system that requires equal educational outcomes. This entry looks at the law's accountability requirements and the relationship between the state and federal governments that it requires.

Accountability Requirements

The adequate yearly progress (AYP) requirements are the primary mechanism in NCLB for bringing all students to proficiency and for closing the achievement gap. AYP is used to determine school, district, and state progress toward increasing academic achievement. States are required to determine a definition of AYP that is based on test scores on reading and mathematics assessments and includes graduation rates for high schools and an additional indicator, such as attendance, for elementary and middle schools.

NCLB requires that all schools and all students meet an absolute level of performance on reading and mathematics assessments and reach the same academic standards by the 2013–2014 school year. To meet that requirement, states must establish a starting point and "annual measurable objectives," or AMOs, that indicate the minimum percentage of students that

must demonstrate proficiency on state assessments. The AMOs increase in a stair-step progression over the twelve-year timeline until the states reach the 100 percent proficiency mark.

The NCLB proficiency requirements are applied to all subgroups of students. The law defines "subgroups" as economically disadvantaged students, students from major racial and ethnic groups, students with disabilities, and students with limited English proficiency. In addition, NCLB requires that 95 percent of students, and 95 percent of students in each subgroup within a school, take the state assessments. A school or district can fail to make adequate yearly progress if a single subgroup of students does not meet the proficiency targets or the participation requirements. A school or district is identified for improvement if it does not make AYP for two consecutive years. Schools designated as needing improvement are subject to sanctions based on the number of years during which they have needed improvement. While the law's requirements apply to all schools, only Title I schools are subject to the law's sanctions for not making AYP.

These AYP requirements are more stringent than those of its predecessor, the Improving America's School Act of 1994 (IASA). Under IASA, states used a compensatory model of accountability, in which high scores in one subject area compensated for low scores in another subject. The performance of one subgroup of students did not cause an entire school to fail to make AYP, nor was there a timeline for ensuring that all students met the proficiency targets. In contrast, NCLB uses a conjunctive accountability model, which requires each subgroup of students to meet the same minimum proficiency levels, regardless of previous performance. It also imposes a timeline for all students to reach 100 percent proficiency. Because of the multiple ways that a school can fail to make AYP, there is the risk of overidentification of some schools as needing improvement.

Research suggests that the core components of AYP—mean proficiency, subgroup rules, and participation rate requirements—pose particular challenges for diverse schools and high-poverty schools. The NCLB requirement that all schools and students meet the same mean proficiency level does not take into

account initial differences in student performance. Thus, students that start further behind have to make large gains to meet the state's proficiency targets. The subgroup rules, while they provide information on how different groups of students are performing, require students in high poverty and racially diverse schools to meet multiple performance targets. Combined with the participation rate requirements, the subgroup rules create multiple performance and participation rate targets. Since a school can be identified for improvement for failing to meet either the performance or participation targets for a single subgroup, the more diverse a school is, the more targets it must meet.

Federal-State Relationships

Education is typically viewed as a state and local responsibility, particularly in areas related to core educational functions. NCLB moved this relationship in the direction of expanding the federal role over states, while strengthening the role of states over local districts. By expanding the federal role in education, the act ensured that the federal rather than state accountability requirements defined which schools were failing and which were successful. NCLB affected governance arrangements within a state by favoring state education agencies and chief state school officers over the governor, legislature, and state and local school boards. It gave state education agencies the authority to define what counts as proficiency and to intervene in local schools and districts that do not meet the proficiency targets.

Finally, NCLB introduced the market principle that competition would create incentives for low-performing schools to improve. There was a shift in focus from the idea that schools needed greater capacity or resources to the idea that capacity was sufficient and the lack of success was due to lack of choice and competition. It advanced a model of school improvement based on external accountability and the premise that external pressure would prod schools systems to take the actions needed to improve achievement among poor and minority students. While prior reforms emphasized equalizing or building the capacity of low-performing schools

(i.e., attending to differences in teacher salaries, teacher quality, teacher-pupil ratios, per-pupil expenditures, teacher turnover, and curriculum quality and rigor), NCLB operated on the assumption that capacity was sufficient and that external pressure and sanctions, combined with more choice and competition, would improve schools.

NORMAL SCHOOLS, HISTORY OF

State normal schools were established in the middle of the nineteenth century to provide standardized and regulated teacher preparation and produce an assemblage of trained educators to meet the needs of a growing “common school” movement. Educational reformers based the ideas of the normal school on the French *école normale* and the Prussian teacher seminary. The state-supported system of teacher training that Prussia established in 1819 gained worldwide interest, including from reformers in the United States.

Key advocates of the normal schools included Horace Mann, who was appointed the first secretary of the Massachusetts Board of Education and worked to assure the success of the common schools and teacher-training institutions. William Channing Woodbridge published information about Prussian teacher education in the *American Annals of Education and Instruction* and also helped to spread the word about normal schools in the United States. In addition, Charles Brooks, a Unitarian minister and school reformer, learned about the Prussian system and thereafter promoted state-supported normal schools in Massachusetts, New Hampshire, Connecticut, New Jersey, and Pennsylvania.

The first state normal school was established in Lexington, Massachusetts, on July 3, 1839. Edmund Dwight, a leader in industry, donated \$10,000 to the state of Massachusetts for teacher training, which was matched by the legislature and used to support this school. The first principal was Cyrus Peirce, a former Unitarian minister and teacher, who was recruited from Nantucket. Two other normal schools subsequently were established in Massachusetts, in Barre in 1839 and in Bridgewater in 1840.

The first groups of normal school students, who called themselves normalites, were small in number. The school in Lexington initially was open only to women, whereas other institutions, such as the normal school in Barre, were open to both men and women. The curriculum included natural philosophy, moral philosophy, arithmetic, algebra, and teaching methods. Religion also was a component of the prospectus, as Scripture

often was recited at the start of a school day. Model schools connected with normal schools were where aspiring teachers worked with and taught children.

Normal schools initially were considered experimental in nature and their futures were uncertain. However, they expanded in number. After Massachusetts established the first state normal schools, Connecticut and New York followed suit. By 1870, eighteen out of thirty-seven states had at least one state normal school. By 1890, there were 103 state normal schools in thirty-five out of the forty-four states. Normal schools evolved into four-year teacher training colleges.

Supporters of the normal schools ultimately wished to have a more careful process of selecting teachers, greater oversight of teachers, as well as a decrease in the teacher turnover that was characteristic of the eighteenth century.

NURSING EDUCATION, HISTORY OF

Prior to the 1800s in both the United States and England, most nursing education occurred within families or religious institutions such as the Sisters of Charity. Toward the end of the nineteenth century, nursing started to be professionalized, and methods of training nurses began to evolve. This entry looks at issues of concern to nursing educators, beginning in the late 1800s, including the role of nurses in both hospitals and the community and appropriate qualifications for nursing education applicants, nursing graduates, and nursing educators.

Appropriate Qualifications

During the 1800s, as long as hospitals were primarily charity institutions that middle-class families tried not to use, nursing tended to be accomplished either by working-class women who had few choices about work or life circumstances or by the ambulatory patients themselves. As medical science improved, especially in the areas of hygiene and nutrition, hospitals became places where middle-class people would seek care or to improve the care of the poor. Just as middle-class women managed the hired help in their own homes, early nursing educators saw the vocation of nursing as one in which women could help manage the sanitation and efficiency of hospitals, as well as teach lower-class women in the community proper preventive care of their children. This was part of the Progressive reform idealism that chaos and disease could be conquered through better sanitation. Although in England, Florence Nightingale transformed the small tasks of actual caregiving into a calling instead of merely a job, she, too, insisted that only certain educated, dignified ladies of character would qualify as nursing students.

Racism affected these decisions, too. African American nursing students were not accepted in most schools run by Whites, just as African American patients were not accepted and African American physicians were not allowed to practice. Moreover, with few exceptions, Black women were denied membership in national nursing organizations. However, within the nursing schools that were developed by African Americans, educators also expressed concern about attracting and retaining higher quality students.

Through the years, especially during war time, when the need for nurses was great, nursing educators worked hard to prevent the lowering of standards by protesting the use of volunteer aides and the reduction of class requirements. Concern about educational standards was expressed by educators in the Goldmark Report of 1923, as well as by the American Nurses Association's 1965 position statement, which said that the basic education required before a student is allowed to take the registered nurse (RN) exam should be a baccalaureate degree. In spite of professional educators'

attempts to distinguish between a technical and a professional nurse, most nurses were trained in diploma (three-year, nondegree) schools through the 1970s, and by the early 2000s, associate degree nurses (ADNs) far outnumbered the bachelor's degree nurses (BSNs).

One of the earliest departments of nursing was located in the Teachers College of Columbia University. The pioneering nursing educators there insisted that educational theory and methodology are essential to teaching nursing. As recently as 2003, the National League for Nursing reiterated this view in a position statement, in the face of the serious shortage of nursing educators.

The Role of Nurses

Whites and Blacks wrestled with the problems of gender essentialism and hierarchy during the period in which women's suffrage was an important part of the reform movement. While Florence Nightingale insisted on the value of female compassion and responsibility—she said that nursing diploma schools should be separately managed from the hospital by nurses—she also insisted (because of her military experience) on the importance of discipline and submission to authority within the hierarchy. This attitude seemed to sanction the exploitation of nursing students in hospitals.

Though they were called students, women were actually unpaid employees, with second-year students supervising and teaching the first-year students, and all the women working long hours and living in carefully monitored dorms. When there was an oversupply of nurses as a consequence of the use of student labor instead of graduate labor, some hospital trustees justified their actions by saying that well-trained nurses made good household managers.

Revering of hierarchy and discipline also cemented the authority of the physicians, in spite of the knowledge of observation, interpretation, and action required of nurses when physicians are not present; early examples of highly trained nurses without the authority of physicians were the midwives, nurse anesthetists, and cardiac care nurses.

Public health nurses, both African American and White, retained much more independence than hospital

nurses, beginning with those in the Henry Street Settlement House in New York. Much of the work of these nurses involved teaching, providing preventive care, and becoming involved in social reform such as women's suffrage and unionism. However, they considered their nursing community, as well as their patients, part of their education, in contrast to the more narrow view of education held at the university.

The nursing focus on teaching and psychosocial care continues today in the form of "nursing diagnosis," as opposed to "medical diagnosis," and the opening of nurse-managed clinics, in which nurses diagnose patients' responses to illness and life situations, concentrating on disease management and life circumstances that may contribute to illness. However, some nurses prefer to try to work as colleagues with physicians, contributing to medical diagnoses and treatment.

OBSERVATION RESEARCH

Observation is a foundational tool that researchers use to collect descriptive information and to make knowledge claims about the physical and social world. As such, it has been a significant source of existing knowledge on phenomena ranging from the intricacies of cellular action to educational practices to human kinship systems. Observation is a practice grounded in “ocular centrality,” a vision-centered paradigm characteristic of Western culture and modernity that often emphasizes sight over other human senses. Disciplined, rigorous observation of events within their “natural” settings continues to contribute to areas central to social foundations of education such as human agency, diversity, equity, social stratification, social justice, and the relationship between schools and society. This entry provides an overview of observation from the perspectives of theory and practice.

Theoretical Perspectives

Although the classic image of participant observation is the anthropologist who travels to a remote village of “vanishing” people, immerses him- or herself in tribal culture for multiple years, and records copious notes of what he or she witnesses, contemporary observation varies in practice, duration, and purpose. Its use as a method of inquiry emerges from the belief that human sight and direct eyewitness accounts are valuable, if not irreplaceable, resources for building

knowledge. Direct observation and active participation in varied settings offer opportunities to witness and experience events from the perspective of insiders and pursue the question central to ethnographic fieldwork: “What’s going on here?”

Indeed, ethnographers have used participant observation as a primary data source in fieldwork since the 1920s. The broader perspective of the observer can provide a more holistic view of events and setting dynamics than the partial perspectives of individuals within the setting. It also can provide crucial data on subjects who cannot fully articulate their experiences or who feel intimidated by interviews. Also, because what people say sometimes differs dramatically from what they do, observation can enrich and clarify findings from other data sources such as interviews and documents.

Variations in theories and methods of observation make it a subject of study in its own right for methodologists interested in the art and science of conducting research. Theoretical frameworks generally shape how researchers conduct observations and thus practices have varied across historical periods and scientific discipline. For example, in the nineteenth century, reigning beliefs about the power of measurement and instrumentation meant that observation was often accompanied by measurement to confirm visual data and extend the reach of the eye. In the same time period, ethnographic studies influenced by social Darwinism often constructed indigenous and tribal peoples as simplistic and savage and Westerners as superior.

Similarly, during the seventeenth century, Robert Boyle required an “open laboratory” and a special

community of male elite witnesses to validate his experiments with the air pump. Women, even when present in the laboratory, could not serve as “witnesses” because they purportedly lacked the independent and objective status to gaze with detachment and reliability. Indeed, women were excluded from the Royal Society of London for hundreds of years until the practice became a legal matter in 1945. Such practices have led scholars to ask whether observation may sometimes reveal more about the researcher than those observed.

Contemporary researchers who draw from a tradition of ethnographic naturalism argue that an objective stance is imperative in undertaking credible observation. In this view, scientists should maintain distance from the subjects of study and strive to capture as objectively as possible the events and interactions they observe. The written products of observation (jottings, diagrams, sketches, and field notes) should reflect neutral language and be free from the personal perspective, evaluation, or judgment of the researcher. In contrast, those who draw from an interpretivist or poststructuralist framework posit that the observing eye is always positioned in a social and historical context and is never neutral, innocent, or objective. The direction in which the eye travels and the interpretation of information is always intertwined with the cultural values, personal beliefs, and theoretical interests of the individual researcher. For example, explorers and naturalists who traveled the globe in the eighteenth and nineteenth centuries often characterized both terrain and people on their travels as “potentially exploitable” resources. What they “observed” in their quest for knowledge reflected ethnocentric and racist ideas of the period and paved the way for colonialism.

Theoretical orientation and subjective perceptions may also enrich the observation process. An observer operating from a critical theory framework might note the way a classroom power hierarchy operates and students’ strategies of resistance to it. A survivor of domestic abuse studying other survivors may have heightened empathy and insight into their experiences. An architect viewing a disaster setting may recognize structural damage that eludes the gaze of a relief worker in the same setting who is focused on threatened drinking water. Because the researcher is the instrument of observation, his or her training and personal

experience can be a potential resource for developing knowledge. Theoretical perspectives influence how observers approach their fieldwork, prioritize their observations, and interpret their findings.

Typical Practice

Observers focus on concrete sensory detail, verbal and nonverbal communication, daily practices, sociohistorical context, and cultural dynamics to sculpt a portrait of “what’s going on.” Many studies use observation to gain insight into the lives of marginalized peoples and the complexity of human experience, including ethnographies of rural Iraqi women’s lives, poor and working-class youth, the devastation of Hurricane Andrew and the response of schools, street vendors’ daily lives in New York City, women living with HIV/AIDS, and Black male children’s experiences with racist educational practices.

Guidelines for the practice of observation in contemporary fieldwork also reflect principles central to social foundations of education. A primary goal that honors human diversity is the effort to capture cultural insiders’ own understanding of their experiences (emic view) rather than imposing the researchers’ framework (etic view). Contemporary observation also requires researchers to reflect on their practices, the reactive effects of their presence in the setting, and the ways in which their insider or outsider status shapes the research endeavor. This time-intensive practice requires a researcher’s advance preparation, training, and deep engagement in the setting.

Observation is grounded in a vision-centered paradigm—ocular centrality—that privileges sight over other human senses. Yet the use of observation in research is a purposeful act that requires more than the physical capacity for sight. Although the powerful filter of the human eye is central, observation is an experiential and interpretive practice that mobilizes all human senses. It involves attention to sound, timbre, and volume as children splash in a fountain or a conversation erupts into anger; it involves attention to fragrance and odor as bread bakes or wood lies rotting in the wake of a hurricane; it involves such kinetic sensory details as the texture of cloth or the warmth of a breeze; it includes elements of time and space as children rush to

class or dancers move in unison to music. Integrating these elements can animate a setting and infuse observations with depth and nuance. In addition, conflicting sensory data—a cafeteria with no smell of food or laughter that accompanies a violent act—can propel the research process by alerting observers to key elements of a setting that may merit closer scrutiny.

Researchers face a number of complex choices in the observation process that shape the data collected, the findings claimed, and the knowledge ultimately created. Before entering a research site in an unfamiliar school, for example, researchers must determine what role observation can and should play in pursuing their research questions; which classrooms, hallways, or offices to observe and for how long; and the extent to which they will participate in school events. They must negotiate access to the research site and determine whether observations will be announced or covert. Within the setting, they must decide how to position themselves and where to direct their gaze; how much distance or engagement to maintain with varied teachers, students, and administrators; how to negotiate the voluminous sensory data that accompany a standard school day; and which terms and events to record in field notes.

When translating and reducing observations to print, observers must determine what to preserve, what to discard, and how best to assess and convey information to others. As fieldwork progresses and observers become integrated into daily practices, they must learn how to negotiate their emotional investments and maintain a fresh perspective to “make the familiar strange.” In addition, researchers must consider how intrusive their presence is for insiders and how this shapes findings. Choices at all stages of the observational process have conceptual, ethical, and practical dimensions that require researcher reflexivity and adaptability in fieldwork.

Observation is limited as a method by its capacity to capture only external behaviors and events rather than internal thoughts and beliefs. In practice, however, it is usually combined with other data sources to heighten understanding of phenomena and credibility of findings. The art and science of observation continues to unfold as researchers experiment with new strategies in fieldwork, philosophers of science ask

new questions about research practices, and the meaning of “observation” fluctuates. These shifts will continue to shape knowledge and practice in social foundations. The relationship between observer and observed, the shifting meaning of identity and Other in an increasingly connected globe, the role of observation in new virtual and Web technologies, and the surveillance of student performance are among many issues that preoccupy scholars and have implications for observation research. Its anthropological and sociological roots ensure that observation will continue to serve inquiry as a tool of social justice and a resource for social foundations.

ORAL HISTORY

Oral history uses audio- or video-recorded interviews to preserve firsthand memories, accounts, and interpretations of a person's life, an event, a place, a way of life, or a period. Interview recordings, typed transcripts, and

supporting materials are preserved and made available to researchers through an archive. The use of oral history as a historical methodology dates as far back as Thucydides' *History of the Peloponnesian War*. What differentiates oral history from all other historical sources is the voice that is captured on the ever-evolving recording devices that became more readily available in the last half of the twentieth century. Like all historical sources, oral history sources should be treated with skepticism and validated by other types of evidence.

As an educational methodology, oral history allows students to passively and actively engage with a range of historical voices that make history come alive for students. Passive oral history enables educators to integrate ready-made oral history sources—such as the Slave Narrative collected by the Works Progress Administration during the Great Depression and the extensive collection of interviews conducted by America's most famous oral historian, Studs Terkel—into the curriculum without having to make the extensive time commitment required of a classroom oral history project.

Active oral history empowers students to become creators of historical sources rather than passive absorbers of historical information. A typical oral history project requires students to collect, preserve, and archive either biographical/life review or thematic oral history projects. The pioneering use of oral history as an educational methodology is often associated with Foxfire (www.foxfire.org), which began in 1966 at Rabun Gap-Nacoochee High School, an Appalachian community in Georgia. This project serves as a model for educators seeking to enhance students' language and writing skills by combining oral history and folklore.

Educators may be reluctant to conduct an oral history project because of time, scheduling, and the increased accountability to standardized tests. An oral history project, however, can last as long as one day or an entire year and has been linked to national and state learning standards as well as Howard Gardner's *Multiple Intelligences* and Benjamin Bloom's *Taxonomy of Educational Objectives*. A one-day project could have students asking their interviewees one question such as, "Where were you when Pearl Harbor was

attacked, John F. Kennedy was assassinated, or September 11th occurred?" or "What was it like the first time you voted?" or "Describe your immigration experience."

Students can then compare their interviews with more traditional sources. Longer projects allow students to complete more of the oral history process that leads to more usable historical sources. The oral history process involves extensive research focused on the interview topic, the development of an initial question set with questions strategically placed to yield the best response (thus leaving controversial and emotional questions for the end of the interview), interview training (in order to avoid "yes" or "no" responses), transcription, and project archiving (which should include a transcription and recording of the interview).

The benefits of an active oral history project include building intergenerational bridges and providing a community service by collecting stories of marginalized or undocumented people, places, or historical moments. Extensive support for educators can be found online or in the growing literature on the subject as well as through collaboration with a local library or state historical society. Additional support is available through the Oral History Association and its Education Committee as well as the Consortium of Oral History Educators, whose membership is free to educators. Each of these organizations extends awards to exemplary projects at all grade levels.

In short, oral history provides students with a more authentic opportunity to connect with the past. For educators interested in reinvigorating the teaching and studying of history, an oral history project is flexible enough to be integrated into the curriculum at any grade level and across disciplines, regardless of student ability or geographical location.

ORGANIZATIONS FOR TEACHER EDUCATORS

Professional associations provide members with opportunities to exchange ideas and learn from each other through annual meetings, newsletters, Web sites, monographs, and peer-reviewed journals. They articulate standards for professional practice; acknowledge excellence through awards, grants, and fellowships; and represent the interests of members through political activities and collaboration with other organizations. Teacher educators reflect the variety and complexity of the field of education as a whole, participating in a wide array of local, state, regional, national, and international organizations and professional associations. They are influenced by, and participate in, research- and policy-oriented organizations, interdisciplinary associations, specialized disciplinary professional societies, labor unions, and honorary societies. This entry offers a quick review of the history of such organizations and their various agendas.

First Organizations

The National Education Association (NEA) established the first national organizations for teacher educators in the United States. When the NEA was formed in

1857, about a quarter of its members were affiliated with colleges, universities, and normal schools (an early term for teacher training schools derived from the French term *école normale*, or “model school”). Annual meetings provided opportunities for administrators, normal school teachers, and university professors to debate and describe the role of higher education in teacher preparation.

In 1902, the Society of College Teachers of Education (today called the Society of Professors of Education) was founded in conjunction with a meeting of the NEA’s Department of Superintendence. The initial purpose of the Society was to improve the work of the departments of education in colleges and universities by providing a forum for examining and evaluating the organization and content of courses in education. Members also examined the relationships between departments of education and other academic departments (to foster harmonious relationships) and discussed current educational theory and its relevance for the work of members.

In the 1920s and 1930s, the NEA articulated principles of tenure, due process, and academic freedom for educators at all levels. Over the years, it has also worked to improve teacher education programs through formal accreditation. In 1946, the NEA established the National Commission on Teacher Education and Professional Standards, which joined four other educational organizations in founding the National Council for Accreditation of Teacher Education in 1954.

Research and Policy

The National Council for Accreditation of Teacher Education is a nonprofit, national accrediting body whose purpose is to ensure high-quality teacher preparation programs in colleges and universities in the United States. Thirty-five national educational organizations shape its policies and practices. Although its members are educational associations rather than individuals, the National Council gives teacher educators (as well as teachers, administrators, and subject-matter specialists) a voice in the national accreditation process.

Established in 1948, the American Association of Colleges for Teacher Education is a voluntary

association of about 800 colleges and universities. Its mission is “to promote the learning of all PreK–12 students through high-quality, evidence-based preparation and continuing education for all school personnel” and to improve the quality of schools and departments of education in colleges and universities (www.aacte.org). Based in Washington, D.C., it actively represents members’ interests in the national educational policy development process. It holds an annual convention and offers well-regarded leadership development workshops for college of education administrators and faculty. It publishes a biweekly newsletter, numerous articles, books and monographs, and the *Journal of Teacher Education*.

The Council for Social Foundations in Education is a national federation of twenty professional associations and societies in educational foundations, educational studies, and educational policy studies. Its goal is “to strengthen the role of those foundations’ disciplines in the preparation of educational personnel, in the study and analysis of education, and in policy-making related to education at all levels in the United States” (www.socialfoundations.org). The Council is affiliated with the National Council for Accreditation of Teacher Education and has established *Standards for Academic and Professional Instruction in Foundations of Education, Educational Studies, and Educational Policy Studies* (1978, 1986, 1996), which “offer guidance to institutions of higher education, state education agencies, and other national educational and policymaking organizations concerning the definition, role, and significance of study in the foundations of education” (www.uic.edu/educ/csfe). The Council for Social Foundations meets twice each year in conjunction with the American Educational Research Association and American Educational Studies Association annual meetings.

The Association of Teacher Educators, founded in 1920, offers memberships to individuals. It is a member of the National Council for Accreditation and has established professional standards for teacher education and teacher educators. It offers professional development workshops, and it publishes a quarterly newsletter and the journal *Action in Teacher Education*.

Interdisciplinary Associations

Founded in 1916, the American Educational Research Association promotes educational research and its application. With 25,000 members, it is the largest international society of its kind. Members include professors of education, teacher educators, administrators, counselors, educational testing and evaluation experts, graduate students, and others. Meetings are held annually, and the association publishes a number of newsletters and prestigious peer-reviewed journals, including the *American Educational Research Journal*, *Educational Researcher*, *Educational Evaluation and Policy Analysis*, and *Review of Educational Research*. It also publishes books and handbooks on educational research.

The association has twelve divisions, including Division K, Teaching and Teacher Education, whose purpose is to support research on teaching and teacher education and foster links among teacher education researchers. It is an interdisciplinary organization; the conference program for its annual meeting demonstrates the wide array of vantage points from which practitioners, scholars, and researchers investigate educational questions. Through its standing committees, the association formulates and disseminates policy statements on complex educational issues and works to establish standards for educational research.

Established in 1968, the American Educational Studies Association is a learned society for those interested in the social foundations of education. Most members are professors who teach and study education from multiple disciplinary perspectives (e.g., philosophy, history, sociology, anthropology, comparative/international studies). The association seeks to “promote the academic study of educative processes, educational policy, and the school as a fundamental societal institution” (www3.uakron.edu/aesa). A member of the Council of Social Foundations of Education, the American Educational Studies Association actively supports diverse scholarly approaches to the study of education and promotes cross-disciplinary collaboration in educational studies. Its publications include a newsletter and a peer-reviewed journal, *Educational Studies*.

Founded in 1901, the National Society for the Study of Education is an association of educators, scholars, and policy makers dedicated to the improvement of education research, policy, and practice. The society is the oldest national educational research organization in the United States. It grew out of the National Herbart Society, which was established in 1895. The society publishes a highly regarded series of annual yearbooks that explores topics of interest to educators, administrators, and scholars.

The Society of Professors of Education is a small, interdisciplinary association for individuals engaged in teacher preparation or related activities. Its purpose is to serve the needs and interests of the education professoriat and to provide a forum for discussion of issues and challenges confronting professional educators. Its members include both theoreticians and practitioners in education. The society has established several awards to acknowledge the work of distinguished scholars and institutions. These include the Charles DeGarmo Lecture, the Mary Anne Raywid Award, and the Wisniewski Award for Teacher Education. It publishes a newsletter and two journals, *The Sophist's Bane* and *Professing Education*. Members meet and present papers at the American Educational Research Association annual meeting.

Founded in 1935, the John Dewey Society for the Study of Education and Culture strives to maintain John Dewey's commitment to the use of reflective and critical intelligence to solve crucial problems in education and culture. The society's publications include a newsletter; a peer-reviewed journal, *Education and Culture*; and the annual John Dewey Lecture monograph. It also sponsors the John Dewey

Memorial Lecture given at the Association for Supervision and Curriculum Development annual meeting. Members meet and present papers at the American Educational Research Association annual meeting.

Other Organizations

Higher education membership in unions expanded in the late twentieth century. In recent years, the NEA and the American Federation of Teachers, as well as their local and state affiliates, have provided support for collective bargaining (negotiating salaries, benefits, and working conditions) on behalf of unionized college and university faculty members and other employees.

P

PAIDEIA

The origin of the term *pedagogy* is the ancient Greek word *paideia*. The *Oxford English Dictionary* defines the word as meaning “the sum of physical and intellectual achievement to which an individual or (collectively) a society can aspire; a society’s culture.” *Paideia* in the fifth century BCE was synonymous with the term *childrearing*. In the fourth century BCE, it came to mean education as reflecting the ways of a culture.

The idea that education reflects the ways of a culture—in other words, its values and beliefs—is a concept that is fundamental to the study of the social foundations of education. Essentially, the field is concerned with how schools are connected to and part of the larger culture. In doing so, it assumes a deeply ecological argument, one that suggests that what takes place in schools is not isolated from the culture, but very much dependent upon the forces that are at work in the society. Thus, if there is racial discrimination in the culture, it is logical to assume that there will be discrimination in the content of the published curriculum in the schools, in the content of classroom instruction, and as part of the informal curriculum that is part of the educational system. Likewise, if there is gender discrimination at work in the larger society, then the unequal treatment of men and women in school settings will likewise be evident in the content of school curricula and activities.

The concept of *paideia* provides an important organizing point for asking key questions about education. For example: What is the nature of privilege in schools and other educational settings? Who is privileged? Why? How is privilege perpetuated? What is the relationship of privilege to larger constructions of power and authority in the culture?

The term *paideia* is significantly different in its meaning from the Latin term *educere*, the root of the modern term *education*. The Latin verb *educere* literally means to “to lead out from” or “to lead forth” (*ex* + *ducere*). This word suggests the idea of children who are taught, or who have ideas drawn out from them through the instruction provided by a tutor.

Paideia, as a term, has probably not been used more because of its associations with the more archaic term of *pedagogy*, as well as the fact that its use points to the social and cultural aspects of schooling, a topic which may often be avoided for political purposes.

PARENT RIGHTS

The rights of one party confer duties on others. If parents have educational rights, then the state has a duty not to interfere with the exercise of these rights, for example, by requiring one sort of education or forbidding another. The existence of parental rights is widely accepted. The extent of those rights, however, is controversial. At what point does the state's educational responsibility supersede parents' rights? The extent of a right depends on how it is justified—on the reason given for someone possessing it. This entry explores reasons commonly given for parents' educational rights and reviews arguments for state restrictions on them.

Justification of Parental Rights

Rights protect people's interests (property rights), their ability to fulfill duties (rights of conscience), and societal interests (freedom of the press). Parents clearly have an interest in children's upbringing. Loving others means wanting them to flourish. But does parents' deep interest in their children's well-being justify parental control over not only the quality but also the kind of education the children receive? Does it justify protection of homeschooling or religious education if the child would flourish in public school? One reason it might is people's interest in living what they see as the good life. Often parents can't do this unless children live it as well. This may serve the child's interests, too. Children benefit from strong attachment to their parents, which is enhanced if they share the same way of life.

These arguments are all derived from parents' interests, and hence might be undercut by a different social arrangement. In a kibbutz-based society, for example, parents would not be as close to their children; other people would share their interest in the children's well-being, and parental rights would thus be diluted. The interest-based rationale cannot be invoked to defend the nuclear family because it depends on its existence. To avoid this difficulty, parents' rights advocates turn to a duty-based rationale. The duty to promote children's well-being confers educational rights. On what grounds, though, can one

assert this duty? Biblical arguments are unavailing: in a plural society the devout cannot expect their fellow citizens to share their beliefs.

The nineteenth-century English economist Henry Sidgwick proposed a secular explanation based on the helpless state in which children are born. Being the cause of children's existence, parents are the cause of their helplessness and hence bear responsibility for providing a remedy. This argument is not undercut by generous social services, nor is it vulnerable to a critique of the nuclear family. Parents bear the same responsibility whether the state assists them or not and would do so even if the nuclear family were obliterated.

State Responsibility

State responsibility for education arises from children's rights, a societal interest in citizenship, and considerations of equity. All three concerns can be interpreted narrowly or expansively; which view is adopted will determine the extent to which parental rights may legitimately be curtailed.

Most would agree that the state should protect children against abuse and neglect. To that end, the state may regulate private schools and set minimum standards for homeschooled students. Some children's rights advocates, however, argue that children also have a right to an open future and should choose their own way of life and belief system without family interference. Thus parents may be required to expose children to a variety of beliefs and ways of life. This view has been criticized as biased toward secular liberalism. Critics also question whether one can meaningfully choose a belief system or way of life without first being immersed in it.

The state's responsibility for citizenship preparation is interpreted in similar ways. At a minimum, children should be taught respect for law and the skills needed to understand political issues. A more expansive view holds that they should interact with others from different backgrounds, learn to respect their views, and seek common ground in presenting their own. Advocates of this view generally favor restrictions on homeschooling and religious schools, which are unlikely to meet these requirements. Critics point out that most public schools fall short as well. Furthermore, even if this type of education

is desirable, critics contend that it is not essential to democratic self-government, and hence does not provide justification for restriction of parental authority.

Advocates of state intervention also contend that parents' educational choices should be restricted to promote equality of educational opportunity. The plausibility of this argument depends on which view of equal opportunity one holds. What John Rawls calls "formal equality" means that opportunities are open to talent—no one is excluded, for example, because of race or gender. Rawls's term "fair equality" means that everyone has the same chance of success. The equity argument draws on fair, not formal equality of opportunity. If one holds the latter view, the claim that equity requires restriction of parents' educational rights is not persuasive.

The issue of parental rights involves two questions: (1) whether parental rights deserve protection under current social institutions; (2) whether and how parents' rights morally constrain efforts to change current institutions. An interest-based account of rights addresses the first question; a duty-based account is required to answer the second. Answers to both depend on the scope of state responsibility for children's rights, citizenship training, and educational equity. To ascertain the extent of parents' rights, a comprehensive account of the responsibilities of the state and the legitimate interests of citizens is required.

PARENT TEACHER ASSOCIATION (PTA)

The Parent Teacher Association (PTA), or the National Congress of Parents and Teachers, is a federated voluntary membership association with local, state, and national levels of organization. At the core of its mission is parental support of and involvement in public education and issues, activities, and legislation concerning the health and well-being of children and young adults. The PTA is perhaps best known for its local meetings that bring parents and teachers together to address school issues, raise money, and foster collaboration between home and school. The association's headquarters are in Chicago, and its current membership stands at approximately 7 million. This entry looks at the PTA's history, with special attention to issues of race and equity.

Early Years

Founded in 1897 by a group of elite White women in Washington, D.C., the PTA was originally called the National Congress of Mothers. A product of the Progressive era, the PTA grew out of the fervor of the women's club movement of the late nineteenth century, which was primarily responsible for its swift ascendancy as a national organization. Founders Alice McLellan Birney and Phoebe Apperson Hearst directed the early PTA into disseminating information on parent education and promoting child welfare initiatives such as sanitation laws, child labor laws, and mothers' pensions.

The organization turned to public education in the early twentieth century by promoting kindergartens and providing hot lunches in schools beginning in 1912. By 1924, membership had grown to 700,000 from the original 2,000 in 1897. The PTA network grew rapidly in the early years of the twentieth century as local units were organized around the country and as women's and mothers' clubs joined the association. The organization over these years made a commitment to public education as it focused on building and improving schools, implemented health initiatives, and promoted the functional school curriculum.

In 1929, the PTA revised its program to support the Committee on the Reorganization of Secondary

Education's seven Cardinal Principles of Education: health, command of fundamental processes, vocation, worthy use of leisure time, worthy home membership, citizenship, and ethical character.

The leaders of the PTA maintained they would not draw the color line, though membership of African Americans was negligible during the organization's first three decades. Despite the policy on nondiscrimination, Black teachers and clubwomen did not join the PTA, but instead began a parallel movement to organize parent-teacher and school improvement associations. Through the 1910s, Black units continued to be organized locally, but without any national oversight until 1926, when club leader and community activist Selena Sloan Butler organized the National Congress of Colored Parents and Teachers, the segregated counterpart to the PTA.

A Black PTA

At the organizational meeting in Atlanta, Georgia, four states joined the "Colored Congress": Georgia, Delaware, Alabama, and Florida. With the guidance of a representative of the White PTA, the Black PTA was thus organized as an entirely separate federated organization that would serve only those states with *de jure* segregation. By 1930, however, membership in the Colored Congress was extended to those states also practicing *de facto* desegregation. At this time, membership in the White PTA stood at 1.5 million members, while the Black PTA had about 14,000 members. Overall, the Black PTA maintained a larger proportion of men and professional educators in its membership than the PTA.

Through the middle decades of the twentieth century, the Black and White PTAs grew in membership and public visibility. The Black PTA had fully developed its federated structure and had incorporated district councils to organize local units under the state umbrellas by the 1950s. The work carried out by White and Black PTAs was wide-ranging, but connected to children and youth education and advocacy. While continuing its work on the local levels in local school districts, the state and national levels of the organization held leadership institutes for PTA workers, focused on health and safety initiatives, and promoted drug and alcohol danger awareness.

The Black PTA units supplemented this work by supporting Black history in the schools and working to secure voting privileges for adult members. Also, because of the meager funds segregated schools received, the Black PTA emphasized fundraising for local schools from the 1930s through the 1960s.

The *Brown v. Board of Education of Topeka* decision in 1954 that called for school desegregation presented a challenge to the national PTA. At this time the membership of the White association was 8.8 million and the Black association was 160,000. Immediately following the Supreme Court's decision, the (White) national PTA put forth a pronouncement of its own supporting integration. This provoked a strong reaction in the South, as White and Black state and local units debated and discussed the challenges in desegregating schools and hence the PTA.

White and Black PTA units in border states to the South, such as Kentucky, Delaware, and Maryland, desegregated almost immediately after *Brown*. In the Deep South, desegregation proceeded at a much slower pace. In the mid-1960s, the White PTA put pressure on those remaining states to integrate. Nonetheless, whether desegregation—or "unification," as it was called by the organization—proceeded smoothly or not, the Black PTA faced significant losses as members and officers failed to find a place for themselves in the organization. Therefore, for the first time in the 1960s, membership in the overall PTA began to decline; it dropped from its high of 12.1 million in 1963 to 9.6 million in 1970, the year the two organizations officially became one.

Today's Organization

With changes in public schooling and in the workforce with the women's movement, the national PTA changed as an organization in the 1970s. Membership continued to decline, dropping to 5 million in the 1980s, largely due to the growth of parent-teacher organizations and homeschool associations that did not pay dues to the PTA. In recent years, the PTA has regained some of its membership, as local groups continue to conduct projects and fundraisers to support school programs and the national PTA provides leadership and materials to locals and is involved in

lobbying for legislation to improve education and child welfare.

PARK SCHOOLS

The influence of the ideas of progressive educator John Dewey (1859–1952) resulted in the development not only of the Laboratory School at the University of Chicago, but also of a series of private or independent schools, many of which are still in operation today. Among the most interesting is the Park School of Buffalo, New York.

In 1911, having learned about Dewey's educational ideas, Nina Bull, a socially prominent Buffalonian, went to New York City to try to convince Dewey to help establish a school based on his ideas in Buffalo, New York. Dewey suggested that Bull meet with Mary Hammett Lewis, a teacher at the Horace Mann School, which was affiliated with Teachers College, Columbia University. Lewis had come to New York from Cleveland to work at the school, where she had begun such innovations as having herself and her students sit on a large, "friendly" rug, in an effort to get away from

the rigidity of chairs and desks. The rug became a "magic carpet" for adventures with her pupils.

Lewis also conducted classes on the roof, where she set up a large canvas tent, far away from the distractions of other teachers and grown-ups. Lewis's experiments with open-air education were by no means unique: Open-air education had been introduced from Europe several years before in an attempt to help children with respiratory ailments, in particular tuberculosis. The outdoor classes were extremely successful. She continued to try to develop an approach to teaching that was highly personalized and emphasized the interests of the children.

Lewis met with the group from Buffalo, headed by Bull and Maulyby Kinball, in the spring. Lewis agreed to go to Buffalo and open a school in the fall of 1912, which had an enrollment of twenty-seven pupils. The school emphasized not only educational models based on Dewey's work, but also the idea of open-air education. Advocates of open-air education were reacting to the stuffy and unhealthy conditions found in many schools. Lewis's efforts, however, went considerably beyond the philosophy of the open-air movement. She embraced in her work a unique combination of Dewey's emphasis upon the child learning things that were meaningful to his or her own life and her own idea of the child as a discoverer and a shaper of things and ideas.

Lewis set up her school in a small rented cottage on Bird Avenue. The following year, the school moved to a large colonial house on the Jewett estate at Jewett and Main streets, close to the city's main park, Delaware Park. Special porches were added to the building, which made it possible to hold classes in the open air. Early photographs of the school show children bundled in snowsuits and mittens working at their lessons outdoors in the height of winter. Five additional bungalows were built for the school which included boys through the sixth grade and girls through the eighth.

By 1919 the school had 170 pupils. It had outgrown the facility so Lewis moved first the upper school for girls and then the entire student body to suburban Snyder, a farm on Harlem Road where new buildings were built specifically designed to take advantage of the orchards and fields of the farm. The primary village was designed by Mr. Duane Lyman. Existing

buildings on the farm were continuously altered and a gymnasium was built in 1928. The school's natural environment, combined with Dewey's progressive educational curriculum, provided an ideal environment where children were excited about learning and sharing in a communal life.

Soon, other "Park" schools began to be established across the Northeast, including the Park School of Cleveland, the Park School of Baltimore, and the Shady Hill School in Boston. All but the Park School of Cleveland are still operating today, having evolved into what is popularly described as independent country day schools. Consistent with the philosophy of the first Park School, these schools consider the education of children to be the joint responsibility of parents, teachers, and students. Even though progressive education has waxed and waned, the emphasis on helping the individual child to develop into a contributing citizen has remained the goal of the "Park" schools.

PEABODY EDUCATION FUND

The Peabody Education Fund was the first of several philanthropic foundations established by Northern industrialists during the late nineteenth and early twentieth centuries that focused on education in the Southern United States. George Peabody, a New England merchant and banker, established the fund in 1867 to support the growth of common schools

throughout the South. Capitalized by bonds worth more than \$1 million, the monies were to be distributed without restriction to those in need.

The fund initially supported state-controlled public education, granted scholarships to students who were preparing to be teachers, and promoted the Hampton-Tuskegee model of industrial education for Blacks. By 1871, the fund had established a racially based system of assistance to public schools. The fund's allocation to schools for African Americans was two thirds the amount of aid dispersed to schools for Whites.

Led by its first general agent, Barnas Sears, the fund concentrated on increasing the number of "normal schools." Perhaps the most notable institution founded under this initiative was the Central Normal College of the South, later renamed Peabody Normal College, in Nashville, Tennessee, in 1875. In 1911, the fund's remaining activities were incorporated into the Rockefeller philanthropy general education board.

PEACE EDUCATION

The objective of peace education is to generate interdisciplinary efforts to develop strategies and programs aimed at reorienting the human race to the nonviolent resolution of conflict. As the new millennium begins, the specter of violence is commonplace, from the World Trade Center to the campus of Columbine High School, from bullying in the corridors of our schools to domestic violence at home. This entry provides a brief description of peace education, looks at its underlying theories, and offers a discussion of its marginalized status in the contemporary curriculum.

Some Basics

Peace education is grounded in two major assumptions: (1) conflict is inevitable and can often be fruitful and (2) people can be taught to resolve conflict without resorting to violence. Peace education includes strategies for resolving conflicts at various levels, ranging from individuals, to social groups, and even global conflicts.

The strategic dimension of peace education can be divided into three components. The first is *peace keeping*, which emphasizes tactics of conflict resolution to be utilized in conflict situations where violence has already happened or appears inevitable. The second is *peace making*, which emphasizes prophylactic approaches such as cooperative learning and cooperative discipline, violence prevention, multicultural education, and global education. The third is *peace building*, which explores policy alternatives designed to ameliorate structural violence grounded in social injustice. Galtung's theory of "structural violence" draws a distinction between direct and indirect violence, defining the latter as institutional arrangements structured to reduce the potential realized by victims of discrimination.

Peace education draws from interdisciplinary perspectives in subareas including conflict resolution, multicultural education, and global education. Conflict resolution ranges from interpersonal skills to mediation, arbitration, and negotiation. Multicultural education focuses upon the dialectical relationship between assimilation and cultural pluralism. Now, at the beginning of the twenty-first century, a wave of immigration into the United States is projected to transform the currently dominant status of European Americans into the minority. The United States is witnessing an era of unprecedented racial diversity. These developments will require youth to master cultural competencies and to resolve racial prejudice. Multicultural education and its various permutations, such as "antiracist education" and "Whiteness studies" will contribute to the resolution of these contradictions. The dominance of transnational corporations and the global marketplace will also result in irreversible structural economic changes that will require a mastery of global education.

Theoretical Issues and Controversies

Negative Versus Positive Peace

The most simplistic definition of peace, called "negative peace," is the absence of violence. During the twentieth century the specter of nuclear annihilation appeared to be the most pressing issue to threaten world peace. The doctrine of "mutually assured destruction" (MAD) was put forth as a viable policy alternative and "negative peace" was the priority for many peace educators.

However, the construct of "positive peace," grounded in recognition of the dialectical relationship between peace and justice, has recently gained ideological hegemony. This transformation is evident in the history of peace organizations, which began with the founding of the Peace Studies Association (PSA) in the 1980s, followed by the formation of the Consortium of Peace Research, Education, and Development (COPRED). The recent merger of PSA and COPRED into the Peace and Justice Studies Association (PJSA) is a symbolic manifestation of the ideological hegemony of "positive peace," since the new title demonstrates the predominance of the issue of social justice as a factor of peace.

Violence and Nonviolence

Theories related to violence itself have been embroiled in a "nature/nurture" controversy grounded in sociobiology and neo-Freudianism versus an emphasis on culture. For example, the Centers for Disease Control (CDC) drew upon sociobiology to develop the construct of the "superpredators" as a description of sectors of inner-city youth. In contrast, William Julius Wilson, an authority on urban poverty and race relations, argued against concepts of "ghetto-specific" behavior in favor of a conception of "ghetto-related" behavior originating from the structural economic changes associated with the "deindustrialization of America." On the issue of the origins of war, anthropologist Margaret Mead countered Konrad Lorenz's sociobiological construct of the "aggressivity instinct" with her explication of war as a cultural phenomenon based upon her survey of cultures that were free of war.

Similarly, theories related to nonviolence have been restricted by the ideological hegemony of

religious and personal pacifists in peace education who tend to restrict the discourse to pacifism as a universal moral imperative. Programs that emphasize “alternatives to violence” or “violence prevention” but fail to exclude contingencies of self-defense often receive minimal attention. For example, Deborah Prothrow-Stith’s violence prevention program has captured the imagination of many community activists working with adolescent African American youth, but it has been virtually excluded from the mainstream of peace education discourse.

Gene Sharp’s historical research on “nonviolent direct action” as an intermediate strategy between personal and religious pacifism and armed self-defense is similarly useful. His taxonomy of tactics, ranging from labor strikes, territorial invasion, land seizure, noncooperation against government bureaucracies, to national defense, are illustrated in case studies of actions against regimes as extreme as those of Hitler, Stalin, and numerous Latin American dictators. Also, Sharp’s 1972 *The Politics of Nonviolent Action*, a historical analysis of Gandhi, noted that the grounding of Gandhi’s constructs such as *satyagraha* emphasize action and confrontation. Sharp also pointed out that the components of action and confrontation, central to *satyagraha*, have been a point of contention for personal and religious pacifists.

The point of contention is particularly obvious in the dominant historical accounts of the civil rights movement in which “personal and religious pacifists” often speak from a position of middle-class privilege. Activists’ interpretations of nonviolent direct action and their portrayals of Martin Luther King, Jr., for example, tend to be grounded in a conception of pacifism as a universal moral imperative.

The working-class perspective was introduced by Lance Hill, in his groundbreaking 2004 history of the Deacons for Defense. The Deacons for Defense was an organization whose membership was primarily recruited from the ranks of working-class African American combat veterans, who subscribed to a combination of tactics including armed self-defense as well as nonviolent direct action. Hill noted that Dr. King accepted security from the Deacons for Defense (who were armed) on condition of confidentiality and that both the Student Nonviolent

Coordinating Committee (SNCC) and the Freedom Riders accepted the assistance of the Deacons for Defense once they realized that government authorities would not provide them with protection from the Ku Klux Klan and other vigilantes. Furthermore, Devon Carbado and Donald Weise have documented that Dr. King himself was armed, as Bayard Rustin objected to Dr. King keeping guns in his house for protection.

Global Education

Global education is most heavily influenced by theories of “spheres of influence” from political science along with Marxist-Leninist theory, and Johan Galtung’s alternative theory of “structural imperialism.” Vladimir Lenin’s theory of imperialism, Nkrumah’s neocolonialism, and Walter Rodney’s views on underdevelopment are marginalized in the United States, because of their grounding in Marxist theory.

Imperialism and neocolonialism are seen as successive stages of advanced monopoly capitalism, in which finance capital is exported for purposes of economic exploitation. Imperialism is perceived as relying more upon war, while neocolonialism is more dependent upon organizations such as the World Bank and World Trade Organization as mechanisms of economic manipulation by transnational corporations. Rodney views underdevelopment as a consequence of imperialist and neocolonial exploitation.

The opposing view is that the exploitation of underdeveloped nations and human rights violations have transcended the boundaries between capitalist and socialist societies. Galtung’s formulation of structural imperialism provides an alternative to the theories of Lenin, Nkrumah, and Rodney.

Feminist Perspectives

In her classic work on feminist perspectives in peace education, Brigit Brock-Utne celebrates the fact that “the gender neutrality of most social science, including peace research” has been broken. One of the major debates among feminist peace researchers has been around the position taken by Elizabeth Cady Stanton, Betty Friedan, and more recently Betty Reardon that sexism has been such a source of support for the male-dominated “war machine” that an increased number of

women in positions of world leadership would be sufficient to decrease the probability of war and even that women warriors would be more humane. However, other feminist peace researchers, including Jean Bethke Elshtain and Berenice Carroll, have dismissed this position as naive and simplistic.

Analysis

Ian Harris provided a historical assessment of the progress of peace education in the United States in which he concludes with the sobering observation that “peace education remains peripheral to mainstream educational endeavors.” Harris attributes the failures of peace education to the difficulties inherent in developing a research paradigm capable of demonstrating the efficacy of peace education programs. There are other views.

Betty Reardon and Manning Marable put greater emphasis on Eurocentricity as an explanation of the marginalized status of peace education. Reardon and Marable agree that the dominance of Eurocentricity in peace education leads to the exclusion and distortion of African American perspectives, and this restricted focus undermines the status and viability of peace education. Marable explicitly pointed out that many White peace advocates may be ill informed about ways in which Blacks have influenced and contributed to White movements. He further has noted that social movements in the United States that have failed to include African Americans in their leadership have consistently failed.

According to scholars, including Noam Chomsky, James Loewen, and John Marciano, the virtual absence from U.S. public schools of any critical assessment of our government’s accountability in issues such as social justice, war, genocide of Native Americans, and worldwide violations of human rights has led to a ubiquitous form of “civic illiteracy.” The history, music, and literature of movements, organizations, and individuals committed to peace and social justice is also consistently omitted from our curriculum. Cultural norms based upon “rugged individualism,” zero-sum relationships, and unbridled competition are dominant in U.S. society and reinforced by popular culture and athletic programs. In teacher education programs, peace

education is excluded in favor of instruction in “classroom management” and behavior modification.

A survey of program evaluations in peace education by Tricia S. Jones and Daniel Kmitta indicates that researchers must increase the rigor of their research design and emphasize outcome variables if they hope to demonstrate efficacy. The survey also indicates that long-term training has far greater efficacy than the short-term workshops dominant in the field of peace education.

Although women have achieved a significant presence in the leadership of peace organizations and feminist perspectives are well represented in the knowledge base of peace research, efforts must be made to achieve commensurate progress for African Americans and other racial minorities. If peace education could be infused throughout the U.S. curriculum, this might abate civic illiteracy and the culture of violence. Both direct and indirect violence appears to be the challenges of the new millennium, suggesting the important potential contributions of peace education in the struggle for peace and social justice.

PENMANSHIP

The idea of literacy, even through the eighteenth century, was limited to the ability to read. People who could read the Bible, basic civil documents, and the paperwork associated with earning a living were thought literate. Learning to read was accomplished in primary schools through teaching methods that centered on phonics. Most of the persons meeting this definition of literacy did, however, learn to write their name in order to sign contracts or deeds. Writing became part of the public school curriculum in the early nineteenth century. Model scripts were displayed in classrooms as part of penmanship instruction that continued into the mid-part of the twentieth century. Instruction in penmanship became less important in the latter half of the twentieth century as the typewriter and, then, computer word processing were thought to make good penmanship less important.

Writing was a skill believed to be beyond the ability of the young child, since the ornate scripts of the times required a level of hand-to-eye coordination and small muscle development not yet attained by those under eight or nine years of age. Writing schools were organized for boys in the colonial period who had learned to read in primary school and who had an interest in attending grammar schools in preparation for admittance into colleges and the professions.

There were professional penmanship instructors in the nineteenth century who had mastered the various competing scripts and taught the “art” of penmanship and whose services could be obtained for embellishing documents. Often, these professionals became itinerant teachers who conducted evening classes that included such niceties as letter writing and composing invitations.

As civil and economic life expanded, the need for practical writing led to the development of less ornate scripts that could be taught to children in the upper primary grades. One of the cornerstones in the development of public schools in the United States was the concept that a common education involved both reading and writing and that these elements should be taught to both boys and girls. This was in keeping with the expanded definition of literacy to include writing.

The new emphasis on writing a legible, if not beautiful, hand was in place by the 1840s. A nation of commerce would require clerks, stenographers, and businesspeople who had mastered penmanship. This led to the creation of new scripts that would increase speed and legibility at the cost of flourish. Business colleges sprang up and penmanship became a curriculum staple. Decorative scripts would become the basis of calligraphy.

Developers of model scripts that were popularly adopted by the common schools included Platt Rogers Spencer in the mid-part of the nineteenth century and Austin M. Palmer in the first half of the twentieth century. The model scripts they produced could be found displayed across the front wall of classrooms everywhere.

Pencils were used in the early grades so that the simple manuscript printing of words and numbers could be taught. For the younger children, these pencils were larger than standard and the paper used was ruled so that the students could begin to develop the habit of allowing certain letters to be printed within one vertical space, two, or three. Cursive writing, as a school subject, was usually introduced in the fourth grade.

The introduction of the ballpoint pen in the 1950s and the introduction of the typewriter followed by the computer caused a diminishing expectation as to the importance of penmanship much beyond personal utility and led to its gradual demise as a principal school

subject. Penmanship is still taught in schools, but it receives less emphasis and the time once spent on it has been divided among the other school subjects.

PERFORMANCE THEORY

Performance is a manifestation of knowledge through and on bodies situated in culture. All performance theory assumes everyday and aesthetic (e.g., “on stage,” etc.) performances are necessarily interdependent and therefore ought to be subject to similar scrutiny. In order to understand performance theories in education, one first needs a functional understanding of performance studies. Craig Gingrich-Philbrook, in his 1998 article “Disciplinary Violation as Gender Violation,” offers a definition useful to teachers and scholars of education when he states that “performance studies occurs at a point of speculation about the scale and durability of knowledge brought to consciousness before a particular audience, the aesthetics of this production, and its relationship to similar events for other audiences.”

Three distinct modes of research characterize performance theories in education: everyday and aesthetic performance events as sites of research; performance as a method of inquiry; “performance” as an explanatory metaphor. Performance theory in education might therefore include studies of representations of education already existing in any genre or medium, new performances specifically intended to create knowledge about education, or studies that assume some aspect of education is “like a performance.” These three modes of research are often engaged in useful combinations.

Performance theory in education is linked through its history in the academy to the study of culture in disciplines including (but not limited to) anthropology, communication, theater, and sociology. Some significant research topics have included performance of identities (such as race, class, gender, sexuality, and ability), performance and methodology (such as performative writing and performance ethnography), and performance politics (e.g., teaching is/as performance). Performance theory in education is somewhat similar to arts-based inquiry, but these research paradigms are fairly distinct with little evidence of collaboration among practitioners.

PHELPS STOKES FUND

The Phelps Stokes Fund was founded through a bequest in 1911 from Caroline Phelps Stokes. Her son, Anson Phelps Stokes II (1874–1958), guided the foundation during its early years. It is the oldest continuously operating foundation serving the needs of African Americans. The fund has also addressed the needs of Native Americans, Africans, and the rural and urban poor. Among the organizations that can trace their origins to the fund are the African Student Aid Fund, the American Indian College Fund, the Archbishop Tutu Southern African Scholarship Fund, the Association of Black American Ambassadors, the Booker Washington Institute of Liberia, the Boys Choir of Harlem, the

Cooperative College Development Fund, the Caribbean Cultural Association, the Jackie Robinson Foundation, the Native American Science Association, the South African Institute of Race Relations, and the United Negro College Fund.

The fund has been actively involved in development efforts in Liberia since the 1920s, including the funding of the Booker T. Washington Institute, a major Liberian center for technical education and training. Also during the 1920s, the fund ran a competition for the development of model tenement housing designs in New York City. In the 1930s and 1940s, it sponsored attempts to create the first “Negro” encyclopedia—a project that was under the direction of W. E. B. Du Bois.

During the first half of the twentieth century, the fund sent American educators to Africa to observe conditions firsthand, provide assistance, and help Americans better understand the origins of African Americans. Jackson Davis, for example, who was a field agent for the General Education Board, was sent by the fund to Africa in 1944. His travels eventually led to the publication of the book *Africa Advancing*. He later became the head of the Booker T. Washington Institute in Liberia. Davis was convinced that Africans had great potential for advancing socially and economically, provided they had access to the necessary education. Without the help of the fund, he almost certainly would not have gone to Africa.

The fund’s motto, “Education for Human Development,” has been realized through its efforts at conflict resolution, as an intellectual think tank, as an operating fund, as a service provider, as an advisor to other organizations, and as an advocate for marginalized groups.

PHILANTHROPY, EDUCATIONAL

Since America’s earliest years, charitable institutions have served a diverse set of philanthropic purposes in the United States. While the majority of these institutions were historically tied to religious organizations, today there are many different types of private philanthropic bodies that serve a multitude of needs across many issue areas. While philanthropic participation in numerous matters has grown in all categories, the increasing existence of educational philanthropy in America provides perhaps one of the clearest illustrations of the ways in which private philanthropists can support and shape U.S. institutions. This entry begins with a brief history of general philanthropy, then looks at education-oriented philanthropy, its contributions, and some critiques.

A Brief History

America saw the first significant presence of private charitable institutions after the American Revolution, when numerous private foundations were created to serve a range of purposes in the construction of our country. While these foundations continued throughout the nineteenth century, American philanthropy as we know it today wasn’t fully realized until the first contemporary philanthropists, such as John D. Rockefeller, Henry Ford, and Andrew Carnegie, created private foundations to house their fortunes. During America’s industrialization, the presence of private foundations continued to grow in proportion to the accumulation of private wealth across the country.

Economically prosperous periods like these, and again much later in the 1980s, are largely responsible for the growth and maintenance of the large, private

philanthropic foundations that continue to thrive today. Since these private foundations operate without many of the same restrictions that limit other American institutions, philanthropy presents interesting possibilities for involvement across endless issue areas. Philanthropic involvement in education provides an excellent example of this phenomenon.

Role in Education

Even the earliest American philanthropic institutions had connections to education, since some of the country's first schools were created by the contributions of private donors and local religious organizations. Throughout U.S. history, private charitable contributions from individuals and organizations have supported schools. Today, educational philanthropic contributions constitute less than 1 percent of the total K–12 spending. However, there are currently over 600,000 philanthropic foundations in the United States with approximately 25 percent that provide financial assistance to schools. To understand the multiple roles that philanthropists continue to play in creating, shaping, and supporting American public schools, it's important to understand the multifarious nature of their involvement.

While early educational philanthropy was primarily generated by personal contributions of time and service, the scope and influence of educational philanthropy has grown significantly. Today, there are nearly as many types of organizations as there are organizations themselves. These groups are categorized in a number of different ways. They may be think tanks, advocacy organizations, networks, researchers, data gatherers, grant makers, associations, community outreach organizations, foundations, and/or institutions. They range from small, local bodies that primarily support local causes to large, statewide and national institutions that influence broad educational reform efforts and policies.

The types of support offered by philanthropic organizations also differ based on the group's mission. While some philanthropists support education with unconditional financial contributions, an increasing number of associations have a more "hands-on" approach to educational philanthropy. In these cases,

financial support is often tied to the creation or implementation of certain educational reforms.

With all of the diversity among educational philanthropy organizations, it is clear that they provide a wide range of services to American education. Such services include, but are not limited to, researching issues and trends, supporting the efforts of other institutions and organizations, providing financial support, raising public awareness, analyzing policy, collecting and distributing donations, advising other donors, training practitioners and policy makers, offering technical assistance, and organizing grassroots and community efforts.

Notable Examples

To survey briefly the ways in which educational philanthropies have provided support, consider the following exemplars of philanthropic contributions to American public education that span our nation's history.

In colonial times, several well-known higher education institutions were created and funded by philanthropic donors. Often, these colleges were named after their benefactors, such as John Harvard, Lord Dartmouth of England, and Governor Elihu Yale. As the decades passed, larger philanthropic organizations and foundations formed that continued to support public education. Consider, for instance, the support provided by the Rosenwald Fund for thousands of schools that served African American students during the Jim Crow era.

More recently, the United States has seen a surge of larger, national private foundations with educational philanthropy at their core. One of the best known examples of contemporary educational philanthropists is the Annenberg Foundation. In 1993, Walter H. Annenberg made the nation's largest philanthropic contribution to American public schools when announcing his "Challenge to the Nation." Designed to encourage and motivate others to do the same, Annenberg's initial \$500 million personal donation inspired another \$600 million in contributions from individuals, businesses, foundations, colleges, and universities. Together, these examples convey the potential benefits and exciting possibilities evidenced by the philanthropic contributions to education like these.

Related Issues

While most would agree that private foundations focused upon educational philanthropy are predominantly beneficial to American schools, an overview of the topic would be incomplete without a brief acknowledgment of some of the issues related to philanthropic involvement in public education. Generally speaking, these are mostly matters related to accountability and sustainability. For example, there is concern over the possible intentional or unintentional influences that large private foundations may have on political matters and educational policy as a result of their research, outreach, advocacy, financial support, and so on. This concern is echoed by the philanthropic organizations' careful negotiation of the line between advocacy and lobbying, since federal law prevents tax-exempt foundations from engagement in certain political activities. Some critics believe that private educational philanthropy organizations further muddle the already-confusing question of school governance in the United States and that outside involvement in educational issues by organizations such as these further contributes to the growing belief that public schools do not have the capacity to address their own problems.

Other issues related to educational philanthropy are less political in nature and revolve instead around the actual potential of private donors to make lasting, positive improvements in education. In this case, there are many unanswered questions that are just beginning to be explored by educational research. Such questions address issues of systemic reform, sustainability, and the long-term benefits and consequences of philanthropic involvement in public education.

Finally, it is also important to acknowledge that the private funding provided by educational philanthropists yields a seemingly insignificant proportion of overall public funding of education. However, the potential for influence is not realistically portrayed by this proportion.

Overall Contribution

The United States has a long history of private donorship that can be traced back to its earliest days. While the size and nature of these contributions varies, they are united by their intention to support and enhance

democratic society. As such, many philanthropic organizations throughout American history have served education, since investing in American children may be one of the best ways to positively influence broad social change. While it is impossible to generate an exhaustive list of meaningful contributions made by countless educational philanthropists throughout our history, it is important to acknowledge the undoubtable influence of the powerful triad formed by philanthropists, practitioners, and policy makers on the American system of public education.

PHILOSOPHY OF EDUCATION

Philosophy of education is the field of study that uses philosophical methods to study education. Textbooks

and courses in philosophy of education may be organized around the branches of philosophy—for example, epistemology, ethics, political philosophy—or around centers of educational interest such as curriculum, pedagogy, or school structure. An organizational scheme that was popular fifty years ago—stressing broad philosophical schools of thought such as idealism, realism, and pragmatism—is rarely seen today. In its place, we see some works written from the perspective of critical theory, feminist philosophy, or postmodern philosophy. Philosophers of education in the United States today address questions of standards, accountability, equality, and testing as part of their analysis of school reform, but they also examine perennial issues such as the aims of education, democratic citizenship, and what constitutes the good life. Philosophy of education has a long history, and it is helpful to know something of that history before tackling contemporary work in the field.

Historical Background

Western philosophy of education begins with Socrates (469–399 BCE), whose ideas come to us through the writings of Plato. Socrates modeled the Socratic dialogue in which the teacher engages a student in a vigorous exploration of an important issue through a sequence of questions. The harms and benefits of the Socratic dialogue as a teaching method are still debated today.

Socrates also suggested a central place for self-knowledge in education—“Know thyself.” He argued that self-knowledge is essential to critical thinking, and many current writers agree with Socrates on this. But again the debate is ongoing, and some critics confuse education with self-knowledge with therapy or the mere promotion of self-esteem. Philosophers of education try to clear up such misunderstandings.

Education was a central concern for Plato (427–347 BCE) as he attempted to create an ideal state. He was particularly interested in the education of intellectually able young people who, as philosopher-kings, would become the rulers of his republic. Plato rejected the notion of hereditary rulers and recommended that youngsters be evaluated early so that the most talented could be identified and appropriately

educated for leadership. His recommendation that different forms of education be provided for children with different aptitudes (and different destinies) won the general approval of John Dewey, but Dewey criticized Plato’s prescription of just three different forms of education as too limited. Ideally, Dewey said, education should be tailored to each child’s interests. This debate continues today: Should all children have the same education? Should different courses of study be provided for children with different interests and/or talents? How should children be assigned to particular courses or tracks? How do we justify our decisions?

Aristotle (384–322 BCE), too, gave serious attention to problems of education. As one of the founders of an important approach to moral philosophy—virtue ethics—Aristotle was especially interested in the development of good character. His *Nicomachean Ethics* lays out a plan for moral education that, with minor changes, has remained influential for centuries. Indeed, many recommendations in today’s programs of character education can be traced to Aristotle.

Jean-Jacques Rousseau (1712–1778) is another great philosopher who contributed significantly to philosophy of education. In *Emile*, he described the ideal education for boys: a child-centered education that would allow boys to learn primarily from interaction with objects and the natural environment. Rousseau aimed at an education suitable for free men, men who would become autonomous citizens and responsible heads of families in adult life.

His recommendations for education are often embraced by educators for both boys and girls but, in fact, Rousseau prescribed a highly restricted education for girls. Their entire education, Rousseau said, must direct them toward pleasing and serving men. Feminist philosophers today find Rousseau’s recommendations offensive, and there is a temptation to reject them entirely. However, without the misogynist recommendations for female education, Rousseau’s ideas have been widely adapted in forms of progressive education.

Dewey admired Rousseau’s plan to encourage intellectual development by building on students’ interests. Indeed, that idea is basic to Deweyan forms of progressive education. But Dewey challenged Rousseau’s claim that children are born good. As

a thoroughgoing interactionist, Dewey believed that children are born with propensities for both good and evil and that education must play a significant role in healthy moral development.

Although space limitations prevent further discussion here, interested readers can find much relevant material on the periods between classical philosophy and Rousseau and, again, between Rousseau and the twenty-first century. Some names to check on: Thomas Aquinas, Peter Abelard, Johann Heinrich Pestalozzi, Friedrich Froebel, Johann Friedrich Herbart, and Maria Montessori.

Approaches to Philosophy

Changes in philosophy of education are influenced by changes in philosophy as well as changes in the larger society. In the second half of the twentieth century, philosophy changed its emphasis from metaphysics (the philosophical study of the cosmos and reality) to analytic philosophy, and philosophy of education texts abandoned their earlier concentration on realism and idealism. Instead, philosophers of education undertook the careful analysis of educational concepts such as teaching, heuristics, knowledge and knowing, discovery, readiness, slogans, and indoctrination. The 1960s and 1970s were exciting years for analytic philosophers of education, and they often joined research teams, working to clarify the concepts central to various investigations. The strictest analytic philosophers followed the dictum of Ludwig Wittgenstein that philosophy properly “leaves everything as it is”; its job is simply to make everything clear.

Not everyone agreed with Wittgenstein on this. In contrast, Karl Marx had insisted that the whole point is to *change* the world, not to leave it as it is. In agreement, some philosophers of education took a Marxist approach in their writing. All philosophical work involves some analysis, but analytic philosophers confine themselves to analysis, whereas Marxist philosophers and many others take a particular perspective and often suggest an agenda for social change.

Another general approach, pragmatism (a school of thought that emphasizes the consequences of acts and concepts rather than their foundations in principles), has coexisted with analytic and Marxist philosophy.

Indeed, pragmatism was popular earlier as an alternative to the realism/idealism scheme, and it survived (as a “school”) beside analytic and Marxist philosophy. Most pragmatist work was built on the philosophy of John Dewey, but some draws as well on William James, C. S. Peirce, and C. I. Lewis. It is interesting to note that Dewey himself rarely used the term *pragmatism*, preferring *instrumentalism* or *experimentalism*. Today, many philosophers of education are heavily indebted to the pragmatic tradition, but few identify themselves specifically as pragmatists. Similarly, although most philosophers engage in analytic work, few limit themselves to clarification or even believe that it is possible to do so.

There have been changes also in the Marxist tradition. Some continue to write as neo-Marxists, but many more work in critical theory—a philosophical approach that concentrates on political, social, and economic struggles. Critical theorists sometimes draw on Marx but more often today on Antonio Gramsci, Theodor Adorno, Herbert Marcuse, Michel Foucault, and Jurgen Habermas. Critical theorists are particularly interested in the quest for human freedom and the social conditions underlying domination and oppression. In philosophy of education, Paulo Freire’s *Pedagogy of the Oppressed* has been highly influential.

Critical theory is often thought of as part of Continental philosophy, and Continental philosophy is contrasted with analytic philosophy—especially with the British tradition. Another facet of Continental philosophy is *existentialism*. Existentialism includes a collection of thinkers (sometimes in conflict with one another) interested in the nature of being, meaning and absurdity, death, anxiety, relationships, and freedom. Some existentialists—for example, Jean-Paul Sartre—are frankly atheist, and their philosophy is influenced by their atheism. In it, we find themes of loneliness, alienation, anxiety, and absurdity but also freedom and responsibility. Other existentialist philosophers, such as Martin Buber and Søren Kierkegaard, are religious existentialists, and their concentration is often on relation and response. Not surprisingly, given their interest in life’s extreme situations, existentialist philosophers draw heavily on literature, and some are known for their fiction, plays, and poetry.

In education, Maxine Greene has used the work of Sartre on freedom, and her work has had an important influence on views of freedom in education. Nel Noddings (while rejecting the label “existentialist”) has drawn heavily on the work of Buber and applied it to relations and response in education as well as to feminist ethics. Just as analysis is part of all philosophical work, existential questions have been treated throughout the history of philosophy. They appear in Plato, Immanuel Kant, Arthur Schopenhauer, Martin Heidegger, and Dewey, and they remain important today even for philosophers who do not call themselves existentialists. Educators who are alarmed by the apparent lack of meaning in today’s curriculum might profit from reading some existential philosophy.

Hermeneutics is another trend that should be mentioned in connection with Continental philosophy. Long associated with religious studies, hermeneutics—the practice of scholarly interpretation—has grown in popularity. As it has become clear that pure analytic philosophy may be an impossible dream—there is always a viewpoint or set of values from which analysis is launched—the enterprise of interpretation has become more acceptable in philosophy and philosophy of education. In current philosophy of education, we find work that interprets and reinterprets concepts found in the work of Plato, Aristotle, Rousseau, and Dewey.

Possibly the most prominent school of thought associated with Continental philosophy is postmodernism. Postmodern philosophers, like existentialists, are not all of one mind, but they all challenge what they take to be the central tenets of modern philosophy—objectivity, “grand narratives” (declarations of universality in human life), the possibility of autonomy, the legitimacy of power, and the rigidity of categories once thought to be biological, such as gender. Postmodern philosophy is not, however, merely destructive. The work of Emmanuel Levinas and Jacques Derrida, for example, is emotionally powerful in treating the uniqueness of the Other—a plea for preservation of and respect for the living Other who cannot be completely subsumed under a universal category. Educators interested in current problems of diversity should find the writings of some postmodern philosophers useful.

Feminist philosophy has also influenced philosophers of education. One of the great contributions of feminist thought is its powerful criticism of traditional philosophy and its support for the subordination of women. Feminist philosophers may identify themselves methodologically with existentialism, postmodernism, critical theory, pragmatism, or analytic philosophy. Like all philosophers, they tend to work primarily in one branch of philosophy—epistemology, political philosophy, ethics, or philosophy of science—and within that branch on problems related to education and the liberation of women. In political philosophy, for example, they make take positions as liberal, socialist, Marxist, or radical feminists. They draw their methods from a tradition, but their purpose is to correct those methods in order to achieve justice for women.

Branches of Philosophy

Epistemology (theory of knowledge) is a branch of philosophy closely associated with education. From the time of Socrates to the present day, philosophers have raised questions about the nature of knowledge, what it means to know, and how to define truth. Socrates argued that knowledge is stored in the immortal soul and is recovered and displayed through sound teaching methods; Rousseau asserted that children learn best through unfettered interaction with objects and the natural environment; Dewey argued that knowledge is built through interested experimentation, social interaction, and critical reflection. Many of today’s educators argue that all knowledge is constructed and that the mere memorization of facts is the weakest form of construction, resulting in a short-lived catalog of information subject to rapid decay.

Teachers have always been interested in the criteria by which we can judge whether or not a student *really knows* something. Those who lean toward a behaviorist view of learning make their judgment on the basis of accurate responses to specific stimuli. This approach is familiar in the widespread use of single-answer tests which can answer the question, “Has Johnny learned X?” but, as Noam Chomsky pointed out, cannot answer the more complex question, “What has Johnny learned?” Answering that question requires open relationships, observation, and intelligent

dialogue. Further, even on simple, single-response questions, students may answer correctly without being able to justify their answers.

We might insist that A should be credited with *knowing that p* (where *p* is a proposition) if and only if

A believes that *p*.

P is true.

A offers good reasons for believing that *p*.

This traditional test of knowing (justified true belief) is still widely accepted in education. Notice that this view implies that truth is a larger set than knowledge, and knowledge is that subset of truth that human beings have managed to acquire. If we accept this view, we are faced with questions about how truth is established, where it resides, and how people access it.

But there are other views. From Dewey's perspective, for example, knowledge is bigger than truth, and anything that we use in our explorations can be called "knowledge" until it shows itself to be ineffective. That which continues to contribute to successful investigation, that which resists refutation, approaches the level of *truth*.

Present-day constructivists take a similar approach. Following Jean Piaget, they claim that all knowledge is constructed. Constructivist philosophers and teachers recommend that students test out their ideas in experimentation and discussion. The test of knowledge lies in application, not in rote response.

Clearly, this basic difference in epistemological orientation suggests major differences in curriculum and pedagogy. The "justified true belief" perspective often guides a curriculum that is almost entirely specified at the outset—a body of knowledge (already confirmed by experts) to be learned by students. The Deweyan and constructivist views lead more often to a larger role for what Philip Jackson has called the "interactive" curriculum—one built cooperatively by students and teachers as they work on topics and problems of mutual interest.

Few educators take a postmodern position, one that rejects the notion of truth and asserts that all knowledge is relative to the culture in which it is pronounced. A position very like this appears in the

work of some philosophers of education who focus on multicultural education, "Whiteness" theory, and racial identity but, so far at least, the rejection of universal truth and knowledge has had little impact on the school curriculum. Whereas postmodern philosophy has led to increasing emphasis on the sociology of knowledge (as contrasted with epistemology), curricula on diversity and identity look very like traditional curricula with different topics. It should be noted, also, that philosophers of education often tackle these topics from perspectives other than the postmodern.

Epistemological topics are of special interest to philosophers interested in educational research. Hotly debated questions include: What *is* scientifically based research? Must such research be quantitative? Must it be experimental? Is pharmaceutical research a good model for educational research? Is there something ethically questionable in using randomized experiments in schools to try out various teaching methods? (Interested readers might consult the work of, for example, Gary Fenstermacher, D. C. Phillips, and Harvey Siegel.)

Philosophers of education interested in ethics usually approach the subject from one of several perspectives: the liberal tradition through Kant and Rawls; utilitarianism (e.g., John Stuart Mill); virtue ethics; or the ethics of care recently developed by feminist philosophers and psychologists. All of these views receive considerable attention in current philosophy of education.

Virtue ethics is enjoying a robust revival in the work of Martha Nussbaum and Michael Slote. In education, it serves as the theoretical framework for new programs in character education. Virtue ethics, in contrast to Kantian and utilitarian ethics, de-emphasizes moral principles and concentrates on the development of character and good motives. Caught in a moral dilemma, virtue ethicists ask, "What would a person of the best character do in this situation?" Accordingly, character educators emphasize the acquisition of virtues. In a debate echoing concerns as old as Socrates, philosophers still argue over whether and how virtues can be taught. Can they be taught, or are they somehow "caught"? What difference does this make in how we approach moral education?

Character education may be contrasted with the cognitive-developmental program based on the work of Lawrence Kohlberg. Kohlberg's approach concentrates on moral reasoning, and teachers promote more powerful reasoning through the use of moral dilemmas. According to this scheme, moral growth occurs in stages, and the highest stage requires moral thinkers to apply principles of universal justice. The Kohlbergian approach has generated much empirical research (some of it cross-cultural) and also much debate. Its Kantian/Rawlsian emphasis on principles has been challenged. In a morally problematic situation, do people ask, "What moral principle should govern my decision?" or are they more likely to follow the customs of their moral community or moral leader as virtue ethicists contend? Some recent studies suggest that relatively few people use principles to guide their moral behavior; more often they obey the customs of their group or respond directly from sympathy or care. (Kohlbergian-Kantian-Rawlsian philosophers can still argue that people *should* use moral principles.)

Another challenge to Kohlberg came from the psychologist Carol Gilligan who argued that females may develop along a different (but morally sound) path—one that emphasizes caring and response rather than justice. Interest in care ethics has grown rapidly over the last two decades, and its influence can be found not only in philosophy and psychology but also in education, nursing, law, business, religion, and global ethics. A lively debate arose in philosophy of education over the primacy of justice (a Kantian approach) or caring. The debate is not closed, but most of the contenders recognize the need for both caring and justice. One important remaining question is this: Can justice be derived from caring or are the two concepts independent? (See the work of Kenneth Strike, Nel Noddings, Ann Diller, Barbara Houston, Barbara Thayer-Bacon, and Karl Hostetler.)

Just as philosophy of science is closely related to epistemology, political/social philosophy is closely related to ethics. It treats, among other topics, liberalism, democracy, equality, oppression and liberation, and problems of identity (racial, ethnic, gender, and religious). Possibly this branch of philosophy receives more attention today from philosophers of education than any other. Some such work is directed by the

liberal tradition, and some is distinctly postmodern in its orientation. There are lively arguments over the adequacy of liberalism, the meaning of equality, democratic education, and the politics of recognition. Philosophers of education have been deeply involved in studies of multiculturalism, diversity, discrimination, domination, and identity. (See, for example, the work of Kenneth Howe, Walter Feinberg, Audrey Thompson, Eamonn Callan, and Lawrence Blum.)

Philosophical Themes in Education

Themes in education, like themes in most social enterprises, shift with changes in the social milieu, but some educational themes are perennial. They must be addressed conscientiously by every generation of citizens.

One such theme is the *aims of education*. Until quite recently, philosophers, educators, and policy makers seemed to take the discussion of educational aims seriously, and virtually every school prefaced its description of curriculum with a statement of aims. "Aims-talk" has been almost synonymous with philosophy of education. Today, fewer teacher preparation institutions require courses in philosophy of education, and policy makers seem to have settled on economic success as the aim of education—a decent income for individuals and economic success for the nation.

The history of aims-talk, however, is far richer. Philosophers have argued for broad aims in education: preparation for a good life, including personal, occupational, and public life. When we start with such broad aims, we must devote much time and effort to describing what we mean by the good life, how education is connected to occupational life, and what is meant by good citizenship. Each of these aims is necessarily colored by the times and cultures within which we live. When we talk about citizenship in the United States, for example, we are interested in how schools should prepare students for life in a liberal democracy. Because we are living in the twenty-first century, we must consider the possibility of global citizenship. What does it mean to be a global citizen, and will global citizenship enhance or reduce the status of national citizenship? Much current work in philosophy of education focuses on such questions.

Occupational life has always been a central interest in philosophy, but recommendations on preparation for occupational life have differed greatly. Some philosophers (including Plato) have recommended that children be prepared according to their talents for their probable destinies; education for artisans and workers should properly differ from that designed for the intellectually elite. Others (e.g., Mortimer Adler) have argued that all children should have exactly the same curriculum, one rich in the traditional disciplines. Still others (e.g., John Dewey) have argued that, within a common framework, actual learning objectives should be established cooperatively with each child. Differentiation should follow talents and interests.

Today, in reaction to the discriminatory practices that have arisen with tracking, many philosophers and policy makers demand an end to tracking, but only a few have examined carefully what this entails. Should all students study academic algebra and science? Why? Suppose many students fail these courses and quit school in discouragement and disgust? Should preparation for work and for college be exactly the same? What logic supports this recommendation?

There is an interesting new trend in educational thought exploring what might be meant by universal education. One meaning, of course, is simply to be sure that all children are enrolled in school. But in addition to this, in addition to basic literacy and numeracy, a defensible universal education would prepare students to work cooperatively in teams, communicate effectively, analyze and think critically, care for the natural world, establish healthy relationships and home life, continue learning, and remain flexible in the face of continuous change. What is interesting and promising about such goals is that they can be pursued within academic, vocational, or commercial courses. We can provide different courses of study, it is argued, and still work toward common goals. People in think tanks and global institutes are discussing the possibilities for this sort of universal education but, so far, only a few philosophers of education are studying it seriously.

The need for such an approach was recognized years ago by the prominent philosopher Alfred North Whitehead in his *Aims of Education* (1967). He criticized the traditional curriculum—one surprisingly like

ours today—for its almost complete lack of connection to actual life, and he insisted that connections be made in both general and specialized courses. He also heaped scorn on the practice of depending heavily on external examinations to evaluate student learning.

Decades earlier (in 1918), the U.S. Department of Education's *Cardinal Principles of Secondary Education* was published. It too recommended that school work be more closely aligned with real life. It listed as educational goals health, command of fundamental processes, worthy home membership, vocation, citizenship, worthy use of leisure, and ethical character. In breadth and tone, these aims are similar to those suggested by the new view of universal education.

Periodically, philosophers and educators have attempted to broaden the aims of education, but their efforts have met strong resistance. Why the resistance? This is in itself an important philosophical question. And will the current attempt to connect humanistic goals with economic goals overcome the resistance? Or is something deeply conservative operating here? There have always been, and still are, strong proponents of the traditional disciplinary curriculum. This academic curriculum was once thought to be appropriate only for the intellectually able students, those headed for college. Today, many argue—in the name of equality—that all students should have this curriculum. All should be prepared for college.

But in what sense do we achieve equality through sameness? Some philosophers argue that forcing all children to study the same curriculum ensures *inequality*. Children whose talents do not lie in the academic arena are doubly cheated: They do poorly in the required courses and are deprived of courses in which they might excel. For obvious reasons, *equality* is a concept getting much attention from philosophers.

One angle of attack on issues of equality concentrates on equality of opportunity. It is argued that equality of opportunity should be provided for all students. But this declaration raises crucial questions: Opportunity for what? What constitutes equal opportunity? Can the schools compensate for great inequalities that children bring with them from their homes? There are those who insist that equal opportunity can be defined in terms of a standard curriculum, high standards for all, and competent teaching. But,

critics respond, children who come to school with toothaches and uncontrolled asthma, who have no one at home to help with homework, who live in dangerous neighborhoods—these children do not have an opportunity equal to that of wealthier children, and the school, by itself, cannot make the opportunities equal.

At bottom, we must ask the question: Equal opportunity for what? The answer today seems to be, for college. But, some philosophers argue, a better answer would be “to live a full, happy life.” If we respond this way, we are likely to suggest universal goals that are not tied to specific disciplines, nor to specific futures. Then we must ask how existing subject matter courses can contribute to these broader goals. We must find a way to accommodate the culturally specific, local, and personal within the overarching goals of universal education.

Preparation for democratic citizenship is another topic of central interest to philosophers. Those who follow John Dewey recommend that students be offered age-appropriate opportunities to make choices while they are in school—preparation to exercise a fundamental right in liberal societies. Opponents of Dewey’s recommendations insist that schooling should provide academic knowledge and skills which, in adulthood, will prove useful in democratic life. It is hard to imagine an intellectual disagreement that has resulted in more heated debate than this one. Deweyans claim that the traditionalists offer a tightly prescribed curriculum that is coercive and often meaningless. Traditionalists condemn progressive education for lack of rigor, disrespect for national icons and religion and, in general, for corruption of both the young and our system of education.

Even on the topic of choice—a bedrock concept in liberal democracies—philosophers in the United States often disagree. Some are sympathetic to forms of school choice that allow parents to send their children to private or parochial schools at public expense. Others, adamantly opposed to the use of public funds for religious schools of any sort, recommend more choice within the public system—especially the sort of student choice discussed above. Arguing that the public schools provide the very foundation of our democracy, these philosophers want to strengthen the schools by giving all children opportunities to pursue

the universal goals mentioned earlier. Those in favor of school choice respond that it is more likely that children will attain these goals if they are allowed to escape the atmosphere of failure in many of our public schools.

The question of what constitutes failure or success also interests philosophers. No one doubts that many poor and minority children have been ill served by our public schools. Jonathan Kozol has described our neglect in poignant detail over the past forty years, but he has pointed to injustices in resources and attitudes. He has not concentrated directly on outcomes, as present critics do. Ideally, it seems right to insist that there should be no substantial differences among racial/ethnic/gender groups in achievement. But what produces these differences? If it is just a matter of conscientious teaching, then present critics are right to insist on high standards for all and “no excuses.” But the schools are not the only culpable institutions. Some philosophers suggest that the current school reform movement is, in part, an attempt to distract citizens from the massive social problems that must be solved if there is to be any real meaning to “equal opportunity.”

Then, too, there is a question about how achievement should be defined and measured. Should achievement be defined and evaluated entirely by scores on standardized tests? Are there no other criteria for achievement and satisfaction in schooling? Close on the heels of these questions come questions on how the achievement gap can be closed. On the assumption that achievement will be measured by test scores, are we justified in spending most of the school day on exercises designed to improve those scores? Is it acceptable to deprive poor children of art, music, social studies, and recess in order to maintain a focus on reading and mathematics? Is it morally acceptable to retain children in Grade 4 until they can pass the standardized tests on material designated for that grade? Should we worry about the emotional and intellectual effects of retention? Or is such treatment justified by the commitment to close the gap and give all children an equal opportunity?

These are among the important questions addressed today by philosophers of education. Readers should note, however, that current questions are closely related to perennial questions, among

which are questions of aims: Why do we educate? How much of the curriculum should be common and how much differentiated by talent and interests? Can we create curricula that will provide for both universal and personal education? These are questions that must be considered anew by every generation.

assumptions and cultural values. In the 1980s and 1990s, a “reading war” raged between advocates of each approach. Although policy makers currently favor phonics, whole language advocates have not conceded defeat.

The whole language movement began in the United States in the early 1970s, championed by Kenneth Goodman and Frank Smith. Based on the assumption that learning to read is a natural process, like learning to talk, whole language advocates argue that children immersed in personally meaningful literacy activities will figure out for themselves how to read and spell. They encourage children to use context clues to guess at unknown words and to invent the spellings of words they can't spell. Skills are taught in context when needed. The emphasis is on comprehension and the development of a positive attitude toward reading and writing.

Phonics approaches emphasize early systematic instruction on the spellings of various sounds, enabling children to sound out unfamiliar words. Advocates assume that once children can read words fluently, comprehension will follow. Phonics programs typically rely on teachers delivering preplanned sequential lessons. Over time, such lessons cover most of the spelling patterns that children are likely to encounter. The majority of words in assigned reading materials are ones that children can recognize or sound out based on the spelling patterns they have already learned. Phonics advocates criticize whole language approaches as being too haphazard.

Since the 1950s, authors such as Rudolph Flesch, Jeanne Chall, and Marilyn Adam have promoted phonics. By the mid-1990s, whole language was blamed for low reading scores in California, and phonics was beginning to defeat whole language in the reading war, at least among policy makers. Then, in 2000, the Congressionally appointed National Reading Panel published a review of research on reading instruction that supported intensive, systematic phonics instruction. With federal funding tied to the use of research-based pedagogy, states and schools began to adopt intensive phonics programs.

Whole language advocates have several objections to mandated, intensive phonics instruction. They believe that children in phonics programs spend too

PHONICS AND WHOLE LANGUAGE

Phonics and whole language are two approaches to early reading instruction stemming from different

much time on phonics drills and not enough time actually reading. Although whole language teachers are willing to teach phonics, they object to phonics programs that require teachers to follow scripts, thus eliminating professional decision making and adaptation to individual learners' needs. Most importantly, they believe that the research base supporting intensive phonics is inadequate and ideologically biased.

Whole language instruction is consistent with the constructivist notions that people build understandings through experience and that meaning cannot be imposed by others. Many political and religious conservatives object to constructivism and favor pedagogical approaches that transmit traditional culture and values. Therefore, many conservatives favor phonics programs because they teach children standard spelling and interpretations of texts.

Evidence shows that academic achievement depends more on having a skilled, thoughtful teacher than on having any particular instructional method. An outcome of the reading war is that decisions about reading instruction have been shifting from classroom teachers to policy makers. It may be that neither phonics nor whole language, when imposed on all teachers and students, will lead to optimal achievement.

century, phrenology exercised a wide and important influence as a physiological theory of the mind with profound implications for the regulation of behavior. Aligned with liberal Christian values and Whig political ideals, it drew upon knowledge of the innate structure and development of the brain to justify social reforms that would perfect individuals and help engineer a rationally ordered state.

Every atom of modern life came under the phrenologist's moral gaze: diet, the choice of a spouse, the organization of industrial labor, the reformation of the criminal, and the treatment of the insane had to be guided by the principles God purportedly used to fashion human nature. Most importantly, phrenologists sought to advance society through education. Champions of public schooling, they argued for developmentally appropriate training to elevate the moral and intellectual character of the population and a scientific curriculum to teach the working poor the basic principles of the middle-class worldview.

The fundamental doctrines of phrenology were developed in the 1790s by the German physician Franz-Joseph Gall. Based upon a comparative analysis of animal behavior and neural anatomy, Gall claimed that mental functions were the product of some twenty-seven discrete organs (later phrenologists added more) housed in various regions of the brain; the larger the cerebral mass, the more powerful its operation. Because the skull—thin and plastic, especially in childhood—adapted to the contours of the brain, Gall also maintained that the shape of the cranium served as a map of the mental landscape below. Accepting that each organ could be strengthened by exercise, Gall nonetheless retained a conservative view of human nature that pictured the majority of men and women driven to vice by their inner desires.

In contrast, his one-time assistant, Johan Gasper Spurzheim, developed a more liberal reading of God's handiwork. Systemizing the brain around bourgeois values, Spurzheim described the ideal mind as a harmonious order of positive intellectual, moral, and passionate traits. Wickedness and other moral ills resulted from an imbalance caused by over- or underdeveloped faculties, he thought, and the key to individual and social progress thus lay with the proper government of the faculties through scientifically grounded pedagogic

PHRENOLOGY

Frequently characterized as a pseudoscientific fad in which a person's character was read from the shape of the head, during the second quarter of the nineteenth

practices. Utilizing the technique of moral treatment pioneered by Philip Pinel for the care of the insane, Spurzheim explained how appropriate behavioral therapy could temper excited organs and bring aberrant drives under control. This linking of the moral and the physical helped justify medical authority over the mad and had important implications for penal reform. Applied to schooling and other social practices, it suggested a host of practical methods—through the management of base propensities, moral sentiments, and rational powers—that would normalize the mind in accord with middle-class expectations.

While Spurzheim was cautious about the limits of improvement—retaining a strong belief in the hereditary basis of criminality, degeneracy, and intelligence—his Scottish follower, George Combe, believed that learned inherited traits could gradually advance the physiological condition of the masses. Promoting infant and elementary schooling, he joined with James Simpson in the 1830s movement for a national system of public education. They described the playground as a moral theater for regulating desires, presented the object lesson as an instrument for training the knowing faculties, constructed a scientific curriculum to teach children about the world, and, opposing classical learning and religious indoctrination, offered natural theology as the best evidence for God and the duties of Christian life. Sectarian dogma and the Bible, they insisted, had to be restricted to the home and the church. Although this crusade was frustrated by the Anglican establishment, Combe's ideas did have a powerful impact the United States thanks to the efforts of his American disciples, Horace Mann and Samuel Gridley Howe.

Mann was introduced to phrenology in the early 1830s when, as a member of the Massachusetts General Court, he oversaw the establishment of Worcester Asylum, America's first public hospital for the insane. Reading Combe's *Constitution of Man* in 1837 persuaded him to accept the position of secretary to the newly appointed Board of Education and apply the same principles of moral management to improvement of society. When Combe visited the United States the following year, he discovered Mann justifying sweeping changes in public schooling in accord with the basic principles of phrenology. Mann's rejection of

corporal punishment for moral suasion; his advocacy of the object lesson and scientific studies; his campaign to establish normal schools, school libraries, and nonsectarian textbooks; and his vision of a centralized body to oversee educational reform all flowed from Combe's and Simpson's teachings.

Howe pushed an equally ambitious program in the field of special education. Director of the Perkins School for the Blind, he gained international fame as the teacher of the deaf-blind pupil Laura Bridgman. Laura's remarkable education, designed to prove the truth of phrenology and the power of the new pedagogy, did much to recommend Mann's common school initiatives. Equally competing was Howe's work with the severely learning disabled at the New England School for Idiotic and Feeble-Minded Youth. Not simply an exercise in humanitarianism, Howe investigated the causes of idiocy (as it was then known) in order to justify physiologically grounded welfare policies. Insisting that all diseases resulted from breaking God's moral laws (such as early or inappropriate marriages), he advocated protoeugenic policies to control social dependents and degenerates. Fearful of propagating negative traits, he called for the deinstitutionalization of the disabled; and, convinced that only oral and written communication could train the higher powers of the mind, notoriously opposed the sign language of the deaf.

PHYSICAL EDUCATION, HISTORY OF

Evidence of physical education as a discipline can be traced to the early Greeks. The great philosophers of the Greek world posited that the human is composed of body and mind (soul) and that training is required of both. The writings of these philosophers reveal that they believed in the need for organized physical activities for all citizens. Plato claimed that swimming and gymnastics were of great value and that participation in them should be obligatory for all youth, girls as well as boys.

However, the notion that physical activities should be provided for all citizens would be lost in subsequent civilizations as the demand for physical fitness would be reserved for the privileged class in preparation for the elite games they played. A revival in the need for physical education would not occur until after the Reformation. The Reformation marked the beginnings of the desire to provide a common education for all children. It would be within this movement to provide universal education that the discipline of physical education would emerge. This entry looks at these foundations.

Early America

The colonists brought to America this desire to provide a common education for all children. The earliest undertaking for these settlers was often the establishment of schools of some sort. As early as 1647, the Puritans of New England had passed a decree mandating that schools be established for all children. However, not only did physical education have no acknowledged place in education, but the educational spirit influenced by the prevailing Puritan attitudes was hostile not only to play, believing it to be a sin, but to all activities related to play, including sport and even physical exercise.

Yet, a few educational leaders in colonial America, influenced by the Enlightenment writings of Jean-Jacques Rousseau and John Locke, urged that schools provide for the physical activity needs of children. Locke had expressed the idea that vigor and discipline

of the body were the chief aims of education, while Rousseau proclaimed that physical and intellectual education were intimately bound together. Chief among these early proponents of physical education in America, Benjamin Franklin recommended schools provide activities to engage pupils in games, running, wrestling, and swimming, and he did so as early as 1743 in his *Proposal Relating to the Education of Youth*.

In his writings on education, Thomas Jefferson also expressed his belief in the necessity of physical exercise as a part of general education, while fellow patriot, Dr. Benjamin Rush articulated a need for physical education in his 1772 sermon, *Sermons to Gentlemen Upon Temperance and Exercise*. Although the theories regarding the need for physical education inspired many of America's educational leaders, it would not be until after the War for Independence that exercise and games would come to be seen as necessary for the proper growth of children and that schools should be responsible for the physical as well as the intellectual education of youth.

European Roots

On the eve of the American Revolution, Johann Basedow, an ardent follower of Rousseau, opened a school in Dessau, Germany, in which gymnastics were given a definite place in the school curriculum. This was the first time physical education was included as a part of a school program. Basedow and other European educators would come to have a significant influence on the development of education in the new republic. Molding much of the early thinking on physical education in American educational circles were the works of Johann Friedrich GutsMuth, Friedrich Ludwig Jahn (of Germany), Per Henrik Ling (of Sweden), and Franz Nachetegal (of Denmark).

During the 1820s, Charles Follen, Charles Beck, and Francis Lieber, teachers and devoted followers of renowned German physical educator Friedrich Ludwig Jahn, made their way to America. The arrival of these men marked the beginning of physical education programs in American schools. Under the leadership of these recently arrived German immigrants, Yale,

Amherst, and Dartmouth began to offer instruction in gymnastics. In addition, Joseph Cogswell, George Bancroft, Catharine Beecher, and Mary Lyon would establish schools with carefully planned exercise programs patterned after the philosophy of these European educators. Cogswell and Bancroft founded the Round Hill School in 1823, with physical education a regular part of the course of instruction for the first time in America.

Charles Beck was hired to teach physical education at Round Hill in 1827 becoming the first instructor of physical education employed in an American school. At her Mt. Holyoke Female Seminary, Miss Mary Lyon developed a system of calisthenics for girls, while Catherine Beecher, the founder of the Hartford Female Seminary and later the Western Female Institute, also developed a program of exercise specifically designed for women.

By the middle of the nineteenth century, Horace Mann's belief that common schools were to be common to all was generally accepted. During this same period, many educational leaders began to advocate that education for health, by means of regular exercise and instruction in hygiene, be a part of the standard curriculum. Concerned about the physical and moral health of newly arriving immigrants and the growing population of those living in towns and cities who lacked physical activity, the intellectual and spiritual leaders of the country began to recommend the beneficial effects of systematic exercise, referred to as gymnastics, for the maintenance of physical as well as spiritual well-being. German gymnastic societies, public gymnasiums, the formation of the YMCA (Young Men's Christian Association) in 1844, and the growing participation in sporting activities also influenced the growing interest in physical education. Young men were exhorted by such evangelists as the Reverend Henry Ward Beecher to follow the precepts of "muscular Christianity," and to participate in wholesome exercise. Dr. Dioclesian Lewis, perhaps the most effective of the fitness proponents of this period, sought to call attention to the declining health of many Americans, including women, and arouse an interest in physical culture and the necessity of making it a part of school training.

The Late Nineteenth Century

The poor condition of the soldiers drafted for the Civil War, along with the growing tide of immigration and industrial expansion, gave further impetus to a call for the adoption of physical education in the schools and colleges. The period following the War Between the States brought about a time of great expansion for physical education. While in the first half of the century educational programs were influenced by the gymnastic philosophies of European educationalists, following the war, a new attitude toward physical education began to gain momentum.

The popularity of organized sports, college athletics, the public's desire for recreational activities, and a changing educational philosophy contributed to a wave of enthusiasm for the expansion of physical education. Physical education programs were being accepted and introduced into the public schools throughout America. In 1866, California, under the leadership of Superintendent John Swett, passed the nation's first regulation requiring physical education be taught in elementary and secondary schools. Half a dozen states would join California in enacting similar legislation by the early twentieth century.

In 1885, the American Association for Physical Education was formed. Later in 1894, the National Education Association set up a Department of Physical Education within its own organization. Many local and state teachers' associations also began to organize physical education sections within their organizations. Although it would be well into the early twentieth century before all states would pass such regulations, the social reform movements combined with the growing interest in sports and games created a climate conducive for the expansion of physical education that would follow in the new century.

The Progressive Influence

Yet, it would be birth of the progressive education movement at the turn of the century and the events of World War I that would cement physical education's place in the public school curriculum. Rather than expecting the child to adjust to school, this new philosophy suggested that education and schooling should adjust to the needs of children. Dr. Thomas

D. Wood, a physical educator from Columbia University and ardent supporter of John Dewey, published *Health and Education* in 1910, in which he argued physical education be organized around sports and activities related to real life.

However, it would be the shocking revelation of the rejection of over 30 percent of the men drafted for the U.S. armed services during World War I that would awaken a national outcry. President Woodrow Wilson, along with general educators and physical educators throughout America, spoke out for the establishment of a real program of physical education in the schools. The Committee for the Promotion of Physical Education in the Public Schools, headed by John Dewey, was organized to push for a model bill for physical education. While there would continue to be debate (which continues today) over the role and aims of physical education in the school curriculum, by the 1930s schools across America were providing comprehensive physical education programs.

PHYSICAL EDUCATION IN AMERICAN SCHOOLS

Like sport and education in general, physical education responds to and reproduces broader social values.

As such, it is an important topic for those interested in the history of schooling, as well as policy issues in education. This entry looks at the history of physical education in schools from the colonial era to the twenty-first century.

Early Practice

Before and after European settlement, Native Americans played lacrosse and many other games. European colonists' early schooling slighted physical development, despite the exercise recommendations in John Locke's important *Some Thoughts Concerning Education* (1693). Scattered beginnings of the inclusion of physical education, for example, Benjamin Franklin's 1751 Philadelphia Academy, preceded independence.

Schools in the new nation gradually included exercise. Some boys' teachers instituted military drill, although Congress declined to require it after the War of 1812. German-style gymnastics won brief fame in schools during the 1820s. Round Hill School (1823–1834), an elite boys' academy in Northampton, Massachusetts, secured a German teacher and apparatus and added swimming, running, archery, and vigorous outdoor play to its curriculum. Other boys' schools in the 1820s to 1840s tried gymnastics, agricultural labor, and fencing.

Girls' educators, led by Catharine Beecher at the Hartford Female Seminary, developed "calisthenics" (from Greek words for "beauty" and "strength"), which incorporated slow ballet movements and wand exercises rather than masculine gymnastics. Mount Holyoke Seminary (1837) and others embraced calisthenics; more simply required girls to walk, weather permitting.

European Influences

Further innovations came from overseas. Among German immigrants after 1848 were thousands of gymnastics' enthusiasts or "turners." Their athletic clubs (*turnverein*) at first appealed mostly to Germans—by 1860, the national Turnerbund had 10,000 members—but a turner normal school, founded in 1861, helped broaden the sport. Boarding schools

rediscovered the athletically rich Round Hill model, starting with St. Paul's School in New Hampshire in 1856. Around then, Boston, Cincinnati, Hartford, and San Francisco required exercise in public schools.

The English games tradition gained institutional footing when the Young Men's Christian Association, founded in England in 1844, migrated to Boston and New York in 1851 and 1852, linking young men's physical and spiritual development. The Young Women's Christian Association started in Boston in 1866 with similar goals. Swedish gymnastics, a drill-based program using light apparatus like wands and climbing ropes, also arrived in the 1850s, winning Beecher's recommendation in an 1856 calisthenics schoolbook. Meanwhile, Dioclesian Lewis developed his "American System" or "New Gymnastics." He founded the Boston Normal Institute for Physical Training in 1861 and wrote several books; Boston schools soon adopted his program.

Now the "Battle of the Systems" was on, as school districts, cities, and states—California in 1866, and five others from 1892 to 1901—began mandating physical education in public schools. German gymnastics predominated for a time, using turner-trained teachers and heavy apparatus in high schools, colleges, and YMCAs (Young Men's Christian Associations). Swedish immigrant Baron Nils Posse founded the Boston Normal School of Gymnastics in 1889, which spread Swedish gymnastics to Boston's schools and beyond. Deweyan education, however, favored recreational, informal, individualized programs.

The Swedish and American systems fell out of esteem; German gymnastics survived as an individual sport. School-based programs, such as those developed from 1885 to 1902 by Luther Halsey Gulick, emphasized pleasant games and exercises, and his student, James Naismith, developed basketball toward this end. Gulick's influence helped plant school gymnasiums, playgrounds, and nonschool athletic leagues throughout the nation. Military drill briefly reappeared in curricula during World War I.

University Athletics

Intercollegiate athletics debuted with Harvard and Yale's 1852 rowing showdown. Amherst College

founded the first collegiate physical education department, hiring Edward Hitchcock and building a gymnasium in 1861. Harvard's Hemenway Gymnasium came second, headed by Dudley Allen Sargent from 1879 until 1919. Harvard granted the first college physical education degree in 1893 and offered summer training for physical education teachers from 1887 to 1932.

Wellesley College hired the first full-time collegiate women's physical educator in 1881. Gilded Age women's colleges defensively instituted physical education, intercollegiate teams, and anthropometric testing to rebut medical claims that higher education damaged women's health. Normal school, college, and graduate degree programs multiplied from the 1890s to 1910s, producing trained physical educators, as did physical education and swimming requirements for college graduation. Public land-grant colleges established following the 1862 Morrill Act required agricultural labor.

Modern Times

Despite the booming popularity of sport and "physical culture" after 1890, one third of American World War I recruits flunked their physical exams. In response, more states mandated school-based physical education: twenty by 1921, nearly forty by 1930. New schools included large gyms and athletic fields for expanded physical education and competition. Yet a backlash marked the late 1920s.

Women had won the vote, shortened their skirts, abandoned their corsets, and discovered myriad sporting interests since 1890; competitive sports for girls and women, especially basketball, attracted large crowds. But, alleging medical, reproductive, and emotional threats from intense competition, women physical educators now opposed competitive sport for girls. Instead these educators promoted noncompetitive "sport for all" that stymied girls seeking advanced competition and skill development. "Girls' rules" for basketball, developed in 1901 to exalt "femininity" over aggressiveness, came to dominate the game. This philosophy hobbled girls' physical education and sport for forty years.

World War II again revealed American physical shortcomings and prompted campaigns for physical

fitness. By 1950, about 90 percent of precollegiate students received physical education. The 1953 Kraus-Weber fitness test showed American children trailing European peers, inspiring the President's Council on Physical Fitness and Sports in 1956.

In the late 1960s, as women renewed their fight for rights, female physical educators reconsidered limitations on girls' sport and physical education. But institutional and attitudinal barriers channeled girls and women into inferior facilities, narrower opportunities, and watered-down expectations. Title IX of the Education Amendments of 1972 addressed those and other problems; over time, the law has vastly improved women's athletic participation. "Lifetime sports" emerged in secondary-level physical education during the 1970s.

Since 1990, funding shortfalls and competing time demands, including high-stakes testing, have crowded physical education out of many school curricula, contributing to epidemic obesity. Although most elementary students still take some physical education, a 2001 Centers for Disease Control report found only 5 percent of schools requiring physical education for twelfth graders. Since 2004, many states have moved to restore physical education. Likewise, collegiate physical education requirements declined in the late twentieth century; by 2003, barely ten colleges retained swimming tests. To address colleges' concerns about obesity, mental health, and other issues, physical education requirements may return as "wellness education" at the college level.

PLACE-BASED EDUCATION

Place-based education is a philosophical orientation to teaching and learning that emphasizes the study of geographic context, particularly the local community, as a focus of elementary, secondary, and higher education. Its lasting contribution to contemporary Western education is the requisite community study unit in elementary school, which only hints at the potential for place-based education in schools. This entry looks at the idea's development and current status.

Background

The study of place can trace its philosophical roots back to Aristotle's notion of *topos*, which refers to feelings of belongingness that are evoked by the "where" dimension of a person's relationship to the spaces he or she inhabits. This ancient Greek concept points to place-based education's disciplinary lineage—psychology and geography—which together frame its perceptual and spatial roots.

Place-based educators are interested in spaces, not solely in and of themselves, but also as natural and cultural spheres to which humans assign meaning and from which they derive meaning and purpose and locate their individual and collective identities. Hence, the sense of place, the quality of place, the utilitarian use of space, and the study of urban and rural communities are all reoccurring themes within the academic study of place.

In higher education, place-based education also draws from a number of interdisciplinary traditions that define both its conceptual foundations and research priorities. Working from a phenomenological perspective, some place-based educators are interested in the deeply personal experience of place that is rooted in feelings of attachment and belongingness to particular environments. Home and childhood environments are prominent themes in this regard. Closely related to this research is the study of spatial perception

in childhood, including nearby and far away places. Place-based research also incorporates elements of critical sociology. By deconstructing the physical environment as a visual text, some critical pedagogists aim to expose schools and other places as contested spaces of power rooted in imbalances of environmental quality and equity of access.

From a historical perspective, place-based K–12 education is rooted in the progressive tradition of educational practice and reform. In recent centuries, some of the most prominent progressive educators in Europe incorporated place-based education as a key component of their instructional practice. Johann Heinrich Pestalozzi (1746–1827), for example, would routinely take his students on regular excursions outside of the school into the local villages and countryside for the purpose of studying the local flora and landforms. Rudolf Steiner (1861–1925) called on educators to incorporate the local community context, including local farming practices and cultural traditions, into the school's curricula.

Contemporary Role

As noted above, place-based education's most notable contribution to contemporary education is the requisite community study unit in elementary school in which children learn about the basic functioning and infrastructure of their local community (e.g., community helpers and their tools). In addition to in-class work, such a unit may also comprise walking tours, the sketching of local buildings, the analysis of local artifacts and monuments, the study of maps and city plans, interviews with local residents, and other forms of community data gathering.

Most place study proponents see the traditional community study unit only as a starting point for place study in school. They also advocate for the more advanced study of place in the secondary grades and higher education. So, too, place-based educators link the study of place to environmental advocacy, child psychology, social psychology, human geography, and rural schooling, among other topics.

Architecture is an often neglected subject in elementary and secondary education that is also promoted in schools by some place-based educators.

Other place-based educators are especially concerned with promoting a developmental congruence between how geography is taught to students in elementary and secondary school and the unique ways in which children and youth make sense of the world. Aligning a place-based curriculum with what researchers know about the development of children's spatial perception is judged to be critically important in this regard.

There is a clear biocentric line of thought running through many place-based advocacy arguments. Most place-based educators lament the loss of natural spaces in cities. Responding to this concern, environmental educators have argued that place-based education should take into full account the natural as well as cultural environments of local communities in the design of place-based curriculum. Working within an environmental education context, many place-based educators have sought to align their teaching with other holistic traditions in education, such as gardening and the ecological restoration movement.

Place-based education also honors the "think global, act local" axiom of the more progressive forms of global education. For example, students may study the local implications of global environmental change and resource scarcities. They may also learn social action skills which they then put into practice in improving their local community. Cyber places as virtual settings for online and distance learning via the Internet are relatively new contexts for place-based educational research. Studies exploring the similarities and differences between face-to-face teaching in traditional classrooms and online learning in Web-based classrooms explore, in part, the transformations to the experience of place that Internet-based education entails.

PLAGIARISM

In widely accepted terms, plagiarism is the intentional use of other people's words or ideas without due acknowledgment. The U.S. Office of Research Integrity defines plagiarism as the "appropriation of another person's ideas, processes, results, or words without giving appropriate credit" (§ 93.103), and it is a rapidly increasing problem facing today's educators. This entry explores the types of plagiarism, the impact of the Internet on the plagiarism, and recommendations for ameliorating the problem.

Plagiarism applies to both the intentional and unintentional use of intellectual property, an issue that many find confounding. Plagiarism comes in many forms, from replicating a few words, to copying entire texts, to buying "custom" papers. Examples of what needs to be credited or documented include words or ideas presented in a book, journal, Web page, or magazine, and diagrams or other visual materials. Examples of what does not need to be credited or documented are an individual's own thoughts or ideas; common knowledge, such as myths or folklore; and results of the individual's own research.

There are three general forms of plagiarism, *criminal plagiarism*, *careless scholarship*, and *ignorance of the rules*, and each is aligned with an increasing degree of intent. The criminal plagiarist knowingly steals or buys the intellectual property of another, while the sloppy scholar engages in an unintentional

act of omission. The third category, ignorance of the rules, is linked to students (or professionals) who are not acquainted with the conventions of scholarly writing. Often students often cannot tell the difference between correctly paraphrased versus plagiarized text, and the plagiarism is unintentional. Studies have shown that students often lack the knowledge to cite sources properly.

The first use of the word *plagiarism* dates back to the seventeenth century. While plagiarism is certainly not a new problem, many cite the Internet as the reason behind the explosion of incidents of plagiarism in recent years. According to many, Internet plagiarism is a serious and growing problem, and offenses range from "cutting and pasting" passages to purchasing entire custom-created papers. Internet plagiarism offenses are becoming so widespread that new words are evolving to adequately describe the offenses. For example, the term *cyber-plagiarism* is used to refer to the practice of cutting and pasting information from the Internet into a writing assignment without a citation. *Cyber-pseudepigraphy*, on the other hand, refers specifically to the practice of buying papers online, which constitutes fraud.

Indeed, the advent of the Internet has been a double-edged sword for educators. While it has allowed students free and easy access to a wide variety of resources from which to plagiarize, it has also facilitated the invention of tools to detect such improprieties. A variety of commercially marketed software programs and Internet sites make it possible to check for incidences of plagiarism. The most commonly recognized fee-based software programs are Turnitin, Essay Verification Engine (EVE), and Copycatch. It is often suggested that faculty discuss plagiarism concerns with students and request that students submit all written work to one of the programs.

No specific data are available that provide a complete picture of the scope of plagiarism. Individual studies have cited the incidence of plagiarism to be anywhere from 26 percent to 80 percent. However, it is difficult to accurately grasp the full extent of plagiarism, as many statistical references rely on student self-report. In addition, faculty often are reluctant to report plagiarism because they are fearful of ruining a student's career or becoming embroiled in litigation,

or because they are concerned that the incident may reflect poorly on their teaching practices. In addition, faculty may not be confident in their own ability to detect plagiarized material.

Many schools and universities do little more than provide an academic honesty statement that includes a reference to plagiarism in student handbooks. However, it is highly recommended that faculty take a more proactive approach, spending time educating students as to what plagiarism is, what constitutes plagiarism, and the consequences if one is caught engaging in plagiarism. Studies have shown that detailed descriptions in each of these areas are imperative, as subtleties do little to change behavior. One strategy for amelioration is instruction providing students with examples of plagiarized work and asking them to determine what offense has been committed. Another strategy is breaking major assignments into smaller interim assignments and monitoring student progress by requiring that they submit each component for review. This not only allows faculty to detect irregularities but also forces students to manage their time more effectively, perhaps eliminating the need to plagiarize a hastily prepared assignment.

While no one knows for certain why students plagiarize, studies have linked plagiarism to the following reasons: lack of time, especially for nontraditional students; ignorance and/or lack of understanding of the rules; access and opportunity; fear of failure; personal values/attitudes; and lack of academic integration, which in essence is an issue of student engagement. Numerous studies have pointed to the value of student engagement and have tied student engagement to student success, retention, and persistence; however, few, if any, studies to date have examined the link between student engagement and plagiarism.

PLAYGROUNDS

Although children have always played in open spaces in city settings and around schools, the early history of playgrounds is obscure. Formal playgrounds, however, seem to be an invention of the first half of the nineteenth century. The American educational reformer Henry Barnard (1811–1900) described a “Play ground” for a primary school in his 1848 treatise “School Architecture.” It was fenced in and included a play area for block construction, and a set of rotary swings and ropes for jumping games. Barnard emphasized that the play area was under the supervision of a teacher—representing one of the earlier notions of play being regulated by adults.

Following the Civil War, playgrounds began to appear in urban areas on the East Coast of the United States. A playground was built in a schoolyard in Boston near Copley Square in 1868. By 1887, city officials had approved the construction of ten “sand gardens” in the poorer areas of the city. In 1887, New York passed a law calling for the establishment of parks and playgrounds throughout the city. Construction of these playgrounds, however,

did not really begin in earnest until almost a decade later.

During the 1890s, playground development became associated with issues of urban and educational reform. The social reformer Jacob Riis (1849–1914), in works such as *The Children of the Poor*, argued that playgrounds would keep the poorer children in New York out of trouble and provide the foundation for a better society. Riis called for a renewed effort to establish playgrounds and parks around schools that would not only serve student populations, but provide a place where mothers could leave their apartments and take their children out to play in the fresh air. He felt that this was particularly important in the poorer neighborhoods where the possibilities for wholesome play were so severely limited by crowded tenement conditions.

Riis's efforts eventually led to the creation of a large network of playgrounds throughout New York City, most of which are still in existence today. Other urban reformers were also concerned with the development of playgrounds. In 1894 in Chicago, the settlement house leader Jane Addams (1860–1935) developed a sand garden for the children in the Hull House neighborhood. A playground was opened in 1896 as part of the Northwestern University Settlement House and a third playground was started at the University of Chicago in 1898.

In 1906, the American Playground Association was begun. Under the leadership of figures such as Joseph Lee, Jane Addams, and J. G. Phelps Stokes, a national movement began for the development of playgrounds in urban areas. These efforts represented an attempt to shape the experience of urban youth, providing them with a positive environment in which to grow and mature.

Modern playgrounds, consisting of standard apparatus such as swing sets, merry-go' rounds, teeter-totters, and slides, became widespread during the period around World War I. By World War II, playgrounds had become an accepted part of the urban landscape.

During the 1940s, European playground designers began to argue for less-regimented and controlled playground environments for children. In 1943 the Danish landscape architect and educator C. Theodore Sorenson in collaboration with the Worker's Co-operative

Association, opened the first Adventure Playground in Emdrup, a small town near Copenhagen.

Adventure Playgrounds emphasized the link between the physical environment and the psychological development of the child. In the case of the Emdrup playground, its construction was largely undertaken by the children who were intended as its principle users. Thus, the idea of children having control over their own play space was emphasized. This represented a significant movement away from the models established by the American Playground Association at the beginning of the twentieth century.

In the United States, playgrounds changed very little in the period immediately following World War II. By the mid-1960s designers such as M. Paul Freidberg began to develop innovative playgrounds that emphasized the use of natural materials. Richard Dattner, another leading designer, introduced new elements such as water play. These new designs moved significantly beyond previous playgrounds by incorporating both planned and free-form elements.

In an era when children are losing many of their naturally found spaces for play, and as media in electronic forms such as video games, increasingly occupy their play time, the question of how playgrounds will continue to evolve and develop is open to considerable speculation. In fact, planned play spaces have the potential to provide alternate learning spaces and protected environments for children in a post-modern culture. Playgrounds may be even more important for children than they have been in the past.

PLEDGE OF ALLEGIANCE

The Pledge of Allegiance is an important tradition of American education that dates back to the early 1890s when James Upham, the head of circulation at the children's magazine *The Youth's Companion*, developed a campaign that encouraged children across the United States to raise money for the purchase of flags in their classrooms. As a result of his, and the children's, efforts over 30,000 flags were eventually purchased across the country.

With the success of the flag campaign, Upham decided to create a pledge that students would recite each morning as the flag was raised in their classroom or school. Francis J. Bellamy, one of the magazine's editors, actually wrote the pledge. Heavily involved in the promotion of the 1893 World's Columbian Exposition in Chicago (where *The Youth's Companion* was based), Bellamy made the pledge an important component of the plans he put together to celebrate Columbus Day (October 12) as a national holiday. As a result, federal education officials sent out copies of Bellamy's pledge to teachers throughout the nation.

The Pledge of Allegiance was consciously created as a means of inspiring patriotism among public school children, an idea that was thought to be particularly important with recently arrived immigrant populations. Often students would mindlessly repeat the pledge, however, without understanding its meaning, sometimes even substituting what they thought were the words, rather than its actual content. Amusing examples of these mistakes include: "I pledge the pigeons to the flag," "and to the republic for witches stands," "one nation under guard," "invisible" "with liberty and jelly for all."

In spite of the inaccuracies of student recitations of the pledge, its daily recitation quickly became part of the culture of American schools. Its official content, however, did not remain fixed. Bellamy's original pledge (1892) was: "I pledge allegiance to my Flag and to the Republic for which it stands—one nation indivisible, with liberty and justice for all." At National Flag Conferences held in 1923 and 1924, the pledge was changed to: "I pledge allegiance to the

Flag of the United States of America and to the Republic for which it stands, one Nation indivisible, with liberty and justice for all." In 1954 the pledge was changed once more by resolution of the U.S. Congress to include the words "under God": "I pledge allegiance to the Flag of the United States of America and to the Republic for which it stands, one Nation under God, indivisible, with liberty and justice for all."

The pledge has often engendered controversy. In 1940, the Supreme Court decided in the case of *Minersville School District v. Gobitis* that children who refused to salute the flag as a part of regular school exercises could be compelled to do so. That decision was overturned in 1943 in the Supreme Court decision of *West Virginia State Board of Education v. Barnette*. In this decision, Justices Hugo Black and William Douglas reasoned that students had the right to remain silent and not take place in the pledge ceremony. According to them: "Words uttered under coercion are proof of loyalty to nothing, but self interest. Love of country must spring from willing hearts and free minds."

The *Barnette* decision was usually interpreted as maintaining the religious rights of the plaintiffs, the Jehovah's Witnesses, whose religious beliefs precluded them from giving allegiance to the flag, which represented a sovereign political system that they saw as subordinate to God. During the 1960s and the upheaval of the Vietnam War, the *Barnette* decision was extended to protect students who did not want to salute the flag as a matter of moral conscience, since they felt it symbolized the political power that was waging what they believed was an unjust war in Vietnam. In March of 2004, the United States Supreme Court heard Michael Newdow present the case that the Pledge of Allegiance was unconstitutional by suggesting that those who do not believe in God are wrong in their beliefs. Newdow argued that this represented a violation of the Establishment clause of the Constitution, which maintains the right of citizens to pursue or not pursue their religious beliefs based on their personal conviction. U.S. Solicitor General Theodore Olsen and Elk Grove School District Attorney Terence J. Cassidy countered Newdow's argument, maintaining that the use of the phrase "under God" was "descriptive" and "ceremonial" and not a "religious invocation" or prayer.

In June of the same year, the Court maintained that Newdow was not qualified to sue the Court and left the Pledge intact. In September of 2005, a federal judge in Sacramento determined that having public school children recite the words “under God” as part of the Pledge was a violation of their First Amendment rights.

Today, the Pledge of Allegiance continues to be an important part of the culture and tradition of American classrooms. While celebrating the United States and its political values and ideologies, the right of students not to participate in its recitation also addresses the country’s important traditions of free speech, religious toleration, and diversity. Despite its acceptance, the Constitutionality of the use of the Pledge in schools continues to be open to debate.

undergone by those affected by policy and serve to circumscribe the meanings created by those experiences. When understood as a major impetus for policy authors, these boundaries become part of the larger narrative which defines what is “real” not only regarding policy studies, but regarding larger ontological factors surrounding policy. Because the term “policy” can be replaced with *rules*, *guidelines*, *mandates*, and the like, and still be consistent, for purposes of academic clarity, *policy* is differentiated as the larger umbrella under which the more specific terms fall.

Historically, policy, broadly conceived, has been a focus of debate between those who wish to maintain the traditions that a policy represents and those who wish to enact change in the society a policy affects. The process of negotiation that ensues between these two sides is what ultimately takes shape in the form of policy. There are two main threads of history that serve to highlight the development of policy as a union of debate and meaning: (1) a historical review of events that led, and continue to lead, to the creation of policy; and (2) a retracing of the etymology of the term *policy*. This overview acknowledges the history of policy as a series of events and changes in etymological meanings in an effort to illustrate ways policy is currently conceived. Because this entry must be relatively terse, the history described herein outlines only some of the significant starting points and shifts in meaning that policy as a term has undergone.

Historical Contrast

The role of policy in society can be traced back to the ancient Greek debate between custom or human law (*nomos*) and nature or natural law (*physis*). This discussion was framed by some of the earliest recorded Greek philosophers, such as Thales and Parmenides, and historians, orators, and playwrights also influenced the courts and politics. In search of a guiding principle for life, both public and private, philosophers, politicians, and citizens discussed the roles played by human law in contrast to the influence of natural law. Policy as human law falls on the side of *nomos*, due to its influence of human interactions. The citizens of Ancient Greece are renowned for their

POLICY STUDIES

The term *policy* has many uses and, as a result, is difficult, if not impossible to define in a meaningful way that is free from controversy. Arguably, the disputes over such definitions are largely what create policy in the first place. Said differently, the arguments concerning what should or should not be guaranteed by law are the arguments that give rise to the implementation of policy. In a stronger sense still, policy exists to define (and redefine) what is real. “It is our policy that . . .” and “The policy clearly states . . .” place ontological boundaries on what actions, behaviors, or ideas will be accepted. Such boundaries dictate the experiences

arguments in the public square and the Assembly pertaining to questions of justice and the laws made by society to embody policy definitions.

Likewise, the role of the current democracy in the United States is heavily argued, but, significantly, the locus of such debate has changed. The Senate, House of Representatives, and White House administration serve as the voices for U.S. citizens. Whereas Ancient Greek citizens were speaking directly to the Assembly, which consisted of other Greek citizens, in order to persuade legal change, U.S. citizens are now represented by the governmental district officials they vote into office who, in turn, speak to other elected representatives to enact change. The shift from the ability to have one's voice as a citizen heard physically to having one's voice represented by a ballot, which is cast wholesale for or against an already constructed policy, is a significant change in the way in which policy is written and enacted. The most immediate effect of this change is the removal of any citizen or group of citizens from the space where policy is contested and materially changed. As a result of their removal, important also is the lack of citizens' need to be able to express themselves in an informed and persuasive manner regarding the policy in which they are implicated.

While the Greek Assembly was not without its own set of difficulties, its organization allotted a publicly recognized space for any and all citizens to participate in the writing, amending, and even negation of laws. For better or worse, such direct power is unavailable to U.S. citizens. Instead, U.S. policy makers enact policy that citizens are required to follow but unable to directly dispute at the time of its conception. This shift away from direct to representative participation is further corroborated by the ways in which the word *policy* has historically changed meanings.

Etymology

Etymology sheds light on the current meanings of policy and relates the word to some of its cognates. Knowing *policy*'s etymology allows for a much broader conception of how the word came into use and what other ideas and words contribute and share elements that also belong to policy. The word *policy*

has its origins in the Ancient Greek word *polis*, which means "city" or "state." From *polis* comes both *polites*, meaning citizen, and *politea*, meaning both "government" and "citizenship." The Assembly was both the governing body and the citizenry in Ancient Greece. Indicative of such a union is that citizens and the government were one and the same.

As the Romans developed their society, the Greek *politea* shifted to the Latin *politia*, which means simply "the state." Already, there is a shift away from the inclusion of citizens in the government, though the state is arguably comprised of citizens. Still the change in the word's definition can be understood as meaningful for the ways which people, through a shared language, conceived of their relationship in and to the state. Whereas citizenship and government were said in the same breath with *politea*, the Latin *politia* was exclusive to the state and separate from *civis* or "the citizen."

As the Latin language spread with the Roman Empire through Greater Europe and into Asia, the ideas represented by *politia* came into direct contact with many parts of the world, but the next change in the etymological evolution of *policy* took place only a few hundred miles north of Rome. In fourteenth-century Old French, the ideas expressed by the Latin *politia* shifted even further from citizen involvement in government with the new word *policie*. Interestingly, this word parented not only the English word *policy*, but policy's cognate *police* as well. As this division suggests, the meaning of *policie* takes on a more calculating sense as a way of management, government, or administration. As a way of management, *policie* adds to its former roots an institutional sense of ordering through which actions can be "policed" or controlled. This should not suggest that such ordering did not take place in the name of *politea* or *politia*, but *policie* exhibits the first overt mention of such managing in *policy*'s etymological history. As well, considering that *policie* gave rise to the English words *policy* and *police*, the move toward a clearly more controlling notion of government gives a more contemporary ring to policy as it is presently enacted.

Economistic Versus Humanistic

Today *policy* can be conceived as having bifurcated along the lines the above etymology suggests. *Policy*

understood from the Greek *polis*, *polites*, and *politea* holds the role of citizenship as collectively identical to the state. A contemporary analogy to this meaning is found in social justice advocates' notion of policy, what is designated here as humanistic policy, which seeks laws that promote democratic participation of all citizens with the aim of eradicating poverty, racism, classism, and other social inequities that currently serve and promote the status quo through federal, state, and local laws. Policy from this side seeks critical engagement in the government on the part of diverse citizens and citizen groups in order for the voices that influence policy to reflect their pluralistic roots.

On the other side of this bifurcation, derived from *police*, policy is understood as a means to police or control through positivistic appeals to objective data. Support for this area is drawn from foundations, legislation, and think tanks that are economistic in their motivation. Policy from this side seeks uniformity and assimilation of citizens in order for one, universalized voice to dominate society.

In order to draw the division between economistic and humanistic policy more clearly, educational policy serves as an excellent example. Educational policy gains much of its definition from primary and secondary iterations of meaning. Specifically, *policy* leads to *public policy*, which leads to, among other ideas, *educational policy*. Whereas policy is a principle, plan, or course of action which is typically pursued by an individual, organization, or government, public policy qualifies the primary definition by, theoretically, restricting the domain of the definition to groups (organizational and governmental) rather than highlighting individuals. This should not suggest individuals have no role in policy, but that public policies concentrate on the welfare of the larger public (to such a degree as a "public good" exists and is positively regarded). In linear fashion then, educational policy is borne of public policy and typically denotes attempts to either reinforce or alter prevailing norms in schools.

Public policy and educational policy have similar defining features. While both "look out" for the welfare of their charges, educational policy, specifically, exists in an effort to guide schooling practice where "doing" educational policy studies, as conceived at present, means to appeal to objectivity, politics, and

power. This being said, current educational policy, referred to here as economistic, can be understood as having two, interconnected purposes: (1) appeals to impartial data (objectivity), and (2) economic competition (politics/power).

Underpinning both of these purposes is a free market logic which holds that schools are merely businesses, and if they fail to supply what the market demands then they, by necessity, should "go out of business." A key term used in this ideology is *competition*, or more specifically, competition in a global market. As a free market construct, schools, and the policy that surrounds them, are results based. Emphasis is placed squarely on what the market "gets" as a result of schools. The student becomes the product of schools, rather than a participant in schools, and as a product, the student is expected to function within the market as a worker in a globally competitive economic system.

One of the more influential proponents of education as a free market enterprise is the economist Milton Friedman. In his view, the government's role in public education (as well as the rest of society) should be drastically minimized if not entirely removed through the implementation of a national voucher, or choice, program through which schools compete with each other by providing a globally competitive workforce and the losers of the competition (schools whose students are not trained for jobs) are subsequently closed.

Economistic Education Policy

But understanding social institutions and writing policy in economistic terms is not a phenomenon which appeared *ex nihilo*. The influences which have brought about this change are, like the schools and other institutions they have affected, historically situated. What follows is a brief exposition of some of the important events that helped reframe the discussion of educational policy specifically in an objectivistic free market paradigm.

The Space Race

This history arguably takes for its starting point the Smith-Hughes Act of 1917, which was the first instance

of federal funding in K–12 public schools. The funding from the Smith-Hughes Act was specifically intended to support vocational education and what would become a central feature of industrialization: careerism. Furthered by the GI Bill after World War II, the United States increased its role on the global stage, finding itself enmeshed in a military-industrial effort to broaden its reach of power and deepen its economic interests. In 1957, when the Soviet Union successfully launched the *Sputnik* satellite into outer space, the U.S. federal government firmly recognized the nexus of schooling and national interests.

Worried about their late start in what would be known as the “space race,” the United States turned to schooling as an important reason why the Soviets had launched first. The following year, 1958, the United States launched *Explorer I* into outer space and instituted the National Defense Education Act (NDEA). This policy, born of competitive concern, provided federal monies to elementary and secondary schools primarily for improvement of their mathematics, science, and modern foreign language curricula with the intent of making scientists and technology workers who would be better prepared to compete with global science and technology industries. This act has been reauthorized and renamed as the No Child Left Behind Act of 2001 (NCLB) and is discussed below in more detail. Significant to the NDEA was the focus on science, math, and foreign languages as singularly important to national education for remaining ahead of other countries in the field of industry. Education can be narrowly understood through the NDEA as preparatory for global competition as exhibited by its impetus, the space race.

War on Poverty

In what can be understood as a response to the NDEA’s specific focus on math, science, and foreign language education, the next sweeping federal educational reform came in 1965 with the passage of the Elementary and Secondary Education Act (ESEA), the centerpiece of President Lyndon B. Johnson’s “War on Poverty.” A specific feature of this act, the Head Start program, is discussed below, but important to this historical discussion is the focus of the ESEA

on students who come from low-income and poverty-stricken families. Whereas the motivation behind the NDEA was a desire for the United States to win the space race specifically (more basic even, to be the winner in global competition), the ESEA was written to address poor students’ backgrounds and social situations within the United States. In reading the ESEA as a response, rather than framing schools as productive of members of the U.S. workforce, this policy looks at the problems students and their families face that can hinder their education.

Returning to the notion of schools as productive in economic terms, in 1983 the National Commission on Excellence in Education published the report *A Nation at Risk* at the behest of the U.S. Secretary of Education, T. H. Bell. This report, which was responsible for the wave of educational reform that framed much of the language of NCLB, strongly characterizes the United States as having fallen from a position of unquestioned dominance in science, commerce, and technology and being overtaken by competitors from around the globe. A “rising tide of mediocrity” is accordingly what threatens the future of the United States in this view. With *A Nation at Risk* establishing a direct link between schools, the global market, competition, and workshops, future policy and policy research avidly pursued these themes as the goal of education in the United States.

Education Policy Research

The casting of schools as markets both shapes and is shaped by educational policy in the 1990s. A review of policy center reports on education across several U.S. states from this time will be helpful to substantiate the point and further portray the ways in which policy is shaped by policy center research in order to achieve specific ends, in each case framing public schools as competitive spaces (i.e., productive of a globally competitive workforce).

For instance, the Indiana Consortium on Educational Policy Studies compared international tests of math and science and concluded that U.S. students consistently score poorly. Furthermore, students were compared to students of previous decades and the Indiana Consortium concluded that

dropout rates, literacy rates, and basic skills like math and reading were comparatively lower on a variety of measures. The consortium's point is that if the educational achievement of future workers does not improve, then the United States will face increasing competition in areas like technology and engineering.

Linking the purpose of its policy center with an ideal, the Centers for the Study of Education in Florida suggested that new "stakeholders" in education enter into a kind of "collaborative thinking" in order to better figure out how to make schools both more competitive and productive in a global economy. The goal of the South Carolina Educational Policy Center was to focus research on issues related to student performance in order to better inform state and district school officials, legislators, and foundations.

In general, policy centers and policy research primarily involve accounting, quantitative data analysis, national, regional, or state economic considerations, global competition concerns, and performance assessments. Overriding these various purposes is the need to supply information to policy makers. Policy making, exhibited above at the state level, results in an assertion of power by policy centers that are interested in replacing lobbyists and partisan organizations with "nonpartisan" information. Yet policy analysts, aware of and involved in their current political climate, have their focus set by political officials. More bluntly, if a governor wants information on the effects of smaller class sizes on learning, analysts research precisely that. The studies, in other words, are traditionally set by legislatures. Further still, tax studies, student population growth rates, teacher-to-pupil ratios, and so on, become studies (i.e., funded) when issues involving such information are raised in legislative sessions or are underwritten by foundations.

No Child Left Behind

During the 1990s, many policy centers couched their language in terms of market ideology. The culmination of such policy research for the 2000s was the No Child Left Behind Act of 2001 (NCLB). An examination of NCLB reveals the most recent and sweeping iteration of economistic policy described here. Briefly, NCLB promotes a standards- and accountability-based

scheme that holds public schools, from the school districts down to the students, liable for their performance. This is done through economic sanctions whereby schools that fail to perform up to preset statewide standards in a timely manner are no longer eligible for federal funding. In other words, if a school fails, that school no longer receives monies (Title I funding) from the U.S. government.

The economistic sense of this policy is already apparent, given the use of the word *accountability*, which comes from economics. Also the enforcement of standards, through test scores, brings with it the idea that persons need be controlled because of scores that represent objective determinants of ability. By this logic, other issues can be represented by the test scores of schools that fail, including a lack of knowledge or character.

In addition, if a school is determined to be failing through insufficient test scores for three consecutive years, NCLB contains provisions that allow for the school to be closed (i.e., no longer a place which receives public funds) and reopened by private companies that will provide educational services to students with the possibility of making a profit, for example, Edison Schools, Inc. Conceivably, a public school closed due to failure to meet standards set by NCLB can be taken over by Edison Schools, Inc. in an effort to make the school profitable through private investments from industries such as computer manufacturers as well as through the sales of advertising space within the school. Through the NCLB policy, private corporations are now eligible to take over formerly public schools.

As detailed above, an appeal to objective measurement is one aspect of educational policy for which legislatures have called. In response, analysts have researched particular aspects of schools in particular ways largely to justify the economic models of schooling that support the research in the first place. Since a school's failure, according to NCLB, is determined entirely by low test scores, much of educational policy research is currently focused on what causes low test scores with the aim of raising those same scores.

For instance, the category of "at-risk" students has been created by educational researchers to describe students with low test scores. This category allows

students to be quantified and disaggregated according to discrete subsets, such as race and physical ability. Such labeling can adversely influence a student's self-esteem. Critics argue that the appeal to objectivity fails to examine the ethical assumptions that underlie categories like that of at-risk students and fuels an accountability regime that seeks, not social change, but social compliance. Policy that designates at-risk students as failing to score adequately on standardized tests operates in tandem with policy that stresses the importance of schools producing a globally competitive workforce. Ultimately, this is the success of economic policy. When the supply can be clearly identified and measured, then efficiently produced by private enterprise for the market's demand, questions hinge on quality assurance and effective methods of production, and "better" comes to mean cheaper and more efficient in order for students as future workers to better compete in a global market.

A Humanistic Alternative

Returning to the larger sense of the word, *policy* as a humanistic endeavor can be understood as an alternative to the more economic notions described above. Where current policy and policy analysis primarily assumes a free market ideology underpinning the functions of society, policy that is oriented humanistically seeks to involve citizens in its authoring with the aim of mirroring the diversity represented in the U.S. democracy. It is humanistic in the sense that it re-centers the human, as an inclusive term, in the realm of policy. Law is, after all, a human creation.

As well, a reformulated policy studies guards against status quo reproduction and offers different means of validating disparate forms of questioning without marginalization and without regressing to relativism. That is to say, rethinking the domain of policy does not eschew viewpoints merely because they are not objectively and economically oriented but instead encourages a notion of policy that serves as a legal manifestation of the space in which such viewpoints are brought together in order to address social inequities that are currently in place and enact change toward a more just society.

The Head Start Example

To ground the idea of humanistic policy in existing legislation, this entry examines the Head Start Program of 1965 as such an effort. Head Start is one of several programs that comprised the Elementary and Secondary Education Act of 1965 (ESEA). Each program established under the ESEA addressed poverty of children and their families in the United States, specifically in terms of their difficulties in pursuing education. Part of President Lyndon Johnson's War on Poverty initiative, Head Start was authored with the direct intent of bringing together viewpoints that originate in social inequalities. In the words of the program, "Head Start was designed to help break the cycle of poverty by providing preschool children of low-socio-economic status families with a comprehensive program to meet their nutritional, emotional, social, health, and psychological needs."

The original focus of this policy was on students and the problems that they brought into schools as a part of their social status. As a result, Head Start implemented an array of mediation efforts, such as a strong emphasis on bilingual education and counseling and guidance programs, in order to create experiences for students that were not predicated on their poverty. Also, Head Start established programs that involved the families of the students in order to strengthen ties within the family and their larger community.

The inclusive intent of Head Start's implementation does much to substantiate the humanistic qualities that policy can engender. However, Head Start is not a perfect representation of what is described here as humanistic policy. The purpose of citing the Head Start program is to focus on its intent of addressing broad social inequalities rather than discounting and dismissing such inequalities as the necessary byproduct of a free market economy.

An Economic Turn

There is much about Head Start that is now economic, such as the "objective" statistical research that goes into reshaping the policy today. As a historically situated policy, the Head Start program's impetus as a redress to children living in poverty has

taken on new meanings shaped by dominant policy discourses up to the present. In fact, the Head Start program has appropriated much of the same language as the largely economistic policy described above. This serves as an example, however, of how the assumptions underlying contemporaneous policy research and policy overlap and influence one another. To be sure, these assumptions are adopted by policy to the degree it is written with the same rhetoric, until that policy is scrutinized critically in terms of value, purpose, and meaning.

In educational policy research, ideas for policy analysis become entangled in market logic and accountability schemes when the thrust or essence of the larger project (pedagogy) is neither market logic nor accountability, regardless of appeals to “real world” phenomena such as “at-risk” students. By opening up policy to viewpoints that challenge the status quo, that bring into relief the difficulties inherent to policy making, rather than casting them aside in the name of economic efficiency, that insist democracy is made by the entirety of its participants, citizens and the state merge in a way the root of policy, that is, *politea*, provided.

POLITICS OF EDUCATION

The importance of education issues to the citizenry is clear. Public opinion polls and surveys of the U.S. electorate consistently show education at or near the top of a list of issues that interest them. For example, in national survey reports copublished by the Public Education Network and *Education Week*, citizens put education issues at the top of their list of concerns. In a 2003 report titled *Demanding Quality Public Education in Tough Economic Times: What Voters Want From Elected Officials*, 55 percent of those surveyed consider education the top national priority, followed by health care (51 percent), jobs and economic development (37 percent), retirement and social security (36 percent), and terrorism and security (28 percent). Reports published in 2001 and 2002 showed similar results.

Politicians view this as an invitation to propose programs and policy solutions to the “problems” existing in public education. Similarly, local politics between school board members and administrators is commonplace, arouses community contempt and/or support, and often provides fodder for local journalists. From school board meetings in which the superintendent’s performance is under review to budget meetings in which the tax rate is being debated, issues of power, conflict, and ideology are evident. Whereas this political theater may seem more prevalent today than in previous eras, the fact remains that politics has been a constant in educational practice and policy.

Politics Defined

The politics of education as a field of study was first introduced in 1959 by Thomas Eliot, when he called on researchers to examine the effects of political decisions on schooling by administrators and elected officials. He posed questions such as: Who should pay for schools? Who should lead schools? And, what should be taught in schools? Inherently political, these questions continue to drive the policy debate around school effectiveness, teaching, curriculum, and funding.

Although initial research on politics and education came from political scientists attempting to understand political phenomena in educational contexts, educational researchers soon began to study politics from educational administration and policy perspectives. Jay Scribner and Richard Englert attempted to define the field of the politics of education within educational administration research with a categorization of central concepts. Utilizing David Easton's "authoritative allocation of values" definition of a political system, they framed their discussion around the concepts of government, power, conflict, and policy. As Easton described it, the political process involves an interaction that assigns a society's values, values which are then used to inform the policy formation process. Along with other scholars, Scribner and Englert propose that understanding how a community's values are manifested as policy and examining how such policy is advocated for, debated, and opposed prior to adoption becomes vital to understanding the politics of education and the democratic process.

Advocacy and Policy

School leadership, educators, parents, students, and community activists advocating on behalf of communities of color and marginalized students have historically questioned the political motivations or influence of certain policies and practices. These leaders have utilized advocacy frameworks to engage in the political and policy discourse. Educational historian Joel Spring traced the history of politics in schools from 1958 and the development of the National Defense Education Act to the 2001 reauthorization of the Elementary and Secondary Education Act (ESEA),

commonly known as the No Child Left Behind Act (NCLB). He delineated how educational policy and politics have influenced the effectiveness, fairness, and equity in schools and described the key political players and the roles they have undertaken in this endeavor.

Catherine Marshall and Cynthia Gerstl-Pepin argued that understanding advocacy, politics, and policy requires that researchers consider multiple perspectives of reality, and the authors question the manner by which power and interests are used to benefit some. How was the political debate framed by civil rights lawyers and leaders at the heels of the *Brown v. Board of Education* landmark case? How did Chicano rights activists spur the development of bilingual education programs across the nation, which culminated in the federal bilingual education legislation in 1968? And, how are current advocates of multiple-criteria accountability legislation attempting to combat high-stakes testing systems or organizing and mobilizing their efforts? These questions are at the heart of understanding the political nature of educational reform and law. They also center on discussions of power, conflict, and interests.

Conflict and Power

In 1960, Elmer E. Schattschneider argued that the essence of politics is the privatizing or nationalizing of conflict. Without a public or nationalizing effect of political conflict, the multiple sides or competing interests cannot air their differences. Often, those in power attempt to suppress debate by privatizing the conflict, or keeping it from receiving the attention needed for debate, argument, or persuasion. More recently, however, G. R. López has contended that conflict must be considered while also understanding how power can be used to institute racial hierarchies. While understanding how educational conflict influences, for example, the adoption of history textbooks, the method of teaching science, evolution, or creationism, or the ability of students to meet in gay-straight alliances, is essential and informs educational research. López has argued that the inherently and institutionally racist nature of educational policy, politics, and practices coupled with unequal power dynamics also influences political phenomena.

Macro- and Micropolitics

The politics of education exists at multiple levels of influence. Historically, the federal government did not play a significant role in making or influencing educational policy for public schools, but this has changed in recent years. State government is the level of government at which the most influence has been wielded over how schools are funded, how teachers are credentialed, what is taught to students, and what requirements will result in a high school diploma. Local level or school district governing structures have also influenced political reality. Along with campus or school-level micropolitics, local-level politics are influenced by the roles taken by their school board membership.

Having the ability to examine political phenomena from macropolitical and micropolitical frames enables researchers, educators, and students to better address issues of power, conflict, and interests. Although student and parent perspectives of political phenomena have remained scant in the politics of education literature, it is yet another level of micropolitical activity that deserves study, especially in regards to student activism, organization, and leadership.

POPULAR CULTURE

Before students ever set foot in a classroom, they have accrued an understanding of teachers and teaching. That is, children come to school already having consumed images and ideas about education. Popular culture (mediated texts like television, films, magazines, music, comic books, etc.) partially informs such a cumulative text. Since ideas about schooling are socially constructed, popular culture influences the knowledge people (adults and children) have about schooling. Popular culture mediates the sociocultural context from which schooling is understood. This means that analyses about schooling must include questions of how popular culture helps inform these understandings. This entry examines how the investigation and inclusion of popular culture is important to our knowledge about schooling.

The Role of Culture

Popular culture texts are often utilized as part of people's leisure activities. They are generally texts that amuse or entertain. People, including students, seek out texts as willing consumers. They read magazines, watch television and movies, and listen to music of their choice. Some view the texts as harmless entertainment, while others argue the different texts comprise a larger institution, often synonymous with media, that works to uphold society's values.

This is one of the main reasons educators have become concerned with popular culture as a site of education. Ideological messages are communicated through representations, thus popular culture becomes a teaching tool. People learn about the world, including schools, through these representations. For example, a

child may learn about gender roles from watching Disney films, most of which illustrate traditional and confining gender stereotypes. Through media, people also have access to worlds with which they may not be familiar. For example, many Americans learn about the Middle East only through mediated representations, having never traveled or lived there.

People also learn about themselves through the consumption of texts. For example, many students, questioning their sexual identities but having no experience outside of the heterosexual world, may learn what it means to be gay through texts like *Will & Grace* or *Brokeback Mountain*. Popular culture is a teacher and the lessons taught are not always consistent with educators' beliefs about what students should learn.

People also construct vivid understandings about schooling through popular culture texts. One way people come to know schools, teachers, and students is through viewing the ways they are portrayed on television or in Hollywood films. For example, through watching films like *Dangerous Minds* or television programs like *Boston Public*, people may conclude that urban schools are dangerous places and kids of color within urban schools are in desperate need of saving by White teachers. Films like *Clueless* and *Ferris Bueller's Day Off* may suggest that White upper-middle-class youth are self-absorbed, consumed by the desire for popularity and material goods, and that their teachers are easily duped by their adolescent antics.

Through media, people also hear how unprepared and unprofessional teachers really are, and they are taught the dominant discourses surrounding what makes a good teacher. This is ideological knowledge filed away in consciousness. Unless these images get interrupted by personal and/or professional experiences in schools, people construct negative images of the education system because there are few positive images portrayed in popular culture.

Popular Culture and Academia

Popular culture has not always been welcomed into academia. Part of this is due to the binary that exists between academic versus popular knowledge. Many

cultural theorists believe the reason for this is that popular culture had long been viewed as a lower form of culture compared to artifacts like theater and opera. The Frankfurt School theorists engaged in critical communication studies in the 1930s and, with the help of Theodor Adorno, coined the term *mass culture*. This term actually reified the binary between high and low culture. Though followers of the Frankfurt School analyzed mass culture within the context of the cultural industry in which the artifacts were produced, many critics now believe that Adorno and others viewed the "culture industries" as too adept at mass deception. Instead of envisioning consumers as capable of resistance, the Frankfurt School viewed them as easily duped by the industry. They conceptualized mass culture as an ideological tool, which existed to legitimate the status quo.

The Birmingham Centre for Contemporary Cultural Studies was the next large academic focus on popular culture. It came out of the U. K. in the early 1960s and approached popular culture from a multi-disciplinary perspective. The intent of those affiliated with British cultural studies (BCS) at the time was to subvert the binary that existed between high and low culture and to do that, they rejected the term *mass culture*. Cultural critics now charge BCS with analyzing popular culture texts from a narrow perspective. Although participants in BCS conceptualized texts as either dominating consumers or enabling resistance, many critics now claim there was too much of a focus on class and a lack of focus on race and gender.

As a discipline, cultural studies has been and continues to be dynamic, that is, changing in response to social, political, and historical contexts. In the 1970s feminist scholars and Black scholars challenged the discipline to look at the ways gender and race, like class, must inform any study of culture. This raced and gendered influence continues to be seen in cultural studies texts that examine popular culture today. This focus has expanded to also include notions of ability, sexuality, and all other features of identity.

Popular Culture and Critical Pedagogy

Cultural studies work, by necessity, is interdisciplinary. This has enabled educational theorists to make links

between popular culture and schooling. The discussion of popular culture and critical pedagogy has examined questions about the relationship between knowledge and power. In the early 1990s, there was a move to include the study of popular culture in the development and practice of critical pedagogy. Many argued that critical pedagogy must include popular culture as a site of inquiry and schools should be conceptualized as instructional sites as well as cultural sites.

Schools were places that produced subjects and subjectivities. One of the ways students constructed knowledge was through learning from popular culture. It was believed that if educators could acknowledge popular culture as a site of learning, they could link learning school knowledge to students' everyday lives. Since part of critical pedagogy is working toward a democratic society while empowering students, understanding how students constructed knowledge through practices outside of school could only assist educators in the empowerment of students.

The relationship between popular culture and schooling is complex, particularly as it relates to pedagogy. Since popular culture is most often reflective of youth culture, school systems, including both administrations and teachers, and youth, often clash over its incorporation in school social and academic settings. In schools, a familiar stance is one of opposition to popular culture sharing academic space. Students are often chastised for or forbidden from participating in popular culture in schools where certain genres of music, I-pods, body art, trendy magazines, and words on T-shirts are banned and labeled as destructive and distracting. This judgment made by schools on the popular cultural choice of students is often met with resistance since many students see these expressions as integral parts of their identities.

At the same time, teachers seeking to include popular culture in the classroom will choose texts they deem "proper," which students may or may not find relevant or representative of their lives, and this too is often met with resistance. This resistance informs how children perform their role as students. It dictates when they decide to listen, cooperate, and learn and when they dismiss a teacher's knowledge and academics as irrelevant to their social world.

Critical pedagogues believe teachers can learn to embrace and utilize popular culture and its multiple forms of expression without judgment. Doing so changes the nature of authority in the classroom as students become experts and knowledge holders and the teachers become learners. Educators may have to accept that they can never be the "experts" in this arena. Due to its dynamic nature, once a popular culture form enters the realm of teacher knowledge and pedagogy and is made acceptable in school settings students lose interest and move on to the newest, latest, and coolest forms of expression.

Consumption

The field of cultural studies has also examined the processes of consumption as a cultural site. The discipline explains that this phenomenon is not just about economics but also incorporates desires, identities, and dreams. These desires and dreams are fueled by popular culture texts that shape and reflect what items kids think are "cool" and what brings status. They direct the trajectories of consumer culture. As a result of their relationships with both the items and the popular culture representations, kids are often accused of materialism. This materialism, and the means by which students go about acquiring desired material goods like the latest pair of designer jeans, the most up-to-date technology, or the hottest new sneakers, is looked upon as detrimental to academic progress since it is claimed that the focus on school work is often overshadowed by preoccupations with material items.

This engagement with consumer culture is highly contested across class, gender, and racial lines. Students from low-income families are often berated for their preoccupation with items they cannot afford. Students of color are often represented as criminal in their attempts to secure items, since a dominant discourse presumes they steal from their classmates and others. Internalizing these representations results in a preoccupation on the part of schooling systems with character education and security measures designed at reigning in these consequences of consumption practices and mitigating the influence of popular culture.

Representation and Marginalization

Some educational theorists questioned not the linkage between critical pedagogy and popular culture but the means to obtain it. These theorists claimed much of the work on critical pedagogy neglected the potential contradictions between various political movements and subsumed everything under a White, working-class, male perspective. This critique occurred while a growing field of cultural criticism was emerging.

Many cultural critics, concerned with the ways ideology was transmitted through popular culture forms, turned their attention to critiquing the power of the few representations that existed of marginalized groups like African Americans, Latinos, and gays and lesbians. Critiques about representation of marginalized groups have been important because of the ways the dominant society utilizes popular culture as a means for us to learn about ourselves and others. At first, critiques focused on the lack of representation and/or the negative stereotypes embedded within the representation. Soon, attention turned to how audiences make sense of the representations and how that sense making informs their understandings about themselves and others. This attention to meaning making by the discipline revealed that audiences are active participants in popular cultural discourses, not empty vessels waiting to be filled or cultural dupes led only by what they see and hear.

Media Literacy

Media literacy is the teaching about the power of textual representation. Before teachers can help students to become critical consumers of popular culture, they must first educate themselves. The move toward media literacy in schools takes two approaches. The first approach views media in a critical way. It conceptualizes popular culture as an ideological tool (similar to the Frankfurt School) but works to teach students how to be critical consumers and uncover the embedded ideology within a text. This type of media literacy grew out of Stuart Hall's conceptualization of three reading strategies a viewer may utilize to make sense of a popular culture text. The reading positions, dominant, negotiated, and resistant, are directly related to

the reader's social position in relation to dominant ideology. A dominant reader, because of his or her position in society, is often blind to dominant ideology and, therefore, much of the ideological messages and negative stereotypes produced by racism, sexism, classism, and heterosexism remain invisible. Media literacy in this approach seeks to assist students in uncovering the ideology and critiquing the negative stereotypes as part of a larger project toward social justice.

The second approach is similar to the critical pedagogy stance but also has similarities to the BCS approach. Here popular culture is viewed as an integral part of students' lives. By validating students' consumption of popular culture, educators are validating student-constructed knowledge. This approach also views popular culture as a space of resistance. Students may learn about themselves and others but are also able to speak back to the messages they garner. This type of media literacy takes the stance that popular culture is capable of more than being an agent of ideological domination. Instead, it is viewed as an authentic part of the student's experience. Educators must understand what students know and learn from the popular culture texts they consume. By valuing this student knowledge, educators are viewed as helping to further democracy and emancipation, in other words, a media literacy version of liberatory education.

POSTCOLONIALISM

The study and theory of postcolonialism investigates history: the origins of colonialism during the age of discovery and exploration; the ensuing political, economic, and cultural struggles between colonizers and colonized peoples through the twentieth century; and the enduring effects of colonialism upon relationships between individuals, societies, and nations.

Whereas imperialism describes the expansion of a state from the center through economic and cultural domination and military force, the two major forces behind colonialism are economic exploitation and trade and settlement. Colonialism and imperialism have common features and differences. While they both are terms that imply subjugation of one group of people by another, imperialism works under the initiative of overt exploitation and extraction of wealth. Neocolonialism (i.e., new colonialism) contrasts with postcolonialism in that the postcolonial state remains in a situation of dependence on its former masters and the former masters continue to act in a colonialist manner toward formerly colonized states. Neocolonialism is oriented primarily to the cultural and economic relationships associated with development, dependency theory, and critical development theory. Postcolonialism examines the relations of domination and subjugation between and within nations, cultures, and societies. It signifies a field of inquiry concerned with the cultural, psychological, social, political, and economic interactions of colonizers and colonized people.

The term's denotation varies, as the concept transcends disciplines. Edward Said's *Orientalism* is considered a founding work of postcolonial theory,

deconstructing the Western exoticizing of Middle, Near, and Far Eastern cultures, and rigorously explicating the ways in which this defining as "the other" reinforces occidental stereotypes and effectively precludes the self-representation of oriental voices. One major literary voice is Chinua Achebe, whose *Things Fall Apart* and *No Longer at Ease* fictionally portray the stark position of those who must negotiate untenable positions between former colonizers and their own indigenous communities, while dealing with issues like bribery and corruption as virtual aliens in their own countries. Franz Fanon and Albert Memmi explain in nonfiction how colonizing education is a two-way street, in that the colonizers as well as the colonized produce and perpetuate knowledge claims that are epistemologically and ontologically biased and inherently subjective; the knowledge claims are rooted in a particular group's collective heritage, which itself is in constant flux. These forms of education, founded on injustice, do sociopsychological violence to the identities of all parties, especially the subaltern.

Robert J. C. Young aligns the study of postcolonialism with Marxist political philosophy, committed to a more just and equitable society. Marxism historically provided the theoretical inspiration and most effective political practice for twentieth-century anti-colonial resistance.

While imperialist and colonizing countries have largely withdrawn from direct political control, independent excolonies have not completely realized political and economic self-determination. Thus as its agenda, according to Young, postcolonialism critiques the forces of oppression and coercive domination that operate in the contemporary world. Young further asserts that postcolonialism is not a static poststructuralist intellectual exercise—it inherently warrants action.

Gandhi observed that education systems around the world, historically, have functioned as mechanisms for the maintenance and perpetuation of power structures in colonial relationships. Postcolonial thought directly informs the fields of comparative and international education, particularly in the understanding of the development and organization of schools and education systems, globalization, and curriculum and language policies. The theory is particularly helpful for understanding conflict and postconflict education in

postcolonial contexts. Postcolonial theory indirectly influences domestic education in the subject areas of history, geography, sociology, economics, literacy, and civic and multicultural education.

John Willensky extends Said's critique of Western naming, ordering, classifying, and emphasis on differences and explores how schools, curricula, and teaching methods have been shaped and influenced by the legacies of imperialism and colonialism. While acknowledging the value of knowledge gained during this period, he questions the resulting connection between having a Western comprehension of the world inextricably linked with the conquest of it. He recognizes that schools are actively responsive to diversity, multiculturalism, and multilingualism, and that the content of contemporary textbooks is carefully evaluated, but that the broad context of understanding difference and the role of schools in society can be informed by a postcolonial examination of education.

POSTMODERNISM

From the perspective of postmodern theory, modern education is seen as the mass education that began in the nineteenth century with standardized curriculum, grades, degrees, and public accreditation. It is criticized as homogenizing, normalizing, and imposing the norms, practices, and values of the dominant society on the

young. Modern education, from this perspective, corresponds in the field of education to mass production and consumption characterizing modern societies, and an era dominated by corporations, the state, military, and educational institutions marked by bureaucracy, a technical system of instrumentalized rules and regulations, and mass conformity. Proposals for a reconfiguration of education to suit a postmodern philosophy and electronic technology have been made. This entry contrasts the modern and postmodern views and looks at their application to education.

Modern Versus Postmodern

Modern education is connected to an era of print technology and literacy based on reading books. As Marshall McLuhan argued in the mid-1960s, in works such as *Understanding Media*, different societies have various dominant media that provide diverse modes of society, culture, and education. McLuhan distinguishes between premodern oral culture and traditions, modern print culture, and (postmodern) electronic culture. In traditional, premodern societies, education is oral and transmits relatively fixed and changing traditions and a hierarchic, authoritarian social structure.

For McLuhan, the major instrument of modernity was the emergence of print technology that created an entirely new modern culture, and modes of education and subjectivity with print media dominant. Modern culture and education were highly nationalistic, often determined by the state and reproducing national cultures. Modern education tended to be secular, following the enlightenment and predicated on a separation of church and state. Modern education was organized on the factory and industrial system with public and private buildings and grounds, and classes organized around time periods.

In McLuhan's view, new electronic technologies create new modes of culture connected to media like radio, film, television, and now computers, and create new forms of subjectivity that are more sensory, multimodal, fragmented, and decentered. For McLuhan, there is a misfit between the experiences of students in a rationalized, abstract, book culture environment of schooling and the more kaleidoscopic and aesthetized media culture in which they are immersed.

Sherry Turkle, in her 1995 book, *Life on the Screen*, describes the emergence of personal computer technologies and the novel forms of interaction, identities, and experiences that they are producing. She interprets the shift from big mainframe computers to personal computers as symptomatic of a postmodern shift to an innovative type of computer technology and novel forms of subjectivity and culture. For Turkle, big IBM mainframe computers are bound up with centralization, massification, hierarchy, big government, and corporations, and are thus a symbol for modernity itself. Further, modern computers are connected with mechanistic science that is universalist, rationalist (there is one way to do it), and top-down, with a cult of experts and hierarchy; it is also for Turkle rooted in hard masculine science that is logical and abstract.

By contrast, Turkle claims that personal computers are bound up with a postmodern logic and aesthetics. On her account, postmodern computer technologies are “soft” and “feminine” (e.g., more concrete and ductile), subject to tinkering, more graphic and multimedia, and more expressive, merging art and technology. Whereas modern mainframe computers required highly specialized knowledge and were only accessible to a techno-elite, postmodern personal computers are “user-friendly” and lend themselves to experimental activity and promote creative and multifaceted selves. Personal computers thus nourish a postmodern culture of the iconic surface, for while old modern computers required depth-oriented thinking and in-depth technological know-how to get behind the screen, current computers operate on the surface, requiring only that one point and click to navigate cyberspace.

Furthermore, personal computers, in Turkle’s analysis, enable a more decentralized, individualist, and variegated culture that can generate postmodern selves—multiple, fragmented, constructed and provisional, subject to experiment and change. “Windows” for Turkle is the privileged metaphor for postmodern subjectivity—dispersed, decentered, and constructed. Computer software windows open the subject not only to the work world of texts and word processing, but also to the emerging realms of simulation, cyberspace, and interactive multimedia culture.

A Prescription for Education

From these postmodern perspectives, education needs to be reconstructed to overcome the divisions between students’ everyday life in a media and computer culture, and to generate new literacies that will enable students to interact in the contemporary world. Allan and Carmen Luke, in their 2001 article “Adolescence Lost/Childhood Regained,” argue that broad-ranging and robust new pedagogies are needed to grasp the changing social and psychological conditions of life in a globalized, high-tech, and digitized world. They also argue that dramatic transformations of education are necessary to create subjects and practices appropriate to a new global society, digitized culture, and world of new identities, social relations, and cultural forms.

Indeed, some educators have been arguing for a reconstruction of education based on developing new literacies to engage new technologies variously described as multiliteracies, multiple literacies, or multiple technoliteracies. Projects for a postmodern reconstruction of education also build on Dewey’s pedagogy, and particularly his calls for the democratization of education to produce more robust democratic societies.

Ironically, during the opening years of the third millennium when postmodern critiques of modern education were widely circulated and reconstructive programs were being advanced, the Bush administration in the United States was pushing a program predicated on standardized testing, focusing on print literacy and mathematics, and generally reproducing what critics believed to be problematic aspects of modern education. However, in an era of continuous technological development and the emergence of new technologies, critiques of modern education will persist and new proposals for the postmodern reconstruction of education will continue to circulate.

PRAXIS

Praxis, in its simplest construal, means “theory plus action.” It indicates life practice formed from both reflection and action. The self, striving to transform the world creatively according to an emerging vision based on its own values, actualizes itself as it actualizes its vision. Because individuals’ actions always affect other people, *praxis* is inherently political.

Aristotle was the first to conceptualize *praxis*. He drew distinctions among three types of knowledge: *theoria*, from which the word theory is derived, which meant speculation, contemplation; *techne*, meaning craft, skill, or art; and *phronesis*, the knowledge born of a combination of *theoria* and *techne*, which is most commonly translated into English as practical wisdom. *Praxis*, which derives from the practical wisdom of *phronesis*, is concerned with making the best life choices. It assumes not only intellectual insight, but in-depth acquaintance with the practical considerations needed to intervene skillfully, creatively, and in a timely manner in practical problems.

Karl Marx also used the term *praxis*, but with a decidedly different emphasis. Against the prevailing Hegelian thought of the time, Marx argued that it is not the consciousness of men that determines their being, but their social being that determines their

consciousness. He argued that industrial capitalism alienated workers because factories severed them from the creation, design, and use of the products of their labor. Instead, he envisioned laborers not as cogs in a machine, but as artists shaping integral, holistic products that emerged as expressions of their visions. In the Marxist sense, then, *praxis* is both practical and revolutionary as oppressed groups critically assess the world and change society based on their own class’s interests, rather than uncritically absorbing the ideology of the oppressor class.

Because Marxist *praxis* depends upon educating those people who need liberation, it demanded new, creative educational approaches, an emancipatory pedagogy that would critically appraise dominant ideology and that could be widely available to the working class. Emancipatory pedagogy never became as important in the United States as in many parts of Europe, South America, and Africa, but the work of influential Brazilian educator Paulo Freire has been studied by North American educators since the early 1970s. Freire, whose perspective derived from both Marxist and existentialist thought, maintained that for the oppressed to become authentic selves they must fight not only for freedom from hunger, but for freedom to create and construct, wonder, and venture. True knowledge, Freire contended, emerges only through restless, impatient, continuing, hopeful, critical inquiry with other people about their relations to the world. Therefore, he advocated that instead of learners receiving, filing, and storing deposits made by educators, learners should be allowed to develop *praxis*, an inventive and interventive way of life that encourages free, creative reflection and thoughtful action in order to change the world, even as the learners are transformed in the process.

PRINCIPALSHIP, HISTORY OF

Until the end of the nineteenth century and the beginning of the twentieth century, full-time building administrators were not typically found in schools. Since then, the role of the principal has constantly been reshaped, redefined, and renegotiated due to changing demographics, conflicting societal values, and shifting expectations. Throughout the history of the modern American school, differences in political, social, and economic philosophies have had a major impact on the development and organization of education in general. Immigration, urbanization, the rise of great corporations, the traumas of two world wars, the Great Depression, the social upheavals of the 1960s and 1970s, and the high-stakes accountability movement of the 1990s influenced the values of society, reshaped the purpose of schooling, and increased the demands of the principalship. This entry reviews that history.

The emergence of the principalship during the late 1800s created the shift of the administrative leader from “head teacher” to “principal.” The professionalization of the principalship during the early 1900s was the process of formal recognition and acceptance of the role. The anti-intellectualism of the principalship between the years 1940 and 1960 questioned the transition from scientific management through the human relations movement to the theory movement. The constancy and change of the principalship throughout the 1960s and 1970s highlighted the tensions between those seeking stability and the maintenance of traditional values and those pressing for change. The reform and restructuring of the principalship from 1980 to 2000 charted the shift in demands from management and control with forced compliance to shared decision making and decentralized site-based management. This entry explores this development of the principalship from its inception to the present, and concludes by outlining the challenges and promises of the principalship for the twenty-first century.

Early Years

The “head teacher” of the early nineteenth century was the first professional position in American

schools to have administrative and supervisory responsibilities. As the nation’s population grew and one-room schools became graded, multiroom schools with several faculty members, the need for program coordination and internal management increased. Although hardly differentiated from teaching, head teachers were appointed to monitor students, teachers, and classroom procedures.

Accountable to the locally elected school board, “principal teachers” were expected to teach the highest class in their school, to implement specific board policies, and to perform certain clerical and janitorial tasks. Over time, their duties became mainly administrative and less involved with direct classroom instruction. The actual term *principal* appeared as early as 1838 in the Common School Report of Cincinnati and then again in 1841 in Horace Mann’s report to the Massachusetts School Board, but the title did not become formally recognized and widely accepted until the latter part of the nineteenth century.

The development of the eight-year, graded elementary school and the district system, combined with the common school ideal of a uniform curriculum for all children, the desire of the middle-class and native groups to protect their values and power, the need for the socialization of students for an industrial workplace, and the position of principal and *his* (i.e., school administration was structured from the beginning as a “manly” profession) accompanying “pedagogical harem” were all elements in the early development of a hierarchical, bureaucratic organization for the administration of American education.

The burgeoning role and new authority position of the principal was solidified in the early 1900s with the beginning of the Progressive movement and the advent of scientific management. Scientific management, with its emphasis on efficiency, had dramatic and almost immediate effects on education, including the “professionalization” of the principalship. During this time period, executive, managerial functions were centralized and structured systematically at the top with specialized divisions in a hierarchical model intended to cause the entire school district and each school to run efficiently. The role of the principal shifted from evangelical missionary and values broker to scientific manager and dignified social leader.

Charged with administering discipline, selecting, hiring, and evaluating teachers, determining the curriculum, monitoring pedagogical techniques, and overseeing other organizational tasks, the principal was quickly established as the school's administrative head and directing manager of instruction. This perspective of the principal as a business executive continued until the alliance between business managers and school administrators collapsed under the economic pressures of the Depression.

A Transition Period

The anti-intellectualism of the principalship chronicled the transition from the scientific movement through the human relations movement to the theory movement. Because of World War II and the Cold War that followed, the values of the 1940s and 1950s were less religious than earlier and more concerned with democratic principles. From 1940 to 1960, there was a pivotal shift from a top-down managerial philosophy to more of a democratic facilitative process of developing, supporting, and coordinating cooperative group efforts as both the end and the means of reform in schools.

As a result, the principal's role changed from authority figure to process helper, consultant, curriculum leader, supervisor, public relations representative, and leader on the home front. Those occupying the role were expected to demonstrate democratic rather than autocratic leadership, to be directly involved with the school's instructional program, and to communicate the practices and priorities of the school to the community. The business-management doctrine was abandoned and the "social conscience" of administrators was awakened.

After World War II, communities began to rebuild, the economy began to rebound, and liberal progressive educators began to speak out. Although the *Brown v. Board of Education* decision happened in 1954, the ramifications of this Supreme Court case and the notion of inequitable schooling were not truly dealt with until the 1960s and 1970s. In 1957 however, when the Soviet Union launched *Sputnik*, the effects were immediate. As fear and panic gripped the nation, a major crusade against ignorance initiated the anti-intellectualism campaign against schools in general,

and principals in particular. Metaphors for the principal in the 1950s include the principal as administrator, defender of educational practice, provider of empirical evidence, efficient manager of time, and overseer of minute details.

The constancy and change of the principalship during the social and political turbulence of the 1960s highlight the tension between forces seeking stability and maintenance of traditional values and those pressing for change and the emergence of diverse values. While schools concentrated on academic excellence, particularly in math and science, principals drew on empirically developed strategies for management, organization, and stability, often neglecting the instructional arena as a domain of primary concern. The role of the principal during this time shifted to that of protector of bureaucracy, user of scientific strategies, accountable leader, and inhabitant of a role in conflict. Principals were caught between the constancy of bureaucratic rational thought and the outcries for a social revolution.

The growth of social problems in the 1970s required principals to provide a wide variety of remedies that turned their primary attention away from academic leadership. They were expected to lead students, teachers, and the larger community; to impart meaning to educational efforts; to juggle a number of roles that often required competing skills; to relate well to others; and to facilitate positive interactions between students and teachers. Public confidence in education declined in the 1970s, and the theme of accountability surfaced for the first time.

A Reform Era

During the reform stage of the 1980s and the restructuring stage of the 1990s, principals emerged as primary players in the improvement of school instructional programs. The instructional leadership role of the 1980s highlighted the centrality of the principal's role in coordinating and controlling curriculum and instruction. During this decade, principals were seen as problem solvers, resource providers, instructional leaders, visionaries, and change agents. They managed people, implemented policies, and provided resources to facilitate the teaching and learning process. Principals also developed

and communicated a picture of the ideal school while facilitating needed changes in educational operations to ensure student learning and school effectiveness.

In contrast, the transformational role of the 1990s emphasized the diffuse nature of school leadership and the role of principals as leaders of leaders. Restructuring during the 1990s brought the knowledge needed for school improvement back to the school and the role of the principal back to the image of leader, servant, organizational architect, social architect, educator, moral agent, and community member. During this phase, it was the responsibility of the principal to lead the transition from a bureaucratic model of schooling to a postindustrial model. The role of the principal had come full circle from 1840 to 2000, from “head teacher” to “teacher of teachers.” The description of moral, ethical, and servant leadership echoes the earlier role of principal as evangelical missionary, values broker, and spiritual leader. And, the notion of goals, objectives, and benchmarks mirrors the earlier concept of efficiency, scientific management, and bureaucracy.

Looking Ahead

As history continues to repeat itself, the twenty-first century presents new challenges and promises for the principalship role. Charged with the mission of improving teaching and learning for *all* children, the position has become progressively more and more demanding and fraught with fragmentation, variety, and brevity. The role has evolved into administering a highly specialized, extensively regulated, and enormously complex human organization—far more complex than at its emergence a hundred years ago. The emphasis has also shifted from pointing out the processes that must be used by principals to more of a values-based, outcomes-based approach to what schools are supposed to accomplish.

The shift in transforming schools from a power-over to a power-with approach signifies a reorientation toward moral leadership, professional empowerment, and collegial interdependence. Through collaboration, communication, and experimentation, principals in the twenty-first century can be learner centered, vision driven, action oriented, and reflectively confident in

their ability to instigate reform and stimulate success for all students.

PRISON EDUCATION

Prison education is any type of education that has inmates of prisons or jails for students. This includes high school or its equivalency, vocational and academic courses of study, undergraduate, graduate, continuing, certificate, and degree programs. Prison education means different things to different people. The reformer may see it as a means of improving prison conditions. The prison staff may see it as a way to keep prisoners occupied. Educators may see it as remedy for past injustices and researchers may see it as a way to reduce recidivism. Prisoners themselves may see it as a way to pass the time. Taxpayers may see it as a privilege for undeserving students.

Despite the differing attitudes, opinions, and purposes that surround this issue, criminal recidivism (the tendency to relapse into criminal behavior) rates indicate that prison alone is not a deterrent to crime. Society in general, and inmates in particular, need ways to understand, address, treat, and ultimately prevent recurrent criminal behavior. Education is one such method. This entry looks at the history of prison education, debates over its effectiveness, and its current status.

Historical Background

In the 200-year history of prisons in the United States, some type of prison education has always existed. Education has played a role in the social mission of the prison throughout its history, and its role has been shaped and changed in the systemic conflict between security, punishment, and treatment.

The Pennsylvania System

The first prison in the United States was run by Quakers in Philadelphia in 1791. They felt that solitude and the Bible would rehabilitate better than public humiliation or corporal punishment. The rehabilitative ideal affirms that the primary purpose of prison is to effect changes in the characters, attitudes, and behavior of convicted offenders, so as to strengthen the social defense against unwanted behavior, but also to contribute to the welfare and satisfactions of offenders. Education, predominantly religious in content, was seen as an integral part of this ideal and was incorporated in 1798. Quaker rehabilitation-based prisons became known as the Pennsylvania system. Later, in the 1820s, a competing system lacking an educational component, known as the Auburn system, was developed in New York State.

Alternative Systems

In the Pennsylvania system, prisoners were totally isolated except for nightly visits from a chaplain. This chaplain would provide reading lessons to facilitate the reading of the Bible. In the Auburn system, men labored together all day in total silence. The latter's founders believed that prisoners needed to be treated severely, producing terror and suffering, and they doubted that the prisoners were reformable. By the 1840s, the Pennsylvania system was losing popularity and the Auburn system was adopted by most states.

Toward the end of the 1800s, a different view of criminality emerged, spearheaded by Zebulon Brockway. He felt that some of the blame for a criminal's behavior fell to society, stemming from environmental influences and poverty. Therefore, he believed that education could provide a regeneration of the individual as well as the individual's successful reintegration into

society. This began the Reformatory era and the first ventures into postsecondary corrections education.

Higher Education

The first higher education courses in prisons were correspondence courses from Columbia University. In the 1920s, other, primarily land-grant colleges, began offering courses in prison, including studies in agriculture, real estate, salesmanship, and remedial level academic courses. College-level studies were given at Sing Sing prison by Columbia University beginning in 1923.

The state of California had the most extensive prison education programs in the country. In 1928, San Quentin prison reported that there were 438 prisoners enrolled in University of California courses. Midwestern inmates took extension courses from colleges and state education agencies. Southern states offered little to no education with the exception of a few, isolated literacy programs. After World War II, due to the GI Bill, adult higher education grew quickly. State colleges and universities increasingly developed continuing education divisions and community colleges. Prison higher education benefited from this growth.

The first degree program in prison was initiated in 1953 by the Southern Illinois University at Carbondale at the Menard State Prison. Inmates were funded by state aid and university grants. Lack of funding was a persistent problem with prison higher education and its growth slowed in the 1950s. By 1965, only twelve postsecondary college education (PSCE) programs were operating on a regular basis.

Pell Grants

Perhaps the single most important event in the development of PSCE occurred in 1965 with the passage of Title IV of the Higher Education Act, which included Pell Grants that were available to prisoners, to pay for higher education. The 1960s and 1970s experienced growth in PSCE unlike any other time in history. Funds were available from public sources, private sources, federal, state and local government, and foundations, although very few received funding from their parent organizations (colleges and universities, etc.). Rehabilitation was a top priority for prisons, which were renamed correctional institutions. The types of

education programs attended typically included adult basic education, high school, GED preparation, life skills, vocational training, and postsecondary education. In 1968, there were college programs in thirteen states, and by 1970, there were college programs in thirty-three states. PSCE grew from 182 programs in 1973, to 350 programs in 1982. In 1981, at least 28,000 prisoners were participating in higher education.

Despite criticism, prison education continued and many researchers attempted to prove its efficacy by studying programs and with small-scale syntheses of prior research. Many of these had vague or mixed findings, however, most found somewhat positive connections (i.e., negative correlations, etc.) between PSCE and recidivism. One study showed that inmates with at least two years of college have a 10 percent re-arrest rate, compared to a national re-arrest rate of approximately 60 percent.

In 1992, Pell Grants for PSCE were reauthorized with assurances that the Pell Grant was to be used to supplement rather than supplant state funding. In 1994, forty-three states provided associate's degrees and thirty-one states offered bachelor's degrees. Nine states offered master's degrees and three offered doctorates. By 1994, more than 60,000 prisoners appeared to be involved in college-level course work. This growth ended in September of 1994.

The Violent Crime Control and Law Enforcement Act of 1994, became public law 103-322 on September 20, 1994. Section 20411 of this act amends the Higher Education Act of 1965 to prohibit awards of Pell Grants to any individual incarcerated in a federal or state penal institution. Once federal aid for prison education was eliminated, state aid was also cut. In 1990, there were 350 higher education programs for inmates. In 1997, there were 8. If prisons are offering any education at all, it is increasingly likely to be computer-based distance learning or housed in programs directly controlled by state departments of corrections.

Pros and Cons

A debate surrounds what types of education are best for inmates. Current trends are away from traditional college courses held in prison, and moving toward an

education component specifically designed for prisoners. Since a traditional college education includes problem-solving and critical thinking skills, a more global worldview, and an understanding of society, it is a matter of debate that programs that focus on literacy, mathematics, occupational factors, good behaviors, attitudes, and discipline, only (for example), enough to enable an inmate to make qualitative changes and achieve legitimate success in life.

The argument for educating prisoners goes beyond the notion of criminals' perceived worthiness or, more likely, unworthiness, of such an effort. Examining the constructs of crime and punishment further complicates the issue. Freud believed that the reason governments forbid wrongdoing is not their desire to abolish it but their desire to monopolize it. Michel Foucault felt that society deliberately created the notion of crime in order to justify law enforcement that was available in case it was needed to suppress political dissent. The concept of crime was also used to funnel aggressive members of society's lower class away from revolution against the dominant social structure.

Rehabilitation demands the constant search for the sources of criminality, which inevitably leads to discussions of how certain social contexts place youth at risk. The fact that the predominance of prisoners come from low socioeconomic families and communities, typically have had less education, both in terms of years completed and the quality of instruction and resources available, is no coincidence. It is a fact that, nationwide, over 70 percent of all people entering state correctional facilities have not completed high school, lending credibility to the assertion that education and criminal behavior are negatively correlated.

Outlook

The tough-on-crime stance of the late twentieth and early twenty-first centuries makes it highly unlikely that a rebirth of the rehabilitation movement will be easily rekindled though legislation or government programs. Despite two decades of decline in correctional treatment, the rehabilitative ideal has shown amazing tenacity.

Although a return to the pre-1994 funding of PSCE would improve and expand its role and impact

enormously, it is doubtful that this will occur. Alternative funding is in place in some areas and some grants are available for those inmates under twenty-six years old. Most mission statements of higher education institutions include some kind of commitment to the community. Educational partnerships with correctional institutions are worth consideration and investigation in line with that mission.

PRIVATIZATION

Privatization represents a worldview that privileges individualism and promotes competition. It operates on the assumed validity of neoclassical economics and the presumption of “free markets.” For schools, privatization is seen in and represented by Channel One television in classrooms, advertisements on stadium scoreboards, soft drink vending machines in hallways, fast food franchises in cafeterias, and textbook covers handed out by teachers. This entry describes privatization in schools and discusses its impact on religious schools.

Characteristics of Privatization

Privatization is perhaps most clearly seen in initiatives to turn public schools into money-making enterprises. The Edison Project and Educational Alternatives, Inc. are examples of this sort of privatization initiative. Privatization is also seen when central offices expand staff responsibilities or hire “public” employees to develop “school-business partnerships” with private corporations. Privatization includes voucher initiatives, for-profit charter schools, and contracting for goods and services in schools. To be sure, these last examples are akin to the practice of contracting for goods and services that have existed in public schools for quite some time.

Peter Drucker’s mid-twentieth-century concept of privatization helps us clarify the practice of public school districts entering into contracts with private, for-profit organizations to deliver educational goods and services. Accordingly, U.S. public schools *already* practice a form of privatization and have done so for quite a long time. They contract out services to companies or entities that provide school districts instructional media (Channel One), books (textbook adoptions), food (cafeteria, fast food franchises, vending machines), transportation (buses), custodial services, and so on.

The idea of privatization is even further clarified by noting proponents’ arguments for it: privatization brings the efficiency of the marketplace to public schooling; because schools do not keep pace with international standards, they must respond to the competitive demands of the marketplace; and privatized schools would be more accountable, cost effective, and entrepreneurial in promoting teacher and parent empowerment. Privatization advocates argue for eliminating government oversight and dispensing with social and collective values because government, on the measures of cost and efficiency, is not as profitable as private industry.

Traditional discussions about privatization of contemporary U.S. public schools usually distinguish between a few forms of private schools in order to clarify how the larger neoclassical privatization effort includes shifting public funds to private entities. This shift does not typically concern private or independent schools, like the

more elite institutions including Choate Rosemary Hall, Phillips Exeter Academy, and St. Andrews School. These are not-for-profit corporations that exist for the sole purpose of schooling young people.

Privatization and Religious Schools

Religious schools such as those affiliated with the Roman Catholic, Independent Christian, Adventist, and other faiths are also private schools. Generally, however, they are not our concern because the free market arguments for competition that are furthered by privatization advocates are not as important to the success of religious and not-for-profit schools as tradition, church affiliations, wealth, and endowments.

Thus, entry is further restricted to keep out those who do not fit the model of a particular school. Even with the irony of restricted competition, however, private religious schools have recently benefited from court rulings that instantiate vouchers and funnel public money into private and religious school coffers. Various states also have versions of privatization in the form of tax credits, tax deductions, and vouchers. Charter schools are another example of creeping privatization, even though they are ostensibly funded and established from the public rather than private sector. Charter schools are typically legally autonomous publicly funded schools operating under explicit contracts with local school boards.

Objections to privatization include the argument that privatization diverts money from public schools to private and parochial schools and, therefore, public accountability is reduced and limited. Some argue that privatization increases segregation and reinforces socioeconomic disparities or that by abolishing the separation between church and state, privatization effectively has the government endorsing one religion over another. In the case of tax credits and tax deductions that mandate families pay tuition prior to reimbursement on their next tax return, privatization efforts significantly help wealthy families more than poor families.

PRIVILEGE

Many approaches can be taken to better understand the relationship between privilege and education. A foundations of education approach assumes multidisciplinary and interdisciplinary applications and explore the relationship by using historical, philosophical, political, and sociological perspectives. A legal approach that may look at case law argues that education is either a right or a privilege in both the private and public domain. Still another approach would be to look at the relationship between privilege and education with a global lens whereby different countries are assessed as to their regard for education and who receives it. This entry makes a quick survey of thinking in all of these areas.

U.S. Values in Conflict

In the United States, Thomas Jefferson was perhaps the most articulate spokesperson on behalf of free education for all children. He believed that a democracy depended upon a literate and informed citizenry. Another icon of

early American education was Benjamin Franklin, who advocated education as the mechanism by which individuals achieved self-improvement. Such noble ideals primarily privileged affluent White male children, however. The story of American education tells of the struggle for inclusion by the poor, girls, slaves, and children of color, along with immigrant, disabled, and other marginalized groups.

If philosophy involves questions of values, beliefs, and visions of possibilities, then scholars should ask how a society uses philosophical guidance to inform activity around the relationship between privilege and education. In American society, the Constitution and Declaration of Independence espouse belief in individual freedoms and rights; they value equality and encourage pursuit of happiness. People are free to adopt idealist, realist, pragmatist, or criticalist philosophical stances on issues. Ultimately, each school of thought must respond to the question of whether it is right or wrong to privilege some over others in education.

Perpetuating Position and Power

Schools are not the only place where those in society get their education. Schooling refers to the academic and extracurricular activities and socialization process that occurs in schools. Education, on the other hand, involves reason, intellect, intuition, and creativity; elements that contribute to human (re)creation. Hierarchical arrangements in society tend to be politically constructed along racial, class, and gender lines. Some scholars accuse schools of “educating” individuals according to their “assigned” position in society. A first-class citizen (White, affluent, male) is expected to get a first-class education whereas a second-class citizen (Black, poor, female) may expect to get a second-class education. The point of these scholars is that people’s respective educations are designed to reinforce and perpetuate their social positions. Disproportionate power relations among politically formed groups underscore the relationship between privilege and education.

Sociologists are concerned with the issue of whether external forces determine an individual’s actions or whether individuals are capable of freely shaping the world. It is difficult to imagine an individual who has been “educated” to assume a powerless second-class

position in society and who also believes his or her contributions to society are valued by the world. Groups that lack power are somewhat justified in their belief that external forces determine their mobility and access to privilege and education. Dominant groups are privileged to adopt a hegemonic attitude, one that allows their worldview to prevail over subordinate groups. The common, often subtle, message connecting schools and society is that individuals from subordinate groups can rise above their circumstances to enjoy the benefits and privileges of first-class citizenship if they too adopt the worldview of those in power. A merit system that requires skill at passing tests is promoted among all groups as an equitable and just way of awarding benefits and privileges. This aristocracy of intelligence, or meritocracy, is then touted as the reason why some make it and some do not.

What the Law Says

The Constitution of the United States is more explicit about protecting rights than it is about protecting privileges. It does not determine that anyone has a right or a privilege to an education, but instead assigns the task of educating citizens to the states where they reside. In 1973 the Supreme Court declared in *San Antonio v. Rodriguez* that education is not a fundamental right under the U.S. Constitution. North Carolina, on the other hand, states in Section 15 of its constitution that the people have a right to the privilege of education, and it is the duty of the state to guard and maintain that right. Still, movement toward establishing the concept of education as a fundamental right at the national level remains a goal for some legal, policy, and educational research advocates.

A number of state legal cases, for example, *Edgewood v. Alamo Heights* in Texas and *Baldwin Park v. Beverly Hills* and *Serrano v. Priest* in California, have piqued national consciousness around several issues including the fundamentality of public education, the struggle of haves versus have-nots, and the battle against discrimination. Great disparity in public educational quality is a result of the formula used to fund public education based on property taxes. Some states have attempted to remedy the funding disparity between affluent and poor districts by consolidating

school districts, arranging contractual agreements between districts, and allowing for creative transfer of commercial property and retail sales taxes. The fact is that lengthy legal battles over the last several decades have yielded tenuous victories at best. Some equal educational opportunity research advocates have concluded that “adequacy” has appeared to replace “equity” as the organizing legal concept for judicially assisted school finance reform.

Apparently the 1954 Supreme Court ruling in *Brown* has offered minimal definitive direction for the legal battles that have followed it, leading *Brown* critics to declare the decision more of a symbolic victory than a substantive one as far as equal educational opportunity is concerned. American society has been historically structured along racial lines, where Whiteness confers privilege and Blackness either negates or questions the suitability of privilege. In systematically unjust societies, differential possession of basic human and political rights becomes a privilege. Racialized social privileges such as education then become a highly contested politicized issue that forces equal educational opportunity advocates to fight to move education from the realm of privilege to the realm of human and civil right.

Article 13 of the International Covenant on Economic, Social, and Cultural Rights recognizes the right of everyone to an education that contributes to the full development of the human personality, its sense of dignity, and respect for human rights and fundamental freedoms. It further affirms that education shall enable all persons to participate effectively in a free society; promote understanding, tolerance, and friendship among all nations and all racial, ethnic, or religious groups; and further the activities of the United Nations for the maintenance of peace. The differential regard for education as a right or a privilege among states within the United States and among countries throughout the world indicates the amount of work to be done to bring about compliance with the International Covenant’s belief in the redemptive value of education in the world community.

PROGRESSIVE EDUCATION

Progressive education refers to a philosophy of education and educational practices that began in the late 1890s and has persisted to the present. Often associated with the writings of American philosopher John Dewey, it has been the subject of intense debate throughout this period. This entry reviews the fundamental principles of progressive education, looks at its development over time in the United States, and offers a brief current perspective.

Purposes

The purpose of education has been seen in a variety of ways: religious, utilitarian, civic, and social mobility. In the late nineteenth century, progressive reformers insisted that government be responsive to the welfare of its citizens rather than to the welfare of corporations. Reformers such as Horace Mann in the nineteenth century had looked to schools as a means of addressing social problems, so reformers once again looked to schools as a means of preserving and promoting democracy within the new urban and industrial social order.

While there is no one definition of progressive education, there are four dominant themes that have defined it:

1. an expansion of the school to include a direct concern for health, occupation, and community life;
2. the use of more caring, active, and organized teaching methods based on research in philosophy, psychology, and the social sciences;
3. the development of teaching methods aimed at different kinds and classes of children;
4. the use of systematic and organized methods for the administration and management of the schools.

John Dewey's Role

John Dewey, although born and raised in Vermont, had by 1894 become thoroughly enmeshed in the problems of urbanization as a resident of Chicago and chair of the Department of Philosophy, Psychology and Pedagogy at the University of Chicago. Distressed with the abrupt dislocation of families from rural to urban environments; concerned with the loss of traditional ways of understanding the maintenance of civilization; anxious about the effects unleashed individualism and rampant materialism would have upon a democratic society, Dewey sought answers in pedagogic practice.

Dewey argued for a restructuring of schools along the lines of “embryonic communities” and for the creation of a curriculum, that would allow for the child’s interests and developmental level. Dewey believed that the end of education was growth, which was firmly posited within a democratic society.

To implement his ideas, Dewey created the Laboratory School at the University of Chicago. There, children studied basic subjects in an integrated curriculum. Dewey advocated active learning, starting with the needs and interests of the child; he emphasized the role of experience in education and introduced the notion of teacher as facilitator of learning, rather than the font from which all knowledge flows. The school, according to Dewey, was a “miniature community, an embryonic society” and discipline was a tool that would develop “a spirit of social cooperation and community life.”

Dewey’s ideas about education, often referred to as “progressive,” proposed that educators start with the

needs and interests of the child in the classroom and allow the child to participate in planning his/her course of study; his idea school advocated project method or group learning and depended heavily upon experiential learning.

Dewey’s progressive methodology rested upon the notion that children were active, organic beings, growing and changing, and required a course of study that would reflect their particular stage of development. He advocated both freedom and responsibility for students since those are vital components of democratic living. He believed that the school should reflect the community, in order to enable students when they graduate, to assume societal roles, and to maintain the democratic way of life. Democracy was particularly important for Dewey. And he believed that it could be more perfectly realized through education—education that would continually reconstruct and reorganize society.

Dewey’s vision of schools was rooted in the social order; he did not see ideas as separate from social conditions. He fervently believed that philosophy had a responsibility to society and that ideas required laboratory testing; hence the importance of the school as a place where ideas can be implemented, challenged, restructured, reconstructed with the goal of implementing them to improve the social order. Moreover, he believed that school should function as preparation for life in a democratic society.

In a progressive setting, the teacher is no longer the authoritarian source of all knowledge. Rather, the teacher assumes the peripheral position of facilitator. The teacher encourages, offers suggestions, questions, helps plan and implement courses of study. The teacher also writes the curriculum and must have a command of several disciplines in order to create and implement the curriculum. Dewey proposed that children learn both individually and in groups.

While few can dispute Dewey’s influence upon educational reformers, few would take issue with the notion that Dewey was often misread, misunderstood, and misinterpreted. Thus Dewey’s emphasis upon the child’s impulses, feelings, and interests led to a form of progressive education that often became synonymous with permissiveness, and his emphasis upon vocations ultimately led the way for “life adjustment” curriculum reformers.

Strands of Progressive Education

There have been three strands of progressive education: (1) child centered, (2) social efficiency, and (3) social reconstructionism.

G. Stanley Hall (1844–1924) believed that children's development reflects the stages of development of civilization. Thus schools, according to Hall, should tailor their curricula to the stages of child development. Hall argued that traditional schools stifled the child's natural impulses, and suggested that schools individualize instruction and attend to the needs and interests of the children they educate. This strand of progressive reform became known as child-centered reform.

On the flip side of child-centered reform was social efficiency reform, which encouraged educators to be "socially efficient" in the ways they went about educating students. This led to a belief that schools should be a meaningful experience for students and that schools should prepare students to earn a living and for life. This strand resulted in "life adjustment" education, the purpose of which was to have children conform to the demands of society, a far cry from Dewey's idea that the schools should be a "lever for social reform."

Social reconstructionism emphasized the community side of the equation, especially with regard to the development of a more just, humane, and egalitarian society. Based upon the work of Kenneth Benne and George Counts at Teachers College, Columbia University, social reconstructionists viewed schools as the key to building a new social order.

Historical Development

1900–1945

Before the 1920s, progressive reformers tended to concentrate their efforts in public education, applying scientific management techniques to the administration of schools, reforming curriculum, and creating secondary, vocational schools. Around the 1920s many progressive educators began to focus on private schools attended by middle-class children. These schools, often the creation of parent cooperatives or talented practitioners, stressed individual freedom and that schools help children develop their potentials.

These schools, commonly referred to by educators as "child centered" were often founded by female practitioners reacting against the strict methods of the existing public schools.

Whereas these child-centered progressive schools were almost all independent private schools, public education was dominated by the social engineering strand of progressivism. The high school was transformed from an exclusively academic institution at the turn of the century to one dominated by life-adjustment functions by the 1930s and later to social class and race-based tracking systems that separated academic and vocational education. Public progressive education from the 1930s to the 1960s often stressed life adjustment rather than intellectual functions and often helped to reproduce rather than ameliorate social class, race, and gender inequalities. However, the paradox of private child-centered schools was that they catered to an overwhelmingly affluent population, thus contradicting Dewey's belief that progressive schools should be democratic.

1945–1960

During the post-World War II period, the patterns that emerged during the progressive era were continued. First, the debate about the goals of education (i.e., academic, social, or both) and whether all children should receive the same education remained an important one. Second, the demand for the expansion of educational opportunity became perhaps the most prominent feature of educational reform. Efforts were also directed at finding ways to translate these expanded opportunities into more equal educational outcomes at all levels of education. As in the first half of the twentieth century, so too, in the second half, the compatibility of expanded educational opportunity with the maintenance of educational standards would create significant problems. Thus, the tensions between equity and excellence became crucial in the debates of this period.

These debates can be best understood by examining reform cycles of the twentieth century, which revolved between progressive and traditional visions of schooling. On the one hand, traditionalists believed in knowledge-centered education, a traditional subject-centered

curriculum, teacher-centered education, discipline and authority, and the defense of academic standards in the name of excellence. On the other hand, progressives believed in experiential education, a curriculum that responded to both the needs of students and the times, child-centered education, freedom and individualism, and the relativism of academic standards in the name of equity. Although these poles and educational practices rarely were in only one direction, the conflicts over educational policies and practices seemed to move back and forth between these two extremes.

From 1945 to 1955, conservative critics attacked progressive education. Critics assailed progressive education for its sacrificing of intellectual goals to social ones. They argued that the life adjustment education of the period combined with an increasingly anti-intellectual curriculum destroyed the traditional academic functions of schooling. Throughout the 1950s the debate between progressives who defended the social basis of the curriculum and critics who demanded a more academic curriculum raged on. What was often referred to as “the great debate” ended with the Soviet launching of the space satellite *Sputnik*. The idea that the Soviets would win the race for space resulted in a national commitment to improve educational standards in general and to increase mathematical and scientific literacy, in particular. From 1957 through the mid-1960s, the emphasis shifted to the pursuit of excellence and curriculum reformers attempted to redesign the curricula in ways that would lead to the return of academic standards.

1960s to the Present

By the mid-1960s, however, the shift in educational priorities moved again toward the progressive side. This occurred in two distinct but overlapping ways. First, the civil rights movement led to an emphasis on equity issues. Thus, federal legislation, such as the Elementary and Secondary Education Act of 1965, emphasized the education of disadvantaged children. Second, in the context of the antiwar movement of the times, the general criticism of American society, and the persistent failure of the schools to ameliorate problems of poverty and of racial minorities, a “new

progressivism” developed that linked the failure of the schools to the problems in society. Ushered in by the publication of A. S. Neill’s *Summerhill* in 1960, a book about an English boarding school with few, if any, rules and which was dedicated to the happiness of the child, the new progressivism provided an intellectual and pedagogical assault on the putative sins of traditional education, its authoritarianism, its racism, its misplaced values of intellectualism, and its failure to meet the emotional and psychological needs of children.

U.S. progressive educators studied British progressive or open education, which resulted in significant experimentation in some American schools. Emphasis on individualism and relevant education, along with the challenge to the unquestioned authority of the teacher, resulted in “alternative,” “free,” or “open” education: schooling that once again shifted attention away from content to process. There is little evidence to suggest that the open classroom was a national phenomena. Nonetheless, progressive education during this period challenged traditional schooling and attempted to provide educational opportunity for the disadvantaged.

By the late 1970s, conservative critics began to react to the progressive reforms of the 1960s to 1970s. They argued that liberal reforms in pedagogy and curriculum and in the arena of educational opportunity had resulted in the decline of authority and standards. Furthermore, the critics argued that the preoccupation with using the schools to ameliorate social problems, however well intended, not only failed to do this, but was part of an overall process that resulted in mass mediocrity.

In 1983, the National Commission on Excellence issued *A Nation at Risk*. This report provided an indictment of American education, citing high rates of adult illiteracy, declining SAT scores, and low scores on international comparisons of knowledge by American students as examples of the decline of literacy and standards. From 1983 to the present, attention has been given to the improvement of curriculum, the tightening of standards, and a move toward the setting of academic goals and their assessment. The No Child Left Behind Act (NCLB) was the culmination of these efforts. NCLB also stressed equity, as its goal is to eliminate the achievement gap between groups by 2014.

Contemporary Progressive Reforms

Although this conservative standards movement dominated U.S. education from 1983 to the present, from the 1990s there has been an increased interest in progressive education, especially as it relates to attempts to balance individualism and community. Progressive reforms echo many of the earlier concerns of progressive education. They stress diversity, child-centeredness, small school size, active learning, integrated curricula, and democracy.

In the early part of the twenty-first century, progressive reformers stressed school size as vital to urban school reform. The Bill and Melinda Gates Foundation has given hundreds of millions of dollars to break up large urban schools into smaller, more progressive schools. In New York City, New Visions for Public Schools has founded over 100 small schools with philosophies similar to that of the Center for Collaborative Education. Although preliminary data on the achievement of children from low-income families seems promising, it is too early to draw conclusions.

Despite continual criticism, progressive education remains an important part of U.S. education. Even one of its severe critics, historian Diane Ravitch, acknowledges the wonderful education her children received in a New York City progressive private school. She argues that all children should have the opportunity for such an education, which combines academic rigor with child-centered process. It remains to be seen if the contemporary progressive public schools will fulfill her wish.

PROJECT METHOD

The project method was developed by William Heard Kilpatrick (1871–1965) during the progressive period in American education. Based on the teachings of John Dewey (1859–1952), it incorporated modifications and focused on a curriculum which used the child's life experiences and interests.

Kilpatrick was Dewey's student at Teachers College, Columbia University. Kilpatrick's focus was upon the use of successful living in a democratic society. He emphasized problem-area studies or social living themes which had a moral outcome that was organized around the children's interests. Subject matter was only used to fulfill the method's educational purpose.

Kilpatrick taught courses in the history of education at Teachers College and published *The Dutch Schools of New Netherland and Colonial New York* in 1912, based on his doctoral dissertation. He wrote about and critically examined the Montessori system and Froebel's kindergarten in 1916.

Kilpatrick believed the best guarantee of sharpened intellectual results and enhanced moral judgment was in a curriculum reorganized around projects. By 1918, he prepared an essay, "The Project Method," which first appeared in the *Teachers College Record*. His essay placed the purposeful act at the heart of the educative process. This publication brought Kilpatrick national and international fame. Over 60,000 reprints of the article circulated during the next twenty-five years. His aim was to show how purposeful activity in a social

environment was capable of reconciling Edward L. Thorndike's connectionism with Dewey's view of experience and education. He believed that by emphasizing purposeful activity, consonant with the child's own goals, he would take maximum account of Thorndike's law of effect, thereby enhancing both direct and concomitant learning. And by using a social environment, he believed certain ethical outcomes would also result.

Kilpatrick's essay "The Project Method" proposed that actual experience offered typical moral life experiences more than the usual school curriculum did, thus ensuring permanent acquisition of intelligent moral character. In 1925 he wrote *Foundations of Method*, which elaborated on the project method. He professed that subject matter could never be set in advance; it would have to result from activities the students pursued and planned. His four steps were: purposing, planning, executing, and judging. According to him, the only way to learn well is to practice living well, thus he favored a child-centered approach over a subject matter one. Kilpatrick used his classes to disseminate these progressive education ideas. Over the years as a professor at Teachers College, he taught approximately 35,000 students from all over the country.

Kilpatrick's work on the project method appears to be the version of progressive education that remains most used and best known. By 1940 small evidences of the project method were clearly used in American classrooms, though often out of their progressive philosophical context.

PSYCHOANALYSIS AND EDUCATION

Psychoanalysis and education have a long history of overlapping concerns and contrasting issues. Sigmund Freud once remarked that education makes psychoanalysis both possible and necessary. In this sense, psychoanalysis might be understood as the prescription for problems created by education. On the other hand, ideas about learning and processes of learning are at the heart of psychoanalysis, so educators might benefit from understanding their work in psychoanalytic terms. This entry will provide several examples of such terms and their relevance for education: *learning*, *resistance*, *transference*, *countertransference*, and *attachment*.

Learning

Psychoanalysis and education have a long history of overlap and quarrel, but they both focus on human development. Many psychoanalysts were also trained in education, for example, Anna Freud, Dorothy Burlingham, Ernst Kris, and Erik Erikson. Similarly, educational writers such as John Dewey and William James studied works in psychoanalysis. More recently, educational thinkers such as Deborah Britzman, Alan Block, Alice Pitt, Sharon Todd, and Shoshanna Felman have applied ideas of psychoanalysis to educational theory and at the same time have offered ideas to psychoanalysis.

Anna Freud once claimed that teaching is "learning twice"; first one learns as one prepares for one's students, and then one learns from one's students as one teaches. Yet, the learning alluded to in this instance is not so much an anticipation of what the students will learn or think about; rather, it is more of a pedagogical disposition, in the sense that the double movement from the material to the potential created in the educational encounter implicates learners in their own learning.

Many educational objectives preoccupy themselves with the quick application of knowledge to the solution of problems. Psychoanalytic conceptions of learning, however, slow us down and ask us to look at the kinds of learning that might come before application.

This “other” type of learning that is often hidden by educational objectives often has more to do with confronting anxiety and exploring identity.

Another approach to learning from psychoanalysis accepts the perpetual “loss” endemic to educational practice, by which it is recognized that the teacher is always pursuing knowledge of her or his students, yet never actually obtaining it. The Western system of education is not designed to notice that learning occurs over time, or even that accidents, chance, and frustration may be as much the source of learning as the effects of learning, and may not even be obviously related to any specific actions on the part of an adult. In general, educators focus on what they can observe teachers doing.

Modern educational theory persists in placing the teacher at the center of education, despite a claim to student-centered learning. Such theory creates “blind spots” that shut out the serious work of the learner, ignore the serious mistakes that cannot be admitted or debated, conflicts that are central to the experiences of learning, and so on. Instead of a clear set of understandings about what makes “learning happen,” the result is a lot of defensiveness on the part of the adult, as if the work of learning is only an authentication of or an answer to the question of the adult’s capacity to control, to predict, and to measure “progress.” A psychoanalytic perspective like this raises the paradoxes or contradictions between principles or conclusions that seem equally necessary and reasonable.

Teachers enter the educational encounter with a whole lot of stuff that they want to share with youth. Teachers know a great deal. If *students* knew the same things, they would be able to do so much! On the other hand, teachers never really can know what the students are doing, how they learn, precisely, what is happening inside their minds. Is there a chemical change in the brain or heart? A neuronetwork restructuring that is formed in response to a question from a teacher or other student in the class? Teachers act as if their specific actions *cause* precise changes in the student, none of which can ever really be known. Or educators may write a history of the event afterward in which they claim that a specific task or a specific way of asking a question led to a new conceptual understanding on the part of a student, even

though there really is no way of knowing at the moment that such a pedagogical move would have that precise effect. This is what comes to be known as a practitioner’s wisdom: Over time experience seems to provide so many case studies of what might or might not happen that the teacher seems to develop a repertoire of potential proactive and reactive actions. Teachers are always feeling as if the objects of their attention are “purloined,” that is, lost, displaced, or misplaced (perhaps stolen?).

Resistance

The concept of resistance can be used to consider events in which it seems that students are not learning. First of all, it must be realized that, from a psychoanalytic perspective, resistance is a part of learning. People must go through resistance to genuinely learn. Resistance occurs when someone meets the otherness of their own unconscious knowledge. People always resist confronting the unconscious. They try to meet the unconscious, and instead, the unconscious is forever creating itself anew from the bits and pieces of everyday life that recall wishes that are taboo and experiences that are too painful to confront head on. Learning might be said to deal with, on the one hand, the curious ways in which ideas and affect organize and reorganize each other and attach themselves to new experiences; on the other hand, learning has to do with the method of approach—how to “go there.” To “go there,” one passes through resistance.

When Freud first started working in psychoanalysis, he thought that resistances to learning were like barriers that the unconscious constructed to protect what was hidden there. Later he refined his theory. He decided that the barriers were constructed by the ego as a defense against such knowledge. What might it mean for teaching mathematics to consider resistance to learning as a mechanism of defense against unconscious knowledge? The French theorist Jacques Lacan called unconscious knowledge “knowledge that cannot tolerate one’s knowing that one knows.” Learning poses dangers to the learners: They must pass through resistance in order to learn. This insight—that knowledge may be refused because it may be threatening to

one's sense of self—is painful for teachers, but their desire that the learner just accept and understand the value of mathematics is also partly a symptom of teachers' own struggle to master their own difficulties.

New knowledge provokes a crisis within the self when it is felt as interference, or as a critique of the self's coherence or view of the world. These crises call forth a “crisis of witnessing” in which the learner is incapable of an adequate response because the knowledge offered is dissonant in the order of trauma; the response can only be a working through—a mourning—of belated knowledge. The confronted self vacillates, sometimes violently and sometimes passively, sometimes imperceptibly, and sometimes shockingly, between resistance as symptom and the working through of resistance.

When the movements of affect and idea are in conflict, varying forms of aggression also can be staged as the self struggles for elusive mastery through strategies such as the discounting of an experience as having nothing to do with the self and the freezing of the event in a history that has no present. These mechanisms of defense—undoing what has already happened and isolating the event in a time that has long past—are key ways the ego attempts to console itself. But the cost of consolation is severe.

Our first interpretation of resistance is often to label it as behavior problems. Teachers feel angry, annoyed, or helpless, and they want to do something about their own feelings. The trick is to recall that these behaviors are just as possibly signs that important learning is taking place. If teachers move directly to punishment or correction, they may be inadvertently teaching the student to avoid the hard work of learning, to not-learn, since trying to learn is a punishable act. How ironic! A critical response to resistance behavior requires that teachers internally monitor themselves:

I feel angry . . . so stop thinking of myself and focus on the student: talk to the student about the mathematics, backtrack with her or him to the point where the resistance can be identified; help the student look at the moment in time when the knowledge was lost.

Teaching may not be the same as acting as a psychoanalyst, but there are many parallels. During the course of every psychoanalytic therapy, the patient

will behave in ways that interfere with the progress of the treatment. This interference is called resistance. Because psychoanalytic therapy helps the patient achieve freedom of thought and action by talking freely, the negative emotional forces that caused his or her symptoms manifest themselves as obstacles to the talking therapy. Similarly, teachers should not be surprised if students exhibit behaviors of resistance throughout every educational curriculum.

In school, too, teachers want students to speak about their thoughts, to share their ideas and beliefs and opinions, and the difficulties of confronting new knowledge will be manifested in behaviors that delay learning. Like a patient undergoing analysis, a student may exhibit any of the following: become unable to talk any longer; feel he or she has nothing to say; need to keep secrets from his or her teacher; withhold things from the teacher because he or she is ashamed of them; feel that what he or she has to say isn't important; repeat him- or herself constantly; refrain from discussing certain topics; want to do something other than talk; desire advice rather than understanding; talk only about thoughts and not feelings; talk only about feelings and not thoughts.

These and many other forms of possible resistance keep students from learning about themselves and from growing and becoming the people they want to be. A patient and analyst study together the meaning and purpose of the resistance and try to understand the key to unlocking it and allowing the patient to continue growing. Many therapists recognize that a patient may *need* to resist, and they use a relaxed approach as an aid in overcoming the problem. Similarly, a teacher and his or her students must together study their resistance to learning, the meaning and purpose of this resistance, and try to understand the key to unlocking it and allowing the students to keep growing. And teachers recognize that resistance to learning is a part of learning itself; students need to do this in order to learn.

Transference and Countertransference

In response, teachers might work to create a “holding environment” in which students can do the work of repair that constitutes therapy. The primary work

to establish such an environment is to listen and to understand how the student is forming relations of meaning. In the process, however, a teacher must develop the skills to recognize when transference and/or countertransference is occurring. Transference is the redirection of feelings and desires, especially those retained from childhood, onto another person. A teacher may be aware of such redirection occurring in the actions and feelings of a student; more difficult is to recognize such transference occurring in the feelings and desires of the teacher her- or himself, an equally likely occurrence, sometimes called countertransference. Countertransference can allow a teacher to gain insight into the kinds of emotions and reactions the student often tends to induce in others. In this way, the countertransference is a welcomed phenomenon which can prove invaluable to the relationship.

Attachment

Attachment is a tie that one person forms between him- or herself and another specific one (usually a parent), such a tie that binds them together in space and endures over time. Psychoanalysts might say that children need to form attachments to a parent in order to be able to form other sorts of attachments—to others, to the idea of leaning, to the value of school, and so on. Many students do not come to a classroom or other educational experience ready to form such attachments. Because of this, many schools and teachers work to create communities where students can feel like they are valued and secure, in order to develop the necessary attachment requisite to learning.

PYGMALION EFFECT

The *Pygmalion effect* refers to the notion that teachers' expectations of their students may come to serve as a self-fulfilling prophecy. The process can be summarized as follows: Teachers form certain expectations about their students. These expectations are then communicated through teachers' day-to-day interactions with their students, their educational planning, and the way they assess their students. Students tend to respond by adjusting their behaviors to correspond with teachers' expectations and interactions. Teachers' expectations are eventually fulfilled and a circle of self-fulfilling prophecies is created. This entry describes the history of the idea and its implications for education.

Historical Context

The phrase *self-fulfilling prophecy* was coined in 1948 by twentieth-century sociologist Robert K. Merton, who asserts that once an expectation is formed, even if it is erroneous, people tend to act in ways that are consistent with that expectation and, quite often, the expectation will come true. Merton describes a self-fulfilling prophecy as an initial false belief about a situation that guides a person to take on a new behavior that causes the original false belief to come true.

Self-fulfilling prophecies can be observed in a variety of social institutions, and educational institutions are no exception. The *Pygmalion effect* takes its name from the mythological sculptor, Pygmalion, who created a woman, Galatea, so beautiful that he prayed to the gods to make her a real woman. It was first demonstrated in a classic study by Harvard University professor and psychologist Robert Rosenthal and elementary school principal Lenore Jacobson. Concerned about the failure of disadvantaged children in the public school system, Rosenthal and Jacobson set up a study in an elementary school they called Oak School. The researchers hypothesized that a relationship exists between teachers' expectations and students' academic performance.

In the spring of 1964, they administered an intelligence test they called The Harvard Test of Inflected Acquisition to all students who might return to Oak School the following fall. They led the teachers to believe that the test could identify those students who would intellectually "bloom" and show a "spurt" of rapid, intellectual growth within the near future. Just prior to the beginning of the following school year, teachers were given a list with the names of those students who, on the basis of the test, could be expected to intellectually "bloom" and "spurt." However, these lists contained the names of students who were randomly selected by the researchers; the only difference between the identified "spurters," 20 percent of the student body, and the rest of the children was in the minds of the teachers.

At the end of the academic year, Rosenthal and Jacobson readministered the intelligence test to all the students. Results indicated that students labeled *bloomers* and *spurters*, outperformed students in the control group. This was particularly true for first and second graders. First graders in the experimental condition showed average gains of 15.4 IQ points compared to gains of 12 IQ points for control students, while second graders in the experimental condition showed average gains of 16.5 IQ points compared to 7 IQ points for the control students. In general, students in the experimental condition showed a 12.22 IQ-point gain compared to an 8.42 gain for the control students across all grades.

It was also found that the academic performance of students in the experimental group improved, and they

were described by their teachers as more likely to succeed in the future, more intellectually curious, and happier. Rosenthal and Jacobson concluded that a relationship *does* exist between teachers' expectations and students' academic performance and that the Pygmalion effect or self-fulfilling prophecy was at work in the classroom.

Implications for Education

Rosenthal and Jacobson's study serves to alert educators about the role that teachers' expectations may have on students' academic performance. Expectations based on preconceived notions about students' abilities can be communicated in a variety of ways, including but not limited to paying more attention to students perceived to be high achievers, giving more praise for correct responses and criticizing less for incorrect responses, allowing more waiting time for responding to questions, providing more accurate and more detailed feedback, and assigning more demanding work.

Expectations may also be based on factors that extend beyond the cognitive capabilities of students and may lead to inequalities in the classroom. For example, teachers' beliefs about gender differences, student behavior, ethnically different students, and students from different socioeconomic classes may direct teachers to create a type of classroom environment in which their treatment of these beliefs and the accompanying expectations will, in effect, help their prophecies come true. Furthermore, teachers' expectations may also impact students with special needs since these students are often labeled according to their performance on tests, which may in turn lead some teachers to justify reduced expectations.

Rosenthal and Jacobson's model of Pygmalion in the classroom remains relevant to contemporary classroom practice. Given the diversity of students in today's classrooms, teachers can use the *Pygmalion effect* to help them eliminate inequalities in the classroom by fostering a climate of positive expectations for all students. James Rhem urges teachers to realize that teaching involves more than just the transfer of facts. Teachers should expect more from their students than what they think is possible and create conditions

to help students fulfill positive teacher expectations. Despite the great pressure to meet the required standards, teachers need to find ways to help all students reach their potential beyond the minimum expectations. Essentially, every teacher should strive to become a Pygmalion and transform every student into a Galatea.

QUALITATIVE RESEARCH

The rise of qualitative research has generated a great deal of renewed interest in the social and cultural foundations of education. Formerly, research and educational foundations were connected largely through the philosophy of science, and that connection was usually limited to the narrow specialization known as logical positivism. Positivism served as the foundation for quantitative and experimental research designs. Yet with the emergence of qualitative inquiry in the 1980s and 1990s, researchers sought support for their work from a much broader range of scholarly traditions. Today, these traditions include not only the social sciences, but also phenomenology, hermeneutics, critical theory, postmodernism, and aesthetics.

Recent developments in qualitative research are examined below in three sections. The first section recounts the growth of qualitative approaches as one of the leading trends in contemporary educational research. How did educational research, formerly a small and often obscure specialty within the social sciences, become as remarkably diverse as it is today? The second section categorizes current approaches to qualitative research based on their conceptual foundations. These categories include social science-based research, continental perspectives, and the arts. The third section briefly examines some of the ongoing challenges associated with each category.

The Rise of Qualitative Research

Before the 1970s, educational research was dominated largely by the social sciences. Psychology in particular was seen as an appropriate home for educational researchers because of that discipline's early interest in theories of learning. Psychology was also attractive to educational researchers because it claimed status as a science. In particular, psychological research vigorously sought to emulate the natural and physical sciences by emphasizing objective procedures, experimental designs, rigorous measurement, and statistical forms of analysis. In turn, early educational research vigorously sought to emulate psychology on the same basis. Early educational psychologists such as Edward L. Thorndike and John B. Watson were committed believers in building a science of education, and that mission was to cast a long shadow across twentieth-century educational research.

Anthropology and sociology, not psychology, were the primary avenues through which qualitative methods first entered educational research. Although these disciplines were widely respected, they lacked the same degree of scientific luster as psychology. Partly for this reason, early qualitative studies were suspect from the beginning, and to counter suspicion, early researchers were devoutly loyal to their discipline. Initially, at least, anthropologists conducted anthropological studies that happened to be on education or carried out in educational settings. Likewise, sociologists

conducted sociological studies that happened to be on education or carried out in educational settings. As researchers became accustomed to the “field-based” methods of their social science colleagues, qualitative research slowly gained acceptance as a valid form of educational inquiry.

At the same time, the late 1960s and early 1970s brought a new skepticism of social science and especially its tight embrace of positivism. Widely read books such as Thomas Kuhn’s *The Structure of Scientific Revolutions* portrayed science as a historical and social endeavor. Scholars came to write about the “linguistic turn” in the natural as well as the social sciences. This movement sought to recognize how language plays an active role in shaping a field’s knowledge base. Later, sociology and anthropology were to draw more openly on the humanities as well. Concepts such as “thick description” made their way into ethnography, and scholars wrote of the “sociological imagination.” Although these developments helped to invigorate the social sciences, researcher objectivity was tainted, and by implication, science itself was no longer regarded as the sole legitimate source of knowledge.

Educational research was again influenced by these broader developments. Researchers began to question the very possibility of a science of education and the likelihood of ever discovering universal laws. Some of the earliest critics came not from the field’s still small qualitative wing, but from its quantitative majority. Lee Cronbach, for example, wrote with growing discontent over the limitations of a strictly scientific approach. A leading psychometrician, Cronbach argued in a 1974 address to the American Psychological Association that the unstable and dynamic nature of human culture ultimately prevented the social sciences from accumulating the types of predictive generalizations found in the physical and natural sciences. Donald Campbell, a well-known research design specialist, also provides an example of changing perspectives. Campbell’s early views privileged quantitative research over qualitative research on all counts. Later, he reversed this position by arguing that in many cases, qualitative rather than quantitative findings should be regarded as the more trustworthy.

Expanding the Foundations of Research

The measured skepticism of the 1970s marked a new openness toward innovative research methods and a greater range of research approaches. These developments did not mean that qualitative research was now suddenly welcomed with open arms. On the contrary, debates over the acceptability of qualitative methods in education have always been intense. Throughout the 1980s, these debates were so animated that they came to be called “the paradigm wars.” Nevertheless, persistent clamor has not prevented qualitative research from flourishing into a broad constellation of approaches, orientations, and distinct methodologies. Although such broadly ranging work is difficult to review, the following section organizes different types of qualitative research into three broad groups: (1) social science–based research, (2) continental perspectives, and (3) arts-based inquiry. Although these categories overlap, each category draws on a distinct set of foundational assumptions about the nature of knowledge and how knowledge grows.

Research Based on the Social Sciences

The influence of social science and its positivist foundations has already been noted. These early foundations eventually gave rise to postpositivism. Researchers who embrace postpositivism acknowledge that science cannot establish truth in an absolute or pure sense. They do, however, see considerable merit in using procedural objectivity (i.e., rigorous measurement and scientific methods) to detect and eliminate mistaken beliefs. Thus, the growth of knowledge in this approach is accomplished by a gradual but persistent reduction of error.

Some qualitative researchers continue to look to postpositivism to support their work as a scientific endeavor. Others have turned to constructivism, a position that is increasingly common within the various qualitative camps of social research. Constructivism is rooted in the empirical pragmatism of John Dewey and the genetic epistemology of Jean Piaget. This position rejects the assumption that knowledge consists of an accurate or error-free representation of reality. Instead, constructivists hold that knowledge is created

through an interaction between researchers and their objects of study. In other words, knowledge is a product of cognition and socialization; it is construed rather than discovered. As a result, knowledge grows horizontally rather than vertically. Progress is made by moving from a simple or singular view of reality to increasingly complex, differentiated, and multiple perspectives.

Continental Perspectives

Postpositivism and constructivism continue the long-standing relationship between education and the social sciences. An increasingly important but less conventional source of foundational support is associated with the traditions of continental philosophy. Approaches in this category include phenomenology, critical theory, hermeneutics, and postmodernism. It is not possible to do justice to these diverse philosophical movements in the limited space at hand. Nevertheless, continental perspectives will be recognized, even if briefly, because they have provided a rich and widely recognized set of foundational assumptions for qualitative research.

The first continental approach is phenomenology. In the field of philosophy, phenomenology refers to both a complex tradition and a technical method. The method, sometimes referred to as “bracketing,” is associated with the work of Edmund Husserl and his colleague Alfred Schutz. It involves an effort to set aside our taken-for-granted assumptions about a particular phenomenon in order to examine it in a more complete way. Qualitative researchers rarely follow this method in any strict sense. Instead, they have been attracted to phenomenology because of its strong emphasis on human consciousness, meaning, and subjectivity. Phenomenology has been especially useful to researchers who are interested in topics such as engagement, attention, identity, affect, caring, and rapport. The basic approach is to systematically vary the contexts of meaning associated with a given phenomenon. Qualitative researchers usually avoid words such as *essence* and *nature*, terms that have been used in philosophical phenomenology. However, they do seek to identify the thematic features of a particular phenomenon and how a range of meanings becomes attached to it.

Critical theory is a second tradition often identified with continental thought. Although critical theory has strongly influenced many forms of social science, the foundational assumptions that have guided qualitative research originate in a philosophical stance. Moreover, the emphasis of critical theory on social justice and activism stands in sharp contrast to the aloof detachment so often recommended in the canons of social science. In particular, critical research is rooted in Karl Marx’s definition of critical theory as a way to support the social and political struggles of a given age. Today, these struggles include the problems of racism, sexism, homophobia, anthropocentrism, and oppressive class structures. When investigating such problems, critical researchers see detachment as neither desirable nor possible.

Instead, critical theory holds that all research is political because it is embedded within socially and historically situated relationships of power. These relationships privilege certain groups over others to create social inequities. The aims of critical research are to reveal and critique these inequities. In particular, the oppression of specific social groups is most troublesome when the mechanisms of oppression are either hidden from consciousness or viewed as a natural part of life. Thus, critical research assumes several functions. First, it seeks to help others recognize that oppressive structures exist and that these structures are unwarranted. Second, critical research seeks strategies for eliminating oppression through political action. Ultimately, the growth of knowledge is measured in terms of democratic participation and social justice.

Hermeneutics is a third broad tradition in continental philosophy that has shaped qualitative forms of research. This tradition may seem an odd juxtaposition with critical theory because the scholarly origins of hermeneutics concern how to interpret biblical texts. Today, however, hermeneutics encompasses a broad range of scholarship, and many different types of qualitative researchers (including critical theorists) may employ hermeneutic methods. These methods are concerned foremost with the interpretation of meaning. Social and educational events are understood by *reading* them, and such readings rely on what is called the hermeneutic circle. Although this term can have

different meanings, it usually refers to a way of examining a text by moving back and forth between the parts of the text and the text as a whole. In hermeneutics, knowledge is a process achieved not through formulaic analyses, but through an ongoing and ever-questioning dialogue among the researchers interested in a given topic.

Postmodernism is a fourth continental philosophy that provides qualitative research with foundational support (and challenges). Postmodernism overlaps with phenomenology, critical theory, and hermeneutics in the sense that all of these earlier traditions have represented a move away from the Enlightenment foundations of modern philosophy. However, whether or not postmodernism is itself a philosophy remains unclear. Postmodernism has been described as a mood, a contemporary condition, a view, and even a malaise. Regardless of what postmodernism is, wide-ranging writers associated with this movement (e.g., Pierre Bourdieu, Jacques Derrida, and Michel Foucault) are best known for challenging the Cartesian modes of rationality in which knowledge is viewed as liberating and progressive.

If modernity holds that language, culture, and knowledge are important tools that people use, postmodernism holds that people not only use these tools but are used by them. What postmodern writers refer to as the “death of the subject,” for example, asserts that the modern subject who constitutes meaning is actually constituted by cultural and historical patterns of thought. These patterns include such grand narratives as humanism, formalism, and structuralism.

Postmodernism has informed qualitative research in several significant ways. Some researchers cite postmodernist writers to emphasize the differences between themselves and those they study. The failure of modern research has been to minimize these differences by “totalizing” others through an indiscriminate application of the grand narratives mentioned above. Other researchers attribute a renewed skepticism of research to postmodern “self-reflexivity.” Researchers who engage in self-reflexivity are constantly asking how their own understandings are both partial and limited to what may be highly specific cultural understandings. Finally, some researchers have used postmodernism to

experiment with mixing various literary and scholarly genres in the reporting of qualitative research.

Arts-Based Approaches

The preceding sections have identified two broad sources of foundational support for qualitative research: the social sciences and continental perspectives. A third general source is that of the arts. Again, significant overlap could be noted between the arts and many of the other traditions already considered. The postmodern mixing of genres just noted, for example, draws upon the arts. However, arts-based research is known also for its distinct principles and practices. Specifically, arts-based research has taken its lead from the work of scholars and critics in fields such as literature, drama, dance, music, and the visual arts.

One aim of art criticism is to help its audience better understand a particular exhibition, play, symphony, or film. Critics are also interested in helping others understand the genres to which these particular works belong. John Dewey defined the aims of criticism as the re-education of perception. Successful criticism provides new ways of seeing by helping people notice what they would otherwise miss. From this perspective, the growth of knowledge is not principally in the accumulation of facts. Rather, knowledge growth is represented in the enhanced ability to understand objects of study.

The objects of arts-based research are not limited to “great works” or outstanding performances. On the contrary, research in this category may investigate ordinary classrooms, school leadership styles, routine curriculum materials such as textbooks and computer software, lesson plans, classroom decor, or student dress styles. Arts-based research differs from other traditions by actively seeking to recognize the aesthetic foundations of education. Elliot Eisner, who developed an early arts-based approach known as educational criticism, argues that classroom instruction may exhibit a range of artistic dimensions. Like artists, teachers seek emergent ends, and their work requires complex and often subtly nuanced skills. Like artists, teachers work within commonly recognized “genres” (e.g., the lecture, role-playing, Socratic dialogue),

and yet who teachers are as individuals also makes a difference in the outcomes of their work. Like art, teaching is shaped by its historical context, and it is open to multiple interpretations. Finally, teaching relies on an amalgam of practiced routine, qualitative judgment, and imagination. All of these artistic dimensions of teaching are open to research.

A final characteristic of arts-based research is that such studies often employ artistic techniques in the reporting of research. In text-based reports, many arts-based researchers consciously use literary forms of language that include metaphor, alliteration, character development, imagery, symbolism, and other rhetorical tropes. Some recent qualitative dissertations in education have taken the form of biographies and novels, for example. In addition, poetry, installation art, dance, drama, and readers' theater have all been used to present research findings at recent professional conferences, including conferences of the American Educational Research Association.

Ongoing Challenges

Each of the foundational categories mentioned above presents a unique set of challenges for contemporary qualitative researchers. Postpositivism and constructivism, for example, are both rooted in the Enlightenment's progressive view of change. Both traditions also privilege a view of rationality as the possession of individuals. These views tend to discount many forms of traditional culture. In today's global context, the result is often a mismatch between research-based technologies and cultural sustainability. Thus, research-"validated" educational programs may actually threaten rather than promote the well-being of some peoples.

Qualitative studies that draw on continental traditions face a different set of challenges. These approaches have given rise to hypersensitivity over the dangers of using knowledge as a tool of cultural domination. Postmodernism in particular holds that all knowledge is local, partial, and suspect. On these grounds, postmodernism has been called an "anti-epistemology." The challenge with this stance is in learning to question privileged knowledge without

dismissing what legitimacy that knowledge does have, particularly at a time when women and minorities are now claiming their own rights to this same knowledge.

The challenges of arts-based research stem mainly from its novelty within the educational research community. In particular, many criteria commonly used in art scholarship and criticism do not seem to align well with conventional research standards. Disagreement among different art critics, for example, is often valued. Compare this desire for differing perceptions and interpretations with what conventional researchers rightly strive for in terms of interrater reliability. The readers of arts-based research may expect different accounts of similar objects or events, from which different conclusions may be drawn. What, then, does this expectation mean for the replication of a study? Is replication no longer important, or can that concept be reconceptualized to better fit arts-based research? Such issues remain unresolved.

This entry examined the rise of qualitative research in education. It also presented three broad categories of contemporary qualitative research based on the sources from which each type of research draws its foundational support. The first category, social science-based research, includes the traditions of postpositivism and constructivism. Continental perspectives include phenomenology, critical theory, hermeneutics, and postmodernism. Arts-based research includes approaches that borrow from fields such as literary and art criticism. The final section of the entry briefly identified some of the challenges associated with each category. These challenges emphasize the need for further foundational analyses and innovation on the part of future researchers.

QUEER THEORY

Queer theory functions as a mode of analysis, and it challenges normative ideologies, that is, taken-for-granted assumptions pertaining to sexuality and identity. It contends that identities are elastic and do not determine who people are because identity is not connected to fixed ideas or essences. Queer theory assumes that sexual identities are a result of representations; more than a marker of who people are, identity is a result of what they do—in effect, a performance. Queer theory is important in education because it questions received (predominant) notions of academic disciplinary knowledge, textual and cultural production and interpretation, identity, and difference, but it does not limit its focus to sexual issues.

Identity is a critical and persistent question. Individuals discover their identity by sampling from those that society/culture presents as possibilities. Identity politics, which hinges on marginalized or racialized groups, stresses definition and essentialism even though this can create further marginalization. Queer theory engages in a critique of received identity and suggests that any identity can be potentially redefined or reinvented by its owner.

For example, the norms that govern gender identification are established on a male/female dichotomy because, in general, humans tend to be one sex or the other and express their gender within strict parameters. That is why individuals who do not appear to conform to established gender norms may suffer discrimination at work and outright prejudice in social settings. Heterosexuality is accepted as the received causal connection of chromosomal sex, gender, and sexuality (or sexual desire). However, queer theory argues that heterosexuality is an effect of this continuum and not its source. It is the behavior that gives rise to the identity, not the biology.

Queer Pedagogy

Queer is a variable concept. It can mean odd, funny, curious, unexpected, or remarkable. Thus, queer theory aligns to any academic discipline or discourse and is not limited to sexuality and gender issues, although it legitimizes gender and sexuality as subjects of study. The curriculum becomes queer when it attempts to understand sexuality, gender, identity, and knowing as relational rather than as objects. Queer theory ruptures with essentialism and allies itself with critical pedagogy.

Queer theory critically questions the heterogeneity of identity formation in texts. It gives depth and focus to gay/lesbian scholarship and cultural theory. It also informs disability studies by redefining disability outside the hegemonic ableist discourse, the normative able/disabled, normal/abnormal dichotomies constructed through social contexts. In disability studies, queer theory supports self-definition and challenges the effects of passing or having an invisible disability.

Philosophical/Theoretical Antecedents

Max Horkheimer (1895–1973), Walter Benjamin (1895–1940), and Theodor Adorno (1903–1969), founding members of the Frankfurt School, promulgate the concept that theory needs to be connected to action. Critical theory does not merely explain social phenomena; it aims to change social institutions. Poststructuralism, rather than a school, represents a group of approaches, theoretical positions, and thinkers, most notably Jacques Derrida (1930–2004). Poststructuralism posits that intellectual faculties are not determined by biological essentialism but are the result of socialization. The subject is decentralized and occupies various sites determined by culture and physical practices.

Queer theory continues the project of the Frankfurt School, poststructuralism, and borrows from 1980s “high” theory, which focuses on decentering subjectivity and undoing identity categories to inform and give direction to social, philosophical, and cultural questions.

Michel Foucault (1926–1984), influenced by the ideas of the Frankfurt School, developed several important concepts that serve as the intellectual foundation

of queer theory. In *The History of Sexuality, Volume One: The Will to Knowledge* (1976) and other works, Foucault describes genealogical critique as the process that shows the consequences of denoting as cause or origin the identity categories that are themselves a result of institutions, received practices, and discourses. A discourse, in turn, constructs a topic with the language of institutions; it is a medium that produces, defines, and legitimizes power relations with the objects of our knowledge. Power, to Foucault, is a process, a technique or action (not strength per se); power is not so much owned but employed. Furthermore, an “identity” is not a fixed component inside a person. Rather, it is a temporary construction that changes with the situation. Interactions with others communicate people’s identities.

Judith Butler’s *Gender Trouble: Feminism and the Subversion of Identity* (1990) is one of the pioneer texts of queer theory. Building on the work of Foucault, Butler asserts that feminists mistakenly describe “women” as a monolithic group with shared characteristics. She challenges the “heterosexual matrix” that establishes a causal relationship among sex, gender, and sexuality (i.e., that chromosomal sex determines gender and gender defines behavior). The heterosexual matrix is a binary cultural framework. This model separates humans into men and women with an inherent bias toward compulsory heterosexuality and pathologizes any deviation from this norm.

Even though feminists resist the notion that biology determines identity, the underlying discourse posits that feminine and masculine genders would be expressed on male and female bodies. Butler suggests that gender is not a fixed characteristic but a flexible variable that changes with context and time. Gender, Butler suggests, is not something one is but something one does. Sex and gender do not cause sexuality. Eve Kosofsky Sedgwick, an important contributor to queer studies, clarifies this assertion by stating that adhering to historical social constructions of the hetero/homo duality are insufficient to account for all dimensions of sexuality.

Teresa de Lauretis is generally credited with first using the term *queer theory*. She later abandons the term because, to her, it has been co-opted to represent the

very things it opposes. Because of its flexibility, queer theory is a useful tool in many areas of study. Important thinkers in queer theory come from fields as diverse as religion, literature, anthropology, communication, philosophy, and sociology. Judith Halberstam, David Halperin, John Boswell (1947–1994), Michael Warner, Kate Bornstein, Gloria Anzaldúa (1942–2004)—these are just a few of the thinkers who have contributed and continue to challenge queer theory with their writing.

Precedents in Education

Multicultural Education

Queer theory is a relatively recent phenomenon; however, it has clear precedents in the social and cultural foundations of education, particularly in multicultural education. In its most basic expression, multicultural education defines a civic curriculum that encourages a multiplicity of perspectives. Groups outside of the mainstream find a voice and representation even in the most elementary application of multicultural programs.

Although multicultural education has been in vogue in the past two decades, James Banks traces its origins to the work of late nineteenth-century Black scholars. In the early twentieth century, John Dewey (1859–1952), a noted philosopher and leader of the progressive education movement, advocated for a new type of education based on the mixed ethnic origins of the United States. Then, in the period around World War I, Horace Kallen (1882–1974), Dewey’s student and follower, introduced the term *cultural pluralism* into the educational discourse and suggested that non-English culture should have a place in American public schools. Rachel Davis DuBois (1892–1993), an activist schoolteacher, spearheaded the 1920s intercultural education movement, which features assemblies that highlight the contributions of ethnic and “racial” groups to American culture.

The modern multicultural education movement is indebted to the civil rights movement of the 1950s and 1960s and carries its imprimatur and values. Multicultural education reflects the needs and goals of society. In the 1960s and 1970s, programs focused on integration: not only of Blacks and Whites, but also

of females. The 1980s saw a rise in bilingual programs, and the 1990s focused on prejudice reduction programs. Recently, lesbian, gay, bisexual, transgender, transsexual, and queer (LGBTQ), as well as disability, appear as categories in multicultural education programs that challenge the perceived status quo.

Ethnic Studies

Protests against the Vietnam War and the fervor of the civil rights movement propelled students and grassroots community organizers, in the late 1960s, to challenge pervading academic structures. College students demonstrated and even occupied administration offices in college campuses across the nation. These efforts yielded, in 1968, the first ethnic studies program in San Francisco State. Chicana/o or Mexican American, Africana or Afro-American, Puerto Rican, Asian American, Hispanic, American Indian—these programs reflected the student population and legitimized, at least in an academic setting, the lives and cultures of overlooked Americans.

Eventually, Woman Studies programs also became part of the academic landscape, and in time, some of these programs became departments. As with multicultural curriculum reform in grade school, these higher education programs reflected the political and social tenor of the nation, and their names changed accordingly. Thus, Africana Studies gave way to Black Studies and later to African American Studies. Hispanic Studies morphs into Latina/o Studies, and American Indian programs change to Native American Studies.

The devastation of AIDS in the 1980s and its concomitant activism introduces Gay/Lesbian Studies to sanctioned academic inquiry. City College of San Francisco is the first school to create a Department of Gay, Lesbian, and Bisexual Studies. Just as in multicultural education programs, Disability Studies also gains credence as a field of study. Eventually, the penchant for postmodern minoritizing—that is, recognizing and giving voice to any group, no matter how small it may be—introduces programs such as Americana Studies, Irish Studies, Caribbean Studies, and Whiteness Studies to many campuses.

LGBTQ Studies

Gay/Lesbian Studies focuses on the historical definitions of sexuality and the construction of normative versus deviant sexual behavior. This discipline interrogates how societal definitions of sexuality and sexual behavior mark or reinforce that identity. Like other specialized group studies, gay and lesbian discourse focuses on shared identities and community. This is not always a good thing as it can lead to exclusion. Subsequently, Gay/Lesbian Studies has been criticized for having a White, middle-class, masculinist, Western bias. The need to include people who do not fit easily into gay/lesbian categories has expanded the title of some of these programs to include bisexual, transgender, transsexual, and queer (LGBTQ). Some schools call these programs Sexual Diversity Studies or Sexuality Studies, yet others opt for the more inclusive but problematic Queer Studies.

Queer theory is one of various modes of analyses that inform queer studies. Queer Studies investigates issues of gender identity and sexual orientation in contemporary politics, literature, art, and historical figures/works that have been overlooked in the academic canon. Queer Studies examines how gay, lesbian, bisexual, transgender, transsexual, and queer identities shape everyday life and connects these issues to the oppression of women, disadvantaged classes, and racialized groups. Thus, there is often a reciprocal relationship between direct action groups such as ACT UP and Queer Nation and queer theory. Because queer is a protean concept, research in this area is fluid and broad.

Conclusion

Queer theory informs the current educational, social, and philosophical debate over the soundness of using sexuality to understand human emotions, behavior, and sexual desire. By using a poststructuralist approach and borrowing from critical theory, it sees sexuality as relational and describes identity outside of normative molds. It challenges binary opposition and mediates between normative ideologies and material practices. In education, it opens the possibilities for analysis or discourse without delimiting the choices.

Because of the very nature of this discourse, it is neither a monolithic school of thought nor a political action group. Even scholars such as Caleb Crain, who works within its scope, criticize it. Crain believes that queer theory is a utopian ideology that mixes politics with history and suggests that it is a passing fad. After its demise, he says, queer theory will not leave behind queer facts. There will still be gaps in understanding of lesbian and gay lives that are contextualized in history and represented in culture.

RAP MUSIC AND ORAL LITERACY

Rap music, also referred to as MCing or “rhyming,” is one of the original elements of hip hop culture. The other elements of hip hop culture include graffiti art or “graf” writing; DJing, or “turntabling”; and breakdancing, also known as “breakin’,” popularized by “b-boys” and “b-girls” since hip hop’s origination in the early 1970s in the South and West Bronx. Each of these elements played a significant role in the development of hip hop from a relatively unknown and largely ignored inner-city subculture into a global phenomenon. Rap, in particular, can serve as a way to develop appreciation for and promote oral literacy among young people. This entry reviews its history and some ways that it has been and can be incorporated in education.

Rap and Verbal Virtuosity

The history of the DJ and the verbal virtuosity of the MC (Master of Ceremonies) can be traced back to a wide variety of oratorical precedents, including West African griots and Jamaican “toasting” dating back to the mid- to late 1800s. Rap music has its roots in the great oral traditions of West Africa and specifically the epic histories of the West African griots, a gendered reference to the learned art of storytelling the history and genealogy of one’s family or tribal community.

Because history was not written down, griots were highly respected for and skilled at memorizing, reciting, and interpreting complex histories that dated back centuries in both oral and vocal form. Whereas griots recited or sang long epics that lasted hours, sometimes days, from the oral tradition’s inception, griottes (female storytellers) had a strong presence, usually singing or playing music at certain segments of the narrative. The prestigious and coveted role of the griot (besides being a historian and genealogist) varied from diplomat to royal advisor for West African kings, to entertainers, teachers, messengers, praise singers, and interpreters or translators.

Other oral traditions derived from West Africa were talking blues songs; schoolyard and jailhouse toasts (long rhyming poems recounting outlandish deeds and misdeeds); the trading of tall tales; and “the dozens” (a ritualized word game with rhyming and exchanging of insults, usually directed toward members of the opponent’s family, such as “Your mama . . .” jokes). The content of traditional African tales or toasts celebrated notorious mythical males boasting about their triumphs, status, and/or power.

Another oratorical precedent that influenced DJs, MCs, and modern-day rap music originated from Jamaica, in the form of “toasting.” Jamaican toasting is the poetic and rhymed form of storytelling usually told in the first person; it varies from egotistical or boastful toasts, to misogynistic, violent, and/or otherwise demeaning toasts.

U.S. Expressions

Rap music, a contemporary manifestation of a rich tradition of orality, includes the use of words in the drum rhythms from jazz musicians such as Frankie Newton and Louis Prima in the 1930s; the irregular rhythms of the snare and bass drum in bebop beginning in the 1940s; the hipster-jive announcing styles of 1950s rhythm 'n' blues deejays such as Georgie Woods, Jocko Henderson, and Ewart Beckford, better known as "U-Roy"; the inclusion of ritualistic insults or "the dozens" in songs by blues singers like Bo Diddley; and, in the late 1960s and early 1970s, the political rhetoric of Martin Luther King, Jr. and Malcolm X, as well as the Black Power poetry of Amiri Baraka, Gil Scott-Heron, the Last Poets, Sonia Sanchez, and Nikki Giovanni.

Modern-day rap began as a variation of toasting. Within this context, toasting can be described as when DJs rapped or rhymed short phrases between or over the music or beats played on the turntable. The ability of the DJ to incite and energize the crowd by yelling "shout outs," or by acknowledging those in attendance (an important example of call-and-response audience interaction), were the earliest forms of oral literacy in hip hop and rap. By using short phrases, such as "mic check" or "yes, yes, y'all, you don't stop" and other popular catch phrases or expressions of the time, the DJ created an atmosphere of anticipation and stimulation among the crowd.

In addition to the short rhymes or toasts growing longer in length, the lyrical content developed into clever and shrewd verses. At the same time, the complexity involved in mixing, cutting, and scratching (i.e., producing) beats on two turntables encouraged DJs to delegate the responsibility of rhyming to the MC.

Jamaican-born DJ Kool Herc (born Clive Campbell) has been credited for being the earliest and most influential hip hop DJ to combine characteristics of Jamaican "dancehall culture" or "blues dances" (similar to modern-day reggae) with the foundational elements of hip hop culture. He moved from Kingston, Jamaica, to the Bronx in 1967. Herc was also renowned for playing multigenre musical sounds ranging from disco and funk to soul and rhythm 'n' blues. He initiated the technique of isolating and

looping "break beats." Other noteworthy and significant DJs who aesthetically influenced the oral expressions of MCs include DJ Afrika Bambaataa, DJ Grandmaster Flash, DJ Grandmaster Flowers, DJ Hollywood, Eddie Cheeba, and Disco King Mario.

MCs devoted their time to perfecting the craft of lyrical mastery in order to create robust and original rhymes delivered on time to the beat of the music. DJ Kool Herc's *Kool Herc and the Herculoids*, consisting of Coke La Rock and Clark Kent, was one of the first MC tandems to coordinate performances. Around the same time, Grandmaster Flash formed a five-member MC team known as *Grandmaster Flash and the Furious Five*. The intricate routines in the *Furious Five*'s performances and the synchronization performed in the rhymes from all five MCs elevated the art of MCing to higher, more complex levels. Other noteworthy MCs include DJ Grand Wizard Theodore and the Fantastic Five, the Treacherous Three, Love Bug Starski, Busy Bee, The Cold Crush Brothers, and Kurtis Blow.

MCs also freestyled, engaging one another in lyrical combat through a sequence of discursive turns. Freestyling occurs when MCs perform mostly spontaneous rhymes reflective of their immediate environment and/or competition with an opponent. Some legendary and notorious MC battles included Busy Bee versus Kool Moe Dee, The Juice Crew's MC Shan versus Boogie Down Production's KRS-ONE, N.W.A.'s Dr. Dre versus N.W.A.'s Eazy-E, Tupac versus The Notorious B.I.G., Jay Z versus Nas, and JaRule versus 50 Cent. Freestyling, battling, and their attendant discourses work together in hip hop culture to promote oral literacy.

Educational Use

Educators incorporating rap music as a form of oral literacy have used modernized methods such as freestyling, battling, and spoken-word poetry in the classroom to enhance literacy skills. Examples may include asking students to tell a story in the form of rap or performance poetry. Because youth today are extremely knowledgeable regarding rap lyrics and can recite the popular hits verbatim, educators also can take advantage of their students' expertise and ask

them to translate the lyrics, via written or spoken form, into standard American English, thus covering the conventions of language and grammar.

Students may also be given instructions to analyze, critique, and deconstruct the hidden and/or explicit messages embedded in rap lyrics, particularly mainstream lyrics, which are often replete with violent and misogynistic messages. Transforming or rewriting these lyrics into positive raps or poems can be performed orally, and, more importantly for educators, students can be assessed for reading, writing, listening, speaking, critical reflection and understanding, and performing skills—all of which fall under the English Language Arts standards.

READING, HISTORY OF

How individuals learn to read and how to best instruct individuals in reading have been two questions that have long intrigued educators and medical doctors alike. Each investigation has shed light on how reading is learned, and each has influenced how instruction in reading is provided. Although several centuries have passed since the first American settlers began teaching their young to read, evident still are

the methods used then and the tug of war between teaching letters and sounds and teaching whole words. This entry looks at that history.

Colonial America

From the history of America emerges the history of reading instruction in America. This history began in seventeenth-century colonial New England. The methods used today can be traced to methods from England brought to America by early settlers. During this period in American history, the purpose of reading cannot be teased away from religion. Early books for young readers were meant to indoctrinate. The purpose for learning to read was to be able to read the Bible and keep to its teachings.

A child of the colonies was taught to read from a hornbook and by the alphabet spelling method. A hornbook was often made out of wood and in the shape of a paddle. The lesson was on a single sheet of paper or carved directly into the wood and protected by a sheet of horn—a thin scraping of an animal's horn that produced the transparent sheet that protected the lesson. The lesson consisted of lower- and upper-case alphabet letters, Arabic numbers and Roman numerals from one to ten, and the Lord's Prayer. Some hornbooks also had vowel and consonant sounds. The alphabet spelling method is a type of synthetic method of teaching reading whereby one starts with letters and then moves on to syllables, words, and sentences. During the colonial period, children were taught to read by spelling the word first and then saying the word.

After the hornbook, a child moved on to read from a primer. A primer was a small book of prayers. Primers consisted of the alphabet, vowels, consonants, syllables, alphabet verses (religious couplets illustrating each letter of the alphabet with a corresponding black-and-white picture made from woodcuts), Biblical verses, and the Lord's Prayer. During the colonial period, *The New England Primer* was the popular primer for reading instruction. Upon mastering the primer, a child moved on to read a book of psalms known as the Psalter; after that, the New Testament; and eventually, the entire Bible.

The New Nation

Popular during the colonial period, spellers continued in use until the early eighteenth century. Spellers focused on spelling, but they were also used to teach reading, writing, and religion. In 1783, Noah Webster published the first volume of his *Grammatical Institute of the English Language*. This book was a speller. It was followed in 1784 by a grammar and in 1785 by a reader. Webster's spelling book eventually became known as *The American Spelling Book* and more colloquially as the Blue-Back Speller because of the book's blue covers.

After the American Revolution, the purpose of spellers was to infuse nationalism, namely by creating a uniform American language, establishing national loyalty, and developing moral citizens. Because of the emphasis on educating moral citizens, religious teachings included in previous spellers were replaced with moral teachings. Patriotic speeches were also added to additional versions of spellers. Emphasis was placed on standardizing a system of pronunciation, so reading instruction of the period focused on rules and exercises in proper American pronunciation—basically, decoding.

Whereas spellers introduced children to reading, readers were intended for children who could read. In 1823, the popular reader was Lindley Murray's *English Reader*. Its aim was to improve the art of reading, elicit the readers' emotions, and inspire righteousness. In contrast, in 1835, Lyman Cobb wrote *The North American Reader*, a book of mostly expository texts that continued the aim of infusing patriotism and creating moral citizens.

Methods of dividing students into classes based on age and assigning these students one teacher were influenced by the Swiss educator Johann Heinrich Pestalozzi (1746–1827), whose methods influenced reading instruction developments such as the word method of reading, the use of pictures in readers, and accessing students' prior knowledge before reading. At the same time, the introduction of an increasingly graded school system (an innovation introduced from Prussia during the first half of the nineteenth century) led to graded readers.

During the period prior to the Civil War, readers began to include texts on a wider range of subjects and less patriotic material. More informational and expository text than fictional material was included. During this time, there also emerged considerable debate over which method of teaching reading was best—the ABC method or the word method; however, silent reading was becoming the new focus. Word lists were also a new focus.

Josiah Bumstead's reader deviated from other readers in that it provided word lists grouped by categories (e.g., the body). In addition, the shift from solely teaching letter names to also teaching the sounds of letters, known as the alphabet-phonetic method, was a major change in reading instruction, evidence of which can be found in David B. Tower's *The Gradual Primer*. Many primers also connected writing with reading and included the copying of sentences as an activity. The most popular and comprehensive readers were the *McGuffey's Readers*, first introduced in 1836. This graded series had readers specifically designed for each elementary grade level.

A New Methodology

Rebecca Pollard's 1889 work *Synthetic Methods* was the first textbook to focus on phonetics. This prompted the reorganization of several basal readers around phonetics (e.g., *Beacon Readers*, *Gordon Readers*, and *Ward's Readers*). At the same time, other authors were using an analytic method in their readers and phonetics was secondary. The sentence or story method, which elaborated on the word method, was the main focus. Sentences and stories focused on rhyme (e.g., *Aldine Readers*), and some texts had folktales as their basis (e.g., Reading-Literature series). Basals were progressing toward literary readers organized around texts of interest to children and complete with pictures.

The early 1900s saw a nascent interest in reading research. The physiological and psychological laboratory studies that were conducted focused on reading ability and disability. Edward L. Thorndike's handwriting scale, published in 1910, marks the beginning of scientific investigation in the area of reading. It was

not until 1915 that a standardized test of reading was published. This has to do partially with the attention given to meaning over pronunciation and the fact that before this time, reading instruction focused on oral reading, which was time-consuming to measure.

With the shift toward silent reading, reading comprehension and rate were able to be measured in large groups. What was measured soon became what teachers focused on, thereby emphasizing silent reading. This focus led researchers to examine the differences between oral and silent reading. Educational periodicals, professional books, and basal readers also advocated the silent reading method. Soon thereafter, attention drawn to the fact that U.S. soldiers fighting in World War I did not have basic reading skills led to demands for the improvement of reading instruction, which led to additional research to identify and examine the fundamentals of reading.

It was also during this early period of the twentieth century that basal readers became popular. They were accompanied by teachers' manuals, student workbooks, tests, and other supplemental resources for the teacher to use. The text selections were structured around directed reading lessons and teaching activities. Students were asked to read silently, answer vocabulary and comprehension questions, and participate in a class discussion about the text read.

New Initiatives

In 1955, Rudolf Flesch's book *Why Johnny Can't Read*, along with world events like the flight of *Sputnik*, rekindled the debate between phonics and the whole-word method of learning to read and put pressure on educators to better educate students. This national focus on education prompted governmental support and funding. It was during this time that reading instruction was implemented beyond the elementary years. With this drive to teach reading to adolescents and adults so that they might procure jobs, remedial reading courses were made available in schools. In addition, a bill was passed to provide financial support for research and programs on reading education.

Around this time, many professional books on the subject of reading appeared. In 1967, Jeanne Chall's

book *Learning to Read: The Great Debate* suggested that phonics instruction yielded better reading outcomes than the whole-word method of reading instruction. Studies during this period, such as Bond and Dykstra's *First Grade Reading Studies*, published in 1967, concurred.

Soon thereafter, in the early 1970s, the whole-language approach to reading instruction, started by Kenneth Goodman and Frank Smith, came to contest with the basal texts. The whole-language camp believed that basal readers were not authentic texts for reading instruction. Basals had controlled vocabulary; too much of a focus on skills; and boring stories that lacked diversity in plot, themes, and ethnicity of characters.

In addition, the instruction promoted by basals (such as ability grouping and round-robin reading) did not foster effective reading practices. Along the same lines, a literature-based approach to reading was advocated around the same time. Literature-based basals were composed of authentic and age-appropriate texts taken from actual children's literature texts.

At the turn of the twenty-first century, The National Reading Panel, using as a springboard the information compiled by the National Research Council in Snow, Burns, and Griffin's *Preventing Reading Failure* (1998), evaluated research-based knowledge of reading. The National Reading Panel singled out five big areas of reading that the panel believed should be central to any federally funded reading initiative. The Big Five, as the areas are referred to, are phonemic awareness, phonics, vocabulary, comprehension, and fluency. With the passage of the No Child Left Behind Act of 2001 and the Reading First initiative (a nationwide effort to produce successful readers), the Big Five have been substantially emphasized as areas on which educators need to focus instruction and assessment.

RECONCEPTUALIST MODELS OF EDUCATION

Reconceptualist scholarship began as a reaction to traditional ways of looking at curriculum. Whereas traditional curriculum scholarship focused on design, implementation, and evaluation of curricular materials, the work of reconceptualist scholars became more theoretical and focused on understanding of context. The more traditional curriculum scholarship had its roots in educational administration, whereas the reconceptualized curriculum thinking was based upon history, sociology, philosophy, literary criticism, political science, psychology, aesthetics, and anthropology. The shift moved much of the curriculum conversation—beginning in the 1970s and increasing through the 1980s and 1990s—from the social sciences to issues of personal authenticity and social justice.

Reconceptualist Ideas

Reconceptualist scholarship approached curriculum as an act of critical self-reflection. Reconceptualists were skeptical of dominant ideas from social science and positivist notions of knowledge. They promoted a more holistic way of knowing that focuses on inner consciousness. They believed that there are multiple ways of knowing the world and understanding one's self. They rejected claims of certainty, arguing that knowing is always mediated by subjective understandings and interpretations. As such, they argued that educators cannot claim to know outcomes of a lesson in advance of that lesson. Classroom encounters are subject to the complex nature of the engagement between a teacher and his or her students as well as possibilities that emerge by virtue of their coming together.

Reconceptualists were also skeptical about relying on knowledge rendered and conveyed purely through language. The world can be perceived and understood in ways that transcend language, they believe. Therefore, educators need to recognize that language can be problematic because the images and ideas it forms can impose ways of responding that are more technical and seemingly objective. With these ideas in mind, reconceptualists argued that curriculum is not merely some imposed plan. It is, instead, a dynamic occurrence based on complex interactions of people.

Paul Klohr, a major figure in the early days of reconceptualist scholarship, identified a number of themes that distinguished reconceptualist theorizing from traditional curriculum work. He noted that reconceptualist theorizing posed an organic and holistic view of humankind. Knowledge and culture are created and sustained by individuals, in this view, and curriculum theory originates in the experiences of the theorizer and is shaped largely by the preconscious realm of that experience. According to Klohr, personal liberty and higher levels of consciousness are central values in reconceptualist curriculum work. Furthermore, diversity and pluralism must be sought as achieved social ends in the work of schooling. To this end, the political and social conditions surrounding and influencing schooling must be critiqued, and through the use of new language, reconceptualized possibilities need to be articulated.

Reconceptualist Scholars

Two scholars, Dwayne Huebner and James Macdonald, were most instrumental in initiating reconceptualist perspectives of schooling. Although their initial work responding to traditional curriculum theorizing began in the 1950s and 1960s, the movement itself did not take significant shape until the 1970s, when a number of their students began writing in the field. Their efforts as well as the work of two other prominent figures, Maxine Greene and William Pinar, help to shed light on the assumptions that guided the reconceptualist movement of the 1970s.

Dwayne Huebner was a central figure associated with the beginnings of reconceptualist scholarship.

Huebner's work focused largely on language and its importance in articulating values and affecting practices in schools. With this in mind, Huebner argued that the traditional language of curriculum perpetuated technical rational ways of being in schools. In response, he believed that educators should be mindful of how language shapes their work and seek out other value systems, language, and metaphors to change the experiences in the classroom. Huebner believed that ethics and aesthetics should guide the way educators think about and work within schools. He believed both ethics and aesthetics help educators avoid the means–end thinking and being within traditional classrooms. Whereas technical rational thinking focused on separating out parts of the world, aesthetic rationality sought integration.

Huebner also focused on temporality within his scholarship. According to Huebner, an individual's life cannot be described by what he or she does at a particular place and time. One's identity is shaped by the course of his or her life, and as such it is futile to try to encapsulate school experiences into objective and predetermined ends. Thus, Huebner argued that educators should move away from scientific and empirical language when talking about curriculum. He further argued that curriculum scholars needed to focus more on the complexity of interactions among humans, using new language and forms or metaphors to explore the significance of phenomena in education, and to engage in thoughtful work within schools. The shift, according to Huebner and other reconceptualist scholars, moved curriculum work into a larger and more complex context and away from what was perceived to be quick fixes for education.

James Macdonald was another prominent figure in the reconceptualist movement. Macdonald viewed critical self-reflection as a way to move beyond the typical means–ends way of looking at curriculum and schooling. Macdonald argued that educators must be mindful of the language being used to discuss the nature and purpose of schooling because the language used often dictates what happens, and it does so often from a perceived position of objectivity. As a result, much of what is learned in schools is technical and emerges from very low levels of thinking. In contrast,

Macdonald argued that schools should help to develop critically aware persons who are able to consider how personal values affect norms of the larger society and then respond to those values. Ultimately, Macdonald envisioned schools as places for self-honesty—where what one says and what one does are consistent with what one believes.

Although she did not consider herself a reconceptualist, Maxine Greene is another scholar whose ideas fall within reconceptualist perspectives. For Greene, imagination provides possibilities for how one perceives one's self and one's place in the world. With this in mind, Greene argued that art and literature draw individuals out of their objectified existences. Greene further argued that education should help individuals become "wide awake" about their place in the world in order to respond to that world. According to Greene, each experience shared between a teacher and a student becomes a unique encounter. Therefore, educators should be mindful of the possibilities within and among these encounters. This awareness requires a constant striving toward heightened consciousness that makes up the force and focus of curriculum work. Greene's call for heightened consciousness goes beyond a phenomenological exercise. For Greene, heightened consciousness is necessary in order to recognize and respond to injustice.

Another scholar closely associated with reconceptualist scholarship is William Pinar. Pinar's work focused on the knowing individual within the context of a challenging world. According to Pinar, it is the responsibility of an individual to use autobiography in order to better understand him- or herself in relation to social challenges. Based upon phenomenological inquiry, Pinar advocated *currere* as a form of curriculum theory. *Currere* transcends the traditional notions of prescribed ends within an educational experience to focus on a more authentic and engaged lived experience within the classroom.

Pinar has been not only instrumental in forming and articulating critical ideas within the reconceptualist movement, but also the primary means through which the reconceptualist movement has been identified as a movement and distinguished from traditional curriculum work. In his 1975 book *Curriculum*

Theorizing: The Reconceptualists, Pinar calls the changes taking place in the 1970s “reconceptualist.” Furthermore, Pinar played a key role in introducing the movement to the larger field of curriculum when, in 1974, he was asked to provide a state-of-the-field address for the Curriculum Division (Division B) of the American Educational Research Association.

Publications and Conferences

Throughout the 1970s, reconceptualist scholarship was manifested within a number of special conferences and publications. One such conference was the Rochester Conference of 1973. Papers from this conference indicated a new sense of skepticism regarding public schools. Presenters argued that schools could not be sites of liberation and change, and therefore curriculum workers should not maintain faith in schools as the source of their work. Attendees eschewed the focus on practical work advocated by Schwab and argued that curriculum work needed to be theoretical and political.

Similar small conferences took place at different universities throughout the 1970s, and in 1978, a new series of conferences began in conjunction with the establishment of the *Journal of Curriculum Theorizing*, the primary publication for reconceptualist scholarship. William Pinar started the journal in 1978 as a means to support the work of new scholars, and the annual conferences sponsored by the journal provided additional space in which new scholars could find like-minded individuals to share ideas.

Shifting Directions

Beginning in the 1970s and throughout the 1980s, forms of curriculum theorizing associated with the reconceptualist movement began to move in two directions. Some scholars writing in a reconceptualist vein did so largely motivated by issues of phenomenology and existentialism, whereas others were motivated more by Marxist ideology and issues of social justice. William Pinar distinguished these differences as “post critical,” referring to the more phenomenological/existential focus, and “critical,” referring to the more Marxist focus.

Both movements within reconceptualist scholarship were influenced heavily by the work of Paulo Freire. Freire’s notion of praxis—conscious, determined, and informed action—as well as his notions of critical consciousness and language of possibility became critical tenets among reconceptualists. According to Freire, it is critical to know one’s self in order to be a subject engaged within the world. With that critical self-awareness, it is then crucial that one acts within the world to make it a more just place. Thus, the work of Freire served as a coherent framework under which reconceptualist scholarship grew and developed.

The Legacy

According to a number of the scholars associated with the reconceptualist movement, reconceptualization of the field has occurred, and as such, the movement has disappeared. Merely opposing traditional curriculum theorizing was not a strong enough force to maintain a unity of ideology among the very diverse scholars. The two directions of reconceptualist scholarship—the phenomenological/existential and the critical—have diverged further since the 1980s. Pinar and others note that the demise of the reconceptualist movement is actually a testament to its success. Thinking about schooling is no longer limited to technical perspectives.

A current legacy from the reconceptualist movement can be seen in the work of such scholars as James Henderson, Jim Sears, and Patrick Slattery. Their scholarship, as well as the work of others in the field, builds upon the ideas of reconceptualist theory in an effort to have a greater effect on the state of schooling. These scholars and others continue to pursue curriculum as a means to understand the complexity of schooling and society, but they have extended that work to explicitly address the theory-practice divide between scholars and practitioners as well as the need for scholars to be directly involved in school reform and social change. Additional small conferences and publications have emerged in an effort to extend the phenomenological, existential, and critical perspectives of the original reconceptualist scholars. One organization that has emerged from

the original small conferences to extend reconceptualist ideas is the Curriculum and Pedagogy Group.

REGGIO EMILIA APPROACH

Reggio Emilia is a prosperous region in northern Italy with a population of approximately 150,000. The people of this region have a history of civic engagement and cohesive communities based on reciprocity, trust, and networking. During World War II reconstruction, citizens of the area, under the visionary guidance of Loris Malaguzzi (1920–1994), developed an educational system within its municipal schools for young children ages 3 months to 6 years. This infant-toddler and pre-primary delivery system is grounded in the idea that all children, including very young children, have the right to an education and that the local citizenry can and should take direct responsibility for educating those children.

Reggio Emilia schools are a means to support the community's many needs and to provide a public space for community members, parents, and teachers to dialogue, connect, and instill ethics in the young. Parental knowledge contributions are essential for learning, thus forming a conceptual triad between child, parent, and staff member. Piaget's concept of creating rich and invigorating learning environments for children is a major pedagogical foundation in Reggio Emilia. So, too, is the perspective of theorist Lev Vygotsky, who valued the importance of the relationship between thought and language, co-construction of knowledge among learners, and the zone of proximal development.

In this approach, children are held to have a legitimate right to intellectual development and to an education that inspires curiosity and discovery through a variety of language forms. Children take an active role working alongside others to explore, discover, and create knowledge for themselves. Through this process of self-discovery and investigation, the child and the teacher act as researchers by exploring questions, finding solutions, and formulating new questions.

Knowledge is a dynamic element that is socially constructed within the relationship of child-child interaction, and interactions between child and adult. These interactions include discord and debate, both of which are valued as opportunities for advanced thinking. Because knowledge formation is dynamic and consistent with constructivist theory, the children of Reggio Emilia develop multiple ways of investigating ideas and interpreting multiple forms of knowledge. Children are encouraged to engage in the "100 languages" of expression and communication derived through oral, artistic, dramatic, musical, dance, and other creative media. In the United States, there are several Reggio Emilia-inspired schools.

RELIGION IN THE PUBLIC SCHOOL CURRICULUM

Because the U.S. Constitution clearly prohibits the promotion of religion in public schools, the courts have rigorously enforced rules against such activities as morning prayer and Bible reading. The teaching of religion as an academic subject, however, may be permissible, and indeed, some research suggests that it may produce desirable results. The latter practice is the subject of this entry.

What Is Legal

At issue in the case *Abington Township v. Schempp* (1963) was a policy of the state of Pennsylvania requiring students who attended public school to read at least 10 verses from the Bible everyday. In addition, Abington Township required the students in its district to recite the Lord's Prayer after completing these readings. Students could be exempted if their parents wrote a note requesting that their children be excluded from these exercises.

The U.S. Supreme Court found that the required activities encroached on both the free exercise clause and the establishment clause of the First Amendment,

because the readings and recitations were essentially religious ceremonies and were “intended by the State to be so.” Moreover, Justice Clark argued in the main opinion that the ability of a parent to excuse a child from these ceremonies by a written note was irrelevant because it did not prevent the school's actions from violating the establishment clause. The Court's decision and a series of others made it clear that public schools could not engage in devotional teaching of religion. At the same time, the Court in *Abington* also noted that *academic* teaching about religion was constitutional.

Some researchers believe that state-supported institutions have excluded religion and religious ways of thinking through a misunderstanding and misrepresentation of the First Amendment. Although the guidelines of the U.S. Department of Education forbid public school teachers from engaging in religious activities in the classroom, they affirm that the establishment clause does not mean that religion is strictly forbidden from public school in all aspects. The Bible, the Koran, and other religious texts may be studied or otherwise used in public schools for their literary, poetic, or historical aspects, but public schools cannot teach that the religious tenets of these texts are true or false.

Furthermore, a student's freedom of speech includes the right to discuss religious issues with classmates and to distribute literature, both religious and nonreligious, on campus. In fact, censorship of this nature would itself violate the free speech and establishment clauses.

Social Context

U.S. schools admit students of various religious orientations and those with no religious affiliation. Statistics indicate that nine out of ten Americans believe in the existence of God and that among developed nations, the United States is the most religiously diverse society and the most religious. Projections by religious sociologists and urban planners suggest that what has been a White Protestant majority among members of religious groups in the United States will change with the growing number of Latino Catholics and evangelicals, with increases in the number of Latter-Day Saints, Muslims, Buddhists, and Hindus,

and with the emergence of more nonreligious people in the population. It is projected that by 2040, minorities will represent more than half of the K–12 student population in the United States.

In 2003, the Pew Forum on Religious & Public Life advised that the United States is currently confronting expanding religious diversity. Consequently, some believe that there is a need for understanding religious differences and learning about the religious traditions of others in the aftermath of September 11, 2001. Some argue that studying religion would provide knowledge and information that exists nowhere else in the curriculum, and they also emphasize that including religion in the curriculum shows respect. Subsequently, some have called for greater incorporation of religion or spiritual guidance in public schools, particularly in the wake of such high school tragedies as those at Columbine and Jonesboro.

Examples of State Involvement

Charles Haynes, a religion scholar, notes that a new consensus on the importance of teaching about religion has begun to influence state frameworks and standards for social studies as well as the treatment of religion in textbooks widely used in public schools. North Carolina and Utah teach about religion in social studies classes, and in California, the history-social science framework and the new history-social science content standards require considerable study of religion. California's students are expected to learn the religious dimensions of the American story, from the influence of religious groups on social reform movements to the religious revivals from Christian fundamentalism to the expanding religious pluralism of the twentieth century.

Begun by a retired Utah middle-grade teacher, Martha Ball, there are a number of what are referred to as 3Rs projects across the nation. 3Rs stands for Rights, Responsibilities, and Respect for Religious Liberty. States that have established 3Rs projects include California, Georgia, Oklahoma, Pennsylvania, Texas, New York, and Utah. Ball continues to work to change attitudes about everyone's rights and responsibilities with reference to conflicts and debates revolving around our differences.

The 3Rs projects help school districts implement policies that protect the religious liberty rights of students by using First Amendment principles. These policies protect students of all faiths and no faith. Moreover, the projects prepare teachers to teach about religion in history in ways that are both constitutional and educational.

The movement to put religion as a subject, but not a devotional topic, in American classrooms is national in scope. The National Center for History in Schools (NCHS) guides many school districts in developing a curriculum. In that capacity, NCHS has listed religion as a critical element of history. In world history, the NCHS recommended the study of Christianity, Confucianism, Taoism, Brahmanism, and Hinduism. For U.S. history, NCHS recommended that students study religions that are representative of the modern population in order to understand "religious diversity and its impact on American institutions and values."

In 1998, Haynes advised that failure to provide the facts about religion can lead students to have the false impression that the religious experience of humanity is insignificant or unimportant. Moreover, the failure to understand even the basic symbols, practices, and concepts of the various religions makes much of history, literature, art, and contemporary life unintelligible. In this context, the study of religion is clearly an important subject for the curriculum of the schools.

RELIGIOUS FUNDAMENTALISM AND PUBLIC EDUCATION

Contemporary tensions in the relationship between religious fundamentalists and the public schools can be understood only within the historical context of the relationship between the schools and religion in general in the United States. It is also important to note that the debate, as defined in the United States, is limited almost solely to Protestant Christian fundamentalism. Although the current debate is often seen as a relatively recent move by powerful Christian conservatives to remove long-established church-state barriers, religion has been intimately connected to American education from its beginnings and was key to the early expansion of the public school system. In contrast, although the principle of a strict wall between church and state was established at the beginning of the nation, the enforcement of that principle is a somewhat recent phenomenon. Following some key definitions and a brief historical context, the focus of this entry will shift to the role that the courts have played in shaping the current relationship. The entry concludes with a description of the issues and trends that characterize the current relationship between the two institutions.

Historical Review

Christian fundamentalism is usually associated most closely with Protestantism and had its beginning—as

a theological school of thought and active movement—in the 1880s. The movement's beginnings were in the urban North; its more familiar association with the rural South came about only after the Scopes trial of 1925. Fundamentalism is characterized by its often dogmatic theology, assertiveness, and a sense of constantly being under siege by secular forces. What fundamentalists see as concerted, secular attacks on religious freedoms and the place of God in the school curriculum might be seen by others as gradual, inevitable cultural shifts.

For nearly 300 years, the religious influence on anything that could be defined as public schooling in the United States, while pervasive, was general in nature. Protestant in its leanings, the religious emphasis in public schools was on general biblical literacy, moral conduct, and the instillation of uniform values and identity. So the charge by fundamentalist Christians that public education has taken a secular turn away from religious values is, to a limited extent, an accurate one. It would be more difficult to support the charge that the change is due to the attacks of special interest groups such as secular humanists, the American Civil Liberties Union, or the Communist party—all of which have been labeled as the source of the problem at one point or another—against the wishes of the general population.

Instead, the shift was due more to societal changes brought about as a result of massive immigration, pragmatic and progressive philosophy, urbanization, growth in public education, and a growing faith in science and technology. The merging of these influences, especially at the end of the nineteenth century and beginning of the twentieth, made any consensus of religious values nearly impossible and even resented by many in the nation. What became more prominent in public education was a sort of civil religion that emphasized ideals such as the importance of individual character in social mobility; the relationship between personal industry, moral rectitude, and merit; and a determined effort to unify America's diverse population through education.

These same changes that many perceived as progress or signs of modernism were accompanied by a lack of certainty and stability to which fundamentalist theology was one response. Two phenomena

especially revealed what has now become a familiar, issue-oriented attack response by fundamentalist Christians. One was the fear of communist influence after World War I. The second was the growing influence of Darwin's theory of evolution. The need to respond to those perceived threats to the United States' spiritual welfare set the stage for the fundamentalist activism that is still powerful today.

In 1925, John Scopes was put on trial in Dayton, Tennessee, for teaching evolution in his high school biology class. The dramatic and flashy trial ended with the jury finding Scopes guilty of violating the letter of the law and fining him \$100. The judgment was later overturned due to a technicality. Legally, the impact of the decision was minimal. The same cannot be said for its educational and cultural impact. On one hand, Clarence Darrow, Scopes's defense attorney, succeeded in creating a national stereotype of fundamentalism and southern culture in general as ignorant and anti-intellectual. Nonetheless, the fundamentalist position won a clear victory in terms of future curriculum decisions. Immediately after the trial, Ginn and Company, the publisher of the textbook used by Scopes, dropped all references to evolution and downgraded the status of Darwin in the field of biology. Evolution did not return to textbooks until the 1950s, and textbook publishers remain cautious regarding controversial topics to the present day.

Over time, three issues in particular have motivated fundamentalist activism in public education: teaching of evolution, school prayer, and disputes over the teaching of values. Among the tactics used to fight curriculum battles have been boycotts and protests of text and library materials, election of sympathetic members to local school boards in order to influence curriculum policy, and use of the courts. It is the latter, especially when cases have made it to the Supreme Court, that have had the most influential or public impact on church/state issues in the schools.

Court Rulings

Over the past sixty years, the extent to which fundamentalism has accomplished its goals in relation to public education has been determined largely by the courts. Since 1940, there have been no fewer than

forty Circuit Court of Appeals and Supreme Court decisions related to public schools and religious liberty. Although the courts have been fairly consistent in ruling in favor of the freedom of individual religious expression, they have been equally consistent in ruling against any policy or practice that might impose a specific religious perspective on students within a school setting.

More specifically, in two of its key areas of interest—teaching evolution and school-led or required prayer—the fundamentalist position has been ruled unconstitutional in every major Supreme Court decision. The other major issue—values-oriented curricula—has typically been settled before reaching the courts. One case that did reach the Ninth Circuit Court of Appeals (*Peloza v. Capistrano*) in 1994 was related to a school district's use of the *Impressions* reading curriculum. In that case, the Court ruled that the curriculum did not, in fact, constitute a promotion of witchcraft and denigration of Christianity, as charged by various evangelical fundamentalist groups.

A lack of influence through the courts, however, has not limited the real or perceived influence of fundamentalist activists on day-to-day decision making in public education. After the Scopes trial, the next major period of activism for fundamentalist Christians came in the post-World War II era as school reform efforts such as progressive education and life adjustment education came under fire from a number of critics. Groups such as the Christian Nationalist Crusade claimed that along with low academic standards, godless communism had found its way into the schools and was trying to destroy American and Christian values.

The 1970s and 1980s proved to be the next, and perhaps most influential, periods of fundamentalist activism. A string of court-based setbacks throughout the late 1960s and early 1970s did not deter the more grassroots tactic of censorship and protest. Between approximately 1974 and 1985, there was a dramatic jump in the number of challenges to textbooks and library acquisitions, and according to some reports, nearly half of those challenges resulted in the removal of the challenged materials. Some of the debates during this period were so emotionally charged that they sparked acts of violence. One of the earliest challenges, in 1975 in Kanawha County, West Virginia, resulted in

strikes, fire bombings, destruction of property, and even shootings and beatings. A few years later, in 1977, fundamentalist groups in Warsaw, Indiana, publicly burned copies of Sidney Simon's book *Values Clarification*.

From its beginnings in the 1880s, fundamentalist Christianity has sought to influence public education, as well as other public institutions, but for much of the time, it was not generally well-organized or unified by any nationally coordinated groups. Therefore, most efforts were local in nature and limited in their influence. That began to change in the late 1970s and especially during the "Reagan Revolution" of the 1980s, at which point the movement came to be known more commonly as the Christian or religious Right. Early leaders of the movement, such as Jerry Falwell's Moral Majority and Phyllis Schlafly's Eagle Forum, found a sympathetic and compatible ear in Ronald Reagan as he ran for president, and they put their efforts into helping to elect a number of conservative candidates in 1980, including Reagan himself. In return, many of Reagan's educational and social policy proposals were heavily influenced by those fundamentalist groups. This pattern has continued to varying degrees since that time and has recently been reinvigorated by ties to the George W. Bush presidency that are even closer than those during the Reagan era.

Current Status

Some issues remain the same for fundamentalists—school prayer and concerns over the teaching of evolution. A relatively new issue that may pose the greatest threat to public education, however, is the issue of education vouchers, which would allow parents to send children to private and parochial schools at public expense. If successful, this movement would not attempt to change the content of public education but instead would, according to some observers, undermine the schools by draining them of much needed funding and active, concerned parents. Local court decisions have been mixed, and there has not yet been a definitive Supreme Court decision regarding the constitutionality of vouchers.

At present, a number of conflicting cultural and political trends make it difficult to determine the

extent to which fundamentalist Christianity will find more or less success in its efforts to change public education. The movement has never had a more sympathetic presidential administration, and a strident conservatism in many areas of the country has attempted to bring religion more directly into public institutions. Perhaps more importantly, recent Supreme Court appointments have given the body an apparently conservative bent. But even there, the past has shown that a judge's previous rulings and writings are not always indicative of high court behaviors. Moreover, there is little evidence that the country as a whole has experienced any type of wide-scale religious awakening that would lead to greater acceptance of the imposition of a single religious perspective in the public schools.

There is also some evidence that even though conservative Christians still make up a significant voting bloc, the national cohesion provided by groups such as the Moral Majority has weakened, and more progressive evangelical spokespersons such as Sojourners' Jim Wallis are gaining influence. Other fundamentalist leaders are encouraging parents to simply home-school their children rather than fight battles in the public schools. Finally, there is some movement among liberal Christians and Democratic politicians to consider the role of religious faith in the lives of Americans more seriously in future policy decisions. Some observers suggest that, if that occurs, it could diffuse the siege mentality and perceived hostility that fuels the fundamentalist reaction to schools and thus lessen the power of the movement.

REPRODUCTION, EDUCATIONAL

According to reproduction theories, societal institutions perpetuate or reproduce the wider structures of inequality and oppression in society. Social reproduction theorists draw upon the work of Max Weber, Émile Durkheim, and primarily Karl Marx to demonstrate how societal institutions reproduce and maintain the capitalist economic order.

According to these theories, schools play a fundamental role in this process. Social reproduction theories, also known as structural dominance theories, show a link or correspondence between the structure of schooling and the structure of the capitalist economy. There is, according to this approach, a tight fit between schools and the wider social and economic order. Bowles and Gintis present one of the strongest arguments from this perspective in their 1976 book *Schooling in Capitalist America*. The authors begin by providing a background of progressive educational reforms in the United States in the 1960s and 1970s to improve educational successes of children from working- and lower-class backgrounds. Despite these reforms, most of these children continued to be academically unsuccessful, as investments in education led to neither equality of opportunity nor equality of results.

Bowles and Gintis asked the question, “Why have these liberal educational reforms for economic equality failed?” The answer, according to the authors, lies in the economic structures of U.S. society. They argue that there is a correspondence between schools and the dominant social order. Students are integrated into the capitalist economy through a structural correspondence between the school’s social relations and those of production.

This occurs through a number of different processes. First, power and authority are similarly organized on a hierarchical basis in schools and factories. Schools in working-class neighborhoods tend to be more regimented and rule based, and they concentrate on behavior management more than do schools in middle- and upper-class neighborhoods, Bowles and Gintis found. This prepares working-class students for their place at the bottom of the social and economic order, as they learn to be properly subordinate within schools and outside in society. As working-class students experience a lack of control over the curriculum, working-class adults face the same situation in their work, the authors suggest. Through this process, students are alienated from their learning, reflecting the alienation that workers in a capitalist society face. Grades and other rewards in school also correspond to the role of wages in factories to motivate workers. Finally, individual competition is encouraged in schools as it is in factories. Children from working-class/poorer families tend to accept this as their fate. Their schooling prepares them to become accustomed to their limited role in society, whereas those at the top become equally accustomed to positions of privilege and domination, the theory concludes.

In a 1985 work, Oakes has shown how school tracking entrenches structural inequality in schools and in effect reproduces the dominant social and economic order. Social reproduction scholars outside of the United States have also shown how schools continue to reproduce structures of inequality, disadvantaging students from working-class families.

Antiracist educators and researchers have also explored the ways that schools reproduce racism in society. Although not drawing explicitly upon the same theories as social reproduction scholars, this work is similar in demonstrating the myth of meritocracy in education for students of minority racial and ethnic backgrounds. Similar arguments have also been made with respect to gender inequalities.

RESERVE OFFICER TRAINING CORPS (ROTC)

Under the Morrill Act of 1862, military training was compulsory for male students at land-grant colleges. Although military training had been taking place at some civilian colleges since 1819, the National Defense Act of 1916 established the Reserve Officer Training Corps to provide training to larger numbers of officers who would be needed for modern wars. Land-grant colleges typically required ROTC for all of their male students. Graduates of ROTC programs were inducted into the Officers Reserve Corps and could be called to active duty in the event of a war.

Navy ROTC training programs began in 1925 and were the first to offer the scholarships and other incentives that are now part of all ROTC programs. ROTC programs also exist for the Air Force and Marines. Junior ROTC programs, which focus on leadership skills, are available at many high schools. Students at more than 3,000 high schools participate in these programs.

During the Vietnam War era, many campus ROTC programs were disbanded because of faculty and student protests. At some institutions, ROTC still has not returned to campus. ROTC is now an elective part of the curriculum at many schools nationwide. Enrollment in the program dropped dramatically beginning in 2003 with the escalation of the war in Iraq.

Another issue that has plagued ROTC since the 1990s is the U.S. military's "don't ask, don't tell" policy regarding gays and lesbians in the military. This has led to protests on some campuses and the exclusion of ROTC programs at many institutions. Currently, there are about 45,000 students enrolled in

ROTC programs at American colleges and universities. More than 50 percent of commissioned officers in the U.S. Army are ROTC program graduates.

RESISTANCE, STUDENT

Student resistance to classroom instruction is often conceptualized as a student's critical rejection of formal and impositional academic content knowledge. Yet student resistance in K–12 and higher education can be understood in much broader and more nuanced terms. If student resistance is viewed as the willful (be it active or passive) rejection of academic content, then one can begin with John Dewey's comment in *How We Think* that teaching and learning are much like selling and buying: "One might as well say he has sold when no one has bought, as to say that he has taught when no one has learned" (p. 29).

Viewing student resistance through such a broad lens makes clear that this is a long-standing phenomenon cutting across categories of race, ethnicity, class, and gender. Although such resistance may be labeled as academic "failure," it is just as possible to suggest that disengagement, withdrawal, and dropping out are legitimate modes of resisting schoolwork viewed as irrelevant to one's future.

The rise of critical theory in the 1960s and 1970s offered an important addition to the understanding of student resistance. Specifically, critical theorists argued that student resistance was a response to the hegemonic attributes of schooling as a White, middle-class, and body-less institution. Students' alienation from school was thus something done *to* students by external structures and norms as well as something done *by* students as an explicit rejection of such

external structures and norms. Such an articulation highlighted the mismatch between the cultural capital of lower-class and non-White youth and the dominant cultural capital of the school. Student resistance was thus viewed as a liberatory disruption of the “total institution” of an educational system that emphasized order, control, and passivity; resistance becomes a strategic move of empowerment devoted to displaying other modes of agency, intelligence, and self.

While critical theorists focused their attention on K–12 schools, a similar movement developed in higher education as Whiteness studies and anti-oppressive education (among other multiculturalist movements) synthesized such work within a developmental framework. Student resistance was viewed as a lack of self-knowledge about crucial aspects of one’s privileged identity—be it in terms of race, ethnicity, socioeconomic status, gender, sexual orientation, or (dis)ability. Where critical theorists viewed student resistance as a legitimate move of maintaining cultural identity in the face of hegemonic imposition, higher education scholars viewed such student resistance as the illegitimate maintenance of unexamined privileges in the face of a pedagogy of unmasking. It thus became important to move students in higher education through a developmental process of progressive stages: for example, from an unexamined identity to some form of identity crisis to a concluding reintegration stage.

Contrastingly, student resistance may also be viewed from an interactionist perspective of the co-construction of classroom life and student identity. Student resistance is here viewed as a strategic move in response to a previous strategic move made by the teacher or other students, which in turn was made in response to other previous moves, *ad infinitum*. Student resistance is thus a tactical, albeit hesitant, identity positioning vis-à-vis a host of layered, complex, and intertwined social, cultural, and academic issues. A simple example of such positioning is the student who is fundamentally resistant in one class yet deeply engaged in another. Student resistance is thus a contextual rather than internal marker of identity.

Student resistance may ultimately be viewed as the “I don’t buy it” response to the selling of school

knowledge. The rationale for and predominance of such a response will vary depending on the theoretical orientation and on the demographic characteristics of specific student populations. But student resistance will continue to be a prevalent feature of classroom life given the large percentages of nondominant youth still marginalized in K–16 education, the pervasive and unacknowledged Whiteness of the hidden curriculum of schooling, and the difficulty of linking classroom work to real-world relevance.

RIGHTS OF STUDENTS

Prior to the 1950s and 1960s, students had few, if any, legal rights within public schools. It was subsequently ruled that state governments have created a property right to public education by establishing compulsory attendance laws. Therefore, students have procedural and substantive rights to due process in situations where school officials deny attendance (i.e., suspension or expulsion). Since the 1960s, state and federal courts have begun outlining the rights of students with regard to public schools, and students and parents have used litigation successfully to broaden those rights. Students maintain their constitutional rights when they enter public schools. However, the courts tend to support limitations when balancing student rights against the needs of public school boards to effectively manage

schools; maintain a safe environment for students, staff, and faculty; and meet educational goals. Federal statutes provide specific rights for students with and without disabilities. The federal government has also enacted many statutes ensuring that students' rights are protected.

This entry looks at student rights in the areas of public education, free speech, privacy, discipline, religion, and disabilities. The rights of students are often complicated and may vary from state to state. *Public School Law: Teachers' and Students' Rights*, by Cambron-McCabe, McCarthy, and Thomas, provides a more complete discussion of these rights.

Freedom of Speech

Tinker v. Des Moines (1969) was one of the first U.S. Supreme Court decisions affecting the rights of students. The Court ruled that students do not lose First Amendment rights to freedom of speech or expression when they enter public school. Students have the right to express their political and ideological views unless the expression interferes with school discipline.

The Supreme Court ruled in *Hazelwood v. Kuhlmeier* (1988) that public school administrators have the right to censor student expression in any school-sponsored publication or activity. The *Tinker* decision deals with a student's right of personal expression on school property, and *Hazelwood* establishes the authority of public school educators over school-sponsored publications. The Court established censorship criteria for school-sponsored publications.

School officials do not have the right to censor non-school-sponsored student publications. Students have the right to distribute materials they have prepared, including religious material. Public schools can limit the distribution of student publications according to reasonable time, place, and manner restrictions. Time, place, and manner restrictions must be content neutral, must not restrict all distribution of a particular type of communication, must show a substantial state interest justifying the limitations, and must be narrowly tailored so that the state interest is furthered and no more free speech expression is limited than necessary.

Right to a Public Education

The Fourteenth Amendment of the U.S. Constitution provides that states cannot "deprive any person of life, liberty, or property, without due process of law." States have created a property right to attend public school by mandating that children attend school between certain ages. States or public schools cannot deprive a student of the right to attend public school without due process of law. Due process of law has two parts: procedural due process and substantive due process. When the state tries to deprive an individual of a property right, such as the right to attend public school, the state must notify the individual of any charges, provide an opportunity to counter the charges, and give a fair hearing. Under substantive due process, the state must be able to show that it based its actions on a reasonable goal or purpose and that the action is needed to reach that goal.

As long as a child's parents or legal guardians are residents in a school district (even if they are illegal aliens), the child is entitled to attend schools in the district. School districts are not required to provide an education for children who have taken up residence apart from their parents solely for educational reasons. Parents can satisfy the school attendance requirement by enrolling their children in private schools. Most states allow tutoring or home schooling to satisfy the mandate.

The McKinney-Vento Homeless Assistance Act of 2001, which is part of the No Child Left Behind Act, protects the education rights of children displaced because of disasters. Under the Act, homeless children have the right to go to school where they were enrolled before they became homeless, even if their new shelter is in another district.

Public schools must provide appropriate programs for students who have limited English proficiency (LEP). The Equal Education Opportunities Act of 1974 requires public schools to help LEP students overcome language barriers. According to Title VI of the Civil Rights Act of 1964, federally funded schools cannot prevent students from participating in any program or activity based on race, color, or national origin. Linguistic minorities are included under Title VI's national origin category.

Students do not have a property right to participate in extracurricular activities. The courts view participation in these activities as a privilege. School officials may deny participation in these activities without providing due process.

Privacy Rights

The Family Educational Rights and Privacy Act of 1974 (FERPA) gives parents the right to see their child's educational records. Schools cannot release this information to third parties unless the parent(s) authorize release. Students who are 18 years old or older have a right to see their school records. Schools cannot release the educational records of these students to third parties, including a student's parents, without the student's authorization. If schools or educational agencies violate these FERPA regulations, the school or agency will lose federal funding.

Searches and Drug Testing

Students have a Fourth Amendment right "against unreasonable search and seizures"; however, the courts weigh this right against the school's interest in maintaining a safe campus. The need for a safe environment is viewed as an overriding state interest that may justify minimal intrusions into a student's constitutional protection against unreasonable search and seizures. The courts have found that the use of metal detectors in public schools is a minimal intrusion into students' rights when weighed against the school's need to provide a safe environment.

Public school authorities may search student lockers and personal belongings if there is reason to suspect that the student possesses items that are illegal or against school policy. School personnel do not need a search warrant to conduct searches of this type; however, law enforcement officers need a search warrant if they conduct a search at a school.

Students who voluntarily participate in athletics and extracurricular activities may be subject to random drug testing. Public schools cannot require a student who does not participate in these activities to take drug tests unless there is reasonable suspicion that the individual is under the influence of drugs.

Discipline

The federal courts have long upheld a school district's right to maintain discipline on its school campuses. Rules and regulations must be reasonable and needed to manage the school or to provide for the welfare of faculty, students, and staff. Students and their parents are entitled to a copy of school rules and regulations.

School officials may discipline students for breaking school rules and regulations, but should consider the student's age, mental capacity, and prior behavior and be sure the punishment is appropriate. The courts have also agreed that if a student's behavior away from school affects the welfare of the school, school administrators may discipline the student.

Suspension and expulsion are acceptable forms of punishment. It is possible for a student to lose his or her property right to an education for violating school regulations; however, students are entitled to due process procedures when faced with suspension or expulsion. Students have a right to due process before receiving punishment for violating school regulations. In the event that the school punishes a student illegally, the student has the right to have his or her status restored and his or her record expunged of all references to the punishment.

Unless prohibited by state law or school board policy, school administrators can use reasonable corporal punishment. Considerable debate surrounds the question of what is "reasonable." It is clear that minority children, children with disabilities, and boys are more frequently physically punished than other students. In all but six of the one hundred largest school districts in the United States, students are protected from corporal punishment in the form of paddling. In terms of legal guidelines, the student's substantive due process rights may be violated when corporal punishment reaches the level that the Fourth Circuit Court described in *Hall v. Tawney* (1980) as "brutal and inhumane abuse of official power literally shocking to the conscience."

It is also permissible for teachers and administrators to use reasonable academic sanctions as punishment for nonacademic purposes. Academic sanctions must also serve a recognized school purpose; for example, many courts have ruled that lowering grades for excessive absences does serve an educational purpose.

Religious Rights

The establishment clause of the First Amendment states that the federal government cannot create any law that establishes religion or prohibits an individual from freely practicing religion. The establishment clause applies to state government via the Fourteenth Amendment. Public schools cannot sponsor prayers, hold Bible readings, or encourage students to include religious messages in speeches, such as graduation addresses. Students have the right to pray or meditate silently or engage in private devotionals as long as these activities do not interfere with regular school activities. Courts have allowed teachers to provide a moment of silence in the classroom, but cannot encourage students to use that time for prayer.

The Equal Access Act requires that federally funded secondary schools allow religious clubs the right to meet during noninstructional periods if the school allows other student groups this privilege. The secondary school establishes a limited open forum for all student groups when it allows such groups to meet on campus during noninstructional periods.

Public schools may allow students release time to attend off-campus religious instruction classes, but cannot encourage students to attend these classes. The school cannot allow the use of school property for religious instruction.

Students have the right to excused absences for religious holidays and observances. Schools are not required to make allowances for such absences if doing so creates an undue hardship for the school. Students may also be exempt from any school activities that are in conflict with religious beliefs unless such an exemption interferes with academic requirements. In 1972, the Supreme Court ruled that Amish children are not required to attend school after completion of the eighth grade.

Students With Disabilities

Rights for students with disabilities are covered by the Rehabilitation Act of 1974, the Americans with Disabilities Act of 1990 (ADA), and the Individuals with Disabilities Education Act (IDEA). Titles II and III of the ADA apply to public and private schools,

respectively. The ADA prohibits discrimination against disabled individuals regardless of age. The IDEA applies to children ages three through twenty-one with disabilities. These children are entitled to a free and appropriate public education (FAPE).

The FAPE requires that the disabled child be educated in the least restrictive environment. The public school must pay for and supervise each FAPE. School districts may place a child in a public or private school that is able to provide an appropriate education to meet the child's needs.

RIGHTS OF TEACHERS

Historically, teachers in the United States have had few rights other than those granted by local school boards. Public school teachers do not lose their constitutional

rights when they sign a teaching contract; however, the courts tend to apply a balancing test when these rights are in conflict with legitimate school administration interests relating to the business of education. Teachers also are entitled to rights created by federal and state statutes. There has been considerable litigation since the mid-twentieth century over limitations imposed on teachers in and out of the classroom. As a result, the courts have defined the rights of teachers and permissible limitations on those rights and freedoms. Several federal acts provide additional protections via the Fourteenth Amendment, which prohibits states from depriving individuals “of life, liberty, or property, without due process of law.”

This entry looks at teachers’ rights in the areas of speech/expression, privacy, religion, and employment. The rights of teachers are complicated and may vary from state to state. *Public School Law: Teachers’ and Students’ Rights*, by Cambron-McCabe, McCarthy, and Thomas, is recommended for a more complete discussion of these rights.

Freedom of Speech and Expression

Protected and Unprotected Speech

The courts have both supported and restricted the free speech rights of public school teachers. In 1968, the U.S. Supreme Court ruled in *Pickering v. Board of Education* that teachers have a First Amendment right to express viewpoints on matters of public concern. In *Pickering*, a teacher sent a letter to a newspaper criticizing the actions of the local school board. The school board dismissed the teacher, claiming parts of the letter were false and damaging to the board. The Court ruled on behalf of the teacher but noted there were circumstances where a school board’s interests would take precedence.

The Court set up a test balancing a citizen’s interest and constitutional right to express views on matters of public concern and the state’s interest in providing public services such as education. A school board can dismiss a teacher for what the board considers offensive speech or expression if, after conducting a reasonable investigation, the evidence supports the board’s position that the expression is not

protected speech. Unprotected speech includes expressing views regarding personal employment issues, comments or attacks on supervisors, or any expression that disrupts the activities of the school. Employers may also limit protected speech under reasonable time, place, and manner restrictions.

Curriculum Rights

Only school boards have the right to decide curriculum content. Teachers must get approval before using any unauthorized materials in the classroom or altering the approved curriculum in any manner. Teachers have the right to determine which strategies and methods are appropriate to use to teach the approved curriculum. Courts have generally looked at the age of the students, relevancy to course objectives, professional support, risk of school disruption, and community standards when evaluating the appropriateness of teaching strategies and materials.

Freedom of Association Rights

The Supreme Court noted under *Healy v. James* (1972) that the right to associate, while not explicitly mentioned in the First Amendment, is implicitly included under freedoms of speech, assembly, and petition. Teachers and other public employees have the right to join political organizations, labor unions, and other types of groups. Teachers may also engage in political activities such as campaigning. They can discuss campaign issues as part of classroom instruction, but must make sure the discussion is fair and balanced. Teachers cannot use the classroom to indoctrinate students or campaign.

Generally, teachers cannot be punished or suffer negative employment consequences based on participation in political groups and activities. School officials can dismiss or sanction employees if political activities impair the employee’s job performance, or the individual’s job involves policymaking duties. In addition, state laws can prohibit or restrict public school teachers from holding certain elected offices.

Although teachers have the right to form or join unions, state law determines whether to recognize the

union's authority to engage in collective bargaining on behalf of its members. Nonunion teachers have the right to express their views at scheduled school board meetings regarding issues in negotiation between the board and teachers' union. Except in limited circumstances, teachers do not have the right to strike.

Privacy Rights

Search and Seizure

The Fourth Amendment protects individuals from unreasonable searches and seizures by the government and requires a search warrant based on probable cause. The Supreme Court upheld warrantless searches of state employees under *O'Connor v. Ortega* (1987). The Court determined that state employers may search an employee's office if the search is work-related and necessary to conduct the employer's business. Public school teachers have a right to expect privacy when it comes to their desks and files on campus; however, school officials can search a teacher's desk and files without a search warrant if there is reasonable suspicion that the search is necessary to carry out educational objectives. In order for such a search to be constitutionally valid, the Court will determine whether the educational objectives are more important than the teacher's privacy expectations.

Drug and Alcohol Testing

School boards can require prospective teachers to submit to physical examinations as a requirement for employment. Court decisions regarding drug and alcohol testing of public employees indicate that this area of law is still changing. Courts have generally struck down state laws requiring mandatory drug testing of state employees unless the employee performs a safety-sensitive role. Court decisions have varied over what job duties constitute a safety-sensitive role in educational settings. Public school employees can be required to undergo testing where the employer has reasonable suspicion that an individual employee may be under the influence of drugs or alcohol; however, court decisions have varied with regard to what constitutes individualized suspicion and when state

employees can be required to undergo drug tests where no suspicion exists.

Lifestyle Choices

Public school teachers have a privacy right to choose their lifestyle. The courts have held that school boards cannot dismiss or sanction an employee just because the board does not support the employee's lifestyle choice. The board can restrict an employee's personal and private behavior if the board finds that the teacher's behavior negatively affects job performance or harms students. In *Montefusco v. Nassau County* (1999), the court ruled that the school board could impose sanctions against a teacher for possessing candid photos of minors in her home even though a criminal investigation did not find grounds for filing charges. This case and others indicate that school boards can fire a teacher based on evidence that would not support criminal charges; however, the courts have also ruled that rumor and innuendo are not sufficient grounds for dismissal.

Employment Rights

Protection Against Discrimination and Harassment

Title VII of the Civil Rights Act of 1964 and the Pregnancy Discrimination Act of 1978 (PDA) amendment to the Act prohibit discrimination practices in hiring, promotion, and compensation based on race, religion, national origin, color, gender, pregnancy, childbirth, or related medical conditions. Title VII and the PDA also make decisions regarding termination, contract nonrenewal, or denial of tenure that are based on gender, pregnancy, childbirth, or related medical conditions illegal. Employers can file for a bona fide occupational qualification (BFOQ) if they can show that discrimination based on religion, gender, or national origin is reasonably necessary for the operation of business activities. An BFOQ cannot cite race or color as occupation qualifications.

Employees have the right to work in an environment free from sexual harassment. The courts have defined sexual harassment as sexual advances,

innuendoes, or demeaning gestures or acts that are repeated and unwelcome and based on gender rather than personal dislike or sexual orientation.

All employees have the right to work in an environment that is not hostile. The U.S. Supreme Court ruled that any conduct that reasonably interferes with a person's ability to work, is intimidating, or is offensive may be hostile. The conduct cannot be merely offensive. The courts look at how often the conduct occurs, if the conduct is humiliating or physically threatening, and if the conduct interferes with the individual's work performance. The Supreme Court ruled in *Burlington Industries v. Ellerth* (1998) and *Faragher v. City of Boca Raton* (1998) that employers can be liable for the actions made by an employee's supervisor.

Disability Rights

The Rehabilitation Act of 1973 protects the rights of disabled individuals. Under this act, if an individual is otherwise qualified for a position with any program or activity receiving federal monies, the person cannot be disqualified solely based on a disability. The Americans with Disabilities Act of 1990 (ADA) requires employers to make reasonable accommodations for a qualified disabled employee; however, employers are not required to make any accommodation that results in undue hardship for the employer. Section 504 of the Rehabilitation Act of 1973 and the ADA establish criteria for determining if a person qualifies as disabled.

Termination, Dismissal, and Nonrenewal Rights

Tenured and probationary teachers are entitled to due process procedures if dismissed for cause. Tenure grants the teacher a property interest in employment with the school; therefore, school boards can dismiss a tenured teacher only for cause as defined by state law. Causes for termination and dismissal vary from state to state. Most states include incompetence, immorality, insubordination, unprofessional conduct, and neglect of duty as grounds for termination or dismissal. School boards must meet numerous requirements when terminating or dismissing teachers; for example, probationary

teachers may be entitled to a hearing, depending on whether the dismissal involves certain rights or creates a situation whereby the teacher will be unable to find future work as a teacher or educator.

Nontenured teachers do not have any right of due process if the school board does not renew their contracts at the end of the contract period. It is common for state statutes to require notification of a teacher on or before a set date that his or her contract will not be renewed. Teacher contracts may be nonrenewed with or without cause, as long as the cause is not a constitutionally protected right.

Retirement and Benefits Rights

The courts have determined that employers cannot set up different requirements for retirement contributions based on gender. The Age Discrimination in Employment Act (ADEA) prohibits employers from setting a mandatory retirement age.

Unless state or local laws prohibit it, school boards may limit employee benefits, such as insurance and retirement benefits, to the legal spouses and dependents of the employee. The Defense of Marriage Act of 1996 allows states to deny employee benefits to same-sex partners who may have been legally married in another state or country.

Religious Rights

Public school employees have the right to reasonable accommodations to allow them to practice religious beliefs; however, the school does not have to make accommodations that may result in undue hardship on the school. Teachers do not have the right to indoctrinate students with a religious viewpoint inside or outside the classroom during normal school operating hours. It is permissible to teach about religion as long as it remains a topic and not dogma.

ROSENWALD SCHOOLS

Rosenwald schools, named for the philanthropist who provided the initial funding for what ended up being thousands of schools, represent an important aspect of the development of Black education in the rural South during the segregation era. Julius Rosenwald, through his generosity, helped stimulate opportunities for the education of African Americans that otherwise would not have been possible. Although occasionally criticized for being part of the “Tuskegee machine,” the Rosenwald schools clearly contributed to an improved quality of education for southern Blacks in small towns and communities where such options did not otherwise exist. This entry looks at their history and contributions.

The Initial Funding

Julius Rosenwald was the president of the catalog and department store chain Sears, Roebuck and Company from 1908 to 1922, and the chairman of the company's board until his death in 1932. The son of German-Jewish immigrants, he was a classic example of a self-made man. As a successful Chicago clothier, he bought an interest in Sears, Roebuck and Company in 1895 and helped build it into a mail-order and merchandising giant.

In 1912, as part of a much larger philanthropic effort, Rosenwald gave \$25,000 to the Tuskegee Institute. At the suggestion of Tuskegee's president,

Booker T. Washington, part of this money was used to build six schools in rural Alabama. Pleased with the result, in 1917, Rosenwald established a challenge-grant program that led to the construction of nearly 5,000 schools throughout the rural South. Rosenwald hoped to build a school in every rural county in the South. By 1928, one in five schools for Black students in the South was a Rosenwald school. The schools provided space for more than 600,000 students. The program ended in 1932 with Rosenwald's death.

A Community Effort

Rosenwald did not want his name attached to his charitable works. He was one of the founders of the Museum of Science and Industry in Chicago, for example, but his name is not on the museum. Despite his reticence to be publicly recognized, the rural Black schools he funded eventually came to be known as Rosenwald schools. Rosenwald's contributions did not completely pay for the schools. In fact, only about 15 percent of their costs were covered by him (Rosenwald contributed a total of \$4.4 million of the \$28 million that was spent on the building of the schools).

Instead, his contributions acted as a stimulus for local communities to use taxes to build new schools, as well as to raise their own funds generated through personal contributions. Fundraising events in the local Black community included chicken dinners and sandlot baseball games. Sharecropper farmers put aside part of their crop—creating “Rosenwald patches”—to contribute to the school fund. Children saved pennies in snuff boxes.

Rosenwald's efforts were important in that they provided the means by which local communities could move beyond the ramshackle and inadequate school building structures that were typically provided for Black students during the segregation era. The Rosenwald schools were simply constructed, primarily wood frame buildings, but represented a significant improvement. Playground space, maximum use of light (East-West sighting of windows), and proper toilet facilities were all included as part of the designs. Few of the Rosenwald schools are still used today.

RURAL AND ONE-ROOM SCHOOLS

One-room schools were widespread in America until the 1960s. Almost always located in rural areas, very small schools evoked strong feelings. Most educators criticized them and sought their elimination. Yet most rural citizens valued their local schools and fought efforts to merge tiny school districts. At the start of the twentieth century, there were nearly 200,000 one-room schools. The numbers fell steadily, to 60,000, by mid-century, and then the rate of change accelerated, leaving only 2,000 by 1970. As one-room schools disappeared, so did 90 percent of the districts that governed those schools. What accounts for the consolidation of tiny schools and small districts? This entry offers answers to that question and briefly describes the renewed interest in small schools as the twentieth century drew to a close.

What the Smallest Schools Lacked

When educators assailed the smallest schools, they stressed the problems of an “ungraded” organization. Having students of widely different ages in the same room precluded good teaching, most experts agreed.

Only an extraordinary teacher could provide suitable instruction to students far apart in academic preparation and social development. What the students shared—similar neighborhoods, common relatives, comparable experiences on the farm—mattered less than their differences, the experts said. Thus, students should be grouped by age in separate rooms.

Educational leaders thought that in high school, students should also be classified by ability and interests. It seemed impossible for a small school to do that. According to an influential report in 1959 by former Harvard University President James Conant, a decent high school needed at least 400 students in order to offer rigorous courses in mathematics, science, and foreign languages. Yet on the eve of World War II, 75 percent of the nation’s high schools had fewer than 200 students.

The smallest schools could not afford the facilities that a “modern” school offered. A large school could more readily provide the space and equipment for vocational coursework, especially home economics for girls and various shops for boys. Art, music, and drama could be taught in small schools, but the buildings lacked ample space for storage and performances. Athletics, the fastest-growing part of the curriculum during the enrollment surge of the 1930s, required extensive space, indoors and outdoors.

Rooms to serve the entire school could be justified if hundreds of students used those costly sites. Libraries, lunchrooms, auditoriums, swimming pools, and study halls were otherwise considered too expensive. The economies of scale seemed compelling, although educators acknowledged that financial savings were not guaranteed by larger size. The per-capita annual operating costs of new and larger buildings were sometimes less, sometimes more, than those of smaller schools. The educational advantages of larger schools were worth the price, educators argued.

Careers Paths That Led to the Cities

Most small rural schools could not match the professional attractions of a teaching career in a larger school and district. The chance to specialize in one subject was rare in the small school, and educators had little respect for the notion of the teacher as

generalist beyond the elementary grades. To save money and avoid surprises, most rural school boards hired young women who lived in or near the area. Typically, they taught for a few years and then either married or moved. Few supervisors were close at hand to lend assistance. The collegial support that was available—specialists from the state department of education, summer “institutes,” college courses—was sparse and patchy, in part because many officials and professors yearned to close small schools, not find ways to improve them.

For teachers interested in a lifelong career, the larger urban districts beckoned. Usually, the salaries and benefits were better than rural compensation. Tenure was more common. So were opportunities to earn advanced degrees in the evenings and summers. Of great importance was the liberation from constant surveillance. Well into the twentieth century, teachers in many small towns were expected to act like saints, forsaking leisure-time activities that might be controversial. Smoking, drinking, dating, or skipping church were out of the question. In the cities, by contrast, there was far less oversight of teachers’ personal lives.

An ambitious young administrator’s career path also led to larger districts. Salaries were significantly higher. Opportunities to innovate abounded because most urban districts, before the 1960s, were seen as leaders in school reform. School boards usually deferred to the credentialed experts who ran the sprawling systems like huge corporations. In contrast, the rural districts’ superintendents not only lacked the training of their urban counterparts but usually were at the mercy of school trustees who made a wide range of picayune decisions that were handled in the cities by educators.

Provincial Character of Small Rural Schools

To most prominent educators, the devotion of rural residents to small schools and districts reflected deeper problems with rural life. In some areas, especially the South, the challenge was poverty. In more prosperous regions, the residents were criticized as being too cheap and too conservative to support educational progress. They tolerated rickety buildings

without adequate sanitation, ventilation, and lighting. The tiniest villages supposedly did not know what was in their own best interest—they hurt themselves by not aligning with larger towns where wealthier farmers and businessmen were increasingly in control of agrarian life. Only by becoming more cosmopolitan could remote outposts keep their young people from leaving.

In response, many rural residents defended their local school as the heart and soul of the community. It was the one place where everyone could share the pleasures of music, drama, sports, and other wholesome entertainment. It was also a safe place where parents could feel assured that their values would be passed on and their way of life would be respected rather than questioned by teachers. Without its own school, a village might not survive. Newcomers would go elsewhere in the absence of the local school.

Consolidation therefore hinged on the willingness of state legislatures to intervene. Rather than mandate change, most legislatures relied on substantial financial incentives to rural districts if they would merge. The legislators were especially generous in providing assistance for transportation and construction costs. One upshot of casting school size as a question of rural folkways was a lost opportunity to debate the shortcomings of larger schools. Rarely did the rural proponents of small schools resist consolidation on the grounds of instructional practices. They would defend “the basics” and assail the larger schools’ broader curriculum as “frills,” but the opponents of consolidation usually presented no original vision of schooling. A fresh approach to agricultural education, creative roles for volunteer instructors, rigorous use of correspondence courses and educational television—those efforts to enrich rural education were rare. When there was a progressive educator in a small school, she usually tried to show that she could match what larger schools did rather than seek novel approaches designed for very small schools.

Renewed Interest in Small Schools

After decades of believing that bigger was better, the American faith in large schools diminished from the 1970s on. Big schools felt inhumane. Many students

without special abilities or disabilities lacked close connections with anyone on the faculty. Guidance counselors advised too many students to know most of them well, and high school teachers with 150 students could not tailor their instruction to individual needs. Moreover, some large schools were not safe. Although media reports of violence and drug abuse exaggerated the dangers, many parents felt that large urban schools were full of mischief.

No one called for a return to one-room schools, although the growing popularity of home schooling marked a commitment to a version of that format. The innovations that took hold were usually in the form of teams of teachers working together with the same students, several subdivisions (“houses”) within a large school, or the construction of new schools of significantly smaller size than their predecessors. No one enshrined the history of rural education—there was no distinctive pedagogy or curriculum associated with it for anyone to emulate. The value of knowing each student well was the legacy left by the tiny rural schools, and personal attention was attractive to educators in all sections of the country by the end of the twentieth century.

RURAL EDUCATION

Conceptual foundations to define rural education are murky and eclectic. In the nineteenth and early twentieth centuries, nation building was the one educational mission driving rural education. The structure of rural schooling depended heavily on decisions made during the Civil War (1861–1865) and on the Homestead Act (1862). The Act and the actions taken as a result of it had an adverse effect on rural America, specifically in the center of the nation, where it created artificial communities based solely on land speculation, established an agricultural economic framework dependent on national markets that lasted until the farm and economic crises of the 1980s, and ultimately diminished the indigenous customs and belief systems about the way of life in rural America. At the same time, programs like the Cooperative Extension’s 4-H youth program and the rapid growth of community colleges in the 1970s offered higher education and adult education opportunities to many rural communities. These programs have struggled to serve a broader constituency in rural areas beyond agriculture.

No single definition exists to define rural America and its schools; some believe poverty is the one common thread, whereas others believe that any area that is not metropolitan is rural. Rural communities were never homogeneous. The schools that served these regions had to work with issues of race in the South and the Great Plains, and with considerable economic diversity, including fishing (New England), mining and rural industry (Appalachia and the West), farming and sharecropping (Great Plains), and ranching (Great Plains and the West). Concurrently, schools dealt with each unique population inhabiting schools (by ethnicity, religion, and social class). Changes in rural education may be region-specific, and generalizations about education in one rural area may or may not be

true for another. This entry attempts to define some common challenges and future prospects.

Problems and Realities

The United States, like the rest of the world, is steadily becoming more urban. Until the 1920 census, most people lived in small towns and rural areas. By 2000, most Americans lived in urban areas (and most lived in cities of 1 million or more). Currently, rural communities have higher poverty rates than their metropolitan counterparts. In the United States, one in four schoolchildren attends school in rural areas of fewer than 25,000, and 25 percent of all public schools in the United States are rural. Of the 250 poorest counties, 244 are rural. Poverty is a reality of rural living and for rural schools. The most recent U.S. Census confirms that school districts with fewer than 200 high school students are more than twice as likely to have high poverty rates as schools with 200 or more students. Nearly 10 million poor people live in rural America (one out of five residents). Rural minorities are significantly more impoverished as a percentage of the population. Nevertheless, the overwhelming majority of poor people living in rural America are White. Addressing rural education will require solutions to both the poverty gap of minorities and the impoverished conditions of all rural poor.

Rural schools have faith that technology will be the driving force of the rural economy and its schools in the twenty-first century. Improvements in communication and transportation have reduced rural isolation and differences in culture, information, and lifestyles. However, rural schools lack the necessary infrastructure to help overcome historical barriers associated with isolation. Rural America continues to provide the nation's food while also providing cheap labor, land for urban and suburban expansion, sites for hazardous waste storage, and natural settings for recreation. Although rural schools are located in some of the most beautiful areas, about half of rural students attend schools in inadequate buildings without proper laboratory facilities and classrooms; faulty foundations, roofs, and plumbing; environmental pollution; and inadequate library/media/technology access. In the past fifteen years, many successful lawsuits against

states—for example, Kentucky, New York, and Ohio—have attempted to correct this by charging negligence in school finance.

Consolidation of rural schools continues to be the controversial topic for policy makers, school administrators, and rural communities. Consolidation is driven by concerns of efficiency, economics, student achievement, school size, and community identity. Rural schools are also defined by a de facto national curriculum and institutional structure. The James B. Conant Report (1959) was influential in restructuring the small high school, calling for consolidation of small schools and the teaching of subject-based lessons. Conant advocated for consolidation and graduating classes of 100 or more in order to “have diversified curricula.”

In the 1980s, the Committee on Educational Excellence emphasized that good education was based on excellence in math, science, and reading. The effect of the report led to a second phase of rural educational restructuring that saw more consolidation than ever before. Currently, the effects of the No Child Left Behind Act's large-scale standardized assessments, declining enrollments and financial cutbacks, country school finance based on property taxes, lack of qualified teachers, and antiquated curriculum are driving school reorganization and consolidation.

Beyond these political forces, demographers believe that some rural areas adjacent to cities are becoming more metropolitan or are growing fast enough to become a metro area in their own right. Smaller rural schools also suffer from out-migration of both young and highly skilled workers, leaving an aging population and strained public services. Most areas have difficulty providing the human capital and infrastructure to attract new rural entrepreneurs. As a result, many rural areas and their schools rely on two fountains of growth: scenic amenities, environmental virtues, or unique products that reflect the cultural heritage (eastern West Virginia and western Maryland); and expanding agricultural and manufacturing opportunities alongside low-cost housing and new immigrant labor (Greenville, SC; Nebraska; Iowa; and Minnesota for food production at Con-Agra, IBP, and Cargill). The two fountains of growth listed above allow for development and sustainability but also produce distinct types of schools divided

along class lines. Rural schools now must deal with urban and suburban persons who telecommute to their work, diverse groups of white- and blue-collar labor, and immigrants and poor workers with social welfare issues never faced before.

Possibilities and Paradigms

There are some possible solutions that can help rural schools deal with the changing nature of rural America. The most plausible one is the use of regional educational service agencies in their states for school improvement. Second, incentive programs (similar to those in urban areas, such as loan repayment, low-cost housing, medical and retirement benefit packages for service, etc.) can help attract and retain quality teachers because rural teacher shortage affects all subjects, particularly math, science, and special education. A third possibility is changes in leadership and policy action from local-based politics to a more cosmopolitan notion of governance involving the community and its leaders; finances, regional economic conditions, state regulations, salaries, and an adequate variety of classes in running small schools are paramount for rural districts. The above are affected by the turnover of superintendents who are trusted in rural districts to assume those responsibilities, which mainly occurs among the smallest districts (fewer than 300 students) and the lack of focused efforts by school boards in disseminating their problems to local and state politicians.

Finally, rural schools must incorporate some common elements of rural curriculum and education that can form a long-term sustainable solution: (a) place-based education; (b) family and community

involvement; (c) partnership building between culture, business, and social services; (d) student leadership; and (e) entrepreneurial education (from 4-H, extension education, and vocational programs). These unique aspects of rural education are often eliminated as districts attempt to meet the requirements of the No Child Left Behind Act.

S

SCHOOL ARCHITECTURE

As elsewhere, America's school buildings (or their absence) have reflected American goals for pedagogy, citizenship, and schooling generally. Over the years, the prevailing design evolved from one-room schoolhouses to temple-like academies to flat-roofed utilitarian structures that maximize light. This entry summarizes that progress.

Early America

School architecture in colonial America was very limited. Town schools met in spare rooms of meeting houses, town halls, or shops. Dedicated school buildings appeared after U.S. independence. Built vernacularly, without architectural plans, most school buildings resembled cheap churches or homes. In rural districts—subsections of a town—neighbors would erect a simple schoolhouse, often on land unsuitable for farming or close to the road, which gable ends fronted. A counter ran around three sides of the interior wall, which students could use as a desk on benches facing outward. Center benches accommodated smaller pupils and higher winter attendance. Rural southern “old field” schools similarly occupied overworked farmland and lacked amenities.

After 1800, academies proliferated in towns and cities in both the North and the South. Boasting comfortable, well-equipped interiors, their impressive

Greek Revival architecture sought to attract students and link schooling to republican values.

Beginning in 1830, common school reformers included schoolhouse improvement among their broader goals. Concerned about children's health and learning environments, reformers lamented cracked walls, drafty fireplaces, few windows, primitive sanitary facilities, and poor ventilation. Besides solving those problems, reformers suggested facing pupils forward in rows. This layout would improve surveillance, which could reduce flogging and facilitate all-group pedagogy.

A New Emphasis

In 1837, when Horace Mann became Secretary of the Massachusetts Board of Education, a supplement to his first annual report challenged Massachusetts towns to build new schools or improve old ones. Mann's Connecticut counterpart, Henry Barnard, issued similar articles and a book, *School Architecture*, in 1842. Many towns in those states and beyond met the call, building or renovating schoolhouses using reformers' designs.

Sited in more sheltered locations, new schools possessed playgrounds and outhouses. Some separated boys and girls in the classroom, sustaining the era's careful gendering of space. However, southern states, budding western settlements, and poorer towns everywhere implemented schoolhouse reforms more slowly.

Boston took another step into reform with the age-graded, twelve-classroom Quincy School in 1847, which supplanted the large, multiage classroom. Age

grading spread quickly in most cities. By the 1850s, many city school systems included high schools, whose buildings could rival academies in size, facilities, and aesthetic appeal. Typically brick, two to four stories high with pitched rooflines, and located on small sites where land expense dictated, these buildings incorporated classical elements like temple fronts.

After the Civil War

In the South after slavery, African American children and adults craved schooling, but facilities lagged behind educational needs. Although many areas nationwide provided inadequate segregated schooling, rural southern schools for African Americans were particularly shabby. Still, in 1896, the U.S. Supreme Court upheld “separate but equal” public accommodations in *Plessy v. Ferguson*. Many communities overlooked the “equal” part, dramatically shortchanging African American students in funding and facilities.

City school buildings grew again amid surging urban populations after the Civil War. Although some sported Victorian details after 1890, many acquired a factory-like look and feel, with their overcrowded classrooms, hallways, and playgrounds. But reformers could increasingly point to improved heating and ventilation; indoor plumbing; large windows; individual desks; and more blackboards, maps, and scientific apparatus. New York City’s school building superintendent C. B. J. Snyder developed the H-shaped school, which maximized light and air, and city schools installed electricity beginning in the 1890s.

Also beginning around 1890, as the mission of schooling expanded, schools gradually added gymnasiums, libraries, laboratories, art and music rooms, theaters, cafeterias, and workshops—developments boosted after 1910 by John Dewey’s progressive educational ideas, urging organic school-community connections. School Superintendent William W. Wirt of Gary, Indiana, created the Gary “work-study-play” plan to optimize facilities and activities in every school building, a design applied in many cities. Other school architects contributed ideas for more complex, multi-function schools, trying also to ensure flexibility for future pedagogical change.

The Twentieth Century

More than 200,000 rural, one-room schoolhouses were in use in 1920, many retrofitted with indoor plumbing, electricity, and larger windows. Improved transportation had increased access to advanced schooling for rural children, but it also enabled rural school consolidation to accelerate after 1910. Consolidated rural schools, built with expert designs, eventually doomed the one-room schoolhouse.

In growing suburbs after 1920, new schools of one or two stories enjoyed expansive footprints on sites of several acres, expressing their newly comprehensive mission. The Depression and World War II halted school construction for a generation. By 1950, this deferred demand plus the baby boom, along with migration southward, westward, and into suburbs, triggered a school building boom.

Postwar schools adopted modern architectural style, often with flat roofs and, some complained, bland, mall-like appearance. By the 1960s, as baby boomers hit their teens, new high schools appeared in suburbs and cities. Admiring British open classrooms intended to encourage self-directed learning, the Ford Foundation established the Educational Facilities Laboratory. The EFL promoted innovations such as movable walls, open designs, and educational use of new media.

Many school buildings fell into disrepair when enrollments dropped again in the 1970s, whereas others were converted to offices and apartments. By the 1990s, critical maintenance problems threatened numerous school buildings, and rapid growth areas faced an outright shortage of schools, problems that communities are scrambling to rectify. Positive trends today include designing school buildings with greater community use in mind, particularly regarding athletic and library facilities, and school libraries that integrate information resources beyond books. Besides capacity and maintenance, challenges in school architecture include air quality, handicapped access, energy efficiency, and security.

SCHOOL CHOICE

For American students sixteen years of age or younger, public school attendance has been compulsory since a Supreme Court ruling in 1925. Choice in American schools was traditionally the option of the wealthy, who could pay for private education. Private schools over the past century have enrolled about 12 percent of American students, especially within the past twenty years; choice of school has been significantly expanded in the form of vouchers, charter schools, home-schooling, and magnet schools. This entry looks at existing forms of school choice and reviews some of the comparative literature.

Types of School Choice

At present, based on information from the Center for Educational Reform, there are about 51,000,000 students involved in K–12 schooling; the vast majority of these students are enrolled in traditional public schools. Students not attending public schools include about 5,200,000 in private schools; 2,500,000 in Catholic schools; 800,000 in charter schools; and 1,100,000 being homeschooled. The percentage of students attending private schools has been stable for the past 100 years (12–15 percent); in contrast, other

forms of choice have increased, especially in the past fifteen years.

For example, since the first legislation was approved to allow charter schools in Minnesota, the number of states allowing charter schools has risen to forty-five. In the 2004–2005 school year, about 450 new charter schools opened with an enrollment of roughly 76,000 students. Importantly, choice within the public school system has also increased in the form of more than 4,000 magnet schools. Magnet schools are public theme schools (e.g., math, science, and the performing arts) that allow students from diverse neighborhoods to attend.

The type of voucher programs and charter schools offered vary tremendously from state to state. Essentially, a voucher is a subsidy that pays some, or all, of a student's tuition to attend the private or Catholic school that a parent chooses. Eligibility for receiving vouchers varies widely, but typically low-income children in inner-city schools are the targeted recipients. Charter schools are public schools that have been approved by some form of state-level authorization. In charter schools, some regulations that other public schools face are waived (e.g., teacher certification requirements) to allow for more flexibility and experimentation. However, as Thomas Good and Jenifer Braden note, laws show tremendous variation.

Comparative Analysis

The effect of attending choice schools (voucher, charter, private, or home school), rather than traditional public schools, can be analyzed in a number of ways: Does a choice school attract better students or teachers? Do certain types of students do better in one type of school? Are some schools more efficient or economical than others? Here we limit the discussion to a comparison of the effects of instruction and student achievement.

Proponents of choice argue that the public school monopoly discourages competition or policies to encourage risk taking and experimentation. However, actual research on vouchers has been limited and hotly contested. Across extant research, there is no evidence to suggest that vouchers consistently have a positive impact on student programs or achievement. Some

studies show gains, whereas others do not. In general, the research on school vouchers has been limited to small studies in a particular city; however, this research in aggregate indicates that the programs do not have the positive effects that their proponents argue. Importantly, there is an absence of data that examine how instruction varies in choice schools, and indeed, some limited evidence suggests that instruction in private and public schools is more similar than different, as Richard Rothstein and his colleagues have noted.

Although estimates vary, it is safe to conclude that more than a million students are homeschooled in America. Homeschooling has been supported by the full political spectrum, and children are homeschooled for various reasons, including the enhancement of achievement, the protection of students from their peers, and for religious training. The curriculum followed varies tremendously, and there are many Web-based resources and organizations available to parents who choose to educate children at home. Although the effects of homeschooling on children's social development are debated, there is a small but consistent literature that suggests that, on average, homeschooled children achieve better than their peers in public schools. There is no research to describe how homeschooled students are instructed. Furthermore, evolving changes in public laws have made it increasingly easier for parents to provide school at home. The requirements that homeschooling parents must address vary from state to state. Increasingly, universities are making it easier for homeschooled children to meet university admission requirements.

Good and Braden reviewed the extant literature comparing charter and regular public schools and found wide variations in both forms of schools, but that on average, mean student performance was lower in charter schools than in traditional schools. The review noted the weakness of extant research and called for more and better research. It concluded that charter schools as a group showed little evidence of innovation, especially in the area of teaching and classroom reform. Given the absence of innovation, charter schools do not appear to be a powerful source for enhancing student achievement. Subsequent research on student achievement in charter schools has yielded even more disappointing results.

In the summer of 2004, the American Federation of Teachers published a large, comprehensive study comparing student achievement in charter and traditional public schools. This study used student scores on the National Assessment of Educational Progress (NAEP) that were collected in a nationally representative sample. NAEP scores are typically considered the "gold standard" or "national report card" of educational achievement tests. This research found that students attending regular public schools had achievement levels that were a half-year higher than those in charter public schools. More favorable data on charter schools have been reported elsewhere by Caroline Hoxby. However, other researchers, including David Rogosa, have suggested that student achievement is better in traditional public schools and have directly challenged the Hoxby findings.

School choice is increasing in the United States, although the vast majority of youth continue to attend traditional public schools. Some would argue that expanded choice per se is a desirable outcome that allows more options for meeting the needs of the students. Many have claimed that choices (charter schools in particular) have led to more innovative forms of governance and parent involvement. However, the effect of choice on classroom learning and student achievement has been notably less than proponents predicted.

SCHOOL FUNDING

Funding of U.S. public schools has long been a focus of contention, primarily because children living in high-poverty and high-minority neighborhoods so often attend schools that have relatively few resources. Decades of litigation document a clash between commitments to “local control” of schools, on one hand, and the provision of equal educational opportunity, regardless of where one lives, on the other. This entry examines sources of funding for U.S. public schools, disparities in resources, and legal challenges to the continuing situation.

Sources of Funding

Unlike most industrialized nations, the United States relies heavily on local property taxes to fund its public schools. These revenues, which account for about 45 percent of total school funding, create significant disparities among school districts because local property

values vary so much. Even when property-poor communities tax themselves at higher *rates* than property-rich communities, as is often the case, they cannot raise comparable revenues because property *values* are so much lower.

State revenues are another significant source of funding for public schools. Because budget priorities and tax policies differ from state to state, the size of the state share varies considerably, but on average, it is about 47 percent of the total. Some states allocate funds in such a way as to reduce the disparities created by local property tax revenues, but many do not. A report by The Education Trust, a research and advocacy organization, found that in the six years it has been tracking the funding gap, the disparity between high- and low-poverty districts has remained unchanged. In 2003, in the nation as a whole, low-poverty school districts received approximately \$900 *more* in state and local funds than high-poverty districts. (High-poverty districts were defined as the 25 percent of districts with the highest levels of poverty, and low-poverty districts as the 25 percent with the lowest levels.)

The third source of funding for public schools, federal revenues, comprises only about 8 percent of the total. These revenues come primarily through Title I of the Elementary and Secondary Education Act (reauthorized most recently as the No Child Left Behind Act). Although Title I funds often are used to bring spending in schools in poor neighborhoods up to par with spending in other neighborhoods, some funding is diverted to schools in wealthier neighborhoods.

Widespread Disparities

How large are disparities in school funding? In its 2006 *Quality Counts* report, *Education Week* reported that in 2003, average per-pupil spending (adjusted for regional cost differences) ranged from a high of \$11,031 in Washington, D.C., to a low of \$5,087 in Utah. Gaps among districts within states and among schools within districts exacerbate the state-to-state differences.

Funding disparities between large, predominantly minority city districts and nearby predominantly White suburban districts are particularly significant. Illinois Board of Education data for 2003, for example, show

per-pupil spending of \$8,482 in Chicago (87 percent minority), but \$17,291 in nearby suburban Highland Park (10 percent minority). Similar patterns can be found in the Philadelphia, Detroit, Milwaukee, Boston, and New York City areas.

Recent research has uncovered “hidden” disparities among schools within a single district resulting from the way teacher salaries are factored into district budgets. If one or more schools in a district have a disproportionate share of the highest paid teachers, this does not necessarily show up in districtwide budget reports. The highest paid teachers commonly are found in schools with the lowest poverty levels.

A 2006 report by the 21st Century School Fund documents additional inequities in spending on school construction and renovation. Despite record-level spending between 1995 and 2004, the most disadvantaged students received only about half as much per pupil as their wealthier counterparts. Furthermore, in the poorer schools, most of the funding went toward basic safety provisions (roof repairs or asbestos removal, for example) rather than educational enhancements such as science labs and computer rooms, as was the case in the wealthier districts.

Legal Challenges

Although the question of whether “money really matters” in schooling continues to arise in school-funding lawsuits, the ongoing litigation itself attests to broad agreement that much is at stake. Significant disparities in funding mean that students in property-rich districts typically attend classes in well-maintained buildings, with well-qualified and adequately compensated teachers and abundant opportunities to participate in art, music, and sports programs. Students in property-poor districts, however, often face years of schooling in buildings in disrepair, with teachers lacking credentials (or even full-time positions), outdated textbooks that must be shared, and few extracurricular activities.

As of 2006, school funding lawsuits had been brought in forty-five states, and plaintiffs had prevailed in almost two thirds of the cases. A landmark case, *San Antonio v. Rodriguez*, was decided by the U.S. Supreme Court in 1973. This case focused on large disparities in funding among property-rich and property-poor school

districts in Texas. The Supreme Court acknowledged the disparities but found no constitutional violation and no justification for altering the school funding system in a way that might lessen “local control.” This decision closed the door to appeals to the U.S. Constitution but did not stop lawsuits over school funding. Almost every state has language in its constitution that obligates it to provide some quality of public schooling statewide. Since *Rodriguez*, plaintiffs generally have asked courts to interpret provisions in state constitutions in ways that require states to provide funding that is more equitable, more adequate, or both.

“Adequacy” arguments constitute the most recent legal strategy in the ongoing battles over school funding. Adequacy sometimes has been defined as the level of funding required to provide all students with an opportunity to learn what they need to know to pass high-stakes tests—that is, tests used to determine promotion or graduation. However, it also has been defined as a baseline level of funding. Recognizing that “equal” funding can nevertheless be insufficient, many scholars and lawyers regard the pursuit of “adequate” funding as a more desirable objective than “equity” or “equality.” Others, however, see the pursuit of adequacy as tacit acceptance of a system of schooling that is both separate, in the sense of racially segregated to a significant extent, and unequal, in the sense of unfairly funded. Funding that allows for an adequate education for some children, but for a far more expensive (and much better) education for others, undercuts the ideal of equal educational opportunity.

The federal No Child Left Behind Act, reauthorized in 2007, promises to intensify these arguments in the years ahead. Questions will continue to be raised, in and out of courts, about how a law that attempts to hold all students and schools to the same high academic standards can be reconciled with structures of funding that year after year underwrite a top-quality education for some students (disproportionately White students in middle-class and wealthy communities) and a bare-bones minimum for others (disproportionately students of color in poor communities).

SCHOOL GOVERNANCE

The question of who governs our schools seems to be a simple one, easily answered by referring to the local school board, which is often responsible for making important decisions about budgets, personnel, and curriculum. Such an answer, however, doesn't adequately consider the constellation of governmental and nongovernmental forces that coalesce to shape educational policy and the ways in which educational decisions are made. Today, the center of power and authority in school decision making no longer resides with local school boards, but rather with state and federal governments. Historically, this has not always been the case, yet power has slowly been shifting away from local districts for the past thirty years. This move away from local control accelerated in the 1990s and has raised important questions about the proper location for governmental decision making regarding education. By outlining some of the major trends in the evolving nature of school governance, this entry provides a contemporary portrait of the state of school governance today. It is broken into four sections. The first considers the growth of the federal role in education and why it has expanded. The second looks at the increasing importance of the state, particularly with respect to financing education. The third examines additional

outside forces that are involved in and sometimes complicate educational governance. The final section of the entry considers the consequences of these changes for local school districts and some of the calls for reform in local school governance.

Growth of the Federal Role

Historically, the federal government has had a limited role in educational governance. During the nineteenth century, schools developed locally, and patterns of school governance and funding tended toward the use of locally elected school boards to oversee financial and curricular decisions. By the late 1800s, local school boards were well established, and local control of schools was beginning to result in discrepancies between the quality and type of education received in various districts. Governance became increasingly complicated as immigrant and Black communities began to vocalize their concerns about the inferior education their children were receiving. In this sense, local control was a two-edged sword: It allowed communities to develop and define schools around shared local values, while it also supported various discriminatory practices that left some groups, particularly Blacks and immigrant minorities, with substantially inferior educational opportunities.

The issue of racial segregation gained increasing attention throughout the early twentieth century and set the stage for increased federal involvement in educational governance beginning in the 1950s. Starting with the *Brown v. Board of Education* decision in 1954, school desegregation became a federal issue. Increasing amounts of federal resources were directed toward schools in an effort to create greater equality in educational opportunity for Blacks who had been denied access to White schools.

Beyond the issue of racial equality, however, the federal government also became involved in efforts to create greater economic equality, military defensive capacity, and improved economic productivity through investment in education. For example, in the wake of *Sputnik*, the 1957 National Defense Education Act focused directly on science education and the need to improve curriculum and instruction so that the country

could produce the scientists and engineers needed to strengthen national security during the Cold War. Another example of increased federal involvement was the Elementary and Secondary Education Act of 1965, which created Title I. This program provided a monetary incentive for school desegregation (segregated schools could not receive these funds) while also working to improve the educational experiences of poor children across the nation. In the 1970s, additional legislation such as the Education for All Handicapped Children Act of 1975 focused on the rights of individuals with disabilities. Title IX, passed in 1972, mandated equal rights for women with respect to participation in athletics.

The 1983 report by the National Commission on Excellence in Education, *A Nation at Risk*, tightly linked the nation's future economic productivity to improved academic performance. This report set the parameters for federal involvement in the 1980s and 1990s, which had focused on getting states to measure their students' progress toward carefully defined curricular goals. David Conley contends that since the 1990s, the federal government has moved aggressively to force states into compliance with its educational initiatives through various means, including the use of the "bully pulpit," leveraged federal dollars, and new legislative requirements.

With respect to the bully pulpit, presidents and secretaries of education have increasingly used the media to influence educational policy. Their statements have been directly linked to the content of various reports such as *A Nation at Risk* (1983) and to the outcomes of national tests of student achievement such as the National Assessment of Educational Progress (NAEP), sometimes called "The Nation's Report Card." International comparisons in the areas of math and reading achievement have also gained media attention and raised concerns about the performance of our public educational system. Most federal funding for education is connected to federal initiatives such as the need for specific types of testing (i.e., participation in the NAEP), and to limitations on the types of programs that qualify for federal aid. Specifically, programs must be based on scientific research as defined by the U.S. Department of Education. Finally, legislative requirements, such as those embodied in No Child Left Behind

(NCLB), have become more comprehensive and influence issues ranging from compulsory testing to the obligation that schools teach about the U.S. Constitution on September 17, the date on which it was signed in 1787.

Continuing calls for equity in educational opportunities and outcomes, combined with a growing belief that the federal government should play a major role in improving the academic performance of public schools, makes it likely that the federal role in school governance will continue to grow over the next decade. The growth of federal involvement has had a significant impact on the state role in education as well as the local role. These are taken up in the next sections.

The State Role

Over the past three decades, states have played a larger role in school governance. Perhaps the biggest driving force behind this change has been the use of property taxes to provide local financing of education. This system has exacerbated inequalities between school districts because poor communities have been unable to raise the revenues necessary to improve their schools, and wealthy communities have had no incentive to share their resources. In the 1970s, school funding became the most important issue facing many states as interest groups and coalitions began to form around the issue of funding.

Initially, these groups attempted to demonstrate that unequal school funding was unconstitutional because it violated the equal protection clause of the Fourteenth Amendment of the U.S. Constitution. This avenue for complaint was closed when the Supreme Court decided in *San Antonio v. Rodriguez* (1975) that school funding was not a federal issue but a state issue that would have to be resolved in state courts and legislatures. As a result, numerous state lawsuits throughout the 1970s claimed that school funding systems that perpetuated inequalities violated equal protection clauses within state constitutions. These cases were often successful and usually led to increases in the proportion of state spending on education. According to Allan Odden and Lawrence Picus, by the end of the 1970s, state spending as a proportion of overall educational spending had risen from 39 percent to 47 percent. This trend continued

through the 1980s, and new lawsuits focusing more on inequalities in educational outcomes, rather than opportunities, began to surface in the 1990s.

As states have taken on a greater fiscal burden, they have also taken on a greater role in school governance. By the late 1980s, increased state investments in education, combined with prodding from the federal level, resulted in greater state involvement in defining curriculum standards in various subject areas, creating graduation requirements, and developing statewide educational assessments. Throughout the 1990s, state mandates intensified and brought about further changes in these areas as states sought to address various inter-related issues in their effort to create systemic reform. NCLB has spurred states on to further develop their curricular goals, assessment systems, and plans to decrease gaps in the achievement of various racial and ethnic subgroups within the school population. Frederick Wirt and Michael Kirst indicate that districts have been left with little more than a “sandbox” within which they can construct local policy.

States have also been influential in developing alternatives to traditional public schools such as charter schools and voucher programs. The development of these alternatives is the result of disillusionment with the public schools’ ability to change and has been perceived as a threat by those within the educational establishment. These new models step outside of traditional bureaucratic structure in an effort to provide more efficient and flexible alternatives, although they may also reduce the democratic nature of public education. As with the federal role, it seems likely that state control over education will continue to increase over the next decade.

Other Forces Influencing Educational Governance

Beyond federal and state influences, a number of other forces tend to influence and also complicate the process of educational governance. Several of the most important include public pressure for school improvement, the influence of the business community, the power of the religious right, and the role of traditional educational interest groups such as teachers’ unions.

As public awareness of the performance of public schools has grown, so, too, has pressure for improvement. Much fanfare now surrounds the publication of both local and national performance data in the media. The Gallup Poll of the public’s attitude toward the public schools, published annually in *Phi Delta Kappan*, garners a great deal of attention and typically shows that although individuals feel confident about the quality of their local schools, they are concerned with the performance of public schools in general. These attitudes, coupled with a growing skepticism of government-run enterprises, have created a political climate where accountability-focused legislative measures have been quite successful.

An additional force fueling public awareness of educational issues has been the business community. To a large extent, business leaders have taken center stage in efforts to define educational standards and develop models of educational reform. Much of this participation has centered on arguments for greater social efficiency within the educational system and the idea that schools should help to prepare workers for the jobs needed in the new postindustrial economy. The business community’s support for vocationalism in public education is not new, yet rapid changes in the economy coupled with a growing disenchantment with government and the public provision of services have created an environment in which the market is seen as superior to bureaucracy in organizing human activity. With regard to education, this has meant growing support for a variety of market-oriented reforms, including charter schools, vouchers, and contracting for services with the private sector. It has been suggested that business interests have facilitated this change in attitude by exerting pressure to break public sector “monopolies” on various services, including utilities and education.

The religious right has also exerted influence over the governance of schools. Espousing concerns about state regulations meant to influence the moral conduct and beliefs of children, members of the religious right have created powerful coalitions that have been able to defeat and/or challenge various state and local educational initiatives. Two examples include the defeat of Outcomes Based Education (OBE) in the 1980s and recent challenges regarding the teaching of evolution in public schools. In the first instance, the religious right

successfully defeated OBE by framing the issue as one in which the schools were encroaching on traditional values and parental authority. With regard to evolution, the religious right has been able to sustain efforts to introduce concepts such as intelligent design into the school curriculum despite a lack of evidence proving its credibility.

Finally, various traditional educational interest groups such as teachers' unions, taxpayer associations, and booster clubs try to influence educational governance in ways that favor group members. Conflicts among these groups over curriculum, funding, and control of the educational enterprise create a turbulent political environment leading to instability in educational goals and the creation of a climate of distrust.

Consequences for Local Districts

Given the trends discussed above, it seems clear that changes in federal and state policies regarding education will have a significant impact on local school governance. As the state and federal governments demand more from local districts, school board members and school administrators will need to redefine their roles in ways that may limit democratic participation but create greater equity and accountability. Some alternate models of governance currently being experimented with include mayoral takeovers of urban school districts, state takeovers of poorly performing districts, and market-driven models based on consumer choice such as charter schools and school vouchers. In general, these reforms serve to limit the power of locally elected school boards and create confusion within districts regarding lines of authority and the appropriate role of the school board. The challenge for school districts over the next decade will be to refine these governance models in ways that ensure both democratic participation and greater equality in educational outcomes.

SCHOOL LAW

On average, a teacher violates the law on a daily or weekly basis. Why? Because approximately 75 percent of everything that a teacher does in a typical school day is affected by school law. These violations are generally not intentional, but result from a misunderstanding or lack of knowledge that a law exists. This makes sense after one understands the vast expanse of school law: all of the statutory law, case law, and statutory regulations that affect school districts, certified and noncertified employees, students, and taxpayers as they relate to the operation of a school district.

The goal of this entry is twofold: (1) to provide a basic overview of school law, and (2) to heighten awareness of the role the law plays in the school as well as its impact on K–12 educators. Consequently,

this entry will serve to heighten awareness that schools function in the midst of a complex legal environment that affects all aspects of public education.

Legal Impact on Schools

Public schools do not operate in a vacuum. They function in an environment that is responsive to external factors, which include parents, the business sector, and the religious community. One increasingly important external influence is the law. It is undeniable that statutes, regulations, and case law are now becoming major factors shaping public education.

As external groups attempt to monitor public education, there is an accompanying concept that state legislatures are enacting more statutes to regulate public education. For example, in 2006 alone, the Illinois General Assembly enacted more than sixty-five new laws that affected public education. To appreciate the extensive scope of school law, it is necessary to understand the numerous sources of laws that affect public education.

The U.S. Constitution does not address public education. More specifically, the word “education” is not found in the Constitution. Therefore, according to its Tenth Amendment, any powers not delegated to the federal government are reserved for the states. Therefore, education is an issue for which states have primary responsibility.

Despite the lack of expressed constitutional authority to govern education, however, the federal government—specifically, the executive and legislative branches—has a significant impact on public education. Specifically, legislative acts such as No Child Left Behind and the Individuals with Disabilities Education Act are federal statutory provisions with which state and local educators must comply. How can this occur if the federal government does not have any reserved powers to govern education? The answer is “money.” The federal government can require certain actions by conditioning federal monies to schools upon compliance with its specifications. Thus, a state or local school district could decline the money and be free of the federal requirements, but for most districts, it is not financially feasible to bypass the federal financial assistance.

Each of the fifty states has a constitution that provides a framework for how it will provide free public education to elementary and secondary students. Most state constitutions include a provision on how public schools will be funded as well as a statement regarding the educational and curricular goals for local schools.

The legislature of each state plays a tremendous role in shaping public education via the enactment of statutory laws that affect state, regional, and local educational agencies. It is essential to realize that local schools can operate only within the parameters the state sets forth for local schools. Statutes are often broad policy statements and do not contain the specific directions necessary to operationalize the policy. For instance, one state enacted a law that there would be state curricular standards for all public schools, but did not provide the specific standards for each curricular area or grade level—it was left to the state educational agency to create regulations to make the statute functional.

Key Legal Issues for Teachers

Throughout the United States, certain legal issues continue to come to the forefront in public school districts. These are discussed briefly here.

Liability

As we live in an increasingly litigious society, the issue of liability is of growing concern to school districts as well as school employees. Civil liability is the type of liability most often incurred by school districts and employees. It is a noncriminal liability (usually monetary damages) and consists of either tort or contractual liability. A tort is a private injury, other than a breach of contract, for which the law provides a remedy in an action for damages. The two types of tort most often alleged in a school setting are negligence and intentional (willful/wanton) misconduct.

Negligence is the failure to exercise that degree of care that an ordinary person would exercise under similar conditions. The elements for negligence are (a) a legal obligation that a school or employee owed a victim, (b) a breach of that obligation, and (c) damages that proximately result. In other words, negligence is liability that results from an “accident” that should not

have occurred had employees been doing their job correctly. Most states have some type of statutory protection for school districts and their employees against liability for negligent actions.

On the other hand, intentional (willful/wanton) misconduct is an intentional act or an act committed under circumstances exhibiting a reckless disregard for the safety of others. It may also include the failure to exercise ordinary care to prevent injury after knowledge of impending danger. This results in personal liability because the employee acted unreasonably or in a manner outside of his or her official capacity.

Special Education

Under federal law, public schools have an obligation to provide a free and appropriate public education for all students between the ages of 3 and 21. Dating back to 1975, the federal government has taken the lead to ensure that students with a disability receive an individualized education program to determine an appropriate education in the least restrictive environment with their nondisabled peers. In 2004, Congress made its most recent reauthorization of the law, the Individuals with Disabilities Education Act.

Parents of students with a disability who believe their child is not receiving adequate educational services can contest the level of services being offered by the public school. Federal law provides for a due process hearing in which an impartial hearing officer will hear the case and render a binding decision. Ultimately, the case can be reviewed by a federal district court. Depending upon the nature of the disability, students can also be afforded benefits under the Americans with Disabilities Act or Section 504 of the Rehabilitation Act.

Constitutional Issues

As noted in the famous 1969 Supreme Court case, *Tinker v. Des Moines School District*, students do not lose their constitutional rights once they enter the school grounds. Granted, their rights are not co-terminous with adults' constitutional rights, but nonetheless, students still have constitutional protections. In the school environment, the most frequently used protections are those in the First, Fourth, and Fourteenth amendments to the U.S. Constitution.

The First Amendment protects employees' and students' rights to freedom of press, petition, assembly, religion, and most notably, speech. Students sometimes erroneously believe they have unabridged rights to free speech. This right, however, is not absolute or without limitation. Courts have consistently held that the legal standard is to find the balance between preserving the educational integrity of the school versus protecting the speech rights of students.

The specific legal standard a court must employ depends upon the nature of the student speech. Courts have developed three categories of student speech: (1) student communication that takes place at school, but not as part of the curriculum; (2) communication that is part of a school program/curriculum; and (3) non-school-sponsored speech occurring off-campus. Curricular speech can be most easily regulated, whereas speech occurring totally off-campus (no "nexus" to the school) is afforded the most legal protection. All other speech occurring at school can be regulated only if it causes a material and substantial disruption to the educational environment.

The other major First Amendment protection relating to public education deals with religion. The First Amendment to the U.S. Constitution provides that Congress "shall make no law respecting an establishment of religion" and, furthermore, that it will "make no law . . . prohibiting the free exercise thereof." The primary accusation, though, is that a school official has taken an action that infringes upon the district's perceived obligation to be "religion free." This concept, however, is not consistent with case law, which clearly provides that schools are to be neutral toward religion. In practice, school officials have great difficulty implementing neutral policies toward religion. Such difficult issues often include distribution of literature and use of school facilities by religious organizations.

The Fourth Amendment protects students from "unreasonable" search and seizure. The reasonableness of a search in the school context is determined by balancing the student's legitimate expectation of privacy (when such expectation exists) against the need of the school to perform the search to maintain order and discipline. Case law provides that school administrators do not need the same level of proof to search a student (or his or her personal effects) as would a law

enforcement officer. Specifically, school officials need only “reasonable suspicion” that a crime or violation of state law or school rule has been or is about to be committed. In reviewing the legality of a search, courts must ensure that the search was justified at its inception, and that it was reasonably related in scope to the circumstances that originally justified the search (given the age and sex of the student as well as the nature of the infraction). The U.S. Supreme Court has extended permissible school searches to include the use of random urinalysis drug testing of extracurricular participants.

Finally, the Fourteenth Amendment provides public school employees and students the benefits of due process as well as equal protection of the law. The equal protection clause protects classifications of people and ensures that “similarly situated” people are not treated differently. The level of review that a court will afford an equal protection allegation depends upon the status of the victim. Only victims that are considered a “suspect classification” (based upon race, national origin, sex, or alienage) receive the highest level of scrutiny.

Regarding the due process clause, the Constitution provides that due process be afforded before there is a deprivation of “life, liberty, or property.” Procedural due process consists of two primary components: notification of the complaint against you as well as an opportunity to respond to those charges. The extensiveness of the notice and response depends upon the severity of what the accused could be deprived of. For example, a student who is about to be suspended from school will have a lesser expectation of due process than would a tenured teacher who might be terminated. That stands to reason because of the detailed procedures the law provides to terminate a tenured teacher.

SCHOOLS OF EDUCATION

Schools of education in the United States are a modern sociocultural product following on the heels of colonial expansion and competition, American and European revolutions, and the rise of nationalism and industrialization. They grew rapidly from humble beginnings. This entry explores their historical precedents, current problems, and possible solutions.

Historical Background

The history of American public education, including its growing staffing needs, begins with the advent of the common school (and continues with the comprehensive high school). Under the leadership of Horace Mann, it flourished for at least three reasons: the expanding republic's need for well-trained, professional teachers; the industry's need for educated workers; and families' widening visions of better lives for their children. In the South, education was largely a private affair, but elsewhere, there were three imbricate forms of professional education available to meet this demand: teachers' institutes, local academies, and state-supported normal schools.

The first two could not compete and disappeared. Only normal schools remained and survived until the 1930s, after which time they evolved into teachers' colleges; by the 1950s, most of them had become departments or schools of education inside universities. Their curricular needs were met by professors in research-oriented universities who produced and disseminated educational knowledge for normal school instructors to develop future common school administrators and teachers. This hierarchical structure and hybrid method produced a tenuous relationship between theoretical disciplines and practical pedagogical problems that persists to this day.

Current Problems

Several scholars have written about what they understand are the major problems facing schools of education today. David Labaree points to low status. He claims the main reason for this lies in the ways in which two market forces have shaped their development: social efficiency and social mobility. Schools of education, he argues, had to become “teacher factories” to produce a cheap supply of labor to meet the needs of industry, common schools, and comprehensive high schools. Unable to combine quantity with quality, schools settled on producing sundry ill-prepared teachers. Simultaneously, growing consumer demand for social mobility became an incentive for schools to recruit more students with expanded liberal arts curricula (thanks to university membership) and the promise of a bachelor’s degree, which had the effect of further depressing the need to raise the quality of teacher training programs.

The effect, Labaree argues, has been expanded social mobility at the cost of declining social efficiency and teacher quality. The growth of graduate programs of education has only worsened this condition. Contemporary trends in alternative certification and school choice continue to reinforce the need for education schools to produce teachers quickly and cheaply, which Labaree sees as evidence of an unabating trend.

Similar difficulties plague education researchers, claims Labaree. Schools of education prepare researchers to occupy the unenviable position of generating scholarship generally undervalued because it tends to be descriptive, variegated, and ephemeral; this phenomenon arises from the paradox of expecting education researchers to do pure research, on one hand, and recruiting them from the ranks of practitioners on the other. Another paradox is that two camps of researchers exist within schools of education—those who pursue research agendas and prepare future researchers, and those who prepare teachers and curricula; the pursuit of excellence in one tends to compromise the other.

In like fashion, Ellen Condliffe Lagemann has also written about the historically low status of education schools. Although Labaree considers the historic relationship between their status and women in brief,

Lagemann’s treatment of gender (and class) is more comprehensive. Although Lagemann agrees with Labaree that the influx of women into an expanding education enterprise has lowered the status of the teaching profession, Rita Kramer offers an analysis of why the profession still so suffers. She concludes that schools of education focus their efforts on preparing individuals to mend students’ broken self-esteem while scorning measurable learning outcomes. Their methods sacrifice accomplishment, understanding, and excellence to equity. “Excellence” she understands as denoting both academic achievement and promotion of a common nationality and culture.

Low status, however, is not the only challenge for schools of education. According to scholars like Robert McClintock, their problems are structural. He argues that the reason why schools of education are crippled in attempting to produce both researchers and practitioners is that professional schools are usually buttressed by independent academic departments (e.g., business by economics, medicine by the sciences). In the former, the two are conflated and thus weakened. In short, although he does not state it explicitly, we may infer that he would consider Labaree’s paradoxes irresolvable and criticize Lagemann’s intraeducation school proposal (see below) as limited in its capacity to generate success.

Possible Solutions

Despite their criticisms, many of these scholars offer some solutions. Labaree suggests improving scholars’ opinions regarding the quality of teachers that schools of education produce by encouraging them to acknowledge the unique difficulty of the teaching profession, which, unlike others built on willing clients who are served one at a time with minimal emotional attachment, often depends on appealing to students’ emotions in order to teach them predetermined subject matter in a school they are compelled to attend. Labaree also proposes that scholars acknowledge the difficulty of isolating and measuring the impact of a single teacher on a single student when the latter exists in a broader social context where interaction with other teachers is common. Moreover, the acknowledgment that Labaree seeks from scholars Lagemann wants

from public attitudes unwilling to accept the intricacies, challenges, and costs of doing education research well enough to inform policy and practice.

Within the schools themselves, Lagemann suggests that the relationship between research and practice should be fortified for the sake of creating knowledge relevant to institutional decision makers and advancing new knowledge, although she does not consider the economic forces that Labaree sees in such a proposal. For within the university, she recommends that education and noneducation faculty form interdisciplinary bonds so that cross-disciplinary scholarship may flourish.

In agreement with Labaree, the Holmes Group proposes professionalizing teaching and strengthening education school ties to the university (akin to Lagemann's suggestion), given the former's intellectually weak curricula and the latter's purview of research-based knowledge. However, Labaree thinks that this proposal may help teacher educators gain at the expense of practitioners and may not improve their status relative to their university colleagues (indeed, the forebears of professors of education are normal school teachers).

Suggesting the very opposite course, although agreeing that schools of education and their faculty indeed have a low status relative to their university counterparts, Geraldine Joncich Clifford and James W. Guthrie agree with the Holmes Group that teaching should be professionalized. However, they argue that this should be done by strengthening ties to the teaching profession instead because teacher education will never equal the arts and sciences. Any attempt to raise its status as the Holmes Group suggests runs the risk of further alienating the very people it should serve: practitioners. However, Labaree points out that this suggestion amounts to education professors abandoning their (uneasy) place among the high-status academic professoriate and running into the arms of a low-status occupation.

The National Council for Accreditation of Teacher Education (NCATE), although not entirely adopting these scholars' suggestions, does so in part. This national organization accredits schools of education. Authorized by the U.S. Department of Education, NCATE determines compliance with its teacher and professional preparation standards. In effect, NCATE

seeks to achieve quality control and reform teacher preparation programs. It provides national accreditation in an effort to lift education to a level of professionalism on par with other professions, such as medicine. In this way, NCATE seeks to assure the general public that graduates from its accredited institutions have the knowledge, skills, and dispositions necessary to help all students learn. In an expanding standards-driven environment, NCATE expects its role to grow: NCATE currently accredits more than 620 schools of education, with nearly 100 more seeking its seal. Despite its involvement in teacher education, however, NCATE is silent about the troubled relationship between university and school of education faculty.

The exact nature and role of schools of education in society have generally been nebulous. Debate of these issues is lively and will likely persist into the foreseeable future.

SCIENCE, IMPACT ON TWENTIETH-CENTURY EDUCATION

Scientific developments in the twentieth century have redefined the natural world in ways largely unforeseen by earlier generations. The impact of these developments has extended far beyond the laboratory and into nonscientific realms such as the arts, humanities, and social research. Consider, for instance, Salvador Dalí's "Persistence of Memory." Scholars point to the soft watches in this painting as representing the penetration of popular conceptions of Einsteinian relativity, time, and space in the art world. In terms of educational ideas and institutions, the impact of science and related societal-level developments has been profound. This is particularly true of advances in twentieth-century biology and physics, which highlight the interactions between science and education in relation to broad social and cultural concerns—the subject of this entry.

Biology

Some of the most impressive and broadly influential advances in twentieth-century biology have come from the field of biogenetics. The foundations of this field were laid in the initially dormant work of Austrian priest Gregor Mendel (1822–1884). His analysis of genetic variation in pea plants, not discovered until 1900, gave rise to the study of genetics. The significance of his work centered on ratios he developed suggesting that statistical laws governed trait variations as passed down from generation to generation. Reasons for the rise of the study of genetics include the success of Mendelian theory and methodology as well as interest in potential social applications of genetic research.

Eugenics

Popular interest in human genetic variation fueled societywide developments such as the eugenics movement. According to its leading proponent, Francis Galton (1822–1911), eugenics aimed at the improvement of human traits by way of a social policy governing human reproduction. Inspired, in part, by the

work of animal breeders (rather than by Mendel), Galton created statistical tools to study variation in human populations as well as the general stability of differences between race characteristics. A "hereditarian" school of thought developed around his work and these tools.

Formal institutional support for the school emerged with the founding of the Eugenics Laboratory at University College London (1906), the Balfour Chair of Genetics at Cambridge University (1912), and the Eugenics Record Office at New York's Cold Spring Harbor (1906). Social policy, influenced by the ideas of hereditarians, also appeared in the Immigration Act of 1924. This act sought to restrict non-western-European immigration. Meanwhile, seventeen state-level enactments supported sterilization of criminals, in many cases including those considered mentally feeble. By the 1930s, thousands of the so-called feeble-minded had been sterilized as a result. The state of Virginia carried out forced sterilizations until 1972.

Educational Impacts

The work of hereditarians had an immediate and lasting impact on education. Psychologist and eugenicist Henry Herbert Goddard helped construct America's first intelligence testing instruments and also wrote one of the most popular works in eugenics, *The Kallikak Family*. Goddard had originally imported the work of French psychologist Alfred Binet, originator of modern intelligence testing, and drew from it when appointed to a committee of psychologists charged with sorting U.S. military personnel during World War I.

After the war, Goddard and his colleagues, including Lewis Terman and Robert Yerkes, advocated the use of intelligence testing in schools to provide for an efficient means of sorting students into various tracks. What most testers believed they were testing was an inherited native intelligence unaffected by environmental factors. What Binet had long before discovered was that testing for intellectual abilities was highly influenced by social class and educational background. During the interwar period, the Army intelligence test became the foundation for the SAT. The SAT was first used mostly by high school students aiming to attend elite universities. The practice

expanded to approximately 2 million college aspirants by 1970. The impact of eugenicist thought on education, however, extended beyond testing and made its way into the textbook.

During the first half of the twentieth century, nearly three fourths of high school and college biology texts described the field of eugenics as a veritable science; about half of the same discussed favorable mating policies for socially superior individuals and the opposite for the socially inferior. Thus, students were not only tested as a result of eugenicist ideas about social efficiency but also taught sympathetic views about eugenics in biology texts.

Debates over the implications of intelligence testing continued throughout the second half of the twentieth century and, in part, culminated with the scholarly storm surrounding *The Bell Curve*, published in the mid-1990s. The authors, Richard Murray and Charles Herrnstein, argued for the dismantling of educational programs such as Head Start on the basis of intelligence testing that they believe suggests immutable native intelligence. More recent developments in genetics with the Human Genome Project have raised social and ethical questions about the role genetic testing will play in employment practices, the insurance industry, and access to education.

Physics

At the very start of the twentieth century, leading physicists declared that little else in their field was left to be discovered. Suggesting that the outlines of matter, energy, and motion had, with great clarity, been determined, they encouraged scientists to fill in the details rather than work on new conceptual frameworks. Within the first decades of the century, however, classical Newtonian physics was turned on its head with the rise of Einsteinian relativity, quantum mechanics, and puzzling discoveries in astrophysics. When it comes to popular conceptions of twentieth-century physics, the common inclination is to think of the atomic bomb (rather than relativity, quantum mechanics, or, more recently, string theory). Early developments in the study of atomic energy can be traced back to breakthroughs in the conception of the atom itself and, in 1939, the discovery of fission.

Nuclear Physics

The latter discovery opened the possibility of direct military and social applications of nuclear physics. Military applications were obvious, but hardly inevitable, in the construction of nuclear weapons. Because fission's discovery occurred within the context of the start of World War II, several nations launched research programs in the area. The most famous program, the Manhattan Project, focused the attention of more than a dozen Nobel laureates to the task of overcoming conceptual and technical hurdles in the race to create the first atomic bomb. Their efforts directly resulted in the weaponry used on Hiroshima and Nagasaki.

After World War II, continued research into such weapons as the hydrogen bomb and the neutron bomb were fueled by the Cold War arms race between the Soviet Union and the United States. In the meantime, social applications of nuclear physics focused on the production of civilian energy. Russian scientists and technologists developed the first civilian reactor in 1954, with the British and Americans doing the same in the years that followed.

Educational Impacts

The impact that developments in physics had on education was felt at all levels. Through such programs as the Manhattan Project, higher education forged relationships with the military and industry that irrevocably changed the culture and nature of research in American colleges and universities. Physics became a dominant field of study that attracted billions of dollars for research (approximately 2 billion dollars were spent on the Manhattan Project alone) and assumed a formidable presence on university campuses. Competition increased between institutions for federal and other funding. Classified research, moreover, put a strain on scholars accustomed to higher education's culture of the free exchange of ideas. In short, American institutions of higher education were fundamentally transformed by collaborations formed with the military and industry as a result of developments in the field of physics.

Students in primary through secondary schools, meanwhile, received preparation for living in a world with the results of nuclear research. Curricular developments and school practices made educators conduits

of information on how to appreciate rather than fear atomic energy as well as how to respond to a nuclear catastrophe in the event of war. The Federal Civil Defense Administration disseminated educational materials, booklets, pamphlets, and animated film strips. Some taught about the “peaceful atom” that produced civilian energy; others, such as the animated “Duck and Cover,” offered advice on what to do in case of an atomic attack.

School practices also changed as a result, with planned and surprise drills occurring in New York, Chicago, Los Angeles, and other major cities considered to be targets of Soviet aggression. In Los Angeles alone, thousands of teachers were enlisted to teach hundreds of thousands of students tactics for surviving a nuclear blast in the early 1950s. Meanwhile, schools themselves were fitted to serve not only as the locus of education, but also as community fallout shelters. The new “double duty” philosophy restructured the appearance of classrooms. Windows in the classroom, once valued as a fundamental aspect of school design, were seen as sources of weakness in the event of a nuclear attack and discouraged in new school construction.

SCIENCE, TECHNOLOGY, AND EDUCATION: HISTORICAL PERSPECTIVES

Throughout American history, science, technology, and education have influenced one another in innumerable ways. This interplay has led to the establishment of institutions and ideas that have fundamentally shaped the experiences of students and educators alike. The intellectual, social, and cultural foundations of nineteenth-century education in particular were profoundly influenced by the impact of science and technology, as summarized in this entry.

Intellectual and Social Foundations

How did science and technology affect nineteenth-century education? Consider the following two ways: (1) the relationship between the expansion of knowledge and the curriculum and (2) the influence of scientific theories on ideas about access to education. In the first case, science failed to penetrate American higher education to any substantial degree until the early nineteenth century. Scientific knowledge generated from the so-called scientific revolution as well as developments in mathematical sciences during the eighteenth century far outstripped what was taught in colonial colleges. The classical curriculum tended to dominate the seventeenth- and eighteenth-century undergraduate course of study.

During the first two decades of the nineteenth century, however, college leaders began to recognize the vast explosion in scientific knowledge and its lack of study in higher education. Reform efforts appeared with the purpose of expanding scientific course offerings and increasing science faculty. In 1800, rare was the college that employed a single faculty member devoted exclusively to scientific studies. By 1860, these same institutions commonly had four. Social forces and developments during the antebellum period, such as rapid industrialization and the professionalization of science, facilitated the expansion of science instruction in education.

With the rise of industry came the decline of the apprenticeship model of education. The apprenticeship model had long afforded working classes a source of instruction that provided for social mobility. An apprentice would work for a master and, over the course of an extended period of time, learn all aspects of a trade and become a “master” in the process. Factory life provided no such social mobility, and thus, calls for practical and scientific instruction to replace the disappearing apprenticeship model encouraged the establishment of new kinds of institutes of technology, such as the Rensselaer School (1824) and the Massachusetts Institute of Technology (MIT) (1861). As such, social and intellectual forces came to bear on American education during the antebellum period in ways that not only transformed programs of study but also changed the composition of faculty at traditional colleges and inspired the creation of new institutions.

In the second case, scientific theories developed in nineteenth-century biology and geology had an impact on ideas about human nature and thereby influenced access to education. One of the most often-cited examples emerged from the work of Edward Clarke, a Harvard University professor of medicine. In 1874, he published *Sex in Education*, which described case studies of what he perceived to be the debilitating effects of higher education on women. Stress on the mental faculties of his subjects came, he argued, as a result of their attempts to complete advanced courses of study.

Although access to education of whatever form is socially constructed, Clarke sought to settle the matter of “separate spheres,” the ideology that placed women at home and men in the world of work, on a scientific basis. “The question of [the] woman’s sphere, to use the modern phrase,” he stated in *Sex in Education*, “is not to be solved by applying to it abstract principles of right and wrong. Its solution must be obtained from physiology, not from ethics and metaphysics” (p. 12). His conclusion: Women should not attend higher education and should not attempt rigorous classical or scientific studies.

To add credibility to his conclusions, Clarke framed his work within biological theories then in ascendancy, such as Darwinian evolution, and suggested that women were less developed than men; that

the physiology of women, therefore, could not tolerate the mental strains that men could; and that women would, over time, be at risk of evolving male properties and characteristics if coeducation were permitted. Although Clarke’s impact was limited, the debates raised by his work revealed attempts to transform commonly accepted social norms into scientific terms for the purpose of shaping educational policy.

Similar scientific arguments about educational access were made with reference to race and class. Some supporters of industrial education for African Americans during the postbellum period, such as Samuel Armstrong, founder of the Hampton Institute, viewed the development of races in evolutionary terms. Herbert Spencer, a social scientist who coined the phrase “survival of the fittest,” argued by way of evolutionary metaphor that it was irrational to support government interventions such as public education that might aid the poor and weak in society. Both held ideas about access to education for minorities or the poor based on what they perceived to be scientific claims. Their ideas—particularly in the case of Spencer, who sold more than 300,000 books in America—reflected a broader, socially constructed sentiment.

Cultural Foundations

How have cultural and educational forces had an impact on the development of science and technology? Consider (a) the intersection of slaveholding culture, science, and education and (b) cultural debates over the curriculum. During the antebellum period, the culture of educational institutions in the South took a form different from those in other regions of the country. Slaveholding culture produced a turbulent, even violent society that was mirrored at southern colleges and university. Although institutions of higher education in other regions were not free of violence, the nature and character of acts differed: Attacks on property were more common in the North, whereas attacks on persons were more common in the South.

Several scientists, such as F. A. P. Barnard, James Joseph Sylvester, and William Barton Rogers, remarked on the differences between regions while in southern institutions and claimed this cultural attribute

as one reason why they left the South. The loss of active scholars and educational reformers, such as Rogers who left, in part, to establish MIT in Boston, hindered the development of science and technological instruction in the southern states.

Meanwhile, mid-nineteenth-century debates over the curriculum reflected cultural differences between classicists and scientists. It also affected mechanics' institutes and their attempts at diffusing middle-class morality to the working classes. In the first debate, scientific studies began to displace the classical curriculum. Concerns over the crowding of the curriculum emerged in response to reform efforts to change the undergraduate course of study and faculty composition and to establish independent institutes of technology, some of which offered exclusive attention to scientific and practical studies.

In some cases, the culture of classicism overlapped with the culture of religion. This meant that, with the process of modernization and the displacement of religion as a central authority in society, curricular change met resistance when it came to the addition of such sciences as biological evolution. Many of the battles associated with this culture clash were fought in the pages of the *Atlantic Monthly*, the *North American Review*, the *New Englander*, and *Scientific American*. For some writers, nothing less than western civilization was at stake in the outcome. Both sides of the classical-scientific divide attempted to define what it meant to be an educated individual and the necessary prerequisites to achieve this end.

While traditional colleges debated what programs to offer, working classes at mechanics' institutes received technical education that often advanced middle-class cultural views on morality. Among the notions that influenced the mechanics' institute movement was the view that technical studies would be salutary to working classes in developing responsible attitudes toward alcohol and sexuality. In addition, libraries were carefully constructed so as not to include works that might inspire radical political ideologies. As such, from the view of founders and other civic leaders, the aim of courses in chemistry, mathematics, natural philosophy, and practical studies had more to do with creating middle-class gentlemen rather than preparing scientists and technicians.

Legacies of many nineteenth-century debates continued to appear throughout the twentieth century. Contemporary versions of the "crowding of the curriculum" have stemmed not from the expansion of science but from developments in humanistic and multicultural studies; however, proponents of basic forms of cultural literacy, such as E. D. Hirsch, have generated for their view similar arguments to those of nineteenth-century classicists who rejected increased attention to scientific studies. Meanwhile, the struggle for coeducation was, for the most part, not fought in scientific terms or through the use of scientific metaphors. But early twenty-first-century claims about differences between male and female physiology have been used to argue for a modifying of Title IX that secures equitable funding of women's athletics. These claims raise the prospect that socially constructed ideas about access may resurface along scientific lines.

SCIENTIFIC MANAGEMENT

One of the signal events in the history of modern organizational management was the 1911 publication

of Fredrick W. Taylor's *Principles of Scientific Management*. This work, along with Taylor's widespread personal influence and the invention of the automobile assembly line by Henry Ford, gave the term *scientific management* a central place in the lexicon of both scholarly research and professional management practice. Although Taylor had used the phrase in an 1895 paper, it was the publication of the influential 1911 volume that moved the concept from innovative idea to established managerial practice.

At its inception, scientific management consisted of aggressive task specification and intense worker supervision. Time and motion studies were used to break production tasks into the smallest possible units, examine in detail how the most productive workers performed each task, and then carefully supervise all workers to ensure that each performed his or her tasks in the most efficient way possible. Taylor, recognizing that this initiative would not be attractive to workers, focused attention on linking compensation to task performance through piecework and other forms of incentive pay.

The intense managerial control of scientific management, in combination with the rational and functional design of bureaucratic organization, provided the cornerstones of modern organizations in government and education as well as in business and industry. Well before World War II, these twin concepts had become a kind of orthodox business and civic ideology. Raymond Callahan derisively called the introduction of this ideology into the management of public schools a "cult of efficiency." David Tyack described it as the ideological framework used to enhance professional control over the schools and, under professional leadership, to design education's "one best system."

Throughout the twentieth century, organizational theorists and leading industrialists maintained an intense love-hate relationship with the concept of scientific management. Enthusiasm for measurement of performance and micromanagement of worker task performance never waned, but criticism of both the dehumanizing and potentially destructive consequences of worker alienation and the overcentralization of organizational control began to surface almost as rapidly as the scientific management idea was carried forward by the Industrial Revolution.

By the 1930s, what came to be known as the human relations school of management had begun documenting the extent to which worker productivity is influenced by attitudes (pride of workmanship, enthusiasm for the work being done, a sense of identity with the employing firm, etc.) as well as task definition and the workers' technical skills. Management theories began to recognize both the limits of rationality and the more human dimensions of worker supervision. These movements eventually led to substantial interest in "job enrichment" and redesign or reengineering of corporations.

On a more technical level, the idea that task management of everything from automobile manufacture to reading instruction could be guided by scientific, data-driven management blossomed into a virtual obsession. A "theory movement," grounded in social scientific interpretations of organizational behavior, confidently predicted that task definition, functional organization designs, and careful measurement of product quality could lead to workplaces that are both humane and highly successful. W. E. Deming is widely credited with bringing scientific management concepts to bear on the rebuilding of Japanese industry following World War II and with making this devastated nation economically successful and a leader in the production of highly reliable and durable products in a broad range of industries including electronics and automobiles. Advances in theory and the advent of digital computers enabled the development of operations research, total quality management, and strategic planning, all aimed at refining the scientific management process and improving the micromanagement of production processes.

In public education, the latest round of scientific management theory lies at the heart of the federal government's No Child Left Behind policy (Public Law 107-110), which insists on outcomes measurement, scientifically based program improvement, and high-stakes accountability enforcement for professional educators. In a recent and provocative essay, Dorothy Shipps challenges the scientific management model, not for its dehumanization of workers or naïve confidence in rational task specification, but for its denial of the fundamental importance of democratic political principles. She argues that scientifically managed

organizations, particularly public bureaucracies like school systems, are driven by this ideology to reject democratic principles of decision making, thus becoming hopelessly insensitive to the rights and needs of clients (or customers) and forgetting the purposes for which they were established.

For Shipp, the tension is not between scientific management and respect for workers, but between organizational autonomy and the political legitimacy that comes with respect for democratic principles of decision making. This same challenge to the emphasis of scientific management on autonomous entrepreneurial control over organizational operations is being offered under the rubric of the "new institutionalism" by organizational theorists focusing their attention on the importance of links between organizations and their social environments.

imperialism. Theorizing and inquiry associated with slavery and conquest in part fueled the new studies. As Darwinism brought new interest in biological study, the scientific revolution demanded measurement and attention to method. Natural scientists, anatomists, biologists, physicians, neophyte anthropologists, ethnologists, social theorists, and even an occasional president of the United States turned their attention to race study and finding "scientific" evidence rendering dark people inferior. So-called proof of White superiority could justify social hierarchy. This entry looks at the development and eventual discrediting of these ideas.

Early Thinking

In 1735, acclaimed biological taxonomist Carolus Linnaeus was among the first to classify human beings by race. His essay "Systema Naturae" claimed that races exhibited different mental and moral traits. In 1781, Johann Friedrich Blumenbach, physiologist and founder of modern anthropology, added aesthetic judgments to race. He introduced the term *Caucasian* because he considered White people to be as beautiful as the southern slopes of Mount Caucasus.

In 1799, British surgeon Charles White added that Blacks were a separate species, intermediate between Whites and apes. His book *An Account of the Regular Gradation in Man and in Different Animals and Vegetables and From the Former to the Latter* (1799) argued that the feet, fingers, toes, legs, hair, cheekbones, skin, arm length, skull size, size of sex organs, and body odor placed Blacks closer to the animal kingdom.

French intellectual and journalist Arthur de Gobineau is often called the father of racism. Gobineau's theoretical racism was articulated in *Essai sur l'Inegalite des Races Humaines* (1854). He wrote that the racial question overshadowed all other issues in history. It was the inequality of races that explained all destiny. He further argued that all civilizations derived from the White race, especially the superior Aryan stock. Mankind is thus divided into races of unequal worth, and superior races are in a fight to maintain their position. He offered a hierarchy of race that would influence the next century and a half. The top group was the Caucasian, Semitic, or Japhetic people. The second or yellow group was the Altaic,

"SCIENTIFIC" RACISM

"Scientific" racism arose in the eighteenth century during the expansion of mercantilism and the rise of

Mongol, Finnish, and Tartar people. The lowest group was the Hamites or Blacks.

German zoologist and physician Ernst Haeckel wrote in the mid- to late 1800s, situating Blacks on an evolutionary tree below gorillas and chimpanzees. He put forward a hypothesis that each individual, in the course of his or her development, relives evolutionary history; that is, "ontogeny recapitulates phylogeny."

A Justification for Slavery

As world hegemony and power shifted in the nineteenth century, America, with its virulent brand of slavery, became the main locus of White supremacy. Building its economy and social order on slave labor, the United States shaped a modern sociology of race.

Dr. Edward Jarvis, a specialist in mental disorders and president of the American Statistical Association, wrote in 1840 that insanity for Blacks in the North was ten times greater than for Blacks in the South. He concluded that slavery had a salutary effect on Blacks, sparing them the problems that free, self-acting individuals faced.

Physician John H. van Evrie authored *Negroes and Negro Slavery: The First an Inferior Race, the Latter Its Normal Condition* (1853), which offered a scientific justification of slavery. Van Evrie wrote that dark-skinned people were diseased and unnatural, and that they possessed impeded locomotion; weakened vocal organs; coarse hands; hypersensitive skin; narrow, longitudinal heads; narrow foreheads; and underdeveloped brains and nervous systems. Van Evrie concluded that the aggregation of these straits translated to human inferiority.

In the 1850s, Dr. Samuel Cartwright chaired a committee to inform the Medical Association of Louisiana about the Black race. He, too, wrote of the diseased Negro. His "Report on the Diseases and Physical Peculiarities of the Negro Race" (1851) gained attention for its scholarly approach. He wrote of the insufficient supply of red blood, smaller brain, and excessive nervous matter found in the Negro. This combination of problems, wrote Cartwright, led to the "debasement of minds" in Blacks. He felt that the physical exercise provided by slavery would help increase lung and blood functions. Slaves, he argued,

were sometimes afflicted with "drapetomania," a disease of the mind making them want to run away.

American scientific racists included monogenists, who believed that there was but a single species of people originating from a single source. The creationist story of Adam and Eve shaped their view. Monogenists believed that the human races had degenerated since earliest mankind. This degeneration led to differences in people likely caused by climate and environment. Polygenists, on the other hand, argued that human races were separate species. Both monogenists and polygenists developed views of racial inferiority. The emerging field of anthropology drew from the race literature, and renowned scientists contributed to the field.

Academic Thought

Harvard professor Louis Agassiz (1801–1893), a respected natural biologist, wrote "The Diversity of Origin of the Human Races," published in the *Christian Examiner* in 1850. He argued that all men shared some commonalities, but the races were created as separate species occupying different parts of the earth. Races had different characteristics manifested in culture, habit, intelligence, and ability. Intermarriage and miscegenation were an offense and a sin against nature, and they created feeble-minded offspring with physical disability.

The libidinous Black, Agassiz believed, would lure the White race to degradation. White people must maintain their natural inhibitions, which were absent in the Blacks. He added charged adjectives and adverbs—such as *submissive*, *cunning*, *trickery*, *cowardice*, and *apathetic*—to his discussion of various race groups. His views became coupled with the empiricism of others.

Samuel George Morton of Philadelphia, physician and scientist, also believed in separately created human species. Morton advanced the study of cranial capacity thesis—that is, bigger skulls, more brains. Measuring the cubic inches of skulls from around the world, he reported his findings in *Crania Americana* (1839), *Crania Aegyptiaca* (1844), and "Observations on the Size of the Brain in Various Races and Families of Man" (1849).

Morton's work was highly acclaimed for its quantification of data and especially its attention to detail. Colleagues urged that he broaden the interpretation of his findings to read mental and moral worth from his data.

Paul Broca, an internationally renowned professor of clinical surgery and founder of the Anthropological Society of Paris in 1859, upheld the cranial capacity thesis. His exhaustive studies and meticulous statistics defended those ideas against a variety of European theorists and scientists.

The Eugenics Movement

The eugenics movement advanced by Sir Francis Galton (1822–1911) was built on the platform of scientific racism. His influential works, including “Hereditary Talent and Character” (1865), *Hereditary Genius* (1869), and *Natural Inheritance* (1889), asserted that man's character and capacities were primarily shaped by heredity and that the current generation could shape the future by how they breed.

Eugenicists attributed poverty, ignorance, infirmities, intemperance, incompetence, feeble-mindedness, and criminality to genetic explanations. Nascent American eugenicists (1870–1905) labeled the dependent, insane, ill, and criminal as genetically inferior. They proposed restricting propagation. Organized eugenicists (1905–1930) later advocated custodial care and sterilization as solutions for “defective” types. Immigrants became targets of eugenic discourse. Notions of human intelligence, IQ, and development were profoundly influenced by the field.

Early in the twentieth century, a retreat from scientific racism occurred. The field was critiqued as politically motivated. A new wave of scientists, and especially cultural anthropologists, argued that biological determinism could not be proven. Biological explanations of race and behavior gave way to cultural explanations. The concept of race and difference became more complicated. Later critics of scientific racism, such as Stephen Jay Gould, demonstrated outright deceit and falsification of data by earlier researchers in the field.

As Taylorist scientific management was embraced by school leaders, the call for efficiency in schooling was increasingly heard. Behaviorist psychology, testing, and

notions of intelligence quotient became joined. IQ designations and testing became central organizing foci in the schools. Ability grouping, tracking, and access to honors and advanced curricula all were outgrowths of testing and IQ.

Scientific racism contributed to a permanent field of study, which continues to this day. The dialogue takes place at the level of scientific research as well as public policy. In the twentieth century, the writings of Arthur Jensen and William Shockley on race and genetics and of Richard Herrnstein and Charles Murray (*The Bell Curve*) illustrated that the pursuit of a scientific basis for racist thinking undergoes refinements but continues.

SEMIOTICS

The term *semiotics* originated from *semēion*, the Greek word for “sign,” and can be defined most simply as the study of signs. In this context, a sign is broadly conceived as anything that signifies something else, such as a spoken word signifying a concept, a hoofprint signifying the passage of an animal, or a computer icon signifying the location of a file.

A contemporary semiotician could be a philosopher, psychologist, biologist, psychoanalyst, mathematician, or educator who studies the use of signs within his or her discipline, such as a linguist investigating grammatical

structures, an anthropologist interpreting the significance of a ritualized behavior, or an educator trying to further the development of a child's mathematical understanding. Although semioticians may vary widely in the content of their analysis and even their notion of what constitutes a sign, each ascribes to the following: (a) The making of meaning occurs through the use of signs; (b) all signs share certain universal qualities, properties, or relationships; and (c) these universals can be either revealed or applied within the context of different disciplines. This entry looks at two major influences in the field and the application of their insights to education.

The potential for wide application across varying contexts has given semiotics an interdisciplinary character that dates back to its origins. For example, Aristotle (384–322 BCE) examined the use of signs through linguistics; Augustine (354–430) created a theory of mental representations based on sign use; and William of Ockham (ca. 1285–1347/1349) featured the use of signs in his conception of logic. Similarly, the inclusive character of semiotics has also enabled the study of signs across diverse educational settings.

Signifier and Signified

The foundation for the contemporary study of signs can be attributed to two major influences. The first was Ferdinand Saussure (1857–1913), a linguist who conceived of a sign as having two parts, a signifier, or the form of the sign, and a signified, or the content of the sign. For example, the spoken word “dog” would be the signifier, and the concept or idea of a dog would be the signified. The most innovative aspect of Saussure's theory is that meaning does not originate from a connection between a sign and its referent. Instead, meaning resides in the arbitrary relationship among signs and is contingent on their relationship to an overarching structure or sign system. Thus, no single sign has meaning in isolation. For example, the word “chair” has meaning only in relationship with the words “desk” and “table” and as part of the broader concept of “furniture.”

This insight was seminal for a number of structuralists whose semiotic contributions were made through the formal study of their discipline (e.g., linguist

Roman Jakobson [1896–1982], anthropologist Claude Lévi-Strauss [b. 1908], and philosopher Michel Foucault [1926–1984]). Later in the twentieth century, Roland Barthes (1915–1980) further extended the study of signs to popular culture. Barthes's analysis showed how artifacts such as clothing styles, food arrangements, and haircuts could be used to structure meaning in advertisements and films.

In a comparable way, much of the work in educational settings recognizes the presence of multiple sign systems, such as text, spoken language, body language, and visual images, among others. To what degree any or all of these would become part of a semiotic analysis depends on the subject. Consider the predominance of textual signs when analyzing the written communications from administrators to teachers. Contrast that context with an analysis of the physical facilities available for handicapped students or the videotaped interactions between a teacher and student in a classroom.

These two settings may involve an interplay of textual, visual, and spatial signs. The semiotic content of these sign systems or “texts” is addressed by examining the relationship among signs; for example, what is placed first or last, what is their order, what occupies more and less space, what is placed higher or lower, and how do content and form interact with each other? Questions like these emerge from the character of the signs themselves and their previous treatment in the literature.

A Triadic Relation

The second major influence on contemporary semiotics comes from the logician Charles Sanders Peirce (1839–1914). In sharp contrast to Saussure's dyadic description of a sign (signifier and signified), Peirce characterized signs as occurring in a triadic relationship of object, representamen, and interpretant. *Object* refers to a thing or a thought, *representamen* to the corresponding sign, and *interpretant* to a relationship between the object and the representamen. For example, the meaning of “chair” resides in the interpretant (relationship) mediating the object “chair” and the sign “chair.” The interpretant can itself become an object of thought for a succeeding sign, thus initiating a new triadic cycle. Peirce characterized his triad as an

unceasing process of *semiosis* and emphasized its fluid, dynamic character.

Peirce's triadic conception of semiosis is particularly helpful for examining the evolving nature of signs in a particular context over time, such as an examination of a child's thinking in response to a particular set of mathematical signs or the impact of a field experience setting on a preservice teacher. A Peircean perspective also resonates with the poststructuralist position that the structure of a sign is unstable and continually changing, a viewpoint originally introduced by two writers familiar to semioticians, philosopher Jacques Derrida (b. 1930) and psychoanalyst Jacques Lacan (1901–1981). Their work favors the dynamic, unpredictable, and unlimited potential of semiosis, thus challenging semioticians to continually and creatively mine the multiple levels of meaning residing within signs.

SERVICE LEARNING

Service learning is traditionally defined as a curricular-based activity that integrates community service into classroom instruction. Often linked to and grounded in John Dewey's and David Kolb's experiential education, the field of service learning is contemporaneous with the rise of the civil rights movement and the insistence that education be linked to democratic practices and social justice.

Service learning has become an ever more accepted and institutionalized component of K–16 education. As

of 2004, more than one-third of K–12 schools provided service learning activities to 5 million students, and approximately 1,000 colleges and universities were members of Campus Compact, a national organization committed to the civic purposes of higher education. Service learning may be viewed as an extension of the federal mandate given to land-grant institutions in the mid-1800s and eloquently articulated in the “Wisconsin Idea”: that the boundaries of the university are the boundaries of the state.

Although tutoring and one-day service projects are the most common service learning models practiced both in K–12 and higher education, other formats include alternative spring breaks and community-based research. Service learning in higher education is most commonly practiced in disciplines and fields such as education, social work, English, and sociology; however, an American Association of Higher Education series on service learning and higher education spans twenty-three disciplines ranging from accounting to economics to women's studies.

Service learning is grounded in four criteria: *respect* for the individuals, groups, and communities being served; *reciprocity* of services such that all stakeholders have a voice in the format and direction of the service learning experience as well as gain from such engagement; direct *relevance* of the service learning experience to the curricular content of the academic course; and ongoing and systematic *reflection* upon the experience of the service. Service learning is often viewed as a “text” that, like any other curricular artifact, may be read, analyzed, and questioned to better inform the pedagogical process and curricular content of the academic course.

This raises three fundamental tensions within contemporary service learning theory and practice. The first tension revolves around goals: whether service learning is a technical practice that improves the teaching of content knowledge; a cultural practice that improves participants' notions of, for example, civic engagement and cultural diversity; or a political project meant to promote a justice-oriented perspective of and engagement with inequitable local and global conditions.

The second tension focuses on the appropriate methods for promoting meaningful and effective service learning. Service learning is most often short-term and

focused on immediate needs (e.g., a certain number of students are needed to tutor youth in an after-school program for a 14-week semester). This individualistic “charity” orientation is viewed by many as an inadequate model for fostering both systemic and systematic changes, but there are as yet few prominent examples where service learning is embedded in the very mission and vision of the educational institution rather than being an add-on to individual or departmental practices.

Finally, service learning is often positioned as a cocurricular practice that is not academic or rigorous enough to be taken seriously in the traditional research and publication emphasis of tenure and promotion committees. This is exacerbated by service learning’s predominant cocurricular institutional placement, such as under the Dean of Students. The prevalence of alternative monikers and emphases (e.g., “academic service learning,” “community-based learning”) attests to this attempted legitimization.

Two distinct movements, though, suggest that service learning will continue to develop across K–16 education (while still beset by the tensions described above). First, there is a long-standing and ongoing federal involvement in and financing of service learning practices in K–16 education. Second, there is renewed interest in higher education with a “scholarship of engagement”—for example, undergraduate research, the scholarship of teaching and learning, community-based research, experiential education, action research—that dovetails with emphasis on service learning’s activity-based and real-world learning.

SEX EDUCATION

Few topics in the history of American schooling have been as fraught with controversy as that of sex education. Since concerned leaders introduced advice manuals into the nineteenth-century landscape to combat social decay and disease, sex education has remained a highly contested site in which conflicting beliefs about adolescence, morality, relationships, and public health have been played out across the twentieth century. Sexuality is simultaneously a personal and profoundly public matter central to human relationships, public health, and the reproduction of citizenry.

From nineteenth-century medical pamphlets to HIV/AIDS prevention today, sex education raises complex questions for American educators: What role should schools play in such private and public terrain? What should constitute the curriculum, and what should be its purpose? When does sexual information shift from acceptable to dangerous? What constitutes healthy, appropriate sexual expression? Who should decide? The contours of sex education have shifted dramatically as concerned citizens, educators, medical professionals, and policy makers have grappled with answers to these questions. Sex education is a topic that continues to incite significant social anxiety even as it symbolizes the promise of social reform for many in American public education.

Sex education has varied in response to shifting social values, public and financial support, and beliefs about “the child” and “the adolescent.” Whether youth are conceptualized as vulnerable children in need of surveillance, potential tax burdens, or future citizens capable of self-governance shapes how their education is envisioned, designed, and delivered. Race, class, and gender inform those conceptions. Unlike many other educational topics, the intent of sex education has often been to effect behavioral changes in those who receive it. This entry provides a historical overview, a brief look at some current issues, and a glimpse of future trends.

Historical Background

Early Efforts

Concern about social upheaval led nineteenth-century reformers to distribute the first sex education-related materials in the United States. As urbanization and immigration increased, and fears about prostitution, masturbation, and disease escalated, leaders produced a flurry of advice manuals for White, middle-class young men. Pamphlets urged young men to maintain self-control and direct their sexual energy for the good of “the race.” Men’s self-control and women’s modesty were championed as ideal characteristics of civilized Americans in contrast to the immoral sexual behavior imagined of other cultures.

A recurring argument in sex education debates is that providing information about sexuality, however conceived, is a matter best left to families. Yet parents and medical experts in the nineteenth and early twentieth centuries viewed threats such as prostitution and disease as too great and public health as too important for parents to shoulder the full responsibility for transmitting sexual information and moral values. They turned to schools to aid in the battle. The rapidly expanding public school system and its increasingly regulated curriculum seemed an ideal arena to reach large numbers of children and contend with moral and social decay.

Even as professionals felt the urgency of their mission, they struggled with how best to convey information considered sensitive without polluting children’s natural “innocence” or violating federal laws that deemed explicit information “obscene.” Educators perceived a fine line between beneficial and dangerous information. Indeed, an enduring fear woven through sex education debates is that providing information about biology and sex might pique student interest, encourage experimentation, and undermine educators’ intent to instill self-control. Thus, early sex education materials were scientific in tone and focused on the alarming consequences of disease.

Progressive educators (1880–1920s) were vanguards in the effort to institute more comprehensive sex education in American schools and to shift responsibility for its provision away from medical professionals and into the hands of educators. With financial support

from prominent business leaders, reformers established the American Social Hygiene Association to promote sex education as a tool to address social problems. In this spirit, progressive educator Ella Flagg Young organized a series of lectures in 1913 on social hygiene and physiology that reached more than 20,000 Chicago children. Although the program was short lived because its direct approach raised public concern, some of its characteristics have endured in contemporary practice: Educators delivered information to sex-segregated groups; lectures were provided to parents before delivery to children; and children of different ages received different information. Young’s approach also reflected budding efforts to educate “the whole child” and to frame sexuality in humanistic terms of love and intimacy rather than solely in medical language of danger, disease, and decay.

Wartime

Changes in the contours and reach of sex education have reflected shifting national priorities. Funding has been a key element. For example, the perception that increased sexual activity and venereal disease posed a threat to servicemen during World War I led the government to fund sex education for soldiers’ benefit. The passage of the Chamberlain-Kahn Act in 1918 and the establishment of a Venereal Disease division in the public health service helped expand educational initiatives to civilians, including college students and teachers in normal schools. The majority of normal schools in the 1920s provided some sex education preparation to teachers.

Yet “sex education” meant little more than disease containment, teachers were offered little tangible support to integrate sex education amidst other teaching demands, and Congress cut funding when public energy shifted to other fears. Also, as youth left the war years and entered the roaring 1920s with shorter hemlines, motor cars, and dancing shoes, the rhetoric of fear did little to quell their desires to mingle. Framing messages about intimacy in positive terms promised to resonate far more with youth yearning for pleasure and connection in the wake of war.

Funding was equally influential during World War II as leaders initiated aggressive disease-prevention efforts

for soldiers that had reverberations for school-based initiatives. During the war, leaders used a range of tactics to detach sexual practice from its associations with morality and reframe it as vital to healthy American manhood. Medical personnel offered explicit lectures, showed detailed films on disease, and advocated condom use. This pragmatic approach to promote national health over abstinence was understandable given the findings from Alfred C. Kinsey's well-known sexuality research at mid-century. Kinsey, drawing from 12,000 interviews, found that the majority of men and increasing numbers of women were sexually active despite long-standing prohibitions against premarital sex. Preserving the health of soldiers took priority over championing abstinence as the ideal.

The Baby Boom

In the 1950s, when the American middle-class family ideal became paramount to a nation recovering from war, private and government funding was redirected to champion heterosexual unions and to develop family life education. Family life became a salve for the wounds of war. Although courses teaching marital and family skills surfaced during the 1920s and 1930s, they emerged with greater vigor during the baby boom era. Rather than providing sexual information, or proscribing sexual relations, programs primarily used glowing rhetoric to beckon students to the nuclear family ideal. The curriculum included mental hygiene films such as *Dating Do's and Don'ts* (1949), *Going Steady?* (1951), and *Marriage Is a Partnership* (1951). Lessons emphasized traditional sex roles for men and women, wholesome dating, consumerism, and marital harmony.

A series of explosive social changes in the 1960s reinvigorated efforts to foreground sex education, rather than family life education, in schools. The civil rights, feminist, and antiwar movements; changes in gender roles; the approval of the birth control pill in 1960 that placed fertility control more firmly in women's hands; the rebellion of gays and lesbians at Stonewall; and changes in obscenity laws are among the forces that contributed to the "sexual revolution." A series of Supreme Court decisions during the 1960s and 1970s upholding the constitutional right of individuals

to control their fertility further enabled individuals to separate sexual activity from reproduction.

These social and legal changes prompted widespread efforts to teach pregnancy risks, human anatomy, reproduction, and sexually transmitted disease (STD) prevention to youth. In 1963, Dr. Mary Seichen Calderone founded the Sexuality Information and Education Council of the United States to advocate for sex education and the reduction of sexual risk among youth. Although Calderone never strayed far from the marriage ideal in her vision of sex education, she argued that all youth needed access to information to make sound decisions and prepare for their adult roles. Schools began to incorporate sex education into the health curriculum and enlisted physical education and biology teachers to offer sex-segregated lessons on reproduction.

While sex education battles continued nationwide, public opinion surveys in the late 1960s found that the majority of Americans supported some form of school-based sex education. Opinions as to the content of that education, however, continued to differ significantly over the next few decades. For instance, the HIV/AIDS crisis in the 1980s and 1990s spurred the Centers for Disease Control and Prevention to distribute millions of dollars to states to instigate AIDS-prevention education. States that did not require sex education courses in their schools nevertheless established policies requiring educators to include HIV/AIDS-information. The depth and duration of such education varied, from programs that included detailed information to those that required educators to address HIV/AIDS a minimum of three times from Grades 5 through 12. By 1990, all fifty states had such recommendations or mandates, shaping and limiting other kinds of sex education available to youth.

Contemporary Issues

Feminist Perspectives

Sex education has attracted significant analytic attention from feminists because it is a site in which gendered power is enacted at the national, state, and school level with particular implications for women's lives. Margaret Sanger's well-known crusade to circulate birth control information in the early twentieth

century despite laws that deemed such information obscene was driven by her conviction that poor women desperately needed tools to protect their health. As a nurse in New York, Sanger witnessed women's despair from constant cycles of childbearing. Similarly, advocates for reproductive rights and legal birth control during the 1960s and 1970s insisted that inadequate information about sexuality and a lack of access to contraception posed specific threats to women's lives and well-being. Because women alone bear the physical capacity for childbearing, sex education is imperative to women's bodily integrity, sexual agency, and economic empowerment.

As sexuality education has been incorporated into public schools, feminist attention has shifted from promoting basic access to reforming the curriculum to better meet women's needs. In recent years, advocates have argued that programs offering comprehensive information about same-sex relationships, birth control, abortion, and HIV/AIDS are necessary because human beings are entitled to full and accurate information to make wise choices for their lives. In this sense, access to information is foundational to democratic principles. Feminists also emphasize the need for educational programs to consider the gap between accessing and applying information. For example, women socialized in traditional gender roles may recognize contraceptive options and yet be unprepared to insist on condom use, navigate power dynamics in heterosexual relationships, or discuss and pursue equitable sexual practices. Sex education, to be effective for women, must explore how larger social forces shape individual experiences.

Teen Pregnancy and Abstinence Education

Teen sex and teen pregnancy are central issues shaping contemporary sex education. Despite a decline in teen birthrates from the 1960s to the 1980s, concern for teen pregnancy skyrocketed after the 1960s and has recently come to symbolize a decline in American family values. Social reformers once again turned to sex education to address social ills, mobilizing a national effort to promote abstinence-only education programs. In 1981, the Adolescent Family Life Act established a series of programs advocating abstinence

to teens and young, unwed mothers. In 1996, the Abstinence Education Law was passed as part of welfare reform, the Personal Responsibility and Work Opportunity Reconstruction Act. This act broadened the reach of abstinence education by funding states that incorporated abstinence programs in schools. To receive funding, sex educators could not promote condom use or refer to the potential benefits of contraception for preventing pregnancy and STDs.

Advocates of abstinence-only education insist that pressing social problems require such strong and focused responses. Sexual images dominate contemporary media culture, rates of unprotected oral sex among teens have increased, and the United States continues to reflect one of the highest rates of teen pregnancy and STDs in the developed world. Supporters argue that abstaining from sex is the only method to ensure teens' safety. Programs emphasize the risks of failed contraception and the range of benefits associated with delaying sexual initiation. Although some states have refused abstinence-only funding because of its curricular restrictions, the majority of states have relied on it to ensure the support of school-based sex education.

Feminist educators have critiqued a curriculum that emphasizes the dangers of sex and the silencing of women's desire. For example, researchers point to problematic discourses of heteronormativity, risk, and alarm legible in the 1996 federal guidelines for abstinence education. These guidelines, backed by millions of dollars in federal funding, explicitly endorse marriage as the expected arena for sexual expression and portray nonmarital sexual relations as dangerous. Messages of "personal responsibility" and "accountability" dominate. Critics contend that such a curriculum endangers youth by severely limiting the information schools can provide; targeting low-income and minority youth as problems in need of containment; idealizing one type of sexual relationship at the expense of all others; and marginalizing lesbian, gay, bisexual, transgendered, and queer (LGBTQ) youth. Also, some argue that the religious origins and morality-based undercurrent in abstinence education subtly violate the separation between church and state with little scientific evidence that the programs reduce teen sex, pregnancy rates, or the transmission of STDs.

Sexual Identity

The topic of sexual identity has also become visible in the sex education curriculum. National organizations such as Parents, Families, and Friends of Lesbians and Gays and the Gay, Lesbian and Straight Education Network; anti-bullying campaigns; and gay-straight alliances have worked to create a safer climate for sexual minorities in schools. Some have integrated information about LGBTQ-identified youth into the curriculum and created spaces for youth to discuss sexual identity issues. Educational tools include peer educators, panels of gay speakers, texts with gay characters, and photographic displays of gay families.

Such efforts, despite their emphasis on sexual identity rather than sexual behavior, have often met with fierce opposition. Some critics oppose any portrayal of same-sex relationships as acceptable or healthy. Abstinence-only programs traditionally maintain firm silence on LGBTQ issues. Visible here is a concern that has endured throughout sex education debates: that discussing sexuality issues in the risky spaces of schools might appear as condoning behavior or impelling youth to sexual activity. The backlash against LGBTQ-inclusive programs also indicates the rising visibility of sexual minorities as they slowly gain greater social and legal rights.

Does It Work?

Since the inception of formal sex education, educators have often intended their lessons to effect tangible behavioral changes. What remains in question is the degree to which sex education has that power. American sex education efforts have been neither uniform nor universally accepted. They have shifted with the ebb and flow of public opinion and the emergence of new crises that claim citizens' attention. Teachers expected to instill biological and moral lessons have often been left unprepared for the complexity of the task. Indeed, critics contend that occasional lessons or week-long programs are artificial and impotent structures for effecting change in a society saturated with sexual messages. In addition, treating sexuality as a distraction to student learning and a risky impulse that must be controlled approaches sexuality as a rational,

rather than a complex, emotional, and sensual, phenomenon. The diverse racial, ethnic, religious, political, and sexual identities of U.S. citizens render homogeneous programs ineffective and homogeneous responses impossible.

Scholars suggest that fear, risk, and reproductive information have dominated the history of formal sex education at the expense of its powerful role in human identity, connection, and pleasure. Some sex educators have tried to address such perceived limitations by establishing alternatives that shed the moral and medical associations of sex education historically and work to integrate it within a broader humanities curriculum. Others strive to open dialogue about the emotional and power-laden aspects of sex and the decision-making processes that accompany it. Many programs have used peer educators and popular culture, humor, props, and videos to connect with diverse youth or have envisioned sex education as a springboard to critically examine larger social issues.

Some have expanded sex education to younger children. For example, some schools have designed lessons for kindergartners on self-esteem, good touch/bad touch, and peer relationships as an effort to stem rising rates of STDs and HIV/AIDS in their communities. The hope is that providing information earlier and more consistently will not only emphasize sexuality as a foundational aspect of humanity but also offer youth greater tools to contend with complex sexual and social issues across their lifespan. These diverse initiatives will continue to spark debate as educators grapple with the philosophical, practical, and symbolic aspects of sex education in a democracy.

SEXUALITY, GENDER, AND EDUCATION

Sexuality, one of the central aspects of human existence, encompasses a range of expression that can vary by historical moment, culture, social or economic class, and even the individual. Its seeming fluidity and scope can make it difficult to comprehend. Closely connected with the notion of sexuality is gender. Gender is a set of stories people tell themselves and each other about what it means to be male and female. Like sexuality, stories about gender vary among individuals, cultures, and historical eras. As with any complex, socially created quality, individuals create and recreate their gender throughout their lives. Sexuality and gender are intimately intertwined concepts in the sense that gender assists individuals in navigating sexual choices, in helping them find others with whom sexual activity may be a possibility. This entry looks at the impact of sexuality and gender issues in education, providing both a brief overview and a more detailed look at the historical record.

Schools Take Responsibility

Perhaps because of the fluidity and possible variation in sexuality and gender expression, societies have endeavored to define norms that are maintained through rule creation and enforcement, individual and group vigilance, and language aimed at reinforcing notions of sexual and gender conformity. In the past, religious institutions, local communities, and extended families upheld the greatest portion of responsibility for maintaining sexuality and gender norms. As educational

institutions, particularly tax-supported schools, proliferated, however, they bore ever-increasing responsibility for imparting normative sexuality and gender in youth. This shift in responsibility was most pronounced during full-scale industrialization of the economy, which had as an attendant consequence the greater involvement of parents in wage-earning work outside the home. Schools then assumed growing responsibilities for raising children to the degree that working parents declined it. Schools essentially became important agencies in defining and shaping sexuality and gender among youth.

The significant responsibility for maintaining normative sexuality and gender among youth has been carried out by schools ever since. This largely implicit work is embedded in virtually every aspect of schooling: who is hired to teach, how students and schoolworkers may dress, what events—both curricular and extracurricular—might be organized, how students may behave with each other and with school staff, and what content constitutes the explicit curriculum. Because the regulation of sexuality and gender norms among youth so pervades the work of schooling and is so deeply enmeshed in its culture as well, members of school communities simply have assumed that this function always has existed and therefore is a natural part of the work of schools.

This ongoing assumption, which is akin to acceptance of the sexuality and gender regulating functions of schools, has continued until persons who transgress sexuality and gender norms have challenged that authority. Over the past half-century, persons who have defined themselves as lesbian, gay, bisexual, transgender, transsexual, intersexual, or, to use the broader but still contentious label, “queer,” have mounted challenges to the conventional sexuality and gender order of schools. At first, only a few schoolworkers with nonconforming sexuality and gender identities publicly stood up for their employment rights. Since then, not only have larger numbers of schoolworkers and their allies campaigned for improved conditions for queer-identified persons in schools, but so, too, have students. Over the past two decades in particular, students have played powerful and central roles in winning rights for sexuality and gender transgressors in schools.

These efforts have not succeeded easily. Rather, conservative countermovements have confronted sexuality and gender transgressors at every turn. As the mutability and variety of sexual and gender identities has been championed by growing numbers of persons, a backlash movement effectively has tempered this expansion, endeavoring to squeeze human sexuality and gender into a narrowly constrained, binary model. Within this model, room exists only for heterosexual behavior among persons with distinct, polarized gender identities aligned with supposed biological sex. The right-wing backlash movement has enjoyed significant political and social success over the past few decades by deploying strategies that include using emotionally laden language, casting all talk about sexuality and gender in starkly oppositional or binary terms, and essentially leaving out or ignoring the social complexities and nuances that complicate phenomena as deeply rooted as gender and sexuality.

Tracking the History

During recent skirmishes between sexuality- and gender-transgressing persons in schools and their conservative critics, as well as over the long-term past since the industrialization of our economy and compulsory school attendance, one of the fundamental means of influencing or regulating students' sexuality and gender has been through hiring schoolworkers who might model acceptable sexuality and gender norms.

Early Schools

When coeducational common schooling spread during the mid-nineteenth century, schoolwork split neatly into two realms: administrative work performed primarily by men, and teaching, which quickly became women's work. This division closely resembled the bifurcated responsibilities of men and women in conventional heterosexual households, with men exerting authority and representing family units in the external realm and women overseeing domestic affairs. Schools, then, essentially came to resemble the families whose services they had come to supplement. School principals, then later superintendents, performed manly work while teaching became feminized in the sense

that it was acceptable mainly for women. This role segregation could not have been lost on students, who, no doubt, internalized this implicit and powerful message.

Schoolworkers similarly modeled normative sexuality for their charges. When communities first employed teachers, they selected only single women whom they regarded as chaste paragons of virtue. Women who married were forced to resign. This prevented any conflicts they might experience in deciding where their primary allegiances might lie: with their husbands or male supervisors. At the same time, communities expressly sought married or marriageable men for school administrative positions. By heading a heterosexual household unit, these men defused any potential criticism of their sexuality, manliness, responsibility, character, or fidelity. Women and men in school work thus experienced expectations about their marital and sexual status that were directly inverted. In the end, when schools hired workers who manifested normative sexuality and gender, they wanted to ensure proper modeling for students. Eventually, schools would add curricula with the overt intent of shaping youth into acceptably heterosexual individuals who clearly demonstrated gender-normal qualities and who possessed a keen understanding of middle-class courtship rituals.

Despite persistent efforts to shape the sexuality and gender of students through modeling provided by schoolworkers, schools also have offered fascinating opportunities for supporting sexuality and gender transgression. A century ago, for instance, communities so feared the effects that a nearly completely female-dominated teaching force might wreak on students, particularly males, that they aggressively sought any men who might show the slightest interest in teaching or an ability to teach youth. They even were willing to hire men who fell outside the normative range of sexuality and gender. The women hired to teach sometimes also transgressed the bounds of normative sexuality. Schools primarily or exclusively hired only single women, which allowed large numbers of single women to live independently, if only modestly. Some single female teachers chose to live with other women, perhaps to share living expenses, but undoubtedly in some cases to center their lives on other women. Women who developed enduring

romantic and/or sexual attachments to other women departed radically from conventional sexual mores requiring instead that they center their lives on men.

At first, when these historical moments fostered opportunities for transgressive sexuality and gender among schoolworkers, little public discussion ensued, especially if the ranks of schoolworkers could be maintained with reasonable quality and relatively low costs. Eventually, though, criticism mounted. Publicly expressed concerns focused not so much on schoolworkers in and of themselves, but on how students might be affected by such influences. Critics complained that spinster teachers encouraged girls to eschew marriage. Others argued that effete male schoolworkers exposed students to sexual abnormalities and infected them with deviant behaviors. Schools typically responded to such public complaint by scrutinizing the ranks of schoolworkers and insisting on sexuality and gender conformity, and also by clamping down on the range of behaviors and expressions permitted of students. Schools, then, have both nurtured transgressive sexuality and gender, and, just as surely, endeavored to contain such transgressions.

Turn of the Century

Such pressures to constrain sexuality and gender in schools gradually built over the first half of the twentieth century. One particularly powerful force was the suffrage-era backlash movement against women's steady gains in social, economic, and political power. Teddy Roosevelt led the charge with his vehement protest that middle- and owning-class White women as a group were abandoning their responsibilities to marry and bear children—that they essentially were committing “race suicide.” Because an overwhelming portion of the ranks of educated, middle-class, single women either were or had been teachers, spinster teachers found themselves in the crosshairs of such attacks. Making them even more suspect was the fact that many of the leaders and grassroots workers of the suffrage movement were single female teachers.

Along with these developments, the early decades of the twentieth century also brought increased public awareness of persons who transgressed sexuality and gender norms. Books documenting the scientific study

of human sexuality, first published in Europe, reached bookshelves in the United States during these years. For the first time, elaborate detail demarcated lines between new classes of sexual beings and behaviors, including “homosexuals,” “inverts,” “intersexuals,” and so on. Much of this early sexology research pathologized persons who transgressed sexuality and/or gender norms. The rapid spread of interest in the young field of psychology also fueled public discussion of a range of sexual identities, behaviors, desires, and neuroses as translations of Freud's works became widely available. In time, scholarly discussion of human sexuality and gender gave way to portrayals in popular media. Newspapers began reporting police busts of known enclaves of individuals seeking sexual experiences with others of the same sex. Artists, writers, and movie-makers featured characters with explicitly transgressive sexuality and gender until Hollywood production codes imposed in the early 1930s drove such depictions into the shadows.

As language describing homosexuals increasingly appeared in newspapers, books, magazines, and films, public awareness of their existence also grew. However, popular understanding of homosexuality easily crossed any boundaries that may have existed between sexuality and gender. To many, same-sex desire connoted gender transgression. Women who defied gender norms and worked in the public sphere or asserted their rights could be regarded as sexually deviant, or lesbian. During the 1930s and 1940s, the popular image of the spinster teacher shifted away from that of peculiar individuals devoted to public service and toward one of sexual suspicion. School systems largely retained this increasingly tainted pool of workers, though, because single female teachers provided devoted and skillful service at little cost.

A New Teaching Cadre

However, when new categories of potential teachers appeared after World War II, namely married women and veterans, school districts quickly dropped their long-standing practice of hiring only single female teachers. Married women not only entered teaching in significant numbers during these years, but their representation in the classroom quickly outstripped that of

single women. In fact, the proportion of married to single teachers rose sharply higher than the proportion of women in the general workforce. School officials, eager to rid their personnel of the taint of deviance, contributed to the postwar trend where teaching radically shifted to work for married women after having been spinsters' work for more than a century.

If the years before World War II brought growing awareness of persons who desired others of the same sex, the years after produced outright fear, dramatic headlines, and nationwide efforts to stem this supposedly rising threat. The armed forces, in efforts to downsize after the war, identified and purged suspected homosexuals from their ranks. In the Cold War hunt for enemies in our midst, Senator Joseph McCarthy temporarily wielded enormous power by launching widely publicized hunts for communists in government; but after finding few, if any, he switched to a somewhat easier target: homosexuals. His efforts garnered national media attention and inspired similar efforts by state and local governmental agencies.

Then, a popular magazine in 1950 published what it called a groundbreaking piece of journalism describing the threat purportedly posed by homosexual teachers. The article, which opened by celebrating the work of Senator McCarthy, charged that "the homosexual is an inveterate seducer of the young of both sexes, and . . . presents a social problem because he is not content with being degenerate himself; he must have degenerate companions, and is ever seeking younger victims" (Major, 1950, p. 100). The author conveyed the impression that, as Senator McCarthy charged, homosexuality spread like a contagious disease, that youth were unable to resist its lures, and that homosexuals wanted nothing more than to corrupt as many youth as possible.

School officials rapidly responded by examining their personnel rosters for individuals with supposedly homosexual tendencies who might corrupt students by association or, worse, actively prey on them. School administrators examined male applicants for effeminacy, which seemed to connote homosexuality according to popular understanding that conflated same-sex desire with gender transgression. They inspected women, too, to ensure properly feminine attire; the presence of wedding or engagement rings; and

commitment to upstanding, heterosexually oriented social activities.

Local and state education agencies pressed the matter further as well. California legislators enacted a law requiring local police to notify school officials whenever they caught teachers in sting operations aimed at snaring homosexuals. These teachers invariably lost their jobs regardless of the outcome of legal action based on such charges. Some investigators, having assisted McCarthy in finding and purging homosexuals from federal offices, traveled to Boise, Idaho, to investigate the existence of a supposed homosexual ring. Interrogations, stakeouts, intimidation, and campaigns of public humiliation were meted out as investigators spared no effort to find teachers and others who were rumored to prey on boys, even though few were ever found guilty.

The Florida legislature would not be outdone. In the late 1950s, a special committee, which initially sought to investigate the activities of civil rights workers and then communists but failed to find or successfully prosecute any, then moved on to identify and purge the state's teaching force of homosexuals. Because of the national media attention netted by each of these campaigns and others, schoolworkers learned that they needed to conceal any trace of gender-transgressing behavior or appearance because these supposedly hinted at homosexuality. Once any teacher was suspected of homosexuality, regardless of the truthfulness or relevance of such a charge, she or he usually was summarily dismissed with little recourse.

Tolerated Scrutiny

For years, schoolworkers tolerated the heightened scrutiny faced by the profession. Licensed educators were particularly vulnerable because of their close association with young people and an ongoing supposition in the minds of many linking homosexuality with pedophilia. This supposition, largely trumped up by McCarthy and others who followed in his footsteps, was the notion that homosexuals, like Cold War enemies, would take over if only given a foothold. As Americans were warned to be ever vigilant about the supposed threat from within of communists, so, too, was the public admonished to be wary

of gender-transgressing teachers who might convert the next generation into “practicing homosexuals.” These threats typically were accompanied by untraceable anecdotal evidence and high-flying rhetoric rather than verifiable facts.

Schoolworkers mostly endured these conditions. Those who desired others of the same sex or who wished to transgress gender norms knew that retaining their jobs required acquiescence. However, with the rise in the late 1960s and early 1970s of a full-fledged, grassroots gay liberation movement, conditions for schoolworkers slowly began to change. The Stonewall Rebellion, during which patrons of a gay bar in Greenwich Village openly and brazenly resisted police harassment in a three-day riot, sparked a collective shift in consciousness among self-identified gay men and lesbians. The movement was born as individuals decided to stand up against the oppression directed at them for so long.

Some teachers who desired persons of the same sex and/or who transgressed gender bounds joined the many activist organizations that proliferated in the years after Stonewall, in the process learning the politics of gay liberation. Eventually, lesbian, gay, bisexual, and then transgender schoolworkers formed their own associations. Such LGBT organizations appeared in New York, Chicago, San Francisco, Los Angeles, Denver, and Boston, among other cities, during the mid-1970s. Organizers sought to provide social support to members as well as to engage in activities to increase their collective visibility and employment rights. Virtually all of these LGBT schoolworker associations marched in local gay pride parades, an act that flew directly in the face of the requirement that they be invisible. They began to fight back when school administrators sought to fire or demote them on account of their status. They brought employment discrimination lawsuits and staged media events designed to highlight their plight. And they successfully leveraged their growing clout into policy shifts by larger teacher associations, even, in time, the National Education Association and American Federation of Teachers, both of which went on record as supporting the employment rights of teachers regardless of their sexual orientation.

Gay Liberation

The larger gay liberation movement scored some impressive early political victories as several metropolitan areas passed nondiscrimination ordinances protecting individuals against discrimination in housing and employment on account of sexual orientation. However, in time, the growing visibility, flamboyance, and political power of the fledgling gay movement would trigger a vigorous backlash. That backlash specifically would target the most vulnerable members of the LGBT community: those who worked with youth, especially teachers, because of an imagined threat of child molestation or their “homosexual influence.” Such fears were confirmed in a nationwide poll conducted in 1977 that found that although most believed homosexuals should enjoy freedom from employment discrimination, this belief did not extend to schoolworkers. In fact, 65 percent objected to the presence of homosexual elementary teachers.

It was at this moment that Anita Bryant, the former Miss America and singer for evangelical ministries, took on as her mission the elimination of homosexuals in school employment. She rallied fellow conservative Christians in the Miami-Dade area to overturn a new nondiscrimination ordinance offering protection against employment and housing discrimination on account of sexual orientation. She attacked the ordinance not by going after all members of the LGBT community, however, but by narrowing her focus strictly to schoolworkers. She appeared on nationally syndicated conservative Christian television shows such as the PTL Club and 700 Club, arguing that the presence of homosexual teachers would encourage more pupils to become homosexuals, that youth may come to regard it as an acceptable lifestyle, that children might begin to cross gender-appropriate bounds, and that such teachers would molest children. She triggered public outrage when she conjured the spectacle of male teachers wearing skirts or cavorting with children. Initially, gay liberation activists ignored Bryant, writing her off as a second-rate performer with limited social impact. When Bryant’s campaign to “Save Our Children” started receiving hundreds of thousands of checks from around the country, though, her growing political might became

clear. Even though polls indicated that the majority of Miami-Dade voters supported retaining the ordinance, most supporters failed to show up to vote. In contrast, busloads of Bryant's supporters poured into polling places, eventually scoring a lopsided 2 to 1 victory and bringing the ordinance down.

Among those attending Bryant's victory party was John Briggs, a California state legislator with gubernatorial ambitions. Briggs jubilantly told a reporter that night that he would capitalize on this political groundswell by launching a referendum aimed at ridding schools of homosexuals. He described how this campaign would ignite his quest for the governorship. Shortly afterward, he succeeded in obtaining enough signatures to place the referendum on the ballot, partly with the help of Bryant, who flew to California to assist. Proposition 6, as it came to be known, would have required school districts to rid their ranks of any employees who either were lesbian or gay or who supported the employment rights of those who were. The referendum read:

The state finds a compelling interest in refusing to employ and in terminating the employment of a schoolteacher, a teacher's aide, a school administrator or a counselor, subject to reasonable restrictions and qualifications who engages in public homosexual activity and/or public homosexual conduct directed at, or likely to come to the attention of, schoolchildren or other school employees. This proscription is essential since such activity and conduct undermines that state's interest in preserving and perpetuating the conjugal family unit.

Proposition 6 captured national headlines as it highlighted a showdown between a new and vigorous lesbian and gay rights movement, on one hand, and religious/political conservatives on the other. Although Proposition 6 particularly focused on schoolworkers, grassroots lesbian and gay rights workers understood it as a much broader attack on the larger movement. Lesbian and gay schoolworkers (and their allies) needed the assistance of activists across the movement because they were quite vulnerable themselves: If they openly campaigned against Proposition 6 and it passed, then

they would lose their jobs. Nonetheless, many lesbian and gay teachers risked their chosen profession by coming out and working hard to defeat the referendum. Soon, labor, coalitions of persons of color, women's liberation activists, and others joined them. Engaging in this work proved daunting in other ways, though. Although volunteers eagerly signed on to help, most felt safe giving only their first names. Because campaign contributions over \$50 required public reporting, the movement received large numbers of contributions of \$49. Fund-raising events, including high-profile celebrity fetes, quickly dissipated when media cameras arrived. Despite these challenges, momentum to defeat Proposition 6 increased steadily, culminating in a decisive victory for lesbian and gay movement activists.

Renewed Backlash

The conservative backlash, if temporarily slowed, did not abate, however. Through the remainder of the 1970s and into the 1980s, a wide variety of local, state, and national groups sought to resist the larger lesbian and gay rights movement by concentrating their political efforts on ridding schools of visible LGBT persons. Oklahoma legislators resoundingly passed a law similar to Proposition 6. However, this law eventually was struck down when the Supreme Court deadlocked on the case. Legislation introduced in Missouri would have required all lesbians and gay men who worked with youth under 21 years old to be listed on a Division of Health registry, which would be consulted for personnel decisions. All of the conservative efforts such as these had in common at least two assumptions: Lesbian and gay schoolworkers would, through their influence, make children transgress the bounds of sexuality or gender norms; and lesbian and gay schoolworkers were thought highly likely to molest students, even though this assumption could not be substantiated with evidence. In fact, evidence consistently indicated instead that lesbian and gay schoolworkers were less likely to molest children than heterosexual men.

Around this time, the AIDS pandemic first emerged in national reporting. AIDS, which in the United States quickly became known as a disease that disproportionately afflicted gay men, caused public

alarm. Communities feared the presence in schools of anyone infected with the virus, which translated into a fear of gay male schoolworkers. Soon, though, it became clear that AIDS might directly affect youth who became sexually active while possessing minimal knowledge of the dangers. Ignoring the existence of gay, lesbian, and bisexual youth became equated in the minds of concerned schoolworkers and parents with simply allowing such youth to die. Furthermore, school communities increasingly became mindful of the plight of sexuality and/or gender nonconforming or queer youth, who claimed their identities at ever-younger ages and who typically faced brutal emotional and physical abuse at the hands of their peers at school. Schoolworkers and parents learned about the profound self-loathing experienced by some, but certainly not all, queer youth and their particularly difficult transitions to adulthood. The NEA Delegate Assembly decided in 1988 to support youth counseling programs geared toward helping queer youth accept and adjust to their same-sex desires. This development stood in stark contrast with the then-prevailing practice of counseling such youth to become heterosexual, or even committing them to programs or institutions aimed at ensuring their heterosexuality. A few model LGBT-affirming counseling programs emerged soon afterward, most notably Project 10, started by Los Angeles counselor Virginia Uribe.

Efforts to ensure the welfare of queer youth received explosive growth of support in 1991 with the release of a federal report describing alarmingly high suicide rates among lesbian and gay youth. The report, initially withheld from public release for years because of conservative political concern about its findings, declared that

A majority of suicide attempts by homosexuals occur during their youth, and gay youth are 2 to 3 times more likely to attempt suicide than other young people. They may comprise up to 30 percent of completed youth suicides annually. . . . Schools need to include information about homosexuality in their curriculum and protect gay youth from abuse by peers to ensure they receive an equal education. Helping professionals need to accept and support a homosexual orientation in youth. Social services need to be developed that

are sensitive to and reflective of the needs of gay and lesbian youth. (Gibson, 1989, p. 110)

The eventual release of the youth suicide report triggered strong responses from both the political left and right. LGBT rights activists and their allies contended that the report demonstrated the necessity of attending to the unique concerns of LGBT youth that, at root, schools must foster a climate of acceptance and support for LGBT persons. No doubt, some activists found that working on behalf of youth was considerably less controversial than seeking rights for schoolworkers, whom the public still regarded with suspicion. On the political and religious right, however, critics charged that the report contained erroneous data that exaggerated the phenomenon of high suicide rates among LGBT youth. They fundamentally questioned the purpose of any counseling that led to acceptance of same-sex desires or gender transgression, arguing instead that such youth needed skillful counseling geared toward making them heterosexual, gender-conforming adults. Furthermore, they contended that any tax-supported programs encouraging acceptance of LGBT persons directly conflicted with their religious values, which held that homosexuality was a sin.

The LGBT Movement

As adults across the political and religious spectrum debated, growing numbers of students who identified as LGBT or queer decided to take matters into their own hands. The first gay-straight student alliance was formed in 1989 in Massachusetts with the sponsorship of Kevin Jennings, a gay teacher in an independent school who later led in the formation of the Gay, Lesbian and Straight Education Network. Gay-straight alliances in schools endeavored to bring queer and allied youth together with supportive adults in an effort to improve school climate for all queer persons. Led largely by student initiative, the movement to establish gay-straight alliances in schools spread with astonishing speed, growing to more than 900 such groups within the first decade—and the pace of growth shows no signs of slackening. In Massachusetts, one of the earliest coordinated efforts across gay-straight alliances was a statewide lobby day in 1993 where queer and

allied youth traveled to the capital to convince legislators that a state law was necessary for the elimination of discrimination against queer youth in schools. Their lobbying succeeded, and not only did lawmakers enact protections for queer youth in schools, but they also allocated funds to create and offer training programs to help members of school communities respect their queer members.

Despite these early and impressive successes, students usually confronted stark and overwhelming resistance. When Kelli Petersen organized a gay-straight alliance in her Salt Lake City high school, the state legislature responded by passing a law requiring schools to forbid student clubs that discussed issues related to sexuality. Petersen, undaunted, continued her activism to secure the creation of her high school's gay-straight alliance and, in the process, attracted considerable national attention and support. Eventually, Petersen's principal resisted the authority of school board members—and state legislators—by not only supporting the gay-straight alliance, but also enacting policies protecting queer youth from discrimination. And finally, in a precedent-setting court decision, Jamie Nabozny won a million-dollar judgment against his former school administrators who either did nothing or even encouraged homophobic verbal and painful physical abuse against him when he was a student. School districts around the country took notice and immediately began studying how to address the issue of LGBT discrimination against students so that they might avoid similar legal judgments.

The Current Situation

Although concern about sexuality and gender transgression in schools centered on schoolworkers for most of the twentieth century, more recently, self-identified queer students and their allies have recentered discussions and taken up the cause of winning rights for queer persons in schools. This may be in part because the larger queer-rights movement has shifted from the margins to the mainstream and, in the process, increased awareness of queer issues. Students may recognize and claim queer identities at earlier ages than in the past. Queer youth also may have organized their own support networks because queer adults largely

have been reluctant to assist them, mainly out of concern that their efforts would be viewed as predatory.

The old stereotype of queer adults as child molesters dies hard even though evidence repeatedly has refuted it. Through the 1990s and early twenty-first century, queer youth also have enjoyed new means of connecting with each other electronically and thereby resisting what previously had been an inherently isolating experience. They have forged vibrant new forms of culture and actively insisted on determining their own individual and collective identities rather than passively accepting identities foisted on them by others, such as the early 1990s stereotype of the helpless, hopeless suicidal gay youth. Queer youth, then, are on the front lines of the ongoing effort to make schools safe places for all people.

SEXUAL MISCONDUCT BY EDUCATIONAL PROFESSIONALS

Sexual misconduct is defined as inappropriate professional behavior of a sexual nature. The term includes sexual harassment, sexual abuse, and inappropriate sexual relationships. Although there is no definitive study indicating how prevalent educator sexual misconduct is, experts in the field estimate that approximately 10 percent of the student population experiences some form of inappropriate sexual activity with an educator at some time during their PreK–12 education. Yet because of the shame and guilt often experienced by students, these same experts suggest that there is a greater incidence of sexual misconduct than actually reported. This entry briefly discusses typical instances of misconduct and makes some suggestions for identifying and preventing such cases.

Defining Typical Misconduct

The most common form of educator sexual misconduct is classified as sexual harassment. Sexual harassment is unwelcome behavior of a sexual nature. One type of sexual harassment is *quid pro quo*, literally meaning “this for that,” in which a harasser in a power relationship (e.g., supervisor to employee or educator to student) either grants or withholds something desired, or undesired, from a victim in return for sexual favors. For example, a teacher may award a favorable grade to a student in exchange for sexual favors. Or as a reward for sexual favors, a counselor may promise to withhold sensitive information from a student’s parents.

Another type of harassment, hostile environment sexual harassment, occurs when a harasser creates an unwelcome environment by means of sexual acts, inappropriate language, pictures, or other messages. A power relationship need not exist to create a hostile environment, and usually a single incident is not pervasive enough to establish a legal claim of harassment. Examples of hostile environment harassment include the telling of sex-related jokes and stories, sending sexually related e-mails, and distributing sexually graphic photographs or cartoons.

Although sexual abuse can be categorized as sexual harassment, sexual abuse is typically viewed as a criminal act. Often defined by state statutes, sexual abuse is a nonconsensual sexual act that includes rape, child sexual abuse, and incest. When reported to law enforcement authorities, incidents of sexual abuse may lead to fines, orders of restraint, or incarceration.

In some instances, consensual sexual activity occurs between an educator and a student who is of consensual age. The age of consent varies greatly from state to state, ranging from 15 to 18. Nevertheless, most states have laws or ethics codes that prohibit inappropriate sexual conduct between an educator and student, regardless of the student’s age.

There is no stereotypical perpetrator of sexual misconduct. Research indicates that teachers are the most common offenders, with others being coaches, administrators, and other school employees. Coaches, and others who spend extensive amounts of time with students in an extracurricular setting, often develop close relationships with students. These relationships, combined with opportunity, enable the boundaries between educator and student to become blurred, leading to inappropriate sexual relationships. Offenders tend to be males who have been deemed trustworthy, popular, and model educators. The perpetrators are seldom predators—they do not enter the profession to prey on the students. In retrospect, the perpetrators usually experience deep feelings of guilt and shame.

Similar to the profile of the perpetrator, there is no stereotypical victim. Although victims of educator sexual misconduct are typically Caucasian females, females of color are overrepresented in relation to the population percentages. In many instances, the victims are vulnerable, have a psychological need for adult attention, are under great stress, and are easily intimidated. The victims often do not report the abuse because they feel responsible for the behavior, or the victims perceive that other adults will challenge the veracity of the reports. Additionally, the perpetrators may threaten or coerce the victim to remain silent.

Identification and Prevention

Identifying sexual misconduct is not an easy task, but there are some indicators that inappropriate behavior

may be occurring. One indicator is overly affectionate behavior such as hugging or touching. Related indicating behavior is telling jokes of a sexual nature or using suggestive terms in conversation. Telephone visitation and conversations of an intimate nature between the educator and student are additional indicators of inappropriate relationships.

Unnecessary visitations beyond the school day are another sign. Those educators who extend their work days to assist students are often hard-working, dedicated educators seeking to make a difference in the lives of students. Yet perpetrators frequently use this contact as a means of grooming the student for future sexual activity. Likewise, student-initiated contact may be an attempt to violate appropriate educator–student boundaries.

Finally, complaints and innuendos of an inappropriate relationship between an educator and student are indicative of sexual misconduct. These rumors should be taken seriously and properly investigated.

To combat educator sexual misconduct, schools should establish clear written policies that delineate and prohibit inappropriate relationships. Additionally, school personnel should be diligent in the scrutiny of prospective employees and train employees on how to avoid inappropriate relationships and identify signs of misconduct. Finally, school-district policy makers should identify individuals to serve as investigators of allegations and rumors. Although a sense of educator guilt is embedded in these recommendations, experts caution policy makers to avoid establishing a climate of suspicion. In such a climate, innocent educators may believe that false accusations and vendettas against demanding teachers would become commonplace, although studies indicate that such accusations are rare.

SEXUAL ORIENTATION AND IDENTITY, EDUCATIONAL POLICY ON

Historically, issues of sexual orientation and identity have been some of the most contentious areas in U.S. educational policy. Since the mid-1960s, conservatives have been concerned that public schools have either directly or indirectly promoted what they would label “a homosexual lifestyle.” By contrast, it is not until the mid-1990s that queer activists (or individuals who identify as lesbian, gay, bisexual, transgendered, transsexual, intersexual, and/or queer) became consistently and directly involved in political debates shaping policies for public schools.

Queer educators and students who work, learn, live, and play within the walls of U.S. public schools reside at the intersection of a host of contradictory and paradoxical laws and policies. This sheer complexity in law and policy means that there is quite a bit of variation in what individual queer schoolworkers and students experience within their own public school. Much of the political concern regarding queers, sexual orientation, and public educational policy involves the areas of personnel; curriculum, student identity, and behavior; and extracurricular activities.

Educational Personnel

In the areas of personnel, local school boards have been given wide latitude in regulating public school employees’ behavior and identity through the mechanism of the “morality clause,” which typically has been interpreted as the behavior that a majority of the school board members deem as moral. Under these broad and ill-defined morality clauses, school boards have forbidden a range of

seemingly innocuous activities, including dancing, smoking, drinking alcoholic beverages, and working in establishments that serve alcohol. Female teachers have been subject to far closer scrutiny and have been barred from riding in automobiles with men who are not their relatives, required to live in “teacherages,” and barred from marrying if they wished to remain employed by the district.

For queer educators, mere suspicion of a nonheterosexual identity could mean dismissal as well as licensure revocation. Beginning in the 1950s, as part of a larger U.S. witch hunt for suspected homosexuals in almost every area of public employment, school districts and some states began to aggressively ferret out the suspected queers in their midst. At the time, the justifications for these purges were threefold. Queer sexual behavior was a felony in all fifty states. Consequently, queer educators, by definition, were statutory felons, and felons could not hold licensure or work with public school children. Furthermore, homosexuality and bisexuality were considered mental illnesses by a majority of the medical establishment, and most states at that time barred school districts from employing individuals who had a history of mental illness. The third and final justification was that queer identity violated traditional Biblical norms (usually framed as “traditional values”) regarding sexual relationships. Quite simply, queers were religious heretics.

Consequently, homosexuals who either hid their identities or who were open were seen as a corrosive influence upon the tender morals of public school children. A particular irony was that single females, who had long dominated the teaching profession because of their economic utility (they did not have to be paid very much because of limited employment opportunities), were increasingly demonized as potential lesbians throughout the 1950s by public commentators.

Although the witch hunts for suspected homosexuals wound down throughout the 1960s, beginning in the 1970s, an increasingly vocal and visible lesbian and gay rights movement worked to declassify homosexuality and bisexuality as mental illnesses, as well as end the legal restrictions on consensual queer sex. Their efforts were marked by partial successes: Although queer identity was depathologized by the medical establishment, states were generally slow in repealing laws barring

consensual same-sex sexual behavior. By the late 1970s, religious conservatives, particularly conservative Protestants, began mobilizing, partially in opposition to the gay liberation movements, but also in opposition to the African American civil rights movement and the women’s liberation movement.

For queer public school workers, the 1970s saw a redoubling of state-level efforts to ban queers from working in public schools. In particular, conservative Protestant activists worked to pass statewide referenda barring queers from being employed by public school districts regardless of local policy. Although they failed in California in trying to pass what was known as the Briggs Amendment, conservative Protestant activists were successful in Oklahoma in passing a state-level ban on queer schoolworkers. However, this law was later invalidated in 1985 by the 10th Circuit Court of Appeals.

Nevertheless, public schoolworkers could still be fired for being perceived as queer no matter what their actual orientation. Public school workers had little recourse because sexual orientation was not protected under most state equal rights laws and/or equal protection clauses at that time. Generally, if queer schoolworkers sued their districts for improper dismissal, in either state or federal court, they lost the case.

This situation changed little until the 1990s, when queer rights activists and their allies redoubled their efforts to enact statewide civil rights laws that covered sexual orientation, and in some instances, gender identity. Additionally, most states either legislatively repealed or judicially invalidated bans on same-sex consensual sexual activity, which, in combination with licensing requirements, had effectively banned queer educators from working in public schools. By 2003, in *Lawrence v. Texas*, the U.S. Supreme Court threw out the remaining bans on consensual same-sex sexual activity, thus clearing the last legal impediment from openly queer educators working in public schools.

Nevertheless, many contemporary queer public school workers—perhaps the majority—elect to hide their identities while working in public schools. Although some states provide safeguards either under state law or educational regulations (including tenure protections), there are no specific protections regarding sexual orientation and gender identity at the federal

level. Additionally, some states have passed “no promo homo” laws, which ban the promotion of homosexuality in public schools. Although these laws should fail federal constitutional muster (particularly in light of the *Lawrence* decision), at present, they serve as an effective means to enforcing the closet in some states.

Curriculum

“No promo homo” laws have also influenced curriculum development because these laws ban public schools from mentioning homosexuality and bisexuality in any positive manner. Some states, like South Carolina, go even further, requiring that *only* negative mentions be presented (e.g., these forms of sexual activities spread disease and/or are illegal) even if these mentions are factually incorrect (queer consensual sexual behavior was decriminalized in *Lawrence*). Such restrictions on information cut across curriculum areas, including social studies, English (particularly literature), music, art, and sexuality education. Furthermore, with the advent of a federally funded “abstinence-only” sexuality curriculum in 1996, many public school districts have been using materials that advocate celibacy until heterosexual marriage—which neatly avoids any mention of queer sexuality and/or relationships, because at present, queers are unable to marry in forty-nine out of fifty states.

In many locales, U.S. public school curricula have been scrubbed clean of any possible queer taint. This policy stance is particularly problematic on a number of levels. First, all public school students receive distorted and impoverished understandings of history, literature, the arts, and human sexuality, which is true whenever a social group is carefully expunged from public school curricula. Additionally, queer students receive messages that they had best hide or cover their identities, because such identities are so stigmatized that they are literally unmentionable in most situations. Finally, all students learn that stigmatization and silencing of queer people is supposedly natural.

Although developments in curricula regarding queer students have been largely disappointing, many states and local districts have sought to better serve their queer students under various antibullying, anti-harassment, and at-risk policies. In the early 1990s,

data emerged that indicated that lesbian, gay, bisexual, and transgender students suffered very high rates of physical violence, verbal name-calling, and long-term harassment. Furthermore, queer students were more likely to be subject to abuse in their own homes at the hands of their parents and/or guardians than their non-queer peers. Consequently, queer students suffered much higher rates of substance abuse, depression, social isolation, academic underachievement, and, most disturbingly, suicide.

Student Identity

But what was more important than data in prompting public schools to begin to address the needs of queer public school students was successful litigation against a school district for failing to address school-based homophobic bullying. In 1995, Jamie Nabozny sued his Ashland, Wisconsin, school district in federal court under Title IX. Beginning in seventh grade, Nabozny had been routinely and continually harassed, beaten, and called “fag” and “faggot.” He was spat on, punched, urinated on, and even subjected to a mock rape where twenty students looked on. All of this harassment and bullying happened on school grounds, and almost all of this abuse was at the hands of fellow students.

When Nabozny’s parents tried to intervene with school administrators after the mock rape, they were informed that if Jamie was going to act like a “queer,” they should expect this type of harassment. Furthermore, in many instances, teachers and administrators witnessed Nabozny’s abuse and failed to intervene. In fact, one teacher called Nabozny a “fag.” By tenth grade, Nabozny was so savagely beaten and kicked in one attack that he needed extensive abdominal surgery to repair the damage. In eleventh grade, Nabonzy dropped out of school after school administrators recommended that he should attend school somewhere else.

Nabozny’s subsequent successful lawsuit in federal court was the first such case in the United States. Furthermore, he was awarded \$900,000 in damages, a striking verdict against a public school district. The court ruled that his rights under Title IX to be free of gender-based violence had been violated by the school district. The Ashland district had had antibullying policies on the books and enforced them if the

victims of harassment were girls—but not boys. The 1996 decision in the Nabozny case sent a loud message that public schools could be liable for serious financial damages if they failed to protect the queer students within their walls—at least along the lines of gender.

The Nabozny decision opened the door for public schools to attempt to meet the needs of their queer students, but only in a limited fashion. Policies crafted under a protective rationale (antibullying, etc.), assume that queer students are at risk for a host of adverse outcomes. Although that assumption is congruent with the current data, it is only a quick leap in logic to assume that all queer students are intrinsically at risk and intrinsically pathological, which plays to current homophobic notions of queer inferiority, or there is something “wrong” with a given individual if he or she is queer. Nevertheless, antibullying and antiharassment policies that address sexual orientation and gender identity are a hopeful policy step. These policies do begin to address the pervasively homophobic culture found in most U.S. public schools.

Even though queer identity has finally been decriminalized across the United States, it is still highly stigmatized in most places. At the federal level, there are no specific protections for sexual orientation and gender identity, although Title IX may offer some limited protection regarding gender for gender nonconforming males thanks to the successful Nabozny litigation.

At present, eight states ban discrimination based on sexual orientation and gender identity, and another ten list sexual orientation only as a protected category. That leaves thirty-two states without protected status for queer individuals. This means, for example, that queer public school workers can be legally fired merely for being queer—particularly if they do not have tenure protections. A few states have included sexual orientation under their public school codes (Pennsylvania, for example), but these are half measures at best and do not carry the same policy “bite” as statewide bans on discrimination regarding sexual orientation and gender identity.

Additionally, about half of all states have “no promo homo” laws that ban the positive mention of queer identity, history, and culture in public schools.

Such policies effectively stigmatize queer schoolworkers and students by imposing official silences in some instances and official slurs in others. These silences and slurs are reinforced by districts that offer “abstinence-only” sexuality curricula, because the assumption behind the policy is that everyone is non-queer . . . or had better be.

Extracurricular Activities

The most promising policy development has been the rise of gay-straight alliances (GSAs) in U.S. public schools during the 1990s. Although these are highly controversial in some locales, they do provide queer students and sympathetic allies a measure of federally sanctioned safe space. Like other school-based clubs, they are protected by the federal Equal Access Act of 1984, which, ironically, was passed to protect student-initiated Bible and Christian clubs.

GSAs have been highly controversial since their inception, largely because they are federally protected, *queer-positive* student clubs and therefore are a bit of an “end run” around state-level “no promo homo” laws. School districts that have tried to ban the clubs outright have run into a legal buzz saw, repeatedly losing in federal court. For a brief time, the Salt Lake City public school district tried to ban all student-related noncurricular activities, but that eliminated football—a politically problematic stance. Furthermore, in the case of Salt Lake City, Utah, the students who were lobbying for the GSA eventually restructured the organization into a curricular-related club, which made it impossible to ban.

Some states have responded to the GSAs by requiring students to get parental permission to join any extracurricular organization. These laws technically do not target GSAs, but it is clear that, given the high degree of parental disapproval and/or violence relating to queer children, requiring parental permission might well be an effective means to limit the popular student appeal of GSAs.

SHAKER EDUCATION

The United Society of Believers in the Second Coming of Christ, commonly known as the Shakers, came to British North America in 1774 from Manchester, England. Mother Ann Lee, the founder, and a small group of followers established their first community near Albany, New York, the following year. The basic tenets of the Shakers were spiritualism, millennialism, common property, celibacy, and pacifism.

During the last two decades of the eighteenth century and the first two of the nineteenth century, the Shakers were successful in converting several thousand people to their sect. They were aided by the broad sweep of the Second Great Awakening and the widespread attention given to millennialism. Entire families converted, bringing a large number of children into newly founded communities located first in the New England region and then spreading into Ohio, Indiana, and Kentucky. At their peak, the Shakers had eighteen major communities and perhaps as many as 10,000 believers.

The large number of Shaker children required that thought be given by the church leadership to the issues of childrearing in societies characterized by the rigid separation of the sexes. Mother Ann, herself illiterate, died in 1784 and left few details as to the care of children other than the general admonition that they were to be loved and raised in the tenets of Shaker pietism. Married couples who entered the Shaker life were separated. Babies at their mothers' breasts stayed with their mothers until they were weaned and then were placed in common nurseries under the supervision of unrelated caregivers. By age five or six, children were separated into either the girls' order or the boys' order, where they occupied separate quarters under adult supervision. The caregivers of these orders were selected with great care in order to provide behavior models. A communal society with a commitment to pacifism necessitated teaching cooperative social behaviors. Quarrels had to be settled quickly, conflicts resolved, and harmony achieved. To the Shakers, this was part of a concept known as "Gospel Order."

Work was a central tenet in the Shaker belief system. Mother Ann's most famous dictum to her following was "Put your hands to work and your hearts to God." This gospel of work led to survival of the communities in the difficult years and to prosperity in their latter years. Children were given chores and tasks to perform commensurate with their abilities. Their physical workload was reduced during the winter months when they attended school.

The Shakers adopted policies about formal schooling very similar to the German pietists, who generally regarded an eighth-grade education as sufficient. Too much formal learning could lead to intellectualism, which was injurious to spiritualism. As the American Common School crusade swept New England and the Northwest Territorial states, the Shakers had enough people in their various communities to establish local public schools in accordance with state directives. These schools were taught by Shakers who themselves had received some education before conversion, and the Shaker school districts followed the state laws in regard to teacher licensure, the curriculum, the school calendar, and the mandate for periodic visitation by

external school authorities. In the early decades, the students in these schools were almost exclusively Shaker children. As the Shaker population began to decline in the mid-nineteenth century, district boundary lines were sometimes extended to include children who lived near the community in order to preserve the schools and make them financially possible.

The Shaker school districts levied taxes and financially supported their schools. The quality of the schools was deemed to be well above average by outside authorities. The Shakers spent more money on education than their neighbors and gave the same attention to school facilities as they did all of their building projects that were publicly regarded as well planned, well built, well equipped, and well maintained.

Daily life in Shaker schools mirrored the larger society. Bible reading and the recitation of prayers was common; national holidays were observed; textbooks common to all country schools were used; recess, plays and pageants, and outings were standard; and there was no effort at converting non-Shaker children to community beliefs. Shaker children received their religious training outside of school. This pattern lasted throughout most of the nineteenth century.

Within Shaker communities, children were greatly indulged. Corporal punishment was virtually nonexistent, and work expectations were reasonable. Cookies, candies, and small gifts were commonly given, and special attention was given to providing the children with frequent excursions, community celebrations, and picnics. Upon attaining their majority, usually at age eighteen for women and twenty-one for men, the decision to sign the covenant and become a full member of the society was presented. Few chose to remain, and of that number, many were to “apostinize,” meaning they left the community at a later time.

The national efforts to “professionalize” American public education that were under way with the beginning of the twentieth century had a deleterious effect on Shaker education. Chief among such reforms were state laws requiring the college training of teachers. Dropping rates of the conversion of educated persons and Shaker convictions about the sufficiency of an eighth-grade education soon placed several of the Shaker communities in the position of either hiring lay teachers or closing their schools.

Shaker schools were also hard hit by the long-term effect of celibacy—they were not producing future generations of Shaker children to attend their schools. Efforts at taking in orphans and foster children did not solve the dilemma. By the 1930s, the few Shaker communities that were not already closed could not support schools, and efforts at taking in orphans and foster children were abandoned.

Today, only one Shaker community remains. Located in Sabbathday Lake, Maine, it was originally founded in 1794. Four Shakers—two women and two men—continue the Shaker pilgrimage. Their schoolhouse closed in the 1930s and has since been renovated into a library and archives.

SINGLE-SEX EDUCATION

Single-sex education may refer to sex-segregated schools or sex-segregated classrooms within coeducational schools, but both definitions refer to the practice of teaching males and females separately. Single-sex education may imply different pedagogy, curricula, and opportunities for boys and girls, or it may simply refer to teaching girls and boys in different schools or classrooms. The debate over coeducation versus single-sex education has engaged parents, educators, and scholars interested in teaching both boys and girls in the safest and most effective manner possible, but the question has been complicated by the social and political implications of separating boys and girls.

Separate schools for boys and girls, particularly in secondary and postsecondary schools, were common through the early to middle part of the twentieth century, and separating boys and girls in classrooms within

coeducational schools was a common practice until the 1960s and 1970s. Until then, boys and girls were often separated based on gender stereotypes and assumptions about physical differences between boys and girls; thus, vocational and physical education classrooms were the most common sites of single-sex education. Historically, single-sex education has served to deprive girls and women of educational opportunities. Because of changing social and vocational expectations and the 1972 passage of Title IX, which outlawed sex discrimination in schools, single-sex education was much less common in the following decades.

Around the turn of the twenty-first century, a new interest in single-sex education emerged. Some advocates for girls began to assert that coeducation itself did not ensure equity in the classroom for female students, claiming that even within coeducational schools and classrooms, boys still received more attention and advantages than girls. Thus, for some advocates, single-sex education became an option to help provide a safer and more equitable environment for girls. These advocates are supported by research suggesting that single-sex classrooms provide a more comfortable learning environment; boost self-esteem; and increase short- and long-term opportunities for girls, including an expanded conception of gender roles for women.

Support for single-sex education has not been limited to advocates for women's rights. Under the George W. Bush administration, federal regulations within the No Child Left Behind Act of 2001 allowed for the creation of single-sex classes in elementary and secondary public schools. Some advocates suggest that single-sex education accommodates innate biological differences between boys and girls, while also providing a less distracting learning environment. More recently, advocates for boys' rights have contended that single-sex education may provide a less feminized learning environment that better suits boys.

Critics of single-sex education, including feminist and civil rights groups, point to the fact that sex segregation has historically led to inequitable schooling, and some critics express concern that segregating sexes might enable a return to racially segregated schools. Another concern for critics is that single-sex education may, in fact, reinforce gender stereotypes rather than deconstruct them. If single-sex education is

based on assumed differences between boys and girls, single-sex pedagogy and curricula could serve to reinforce these differences. Critics also suggest that single-sex education does not provide an environment representative of the real world, denying students the opportunity to learn with other genders. Finally, some critics are concerned that single-sex educational practices are unable to safely provide education for intersexed and transgendered people.

SLAVE CODES AND LITERACY

Slave codes were laws enacted by colonial and state legislatures in the American South limiting the rights of enslaved African Americans and authorizing the use of force in an attempt to keep slaves subservient to their White masters. Typically, slave codes included provisions making it illegal to teach literacy skills to slaves. The driving force behind the literacy prohibitions was a fear on the part of slaveowners that literate slaves could use the ability to write to either initiate revolts by communicating with fellow conspirators seeking to overthrow slavery, or at the least, create forged passes that would allow slaves to flee to other regions.

The colonial legislature of South Carolina enacted the first slave code in 1740 as a reaction to the Stono slave rebellion of the previous year. Among its many provisions, the code prohibited both teaching a slave to write and using a slave as a scribe or clerk. A violation of the literacy provision of the code brought a rather

substantial fine of 100 pounds. The South Carolina statute became a model for the subsequent slave code enacted by the colony of Georgia in 1755 and then for state legislatures after the installation of new post–Revolutionary War governments.

Although they prohibited the teaching of writing, the early slave codes were silent about reading. A school for slaves opened in Charleston, South Carolina, in 1743, shortly after the prohibition against teaching slaves to write went into effect in the colony. Prominent men of South Carolina were financial backers of the school and, presumably, sent at least some of their own slaves to the missionary school where the Africans learned to read and were taught the catechism.

In the first decades of the nineteenth century, three separate slave rebellions fueled the perception among Whites that literacy among Blacks, slave or free, could foster collaboration and coordination among those plotting to harm slaveowners. In the 1820s and 1830s, southern state legislatures, under the control of the planter ruling class, codified anew literacy restrictions aimed at Blacks.

In spite of legal restrictions, some slaves still learned to read and write through either their own efforts or with the help of sympathetic Whites who saw value in literacy. Nevertheless, historians estimate that at the time of the Civil War, less than 10 percent of southern Blacks were literate, greatly affecting both southern life and culture in the nineteenth century and future social and economic possibilities for the region.

SMALL SCHOOLS MOVEMENT

The small schools movement is known by a number of different names, including *small learning communities* and *schools-within-schools*. In spite of the numerous names, the central point is to reduce the size of large, comprehensive high schools and purposefully reorganize them based on sound curriculum and the delivery of services intended to meet the social needs of students. Many large, comprehensive high schools serve as many as 1,500 to 5,000 or more students in large urban districts. These schools are designed to offer literally hundreds of different student activities, a full slate of coursework (e.g., remedial or advanced placement), and building facilities appropriate for school- and community-based functions. In spite of this intent, for a number of students, “large” became synonymous with “uncaring,” leading to a disastrous rise in dropout rates for many students, especially students of color (e.g., African American and Latino). Small schools are designed to counteract the unintended consequences of large, comprehensive high schools—leaving some students academically unprepared and socially isolated.

The American high school is one of the crowning achievements of the educational system. As the size of high schools increased, concern began to mount about student academic achievement and the development of social skills. Some students traditionally have required some alternative educational services (e.g., students with disabilities), but as high schools grew in size, it became apparent that the population of students in need of alternative services had progressively increased. High schools with student populations of 1,500 and more seem to fall victim to their own success. As schools tried to offer comprehensive services to more and more students, many students were often isolated from the mainstream and were unable to benefit from the large high school configuration.

Many have posed questions about the most effective manner in which to assist students in urban high schools in making academic and social gains. The lag in academic achievement in many large high schools (i.e., urban, suburban, and rural) in part was the impetus for school reform based on reconfiguring and, in

some cases, reconstructing large schools into smaller schools (i.e., small schools movement) with the intent of paying attention to a small number of students to ensure that academic and social needs are met.

Poverty, crime, lack of parental involvement, high student mobility, and seemingly perpetual slumps in student achievement are some of the problems identified as commonplace in large schools. High schools seem especially prone to problems, and not until the late twentieth century (with the onslaught of school reform efforts spawned by the release of *A Nation at Risk*) were concerns raised about the needs of students attending these large high schools. Many students, particularly students of color, do not make significant academic gains and, in many cases, ultimately fail. Students who fail at the high school level generally experience several unproductive outcomes: dropping out, teenage pregnancy, crime, and drug use.

There is an overwhelming notion that small schools benefit teachers and students in ways that are outside of the traditional curriculum. Some of these benefits are as follows: (a) Relationships between students and adults are strong and ongoing; (b) relationships with parents are strong and ongoing; (c) the school's organization is flat, with broadly distributed leadership; (d) most small schools do not attempt to be comprehensive; (e) professional development is ongoing, embedded, and site-specific; (f) the school develops its own culture; and (g) smaller schools engage the community in educating young people.

The small schools movement is a reform effort aimed at redesigning the fundamental structure of large schools as well as implementing highly unique curricular compositions. Students and teachers cultivate distinct and more involved relationships because of the small number of total individuals present in the school. One of the most unique features of the schools is the organizational structure. Although a number of schools may occupy the same building, each school is a separate entity, with independent staff structures and decision-making abilities. The small school movement is still in its infancy. The idea that public education centers should respond to the academic and social needs of students in a nurturing environment is one of

the more ambitious aspects of the larger school reform movement in American schools.

SMITH-HUGHES ACT

The result of a recommendation by the Commission on National Aid to Vocational Education, the Smith-Hughes Act, enacted in 1917 and named after its sponsors, Rep. D. Hughes (D-Georgia) and Sen. H. Smith (D-Georgia), was the first federal legislation to provide nationwide funding for vocational training. Congress had realized that the United States was falling behind other industrialized countries in training skilled technical workers and that a concerted national strategy was needed to make sure American industry remained internationally competitive. This conclusion went hand in hand with the thinking that if vocational education was indeed of national importance, the federal government should help state governments promote vocational teacher education and also pay for such programs.

Under the Smith-Hughes Act, the federal government provided grants to individual states for the salaries of

teachers of trade and industrial subjects and home economics; the training and salaries of teachers, supervisors, and directors of agriculture subjects; and teacher training in home economics, trades, industrial education, and agriculture. States were required to match such funds to pay for all other expenses. A Federal Board of Vocational Education was to conduct the research needed to implement the ideas of the Smith-Hughes Act, advise states on curriculum content and school administration, and supervise the proper use of funds.

The federal scope of the act also tried to address some of the issues that had been plaguing vocational education for decades. To resolve issues of curricular and instructional control, schools were put in charge of vocational education under the stipulation that some training be conducted in the workplace. Arguments over the appropriate philosophical orientation for vocational education between Charles Prosser and John Dewey were addressed by decreeing that students be given an education that made them good citizens and prepared them for gainful employment. On the question of a unified educational system, the act placed control of vocational education within the public education system but made vocational education separate from common education. Each state had to create a State Board of Vocational Education, whose members were often not the same as the members of other boards.

The separation of vocational and common education had major repercussions throughout the twentieth century. It led to separate administrative structures, curricula, teacher training and certification programs, teacher and student organizations, and teacher pay scales. The different board members and funding mechanisms as well as the requirement that vocational teachers have extensive industry and work experience, but not necessarily a college degree, served to isolate vocational education further and contributed to the view that it was inferior to an academic course of study. On the positive side, many current alternative certification programs can be traced back to the alternative certification channels created by Smith-Hughes.

Although planned as an indefinite grant program, the Smith-Hughes Act was repealed in 1997.

SOCIAL ACTION, DEMOCRATIC CLASSROOMS FOR

The concept of developing democratic classrooms for social action has been largely influenced by the scholarship of John Dewey. Dewey defined democracy as a way of defining a culture, a way of living together, and a way of communicating. In a democratic society, he thought, education must embrace the personal interest of those involved while at the same time encourage social change. Highlighting qualities of participation, freedom, interest, and social relationships, democratic principles must be a consistent theme within the public schools so that a democratic way of living may become a future reality, Dewey believed. Public schools, then, ought to be places that teach thinking processes rather than focus on memorization and acquisition of compartmentalized skills or facts. They should become miniature communities, helping students to be active members of society, people who understand the importance of both active citizenship and democratic participation.

Because schooling always occurs within a social context, the classroom becomes a place that instills in children ways of becoming part of the social order. Because of this reality, it is important to understand what is being taught both implicitly and explicitly in schools. It is essential to encourage students within schools and classrooms to understand and practice democratic interaction. Democratic schools and classrooms do not happen on a whim, but rather require deliberate and calculated efforts on the part of both administrators and teachers to create opportunities for the democratic ways of acting and engaging for students. To create democratic learning environments that foster social action, it is necessary to promote the

structures and the processes that allow for this ideal to emerge from within the school itself. In these spaces, it is imperative that children become part of the curriculum designing, decision making, and planning in every facet of the classroom learning and school-related governance.

By encouraging engagement in a democratic experience, public schooling can avoid becoming a dehumanizing institution that depends on authoritarian structures. Schools that transcend the typical norms and promote the democratic classroom understand that student involvement at all levels of decision making is paramount. Decisions cannot be made solely at an administrative level or even by a teacher working alone in a classroom without the direct participation and inclusion of the students. Every member of the school community should have the opportunity to participate actively in the governing processes inherent to the teaching and learning structure. Furthermore, the searching for the common good must be seen in classrooms where teachers and students alike work together to plan, design, and seek out a curriculum that is relevant, meaningful, and worthwhile.

Public schools ought to be places that allow students the liberation for discovery. Students and teachers need to experience planning together and have opportunities for discussion innate to democratic spaces. Through this shared experience, schools can avoid making decisions that are only democratic in name but not truly in the democratic spirit and instead strive for an enabling climate for all stakeholders to make determinations about what will affect them. When all members of the school community cooperate and collaborate emphasizing structural equity, classrooms may go beyond being humanistic and child-centered, and foster a sort of apprenticeship in a democracy where schools are the incubators for ongoing and future participatory endeavors.

In order to create a climate that honors everybody's dedication, investment, and participation, classrooms need to offer varying perspectives and access to a plurality of information sources, as well as encourage multiple points of view. With these attributes in place, these learning environments can begin to live up to a democratic ideal. In so doing, members of these classroom communities learn the notion that the dominant group's

knowledge is unidimensional and that a multiplicity of perspectives can and should be both nurtured and embraced. Those desiring to foster democratic schools and classrooms construct environments that realize that their democracy is constructed in their social context and allows both teachers and students to become more alive through investigation, deliberation, and inquiry.

Instead of forcing arbitrary, prescriptive standards into the classroom through preconceived or contrived curricula, the democratic classroom invites teachers as well as the children to ask questions and pose problems so that they may construct meaning from their own lived experiences. Activities in democratic classrooms go beyond functional or cultural literacy practices and engage students to make sense of, interpret, and become readers in their worlds. These classrooms seek to understand power dynamics inherent to society while challenging the status quo. Accordingly, the experiences in these learning environments are ripe with issues, contentions, and problems that are all a part of our real social surround. The lives of the people involved invite and invigorate endless possibilities, defying neutral or benign fact transmission. Those within the classroom and outside the dominant culture are invited to develop their voice and no longer be silenced while digging deeply to discover their milieu in a new light.

The democratic classroom allows a chance for everybody to be heard and goes beyond what outsiders deem important. The questions and curiosities of involved participants guide the classroom inquiry and subsequent learning. These investigations become essential parts of what is studied in the classroom. As students discard commonplace assumptions that they are merely consumers and recipients of other people's knowledge, they gain power to pursue information revolving around what they believe to be relevant and essential. When teachers and school administrators bring democratic ideals into a classroom, the students authenticate the community concept because everyone is allowed to experience an education that is enabling.

When provided the chance, students search for meaning within their own lives. They want to work to make changes to transform themselves, their learning environments, and their communities because they are the best interpreters of their social worlds. Democratic schools can become an apparatus for students seeking to better

their lives and the lives of others through forms of social action as part of the classroom curriculum. A democratic curriculum promotes more socially responsive citizens because the freedom that exists within the classroom can be replicated and transferred to the social environment in which they live. Students empowered in these sorts of classrooms understand that they are able to be agents of change even as young citizens.

Teachers who stimulate their students to become involved in issues of social action are supporting them to learn the skills and values of participatory democracy. These teachers avoid being shackled into mediocrity by being forced to standardize their teaching and forego the practical philosophizing and imaging that give teaching its strength and fulfillment. With facilitating teachers, students engaged in meaningful and worthwhile curricula learn to reach group decisions that include minority and dissenting opinions; make action plans that take into account legal issues, social norms, and public relations; prepare materials to articulate issues to each other, peers, and the general public; petition, lobby, and work to influence appropriate governmental agencies and legislative bodies; speak and engage with television, radio, print, and Internet media; make public testimony; and negotiate conflict that emerges at each of the preceding levels. To this end, developing democratic schools and classrooms provides a means for induction into the processes of social action, civic participation, and democratic living.

SOCIAL CAPITAL

Social capital is the investment in social relationships with the expectation of returns. It is similar to other forms of capital, such as physical and human capital, apart from social capital's location in social relationships as opposed to material goods or individuals. Sociologists Pierre Bourdieu and James Coleman originally conceptualized social capital in the 1980s. Bourdieu defined social capital as the cumulation of actual and potential resources located within a network of relationships between actors with shared attributes. Coleman developed a similar conceptualization and stated that social capital exists within a social structure of relationships and is available to actors with the intention of achieving specific aims. Bourdieu's and Coleman's pioneering effort led contemporary contributors, such as political scientist Robert Putnam and sociologist Alejandro Portes, to further advance and expand social capital's conceptualization and application. This entry describes the workings of social capital in more detail and discusses its links to education.

How It Works

A single actor, or a group of actors, creates and accumulates social capital by developing and maintaining social relationships with actors from a social structure that possesses common ascriptive and nonascriptive attributes. These actors intentionally develop and maintain social relationships in order to exchange resources with other actors. The development and maintenance of social relationships through the exchange of resources is the investment property of social capital. The returns property of social capital is not the result of merely the indiscriminate accumulation or liquidation of resources. Actors invest in social relationships in order to achieve specific individual or group objectives and interests. The achievement of objectives and interests is the returns property of social capital.

Resources, according to Bourdieu, are material or symbolic in nature, such as textbooks, instructional materials and strategies, and social status and acceptance. Furthermore, resources may also be collective behavior expressed by all actors within the social structure. Putnam, for instance, considers civic engagement, political participation, solidarity, and cooperation as resources that, although not necessarily exchanged between actors, are exchanged collectively.

The exchange of resources is the mechanism that develops and maintains the social relationship between actors within the social structure. Norms, trust, expectations, commitments, and sanctions are embedded in the social relationship and act as the parameters of the exchange of resources. The act of exchange within the social relationship can occur asymmetrically, reciprocally, indirectly, or collectively with no defined timetable to repay the incurred debts unless specifically defined by the relationship or the social structure. An asymmetrical exchange is when an actor provides resources to another actor without immediate repayment. An asymmetrical exchange becomes a reciprocal exchange as soon as the actor fulfills the commitment by repaying the incurred debt. This, of course, reinforces the social relationship, maintains norms and trust, and creates expectations and commitments for the future exchange of resources without inviting unwanted sanctions.

An indirect exchange is an asymmetrical or reciprocal exchange that includes an intermediary to facilitate exchange between two or more actors. It has the same characteristics as both asymmetrical and reciprocal exchanges, but an indirect exchange adds complexities to the social relationship because of the possibility that the actor receiving the resource becomes indebted to the intermediary as well as indirectly indebted to the actor supplying the resources. The justification for an indirect exchange stems from the disconnection between the receiver and the supplier that is due to either uncommon or conflicting attributes, location within the social structure, or the absence of a social relationship.

Collective exchange, which is rather dissimilar from the other modes, is not actual exchange in the sense that a resource is passing from one actor to another. It is the unified, symmetrical, and collective exchange of behavior

and action to profit society in general. Both single actors and groups participate in this mode of exchange; however, collective exchange generally occurs at the societal level, where a greater diversity of actors with different ascriptive and nonascriptive attributes can participate without exclusion.

Social capital can exist at different levels of social relationships. A social relationship between two actors is a dyadic tie. The collection of an actor's complete set of dyadic ties is a direct network, and an egocentric network is the combination of several actors' direct networks. The social structure or sociocentric network is the aggregation of all social relationships found in all the dyadic ties and direct and egocentric networks. Although actors can accumulate social capital at the level of the dyadic tie, it is in the best interest of actors to expand their network beyond a single dyadic tie by developing, maintaining, and including more social relationships. According to Bourdieu, the quantity and quality of social capital accumulated by an actor or group depends on the size of the network of social relationships and the quality of actual and potential resources possessed by each actor or group within the network.

Links to Education

The conceptualization by Bourdieu and Coleman also acted as social capital's initial contribution to the field of education. Their conceptualization, although created under distinct theoretical perspectives, occurred in the context of education achievement and attainment inequalities in both France and the United States. Bourdieu, coming from a social reproduction perspective, suggested that social capital is the means for the socially and economically elite to maintain and replicate their achievement and attainment hegemony over the marginalized masses. On the other hand, Coleman perceived social capital as having the opposite effect based on a functionalist viewpoint. According to Coleman, parents of school-age children have the ability to facilitate the education achievement and attainment of their children (i.e., future social and economic mobility) by way of accumulating and using social capital despite low levels of personal financial and human capital.

Social capital's contemporary contribution and application to education are visible within a variety of educational settings and between an assortment of actors within the educational process. In a recent review of the literature, Sandra Dika and Kusum Singh cited several studies that emphasized different dimensions of social capital in the context of education. For instance, studies explored the accumulation and use of social capital by several types of actors, such as students, parents, teachers, and school administrators, to facilitate the realization of science and mathematics achievement, social mobility, college enrollment, positive student behavior, the reduction of student dropout, and instructional change and accessibility to instructional resources. The review by Dika and Singh, and the recent growth and frequency of additional studies examining social capital and education, illustrate the emergent interest in and significance of social capital's contribution and application to education as well as its explanation of social and cultural phenomena within the educational process.

SOCIAL CONSTRUCTION OF DISABILITY

The concept of the social construction of disability has become popularized as a result of two major factors. On one hand, individuals with medical and physical disabilities have been working for their civil rights to fully participate and have access to society commensurate with their able-bodied, able-minded peers. On the other hand, the disproportionate representation of minorities in special education has created the question of how disability is socially constructed, and the system may, in fact, misinterpret cultural behavior or tendencies as disability rather than difference.

The social construction of disability offers a new lens for understanding ability and disability as a social construction that frames how society understands and interacts with individuals who behave in ways that are different from the norm. It is a tool to assist in recognizing how ability is framed so that people can recognize and work toward more equitable, inclusive practices and perceptions of individuals who are different. This entry discusses the perspective of disability as socially constructed.

Medical Aspects

Disability can be explained as an objective, medically based phenomenon or as a subjective, socially constructed phenomenon. Both perspectives have an aspect of subjectivity because disability refers to one's "inability" in relation to those who are abled. Social construction of disability allows one to shift away from viewing ability as normal toward questioning what social and environmental factors make some abled while others are disabled. By definition, individuals with disabilities have a different way of physically, cognitively, emotionally, and socially experiencing and making meaning of the world. Their perceptions and priorities may be different from what is deemed "normal." Does this mean the individual is disabled or differently abled?

The disability rights movement has highlighted the need to examine disability through a new lens in order

to change perceptions of individuals with disabilities. Historically, disability has been viewed from a medical perspective, suggesting that disability is an absolute condition that creates boundaries for what people are able to do and achieve. Thus, individuals with disabilities have been viewed from a deficit perspective of their inabilities and experience lowered expectations in relation to their able-bodied, able-minded peers. According to the disability rights movement, the medicalization of disability creates an illusion that an individual's abilities or disabilities set parameters on what they can and cannot do.

For example, the deaf community asserts that a person's inability to hear and use oral language is a cultural phenomenon because it shapes how such individuals understand and interact, in contrast with the conventional oral or auditory emphasis in the hearing world. Deaf individuals are more reliant on visuals and use manual language to communicate and interact with their world; their language is more conceptual, with hand shapes serving as the foundation for grammar and morphology. When compared to the societal norms of the hearing world, individuals who are deaf continue to be viewed as "dis-abled" in relation to those who are hearing. However, when hearing persons enter the deaf world, they experience an "in-ability" or "dis-ability" in relation to their "hearing-ness" or reliance on auditory stimulation and oral communication rather than use of manual language.

Historically, able-bodied or able-minded individuals have devalued the thinking or being of individuals with "dis-abilities" by forcing such individuals to perceive the world through the dominant society's view and uphold the same norms of existence. Who created this reality of separating people because of their ability? In a capitalistic society, a stratified system of participation exists in which individuals are categorized and privileged according to their status and ability. In some societies, however, all members have purpose and no one is viewed as better than another. Rather, each member is valued for what he or she is able to contribute.

In many indigenous cultures, an individual's "dis-ability" is considered sacred and provides that individual with unique abilities that benefit the community. For example, in one community, an individual who would be

considered mentally retarded in the United States was appreciated for his gift in preserving and teaching others the native language of his people. In another indigenous community, a child who was nonverbal with severe motor and cognitive delays and had albinism wore a special costume and marched at the beginning of the procession during ceremonies.

Culture and Disability

In the past twenty years, disproportionate representation has become an increasing concern as students of color continue to be overrepresented in special education, whereas White students are underrepresented. Disproportionate representation refers to an unequal percentage of students being represented in special education in comparison with their representation in general education. As a result of these trends, some educators contend that the current method of identifying students with disabilities and the structure of the education system place students of color at a disadvantage. Many researchers challenge the dominant model of education, arguing that it does not emphasize and often disregards the importance of cultural and linguistic factors that influence how people learn and make meaning of the world. Traditional views about how to educate students reflect the dominant society's history, culture, and language and create a privileging pattern that may lead to the misidentification of students of color as "disabled."

A sociocultural approach to disability critically examines the factors that construct a student's disability in an effort to understand why the student is experiencing failure and how educators can provide choices for academic success. The social environment in which a student exists directly affects how that student learns to learn, process information, and form opinions about his or her life world. From a sociocultural perspective, to understand the individual, it is necessary to understand the social relations of the individual. How people behave and interact is in part a reflection of their socialization. So when children come to school with a different set of experiences and norms of behavior, this is partly a reflection of their socialization and not their in-ability or dis-ability for learning.

Culture and learning go hand in hand because education is a tool for transmitting culture, and culture is the lens through which people view the world and create knowledge; it shapes how they learn. Culture not only influences how students think and learn but how teachers teach and how the educational system is set up to teach and assess what is learned. As a result, if an individual does not learn in ways commensurate with what is deemed the norm, there is potential for being perceived or constructed as disabled.

SOCIAL FOUNDATIONS OF EDUCATION: FEMINIST PERSPECTIVES

Feminist scholars have contributed significantly during the past forty years to the interdisciplinary development of the social foundations of education through their teaching, writing, performances, and activism. Many philosophers, historians, sociologists, and anthropologists in the social foundations field have worked diligently to counteract the omission of women's thoughts and work from teacher education programs.

The lack of emphasis on women's issues and perspectives can be explained in part as reflecting the dominant male hegemony in the culture. Also, although the teaching of children and youth has been overwhelmingly a female profession, professorships in the social foundations of education were held primarily by men until recent years. Most coursework perpetuated study of the history, philosophy, and sociology of education from male perspectives.

Feminist writers and teachers seek to disrupt White, male, Protestant, Western European, heterosexual, middle- to upper-middle-class domination of ideas and practices within education. They wish to heal dichotomies, such as the mind/body split and valuing the intellect and reason over knowledge gained from emotion, intuition, and imagination. Connecting issues of power and control to educational success or failure, feminist thinkers investigate systemic problems long institutionalized in schools. They urge that varied sources and kinds of knowledge be respected as legitimate within the teaching/learning process. In addition to recognizing the needs of girls and women in academic environments, the cultural wealth of diverse students from families and community connections contributes to the construction of new knowledge.

Feminist scholarship has recovered some of the writing and activism of teachers from past eras. Using insights from historiography, which critiques how and why certain histories are written, Kathleen Weiler documented the experiences of teachers in California during the early decades of the twentieth century. Similarly, Kate Rousmaniere preserved the effects of school reform efforts on teachers in New York City during the 1920s. In *Reclaiming a Conversation: The Ideal of the Educated Woman*, Jane Roland Martin examined the work of Mary Wollstonecraft, Catharine Beecher, and Charlotte Perkins Gilman, three women whose work was instrumental in developing early philosophies of education.

Continuing the work of historical restoration, several scholars focused on women's influences on the early development of pragmatism, as espoused by John Dewey and others. Pragmatism centered on integrating the needs and experiences of the students into the learning environment. Women whose work affected this movement include Jane Addams, Lucy Sprague Mitchell, Elsie Ripley Clapp, and Alice Chipman Dewey.

Feminist theories also add emphasis on moral issues related to teaching and on the ways that women's thinking differs from that of men. Writing by Carol Gilligan and by Mary Belenky and colleagues represent groundbreaking work in these areas. New curricula for girls in grades K–12 in mathematics and

the sciences resulted from awareness of their different learning needs. Feminist researchers and writers also place importance on listening to the stories and learning from the experiences of diverse individuals. Many voices and stories from marginalized and oppressed people are now included in evaluating how public schools affect the teachers and the students.

As a feminist professor of the philosophy of education, Maxine Greene taught teachers to include the creative processes and products from aesthetic pursuits in their search for meaning. Embracing pluralism, she used many examples from literature and the arts to foster awareness of the role of the imagination in learning.

Also, feminist perspectives insist on opening even the processes and procedures within scientific research to critique. In challenging the objectivity and universality of traditional scientific research, Dorothy E. Smith, a Canadian sociologist, used women's experiences as starting places for scholarly studies. She developed a new methodology called "institutional ethnography," which focused on the social and political contexts of women's subordinated roles. In *Whose Science? Whose Knowledge? Thinking From Women's Lives*, Sandra Harding, a philosopher of science, also questioned research that omitted women as the subjects and objects of inquiry. Through her many books and articles, Patti Lather recognized the influence of researchers within qualitative research and urged that theorizing and meaningful research be combined to lead directly to needed school reform.

Feminist approaches to inquiry have altered and expanded methodologies, particularly in qualitative research. "Standpoint epistemology" recognizes the effects of the political and social positions of individuals or groups within communities or organizations. Race/ethnicity, class, gender and sexual orientation, geographic location, life experiences, and other factors shape people's beliefs and actions. Having access to enhanced opportunities, such as excellent educational experiences, is often dictated by the power and privilege that diverse groups of people have within a society. Studies of teachers and students encapsulated the subjects' opinions and feelings concerning the research questions and the research results.

Nancy Hartsock wrote that the domestic labor of women gave them certain insights into lived experiences

that were not shared by most men. These standpoints should be used to protest and change the oppression of women in societies dominated by male values. Jane Roland Martin and Sara Ruddick examined the practices of mothering and their implications for education. Knowledge from the domestic sphere of life should be recognized for its contributions to the growth and development of individuals within a society. Adding that the personal was also political, Mary Leach proposed that the self does not represent one stable identity, but it shifts and exposes different aspects of personality in varied circumstances. Thus, educating people for successful participation in diverse activities should consider their multiple and often conflicting natures.

Fracturing the stability of "woman" as a single category for research and/or activism, female scholars of color emphasized the importance of race/ethnicity as well as gender. Situated as outsiders to White norms and values, Patricia Hill Collins and Gloria Ladson-Billings captured the perspectives of Black women teachers. Women of color who are immigrants added non-Western, third-world viewpoints to conversations about oppression and resistance. The writing of Gayatri Spivak, a postcolonial Indian theorist, and Maria Lugones, a Chicana philosopher and activist, serve as examples of subaltern women existing in multiple, conflicting worlds. Vietnamese professor, filmmaker, and composer Trinh Minh-ha views her creative work as opposing dominant power relationships through transforming self, others, and society.

As extensions of Nel Noddings's "ethics of care" and Patricia Hill Collins's work on Black women's thought, "womanism" or Black feminism represents another standpoint epistemology. It asserts that the experiences and perspectives of African American women are normative and not deviant from mainstream White standards. "Womanist caring," as espoused by Tamara Beauboeuf-Labontant, examines the teaching of African American women who nurture all children through natural instincts associated with mothering. With no guarantees of success, but often with a sense of spiritual mission, this teaching is constructed as political activism to fight the combined effects of racism, classism, and sexism.

Lesbians adopt a stance contrary to the dominant view of heterosexual women within the context of

marriage and family settings. In *Borderlands/La Frontera*, Gloria Anzaldua proposed that people cross all sorts of boundaries related to gender, sexual orientation, nationality, and so on that have been artificially constructed within societies. In *Gender Trouble*, Judith Butler wrote that gender and sexual desire are represented as a continuum of possibilities that disrupt the male-female dichotomy. Educating students requires acknowledgment of the complexities of their physical beings.

Ecofeminisme, a term from Françoise d'Eaubonne, arose as a merger of the feminist and environmental movements. Karen J. Warren and Ynestra King apply feminist perspectives to the socioeconomic and political destruction of our natural world. They believe that sexism and ecological disasters stem from similar roots—male domination of both women and nature. Reacting to colonialism and other types of exploitation, people should protect and restore the environment to promote wellness for both human and nonhuman entities. Rebecca Martusewicz and Jeff Edmundson use ecofeminism in their social foundations coursework to connect democratic ideals within a pluralistic society to sustainability issues.

Scholarship and activism by many feminist intellectuals and authors from diverse fields of study have contributed to the pluralistic nature of the social foundations of education. They have enhanced philosophical discussions about the purposes of schooling and education in a democratic society through a much more inclusive approach. In locating and analyzing the work of earlier female scholars and teachers, historians have changed our understanding of educational history within the United States and internationally. The achievements and problems of the past can be used to determine directions for the future.

Women's individual and collective thinking, experiences, and labor are sometimes recognized and valued as subjects for research and reform, as well as those of men. Educational sociologists, anthropologists, policy makers, and others focus attention on the relative educational success or failure of girls and students from minority backgrounds. Women of color, immigrants, and lesbian women have added perspectives on student learning through examining intersections of relevant factors, in addition to gender. Race/ethnicity, class, sexual orientation, non-Western

cultural traditions, and other characteristics combine to affect teacher/student relationships and academic and social growth. Situating knowledge and learning within social, political, and cultural contexts allows teachers to assess their students' abilities and needs with greater sensitivity and effectiveness. The social foundations of education can now offer pre-service and in-service teachers many diverse ways of understanding their professional lives within local, regional, national, and global settings.

SOCIAL FRONTIER, THE

The Social Frontier is a magazine that was started in October 1934 by a group of faculty and graduate students at Teachers College, Columbia University. The magazine, which continued to be published in various forms until 1943, was the most interesting and

important educational journal in the United States to emerge from the Great Depression. Largely under the intellectual leadership of George S. Counts and William Heard Kilpatrick, the journal represented a unique example of educational criticism and social and political reconstruction.

The Social Frontier, in many respects, was an extension of the call to arms that Counts had made in a series of speeches before the National Education Association in 1932. These speeches were published in the same year under the title *Dare the Schools Build a New Social Order?* In this and other works, Counts called for the schools and teachers to be actively involved in the social reconstruction of what he saw as the failed American economy and political system.

Counts and his followers believed that education, the schools, and the teachers who worked in them could play a critical role in the process of social reconstruction that had to be undertaken in order to emerge from the Depression. In the case of teachers, the writers for *The Social Frontier* considered them to be a potentially powerful social and political force who had an obligation to become engaged activists. This approach, which recognized that teachers had not only the potential but also the responsibility to act as agents of social change, represented a radical redefinition of the traditional role of the teacher in American society.

The members of *The Social Frontier*'s editorial board were not so concerned about the actual politics of the teachers involved (conservative or liberal), but with the fact that they should be politically and socially engaged. Nevertheless, *The Social Frontier* and its editors were seen as a threat by much of the political and economic leadership in the United States. The magazine was viciously attacked by the newspaper and publishing magnate William Randolph Hearst (1863–1951), who distrusted radicals and was vehemently opposed to the socialist orientation reflected in many of the articles found in *The Social Frontier*.

The attacks on *The Social Frontier* were actually part of a larger political fight that was playing itself out within the Roosevelt administration. As C. A. Bowers has explained, the Social Reconstructionists' views closely paralleled those of the early efforts of the New Deal "to create an organic economy and a co-ordinated society." By 1935, however, the tactics of

the New Deal shifted toward restoring an economically competitive society.

Unlike Roosevelt, Counts, Rugg, and Kilpatrick did not back off from their original vision. Instead, they expanded the idea that there was a social and class struggle at work in American society—one that was profoundly linked to the work of teachers. In February 1936, the John Dewey Society was formed. Much of the energy of *The Social Frontier*'s editorial board was dedicated to the new organization. The journal, which had increasingly emphasized the class struggle in education, began to lose a significant portion of its readership. Running short of funds and energy, the editors of *The Social Frontier* turned to the Progressive Education Association to try to merge their journal with the official organ of the association, *Progressive Education*. The Progressive Education Association unsuccessfully took over the journal. By the end of 1943, it had ceased publication.

SOCIALIST EDUCATION AND U.S. CHILDREN

Throughout U.S. history, radical organizations and grassroots groups have created cultural and educational institutions of various kinds with the goal of promoting progressive social change. Newspapers, journals, colleges, schools, camps, speaking bureaus, literary societies, debating clubs, theater groups, and so on have been established for this purpose. Although most of the attention has been given to adults, some radical activists have also strived to create alternative activities for children, for example, ones that would expose them to "the socialist perspective" and the reasons for "good rebellion" against entrenched capitalist interests.

Such radical activities continue in different forms today, but the heyday for those who explicitly identified themselves as socialists was 1890–1920, although their efforts continued on a smaller scale for several decades afterward. Schools, after-school programs, camps, and the like were organized by those who aligned themselves more closely with anarchists; communists; immigrant societies (German, Finnish, etc.); and Workmen's Circle and other labor-affiliated groups.

Perhaps the most explicit form of socialist education for children was the extensive Socialist Sunday School movement that was established primarily by grassroots supporters of the Socialist Party of America from 1900 to 1920. At least 100 of these typically English-speaking schools were organized in 64 cities and towns in 20 states, with the most prominent ones located in New York City (which had 14 schools in 1912); Rochester; Hartford; Newark; Buffalo; Philadelphia; Washington, D.C.; Pittsburgh; Cleveland; Chicago; Milwaukee; and Los Angeles. Schools ranged from a handful of students in one class, as in the case of the Newport, Kentucky, school, to 1,000 students in dozens of classes at the school that met at the Brownsville Labor Lyceum in Brooklyn. The average enrollment was probably less than 100 students. Most schools existed for several years, although there were schools opening and closing in the same year and others that lasted for more than six years.

Socialist education for children was represented in the lesson outlines, stories, poems, and so on published in newspapers such as the *New York Call*, *Milwaukee Leader*, and the more specialized *Young Socialists' Magazine*, or distributed by the Socialist Party and allied groups; books like John Spargo's *Socialist Readings for Children* and Nicholas Klein's *The Socialist Primer*; and songs and plays written especially for children, including "Kid Comrade," "A Rebel I Will Be," "When the Cry Was Stilled," "Mister Greed," and radical versions of old standards such as "Jack and the Beanstalk" and "Cinderella."

The teaching focused primarily on the nature of working-class life and class conflict; the character of the capitalist system and how it may cause serious social problems (such as poverty, crime, and unhealthy living and working conditions); and basic socialist

tenets and the value of cooperative industrial and personal relations. The schools were intended to counteract what founders saw as the overly individualistic, competitive, nationalistic, militaristic, and antilabor themes that seemed to be prevalent in public schools and other aspects of capitalist culture (e.g., the press, mass entertainment, and the church). They were never expected to provide a complete socialist education for youth, only a more formal, systematic one (albeit only a few hours a week) than could be gotten at home, at rallies, and in youth clubs.

The movement basically died out by 1920, when the Socialist Party faced severe government repression and split apart, although a few schools continued during the 1920s and a dozen schools were reorganized in New York City in the 1930s when the Party experienced a brief resurgence. Gone, however, were any prospects for a national movement and the optimistic spirit that had marked the earlier phase of these radical educational experiments.

SOCIAL JUSTICE, EDUCATION FOR

Social justice is an overarching term used to examine the inequitable social arrangements found between individuals or groups of individuals, including (although not necessarily exclusive of) social class, race, gender, ethnicity, disability, and sexuality. The concept of justice can be traced back to the ancient Greeks, who considered the underpinning principles that would lead to a greater

just society—that is, an ideal for a civilization based on the stability of its citizenry, and furthermore, the well-being and flourishing of its citizens. Two main considerations are often considered when trying to address social justice: the recognition that inequitable social arrangements exist that privilege certain individuals to the disadvantage or detriment of other individuals, and the redistribution of resources and conditions to rebalance the disadvantages accrued by some individuals to others.

Issues of social justice are of paramount importance in education. For instance, there is a strong correlation between a student's achievement in education and his or her future opportunities and socioeconomic class. The positional advantages accrued to students who achieve high levels of excellence will usually lead to a virtuous cycle of employability, mobility, social status, and well-being. The corollary of this is that factors such as race, gender, ethnicity, and social class are strong indicators of whether a child will do well in school or not. These factors have led many educational researchers to attempt to reduce the inequitable conditions for children.

Although there is much agreement that gross inequities exist among children in education, there is little consensus as to the best approach educators should take to reduce these inequities. Given this complexity, it is not clear from individuals' perspectives on social justice what the just outcome would be. Various considerations of social justice may pull in different and drastic directions. Similarly, numerous distinctions are commonly made in examining a specific aspect of social justice. For instance, both culture and color are often considered to be sources of racism.

Sociologists attempt to describe the educational circumstances of a particular phenomenon through empirical work and, in attempts to describe the situation, uncover the educational inequities that they may find. Within sociology, issues of social justice may be addressed more specifically within particular methodological and theoretical traditions. For example, the concept of social capital is one way to describe inequitable social arrangements found in educational settings. Feminists, broadly speaking, consider issues of gender and the role of self and agency, and (neo-) Marxists may consider the effects of social class.

Postmodernists, on the other hand, question the way in which knowledge and understanding have been presented both historically and contemporarily, and the concomitant repercussions that these forms of understanding privilege certain individuals and their viewpoints. Social justice, for them, is underpinned by the dominant discourses predominant in society that oppress and marginalize certain people.

Education policy analysts examine current policies in place and evaluate their effectiveness, and, in providing such information, suggest policies that may better redistribute resources to redress issues of inequity through administrative and legislative acts. Two main priorities are often considered in attempts to redistribute the inequitable social arrangements in education. First, education policy analysts may examine the political dynamics of what is feasible and the potential trade-offs that may be required to move policies into acts. Second, they will consider both the aims of a policy and how effective the implementation of a policy is in rectifying an inequitable arrangement. Again, the ways in which policy analysts consider how to rectify inequitable social arrangements differ drastically.

Philosophers of education generally attempt to do two things within the concept of social justice. The first consideration is to clarify and define what is meant by social justice. The ambiguity of the term and its wide and varied usage are problematic in defining social justice and, consequently, how best one should address issues of social justice. Second, and more important, philosophers often attempt to consider underpinning principles (or normative considerations) to guide individuals toward a closer ideal of social justice. How one redistributes resources that reduce inequitable arrangements is largely determined by the principles that philosophers put forth.

Practitioners grapple with teaching social justice to children. Pedagogic strategies that encourage listening, offer opportunities to provide narratives and share stories, learn to respect alternative perspectives, and reason among children are commonly cited precursors to developing social justice in children. Curriculum development is another way to introduce more diverse and rich histories into the lives of children, providing an acknowledgment and celebration of diversity. Finally, citizenship (or civics) education and moral education

often are considered appropriate subject areas that will help to develop social activism in students.

The diversity and range of how educationalists address social justice are as divergent as the innumerable ways that education is examined more generally. Any inequitable arrangement found within educational settings is often cited as a matter of social justice (and perhaps with some justification). However, the broad use of the term *social justice* provides much ambiguity and lack of clarity to how social justice is conceptually conceived and used in education. A further problem is that there appears to be little collaboration between the education disciplines and, at times, an almost uncomfortable tension between the disciplines in addressing social justice in education.

It is nearly impossible to adequately account for all of the ways in which educationalists address social justice. However, four individuals/movements are worth mentioning that have arguably changed the ways in which educationalists conceive social justice. The brevity of each of these accounts does not do justice to their work, and in selecting these four accounts, other possible worthy social justice movements may have been unduly excluded in the process.

Paolo Freire's *Pedagogy of the Oppressed*—revolutionary when it was first published in Portuguese in 1968—fundamentally challenged class distinctions in education. Freire's experiences of seeing the underprivileged class of people in Brazil pushed him to envisage a transformative education for liberating the oppressed. Two components underpinned Freire's vision. The first component was to make the oppressed conscious of the social, political, and economic dynamics that held them in the particular oppressive environment. The second component was to work with the oppressed individuals in developing a transformative education that would liberate them from their present state. It is through the struggle with and by oppressed individuals that they could resolve the oppressor/oppressed contradiction. Freire's educational projects were largely successful in helping to empower the working illiterate peasants in Brazil to collectively rise and challenge the existing status quo. His work grew in stature, gaining influence throughout Latin America, and later North America and worldwide, and became a pillar in educational thought on social justice.

The notion of power and identity became increasingly prominent in considerations of social justice, growing partially from the work by individuals such as Paolo Freire, but also growing out of a large group of French and German continental philosophers who wished to challenge the existing modernist society that they argued privileged certain individuals. Critical educational theorists have drawn largely from postmodernist and neo-Marxist traditions and have applied their philosophies to issues of social justice (although again, with drastically differing perspectives within the critical theoretical tradition). Some overlapping themes might be said to exist regarding issues of social justice by critical theorists. Generally, critical theorists start from the assumption that the prevailing social order is historically situated and thus socially constructed and changeable. The dominant social order and constructed realities are often referred to as “discourses” in which the dominant view is perpetuated and maintained through the norms and social values of the society. The dominant (or hegemonic) discourses have a strong correlation to those who are privileged and are able to consolidate power so that structure between power and oppression is strongly linked. The work of critical theorists, then, is to unearth the dominant discourses that perpetuate and entrench inequitable social arrangements, and in so doing, resist and challenge forms of oppression.

Philosophically, a growing recognized area in social justice is the application of John Rawls's *Theory of Justice* to education. Since the publication of Rawls's book in 1971, philosophers have been debating the merits and shortcomings of his political liberal theory. Whether or not one agrees with Rawls, one cannot dismiss this pivotal work: It has changed the philosophical landscape on which other texts are based and compared. Political liberal philosophy has made significant strides in advancing the merits of liberty and equality in the areas of legal and medical ethics, international law, and education.

Liberal theory is a normative political theory for how citizens ought to create a just society. Rawls is specifically concerned with the two moral paths: a capacity for conception of the good and a capacity for a sense of justice. How we come to define and create acceptable rules and behaviors is developed through

Rawls's theory of justice as fairness. Two main principles are of highest priority in Rawls's theory: the liberty principle and the "second" principle:

1. Each person is to have an equal right to the most extensive scheme of equal basic liberties compatible with a similar scheme of liberties for others.
2. Social and economic inequalities are to be arranged so that they are both (a) reasonably expected to be to everyone's advantage, and (b) attached to positions and offices open to all. (Rawls, 1971, p. 53)

These two principles constitute Rawls's theory of justice. By building on notions of fairness, Rawls argues that the priority is on the right over the good. Simply put, what are important are principles that are agreed upon by individuals, rather than having a preset notion of *the* good. Within this liberal conception, principles of liberty and fair equality of opportunity would be adhered to, and when inequalities of wealth and income occur, they would be allowed only when it is to the advantage of the least well off.

Liberalism attempts to identify normative principles for a just society. How does this help educators address and consider educational issues? Egalitarian liberalism in an educational context is committed to both autonomy and equality of opportunity. The first principle suggests that the role of education is to provide various opportunities and experiences that may enhance and expose children to different ways of living. It also may require schools to provide opportunities for children to be exposed to and participate in various educational experiences that help to facilitate the process by which children learn how to discern and critically reflect upon their present way of living, and potentially consider alternative ways of living that may be to their benefit. The second aspect of this principle attempts to secure fair equality of opportunity. If we are to secure fair equality of opportunity in society, education arguably plays a major role in this condition. Schools must provide both equitable conditions and opportunities for children in order that they have an equitable footing in later life, having the ability to pursue various opportunities.

Finally, the capability approach developed by philosopher and economist Amartya Sen is gaining

influence and applicability in educational circles. In further developing Rawls's principles of justice, Sen argues that not only are economic redistributive resources required for a human to fully flourish, but other substantive freedoms as well; Sen describes this as "capabilities to function." "Functionings" are those actions that humans can actually do, such as eating an apple, going to work, and so on. "Capabilities" are those actions that individuals have the ability to do; for example, they may wish to eat an apple and have the ability to decide whether or not they will eat it. The distinction between the two is that a functioning is the actual achievement, whereas the capability is the opportunity to achieve the action. A common example that illustrates a capability is the difference between a person who fasts and a person who is starving. The person who fasts makes the decision not to eat, whereas the person who is starving does not have the capability to decide whether or not to eat. Agency is a key aspect of Sen's capability approach. A capability can be achieved only through a person's agency: the freedom and ability to make decisions about how one should live in a certain way.

Sen's articulated capabilities approach then considers the range of options necessary for a person to achieve full human dignity and well-being. Within this redistributive theory, Sen distinguishes between individuals' differing needs in order to achieve well-being, something that is often unarticulated in other theories. For instance, a growing child or a pregnant woman will require more nourishment than a middle-aged person. The nuanced aspect of this redistributive theory provides principles to ensure that social justice is achieved not on a general, ambiguous level but addresses the varying needs of each and every individual.

Education is a pivotal aspect in Sen's theory; it is considered a capability in itself with overlapping capabilities within education. An education is a capability in itself in the intrinsic worth that an individual attains to develop human dignity, self-respect, and fulfillment. However, education provides instrumental ends in assisting an individual to achieve many things both in the present and in the future.

From these four perspectives, it is apparent that there are competing ideals in the recommendations put

forth for social justice in education. Critical theorists criticize the individualist emphasis in Rawls's and Sen's theories, whereas liberal theorists would challenge the assumptions made by critical theorists in their critique of the modernist society. Little consensus exists, then, on a conceptual framework of social justice. Depending on one's a priori assumptions, the methodological and theoretical approaches taken to address social justice and, consequently, the recommendations put forth can be both complementary and competing at times.

SOCIAL STUDIES EDUCATION

The social studies in K–12 education represents the specific area of the curriculum that deals with the social, cultural, and political content of what is being taught. In 1992, the National Council for the Social Studies (NCSS), the main professional leadership and accreditation group for social studies education in the

United States, described the field as including “the integrated study of the social sciences and humanities to promote civic competence.” The field is interdisciplinary and includes subjects such as anthropology, archaeology, economics, geography, history, law, philosophy, political science, psychology, religion, and sociology, as well as content from the humanities, mathematics, and natural sciences. According to the NCSS, the primary purpose of the field is to help students be able to make informed and reasoned decisions as members of a culturally diverse and democratic society—one that is also part of a larger global culture. This entry looks at how the social studies curriculum developed and outlines some of the key controversies.

Historical Background

In schools in the United States, social studies has been traditionally associated with the disciplines of history and geography. In recent years, however, the field has increasingly drawn upon the insights of other academic fields, including anthropology, economics, political science, sociology, and psychology.

Social studies education, in terms of its founding as a curricular field, is rooted first and foremost in the study of history as a modern subject in colleges and universities—one that emerged during the final decades of the nineteenth century. The first efforts to develop a high school curriculum for the social studies came about through the efforts of the National Education Association's Committee of Ten, which issued a detailed report in 1894 calling for the modernization of the high school curriculum. In 1899, the committee issued a subreport on social studies, which highlighted the need to improve historical study at the elementary and secondary levels. Civil government—what was to become civics—was included in the American history curriculum, which was taught in Grades 7 and 11, along with coursework in Greek, Roman, French, and English history, spread throughout the other grades.

Most curriculum historians agree that the modern field of social studies originated with the 1916 publication of *The Social Studies and Secondary Education* by the National Education Association Commission on the Reorganization of Secondary Schools. Earlier

reform movements during the 1890s had introduced history as a core subject in the curriculum. In 1916, the idea of citizenship education was introduced as well. It is the themes of history as a discipline and citizenship education that came to dominate social studies education during the period following World War I. Reforms continued into the 1920s and 1930s. Harold Rugg, a professor at Teachers College, Columbia University, drew on progressive educational theory—specifically the work of John Dewey—in calling for social studies to focus around problems dealing with contemporary life. Criticisms of Rugg's work focused around the belief that the interdisciplinary and integrative approach he emphasized created a "social stew" with little focus or purpose.

Further attempts to better define the social studies curriculum came in 1929 with the American Historical Association's Commission on the Social Studies. The commission's report, which was drafted by Charles Beard and George S. Counts and issued in 1934, was a radical work, very much reflecting a social reconstructionist approach—one that considered the American capitalist system to be a failure and insisted that social change was imperative. Reactions to the report from the media were extremely negative, rejecting suggestions made in it that the social reconstruction of American society needed to take place through educational reconstruction.

The concerns about the report had to do with the growing fear that communism and socialist theories were spreading throughout the country. Conservatives called for the schools and teachers to inculcate patriotic values in children, and not to have them critically engage in independent social thought. Figures such as Rugg came under attack in 1935 at the same time for a series of social studies textbooks he had developed titled *Man and His Changing Society*. These works, while emphasizing history, also required students to consider how they might act as agents for change in American society.

Controversies

The attacks on Rugg were led by the American Legion and continued through the end of the decade and the beginning of World War II. The attacks against him

were important in that they pointed to the extent to which the social studies curriculum was controversial and contested.

This trend has continued into the present. In the mid-1960s, controversy erupted over the development of the new social studies, part of an attempt by academic leaders and scholars to anchor the curriculum in disciplinary fields. Figures such as Jerome Bruner came under extensive attack for supposedly undermining the morals of students as a result of his project, *Man: A Course of Study* (MACOS) (1970), a Grade 7–9 curriculum that shunned absolute values in favor of relativistic interpretations (e.g., Is euthanasia on the part of Eskimo people justified for the survival of the tribe?). Other reasons for the rejection of the curriculum had to do with Bruner's inclusion of information about the practice of wife-swapping, adultery, and cannibalism in Eskimo culture. Among the protesters complaining about the MACOS curriculum were Mel and Norma Gabler. The Gablers were Christian fundamentalists from Texas who, in the early 1960s, had become upset over the content of their son's high school history textbooks. Essentially, they concluded that the basic information included in these textbooks did not provide sufficient emphasis on patriotic values, while emphasizing organizations such as the United Nations and the supposed benevolence of the federal government. The Gablers discovered that history textbooks used in schools were adopted as part of a statewide review—a widespread practice in many states. Realizing that they could lobby to change the content of school textbooks that were being used in their state, they rapidly developed a highly effective program to introduce more conservative material in textbooks. Because Texas adoptions were so important to national textbook publishers (Texas being such a large market as adopters), their demands for change became influential nationwide.

The efforts of the Gablers are interesting in the context of this entry because they reflect the fact that history textbooks, and in turn the social studies curriculum, represent one of the most contested areas of the curriculum. The textbook protests of the Gablers were, in fact, remarkably similar to the protests over the Rugg social studies textbooks of the late 1930s. The issue raised by them—one that continues to be contested in our own

era—is, What should be the nature and purpose of the curricular content of social studies?

SOCIOLOGY OF EDUCATION

The sociology of education has provided important insights into the ways in which schools affect individuals and groups. Through an examination of the relationship between society and schools, sociologists have uncovered how educational processes affect the way people think, live, and work; their place in society; and their chances for success or failure. Research in the sociology of education has attempted to understand whether educational systems provide opportunities for all children to achieve based on their merits or whether they reproduce existing social inequalities.

Theory and research in the sociology of education seek to understand the limits and possibilities of schooling. In the United States, which has placed enormous faith in the power of schools to ameliorate all types of social problems, including poverty, and has viewed schools as the central institutions for social mobility, the sociology of education provides evidence about the extent to which schools can solve social problems.

The discipline of sociology developed at the end of the nineteenth century amid the promise and problems of industrialization, urbanization, and a developing belief in education in Europe and the United States. During this period, more and more children were

required to go to school, and sociologists began to examine the relationship between school and society. As schooling became more available to increased numbers of children, many believed that schools would be critical to a modern era where merit, talent, and effort would replace privilege and inheritance as the most significant factors for social and occupational mobility.

Until the 1960s, sociologists for the most part shared this optimism about the role of education in a modern society. They examined important themes, including how children are socialized for adult roles, the school as a social organization, and the effects of schooling on students' life chances. Beginning in the 1960s, sociologists of education began to doubt that schools, by themselves, could solve social problems, especially problems of economic and social inequality.

Sociologists of education continued to believe that they could improve education through the application of scientific theory and research. Because of their scientific orientation, they are more likely to ask *what is* rather than *what ought to be*, although sociological research has been the basis for trying to improve and change schools. They want to discover what occurs inside of schools and what the effects of schooling are on individuals and groups. The distinctive feature of the sociology of education is empiricism, or the collection and analysis of empirical data within a theoretical context in order to construct a logical set of conclusions.

Thus, the sociology of education relies on empirical methods to understand how schools are related to society, how individuals and groups interact within schools, and what the effects of schooling are for individuals and groups of children. Its findings are based on an attempt to be objective and scientific. It examines individuals and groups in their social context and examines the social forces that affect them. The sociological approach to education is crucial because it provides conclusions based on focused and tested observations. Without such an analysis, one cannot know *what is*; and without knowing *what is*, one cannot make *what ought to be* a reality.

The sociology of education has mirrored the larger theoretical debates in the discipline of sociology. From its roots in the classical sociology of Karl Marx, Max Weber, and Emile Durkheim to the contemporary influences of symbolic interactionism,

postmodernism, and critical theory, sociology of education research has been influenced by a number of different theoretical perspectives.

Functionalism

Functionalist sociologists begin with a picture of society that stresses the interdependence of the social system; these researchers often examine how well parts are integrated with each other. Functionalists view society as a kind of machine, where one part articulates with another to produce the dynamic energy required to make society work. Most important, functionalism stresses the processes that maintain social order by stressing consensus and agreement. Although functionalists understand that change is inevitable, they underscore the evolutionary nature of change. Furthermore, although they acknowledge that conflict between groups exists, functionalists argue that without a common bond to unite groups, society will disintegrate. Thus, functionalists examine the social processes necessary to the establishment and maintenance of social order.

Functionalist theories of school and society trace their origins to the French sociologist Émile Durkheim's (1858–1917) general sociological theory. Durkheim's sociology was concerned with the effects of the decline of traditional rituals and community during the transition from traditional to modern societies. Based on his research, Durkheim provided a sociological analysis of the effects of modernity on community.

For Durkheim, the processes of industrialization, urbanization, and modernization led to the breakdown of traditional rituals and methods of social control, which in turn led to the breakdown of social solidarity and cohesion. He demonstrated empirically how the breakdown in traditional community resulted in the decline of collective conscience and the rise of individualism. Such a breakdown led to what Durkheim called *anomie*, or the condition of normlessness in individuals and society.

As the bonds that connected individuals to each other and to society became unhinged, modern societies faced disintegration from within. He did not believe that the solution to social disintegration was a return to the past, with its strict forms of social control

and regulation. Rather, he believed that modern societies had to develop new forms of social control and cohesion that would allow for the newly developed individualism of modernity to exist within a cohesive modern society. Such a society would allow for a balance between individualism and community.

Durkheim was the first sociologist to apply sociological theory to education. Although he recognized that education had taken different forms at different times and places, he believed that in virtually all societies, education was of critical importance in creating the moral unity necessary for social cohesion and harmony. For Durkheim, moral values were the foundation of society.

Durkheim's emphasis on values and cohesion set the tone for how present-day functionalists approach the study of education. Functionalists tend to assume that consensus is the normal state in society and that conflict represents a breakdown of shared values. In a highly integrated, well-functioning society, schools socialize students into the appropriate values and sort and select students according to their abilities. Educational reform is supposed to create structures, programs, and curricula that are technically advanced and rational and that encourage social unity.

Functionalism is concerned with the functions of schooling in the maintenance of social order. Whereas conflict theory argues that schools function in the interests of the dominant groups in a society, functionalism sees schools as functioning in the interests of the majority of citizens, at least within democratic societies. Therefore, functionalists examine the specific purposes of schooling and their role in society. These purposes or functions are intellectual, political, social, and economic and refer to their role within any existing society. Functionalists, however, are most concerned with the role of schools in modern, democratic societies.

Modern functionalist theories of education believe that education is a vital part of a modern society, a society that differs considerably from all previous societies. Schooling performs important functions in the development and maintenance of a modern, democratic society, especially with regard to equality of opportunity for all citizens. Functionalists argue that inequality was functional and necessary in all societies, as it ensures that the most talented individuals will fill the functionally most

important positions. Nonetheless, modern democratic societies differ from previous, traditional agrarian societies because they are meritocratic; that is, talent and hard work should determine the allocation of individuals to positions, rather than accidents of birth. Thus, in modern societies, education becomes the key institution in a meritocratic selection process.

This democratic-liberal functionalist perspective views education as a vital institution in a modern capitalist society defined by its technocratic, meritocratic, and democratic characteristics. Although considerable inequality remains, society in this framework is characterized by the movement from ascription to achievement, with equal educational opportunity the crucial component. The historical pattern of academic failure by minority and working-class students was a blemish on the principles of justice and equality of opportunity expounded by a democracy. This educational pattern necessitated the formulation of reform programs to ensure equality of opportunity. Even though functionalist theorists disagreed on the causes of academic failure, they vigorously believed that the solutions to both educational and social problems were possible within the capitalist social structure.

The central distinction made by the functionalist perspective was between equality of opportunity and equality of results. A democratic society is a just society if it generates the former. Therefore, functionalist theory rests on a positive view of meritocracy as a laudable goal, with education viewed as the necessary institutional component in guaranteeing a fair competition for unequal rewards. The just society is one where each member has an equal opportunity for social and economic advantages and where individual merit and talent replace ascriptive and class variables as the most essential determinants of status. Education is the vehicle in ensuring the continual movement toward this meritocratic system.

Education plays a significant function in the maintenance of the modern democratic and technocratic society. In a political democracy, schools provide citizens with the knowledge and dispositions to participate effectively in civic life. In an increasingly technical society, schools provide students with the skills and dispositions to work in such a society. Although schools do teach specific work skills, they also teach students how

to learn so they may adapt to new work roles and requirements.

Functionalist theory was the dominant paradigm in sociology and the sociology of education until the 1960s. In the 1960s, conflict theory emerged as a significant critique and alternative to functionalism.

Conflict Theory

Conflict theorists argue that schools functioned in the interests of dominant groups, rather than everyone, and that functionalists confused what is with what ought to be. According to this critique, whereas schools ought to be democratic and meritocratic, the empirical evidence did not support the functionalist contention that they were. Although the specific nature of conflict theory is developed in the next section, it is important to note some of the problems with functionalism. First, conflict theorists argue that the relationship between schooling, skills, and jobs is far less rational than functionalists suggest. Second, conflict theorists point out that the role of schools in providing equality of opportunity is far more problematic than functionalists suggest. Third, large-scale empirical research on the effects of schooling casts significant doubt on the functionalist assertion that the expansion of schooling brings about an increasingly just and meritocratic social order.

Conflict sociologists of education do not believe that society is held together by shared values and collective agreement alone, but rather on the ability of dominant groups to impose their will on subordinate groups through force, co-optation, and manipulation. The glue of society is economic, political, cultural, and military power. Ideologies or intellectual justifications created by the powerful are designed to enhance their position by legitimizing inequality and the unequal distribution of material and cultural goods. Conflict sociologists see the relation between school and society as problematic. Whereas functionalists emphasize cohesion in explaining social order, conflict sociologists emphasize struggle. From a conflict point of view, schools are similar to social battlefields, where students struggle against teachers, teachers against administrators, and so on. These antagonisms, however, are most often muted for two reasons: the authority and

power of the school, and the achievement ideology. In effect, the achievement ideology convinces students and teachers that schools promote learning and sort and select students according to their abilities, not according to their social status. The achievement ideology disguises the “real” power relations within the school, which, in turn, reflect and correspond to the power relations within the larger society.

Although Karl Marx (1818–1883) did not write a great deal about education, he is the intellectual founder of the conflict school in the sociology of education. His analytic imagination and moral outrage were sparked by the social conditions found in Europe in the nineteenth century. Industrialization and urbanization had produced a new class of workers—the proletariat—who lived in poverty; worked up to eighteen hours a day; and had little, if any, hope of creating a better life for their children. Marx believed that the class system, which separated owners from workers and workers from the benefits of their own labor, made class struggle inevitable. He believed that the proletariat would rise up and overthrow the capitalists, and, in doing so, establish a new society where men and women would no longer be “alienated” from their labor. Marx’s powerful and often compelling critique of early capitalism has provided the intellectual energy for subsequent generations of liberal and leftist thinkers who believe that the only way to a more just and productive society is the abolition or modification of capitalism and the introduction of socialism. In the 1970s, political economists Samuel Bowles and Herbert Gintis used a neo-Marxist perspective for examining the growth of the American public school. They argued that there is a direct correspondence between the organization of schools and the organization of society, and until society is fundamentally changed, there is little hope of real school reform. Other conflict sociologists of education, however, argue that traditional Marxism is too deterministic and overlooks the power of culture and human agency in promoting change. They suggest that Marxism places too much emphasis on the independent effects of the economy and not enough on the effects of cultural, social, and political factors.

An early conflict sociologist who took a slightly different theoretical orientation when viewing society was

Max Weber (1864–1920). Like Marx, Weber was convinced that power relations between dominant and subordinate groups structured societies, but unlike Marx, Weber believed that class differences alone could not capture the complex ways in which human beings form hierarchies and belief systems that make these hierarchies seem just and inevitable. Thus, Weber examined status cultures as well as class position. Status is an important sociological concept because it alerts us to the fact that people identify their group by what they consume and with whom they socialize. Weber also recognized that political and military power could be exercised by the state, without direct reference to the wishes of the dominant classes. Weber had a critical awareness of how bureaucracy was becoming the dominant type of authority in the modern state and how bureaucratic ways of thinking were bound to shape educational reforms. Weber made the distinction between the “specialist” and the “cultivated man.” What should be the goal of education—training individuals for employment or for thinking? Or are these two goals compatible?

The Weberian approach to studying the relation between school and society has developed into a compelling tradition of sociological research. Researchers in this tradition tend to analyze school organizations and processes from the point of view of status competition and organizational constraints. One of the first American sociologists of education to use these concepts was Willard Waller. Waller portrayed schools as autocracies in a state of instability. Without continuous vigilance, schools would erupt into anarchy because students are essentially forced to go to school against their will. Rational models of school organization disguise the tension that defines the schooling process. Waller’s perspective is shared by many contemporary conflict theorists who see schools as oppressive and demeaning and portray student noncompliance with school rules as a form of resistance.

Contemporary conflict theory includes a number of important approaches. First, a major research tradition that has emerged from the Weberian school of thought is represented by Randall Collins. He believes that educational expansion is best explained by status group struggle. He argues that educational credentials, such as college diplomas, are primarily status symbols

rather than indicators of actual achievement. The rise of “credentialism” does not indicate that society is becoming more expert but that education is increasingly used by dominant groups to secure more advantageous places in the occupational and social structure for themselves and their children.

A second school of conflict theory is based on the work of Stanford sociologist John Meyer and his collaborators. Called institutional theory, Meyer argues that the expansion of education worldwide has not been due to functional requirements or labor market demands but rather to the worldwide process of citizenship and the democratic belief that educational development is a requirement of a civil society. Like Collins, Meyer does not believe that such expansion is a proof of democracy, but rather the belief that educational expansion is necessary. Through comparative, historical, and institutional analysis, Meyer and his colleagues argue that educational expansion often preceded labor market demands and that educational expansion is legitimated by institutional ritual and ceremony rather than actual practices.

Third, a variation of conflict theory that has captured the imagination of some American sociologists began in France and England during the 1960s. Unlike most Marxists, who tend to emphasize the economic structure of society, cultural and social reproduction theorists, such as Pierre Bourdieu and Basil Bernstein, examined how the social and cultural processes of schooling reproduced society. For Bourdieu, cultural capital (particular forms of culture, such as knowledge of music, art, and literature) is passed on by families and schools. The concept of “cultural capital” is important because it suggests that, in understanding the transmission of inequalities, we ought to recognize that the cultural characteristics of individuals and groups are significant indicators of status and class position. There is a growing body of literature that suggests that schools transmit specific social identities that either enhance or hinder students’ life chances.

Basil Bernstein (1924–2000) argued that the structural and interactional aspects of the educational system reflect each. He examined how speech patterns reflect students’ social class backgrounds and how students from working-class backgrounds are at a disadvantage in the school setting because schools are

middle-class organizations. Bernstein’s early work on social class differences in language distinguished between the restricted communication code of the working class and the elaborated code of the middle class. His critics labeled him a deficit theorist, alleging that he was arguing that working-class language was deficient. Bernstein rejected this interpretation, arguing that difference became deficit because of unequal power relations. Bernstein’s later work examined the connection between communication codes and the processes of schooling. He analyzed the processes of schooling and how they related to social class reproduction, concluding that unequal educational processes reproduced social inequalities.

Interactionist Theory

Interactionist theories about the relation of school and society are critiques and extensions of the functionalist and conflict perspectives. The critique arises from the observation that functionalist and conflict theories are very abstract and emphasize structure and process at a societal level of analysis. Although this level of analysis helps us to understand education in the “big picture,” macrosociological theories hardly provide us with an interpretable snapshot of what schools are like on an everyday level. What do students and teachers actually do in school? Interactionist theories attempt to make the “commonplace strange” by turning on their heads everyday, taken-for-granted behaviors and interactions between students and between students and teachers. It is exactly what most people do not question that is most problematic to the interactionist. For example, the processes by which students are labeled “gifted” or “learning disabled” are, from an interactionist point of view, important to analyze because such processes carry with them many implicit assumptions about learning and children. By examining the microsociological or the interactional aspects of school life, we are less likely to create theories that are logical and eloquent, but without meaningful content.

Interactionist theory has its origins in the social psychology of early twentieth-century sociologists George Herbert Mead (1863–1931) and Charles Horton Cooley (1864–1929). Mead and Cooley examined the ways in which the individual is related

to society through ongoing social interactions. This school of thought, known as *symbolic interactionism*, viewed the self as socially constructed in relation to social forces and structures and the product of ongoing negotiation of meanings. Thus, the social self is an active product of human agency rather than a deterministic product of social structure. Interactionist theory is usually combined with functionalism or conflict theory to produce a more comprehensive theory of society. One of the most influential interactionist theorists was Canadian-born sociologist Erving Goffman (1922–1982), whose work examined the microsociology of everyday life and the functions of interaction rituals in holding society together. Goffman was interested in how everyday, taken-for-granted patterns of interactions serve to hold society together. Goffman's brand of interactionism was functionalist, as he viewed social interaction patterns as rituals that served to maintain society through an invisible micro social order. Although Goffman did not directly study education, his writings on mental hospitals, on the labeling of so-called deviant behavior, and on patterns of interpersonal behavior provided a rich tapestry of concepts for sociologists of education, particularly through the use of labeling theory, which has been applied to the study of teacher expectations, ability grouping and tracking, and the study of schools as total institutions.

Ray Rist has provided some of the most important insights on the ways in which school processes affect educational achievement. Rist's research into the everyday processes of schooling in an inner-city school provided an understanding of how school practices, such as labeling and ability grouping, contribute to the reproduction of educational and social inequalities. He argued that interactionism has provided important understandings of the way in which the everyday workings of schools, including teacher and student interactions, labeling, and linguistic discourse, are at the root of unequal educational outcomes. Drawing upon labeling theory, originally a key approach in the sociology of deviance, Rist demonstrated how teacher expectations of students based on categories such as race, class, ethnicity, and gender affect student perceptions of themselves and their achievement. Rist argues that the processes of schooling resulted in educational inequality mirroring

the larger structures of society. He concluded that education produces the opposite of its stated intentions—instead of eliminating class barriers, it perpetuates inequalities. Combined with the findings of conflict theory, Rist's interactionist approach provides an empirical documentation of how schools reproduce inequality.

Methodological Approaches in the Sociology of Education

Beginning in the 1960s, quantitative methods dominated research in the sociology of education. Large-scale data sets, such as High School Beyond, the National Educational Longitudinal Study, and the School and Staffing Surveys collected by organizations such as the National Opinion Research Center at the University of Chicago and the National Center for Educational Statistics, were mined using sophisticated statistical techniques. The purpose of this type of research was to examine the independent effects of schooling on educational and economic outcomes while controlling for a series of independent variables, both inside and outside of schools. These quantitative analyses examined the explained and unexplained variation in academic achievement among different groups based on race, social class, ethnicity, gender, age, disability, and others. This type of research also examined school effects on these groups by comparing different types of schools, including public, private, and charter schools, as well as the effects of school organization and processes, including ability grouping, tracking, and school and class size.

Although this type of research provided important evidence on the effects of school organization and processes and the independent effects of factors outside of schools, interactionists argued that research based on large-scale data sets often missed the reasons for these effects, as they did not examine school processes. As an antidote to large, data set, quantitative research, qualitative researchers provided complementary approaches to understanding schooling using ethnographic methods. Researchers such as Annette Lareau, Lois Weis, and Michelle Fine provided important analyses of how school processes affect students from various backgrounds.

Some qualitative researchers have remained squarely in the scientific tradition, insisting on objectivity, rigorous research design, and examination of causality. Others are more rooted within interpretive traditions, including symbolic interactionism, ethnomethodology, hermeneutics, postmodernism, feminism, critical theory, and cultural studies, and in varying degrees they reject postpositivist notions of scientific rigor. Despite critiques of qualitative research as unscientific, qualitative research continues to be an important part of research in the sociology of education.

Based upon their strengths and weaknesses, both quantitative and qualitative methods should be an important part of sociology of education research. Qualitative research in the sociology of education has made valuable contributions to our understanding of educational problems and has offered policy makers useful data for school improvement. Quantitative large-scale data set analyses have provided essential evidence on the effects of schooling and have been invaluable to policy makers. Whether studies are quantitative or qualitative or part of a mixed-method approach that uses both quantitative and qualitative methods, sociology of education research provides important data for public policy.

Conclusion

The sociology of education originated in the concerns of classical sociology in the nineteenth and early twentieth centuries. It came of age in the 1960s onward and concentrated on the significant questions regarding meritocracy and equality. Contemporary theories in the sociology of education have attempted to synthesize the major theories in the field—functionalism, conflict theory, and interactionism—and have provided a rich theoretical foundation for empirical work.

Today, the sociology of education is at a crossroads. The twentieth century represented the attempt to refine and empirically test the theoretical insights of the classical sociology of the nineteenth century. Through sophisticated methodological approaches, sociologists of education provided important empirical evidence on the effects of education on different groups and have been an important source of data for discussions of the achievement gap. Qualitative researchers provided an

alternative to what they perceived as the overly scientific, quantitative focus of much of the sociology of education research. For many sociologists of education, this response has weakened the scientific base of educational research. For others, sociology of education of all types has been too removed from policy and practice. In the coming years, sociologists of education need to combine varied research methodologies, quantitative and qualitative, to examine the most important question common to functionalist and conflict theory—why students from lower socioeconomic backgrounds do less well in school—and provide pragmatic policy recommendations for successful school reform and reduction of the achievement gap. Although sociological theory in the sociology of education will continue to be an important part of this project, the separation of theory, research, and practice needs to be diminished.

Regional Education Board has no direct governmental authority; however, the governor of each member state and four representatives appointed by the governor constitute the Board's decision-making membership.

The Board's original focus was higher education. Early programs involved member states' sharing the costs of graduate programs to avoid the expense of having separate programs in advanced areas within each state. Over time, the Board's interest grew to all levels of education. In 1981, it advocated improvement in the preparation of teachers, collaboration between institutions of higher education and PreK–12 schools, and changes in vocational education to meet the demands of local labor markets. In 2002, the Board adopted ten goals for education, emphasizing degree completion, exceeding national averages, standards, efficiency, and accountability.

SOUTHERN REGIONAL EDUCATION BOARD

Established in 1949, the Southern Regional Education Board is a sixteen-member interstate agency whose focus is to improve education from the prekindergarten level to the postsecondary level in its member states: Alabama, Arkansas, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia. The Southern

SPECIAL EDUCATION, CONTEMPORARY ISSUES

Several issues are currently in the forefront of special education. First, some minority groups continue to be disproportionately represented among those in special education. As demographics in the United States become increasingly diverse, professionals continue to be challenged with identifying students who truly need special education services and supports. Second, the question of where to educate students with identified

disabilities remains a central problem. Current practices range from educating students in separate settings to believing that every individual, even those with the most severe disabilities, should participate in educational and living environments that are as close to normal as possible. This leads to a third issue: As more students with disabilities are included in general education classrooms, the role of the special education professional continues to change. Shifting responsibilities of special education professionals entail consultation, collaboration, and facilitation of student learning. Thus, the challenge of preparing all teachers to share knowledge, skills, and expertise is also critical in this entry's discussion of the present state and future developments in the field of special education.

Disproportionate Representation

A variety of factors contribute to the underachievement of culturally and linguistically diverse (CLD) students. However, the continued low progress of CLD students in schools today is very pertinent to the special education field. Students who do not perform well academically end up being referred for special education services. Although prereferral interventions exist to ensure that students are not placed erroneously in special education, students from CLD backgrounds continue to be disproportionately represented in certain programs and disability categories.

For example, African American males continue to be overrepresented in classes for students with emotional/behavioral disorders, whereas Latino students are overrepresented in programs serving students with learning disabilities. Moreover, African American, Latino, and Native American students are underrepresented in programs for the gifted and talented, whereas Asian American and European American students are overrepresented in these programs.

One reason for disproportionate representation that has been discussed in the literature includes the possibility that lower socioeconomic status contributes to disability. However, some scholars argue that the deficit perspective of some education professionals as they view students and families from CLD backgrounds leads to misidentification. Supporting this claim, existing research has pointed out the fact that

CLD students are disproportionately represented in those categories that are socially constructed (e.g., behavior disorders, learning disabilities) or based on professional judgments as to what normalcy means. CLD students are not disproportionately represented in disability categories that entail biological traits or conditions (e.g., deafness, blindness).

Other reasons for the disproportionate number of minority students in special education programs that have been espoused by educational researchers are existing cultural biases in the assessment process and the cultural mismatch between CLD students and their predominantly European American, middle-class educators.

Inclusion of Students With Disabilities

Students with disabilities are increasingly being integrated in general education classrooms, where general educators are responsible for providing services to meet individual students' needs. This philosophical belief, known as normalization, states that every student should be educated in the least restrictive environment (LRE) to the maximum extent possible. Some professionals and advocates of students with special needs argue that the LRE is in the general education classroom where students without disabilities are educated.

Increased integration has led to fostering recognition that people with and without disabilities have the right and capability to make their own decisions (i.e., self-determination) and to become contributing members of society. However, there exists significant controversy about whether people with more severe and profound disabilities are provided a free and appropriate public education in settings where individual supports are not provided. For this reason, the Individuals with Disabilities Education Improvement Act states that educational programming for students with disabilities is to be built upon a variety of service delivery options.

Professionals working with a student with special needs and the student's parents are to determine, from a continuum of services ranging from separate schooling to full inclusion in general education, which is the best setting in which the student can be educated. If a general education classroom is deemed the most

appropriate setting in which a student with special education needs will receive services, it becomes critical that the general educator and special education teacher collaborate to make the inclusion of that student successful.

Collaboration Between General Education and Special Education

The coordination between general education and special education programs tends to be informal and in accordance with meeting the requirements of the law (e.g., general educators' attendance to the special education student's individualized education plan meetings). These limited interactions between general and special education teachers, who are both responsible for providing services to students with disabilities, can sometimes prevent the provision of more appropriate services for students with special needs. If these students are to be successful in any setting, including general education classrooms, it is of utmost importance that special education and general education teachers work together.

Through collaboration, professionals can learn from one another's areas of expertise and share knowledge conducive to the improvement of intervention strategies and instructional practices to work with diverse groups of students. For example, in working more closely together, general education teachers and special educators could better address cultural, linguistic, and disability-related needs of individual students. However, educators have limited opportunities to collaborate with teachers outside their area of expertise. They may participate in professional development, but there are few opportunities available to share knowledge across disciplines. Even when teachers have the intention of learning how to improve their practices in working with students with disabilities, systematic, ongoing planning times and opportunities for teacher collaboration must exist in order for this to happen.

In addition to opportunities for professional development across their respective disciplines, increased collaboration and planning together can lead to developing a shared knowledge base among teachers to facilitate a diverse student body's learning. It is critical that general

education teachers and special educators seek to coordinate their efforts to meet the unique needs of students with identified disabilities. Developing a sense of ownership and shared responsibility for students among school personnel provides a context in which the academic and social development of all students can be supported. Together, teachers can observe students with special needs in different settings and identify important academic and social areas to be addressed. Opportunities for co-teaching also contribute to supporting the integration of students with special needs and allow general educators and special education teachers to meet regularly and discuss student progress.

Conclusion

Many controversial issues continue to be discussed in the special education literature about how to best educate students with disabilities. Differing opinions exist about appropriate identification, the inclusion of students with disabilities, and the amount of collaboration between general education and special education. However, as more empirical research continues to be conducted in the field, answers to questions from professionals working with students with special needs may emerge. At the same time, different challenges will come to light. It is these challenges that must be viewed as opportunities for growth and continued change in the improvement of service delivery for students with and without disabilities.

SPECIAL EDUCATION, HISTORY OF

The special education movement can be characterized as having three major phases, exclusion and isolation, access and inclusion, and accountability and empowerment. Historically, up until the mid-1960s and 1970s, disability was viewed as an abnormality or “freak of nature,” and individuals who had disabilities were forced into isolation and exclusion. During the civil rights era through the 1980s, parents and advocates pushed to shift this perspective and gain rights for individuals with disabilities through access and inclusion. From the 1990s to the present, individuals with disabilities have become empowered and are working toward redefining their role and identity in society as a cultural phenomenon rather than inferior to able-bodied, able-minded individuals in the dominant mainstream. Additionally, systems such as case law and statutes, public and private programs, and advocacy organizations have been created to make schools accountable for providing equal educational opportunity for *all* students, including individuals with disabilities. This entry reviews the political and social aspects that influenced each of these historical phases in special education.

Isolation and Exclusion

Up until the mid-twentieth century, individuals with disabilities were excluded from mainstream society, often being housed in institutions that isolated them from the outside world and their families. Individuals with disabilities were considered abnormal and unable to function in society. It was said that such individuals disrupted and negatively influenced those in the mainstream, which caused many families to stow away their family member with a disability in attics or remote places. Individuals with disabilities were treated as

second-class citizens, and often states took custody, which disempowered families from having rights with regard to their child with a disability.

Because individuals with disabilities were viewed as a burden to society and uneducable, the conditions of institutions were often inhumane, with solitary confinement being the norm. It was not until the early 1900s that schools began to open their doors to individuals with disabilities as a result of parent advocacy groups. However, institutionalization and isolationism continued to prevail until the early 1970s. In fact, the last institutions were dismantled during the Reagan administration in the mid-1980s during the deinstitutionalization movement.

Access and Inclusion

The civil rights movement of the 1950s and 1960s had a major impact on the treatment of individuals with disabilities, and its ripple effect took hold through a series of court cases. *Brown v. Board of Education* forever changed the treatment of *all* students in education because of the change in educational law and procedure, which had a tremendous effect on school policies and procedures. The *Brown* case put desegregation at the forefront of equitable education and outlawed segregation based on unalterable characteristics such as race and disability because it violated equal protections and denied children equal educational opportunity.

The primary contention of the *Brown* case, that segregation by race was a denial of equal educational opportunity, became the gateway for the disability movement because children with disabilities were experiencing total exclusion, at best separate schooling through institutions, with the norm being no access to schooling at all. In 1972, two landmark cases, *Pennsylvania Association for Retarded Citizens (PARC) v. Commonwealth of Pennsylvania* and *Mills v. Board of Education of the District of Columbia*, became the catalysts for the right-to-education movement in the disability community. The *PARC* ruling stated that individuals with mental retardation between the ages of six and twenty-one must be provided with a free public education in programs comparable to their nondisabled peers. The *Mills* case paved the way for the right to due process and procedural safeguards

such as the right to a hearing with representation, a record, and an impartial officer; the right to appeal; the right to have access to records; and the requirement of written notice during all phases of the process. Almost simultaneously, in 1973, another important act was passed, Public Law (P.L.) 93-112, the Rehabilitation Act. Section 504, as it is often referenced, stated that any agency or activity receiving federal funding could not discriminate against or deny benefits to individuals with disabilities.

In spite of these landmark decisions and the additional forty-six cases filed in twenty-eight states following these decisions, school districts continued to plead that they did not have the financial, programmatic, and staffing resources to provide adequate equal educational opportunity. As a result, the federal government increased its role in special education through the Education of All Handicapped Children Action (EAHCA) or P.L. 94-142, which was passed into law in 1975. The primary purpose of this bill was to provide not only an educational bill of rights but also financial incentives to assist schools in providing equal educational opportunity. This bill marked the beginning of an era of disability rights and inclusion. In the next twenty years, public education went through major growing pains to accommodate individuals with disabilities and shift its perspective toward the inclusion of all individuals with disabilities, ranging from those who are medically fragile with multiple disabilities to those with mild learning disabilities.

Simultaneously, society at large went through major shifts in perspective as individuals with disabilities became more visible in the educational system and participated in everyday activities within their neighborhood communities. As a result of educational opportunity, individuals with disabilities were not only attending public schools and general education classes, but also graduating from high school and going on to college. This was a big shift in consciousness from the early part of the century when isolationism and exclusion were not only the norm but encouraged. Many disability advocacy groups gained popularity during this era, even though their roots began well before 1975.

Without the dedication and mobilization of parents and families, many believe that the disability rights movement would not have succeeded. Parents and

families banded together and affiliated themselves with national organizations to push local school districts and key personnel as well as lobby state and national politicians. Many of these groups (e.g., Association for Retarded Citizens, The Association for Persons with Severe Handicaps, Council for Exceptional Children) continue to be the largest and most influential lobbying forces today.

In the 1980s, there was much resistance to inclusion of individuals with varying disabilities, in part because teachers had not been trained or educated in how to provide inclusive education and resources were limited for implementing appropriate inclusion programming. Because parent advocacy groups had already begun to organize in the 1970s, these groups continued to apply pressure on the local school districts and practiced their right to due process. In 1986, the Handicapped Children's Protection Act was passed, which afforded courts the authority to award attorney's fees to parents or guardians who were in litigation.

In addition, during the Reagan administration, early childhood intervention became of interest as reports demonstrated the long-term success of early intervention programs from the 1960s and 1970s. As a result, the Infants and Toddlers with Disabilities Act (ITDA) was passed in 1986, which is now a subchapter under the Individuals with Disabilities Education Act (IDEA). Through ITDA, parents and families receive comprehensive services for their child from the onset of diagnosis through school-age, typically birth through age five. These services differ from what is provided in the public education system because they are developmental in nature. Thus, a heavy emphasis is placed on working with families to promote the development of the physical, cognitive, communicative, social/emotional, and adaptive abilities of the child.

At the end of the 1980s, the Americans with Disabilities Act (ADA), which afforded antidiscrimination protection, was introduced in Congress. This was a momentous time for the disability community as many came together to educate and advocate for the civil rights of individuals with disabilities. Each day, the disability community shared stories, both with politicians and the American people, of discrimination that excluded and segregated individuals with disabilities from being full participants in society. As a result

of this consciousness raising, people-first language became popularized. The use of people-first language was a concrete way of demonstrating the ideology that individuals with disabilities should be viewed as people first, with their disability as secondary. Thus, when referring to an individual with a disability, it is proper etiquette to note the individual first and the disability second (e.g., a student who uses a wheelchair instead of the wheelchair-bound student, a student with a learning disability instead of the learning disabled student, etc.).

Empowerment

ADA and people-first language greatly impacted the reauthorization of IDEA in the 1990s. In the 1990 reauthorization, the word *handicap* was replaced with *disability*, people-first language was used, and a transition component for students sixteen years and older was added. Transition services provide a plan to ensure successful transition into adulthood for students leaving high school. This can include housing and services in the community, employment opportunities through job skills training, and college readiness through financial and counseling assistance.

The 1997 reauthorization had a drastic impact on how students with disabilities were treated and educated in the public education system by affording more rights and access to a free and appropriate education. Prior to this reauthorization, services for individuals with disabilities were still primarily provided through a pull-out or resource-room model in which students were provided services outside of the general education classroom, either by being pulled from their general education classroom or by attending a separate, segregated class often called a resource room. These separate services often used a different curriculum with lower standards than that provided in the general education setting.

As a result of the reauthorization of IDEA in 1997, schools were mandated to provide services in the least restrictive environment, and the model for special education services began to change whereby schools were shifting their primary mode of services from a segregated model to an inclusionary model. Through an inclusionary model, special education teachers enter

the general education classroom to provide services, including consultation, collaboration, and co-teaching, and assist the general education teacher in developing modifications and accommodations of the curriculum for students with special needs.

Also in the 1997 reauthorization, the age for transition services was lowered to fourteen to ensure appropriate planning for successful transition into adulthood; the language of free and appropriate education was added to signify the ideology of education as a right; and nondiscriminatory assessment and inclusion in state assessments were added to ratchet up accountability of special education placement, services, and programs. As a result, the 1990s marked the beginning of the era of accountability and empowerment as the consciousness of the American people shifted with the use of people-first language, education as a right ideology, and the mandate for accountability.

The reauthorization of IDEA in 2004 continued to move the agenda of accountability and empowerment forward by emphasizing the implementation of a standards-based curriculum and scientifically based instruction, ensuring and defining highly qualified teachers, and mandating the use of the response to instruction model to determine appropriate interventions and referral to special education. Response to instruction examines the parameters in teaching and learning that affect how a student learns and uses data to change instructional practices so that students with disabilities can access content from the general education curriculum. This approach serves to empower students with disabilities by raising expectations and outcomes for learning and positioning educators and schools to be more accountable in doing so. There is no longer a question as to whether accessing the general education curriculum is appropriate, but rather a critical examination of how we create interventions and adaptations so that students with disabilities can access this knowledge.

SPELMAN COLLEGE

Spelman College is a historically Black women's college in Atlanta, Georgia, that is now part of the Atlanta University Center Consortium. Over the years, Spelman has played a key role in training African American women for leadership and preparing them for graduate study. Spelman currently has about 2,100 students from forty-one states and fifteen foreign countries. With a ranking of 75, it was the only historically Black institution included in *U.S. News & World Report's* 2008 listing of the top 100 liberal arts colleges in the United States. The college also has the highest graduation rate among historically Black institutions, and at 77 percent, its record surpasses the graduation rate for Black students at a number of high-ranking public and private institutions.

Spelman was established following the Civil War to educate emancipated slaves. Two New England women, Sophia B. Packard and Harriet E. Giles, founded Spelman in 1881 not only to teach women and girls to read, write, and do simple arithmetic, but also to prepare them to serve as teachers, missionaries, and church workers. Practical skills were also stressed as part of preparing students to be good homemakers and mothers.

In 1882, after hearing a presentation by Packard and Giles at Wilson Avenue Church in Cleveland, Ohio, one of the church members, John D. Rockefeller, became a lifelong contributor both to the school and to

African American education in general. With additional support from the American Baptist Home Mission Society and its women's auxiliary, nine acres of land and five buildings—former Union Army barracks—were purchased. The financial support of Mr. and Mrs. John D. Rockefeller, Sr., together with other gifts ranging from \$1 to \$1,000, made it possible to complete payment of the mortgage.

The school moved to its new location in February 1883, and Packard and Giles fought a proposal to merge the female seminary with the Atlanta Baptist Seminary, a school for males. Packard and Giles believed that their female students would be better served by keeping the schools separate. To do so, they had to raise enough money to support separate schools, and they received money from Baptists in the North and African American Baptists in Georgia. The Rockefellers donated the remaining amount needed, and in 1884, the school's name was changed to Spelman Seminary in honor of Laura Spelman Rockefeller and her parents.

The curriculum expanded to include college preparatory classes equivalent to high school. A nurse training department opened in 1886, followed in 1891 by a missionary training department. A new building was dedicated in 1918 to house the expanded home economics program. Spelman Seminary established the College Department in 1897, although most of the college work was at nearby Morehouse College.

One of the most significant events in Spelman's history occurred in 1924, when it changed from a seminary to a full-fledged college intended to provide a liberal arts education to its students. Under the leadership of Florence Matilda Read, who served as president from 1927 to 1953, the curriculum was expanded, with college courses established in the humanities, fine arts, social sciences, and natural sciences.

Albert E. Manley, the first Black and first male president, succeeded Read in 1953, ending nearly a half century of New England leadership. During his tenure from 1953 to 1976, Spelman strengthened its liberal arts program with the addition of non-Western and ethnic studies courses. Several other new programs were implemented in the 1970s, including freshman orientation and freshman studies, the health careers program, the family planning program, and cooperative programs with non-Black institutions.

Spelman women were active in the civil rights movement. Harry Lefever, Professor Emeritus of Sociology at Spelman, documents their participation both in Atlanta and across the South in his 2005 book, *Undaunted by the Fight: Spelman College and the Civil Rights Movement, 1957–1967*. Among those playing leadership roles was Marion Wright (Edelman), who later founded the Children’s Defense Fund. Howard Zinn, author of *A People’s History of the United States* and a member of the Spelman history faculty from 1956 to 1963, played an active role in mentoring and supporting student activists.

When Manley announced his retirement, many faculty and students assumed that in this time of new opportunities for women, the next Spelman president would be a woman. Student protests followed the appointment of an African American man, Donald Mitchell Stewart, but Stewart assumed the presidency in 1976. During his ten-year tenure, several new programs were established, including the honors program, the comprehensive writing program, and the continued education program.

The Women’s Research and Resource Center, established in 1981, was the first women’s research center at a historically Black institution. The center subsequently played a leadership role in the development of a women’s studies minor and a multidisciplinary major in comparative women’s studies. In addition to partnering with other departments to offer courses exploring issues of gender and race, the center sponsors a variety of national and international conferences and continues to support African feminist scholarship and activism. In 2004, the center joined with SisterLove, Inc., to organize a global conference on HIV/AIDS among girls and women in Africa and the African diaspora. Most recently, the center has undertaken a three-year project funded by the Ford Foundation that will explore and strengthen links among women’s studies scholars, departments, and programs in Africa and the African diaspora.

In 1987, Johnnetta Betsch Cole stepped into the role of seventh president of Spelman College, the first African American woman to do so in its 106-year history. Under her leadership, Spelman achieved national status as one of the leading liberal arts colleges in the United States. She presided over a campaign that raised \$114 million, the largest amount that had been

raised by a Black college or university. The endowment was tripled, rising from \$42 million to \$143 million. After leaving Spelman in 1998, Cole joined the Emory University faculty as the Presidential Distinguished Scholar at Emory University, where she is now professor emerita. Cole served as president of historically Black Bennett College for Women in Greensboro, North Carolina, from 2002 to 2007.

In 1998, Audrey Forbes Manley, a Spelman graduate and widow of Albert Manley, became the first alumna to serve as president of Spelman. The first African American to be appointed Assistant U.S. Surgeon General, Audrey Manley also served as Acting Surgeon General of the United States prior to her appointment to the Spelman presidency. As first lady of Spelman, she had played a key role in the establishment of Spelman’s health-careers program in 1971. Under her leadership, Spelman continued to strengthen its position as a leader in educating women in the sciences. Today, about one quarter of Spelman students major in science, engineering, or math. The school ranks second only to Xavier University, a historically Black institution in New Orleans, in the number of graduates who attend medical school. According to American Medical Association data for 2001, Xavier sent ninety-four students to medical school, followed by Spelman, with thirty-eight, and Harvard University, with thirty-seven.

Beverly Daniel Tatum succeeded Audrey Manley in 2002, becoming the ninth president of Spelman. Under her leadership, Spelman has established several new “centers of distinction.” Among them is the Center for Leadership and Civic Engagement (LEADS), formed in 2003. A year later, LEADS sponsored its first national leadership conference. Sisters Center for WISDOM (Women in Spiritual Discernment of Ministry) was also launched in 2004. Its goals include student development and leadership training programs, faculty and staff development, and community outreach. In 2007, global investment bank Lehman Brothers and Spelman announced the formation of a partnership to establish the Lehman Brothers Center for Global Finance and Economic Development. Lehman Brothers committed \$10 million to support new interdisciplinary courses, a scholarship program, and recruitment of new faculty.

The college continues to offer a wide range of innovative programs, including the Summer Art Colony in Portobello, Panama, which gives students an opportunity to live, work, and study in the Caribbean; the Japan Studies Program, which includes an exchange program and an intensive four-year summer program in Japan; and the Spelman Independent Scholars Oral History Project, which pairs students with mentors from the community in a two-semester interdisciplinary and intergenerational program. Spelman also offers a five-year dual-degree program through which students can earn a bachelor's of engineering from one of twelve participating schools, including Georgia Institute of Technology, the University of Michigan, and Rensselaer Polytechnic Institute.

SPIRITUALITY AND SCHOOLING

The spiritual lives of children and adults are considered of utmost importance in education in many

cultures. Psychiatrist Robert Coles noted in his travels that children throughout the world often expressed concern about matters spiritual. Yet when it comes to public schooling in countries such as the United States, spirituality is seldom discussed in official discourse. Public schools and universities (and many private educational institutions) are expected to focus on what is directly important to the purposes of the secular aspects of life. In mass societies, the religious aspects of education are often left to the family and religious communities, rather than to the common schools, which are required to emphasize those aspects of living that are considered essential to all youth, regardless of sectarian religious preferences; in multicultural societies, emphasis on matters related to religion can be highly divisive.

Nevertheless, the spiritual lives of youth and adults have been the major focus of many educators throughout time. An example is the legacy of educator-philosopher Rudolph Steiner, who designed a school for the workers of the Waldorf Cigarette Company. Waldorf schools have spread to many parts of the world, and in addition, retreats, such as ashrams and monasteries, some founded in ancient times, continue to serve the spiritual needs of devotees of a religious tradition; the spiritual is an important part of cultural transmission in the survival of cultures. John Dewey, who has greatly influenced world thinking about formal schooling and its relationship to democracy, recognized that all human beings have a religious component to experience, but questioned the claims often made about how matters spiritual are specifically linked to the doctrinal truths claimed by particular religious sects or institutions, including the existence of the supernatural. Matters spiritual were relevant only when they were part of the pragmatic and continuing project of furthering the well-being of mankind, which was possible to sciences based on experience, he thought. His naturalistic secular humanism has met with criticism from many religious leaders.

Spiritual matters are often associated with religious creeds, which vary from one group to another; even within a particular doctrine, there may be sectarian differences. Yet spirituality common to all faiths is based in a mystical sense of a

personal relationship to an entity larger than one's self. Because this ontological sense is based in the universe of relations, it is not material and often thus difficult to prove through a science based on substance and matter. One of the best modern statements of the fundamental relational basis of spirituality comes from Martin Buber, whose book *I and Thou* emphasized the fundamental, existential relation that arises from the ontology of being; the awareness of being itself awakens persons to the dialogic relation to other beings that include not only persons, but also other individual organisms.

The awareness of the holistic presence of other beings also extends to the mysterious and "eternal thou," which is defined as "God" in the religions that historically emerged from Judaism—including Islam and Christianity, and in other religious traditions that include Buddhism, Hinduism, Confucianism, Taoism, and the many forms of indigenous religions. Relations are difficult to describe because description tends to favor the tendency to convert relations into things, into what Buber calls the relation of I-It.

The arts, including poetry, music, dance, painting, sculpture, and architecture, seem best suited to express spiritual relations. Zen Buddhists have traditionally emphasized the limitations of words, whereas Buber himself lapsed into poetry to express the spiritual in relations. The ancient Pythagorians perceived the religious aspects in mathematical numbers, which was important to their view of education. The philosopher of education Maxine Greene has advocated the need for teachers and pupils to perceive the world through the aesthetic imagination, a view that has a connection with spirituality.

Contemporary Thought

In more recent times, the idea of relations has become fundamental in the naturalistic, biological science of ecology, and the connections between living organisms that sustain the complexity of life have become a basis for the spiritual that is also found in many indigenous religions that were once considered superstitious. The Norwegian philosopher Arne Naess is considered the founder of "deep ecology"—a spirituality that he believes humans sense in their individual and communal

relationship to the larger ecosystem. Naess, like many others in the environmental movement, was influenced by Rachel Carson's *Silent Spring*, which was widely read in the 1960s.

Biologists Lynn Margulies and James Lovelock have proposed the "Gaia hypothesis"—the idea that the earth itself is a complex living system that is biologically constructed through coevolution. It is a system to which humans along with other forms of life have contributed, and unless humans revise their present anthropocentric relationship to Gaia (named after the goddess of earth), it will lead to a destruction of the very environment upon which we depend. The anthropologist Gregory Bateson has also attempted to provide a scientific basis for "deep ecology," showing connections between aesthetics and spirituality, while educators such as David Orr and C. A. Bowers in the United States have called for basic changes in our conception of schooling and formal education that derive from a deep sense of connection to the earth that includes a balanced coexistence with all forms of life. Underlying the views of such ecological perspectives is an implicit criticism of the dominant humanistic views, which included that of Dewey, as being anthropocentric and hegemonic in its view of other forms of life.

Although spirituality based on "deep ecology" is not dominant, it has led to new interpretations of religious and philosophical ideas found in world religions as well as indigenous and folk religions. It has also influenced the basis of some schools in the "Green Movement," such as that of the Martin Luther schools in Berkeley, California, indicating that a secular yet spiritual basis for children's education is possible.

SPORTS MASCOTS

In the sports world, a mascot is a person, animal, or object that serves as a symbol of an athletic team. Schools at all levels, from elementary schools to universities, assign mascots and nicknames to their athletic teams. A mascot is important to a school because fans and supporters of a school's athletic teams often identify with the school's mascot or nickname. Mascots often arouse emotion among current and former students, as well as other supporters of a school's teams. Schools and colleges have a large variety of mascots and nicknames, including colors, animals, people, and other objects. Some mascots are representative of a school's town or state. Others were voted on by the student body. Some mascots and nicknames have been deemed offensive to Native Americans. This entry examines sports mascots in schools across all levels of education, discussing the most common mascots, why they are important to schools, and the controversy over Native American mascots.

What They Are

The term *mascot* is often used interchangeably with the terms *nickname* and *logo*. However, the terms do have distinct meanings. A mascot is a tangible object, usually a person or an animal, that is adopted by a school, college, or other organization to represent its athletic teams. The person or animal that serves as a mascot is often seen on the sideline or in the stands at athletic events and pep rallies. A nickname is simply the name

that is used to represent an athletic team, and a logo is a picture or a symbol that represents the team.

School and college mascots and nicknames often go beyond identification of an athletic team. For better or worse, mascots often become the identification of the entire school or institution, not just of its athletic teams. It is via a mascot or a nickname that current students, past students, prospective students, and others outside the academic community sometimes view the school. With the attention that athletics receives in the media, a mascot or nickname is often the most common identification outsiders have with a particular school.

Derivation of Names

The origin of high school and college mascots and/or nicknames is often an interesting story, although it is sometimes difficult to trace. Some school or college archives do provide a detailed account of how a nickname was chosen. The history behind the nicknames of some schools, however, is not very clear. Thus, officials and supporters of some schools and colleges can only speculate as to how their school's nickname was chosen, and the origin will forever remain a legend.

Some school and college mascots have been in existence for more than a century. Many high school nicknames have historic meaning to their town or community. Likewise, some college nicknames have meaning to the community, region, or state. Some nicknames speak to an institution's heritage, or mission, such as the nickname "Aggies" at some agricultural and mechanical (A&M) colleges or land-grant universities.

Maintaining a symbolic connection between an institution and its state is often especially important for public universities that are the flagship institutions for their state. As such, several state flagship (or secondary flagship) institutions' athletic nicknames resemble or match the state's nickname. Table 1 lists examples of such institutions that adopted their state's official or unofficial nickname as their own.

Having a nickname or mascot that matches the state's nickname is not the only way that a school or college can maintain a connection to its region or state. Many school nicknames and mascots are those of

Table 1 Public University Nicknames That Resemble or Match the State Nickname

<i>Institution</i>	<i>School/State Nickname</i>
Indiana University	Hoosiers
University of Iowa	Hawkeyes

University of Wyoming	Cowboys

animals that were once common to the geographic region of the school. Animals, whether indigenous to a region or not, are the most common choice for nicknames and mascots in schools at all levels. Table 2 lists the most popular nicknames among four-year colleges in the United States, including institutions across all divisions of the National Collegiate Athletic Association (NCAA) and the National Association for Intercollegiate Athletics (NAIA).

Although Table 2 lists the most popular nicknames at the college level, a list of the most popular elementary and high school nicknames would look similar, with various animals topping the list. Some educational institutions, however, have American Indian nicknames and mascots that represent their athletic teams. The use of American Indian nicknames, mascots, and logos has been controversial for many years, and the issue has received a great deal of attention more recently.

Native American Issues

In 2001, the U.S. Commission on Civil Rights declared that American Indian nicknames and mascots

Table 2 Most Popular Nicknames Among U.S. Four-Year Colleges (NCAA all divisions and NAIA)

<i>Nickname</i>	<i>No. of Schools</i>

were “inappropriate” and “disrespectful” in colleges and should be eliminated. The NCAA soon began to investigate the issue, and in 2005 identified thirty-one NCAA-member institutions that use American Indian nicknames, mascots, or logos deemed to be “hostile” or “abusive.” The institutions were asked to specify how they use such imagery and their reasons for doing so. The list of offending institutions was pared to eighteen after their reports to the NCAA.

Late in 2005, the NCAA made a landmark and controversial decision to ban racially or ethnically derogatory imagery from postseason events. The decision meant that the eighteen offending institutions would have to cover Indian references on their uniforms at NCAA postseason playoffs or tournaments, and those institutions would be banned from hosting any NCAA playoffs or tournaments until the offending imagery was changed.

Several of the eighteen schools remaining on the list of offenders made appeals to the NCAA in an effort to keep their name or mascot. Five institutions won their appeal, based on the fact that they had the approval of a local namesake Native American tribe:

Catawba College Indians, Catawba Indian Nation of North Carolina

Central Michigan University Chippewas, Saginaw Chippewa Indian Tribe of Michigan

Florida State University Seminoles, Seminole Tribe of Florida

Mississippi College Choctaws, Mississippi Band of Choctaw Indians

University of Utah Utes, Northern Ute Indian Tribe of Utah

Some of the eighteen institutions lost consecutive appeals and are faced with the decision of switching the name or facing the proposed sanctions. Finally, five institutions decided to switch their nickname and/or mascot as a result of the negative publicity and proposed sanctions:

Carthage College (WI) Redmen became Red Men and changed logo

Chowan College (NC) Braves became Hawks

Midwestern State University (TX) Indians became Mustangs

Southeastern Oklahoma State University Savages became Savage Storm

University of Louisiana at Monroe Indians became Warhawks

Those opposed to the use of American Indian nicknames and mascots claim that such imagery

promotes racial stereotypes. They suggest that the rituals and chants that mascots and fans perform during games (such as the “tomahawk chop”) are offensive and trivialize some items or traditions that are sacred to Native Americans. Supporters of such nicknames claim that they are honoring and celebrating Native American culture. Many supporters of the nicknames also suggest that the NCAA does not have the authority to regulate the choice of nicknames and mascots at individual institutions and is imposing social policy. Many also cite the NCAA as imposing on university autonomy and academic freedom.

The issue of Native American mascots has monopolized significant amounts of time for many college presidents and trustees. Colleges are often hesitant to change their nickname or mascot for fear of backlash from alumni in the form of decreased donations. The issue has also received the attention of lawmakers at both the state and national level. In Florida, Governor Jeb Bush applauded the NCAA’s decision to allow Florida State University to keep its Seminoles nickname with the support of the Seminole Tribe of Florida.

In North Dakota, the state Board of Education ruled in 2001 that the University of North Dakota’s athletic teams must be known as the “Fighting Sioux.” State officials voted in June 2006 to sue the NCAA for penalizing UND. Lawmakers from other states where college nicknames and mascots have caused controversy introduced legislation to Congress that would limit the NCAA’s authority over the issue. The bill would permit colleges to sue the NCAA if it punishes the schools. Rep. Tim Johnson (R-IL) and the Speaker of the U.S. House of Representatives, Dennis Hastert, introduced legislation designed to prevent the NCAA from invading institutional autonomy.

The controversy over Native American nicknames and mascots is not only at the college level. There are currently hundreds of elementary and high schools across the country that use such nicknames or mascots, including names such as Indians, Warriors, Braves, Chiefs, Redskins, and Savages. Table 3 lists, by state, the number of schools at the K–12 level that have Native American nicknames.

SPUTNIK

Sputnik 1, the world’s first artificial satellite, was launched from the Soviet Baikonur Cosmodrome on October 4, 1957. The satellite orbited the earth every ninety-six minutes, broadcasting signals from two radio transmitters that could be picked up by amateur radio operators around the world. Thus, the launch of *Sputnik* literally heralded the start of the “space race,” as the satellite remained in orbit, broadcasting for three months before falling back to earth. *Sputnik* marked a historic moment in space exploration, as well as a historic turning point in American education.

For the American public, this Soviet triumph symbolized a threat to American security, while calling into question American superiority in science and technology. In short, the United States was forced to ponder what it meant to be in second place scientifically, technologically, and perhaps militarily in the midst of an era ripe with ideological tension. As a result, educators, scientists, and mathematicians called for accelerated educational reforms; the public expressed support for the effort; and policy makers increased federal education funding.

Understanding the educational impact of the *Sputnik* launch requires placing this episode into its historical context. As the Cold War began to unfold in the years following the end of World War II, the adversarial relationship between the Soviet Union and the United States touched nearly every aspect of public

life in both countries. Public schools, as the institution responsible for shaping the thinking of the next generation, naturally became one site for this ideological battle. The United States was committed to demonstrating to the rest of the world that the Soviet challenges to American-style democracy were both misguided and impotent. American schools, and the educational programs enacted therein, had a critical role to play in this mission. Thus, the movement toward educational programs aimed at providing enhanced intellectual rigor and promoting economic and military dominance was already well underway before the launch of *Sputnik*.

The Soviet success in launching *Sputnik* made it clear to the American public that further changes to the educational system were in the national interest, particularly as related to the curriculum in mathematics and science. These changes were implemented at all levels and included the passage by Congress of the National Defense Education Act of 1958.

Research scientists and mathematicians from the country's most prestigious universities soon became prominent voices in this discourse on education reform. The scientists were empowered both by the successes they had had in weapon development during World War II and by the goodwill that these successes granted them among the general public. Thus, when the scientists began to voice dissatisfaction with what they saw in schools and then decided to turn their talents to educational reform, there was little or no objection. Scientists gained new and unprecedented influence in matters of public education policy.

These scientists had the support of the federal government to launch a sweeping reform of precollegiate science and mathematics education. At the heart of these policies was a focus on curriculum reform to emphasize content that the research scientists and mathematicians thought most important. The emphasis was on the structure of each discipline rather than on applications. Thus, the structure of K–12 science education was largely brought into conformity with science as taught in the universities. Teaching the internal logic of each discipline as it was understood by university professors was the guiding goal. This was a radical shift away from the “life adjustment” curriculum that held

sway in schools during and immediately following World War II. Built partly on Deweyan progressivism and partly on a psychological need to adjust from a wartime to a peacetime mentality, the life adjustment curriculum focused on applications of knowledge in a real-world context.

The *Sputnik*-era scientist-educators shared a common vision of education as the pursuit of excellence through high academic standards. This vision required banishing the life adjustment curriculum and replacing the emphasis on vocabulary and applied aspects of content with a focus on the structures and procedures of science and mathematics disciplines. Resulting programs in science included work done by the Physical Science Study Committee (PSSC Physics); the Biological Sciences Curriculum Study (BSCS biology); and the Earth Sciences Curriculum Project (ESCP earth science) among others. New programs in mathematics included the University of Illinois Committee on School Mathematics (UICSM), the School Mathematics Study Group (MSG), and the University of Maryland Mathematics Project (UMMP), among others.

Just as social and political factors initiated and propelled the *Sputnik*-era reforms in mathematics and science education, new social and political realities beginning in the mid-1960s acted as oppositional forces to the philosophical underpinnings of these reforms. Specifically, the focus on pursuit of excellence, the emphasis on rigorous academic standards, and the conceptual and methodological disciplinary focus in science and mathematics education were perceived as elitist and inattentive to the academic needs and realities of an increasingly diverse student population.

Although the *Sputnik*-era reforms were not carried forward as initially developed, their legacy can be seen clearly in the latest wave of science and mathematics education reforms more than forty years post-*Sputnik*. The Principles and Standards for School Mathematics put forth by the National Council of Teachers of Mathematics (NCTM) and the National Science Education Standards developed by the National Research Council (NRC) built on the *Sputnik*-era legacy by including prominent research scientists and mathematicians in their development and emphasizing

disciplinary processes and high academic standards as key elements of the reform effort. This legacy is tempered, however, by an equal emphasis on attending to the learning needs of diverse students and promoting scientific and mathematical literacy for all as the ultimate goal. Additionally, the *Sputnik*-era focus on curriculum reform has now been broadened to consider reform of teaching, professional development, assessment, and policy factors, as reform of science and mathematics education is now viewed as a systemic and long-term project.

STANDARDIZED TESTING

The term *standardized testing* is variously understood. For instance, some equate standardized testing as the delimiter to college entrance and predictor of academic success, whereas others see these examinations as sociocultural gatekeepers, testing only a limited portion of the schooling experience. This entry describes typical standardized tests, takes a brief look at their history, and summarizes their pros and cons.

Definition

No precise definition of standardized testing has been agreed on, and debate as to the meaning of the term continues. However, over the years, academic researchers have suggested that standardized tests

are different from other forms of assessment in that they contain all of the following characteristics: (a) they are interpreted with reference to a norm group, (b) administration occurs under standard conditions, (c) they are designed by specialists in the content and measurement area, and (d) they are scored objectively.

There are many different types of standardized tests, each classified into one of the following four categories: mental ability, aptitude, and intelligence; achievement; diagnostic; and attitudes/interests. The testing category of mental ability, aptitude, and intelligence includes the Stanford-Binet Intelligence Scale and Wechsler series of scales, which can be administered individually or to a group. Today, these tests are rarely implemented in the classroom but are frequently used by educational and clinical psychologists.

The Florida Comprehensive Achievement Test, the Scholastic Aptitude Test (SAT), and the Graduate Record Examination (GRE) all fall under the category of achievement tests. Although some test makers argue that many of these examinations are actually some measure of aptitude (i.e., SAT and GRE), they are classified as achievement tests because they are dependent on the instruction received by the test-takers and are always performed on a group of students.

The category of diagnostic tests includes examinations that specify the test-takers' strengths and weaknesses in a given content area; these exams are usually administered to individuals. The final classification of standardized tests, attitudes/interests, includes the Kuder Occupational Interest Schedule, which measures possible career paths for students, and other attitudinal measures that describe student self-concepts to academic and social constructs.

Historical Background

The evolution of standardized tests has an interesting history. The first recorded use of standardized tests dates back to 2200 BCE, when Chinese emperors developed a rigorous examination for public service officials. Serving the emperor of China was one of the highest positions a citizen could attain at the time, and measuring competency in a consistent manner was

considered important. Over the years, the test became refined and “standardized,” being used until 1905.

The modern development of standardized testing originates in the late nineteenth century with the work of Sir Francis Galton. In 1884, Galton conducted an anthropological study that required the collection of person-specific characteristics, including weight and height. Eventually, researchers such as James McKeen Cattell and his students extended Galton’s work into the development of tests measuring psychological constructs.

In 1904, Alfred Binet finished his work on creating a new scale to measure intelligence, which he termed *intelligence quotient* (or IQ), becoming the first major construct measured by a standardized test. World War I saw the implementation of the Army Alpha, a standardized intelligence test deployed to determine the mental capacity of drafted soldiers. However, educational testing in the mainstream society would not be widely imposed until the 1930s with the development of the SAT and the first mass-produced test-scoring machine.

Pros and Cons

Standardized tests have many desirable qualities for statisticians, measurement specialists, practitioners, researchers, and policy makers. For instance, standardized test marks form a normal distribution of scores allowing for the calculation of percentiles, stanines, and *t* scores. A normal distribution of scores is such that 68 percent of the students’ marks will lie one standard deviation (a measure describing the spread of scores around the arithmetic average or mean) from the arithmetic mean (or average score), 96 percent of the scores lie two standard deviations from the mean, and 99 percent of the scores lie three standard deviations from the mean.

Percentiles describe the rank order of a score, ranging from 0 to 100; for instance, a 95th-percentile score indicates that 95 percent of the scores on a standardized test lie below that mark. Stanines, or “standard nines,” approximate a range of percentiles into one of nine values; for instance, the percentile range 0–4 is summarized into a stanine value of 1. The *t* scores

are simply the transformation of any distribution of scores to one that has a mean of 50 and a standard deviation of 10. Other calculating features of standardized tests include computing reliability coefficients and constructing standard errors of measurement.

Standardized testing during the twentieth century has produced both positive and negative effects in educational, psychological, and sociological realms. One positive effect has been the simplification of college admissions through the use of standardized examinations. Prior to standardized testing, college admissions was a tedious process involving interviews and content testing, resulting in a loss of time for professors involved in research. Standardized tests simplified the process of admissions by developing cut-off scores before further interviews or testing would occur. However, standardized tests have also had negative effects. For example, there have been repeated concerns from educational and sociological experts that standardized tests are culturally biased, unintentionally force test-takers to reject the use of higher-order thinking skills, are used as gatekeepers in the ability tracking of students, and force teacher expectations to lessen toward low-performing students.

Yet standardized testing does have its own advantages. For one, the time required to complete a standardized test is much shorter than many other types of exams. Also, they can be very effective in determining the cognitive abilities of students prior to the instruction on some topic; that is, teachers can easily decide the level of instruction that their students would be able to process.

STANDARDS

Standards represent benchmarks for school achievement. In particular, *content* standards specify the subject matter that students are expected to learn. *Performance* standards identify the levels of proficiency that students are to meet in mastering particular skills. *Opportunity-to-learn* standards define the levels of available resources (such as school staff and instructional programs) that are required for students to learn appropriate content and skills. Overall, standards have been central to educational policy for more than two decades, especially at the national level. The standards movement has also played a pivotal role in the rise of school accountability and high-stakes testing. Moreover, standards are important because they exemplify key traditions in public education.

This entry is divided into three parts. Part one focuses on today's standards movement by tracing its recent origins and contemporary developments. Part two briefly examines earlier incarnations of the standards movement, including the efficiency movement of the early twentieth century and the objectives movement of the 1960s and 1970s. Part three looks at the recent coupling of standards with accountability schemes and high-stakes testing. This configuration of standards and assessment practices represents a new, and some would say dangerous, approach to school reform.

The Standards Movement

The 1983 watershed report *A Nation at Risk* initiated the standards movement of today. In strident tones, the authors of this report lambasted the quality, rigor, and efficiency of American schools. Such criticisms were hardly new, but the report was widely acclaimed because it tied education dramatically to the nation's economic well-being and global security. Moreover, the report's dire predictions of national peril struck a chord with a public that was already concerned with more than a decade and a half of gradually falling college admission test scores.

Calls for higher standards offered a ready political response to public concerns that students were not learning as much as had earlier generations. In the

1990s, for example, the Clinton administration promoted Goals 2000, a national education policy that urged schools to voluntarily adopt world-class standards. Supposedly, the absence of such standards would undercut the nation's ability to compete economically with foreign countries.

Some scholars viewed concerns over economic security and failing schools as a misleading and manufactured crisis. Nevertheless, national subject area associations responded by developing content standards in mathematics, science, reading, and other subjects. It was not long before states developed their own content and grade-level standards that trumped those of national associations. The passage of the No Child Left Behind Act of 2001 mandated standards as a component of all state accountability systems. Schools and school districts no longer had a choice but to accept state standards, and in order to tighten accountability further, many districts now require classroom teachers to identify the state standards addressed in their daily lessons. Finally, major textbook publishers recognized a marketing opportunity in this push to ensure compliance. To promote their products, publishers now tailor the teacher's editions of their textbooks to match content with a state's particular standards.

Past Incarnations

In the current rush to standards, it is easy to forget that standards are hardly new to education. On the contrary, today's movement represents a long tradition in education. This tradition looks to efficiency as its primary virtue. In particular, the contemporary movement is rooted in the early twentieth-century social efficiency thought of writers such as Edward L. Thorndike and Franklin Bobbitt. Thorndike, a founder of educational psychology, argued that a new science of education would eventually provide detailed and predictive explanations of all forms of learning and thereby establish a clear set of standards for educational practice. Bobbitt, an educational scholar, lamented what he saw as tremendous waste in the traditional academic curriculum and the outmoded instructional methods of his day.

Bobbitt began from the premise that the purpose of education is to prepare children for adult life, and that

adult life, however varied, could be broken down into specific tasks. This process of creating standards based on an examination of practical roles became known as activity analysis. It was the basis for several major surveys conducted by school districts and universities to formulate thousands and tens of thousands of highly specific educational objectives. Through such work, Bobbitt believed that social efficiency could modernize schools just as American industry had modernized production methods through standardization.

The social efficiency movement contributed to the bureaucratic-corporate model of schooling that emerged and took root during the twentieth century. With more children going to school and staying there longer, activity analysis also may have helped realign a highly academic and elitist curriculum with one that served more practical ends. Yet whatever successes the social efficiency movement might claim are balanced by the host of practical difficulties the movement encountered. First, faced with thousands and tens of thousands of objectives, educators needed some criteria by which to sort or rank potential objectives. In the absence of such criteria, teachers were simply overwhelmed. Second, specific objectives in many areas only served to trivialize adult roles. Would-be efficiency experts found themselves hard pressed with the job of defining a prespecified curriculum for adult roles such as being a good mother or father.

Today's standards movement is an ideological offspring of the social efficiency wing of early progressive thinking, but it is also akin to other trends. In particular, today's standards harken back to the objectives movement of the 1960s and 1970s. This movement had a significantly different impetus from the earlier social efficiency movement. Whereas Bobbitt and his supporters hoped to make schools more relevant to their growing student populations by tethering education directly to adult life, the objectives movement was employed as a corrective for such pragmatic efforts.

In the wake of *Sputnik* and decades of life adjustment programs, the mood shifted back toward academic, discipline-based education. Nevertheless, the objectives movement embraced the same underlying assumptions of both social efficiency and today's approach to standards. These assumptions include the belief that specific ends of education could be defined

prior to instruction, and that the programs designed to meet these ends could be applied broadly across time and place. Unambiguous aims were seen as the key to making this means–ends model work. Thus, an entire generation of preservice teachers was carefully instructed in how to plan curriculum by first writing long lists of behavioral objectives in highly specified formats.

Although the objectives movement was promoted widely in colleges of education, it failed to capture the hearts and minds of classroom teachers. As with the social efficiency movement, the problems with behavioral objectives were largely practical. Objectives may have helped a few teachers think more conscientiously about their aims, but the vast majority of teachers were never unclear about their expectations or what they hoped to achieve. For these teachers, writing objectives seemed like a forced exercise and a waste of time. The challenges of teaching were too often not in knowing one's objectives, but in finding ways to make content relevant and accessible for *particular* students at a *particular* time and place. As interest in objectives waned at the end of the 1970s, proponents predicted their return once technology increased and pre-prepared objectives alleviated the need for teachers to write their own.

Objectives were not destined to return, but standards have taken their place. Therefore, it is relevant to ask two questions. First, what lessons from these past movements might be useful today? Second, how does the contemporary movement differ from its earlier versions?

Lessons for Today

A primary lesson drawn from the social efficiency and objectives movements is to temper any expectations that standards will necessarily or automatically improve educational practice. As with the standards movement of today, its past varieties were touted with great fanfare and optimism. Yet for all their seeming potential, activity analysis and objectives were often resisted, and sometimes flatly rejected, by classroom teachers. Past reformers in this tradition were quick to blame teachers for not finding their approaches useful. Yet the lesson for today is not to blame teachers, but to

reconsider the claims of utility made on behalf of these top-down reforms in the first place. For example, standards are now said to be absolutely essential to maintaining quality schools. A bit of skepticism would be appropriate on this point. As John Dewey observed more than a half century ago, standards do not *necessarily* lead to quality. In Dewey's view, standards tell us about quantities—how much and how many. Quality, however, depends on judgment. Standards may well inform judgment, but they are not a mode of judgment; they are a mode of measurement. Thus, to expect that standards are able to replace or substitute for judgment is a mistake.

This limitation is evident in all three types of standards mentioned early in this entry. Content standards are the most popular of the three types today, and they might also seem the most straightforward. X, Y, and Z are what we expect students to learn. Period. Still, such statements leave many important questions unanswered. Should students, for example, learn everything that is taught? Many good teachers teach more than they expect all of their students to learn. Is providing such a rich curriculum a mistake? Moreover, students may surprise a teacher by learning content or skills that the teacher did not anticipate. Again, should such unplanned learning be discouraged?

In similar ways, performance standards may ask too little of teachers and students. Performance standards are usually formulated in ways that will apply across a relatively large group of students, such as all the fifth graders in a given school or school district. Some enthusiasts want to specify the same level of performance for all students in a given state! Because it seems unfair to create such standards in ways that a significant percentage of students cannot meet, the standards default to *minimal* levels of proficiency. Only for small groups, and perhaps only for individuals, can we set ideal or significantly challenging standards. However, if these standards apply only to a few cases, in what sense are they still “standard”?

Opportunity-to-learn are the least common type of standards, probably because of their cost. Without resources to back up these standards, they constitute little more than an empty gesture. It would be meaningless to say that all students have an opportunity to learn basic health practices, for example, unless appropriate

lessons and skilled health teachers are available to make such an opportunity real. The contemporary standards movement has not increased school resources. On the contrary, because this movement is accompanied by mandated testing and financial sanctions, standards have often diverted significant resources away from opportunities to learn.

The social efficiency and behavioral objectives movements were not complete failures. Nevertheless, their limited successes suggest the conclusions previously stated. First, standards alone are an insufficient basis for school reform. Second, the limitations of standards are most likely to be felt in their practical applications rather than at the level of policy. Finally, although standards may inform teaching in nontrivial ways, they neither provide the necessary resources for education nor ensure its quality.

The Standards Movement Today: Success or Failure?

Today's standards movement is not simply a repetition of its past heritage. Indeed, every reappearance of the efficiency tradition in education is unique to its times. In particular, the contemporary movement differs from the past by closely coupling standards with high-stakes testing, new state accountability schemes, and federal mandates. States that receive federal dollars for education are now required to set standards, test students to determine what percentage of students meet the standards, and then use the results to rank individual schools.

This interlocking of standards and testing has become far more formalized than it was in past accountability systems. Whereas the reforms of the previous century urged efficiency through a variety of means, today's reforms demand it through mandates alone. As a result, the role of assessment has changed. Prior to the standards movement, assessment measures usually followed the aims and content of the curriculum, thereby providing teachers with information about what their students learned. Now that relationship is reversed; instruction follows assessment. With rewards and sanctions tied directly to test results, many teachers believe they have no choice but to teach to the tests.

Moreover, teaching to the test has reached the level of official policy as school districts purchase expensive test-preparation curriculum packages and hire consultants from private companies. These programs focus on intensive drill and practice, eschewing both substance and higher-order thinking skills. Scholars refer to such test-prep programs as a “noncurriculum” because they disconnect skills from other forms of learning. In addition, because these isolated skills require such a great deal of rote memorization, students are quickly deskilled by having their work made a matter of routine.

Although these concerns are important, they beg the question of whether standards have served to raise test scores. On this question, research is not yet entirely conclusive. Nevertheless, early studies of the standards movement have not prompted much optimism. First, these studies suggest that most of the gains associated with standards and accountability are both modest and temporary. Gains found in the elementary grades, for example, typically wash out well before the end of high school. Second, researchers have not been able to link any of these gains with other measures of educational achievement, including student grades, high school graduation rates, or college admissions. They have, however, been linked to stress. In short, research thus far indicates that children are simply learning how to take tests, and that this alone is a poor substitute for education.

This entry has reviewed the origins and recent developments of today’s standards movement, described earlier versions of standards-based school reform, and identified the lessons to be learned from such reform efforts. Finally, the close links between the standards movement, accountability, and high-stakes tests were identified as unique features of today’s policies. Although the social efficiency and behavioral objectives movements were never wholly embraced at the levels of classroom practice, their successes may have been more symbolic. As a branch of progressive education, social efficiency reforms signaled an effort to bring education into the modern age of enlightened industrial and corporate thinking. In contrast, the objectives movement signaled the reawakening of academics as central to the school’s mission. What will the contemporary standards movement come to symbolize? The current path of the

movement seems to signal not so much an affirmation of education as it does a perceived need to control the work of teachers and students.

STATE ROLE IN EDUCATION

Education is a vital dimension of human existence that manifests throughout history from the prehistoric era, to ancient civilizations, to modern society and the postmodern era. Education serves a multiplicity of functions for humans, from basic survival to cultural transmission. The state, meaning any kingdom or nation at any point in time, relies on education as a critical institution within the society. Education serves many purposes, from the constructor of social norms, to economic engine, to ancillary, to national defense, to preserver of culture. Just as the state is a creation of humans designed with the hope of a better existence, education is a creation of humans designed with the hope of supporting that better way of life. In this entry, the relationship of education and the state is traced from earliest times to contemporary societies. Special emphasis is given to the development and relationship of education in the United States.

Ancient Times

The course of human development is marked by milestones related to the economic and cultural survival of the species, and education plays a role at all stages of this development. For prehistoric humans, basic knowledge of survival skills and the development of crude tools were critical to existence. Education served to pass this knowledge from one generation to the next. Children learn to fend for themselves after their parents educate them about where to find potable water and edible plants, when to harvest nutritious fruits, how to avoid dangerous animals, and how to construct a basic shelter.

Tribes and Clans

Innovation accelerates because accumulated knowledge becomes easier to access. Thus, as humans form into tribal groups and clans, knowledge is held in common as it is spread within the group. In addition, the transmission of valuable information to succeeding generations is also made easier. In this group setting, each individual does not have to have all the knowledge needed for survival as specialization within the group takes place. However, the tribal and clan setting adds to the need for even more education. Group cohesion requires that patterns of behavior and interaction within the group follow group norms. In this circumstance, the individual must be socialized to the group. Parents add socialization to their child's education, and the group also assumes responsibility for the education of its members.

Tribes and clans evolve into more complicated organizational structures, and the state, in the form of an elite ruling class and societal hierarchy, comes into existence. Specialization expands not only into areas of technology and basic survival, but is also seen in the roles needed to protect and maintain order within the society. Here, specialization in the form of the military and priestly classes assumes part of the duties of perpetuating the social order. The oral tradition, passing critical cultural information from one generation to the next, becomes a central feature of the society.

Human existence is routinely subjected to natural disaster, war, famine, and disease. These events tend to disrupt societies in ways that randomly affect the

population. As a result, the specialization of skill and knowledge found throughout the society dies with the specialist who held it, also in random ways. In such instances, written language is a technological advancement that mitigates the potential for complete cultural annihilation when disaster strikes. Written language can help a society devastated by disaster recover, because more individuals within the group have access to important survival and cultural information.

Written Language

The great river civilizations and city-states of the ancient world—Sumer, India, China, Egypt, Olmec—each developed forms of written language. Evidence of written language has been discovered as early as 4000 BCE. This technology, written language, requires even greater and broader levels of education in order for it to be used and preserved. Written language serves no purpose if it cannot be read by those who need the information contained in the writing. Reading and writing must be explicitly taught and take time to learn. The historical record shows that as reading and writing become known in a society, some people are selected to learn and preserve these skills, and are often referred to as scribes.

What would appear to the modern observer as schools are organized within these societies. Schools are the inventions of humans and are used to pass on valued cultural knowledge to succeeding generations. They come into existence when the amount and degree of this knowledge is too extensive or complicated for the family to fulfill. Human development is a spiral of ever more complex survival skills, technologies, and social structures. Schools function to maintain and facilitate the development of the individual and wider society.

Thus, the ancient cultures established scribes, accountants, priests, military leaders, and civil servants of all kinds. Specialists in the areas of technology, agriculture, engineering, astrology, religion, philosophy, medicine, maritime, armed forces, and the arts appear. Large states with rich and complex cultures produce these arrays of human endeavor, but they are created and sustained through informal and formal systems of education. Without education, civilization does not exist.

Role in Society

Overwhelmingly, history shows that the social facet of education and religion, when they emerge within a culture, often become indistinguishable. The purpose is to perpetuate social mores and belief systems deemed essential to the culture. Frequently, when this development happens within a culture, the elite classes assume deified personas, thus attempting to strengthen the bond between religion, social order, and ruling elite within the society. This construct is seen in such examples as Egyptian pharaohs, Mayan caciques, and European kings. Even today, education in the form of religion is seen as a state function among some nations.

The state also has a stake in education as an essential part of the defense and economic viability of the society. A universal means of education in this mode is the parent-to-child instruction. Hence, families specialize in certain technologies. Artifacts of this old social economic order are seen today in Anglo-Saxon surnames such as Smith, Miller, Mason, Weaver, and Cooper. More complex means of economic enterprise and military organization require education beyond what can be accomplished within the nuclear family. Often in larger societies, clans or villages assume an area of specialization such as pottery, basket weaving, metallurgy, or shipbuilding, with the encouragement of the state. From such larger enterprises, education through the apprenticeship evolves.

Apprenticeships in the more lucrative and technologically complex fields can develop into a guild system in which admittance to apprenticeships is tightly controlled and the esoteric knowledge of the field is kept secret. It is common for the state to control these forms of education for economic purposes through a system of prohibitions and sanctions such as licenses, charters, and degrees. These systems often award monopolies for the enterprise to favored groups, and with it a monopoly related to the education and training associated with the economic endeavor.

Western Tradition

Education in the Western world traces many of its traditions to the ancient Greek city-states and their renowned philosophers. A clear record of the state

taking a direct interest in the education of its people is seen in the writings of the great philosophers of that era: Socrates (470–399 BCE), Plato (429–348 BCE), and Aristotle (384–322 BCE). Perhaps Alexandria, the city established on the northern shore of the African continent by the Macedonian king for whom it was named, best exemplifies direct state involvement in the promotion of education in the ancient world. The great library and museum of Alexandria, purported to have 700,000 volumes, served as a place of experimentation and learning for intellectuals of all kinds, of various backgrounds, and from throughout the world.

Ancient Rome would come to benefit greatly from the cultural heritage of the Hellenistic age and apply its own perspective to the educational needs of its inhabitants. The expansion of the Roman Empire throughout the Mediterranean and most of Europe set the stage for the ascendancy of Christianity as the dominant religion within the Western world. Christianity, in cooperation with the state and rooted in the Jewish traditions of the obligatory study of the Law of Moses and the education of youth for economic independence, would play the major role in developing the concept of universal schooling for children and the great universities in the Western world.

The Christian religion and the state merged in the form of the Holy Roman Empire. Monarchs throughout its history sponsored and promoted education as a matter of faith and in the interest of the state. The school at court and the monastic traditions were sustained with the patronage of the monarchy. The roots of this empire and its emphasis on education are traced back to Charlemagne and exemplified in his General Proclamation as to Education in 787 CE. The influence of Muslim civilization emanating from its European stronghold in Spain during this era would advance the study of mathematics and the sciences, provide links to the knowledge of the ancient Greeks, and add impetus to the relationship of education and the state by their example.

By the beginning of the sixteenth century, the Protestant Reformation fractured the Catholic Church's hold on Europe. The denominationalism that followed, which was often grounded in nationalism, spurs even more emphasis on education as each religious group strives to instill its form of religious orthodoxy within its

population. Concurrent with these events, advances in the technology of printing in Europe, started a half century earlier, make the printed word more accessible to the populace. Combined with the Protestant emphasis on salvation through reading the Bible, the need for mass education is accelerated. Martin Luther, John Calvin, and other leaders of the movement exhort the church and the state to offer universal education as a matter of faith. The Counter-Reformation by the Catholic Church also spurs educational advancements through, among other things, the rise of teaching orders like the Jesuits, who open schools and universities around the world with state sanction.

American Experience

As the sixteenth century dawns, the European migration to the Americas commences, and with it, the drive to transplant much of the culture of the mother country. Motivated by the competition for wealth and souls, the Europeans compete for territory to exploit and natives to convert. Columbus addresses this quest directly in the log of his first journey across the Atlantic, as does the First Charter of Virginia, granted by King James I.

The European states often used the mission, an educational institution for religious conversion, for technology transfer and for cultural maintenance. Within the first phases of settlement, universities are established, often by an endowment from the ruling monarch (e.g., University of Santo Domingo, 1538; University of San Marcos in Lima, 1551; Mexico City, 1553; Harvard, 1636; William and Mary, 1699; Yale, 1701).

Early Years

The colonial period in the British colonies that would become the United States of America followed the pattern of church-related education for children, the apprenticeship for young adults, grammar school for some, and the university for the select few. An array of approaches to providing education existed: schools mandated by the colonial governing body in New England; parish schools and missions in the Middle Atlantic colonies; private tutors in the home or study abroad in the South; and charity schools for the

orphaned and indigent. Episodes of schools for the growing African population are found in the historical record, although great variance is seen among the geographic regions and time periods. The native peoples of the area were minimally affected by the educational endeavors of the time, relying instead on their own education traditions for economic survival, cultural preservation, and spiritual needs.

With the movement for independence and the creation of a new nation under a system of self-rule, the impetus for education was strong. The European Enlightenment inspired new thinking about the nature of man and a person's right to liberty, but free people also have duties to the state that required thoughtful reflection and assumed a modest education. The new nation struggled to form its own identity, and ideas abounded among nation builders such as Webster, Jefferson, and Franklin about how education could play a transformative role. However, the concept of the state, in addition to the parent and the church, as the vehicle for directing education does not take flight until well into the nineteenth century in America.

Unlike several European nations of the time that had established state-supported schools in collaboration with the Church, the United States, perhaps because of its multiple religious denominations, made little progress in this regard. The federal system and the division of duties between the states and the national government also added to the slower development. With the westward expansion beyond the original thirteen states, community-based schools promoted by the state became more numerous. The forethought of the national leaders to provide resources for schools in the new Northwest Territories through the land ordinances of 1787 and 1789 underscores the interest of the national government in promoting education.

State Systems

By the early nineteenth century, many states were moving to create public education systems. For example, by 1812, New York put a three-tiered system in place, consisting of state, district, and town, that would look familiar to many today. This approach in New York followed even earlier efforts in 1795, by Governor George Clinton, to provide grants to towns willing to

establish a local tax to support schools. But the growth of state-controlled and -supported education developed slowly, differently, and on different schedules in different regions of the country. Constitutionally, education was assumed to be a state function, and most of the states adopted the model of local control and local funding within an overall state system that set broad parameters for governance and operation. However, the idea that education should be a government function for which taxes are collected was hardly a universally accepted concept in the United States.

Eventually, by the late nineteenth century, a system did develop across the country, impelled by immigration, industrialization, and urbanization, that was controlled by each state and mostly funded and run by local communities. This model endures to the present, although control has shifted to the state and national governments, leaving local school districts with essentially ministerial roles. In recent times, the fifty independent state systems, and territorial systems, of education have come under the control of the federal government through its model of incentive funding and heavy regulation, packaged under the label of education reform.

Historically, government programs for education in America are telling with regard to educational trends and the racial and ethnic groups targeted to benefit. For example, over the course of the nation's development, Native Americans, African Americans, Asian Americans, and immigrants have been the focus of state-directed education programs that aimed to bring these groups into the mainstream culture. Over time, various philosophies of education are apparent in the state's goals for students; for example, Social Reconstructionism—school as the place to socialize immigrants, as a vehicle for the social mobility of the disadvantaged, or a means to create a new social order; Perennialism—school as the means of preserving the culture and values of the dominant class; Essentialism—school as the place to prepare citizens for participation in the economy; Postmodernism—school as a mechanism for social justice.

STEREOTYPES OF TEACHERS

Everyone has an image of what teachers look and act like, conveyed through books, magazines, the media, and other forms of popular culture. Taken-for-granted assumptions about teachers comprise stereotypes that represent an oversimplified picture of teachers that shape who they are and what they do. Positive stereotypes of teachers have been prominent in popular films, from the 1955 classic *Blackboard Jungle* to the recently released *Half Nelson*, both stories of young, idealistic teachers committed to saving disadvantaged inner-city kids through their personal charisma and commitment to teaching. Negative teacher stereotypes also exist, such as Dickens's portrayal of the cruel and philistine Mr. Gradgrind in *Hard Times* and the authoritarian and mean Mrs. Krabapple, Bart's teacher in the popular TV show *The Simpsons*. This entry briefly examines the key stereotypes and their impact on teachers and on education.

Bad Teacher as Antihero Stereotype

Stereotypes of teachers can be grouped into two very broad categories: the good hero teacher and the bad

antihero teacher. It is obvious from their names that Mr. Gradgrind and Mrs. Krabapple both fall into the latter category. They are no-nonsense figures who are uninterested in making learning enjoyable for their students. The antihero teacher stereotype depicts the teacher as being joyless, unattractive (like the historical spinster teacher), and boring. This teacher is mean and embittered with life and teaching. Often, antihero teachers are cruel and condescending toward students, resorting to corporal punishment to keep their classes in order. They are also lazy, taking little time to prepare their lessons or care about the learning needs of their students. They become objects of ridicule.

The antihero stereotype is used to propagate the notion that teachers are to blame for societal problems. The stereotype contributes to the belief that teachers are responsible for rising rates of illiteracy, dropouts, and subsequent problems with youth crime, as well as the moral decline of society and slowdowns in the economy. The teacher as antihero stereotype provides a convenient scapegoat for a wide range of societal problems.

Good Teacher as Hero Stereotype

The good teacher stereotype advances the notion of the teacher as hero who is completely dedicated to students. In this view, teachers see their work as their life, and they sacrifice themselves for their students. Contemporary notions of the hero teacher mirror the earlier nineteenth-century stereotype of the teacher as savior or saint, a person who has answered a calling from God to save children from the ills of modern society.

There are two types of teacher-as-hero stereotypes. The first, the charismatic teacher, is inspirational and holds the rapt attention of students. Charismatic teachers often achieve success in unconventional ways and are rarely seen engaging in the ordinary tasks associated with teaching, such as lesson planning. Moreover, they are often rather flustered, disorganized, and unprepared for class. They rarely stick to the official curriculum, preferring instead to innovate and make it up on the go. Through their popularity and charming personality, charismatic teachers are able to inspire their students to success.

Another version of the hero stereotype, most commonly associated with female teachers, is the selfless teacher who is completely dedicated to students. These teachers are willing to go the extra mile for their students, both within and outside of the classroom. They are sensitive to the varying needs of students. Above all, love of children and teaching guides them in their work. The selfless teacher stereotype emphasizes the moral role of the teacher to inculcate in students appropriate moral values and habits to survive in a difficult and dangerous world.

Gendered and Racialized Teacher Stereotypes

The selfless teacher stereotype is most often associated with women, building on and enhancing the notion of women being naturally more nurturing, caring, and dedicated than men. This stereotype reinforces the notion that teaching, especially of younger children, is women's work. On the other hand, the charismatic teacher is generally depicted as a man in full control of his classroom through his personal charm and magnetism. A racial dimension is also seen in teacher stereotypes. In the popular media, for example, the charismatic teacher is most often depicted as a White male savior of Black boys.

Effects and Implications

A number of effects and implications are associated with the teacher stereotypes outlined here. The first is that, as with all stereotypes, complex phenomena are reduced to simplified generalizations. In this respect, teaching stereotypes are caricatures of teaching that ignore the complex and contextualized nature of teaching. Teacher stereotypes prevent people from understanding the complex nature of teachers' work. This, some argue, reinforces the idea that teaching is a job that anyone can do and, in effect, degrades the profession.

The second, related implication of teacher stereotypes is that they reinforce the notion of the independent and autonomous individual. The teacher is seen as bringing particular individual skills and traits to the profession that *alone* enable the teacher to either

rescue or ruin students. Teachers internalize the idea that it is their sole responsibility to help children and improve society through a go-it-alone mentality. Teachers, for instance, who see themselves as parents to their students come to believe in their role as moral agents, meeting their students' emotional, physical, and psychological needs and worrying when they are unable to do so. This individual-deficit model contributes to popular thinking that education (and societal) reform is solely dependent on ensuring that schools are staffed by good teachers.

Ironically, teacher stereotypes also serve to focus on the shortcomings of the individual teacher. Like the 1960s educational discourse of cultural disadvantage and deprivation of the problem child, the flipside of the stereotype of the savior teacher is that it deflects attention away from the wider societal social structures. Indeed, when teaching is seen through these stereotypes, the social and political contexts of teaching are overlooked. In turn, this leaves teachers feeling even more the burden of having to deal with societal problems on their own. Therefore, the teacher-as-hero stereotype undermines collective efforts, both within and outside of schools, to improve societal conditions.

Finally, teacher stereotypes further alienate teachers from the rest of society and force them to act in artificial ways. In his classic 1965 book on the sociology of teaching, Waller explains the negative effects of teacher stereotypes. Waller calls the teacher stereotype a "thin but impenetrable veil that comes between the teacher and all other human beings" (p. 49), leaving teachers isolated from the communities within which they work. In attempting to live up to the teacher-as-hero stereotype, teachers are forced to act in contrived and artificial ways, which has significant implications for teachers' work and the development of teacher identity.

STUDENT NONVIOLENT COORDINATING COMMITTEE

The Student Nonviolent Coordinating Committee (SNCC, pronounced "Snick") was an organization of students and former students active in the civil rights movement during the 1960s. The group conducted voter registration drives and encouraged civil disobedience protests throughout the southeastern United States. The original members of the organization were Black college students, although later, White students from northern and southern states would become members. Many of the students continued their work with the organization after they left school.

SNCC maintained an uneasy relationship with other civil rights organizations, particularly the Southern Christian Leadership Conference, because SNCC members viewed these other organizations as not going far enough in their efforts to eliminate discrimination. This tension is exemplified in other organizations' pressuring SNCC Chair John Lewis to tone down the speech he delivered at the 1963 March on Washington for Jobs and Freedom, in which Lewis spoke against President Kennedy's civil rights bill. Additionally, when most of these other organizations agreed not to allow communists within their ranks, SNCC stood firm in allowing anyone who supported their goals to participate in their efforts.

The formation of SNCC came following a student conference in Raleigh, North Carolina, in April 1960.

There, James Lawson, who had been involved in student sit-ins and other protests in Nashville, Tennessee, argued that the philosophy of nonviolence must be at the forefront of their movement, and this idea remained throughout the existence of the organization; however, later members tended to view nonviolence as more of a tactic than a philosophy. SNCC members participated in the Freedom Rides in 1961 to test how willing the federal government was to enforce a federal ruling that forbade discrimination in interstate bus terminals.

At a 1967 march in Memphis, Tennessee, SNCC Chair Stokely Carmichael (later Kwame Ture) advocated the need for Black Power, making SNCC the target of criticism that it supported Black separatism rather than integration and equality. The organization itself was hampered by internal disagreements over where it should focus its efforts: on voter registration, on training local residents to become political activists, or on providing food and other support for Black people in need throughout the southeastern states. Additionally, some members felt that including White staff members hampered the organization's effectiveness and created unnecessary internal strife.

At the end of the 1960s, SNCC was becoming associated by the media and political leaders with violent urban protests, such as those in Atlanta, and with socialist and separatist ideology. Its final staff meeting took place in New York in June 1969, although the U.S. Federal Bureau of Investigation continued to monitor SNCC activities until 1973.

STUDENTS FOR A DEMOCRATIC SOCIETY

Defunct since the early 1970s, Students for a Democratic Society (SDS) was an organization of more than 100,000 members, with chapters on more than 350 college campuses. Founded in 1960 as an offshoot of other organizations, SDS was originally dedicated to the causes of civil rights and social justice.

In 1962, SDS issued its manifesto, the Port Huron Statement. Here, concerns such as racism, poverty, and nuclear proliferation are addressed. Participatory democracy was heralded as a key way to address these problems. Action on the part of college students was advocated, and the role of America's universities in the process of social change was stressed. It was not until the escalation of the Vietnam War by the administration of President Lyndon Johnson that the central focus of the SDS shifted to this cause. The legacy of student strikes, occupation of campus buildings, and other demonstrations stem from this time period. This also marked a period of great growth in membership for SDS.

In April 1965, SDS organized the first national protest against the war, a 20,000-person march on Washington, D.C. SDS never had a particularly strong national organizational structure, so leadership at the individual campus level was important. At many universities, SDS began to protest ROTC involvement on campus and other forms of perceived involvement with the war on the part of universities, such as grant-funded research with potential military applications. SDS protests at Harvard, Columbia, the University of Chicago, and the University of California at Berkeley all garnered national attention for the organization.

"Teach-ins" against the war were another favored strategy. Opposition to the draft was a rallying point across campuses. In 1968, SDS helped organize and participated in demonstrations at the Democratic National Convention in Chicago. As a result of violent struggles with police, the facts of which continue to be controversial, the "Chicago Seven" were charged with conspiracy to riot, among them Tom Hayden, then president of SDS.

During the 1968–1969 academic year, membership in the organization continued to grow. The trial of the Chicago Seven and the accompanying protests, by a wide array of organizations and individuals, generated media coverage and more national attention. Although the Chicago Seven were acquitted, internal factions within SDS led to its decline and eventual dissolution in the following years. The radical wing of the organization became known as the Weathermen. This extremely small group of former SDS members sometimes resorted to violent means to achieve their goals. Other divisions continued to concentrate on matters such as civil rights and poverty in the developing world.

SUMMERHILL

Summerhill is a school in Great Britain that was founded about a century ago by the liberal and progressive educator Alexander Sutherland Neill, one of the pioneers of the rapidly growing New Education movement in England at the turn of the twentieth century. The school was a demonstration of his belief in the goodness of children and in their ability to regulate themselves. At Summerhill, the teacher's job was to evoke love and to allow the freedom of children; they were to be taught without the use of force by appealing to their interests and spontaneous needs. In addition, laws of morality and religion were not part of the curriculum. This entry looks at the founder's life and how its lessons were expressed in the school he founded.

The Founder's Background

Childhood was not an easy experience for Neill. Because he was timid and clumsy, he was often bullied by his peers. Neill attended the school where his father was headmaster. His father was profoundly disappointed in young Neill's academic performance because the Scottish and English school system, at the time, was based on the *payments by results* principle. Children in Scottish schools were also disciplined by means of the *tawse*, a leather strap. Neill recalls that his father was the hardest on him and often strapped him more severely for noise or mischief.

Neill experienced difficulty in finding direction and choosing a profession. In 1908, at the age of 25, he eventually passed the entrance exams and attended Edinburgh University in pursuit of a Master of Arts degree. His one-year appointment as editor of the *Student* magazine confirmed his desire to become a journalist, a career he followed briefly. When war was declared in 1914, Neill was disqualified from joining the army because of a leg injury and consequently returned home to Kingsmuir, where he secured a job as headmaster of Gretna Public School.

It is there that Neill, in an attempt to discover his philosophy of education, recorded his thoughts on education in the official logbook of the school. These recordings led him to abandon the *tawse*, and he began to formulate his radical ideas on freedom for children. Neill believed that the role of the teachers should be restricted to that of enablers, or guides whom pupils would consult when necessary; teachers were expected to learn with their pupils.

At a self-government meeting at Little Common Wealth, a home for delinquent boys and girls, Neill met Homer Lane, the man in charge of the community. Lane's lectures initiated and reaffirmed Neill's notion that a new approach for working with children was required and presented him with a practical model for this new approach. Lane strongly argued for teachers to step down from the positions of authority, for children to be allowed the freedom to resolve their own problems while schools encourage and support them, and for the reawakening of the play instinct in children. Neill regarded Lane as a genius and the one person who profoundly influenced his work.

A New School

In 1921, Neill cofounded and cogoverned The International School in Dresden, an experimental school, under the pedagogical guidance of the German Ministry of Education. In 1924, when he moved to England, his pupils followed him. Neill rented a house on a hill in Lyme Regis, Dorset, and founded the radical progressive coeducational Summerhill School, which had only five students. When the lease expired after three years, he had twenty-seven students and needed a larger place. Neill bought a house in the small town of Leiston, Suffolk, outside of London, but retained the name Summerhill even though the house was situated on a flat strip of land.

At Summerhill, Neill advocated for the freedom of the child, self-government by the pupils, teaching the child without the use of force, voluntary attendance at lessons, appealing to the child's curiosity and spontaneous needs, the abolishment of authority, and the absence of laws of morality or religion. Students were allowed the freedom to be outdoors and to engage in play. Students could also say what they wanted to.

In 1960, Neill published *A Radical Approach to Child Rearing*, which became an international best seller. The success of the book drew many visitors to Summerhill and attracted a significant number of American students, which saved the school from almost certain closure. In his foreword to Neill's book, the psychoanalystt Eric Fromm describes the ten essential characteristics of the Summerhill approach as including:

1. the goodness of the child;
2. the aim of life is to work joyfully and to find happiness;
3. intellectual development is not enough, education must be both intellectual and emotional;
4. education must be geared to the psychic needs and capacities of the child;
5. discipline, dogmatically imposed, and punishment, create fear; and fear creates hostility;
6. freedom does not mean license . . . respect for the individual must be mutual; a teacher does not use force against a child, nor has a child the right to use force against a teacher;

7. honesty and true sincerity are required on the part of the teacher;
8. healthy human development makes it necessary that a child eventually cut the primary ties which connect him with his father and mother, or with later substitutes in society, and that he or she become truly independent;
9. guilt feelings primarily have the function of binding the child to authority; and
10. Summerhill does not offer religious education.

Fromm concludes his summary of the school and its principles by maintaining that Neill's approach at Summerhill, in the end, represents "the *true* principle of education without fear."

A Legacy

Neill later called Summerhill a demonstration school, as opposed to an experimental school. He lived and worked for the rest of his life at Summerhill and remained actively involved in it. During his last months, he was often tired, though mentally alert, and played a less active role in the school. Just after the publication of his autobiography, *Neill! Neill! Orange Peel!* in 1972, Neill's health started to decline, and in September 1973, he died.

His wife, Ena Neill, continued to run Summerhill on the same principles. Ena was later succeeded by her daughter, Zoe. Summerhill still exists today and continues to be a successful school. Although Neill's philosophy of education was regarded by many as radical and controversial, his influence on present-day education is evident in the abolishment of corporal punishment and the absence of religion in education.

SUPERINTENDENCY

The local school district superintendent is generally known as the chief executive officer of a multischool district. Although the position may seem clearly defined, nothing could be further from the truth. Demographic and social shifts over time have changed public schools in the United States, as well as the superintendent's role. Historically, the superintendent began as an unpaid school inspector who assisted overburdened, local school boards in managing the business affairs of an ever-growing number of schools in larger urban areas. The superintendent's role has evolved in influence and complexity. Consequently, we will describe the current context of the superintendent in a changing society and characterize his or her shifting role(s). Public schools have experienced a significant change in social context and demographics over time, and superintendents have found their greatest success when functioning as political strategists and social scientists.

School district composition, superintendent selection, and their relationship to the school board vary across the country. Specifically, some states designate a school district for each and every community, whereas others designate countywide districts, resulting in districts ranging from fewer than 100 students to more than a million. This, of course, dramatically changes the responsibility and role of the superintendent. Additionally, most superintendents are appointed by either locally elected school boards or mayors, but some are elected. Superintendents answer to elected or appointed school board members ranging from sometimes reluctant, local, nonprofessional volunteers, to

highly educated and politically motivated appointed and/or elected members. Some superintendents serve as the primary leader of the school board, whereas others function in an informational capacity with the mayor and city council members providing the majority authority. This variation in governance structure and function within school districts adds to a general confusion in defining a primary role for the superintendent.

Throughout the American educational system, there are several levels of superintendent, such as those at the state, county, and district levels. This description of the superintendency will focus on the chief executives of the approximately 14,500 local school districts in the United States.

Historical Perspectives

Although many presume that superintendents have always led school districts, the position is relatively new and followed the development of local school boards, teachers, and school principals. In fact, more than 100,000 school boards governed the first school districts, each of which was relatively small in size. Eventually, as larger urban areas began to increase their number of schools, the management of facilities, hiring of personnel, distribution of curriculum, and the inspection of teacher quality became unwieldy for single boards who hired school inspectors, eventually known as "superintendents."

Early Years

These early superintendents assisted the board by performing mostly routine, menial tasks, and they had little authority. As more superintendents were hired in more populated cities, their duties became more focused on communicating the curriculum to teachers, helping them implement the material, and assessing their efforts. This has led some researchers to characterize superintendents in this era as scholarly leaders or teacher-scholars. Despite this mainly nonprofessional role, school superintendents, part of the teachers' organizational society, eventually created a group called the Department of School Superintendence of the National Education Association in 1870.

The Industrial Revolution and the conjoining development and popularization of bureaucracies and scientific management theory in business and industry elevated the level of power and authority of administrative positions in the schools and particularly of superintendents. The focus on the importance of efficiency and the role of managers also provided impetus for a growing number of research studies in the social sciences, an emerging theoretical context, and the development of applied processes such as organizational management, motivational theory, individual and group interaction, resource allocation, and other personnel management.

Advances in social science theory during this era would eventually become the foundation for educational leadership theory and lead to the establishment of formal school management programs, essentially nonexistent at this time. The development of these management theories also contributed to cementing the shift from the religious focus and control of schools to the idea of schools as a secular organization whose main goals were to democratize the American citizenry and develop a stronger, more competitive economy.

To complete this national movement toward a business-based, management approach, a top-down hierarchy was established in schools, placing the superintendent just below the school board and above teachers and building leaders. This shift toward a hierarchical, management model dramatically influenced the role of the superintendent, who would now function as the chief district administrator with increasing power and authority within the school system. In fact, this trend made some business and government leaders uneasy because it allowed an increased capacity for social policy influence by superintendents and departed from a pure grassroots community leadership of schools. Mirroring their newfound authority, school superintendents broke from the National Education Association and created the American Association of School Administrators during this era.

The 20th Century

In the 1930s, following the great stock market crash, there was an increased attack on scientific

management approaches and a call in research literature and from progressive educational leaders to focus more on human relations development. Superintendents were called on to manage more democratically, and the idea of shared authority was introduced. During this time, superintendents were criticized for gaining too much organizational power and relying too heavily on government resources, thus further diminishing the ideals of local control that had been the hallmark of school board-run districts. The subsequent call for superintendents to rely more on their local communities was reinforced by scarce resources. Consequently, superintendent roles became more focused on political activities to garner diminishing resources from state and local leaders and galvanized the superintendent as political strategist.

During the 1950s and 1960s, post-World War II prosperity coupled with the growing dissatisfaction with the concept of democratic leadership promoted a change in the superintendency. During this time, social science theory was rapidly expanding and was now including the studies of school administrators specifically. In fact, educational administrative theory began to replace practical, anecdotal advice in school management textbooks in the 1960s. A growing number of the public were becoming more involved in schools, and there was a resurgence of criticism of the school superintendent's ability to lead schools. Democratic leadership principles were viewed as idealistic and mainly ineffective in the face of an escalating national defense concern with the Soviet Union and emerging global competition in economic and technological arenas.

During this era, school administrative training programs began infusing social science theory into the curriculum, marking a shift in the focus from internal management to the influence of the broader legal, political, social, and economic context. In addition to the societal changes noted above, the 1954 landmark case *Brown v. Board of Education* brought schools and their superintendents squarely into the business of managing and helping resolve national social issues such as discrimination. These trends further expanded the importance and influence of superintendents into national social issues and changed their role into one of an applied social scientist.

Today's Superintendent

During the 1970s and into current times, societal changes continued to influence the role of the superintendent. This era, labeled the Information Age, required skills to acquire and process large amounts of information, and schools were charged with focusing the curriculum more on problem-solving skills, and knowledge acquisition and management. The easy and instant access through the Internet to previously inaccessible information led to an exponential increase in international competition. The 1983 report *A Nation at Risk* criticized schools for not preparing students to meet this challenge and led to a cry for performance-based assessment of schools. This era required superintendents to focus more on collaboration and communication with internal and external stakeholder agencies, and management preparation programs began to focus more on larger issues of social policy and how schools were affected by and could influence that society. This era ushered in the superintendent role of communicator.

Current social conditions have also influenced the role that superintendents play in local school governance. Researchers describe the influence of external forces affecting schools, noting technology advances, changes in family structure, increased pockets of poverty, high minority student populations, diminishment of a common culture or set of values, ideological pluralism, and centrist reform and accountability demands embodied in the No Child Left Behind Act. As a result, superintendents were faced for the first time with the need to successfully educate *all* students while also managing diminished resources and demands for involvement in decision making from a community with often diverse and sometimes contradictory values, cultures, and ideologies.

Required Skills

As a result of this changing social context, educational leadership research has downplayed the need for managerial and technical skills and emphasized skills akin to social engineering, such as the transformation of culture, the development of moral purpose, and equity and social justice. School superintendents are

expected to be experts in consultation and negotiation; consensus building; and reconciliation of diverse culture, values, and ideas both within and outside the school. Superintendents are asked to increase the achievement of all students in their schools, including those with learning disabilities and those who do not speak English as their primary language. All of this is to be accomplished while recognizing and celebrating divergent cultures and ideologies and ensuring social justice and equity.

Superintendents are also called on to be political strategists. Superintendents exist in the center of a maelstrom of centralized federal and state reform directives and local community demands that may or may not be congruent. They are expected to include all stakeholders (school personnel, parents, community members, and students) in a decentralized decision-making process while managing a nonprofessional, elected school board that has statutory power to make the final decision.

Additionally, societal changes seem to demand an increase in the use of collaborative decision making, yet the inclusion of outside community influence is often avoided and resisted by school staff and, sometimes, school boards. Although the educational interests of superintendents seem tantamount, most report that their primary duty is managing their political world, which is contextually unique in each and every school district. Communities differ in their power structures, as do the characteristics of the school board, influencing the superintendent's role.

For example, researchers have found that most communities today are pluralistic, that is, they lack a commonly shared ideology but are willing to negotiate and compromise. Most school boards take on a center ground and remain values static. This combination calls for a superintendent who functions as a diplomat, professional advisor, mediator, and facilitator. Although this represents the majority of communities and boards, a healthy minority are elite dominated, factional, or inert, requiring a superintendent to take on different roles to have success. This process of assessing a community and organizational culture and adapting the appropriate leadership role is known as *organizational socialization*.

Typical Roles

Unfortunately, superintendents tend to fall into one of two categories, that of professional advisor or decision maker, indicating that in more than half of the districts, the leader's role and the community culture is mismatched. Researcher studies have confirmed that superintendents list a strained school board relationship as a primary reason for leaving a district, which they do nationally every six years on average.

In apparent contradiction to the call for leadership over management skills, superintendents report that most of their time on the job is spent on fiscal matters, facilities, and personnel issues. Notwithstanding the call for more focus on student learning, superintendents round out their duties dealing with community and school board matters, writing policy, and dealing with legal issues. Despite the changing demographics in schools and communities, superintendents from 1922 to 2000 have remained mostly White, male, middle-aged, past high school teachers; only their rate of earning doctoral degrees has changed significantly. Even though many individuals hold superintendent licenses, fewer than half seek positions, citing unreasonable job stress and the instability of the position as primary reasons for not doing so.

Although the social context of K–12 schools has changed, as has the theoretical base in superintendent training programs, some believe that the position has remained a mix of scholarly leadership, management, social science application, communication, and political strategy. Generally, superintendents are hired and evaluated by community boards, work on single-year contracts, and do not enjoy tenure protection. Some suggest that these superintendent roles have never been clearly delineated, but rather the focus of each role has ebbed and receded to match shifting external expectations of behavior to please various stakeholders who ultimately determine whether success has been achieved.

SURVEILLANCE IN SCHOOLS

School surveillance via a variety of search and patrol methods currently serves as the most common approach for dealing with student crime and violence. Headline-making instances of school violence in the 1990s led to a proliferation of surveillance. Whereas some believe it increases the perception of safety and decreases crime, others raise questions about privacy issues and the environment of suspicion that surveillance may create. This entry looks at methods of surveillance, the historical background, and arguments both for and against its use.

Implementing Surveillance

School surveillance methods include locker searches; metal detectors; security cameras; police patrols; and, more recently, biometric scanning and Internet tracking. Locker searches basically involve school officials (principals, teachers, disciplinarians, security personnel), randomly and without student permission, opening a student's locker and investigating its contents. Metal detectors, in the form of handheld wands or walk-thru units, are used to find metal objects carried by students, particularly guns or knives. Security cameras and closed circuit televisions (CCTVs) are used to monitor the activities of school participants in places like hallways, parking lots, and stairwells. Police patrols, performed by security personnel, occur within the school environment, as well as in the surrounding community. Officers may be dressed in either plain clothes or uniform. The fairly new technology of biometrics involves fingerprinting and face recognition, with the former being used more prevalently. Internet tracking has become more common in schools and workplaces. School officials and company employers are using the latest software products (eBlaster and Spector Pro) to assist them in overseeing e-mail usage and Web site searches, as well as

preventing sexual harassment and cyberbullying among students and adults.

School surveillance became a central focus in American society in the 1990s after shocking episodes of school violence were witnessed in places like Jonesboro, Arkansas; Jefferson County, Colorado; Paducah, Kentucky; and Pearl, Mississippi. In the wake of these highly publicized tragedies, the need for safer schools became a concern not only for educators and families, but also for politicians. Federal programs and legislation, such as the Gun-Free Schools Act of 1994, geared at minimizing school violence, broadly translated into zero-tolerance policies that found schools across the nation adopting surveillance tactics as the primary means for ensuring school safety. Although surveillance has been criticized as an invasion of privacy and an infringement upon students' Fourth Amendment rights, some regard it as indispensable in maintaining a sense of safety for all school participants.

Roots of institutional surveillance can be traced as far back as the late eighteenth century. Jeremy Bentham, an English philosopher, conceived a model for a type of prison called the Panopticon. The building's tall, circular structure situated prisoners in cells or compartments along its inner circumference, and the building's inspector, or chief guard, was lodged in the center, having a view of all prisoners at all times. As Bentham was faced with numerous political and financial obstacles at the time, the Panopticon essentially remained a blueprint. However, its architectural influence can be seen in the basic organization of today's prisons. The Panopticon's hierarchical design has also served as a metaphor for ideas related to "discipline" and "social structure" within institutions like hospitals, military facilities, and schools. French philosopher Michel Foucault looks at this phenomenon extensively in his 1975 publication *Discipline & Punish: The Birth of the Prison*.

Arguments Pro and Con

There is a range of advantages and disadvantages associated with the employment of school surveillance methods. Proponents of these measures include parents, students, school officials, legislators, lawyers, and security systems experts. These groups maintain that the key benefit of such tactics is that they provide

school participants with a feeling of security. It is widely held that when students and educators are worried less about their safety, teaching and learning can proceed more effectively. It is also argued that the use and presence of school surveillance helps in deterring potential acts of crime and violence such as assault; robbery; vandalism; and drug possession, distribution, and use. The idea is that if students realize that they are being videotaped or at any time may be searched, then they will be less prone to commit an offense. Supporters of surveillance also contend that security systems help keep school participants safe from outside forces such as gangs, terrorists, and parental kidnapping.

Opponents of school surveillance are represented by the same groups as those in favor of it. One criticism that is often presented is its high price tag. The cost for testing and installing the technology (e.g., CCTV systems) can run \$50,000 or more, with an added expense for upgrading. It is argued that these expenses would be better used for curriculum resources or school infrastructure.

Surveillance is also criticized as to whether or not it actually works. As students have found ways to bring weapons into schools, avoiding metal detectors and security cameras, the purpose of its use (and even its overuse) is often called into question. Another argument against school surveillance is largely focused on the use of security cameras. This technology has been thought to encourage profiling based on race, gender, sexual orientation, religious beliefs, and so on. Certain students may be tracked by cameras as their appearance fits a particular profile.

Finally, the most noted argument against school surveillance is that it fosters a climate of paranoia and persecution rather than safety and protection. For example, when student lockers are searched, this is viewed not only as an invasion of privacy, but also as a loss of ownership. Many students consider their lockers to be a private place to store personal belongings. When school officials invade that space, a feeling of disconnection, as well as distrust, can arise within students, negatively affecting their morale.

The most controversial aspect of school surveillance, relative to legal and ethical concerns, revolves around the privacy that is compromised by its use. Although the Fourth Amendment of the U.S. Constitution forbids unreasonable searches and

seizures, schools, like airports and courthouses, have been recognized as distinctive settings where officials have a wider range of powers in order to ensure a safe and orderly environment. Thus, schools possess the authority to decide how and when to execute a surveillance program. For instance, locker or student searches (via metal detectors) can be scheduled weekly or daily and based upon “reasonable suspicion” or hearsay. Courts have been less inclined to uphold cases of “unreasonable” search and seizure, as schools hold the unique power to define what is reasonable and can warrant a search at any time based upon the threat of violence.

The greatest concern among students, parents, and others is that surveillance tactics may extend so far beyond reasonable suspicion that they become an everyday routine. The imagery of Big Brother invading every facet of citizen life creates a feeling of both fear and dread. Although courts often side with schools, ethics do play a role in helping to balance the scales. Various legislation and civil rights policies mandate that the operation of surveillance measures be as minimally invasive as possible in order to guarantee students’ right to privacy. For example, video surveillance should neither record audio conversation nor be carried out in places where students and adults expect reasonable privacy, such as locker rooms and bathrooms. Likewise, in the

case of Internet monitoring, students and adults must be informed that Web searching and e-mailing will be subject to filtering and supervision.

TEACHER ALIENATION AND BURNOUT

Broadly speaking, alienation is an unhappy, unwelcome, and/or indifferent metaphysical disconnect between a person or group of people and something else. Alienation has been studied in all the social sciences and by philosophers and education scholars for some time. However, for all of the interest in alienation, there is little consensus as to how the phenomenon is properly defined or studied. In most lines of inquiry, the nature of this disconnection is primarily social or psychological, and the person or group may be disconnected from any number of things. For example, research suggests that people and groups have been alienated from the products and processes of their labor; political processes and outcomes; other people and groups; social and cultural institutions, values, mores, and norms; and technology.

Although alienation can be traced through a variety of theoretical traditions and disciplines, this entry emphasizes concepts gleaned from three distinct forms of teacher alienation research: those that consider alienation as a philosophical phenomenon; those that regard alienation as a social phenomenon; and those that treat alienation as a psychological phenomenon. The entry concludes by discussing the relationship between teacher alienation and teacher burnout.

A Philosophical Phenomenon

Some have argued that Western philosophers' interest in alienation can be traced as far back as Heraclitus, Plato, and pre-Socratics such as the Orphics, who noted that humans were always distanced from their ideal states and were destined to fall short of perfection by design. This argument was later explained brilliantly by Danish philosopher Søren Kierkegaard, who argued that because individuals were inferior to the divine by design, they were doomed to a life of despair. To Kierkegaard, the only possible escape from alienation and despair was to fully commit oneself to an authentic spiritual existence.

However, Kierkegaard's contemporaries, such as Friedrich Nietzsche, placed emphasis on other aspects of alienation. To Nietzsche, alienation is a characteristic common to the hopelessly weak "Last Men," people whose lack of intellectual depth and will-to-power float through life, adopting others' values as their own because they are scared, unable, or too indifferent to do otherwise. Nietzsche, Kierkegaard, and the work of others such as Jaspers and Heidegger later inspired a strand of philosophy called existentialism.

Alienation was among the central philosophical issues that captured existentialists' attention. Philosophers such as Jean-Paul Sartre and Simone de Beauvoir wrote compelling treatises on alienation, exploring the phenomenon from various perspectives, all of which generally argued that alienation was an inescapable aspect of modern existence. Among twenty-first-century philosophers, Richard Schmitt

has made a useful contribution by pointing out that alienation is multidimensional and can manifest as a global phenomenon, wherein a person is wholly alienated, or other forms of alienation that are either situational or affect only one aspect of existence.

Alienation is largely ignored among educational philosophers, save for a few such as A. S. Neill, who speak of it implicitly as a condition opposed to freedom. The one notable exception to this is Maxine Greene, who, over the course of her career, has engaged in a “dialectic of freedom” through which she has sought to deal with existential themes; among these is alienation. For Greene, the key to escaping alienation is individual agency and choice. Where some philosophers, such as Sartre, suggest that choice and freedom are twin burdens to be borne alone, Greene instead gives educators a framework through which they can meaningfully connect their individuality to others, thereby forming powerful relationships and communities. These communities can create a social network that can overcome, or at least combat, alienation.

A Social Phenomenon

Although social contract theorists such as Hugo Grotius, Jean-Jacques Rousseau, and Thomas Hobbes dealt with alienation in major works, discussions of alienation as a social phenomenon usually begin with Karl Marx. In many respects, Marx’s discussion and treatment of alienated labor was sociological and economic. He argued that alienation is the result of a fundamental problem with capitalism. Because workers do not actually own or control the products or processes of their labor, the system inherently induces alienation.

Max Weber extended Marx’s theory beyond alienated labor and instead suggested that Marx’s observation was but one example of a more pervasive phenomenon. Weber hypothesized that society’s alienation was rooted in bureaucracy rather than capitalism. The relationship of the modern working person to both bureaucracies and rational systems were of great interest to Weber. He developed theories to explain tensions in these relationships, which to him were distinctly social (as opposed to, say, a psychological

or philosophic explanation). Weber saw as the critical feature of these relationships the way they affected the individual’s capacity and ability to move toward rationally chosen goals.

Teacher alienation has been studied as a social phenomenon by neo-Marxist, conflict, and critical theorists. Conflict theories derive mainly from Marx’s and Weber’s ideas of alienated labor and work, and they suggest that conflict and a lack of certainty, rather than equilibrium, characterize educational institutions. Among conflict theorists who have studied schools and the systems to which they belong are Henry Giroux, Pierre Bourdieu, and Jean-Claude Passeron. Giroux in particular made important contributions by pointing out that cultural and curricular norms extant in modern schools perpetuate a situation of domination in both school and society. Bourdieu and Passeron also helped extend Marx’s theories of alienated labor beyond the workplace by using them to develop concepts such as cultural capital. The implications of cultural capital and reproduction theory for teacher alienation studies lie in their usefulness in explaining interactions particular to the milieu of public schooling.

A Psychological Phenomenon

Erich Fromm’s research reveals sustained and detailed analysis of psychological alienation in many different forms. Indeed, Fromm went so far as to suggest that the study of man was the study of alienation. The immense popularity of his work forever changed popular conceptions of alienation and turned what was largely a scholarly puzzle into a matter for popular debate. However, although his work was engaging and astute, Fromm did no favors to those attempting to form a concise definition of alienation. His ambiguous use of the term renders his work obtuse and a precise meaning is difficult to grasp at times.

Fromm built his analyses on Marx’s (and Georg Wilhelm Friedrich Hegel’s) concepts, applying them to a variety of other milieus. However, Fromm deviated from Marx in one important respect; the essence of Fromm’s alienation was that it was an *internal* phenomenon. He approached the relationship between the psychological individual and society without an

assumption that it could be refashioned into a healthy partnership; there is no wistful sentimentality for a better time lost in the work of Fromm. Fromm sought to understand not only the causes of alienation, but also how people made sense of these issues in their daily lives. He saw alienation as the defining feature of modern society and used it as a framework to explain everything from the rise of Adolph Hitler and the Nazi party to the individual's place in the natural world and his or her inner life.

Karen Horney's application of alienation to psychoanalysis reveals some affinity with Fromm in both emphasis and ambiguity. Her treatment of "alienation from self" is central to her psychoanalytic system, and she developed a crucial and useful method for understanding alienation as an empirical phenomenon. Horney's system focused on "inner conflicts" that result from the distance between two psychological entities: (1) the alienated self, and (2) the "real self."

The study of alienation as a psychological phenomenon took an important turn when Melvin Seeman conceptualized alienation as a multidimensional domain of inquiry. Through an exhaustive and systematic review of both empirical and theoretical studies of alienation, he identified an empirical cluster of five distinct variants of alienation. These five meanings constitute the domain of alienation: powerlessness, meaninglessness, normlessness, isolation, and estrangement. Since publication of Seeman's work, educational researchers such as Anthony G. Dworkin and Jeffrey S. Brooks have used these categories to explain and explore teacher alienation.

Teacher Alienation and Burnout

Even though the rich lines of inquiry informing alienation studies suggest that the theory of alienation might be useful in investigating many social, political, economic, psychological, and philosophical teacher-related issues, alienation is often used as a synonym for teacher burnout. Studies of teacher burnout include Margaret LeCompte and Dworkin's important work, in which they connected the construct of alienation to the lives of teachers and students vis-à-vis Seeman's theories (among others). LeCompte and

Dworkin also found that powerlessness and normlessness cause estrangement and lead teachers to experience alienation as dissatisfaction and disaffection, adopt defensive teaching strategies, and ultimately may compel them to leave the profession. LeCompte and Dworkin write of alienation in relation to classroom autonomy and place alienation-related constructs such as de-skilling and locus of control at the center of discussions of teachers' lives.

TEACHER ATTITUDES TOWARD THE TEACHING PROFESSION

In discussing their work, teachers often employ the ideology of professionalism and related concepts: that professionals have an ideal of service, that they have a comparatively higher position in a hierarchy of jobs and remuneration, and that a certain amount of power and authority is attached to their role. This entry explores these commonsense conceptions of professionalism expressed by teachers, teacher educators, and the authors of reform documents and then examines how these conceptions relate to broader ideological and structural dimensions of society.

Data on Attitudes Toward Professionalism

Qualitative studies involving interviews—and sometimes observations—of teachers in Egypt, England, India, and the United States have explored how teachers conceive of professionalism and how they draw on this notion in interpreting and shaping their work and lives in schools and communities. Research has also examined these issues through interviewing teacher educators in England and the United States, as well as through analyzing documents promoting reform in teaching and teacher education in Canada, England, South Korea, and the United States. These investigations make clear that, although there is some variation in conceptions and in evaluations of professionalism in relation to teaching, the idea of professionalism is a salient one within educational discourses, particularly in English-speaking societies.

Teachers, teacher educators, and reform documents articulated conceptions of professionalism related to three major themes: (1) service ideal versus remuneration as a value of professions; (2) professionals' status relative to other worker-citizens; and (3) power/autonomy in relation to clients, administrators, and government officials. These three themes connect to what functionalist theorists identify as traits that objectively distinguish between professions and non-professional occupations. From a conflict theory perspective, however, these traits are viewed as elements of what is considered the *ideology of professionalism*, a portrait that distorts or misrepresents currently existing social structures in ways that mobilize or immobilize individual and collective action.

Service and Remuneration

The linkage between commonsense conceptions about teaching and an ideology of professionalism can be seen by looking at contradictions in the categories that people employ in discussing them. For example, functionalists often include as traits of a profession an ideal of service and an expectation of a high level of remuneration. Some educators and reform documents highlighted an ideal of service in discussing professionalism in relation to teaching, sometimes

applauding and other times criticizing teachers' and teacher educators' degree of commitment to such an ideal.

In contrast, other teachers, teacher educators, and reform documents emphasized a high level of remuneration as a positive attribute of professionalism, usually stressing that teachers are *not* paid well relative to other professionals. The ideological nature of professionalism is further evidenced when some educators and reform documents characterize remuneration as a *negative* element of professionalism, instead promoting an ideal of service, which is argued to be the more fundamental characteristic of professionals.

Hierarchy and Power

The linkage between commonsense conceptions of professionalism and ideology can also be seen in the observed disagreement about whether the occupational stratification associated with notions of professionalism is valid and appropriate. For instance, many educators interviewed and most reform documents treated as unproblematic the idea that professionalism is related to a hierarchical division of labor. Sometimes, this hierarchy was justified explicitly in terms of professionals having higher levels of formal education, knowledge, and skill. Other times, these occupational status differences were just asserted as part of a social class structure, defined in terms of mental versus manual labor or membership versus nonmembership in unions. Nevertheless, other educators—particularly those with leftist political ideologies—rejected the stratification of occupations, whether based on some notion of professionalism or for any other reasons.

Further evidence of the ideological nature of professionalism is evidenced in the contradictory ways in which power relations are discussed by teachers, teacher educators, and reform documents. On one hand, professionalism is sometimes associated with legitimate power being exercised by teachers and other professionals and the notion that the latter should encounter no, or only limited, interference by state authorities or their managerial staff. On the other hand, professionalism can serve as a basis for

delegitimizing the power of professionals; in other words, the idea that professionalism is about following others' directives. This seems to be the case in India, where the British disseminated a particular form of the ideology during the colonial period, but also in the United States, where some school administrators and policy makers appropriate notions of professionalism for that purpose.

Implications

What are the implications of educators drawing on and reproducing the ideology of professionalism in interpreting and developing strategies for their work and lives? First, professionalism is a two-edged sword: It may serve as a resource in teachers' efforts to achieve professionalization or to deflect others' moves to "deprofessionalize" or "proletarianize" the occupation, but it can also be used by administrators, other occupational groups, and state elites to criticize or challenge teachers' claims and aspirations. Second, although the service ideal element of the ideology of professionalism suggests that the interests of professionals and the public are in harmony, the autonomy/power element points to the possibility that adopting professionalism as a model for educators' activity may lead to a distancing, hierarchical relationship between educators and community members. Third, even if teaching is not recognized as a full profession, by drawing on and reproducing the ideology of professionalism in relation to a meritocratic conception of educational attainment, teachers help to legitimate social class and gender inequalities.

TEACHER BELIEFS ABOUT STUDENTS

The process of becoming a teacher is dialogic in that teaching is about negotiating the multiple identities that people possess within the system of schooling. These multiple identities are complex and shape who people are as educators and individuals; they shape beliefs about students and the teaching and learning process. Beliefs are the representations of reality and experience that guide one's thoughts and behaviors; they are the judgments or evaluations people make of their world, others, and themselves. They are also the best indicators of decisions that individuals make throughout their lives.

A considerable body of research demonstrates that teachers' beliefs have a strong impact on the treatment of students and the instructional decisions that teachers make about teaching and learning. In that event, teachers' practice will be improved if they have an opportunity to engage in reflection about their beliefs. In particular, if teacher education programs incorporate reflection as part of their curriculum, prospective

teachers will have practice with reflecting and understanding how beliefs affect student learning. When teachers have opportunities to critically reflect and discuss how their experiences have shaped beliefs that may differ from others, they can better understand and counter practices that reproduce inequity and marginalization. This entry examines how beliefs influence teachers, how this can lead to inequities, and what measures could ameliorate this impact.

How Beliefs Operate

A review of educational research suggests that the individual teacher's beliefs, attitudes, and perspectives about his or her work guide pedagogy, instructional planning, and classroom practice. Moreover, beliefs also play an important role in the decisions that teachers make about students in general because they guide how the learner is perceived. Beliefs become the lens through which teachers interpret behavior. As a result, if a teacher believes that a student cannot achieve, then the behavior of the student will be interpreted or perceived through that lens, even when the student behaves in ways contrary to the belief. Similarly, if a teacher believes that a program works, even when it fails, the teacher will attend to the aspects of the program that preserve the belief in the program.

Teachers' beliefs operate independently from the cognition associated with developing knowledge and skills. Frank Pajares emphasized the importance of understanding the four characteristic features of teachers' beliefs: (1) existential presumptions, (2) affective and evaluative aspects, (3) alternativity, and (4) episodic nature. *Existential presumptions* address the origin of one's beliefs and how these are the reflection of individuals' presumptions about certain truths that they deem applicable to everyone. The *affective and evaluative* aspects of beliefs relate to the experiences that individuals have had and how these have contributed to forming perceptions regarding specific issues. Because they are deeply personal, beliefs can often exist beyond the individual's control or knowledge and become immutable. The *alternativity* characteristic of beliefs provides ways through which individuals can recreate situations that they perceive to be ideal. For example, pre-service teachers

who have a negative schooling experience may describe their beliefs about teaching effectiveness as a reflection of everything contrary to how they experienced learning. Finally, the *episodic* nature of beliefs influences the ways in which teachers apply their knowledge to specific classroom situations. That is, teachers may have guiding images from past events that they apply to dealing with similar situations. With this in mind, it is essential that teacher preparation programs address teachers' beliefs and take measures to dialogue about previous experience that influences what teachers believe.

Teachers may have the necessary knowledge and skills to assist students in achieving academically, but their beliefs determine how to teach in different ways and translate knowledge into practice when working with students. Based on teachers' individual belief systems, learning is accommodated in a way that makes the most sense to them. During the student teaching experience, pre-service teachers experience the realities of teaching and accommodate the knowledge that they have acquired throughout their careers. At this time, dialogue and reflection are required to understand the relationship between teachers' beliefs and the knowledge, skills, and behaviors in the classroom.

Changing Demographics

Students from racially, ethnically, culturally, and linguistically diverse backgrounds continue to experience the pervasive problem of academic failure, inappropriate referral, disproportionate representation in special education, and high dropout and retention rates. At the same time, diverse students continue to be taught by mostly White, middle-class, monolingual English-speaking females. The "underachievement" of diverse learners has been attributed in part to the cultural and linguistic discontinuities that result from the demographic differences between students and teachers.

Research points out that most White teachers have not had the opportunity to think about themselves in terms of having a racial identity or a culture. As a result, White educators often have not examined the complex relationship of students' racial and political identities and how this affects student behavior. Thus, the need to self-actualize and understand personal

culture and its influences on the way one behaves and interacts with the world and to validate *others'* experiences can be seen as a necessary component of teacher education.

Having a better understanding of the rationale behind teachers' actions can lead to further examination of the role of teachers as decision makers. Many teacher preparation programs equip prospective teachers with knowledge and skills to work with an increasingly diverse student population but do not examine the complex social context of schooling. As a result, teachers may lack awareness of systemic, societal, and institutional contributions to the perceived academic failure of culturally and linguistically diverse students with and without disabilities. Teaching and learning are situated in contexts that are influenced by social, cultural, cognitive, and emotional factors. Research on the impact of beliefs suggests that teachers who work with diverse students not only must be prepared with knowledge and skills but also must examine their knowledge, beliefs, attitudes, and assumptions about people who are different from them because these will influence their instructional practices.

Teacher Preparation

In addition to its influence on individual experiences, professional preparation in teacher education programs also influences the views that teachers hold about teaching certain academic content. When the many factors that can affect students' learning are not fully understood, cultural, socioeconomic, and linguistic differences may be viewed as student deficits in need of remediation.

The literature suggests that reflective journaling is one way for teachers to become more culturally sensitive and aware through critically examining their classroom practice and identifying alternative ways of responding to diversity in schools. It is important for educators to recognize and understand the socio-cultural context within which they work. To understand teachers' beliefs, one must examine the sociocultural contexts that they experience in the past, present, and future.

Teacher education programs preparing teachers to work with culturally and linguistically diverse students

must provide opportunities for pre-service teachers' reflection and dialogue about their beliefs about students who come from backgrounds and have experiences different from their own. As the student population continues to become increasingly diverse and the teaching force continues to be largely monocultural, it is also critical for teachers to understand the influence of culture and language on academic performance. Teacher preparation programs must encourage prospective teachers to question and discuss how their own cultural backgrounds, values, and beliefs can influence their view of students from diverse backgrounds, expectations for these students, and instructional strategies used in working with them.

TEACHER CERTIFICATION

Teacher certification is a regulatory measure to ensure a minimal skill level for teachers. Implicit in the definition is the nuance that the certifying agency warrants that the teacher is qualified. Current certification practices focus on ensuring competence in subject matter and pedagogy, often by means of testing. In addition, the certification process allows the certifying agencies to examine certification applications

for individuals with prior criminal records. The certifying agency may require periodic reapplication, continued professional development, and an established level of acceptable behavior for the teacher to maintain certification. This entry looks at the development of traditional teacher certification programs and briefly describes recent alternative strategies.

Traditional Certification

The first school designed for the training of teachers, the normal school, began operation in Massachusetts in 1839. The practice of teacher preparation was slow to spread, and the system did not become commonplace until the late nineteenth and early twentieth centuries. Lacking a national teacher certification requirement, the responsibility for teacher certification was left to each state.

There is substantial variation in the specific rules and procedures among the states, but traditional state certification schemes are similar. First, state certification agencies establish certification standards, or minimum guidelines, for teacher education colleges within the states. In most instances, the certifying agency is the state's board of education or a professional practices board comprised of elected or appointed certified teachers and administrators. Second, the teacher education colleges establish programs to meet the minimum criteria established by the state. Finally, when the prospective teachers complete the college program, the college recommends the students to the state certification agency, who then "licenses" or certifies the teachers. Prior to obtaining the certificate, states generally require that the prospective teacher be a resident of the United States and of good moral character. Additionally, states usually require that the applicant have at least a bachelor's degree and a minimum number of hours in pedagogy and the subject to be taught.

The awarding of a teacher certificate based upon the completion of a state-approved program was the predominant means of certification during the early twentieth century, and by the early 1950s, most states issued certificates on this model. Citing studies showing the importance of the teacher in student learning outcomes, policy makers in the 1980s began to focus on teacher quality. Shifting from the process-oriented

emphasis of teacher preparation, states moved to a standards-based emphasis. Influenced greatly by standards developed by the National State Directors of Teacher Education and Certification, most state standards are similar in nature. Because of the similarity of standards, mobility of teacher certification across state lines is facilitated.

Concomitant with the standards-based movement, certification testing was implemented to make certain that the certified teachers had met the minimum standards. Teacher testing serves two primary purposes. First, testing provides for a systematic method of determining teacher competence. Second, testing enables the certifying agency to focus on standards-related performance as opposed to process-oriented regulations. But because of the pressure to help prospective teachers excel on the state-administered tests, teacher testing also had the effect of altering the teacher preparation curriculum. Many programs adjusted the curriculum to (a) align the content of the course work with the standards, and (b) adjust course assessment to mimic the state assessment. There have been legal challenges to the system of certification tied to testing. But as long as the test maintains content validity (tests what is taught), the courts have upheld the use of testing as a prerequisite to certification.

Empirical studies supporting the effectiveness of teacher certification are scant, at best. There is some evidence that student performance in mathematics is positively associated with teacher certification. However, studies that explore relationships between teacher certification and student success in other subject areas are inconclusive.

National Board Certification. Based upon a recommendation from a Carnegie Foundation task force, the National Board for Professional Teaching Standards (NBPTS) was established by the foundation in 1987. The NBPTS is a nonregulatory, nongovernmental organization designed to provide a voluntary system of national teacher certification. The NBPTS allows for certification in fourteen additional areas, including a generalist certificate. Although each certification is based upon a unique set of standards, national board certification is predicated upon five core propositions: (1) Teachers are committed to students and learning,

(2) teachers know the subjects they teach and know how to teach those subjects to students, (3) teachers are responsible for managing and monitoring student learning, (4) teachers think systematically about their practice and learn from experience, and (5) teachers are members of learning communities. In 2006, about 50,000 teachers had obtained national board certification. A few studies have examined the relationship between nationally board certified teachers and student achievement, and the results have been mixed.

Adverse Certification Actions. Each state has a mechanism for taking adverse actions against teachers holding teacher certificates. These adverse actions include noninscribed (private) reprimands, inscribed (public) reprimands, suspension of certificates for specified periods of time, and certificate revocation. Using an administrative hearing process, the certificate granting agency takes the adverse certification actions because of a wide range of improper actions on the part of the certified teacher. The improper actions include the violation of the code of ethics, contract abandonment, and the violation of state or federal laws.

Alternative Strategies

Traditional teacher certification programs are often criticized as operating under a set of cumbersome, highly structured rules that serve as roadblocks to innovation and creativity. Therefore, during the teacher certification reform of the 1980s and due, in part, to a shortage of certified teachers willing to teach in the public schools, some states began to allow for alternative means of certifying teachers. Many saw the new strategies as an attack on the traditional, university-based system of preparing teachers, and many prominent teacher educators viewed alternative certification as professionally irresponsible.

Alternative certification rules provide for a different system of teacher preparation, often allowing for teacher preparation to occur in locations other than a university setting. Alternative certification programs are based either in a specific school district, in a governmental institution, or as an entrepreneurial venture. School district-based programs are typically housed in large school districts that have the resources available to deliver the training in pedagogy and classroom

management. Generally, it is these same districts that have the greatest shortages of qualified teachers.

Using the flexibility allowed by alternative teacher certification statutes, states have seen the growth of nontraditional programs in universities and intermediate education agencies (i.e., regionally located education service organizations). In states where there are two sets of program regulations, one for traditional university-based programs and one for alternative certification programs, some universities have opted to develop teacher certification programs under alternative rules. Others have chosen to develop two distinct programs, traditional programs for the traditional university students and alternative programs for mid-career-changing individuals or nontraditional students.

Intermediate education agencies use the flexible alternative certification rules to design programs that enable individuals who hold bachelor's degrees to bypass the structured university environment. They begin teaching after completing various program modules. Consequently, unless an arrangement has been made with a university, the content of the modules does not result in university credit.

A few states have opened teacher certification programs to entrepreneurial groups. Prominent among these are national programs such as Troops to Teachers and Teach for America that are touted as viable alternatives to traditional, university-based programs.

TEACHER EDUCATION IN A GLOBAL CONTEXT

In the twenty-first century, educators are experiencing the challenge of working with learners and families who represent a diverse range of experiences, practices, and beliefs. The changing demographics regarding the languages spoken, communication patterns, family configurations and functions, expectations of education, child rearing, problem solving, and access to resources ensure that educators will be working with persons whose culture and experiences are different from their own. Educators will be working with native learners and families who have very different experiences and expectations, as well as children and families who are immigrants from Western and non-Western cultures. As a result, teachers must increasingly be taught to do their work in a global context. This entry looks at what is required and how teacher education can meet these needs.

Demands of the Global Context

As nations are developing their education systems and opening educational opportunities to a broader population of learners, they are confronting the issues of ensuring the quality of teacher education, dealing with the shortage of qualified teachers, and meeting the needs of more diverse students. In their attempts to meet those needs, nations are recruiting educators from more diverse populations and from abroad. These educators are exiting their own cultural niche to enter the cultures and work with diversities that may be very different from their own.

Educators of the twenty-first century are working in a global society and preparing students to be citizens of that society. National as well as state and local economies are competing for the world's resources, among them jobs, education, services, minerals, water,

fossil fuels, and intellectual property. This competition tends to increase friction between the "haves" and "have nots," both globally and locally. Immigration and outsourcing of jobs are key issues.

Educators must prepare young people to create policy and practice that address quality-of-life issues and determine who will have access to basic needs/resources. An unequal distribution of resources and opportunities by ethnic/racial groups will create factors that place children at risk (poor health, poverty, violence, homelessness, migration, education, etc.) and affect local, national, and international societies. Educators will have the responsibility of educating these at-risk learners.

Within this global context, teacher preparation is aimed toward preparing globally competent teachers and, as a result, globally competent students and citizens. Within a global context, teacher education prepares teachers who demonstrate the ability to listen, observe, evaluate, analyze, interpret, and relate political and cultural histories, global systems, and global issues. Teachers are also prepared to understand the interconnectedness and implications of local and national decisions on global issues (nation-states, regions, ethnic groups, European and non-European origins, languages, history, traditions), and vice versa. Teachers prepared within a global context can prepare students to be successful citizens in a global society, who themselves exhibit these same characteristics.

Required Characteristics

Teacher preparation programs that incorporate a global context focus on personal experiences, intercultural communication, problem solving, and collaboration in the context of global cultures and issues as well as local, state, and national cultures and issues. Personal experiences might include faculty providing their teacher candidates with personal acquaintance and experience with a culture different from their own through field experiences in situations that are new and uncomfortable and bringing the world to their teacher candidates in a way that can be heard and understood. The focus of these experiences should be development of self-knowledge, or awareness and understanding by teacher candidates of their own

filters, beliefs, practices, and norms. Providing teacher candidates with opportunities to experience, interpret, reflect on, and share out-of-comfort-zone experiences with the guidance of faculty and trusted others encourages them to listen to people who others may think have nothing to say, see what the larger society often overlooks, and understand the implications for their own professional practice.

A focus on intercultural communication would include modeling new or alternative ways of seeing and knowing and discovering patterns of connection between communities of professional and social communities. This focus involves exploration of communication as more than language differences, analyzing factors such as gestures, paralanguage, context, and so on. Faculty must model listening, observing, and establishing rapport quickly, and they should provide teacher candidates with multiple opportunities and contexts to practice these skills themselves.

Developing globally competent problem solvers involves providing teacher candidates with opportunities of direct observation, investigation, experimentation, and skill in the application of their knowledge and skills, modeling a collaborative mindset in problem solving and taking advantage of the diversity of ideas, practices, and beliefs represented rather than fearing them. Faculty must encourage their teacher candidates to take the initiative and risks of using old knowledge and skills in unique ways or circumstances.

By modeling and providing opportunities to develop resourcefulness and adaptability in using information in new and changing situations and environments, faculty will help their teacher candidates build perseverance so that they can overcome barriers and/or continue despite barriers. Such experiences challenge faculty and teacher candidates to explore their own beliefs and those of others, and to develop self-reliance and self-confidence to function in multiple, dissonant environments and work in difficult and ambiguous settings.

Faculty developing globally competent collaborators use enthusiasm and humor in their interactions with others, and they enlist allies to model being an effective and cooperative team player and motivating others to excel. Faculty model and provide opportunities for teacher candidates to collaborate effectively

and knowledgeably on teams consisting of individuals representing multiple discipline perspectives as well as cultural perspectives, in diverse settings and contexts. Teacher candidates are encouraged to engage in personal and professional inquisitiveness and enlist allies to support their explorations and practice.

In conclusion, teachers of the twenty-first century can expect to plan and implement curriculum and instruction and to monitor learning outcomes for international learners. Whether the venue is a classroom in their native country or in a foreign country, whether the audience be PreK–12 students, higher education students, or in-service teachers, educators must be prepared to address their own and their learners' culture at each stage of the education process—planning, implementation, and follow-up.

Knowing the contexts of the learning and teaching of teachers is important in planning teacher preparation content, processes, and experiences. Understanding the communication and language similarities and differences among agencies, disciplines, and locales is another key to success. Teacher preparation for decision making and practice is facilitated by familiarity with the legal and social policies governing delivery of services to learners with diverse abilities, as well as the involvement of their families and communities. Finally, the need to build easily accessible shared knowledge regarding attitudes, policies, and practices in teacher preparation, teaching, and special needs learners across cultures and globally, as well as knowledge and use of materials normed and appropriate for different cultures' learners, is ongoing and should be addressed.

TEACHER PREPARATION

The social and cultural foundations of education infuse the field of teacher preparation throughout all levels within the United States, providing a context for the study of education. Future teachers learn why schools are the way they are and how they are based within social, cultural, political, economic, community, and historical contexts. Educational foundations is a course taught in many teacher preparation programs. The topics addressed are also frequently found within state standards for what candidates for teaching credentials must demonstrate. The foundations of education also have a presence in national accreditation organizations; contribute to national debates on education; and influence educational policy at the local, state, and national levels. At the same time, however, there is a consistent concern about the dwindling importance of foundations within schools of education because of increased standardization. This entry will describe the basics of teacher preparation: when it occurs, where it occurs, and what is taught in the programs. It will also describe the issues of key concern for the social and cultural foundations of education related to teacher preparation.

When and Where

In order to earn a teaching credential, a candidate is usually expected to hold a bachelor's degree, often along with additional education. Some states allow candidates to receive their teaching credential while earning their bachelor's degrees in education. Other states have a postbaccalaureate program that follows a bachelor's degree. And yet other states have programs that offer the teaching credential in conjunction with a

master's degree. Newer teacher preparation designs involve direct paths to teaching through internship programs that offer full-time teacher status with university courses taken at the same time.

Traditional teacher preparation programs offer university courses at the college or university campus, followed by multiple weeks or multiple semesters of practicum, called "student teaching," in K–12 classrooms. However, there is also a movement toward shifting part of teacher preparation programs into the schools and communities. In what is called the Professional Development School model, teacher preparation programs are expanding to meet not only the credentialing needs of university students who desire to be teachers, but also the professional development needs of current teachers who serve as mentors for the university students. These new structures of teacher preparation have resulted in an increased connection between university colleges of education and public schools and districts. In these structures, teacher preparation is more field-based, and teachers in schools have the opportunity to be more research- and theory-based.

Curriculum Issues

Programs commonly combine university coursework with field-based experiences to gain practice in classrooms. When these two components of a teacher preparation program are separated by time or location, the result is a tension between educational theory and educational practice, often termed the "theory/practice split." To draw theory and practice together, courses in educational foundations draw on philosophy, history, sociology, and anthropology of education to provide the theory on which to base practice.

An additional tension within teacher education is found between pedagogy and content, between "how to teach" and "what teachers should know." Lee Shulman, among other educators, has helped to clarify the connections between pedagogy and content with his concept of "pedagogical content knowledge," which states that a teacher must have in-depth knowledge of a subject matter, as well as knowledge of how to teach that content to students.

Shift Toward Critical Pedagogy

A key role for the social and cultural foundations of education has been to help shift traditional forms of thinking in teacher preparation programs to take a more critical stance on the education system. In what is called critical pedagogy, educators critically challenge accepted norms and power structures within society and the educational system. Teacher preparation candidates are challenged to examine issues of power and racism in order to help create a more participatory democracy within their classrooms and society.

An additional approach encouraged through foundations of education is called “culturally responsive teaching.” Through this approach, teacher preparation candidates are now asked to consider how learning and curriculum relate to race, class, gender, and sexual orientation. Candidates are asked to address how privilege is expressed in education and how to help put an end to inequalities.

National Standards

Several national organizations exist that help forward the agenda of reflective teaching, improved teacher education, and the examination of context within teacher education. Two examples, among many, include the Carnegie Foundation for the Advancement of Teaching, under the guidance of current president Lee Shulman, and the National Commission for Teaching and America’s Future, with founding Executive Director Linda Darling-Hammond. Through these and many other organizations and individuals, the social and cultural foundations of education have found a place in state and national standards for teacher preparation, promoting active participation in debate.

The Council for Social Foundations of Education has created its own standards of preparation and certification, titled “Standards for Academic and Professional Instruction in Foundations of Education, Educational Studies, and Educational Policy Studies,” which clearly define what the foundations of education are and how teacher preparation programs can prepare teachers better if these standards are addressed. Organizations such as these engage in

active examination of how to improve teacher education, as well engaging policymakers to make change.

TEACHER RECRUITMENT

Teacher recruitment includes varied efforts to attract potential candidates to the profession and/or to vacant teaching positions. Although the United States prepares sufficient teachers to staff available openings,

teacher recruitment serves two broad purposes: diversifying the teacher workforce and staffing key shortage areas. Recruitment policies and programs, leveraged by states or local districts, generally address teacher preparation, entry requirements, and hiring incentives. Some of these initiatives appear promising. However, teacher turnover threatens the success of recruitment efforts. Nevertheless, teacher recruitment plays an important role in shaping the teaching profession, especially teacher characteristics and pathways into teaching. This entry looks at goals of teacher recruitment, strategies for accomplishing it, and teacher shortages.

Purposes of Teacher Recruitment

The urgency for teacher recruitment depends on supply and demand. Some studies predict nationwide teacher shortages in coming years. Other speculations are more moderate; arguing regional shortages—inequities in teacher *distribution* (rather than insufficient supply of teachers)—will continue to be the norm. Regardless, two conditions drive contemporary efforts to expand the pool of teacher candidates: teacher demographics and specific shortage areas. The former has national scope, whereas the latter is somewhat more localized. Each presents its own unique set of challenges, but the concern that cuts across both is teacher quality.

Forcing a Shift in Teacher Demographics

There are two demographic issues pushing teacher recruitment: diversity and academic ability. The first tackles long-standing patterns of who becomes a teacher. The teaching population continues to be dominated heavily by White females. Yet student populations are increasingly more diverse, especially in areas of the country like California and Texas. The disparity between student and teacher demographics underlies efforts to diversify the teaching force—recruiting minorities and males so that the race/ethnicity/gender of the teaching population more closely matches the student population.

A second issue concerns teacher candidates' general academic ability. Statistical studies show that students with lower college entrance exam scores are

more likely to become teacher candidates than those with higher scores. These figures cause alarm about teacher quality. If education is the next generation's hope for the future, students deserve the “best and the brightest” as teachers.

Attracting Teachers to Key Shortage Areas

The No Child Left Behind Act, enacted in 2002, requires all teachers to hold credentials appropriate for their teaching position. The mandate prevents districts from hiring teachers who are “out of field,” a practice used to fill vacancies in the past. Consequently, there is a push to attract candidates for national shortage areas in mathematics, science, bilingual, and special education—there are simply not enough teachers preparing for these areas. Labor market specialists point out that potential mathematics and science specialists often have a wide array of career options in industry and government, with better salary and benefits than teaching typically offers.

Certain geographic areas and types of school districts are especially prone to teacher shortages. States with large student populations (e.g., California), high-poverty urban centers, and isolated rural districts often struggle to fill vacancies with qualified teachers. Wealthier districts are more likely to have resources that attract qualified teachers—salaries, working conditions, and other incentives. Consequently, high-poverty schools are less competitive in the teacher market—a situation that leaves the neediest students at risk for substandard education. The recruitment challenge is twofold: increase the number of applicants without sacrificing quality.

Teacher Recruitment Strategies

Whereas local districts typically operate their own recruitment programs, many states sponsor statewide or district teacher recruitment efforts. At the federal level, Title II Teacher Quality Enhancement Recruitment Grants support state and local efforts to recruit highly qualified teachers for acute shortage areas. States/districts strapped for teachers are the most aggressive, employing multiple strategies to attract qualified teachers. Some districts, for instance, hire marketing specialists to put together recruitment

campaigns that include job fairs, slick Web sites, and media coverage. Other types of strategies include specialized teacher preparation programs, streamlined licensure policies, and incentives. As might be expected from locally controlled recruitment, there are many versions, reflecting local variation and staffing needs.

Specialized Teacher Education Programs

Because teacher education programs are dependent on students for their livelihood, recruiting teacher candidates goes hand in hand with teacher preparation. Although teachers tend to cite intrinsic (e.g., helping children, contributing to society) rather than extrinsic (e.g., salary) rewards as reasons for becoming teachers, job security attracts them as well. Programs targeting shortage areas can promise (and sometimes even guarantee) participants teaching positions upon completing their degrees.

Teacher education programs recruit teachers into key shortage areas in several ways—early outreach, “grow your own,” and shortage-specific preparation programs. Early outreach acquaints elementary and secondary students with teaching as a career through job fairs, clubs, coursework, and tutoring/teaching experiences (e.g., the Teacher Cadet program). State and district “grow your own” or “pipeline” programs produce the teachers they need themselves, often in partnership with teacher education institutions. These programs provide financial assistance for undergraduates, paraprofessionals, or teacher aides to obtain their teaching license in shortage areas, often in exchange for a multiyear teaching commitment. Teacher education institutions increasingly offer an additional approach, tailoring undergraduate and postbachelor’s programs for urban districts or other shortage areas—mathematics, science, bilingual, and special education. Many early outreach, grow your own, and shortage-specific programs are designed to attract men and minorities to the profession as well.

Alternative Certification Programs

Alternative certification programs are another method for drawing nontraditional populations, including minorities, mid-career changers, and retired

professionals. Labor market specialists suggest that teacher certification requirements may keep talented individuals from pursuing teaching as a first or second career. Alternative routes, as they are sometimes called, recruit individuals with subject expertise to high-need teaching areas. These programs streamline the path into teaching, allowing college graduates to become full-time teachers sooner than state certification would normally permit.

Alternative certification programs have mushroomed during the past decade. However, programs vary widely, from entry requirements to educational components to on-the-job support. Teach for America and Troops to Teachers are examples of national programs that recruit teachers through alternative certification pathways. At the state level, in 2006, nearly all states reported offering alternative routes to teacher certification. Moreover, districts increasingly design their own alternative route programs for shortage areas. For instance, Chicago and New York both have “Teaching Fellows” programs, recruiting academically and professionally successful individuals to teach full-time in shortage areas while completing teacher certification requirements.

Incentives

Specialized teacher education programs and alternative routes offer ready-made teaching positions as their plum. A parallel recruitment line targets the financial rewards of teaching. Monetary enticements run the gamut—increased salaries and benefits, housing assistance, loan forgiveness, scholarships, and signing bonuses. Most states use at least one of these incentives to recruit teachers. A few states, desperate for qualified teachers (e.g., California and North Carolina), use them all.

Impact on Teacher Shortages

It is difficult to evaluate the impact that innovative recruitment strategies have on teacher demographics and shortages. Although states and districts design recruitment with such purposes in mind, few studies rigorously examine their effects. There is still much to be learned, and results are mixed. At present, it appears that some alternative certification programs

attract a population that is more diverse by ethnicity, gender, and age. Few conclusions can be drawn about teacher education or grow-your-own programs; the research is insufficient. Moreover, there are no conclusive results about the influence of these programs on teacher quality. The same holds true for incentives. Although financial rewards, to some extent, may attract more teachers, there is limited evidence about how these incentives influence the demographics or quality of the teacher workforce.

Shaping the Workforce

The composition of the teacher workforce has been relatively consistent. A more open labor market heightens competition for teachers. Recruitment strategies have the potential to bring more, and demographically diverse, individuals to teaching. It appears unlikely that shortage areas can attract qualified teachers without re-imagining how teachers are educated, certified, and compensated. Much more research is needed, however, on the implications of recruitment innovations on teacher quality.

Furthermore, the extent to which recruitment practices shape the teacher workforce and affect key shortage areas is moderated by teacher attrition. The teacher labor market has been described as a revolving door or a leaking bucket because of teacher turnover. Recruitment efforts can open the door or fill the bucket. However, the hiring practices and working conditions that teachers encounter can just as quickly drive them away. Recruitment, then, is not an isolated activity—its impact is tightly tied to teacher retention.

TEACHERS, LITERARY PORTRAYALS OF

Teachers appear as characters in a wide range of literary writing—including novels such as *Jane Eyre* (1847), *Good-Bye Mr. Chips* (1934), and *The Prime of Miss Jean Brodie* (1962); short stories such as “The Legend of Sleepy Hollow” (1820), “Wings” (1919), and “The Children’s Story” (1963); plays such as *Love’s Labours Lost* (1595), *Three Sisters* (1901), and *A Streetcar Named Desire* (1947); memoirs such as *The Thread That Runs So True* (1949), *To Sir, With Love* (1962), and *The Water Is Wide* (1972); and children’s books such as the *Magic School Bus* series (1986–2001), the *Miss Malarkey* series (1995–present), and the *My Weird School* series (2004–present). These literary depictions of teachers—whether real or fictional—can provide valuable insights into the ways in which the teacher identity is constructed within our society. Furthermore, because such literary works are widely disseminated throughout society, they not only reflect what people think about teachers, but they can also actually help to shape these perceptions.

Some of the more common themes that emerge from literary depictions of teachers include the following: teacher as nurturer, teacher as subversive, teacher as conformist, teacher as hero, teacher as villain, teacher as victim, and teacher as outsider. In some instances, a single teacher may simultaneously possess multiple identities, whereas in other instances, he or she may be transformed from one identity to another as the story progresses.

Teacher as Nurturer

Many teachers are depicted as caring, understanding, compassionate, and benevolent leaders in their classrooms—including Anne Shirley in *Anne of Avonlea* (1909), Ella Bishop in *Miss Bishop* (1933),

Miss Temple in *Jane Eyre* (1847), Rick Braithwaite in *To Sir, With Love* (1962), Laura Ingalls in *These Happy Golden Years* (1943), Mr. Chips in *Good-Bye Mr. Chips* (1934), and Pat Conroy in *The Water Is Wide* (1972). These teachers tend to be respectful toward their students and work hard to provide them with sustenance for their intellectual growth. They also value the formation of relationships with students and the importance of building a sense of community within their classrooms.

Perhaps this kind of teacher is best exemplified by Ella in *Miss Bishop* (1933), a novel about the life and career of a college English teacher. Ella quickly establishes a reputation for being a friendly, hard-working, and gifted teacher who steers her students toward their passions. Her nurturing also extends to her personal life, as she cares for her sick mother for nine years, and also selflessly rears her cousin's newborn orphaned daughter whose father had actually been Ella's fiancé before the cousin had seduced him away from her. Illustrating her eternally optimistic nature, Ella names the little girl Hope.

Teacher as Subversive

Subversive teachers resist "the system" or the status quo of teaching in some way, sometimes openly rebelling and other times quietly proceeding with unsanctioned activities outside public view—often at the risk of being fired. For instance, the teacher might deviate from the approved curriculum, or teach the students to be critically aware of their taken-for-granted assumptions about the world in a way that challenges strongly held belief systems or existing structures of power.

Examples include Mary Logan in *Roll of Thunder, Hear My Cry* (1976), who is fired from her job as a seventh-grade teacher in rural Mississippi during the 1930s for teaching her students about the systemic structures that undergird racism; Joe Robert Kirkman in *Brighten the Corner Where You Are* (1990), who is called before the school board for disciplinary action after teaching evolution in his high school science class; Anna Vorontsov in *Spinster* (1958), who literally burns her workbook in order to free herself from

its control; and Mr. Anderson, the art teacher in *Speak* (1999), who is reprimanded for not grading his students' work.

Undoubtedly, however, the most well-known example of a subversive teacher is Jean Brodie, a progressive educator in a conservative school in 1930s Scotland, who systematically molds her students after her own interests and desires to create an identifiable clique of girls within the school known as "Brodie Girls."

Teacher as Conformist

In contrast to the subversives, conformist teachers unthinkingly conform to the system, fully accepting the conditions of their work and of society at large without critical examination. They serve as agents of hegemony within their communities, continually and unknowingly reinforcing the status quo.

One teacher who fits into this category is Miss Crocker in *Roll of Thunder, Hear My Cry* (1976), who whips Little Man and Cassie because they refuse to accept tattered old textbooks that were previously owned by White students. Miss Crocker cannot comprehend the reason for their behavior and instead views it as a simple act of defiance that must be punished.

Another teacher is Miss Dove in *Good Morning Miss Dove* (1947), who is so formal, so routinized, and so unchanging that she personifies the system itself. Laura Ingalls in *These Happy Golden Years* (1946) is also a conformist. Although sympathetic as a character and well-liked by her students, she nonetheless dutifully accepts the system without question, remaining naively unaware of the moral, social, and political implications of her work.

Teacher as Hero

Some teachers are cast as heroes. They may heroically respond to a crisis in a way that protects or saves others, or they may become heroes by taking a strong moral stand in the face of adversity. In *My Face to the Wind* (2001), Sarah Jane Price is a young teacher who reacts courageously to save the lives of her students when their poorly constructed schoolhouse collapses

during a blizzard. Similarly, in *Blackboard Jungle* (1954), Rick Dadier bravely stops a student from raping another teacher and later performs another heroic act when he disarms a knife-wielding student who attacks him in his classroom.

Mr. Chips, from *Good-Bye Mr. Chips* (1934), acts as a more subtle hero when he calms his students by continuing to teach a lesson on ancient Rome in the midst of a German bombing raid during World War I. With bombs exploding around the school, he wryly insists to his students that the noisiest things in life are not always the most important. In another example, Mary Logan in *Roll of Thunder, Hear My Cry* (1976) acts heroically when she organizes an African American boycott of the local hardware store whose White owner is the main source of racial conflict in their town.

Teacher as Villain

Many examples exist of teachers who are depicted as villains. They may be obnoxious, arrogant, authoritarian, cruel, spiteful, sinister, self-serving, or physically or verbally abusive toward their students. One example is Mr. Warrick in *The Schoolmaster* (1968), who does many positive things for the people of the small Trinidadian village where he is hired, but he also exploits them for his personal financial gain and rapes his seventeen-year-old assistant, causing her to commit suicide.

Another example is Holofernes in *Love's Labours Lost* (1595), who is vain, arrogant, confusing, superficial, abusive toward others, and lecherous toward women. In addition, he tends to speak in heightened language using extensive alliteration and forced puns to demonstrate his verbal dexterity, and he frequently intersperses English and Latin in ways that leave the people around him confused.

Other examples of villainous teachers include Kantorek in *All Quiet on the Western Front* (1929), Mr. Dobbins in *The Adventures of Tom Sawyer* (1875), Mrs. Gorf in *Sideways Stories From Wayside School* (1978), Miss Scatterd in *Jane Eyre* (1847), Mr. Phillips in *Anne of Green Gables* (1908), Severus Snape in the *Harry Potter* series (1997–2007), and Mr. Neck in *Speak* (1999).

Teacher as Victim

Victimized teachers are oppressed or defeated in some way by students, administrators, their communities, or sometimes the profession itself. They may be down-trodden, pitiful, or pathetic, and they may feel totally overwhelmed by the demands of their work. Some are literally the victims of specific attacks targeted against them, whereas others are victimized more figuratively by the overall conditions they encounter in their jobs.

For example, when Wing Biddlebaum in “Hands” (1919) is falsely accused of molestation by a “half-witted boy,” the boy’s father beats him and he narrowly escapes being lynched. Similarly, in *The Children’s Hour* (1934), two teachers are falsely accused of being lesbians by a disgruntled student, causing them to lose their jobs and destroying them financially. Margaret Narwin in *Nothing but the Truth* (1991) also loses her job following a minor conflict with a student that rapidly spirals out of control, leaving both Ms. Narwin and the student as victims in the process.

In other stories, Ichabod Crane in “The Legend of Sleepy Hollow” (1820) is victimized by Brom Bones, and Mr. Dobbins, the villainous teacher in *The Adventures of Tom Sawyer* (1875), is victimized by his students who use a cat, a string, a wig, and a can of paint to play a joke on him while he sleeps. Finally, in *Three Sisters* (1901), Olga is a teacher who is victimized by the job of teaching itself. In a moment of despair, she remarks that four years of high school teaching have drained her of her energy, left her with a perpetual headache, and aged her prematurely.

Teacher as Outsider

Outsiders are teachers who are different from their students or others in their community. They may feel perpetually alienated in some way—being of a different race, class, culture, ethnicity, or sexual orientation—or they may be border-crossers who successfully transcend these differences.

For example, Anna Vorontosov in *Spinster* (1959) is a White woman who teaches Maori children in rural New Zealand, and Frank McCourt in *Teacher Man* (2005) is an Irish teacher working with American

children of various races and ethnicities in New York City. Similarly, Rick Braithwaite in *To Sir, With Love* (1962) is a middle-class African-Caribbean-British man teaching poor White children in east London.

One particularly intriguing outsider is Julia Mortimer in *Losing Battles* (1970). Julia is an educated White woman who teaches poor White students in rural Mississippi. She is fully dedicated to helping her students gain knowledge that will enable them to transcend the ignorant isolation of their families and to improve their lives, yet her life ends in bitter disappointment as she herself becomes completely isolated from the outside world. Other teachers who may be considered outsiders are Grant Wiggins in *A Lesson Before Dying* (1997), Ichabod Crane in “The Legend of Sleepy Hollow” (1820), and Mr. Warrick in *The Schoolmaster* (1997).

Implications

Through examining the ways in which teachers are depicted in literary works, scholars can gain valuable insights into what it means to be a teacher in contemporary society, and what it has meant in past eras, too. In fact, for distant eras in history, the fictional accounts of teachers that were written at that time often provide rare, firsthand glimpses into the daily lives of teachers that are not readily available from other sources. However, the teachers who appear in literature do more than just reflect past and present societal views of teachers; they can also help to shape these views.

People’s preexisting perceptions of teachers (and the work that they do) are routinely challenged, reinforced, or extended by what they read about teachers in literary works. In addition, such works can serve as tools for the professional development of pre-service, beginning, or experienced teachers by enabling them to think about their work through the vicarious experience of reading about the lives of other teachers.

TEACHERS, PROFESSIONAL STATUS OF

In various historical and societal contexts, teaching has been considered a profession—or not—as the result of a historical process in which teachers have experienced professionalization, deprofessionalization, or proletarianization. This entry discusses the professional status of teachers from functionalist and conflict perspectives.

Functionalist Perspective

From a functionalist perspective, professionalism is tied directly to a positive “social fact”: that there are professions (prototypically medicine and law), non-professions, and “semi-professions.” In this view, professionals are differentiated from workers in other occupations because they (a) perform an essential service or task; (b) engage in mental versus manual work; (c) function based on an ideal of service; (d) gain their expertise and values through extensive preservice education; (e) operate with autonomy in the workplace; (f) have colleagues (versus nonprofessionals) in control of selection, training, and advancement in the field; and (g) receive a high level of remuneration.

Social scientists and educators, based in a variety of societal contexts, have addressed the question of whether or not teaching is a profession. Although answers to this question have varied somewhat, studies of the occupation of teaching in Africa, Asia, Europe, Latin America, the Middle East, and North America have generally concluded that teaching does

not fully measure up on the “traits” of a profession, but rather is a semi-profession.

Conflict Perspective

Those adopting a *conflict perspective* may agree that teaching has not fully measured up to the functionalist definition of profession, but they reject such definitions as ideological. Moreover, conflict theorists view functionalists’ traits—and teachers and other worker-citizens who appropriate the ideology of professionalism—as contributing to the reproduction (perpetuation and legitimation) of unequal class, gender, and ethnic group relations.

Within a functionalist perspective, professionalization is viewed as a universal, evolutionary process, potentially open to all occupations in all contexts, involving the acquisition of the traits associated with the ideal type profession. In contrast, conflict theorists view professionalization as the result of an occupation’s success in its struggle with other occupational groups, the state, and/or economic elites.

Many scholars, policy makers, and practitioners have promoted the idea that the occupation of teaching is undergoing professionalization and/or should strive to professionalize. For instance, in France and Mexico, teachers gained in status and work autonomy—but not remuneration—as rewards for allying with secular state elites in their struggle with the Church. During World War II, teachers’ status increased in England, Germany, and Japan as a reward for their ideological and physical contributions to the war efforts. In Canada in the late 1930s through the 1960s, in England after 1926 but particularly from the mid-1940s to the mid-1970s, and in the United States in the mid-1940s, educators experienced professionalization for helping to defuse and deflect radical movements.

From a Weberian conflict perspective, deprofessionalization involves the reduction in an occupation’s status, autonomy, and remuneration—whether that occupation previously was or was not considered a full profession. Deprofessionalization, like professionalization, occurs as a result of interoccupational, occupation-state, and occupation-economic elite struggles in this view.

The issue of teacher deprofessionalization has been addressed by many scholars. For instance, in Vietnam during the French colonial rule; in India during and after British colonialism; in China—with different ideological emphases—before, during, and after the Cultural Revolution; and in Hungary before, during, and after the Stalinist regime, political and economic elites restricted teachers’ autonomy through training, inspection, and rewards. Moreover, in the 1930s in Germany, some teacher groups lost status and were denied the right to organize for higher wages because they publicly protested against the Nazi Party’s fascist project. Additionally, during the 1990s in Europe and Korea, teachers were deprofessionalized, losing social status and authority in the eyes of the public—as the result of government officials’ and media criticisms.

From a Marxist conflict perspective, proletarianization involves the process by which the work of an occupational group—whether such work is considered manual or nonmanual and whether such workers are more or less educated—is altered regarding (a) separating the conception of work tasks from their execution; (b) standardizing and routinizing work tasks; (c) intensifying the demands of work; and (d) reducing the costs (salaries, benefits, training, etc.) of workers.

Various authors have discussed how teaching and teachers have experienced proletarianization. For instance, in Australia, Canada, England, Mexico, New Zealand, and the United States during economic and political crises of the 1970s and 1980s, the state sought to deskill teachers through various bureaucratic and technical controls as well as to intensify the range and pace of teachers’ work. Ironically, some teachers have accepted the intensification of their work—a key aspect of proletarianization—because they perceive such as a sign of their professionalization.

TEACHERS, RELIGIOUS VALUES OF

Religion and education have a complex legal, political, and ethical relationship, particularly as it relates to what teachers can and should do in the classroom vis-à-vis their own religious identity. Robert Nash suggests that teachers often fear to express or even admit their religious identity and that this silencing runs counter to the pluralistic ideal of expressing and embracing other parts of their identity, such as race or gender (although, of course, these are often marginalized as well). Religious identity is troublesome, however, because teachers may not only face prejudice but also be predisposed to practice it themselves. This entry attempts to define religious identity, then looks at how it can influence teaching practice and what the courts have had to say on the issue.

What Is Religious Identity?

To define religious identity requires a broader concept than religious beliefs or religious values. To define it as “being religious” excludes those who are undecided, ambivalent, passively nonreligious, or

actively antireligious. To qualify it simply as belief or a set of values reduces it to an internal phenomenon of the intellect, emotion, or spirit. If religion were solely a matter of belief and thought, it would be only marginally relevant to teachers as it could be easily contained within the individual and not have to affect anyone else.

Religion, however, also entails an important dimension of behavior and action, the external manifestation of what a person does that defines and gives shape to his or her religious identity. What one *does* testifies to one’s devotion to a standpoint on religion as much as (or more than) what one says or thinks.

Likewise, affiliation and community are fundamental parts of defining religious identity, both at present and in the context of history. Religious identity has a social dimension and shared body of experience that frames a person’s life-space long before any conscious choice of belief can be made. Identity can also be ascribed to a person by others, often with stereotypes attached, even if the person does not claim it, believe it, or act on it.

In describing a person’s religious identity, the direction and magnitude of each of these factors—belief, behavior, and belonging—are relevant and important in understanding how their religious identity affects them. For teachers, this provides a more nuanced framework for understanding what teachers do and why, as well as the different ways their religious identity could come into play.

Religion Versus Profession

The connection of religious identity to a teacher’s professional self can be described in several ways. For many, the connection is incidental; religion and profession are compartmentalized in different parts of the teacher’s life-space and have little to do with each other. At the other end of the spectrum are those who perceive that one’s religious beliefs cannot be separated from their daily life and work. They are unable or unwilling to separate teaching from their religious identity, whether in the content of classroom work (where explicit connections are drawn and reinforced between religion-related ideas and ideals and content area topics in all school subjects, from math to science

to history to language) or teaching style and method, or even how the room is decorated.

Beyond the classroom, religious identity compels an impulse to find teachers, students, communities, and schools of similar identity to one's own. Whether teachers tried working in a public context or avoided it because they found it too inhospitable to how they felt they needed to teach, those whose religious and teacher identities are tightly integrated are often winnowed out of the public teaching pool.

In between these extremes are teachers who perceive barriers between how they would like to embody their religious identity and how they are (or believe they are) allowed to do so by the school culture, policy, or community expectations. To reconcile these competing demands, teachers can take different approaches. They could introduce religious content, lessons, materials, and ideas obliquely, indirectly, in coded language, and in the guise of other things, so that if challenged about bringing their religious identity into play, they could simply deny it.

On the other hand, teachers could be quite open about introducing their religious identity but justify doing so within inclusive teaching about the full spectrum of religion and spirituality, universal themes and ideas, ethics, values, and personal and community relationships. Religion could even be read more broadly as a type of culture and explored as a subdivision of pluralistic, multicultural study.

A key balancing point in this is how teachers react and respond to the religious identities of others, especially those whose identities differ from their own and those who are religious minorities. Being attentive to and championing the cause of such students is a way for teachers to remedy imbalances, although it could create a sense of social capital, in that teachers advocating for the needs of other religious identity groups might feel entitled to do more advocacy for their own as well.

What the Law Says

The legal issues around what teachers may do with their religious identity in schools are complex. The anti-establishment and free exercise clauses of the First Amendment offer conflicting imperatives for

what a public school teacher should be able to do as an agent of the state and as a free citizen. Clearly, teachers in public schools cannot openly favor one religious standpoint over another or mandate religious activities. Still, neither teachers nor students forfeit their individual rights and do have a legitimate interest in not having their religious identity kept out of sight, restricted to a purely private sphere. Free exercise entails more than freedom of conscience, belief, or speech, but the dilemma is where exercise ends and establishment begins, especially when balancing majority versus minority rights around religion.

Thomas Jefferson's idea of separation of church and state, which is often invoked to support restricting religious speech, activity, or exercise in schools, is nowhere stated in the U.S. Constitution, and U.S. Supreme Court decisions have given no single clear answer. The chief precedent on the issue, the 1971 *Lemon v. Kurtzman* decision, does allow public agencies to address religion as long as the policy or activity also has a secular policy purpose, does not have the primary effect of promoting or inhibiting religion, and is not an "excessive entanglement" with religion.

The 1984 Equal Access Act also guarantees religious students, groups, and clubs equal rights with nonreligious groups in access to school facilities and resources. The continuing challenge for teachers around how to use their religious identity in schools is finding the right balance, not favoring all religion or secularism, and not silencing or inhibiting any religion in a quest for neutrality or allowing one standpoint on religion to be privileged over others.

This last point is a special difficulty because the commonality of Christianity (at least in a generalized, mainline Protestant sense) in the United States and many other countries creates a societal "Christian privilege." Christine Clark and associates describe this as operating similarly to other privileged identity features (e.g., male or White privilege). Teachers, especially those who are themselves Christian, must learn to recognize the ways in which privilege attaches to their religious identity or that of their students, even without awareness or intent, and to work to reduce or eliminate it. Clark would suggest that this is usually Christian privilege, although others argue that in schools and society, it is a privileging of secularism

that is a larger problem; Stephen Carter's *Culture of Disbelief* is a strong critique from this perspective.

Teachers face real conflicts when their religious identity is not something they can (or wish to) easily hide, even when privilege and prejudice around religion would suggest that they should, and usually must invent their own idiosyncratic solutions for what to do with their religious identity in their work and career choices. Theorists such as Nash and Nord both suggest that this is insufficient, that teacher preparation should be more intentional about preparing teachers to deal with the intersection of religion and education, not just as a subject to be studied but as it personally affects them and their students. Works such as Sears and Carper's *Curriculum, Religion, and Public Education*, involving perspectives from across the spectrum of religious identity, are a good first step in helping beginning teachers think through different perspectives on this difficult question.

TEACHERS AS RESEARCHERS

Teacher research is defined as research that is conducted by classroom teachers on their own practice, hence the title "Teachers as Researchers." Recently, this type of research has expanded into the university setting, and there is some debate as to whether this, too, should be considered teacher research. Generally, the field has settled on the term *practitioner research* to define all forms of teacher research and *teacher research* as limited to PreK–12 teachers. This entry looks at the historical development and current practice of the teacher as researcher.

Historical Development

Teacher research as a research methodology has existed since at least the end of the nineteenth century. Although many would credit the start of teacher research with Stephen Corey at Columbia University, it is difficult to give a precise history or starting point for when teacher research began because many teachers have long incorporated research to inform their own teaching practice, without the intention of publishing their results.

A modern example of this can be seen on a systemic level in the Reggio Emilia preschools, where teachers are expected to do action research as part of their normal duties. The fact that this research is not published does not mean it is not happening. As such, it is impossible to state exactly when teacher research started as a practice and to quantify how widespread it was in the past, or, for that matter, how prevalent it is today. It is safe to say that during the beginning of the twentieth century, teachers started to call their work research and to share it with others.

The struggle to have the research teachers do on their own practice be considered valid has existed since its beginning. This struggle has been fundamentally about control; initially, this argument came from an academy reluctant to relinquish its control on knowledge production. Although this argument continues, and subjects teachers unnecessarily to positivistic criticism that is no longer tolerated within the academy itself, the current struggle of teacher

researchers comes from governments, both federally and locally, as politicians collectively exercise greater influence and control over what teachers can and cannot do in their classrooms.

Increasingly, teacher research is coming under pressure not because it is banned or discounted, but because teachers' work is so legislated and controlled that there is little room for teachers to conduct research on their own practice except as a counternarrative. Teacher research reached a peak of popularity in the 1990s, but it has been steadily losing ground ever since. Today, pockets of teacher researchers can be found in the United States and throughout the world, but rarely are they aware of each other's existence.

Current Practice

How is teacher research best described? Teacher research does not dictate a specific method. It is possible, as a teacher researcher, to do experimental, quantitative research, but the classroom setting and the fact that teachers are typically participating in the research that they are doing lends itself to qualitative approaches.

Often, teacher research is simply described as a form of action research, but this perspective ignores and undermines the power of teacher research as a "new" methodology, and undermines the power of teachers as researchers. Although action research is the one method of conducting research that resonates best with what teachers are trying to do in their classrooms, teacher research is not just a type of action research. Teacher research does not dictate either a qualitative or quantitative methodological perspective or use of specific methods.

This is essentially because teacher research is its own methodology. It is a specific worldview that argues that the teacher can have the authority to conduct research in his or her own classroom. This simple notion turns the world of "traditional" research on its head. Teacher research as a methodology dictates not only that teachers have the right and power to conduct research in their own classrooms, but that teachers are in a better position than anyone else to conduct that research.

Criticisms

In part, this explains why teacher research is often attacked. It challenges the traditional power structures that are inherent in U.S. school systems. Even though exclusively positivistic models reflective of the modernist movement are no longer dominant in current educational research, criticisms of teacher research are often based on the assumptions of this model. Teacher research is seen by these critiques as subjective and unscientific. Others would argue that all research is subjective.

This subjectivity may, in fact, be the potential strength of teacher research. The transformative power of this research has been realized by teachers throughout the world and is now seen as normal practice by many teacher researchers. Despite negative attitudes among some in the academy and others in power, teachers have taken up teacher research, and many schools and communities are transformed for the better as a result. The transformative power of this research has also been seen by many teacher education institutions and is now often a requirement of many postdegree certifications and graduate degrees.

How It Works

The power of teacher research is that it is not significantly different from the work that good teachers already do. Effective teachers are focused on the learning of each student in their class and are engaging in reflective practice, constantly examining their own teaching to become the best teachers that they can be. These two practices supply a teacher researcher with more data than anyone could ever need. The difference between a teacher researcher and a teacher is the intentionality behind the collection of these data.

Teacher researchers are collecting these data not just to be better teachers but to answer the bigger questions that they have about teaching and education. Teacher researchers are systematic about how they collect and analyze data. The power lies in the fact that when teachers approach their own classrooms as researchers, they have total access. Teacher researchers can see more and learn more than any researcher who comes in once or twice a week for a few months can ever experience. Teacher researchers

are unquestionably subjective, but this, as was mentioned, may be a strength, not a weakness, of this research. Their subjectivity gives them access and power to make change in the only place where it really matters—locally, in their own classroom with their own students. Whether or not teacher researchers go on to share this work publicly does not detract from its value as research.

Educational journals are increasingly welcoming work by teacher researchers, and a number of publications specialize in it. Teacher researchers are also increasingly presenting their work locally, regionally, and nationally, at events such as the International Teacher Research Conference, which is held annually following the American Educational Research Association's annual conference, in the same city. With increased recognition and opportunities to share their work, more teachers may adopt the researcher role.

one who is comfortable with both employment in and the direction of the school in which he or she works. Several fields, including psychology, sociology, and business, have informed the research on the satisfaction of teachers. This entry examines satisfaction as a concept, discusses the various factors associated with satisfaction, and considers teacher satisfaction under the current standards and accountability policy context and the No Child Left Behind Act of 2001.

Satisfaction as a Concept

To understand teacher satisfaction, one must wrestle with satisfaction with *what*. In other words, is the teacher satisfied with his or her career choice, with the school organization, with the specific position within the school (e.g., third-grade classroom teacher), with particular aspects or duties of teaching, or with the financial compensation received? Alternatively, teacher satisfaction is sometimes conceptualized in a more global sense in terms of one's general feelings or attitudes about teaching.

Regardless of the level of satisfaction examined, teachers' primary sources of satisfaction have consistently been linked to their individual interactions with students. Teachers derive satisfaction from their ability to make a difference in their students' lives in terms of both academic achievement and social or affective goals. In essence, teachers' primary sources of satisfaction are intrinsic in nature.

Teacher satisfaction is important because it can affect individual attitudes and behaviors, including the decision to leave one's school or district and the decision to leave the teaching profession itself. In addition, teachers' satisfaction levels can affect their motivation, morale, and performance. Beyond the individual level, the satisfaction of the members of an organization can influence the overall performance of the organization. Satisfied members are more likely to accept the organizational goals and work collaboratively toward them, whereas dissatisfied members may either intentionally or unintentionally reduce the effectiveness of the organization.

In defining teacher satisfaction, many theoretical and empirical studies have tried to delineate satisfaction from commitment. Satisfaction is considered a concept

TEACHER SATISFACTION

Teacher satisfaction refers to the pleasure, contentment, or sense of fulfillment one has for a job based on personal expectations or needs. A satisfied teacher is

relating to the nature of one's work; commitment, on the other hand, relates to one's obligation to or engagement in the organization in which a person works. Whether a teacher derives satisfaction from commitment or commitment from satisfaction remains undetermined.

Psychologist Albert Bandura's self-efficacy theory is also discussed in relationship to satisfaction. Self-efficacy refers to one's perception or personal judgment about whether or not he or she can successfully meet a particular goal or outcome. Self-efficacy beliefs can influence satisfaction levels, meaning that the more a teacher believes, for example, that he or she can successfully teach the students in the class the range of academic and affective learning outcomes, the more that the teacher will be satisfied with teaching. Self-efficacy beliefs are affected by both a person's individual ability and organizational environment.

Factors Associated With Teacher Satisfaction

The research examining the relationship between individual characteristics and job satisfaction has uncovered mixed results. Although some studies have found relationships between satisfaction and teacher's gender, length of time teaching, race or ethnicity, and school level, more comprehensive studies that include school-level factors suggest that individual characteristics do not influence teacher satisfaction.

A number of school-level factors, or organizational features or characteristics, influence teacher satisfaction. These factors are often referred to as teachers' working conditions. One aspect of the school environment that influences satisfaction is the culture or climate of the school organization. Teachers are more satisfied when the members of the organization, including both teaching and administrative staff, operate under shared values and norms, exhibit collegial support, and trust and respect each other. These social interactions, particularly with teaching colleagues, influence teachers' attitudes toward their work. In other words, the development of a professional community in the school that has these characteristics is important to teacher satisfaction.

Beyond culture and climate, principal leadership is another aspect of the school organization that is linked

to teacher satisfaction. Teachers have greater satisfaction when they teach in schools with principals who are instructional leaders. These principals articulate the vision for the school, develop goals for students and teachers and a plan for meeting those goals, understand how students learn, provide opportunities for professional development, and offer ongoing support to teachers. In addition to valuing this type of leadership, teachers are more satisfied when they believe that the environment is safe and student disciplinary policies are clearly articulated and supported. When student behavior in the school is perceived as disorderly or unsafe, teachers are more likely to be unsatisfied, especially if they believe that administrators or staff are not providing them with adequate support in this area.

Teachers' beliefs about the degree of control they have within their schools, sometimes referred to as *teacher empowerment* or *teacher autonomy*, also influence teacher satisfaction. Although having decision-making authority over curriculum and instruction in one's classroom is an important aspect of this, teacher control frequently refers to involvement in school-level decisions as well. The association between control and satisfaction has been identified through research, but the relationship between satisfaction and particular reforms designed to increase teacher control, such as site-based management, inclusive or participatory decision making, and charter school reforms, has not been determined, perhaps because of the variation that exists in the implementation of these reforms in relation to the degree of control (or empowerment or autonomy) that teachers experience in practice.

A final school-level characteristic associated with satisfaction is parental support and involvement. Parental support and involvement can range from more traditional parental roles, such as leading field trips and bake sales or communicating with teachers around homework assignments and classroom progress, to more intensive roles, including offering instructional assistance in the classroom. Although teachers have varied expectations regarding the school or classroom activities in which parents should engage, they seek parent cooperation with, rather than opposition to, their teaching efforts.

The professional and social identities of teachers also influence their satisfaction, although less is known about these associations. Teachers who view their job as a profession are more likely to be satisfied about their work. However, teachers' professional identities may be shaped not only by their individual views of teaching and their professional competence, but also by public perceptions of teachers or the status of teachers within a particular community or in society.

Standards, Accountability, and Teacher Satisfaction

State and federal policy over the past two decades has led to statewide standards in particular subject areas, such as mathematics, as well as statewide assessments to measure whether those standards are being met by students. This standards movement has coincided with calls for greater accountability in public education, culminating in the No Child Left Behind Act of 2001, which requires states to create a system of school-level sanctions linked to aggregated student test scores. Whether increased standards and greater accountability influence teacher satisfaction remains undetermined.

However, the increased pressure on teachers to succeed, the public perception of teachers as unqualified or unmotivated, and the limits on control and autonomy that result from higher stakes being attached to test scores have the potential to negatively influence teacher satisfaction. Given what is known about the influence of satisfaction on organizational effectiveness, examination of the association between accountability and satisfaction within the lowest performing schools that are, as a result, operating under accountability sanctions is of utmost importance.

TEACHERS COLLEGE, COLUMBIA UNIVERSITY

Teachers College was founded in 1887 to address the issues of education during a period of profound social, economic, and cultural change in the United States. The purpose of the institution was to educate teachers, in all grades, in the knowledge and skills basic to teaching. Through the fundraising efforts of Grace Hoadley Dodge, the treasurer of the college; the intellectual vision of Nicholas Murray Butler, president of the Industrial Education Society; and the leadership of the first dean, James Earl Russell, the dream of an institution focused specifically on the education of teachers was realized after fourteen years in the making.

Although the curriculum of the college expanded over the past century, there have remained two constants. One is the dynamic affiliation with Columbia

University. The other is that Teachers College has remained responsive to the changing culture, character, and context of education. It has held a central role in shaping the world of educational research throughout its 120-year history.

In the first decade of the twentieth century, Edward Lee Thorndike, one of the school's most well-known professors, established the field of educational psychology, declaring that psychology was the science of intellect, and the schoolroom, a great laboratory. His colleague in the philosophy department at Columbia, John Dewey, was invited to lecture at the college in 1906, making Teachers College an influential center of educational theory.

The economic recession of the 1930s brought to light a new school of thought in the institution. Professor George S. Counts argued that progressive education had focused too much on the child in school. Instead, he countered what the role of the school should be within the larger society. These questions were addressed in a pamphlet titled "Dare the School Build a New Social Order?" Not surprisingly, the 1930s were a time of upheaval, and there was now emphasis on the administration of schools. This led to the establishment of a new degree, the Doctor of Education, or EdD, in 1934, which also saw the publication by the faculty's staff of the revolutionary educational journal *The Social Frontier*.

In the late 1930s to 1950s, many Teachers College faculty members were deeply committed to social issues of the time. Mabel Carney, a professor of rural education, championed the development of Black teachers during this period. She traveled to the South to teach and was instrumental in the migration of Black southern scholars to the college. During the period of legalized segregation in the United States (1896–1954), the largest number of doctorates in education earned by Black scholars was from Teachers College. This was not the first or only example of the faculty looking beyond New York City. In 1899, the program in comparative education was established, and in 1956, the first society and journal dedicated to those issues was established by the faculty in that program.

During the 1960s, the issue of equity emerged as an increasingly important issue for the college. In the

ensuing decades, the institution has managed to stay in the forefront of educational transitions and policy while maintaining a strong connection to the foundations of its past.

TEACHING PROFESSION, HISTORY OF

Teaching is the mechanism by which skills and knowledge are imparted to an individual, and society has entrusted teachers with the responsibility of providing the populace with the skills and knowledge deemed necessary to engage as citizens and lead productive and meaningful lives. To be effective, teaching must be interesting, stimulating, challenging, and satisfying, and it must result in learning that is culturally significant, is valued by society at large, and prepares individuals to meet the needs of their changing world.

The American public school system was built on the premise that the quality of education children receive can have a tremendous impact on their quality of life and their ability to become contributing members of society, especially given the demands of globalization in the twenty-first century. As the U.S. educational system struggles to deal with demands and controlling influences imposed by politicians, businesspeople, and special interest groups, as well as with the ever-increasing diversity in today's schools,

it is important to understand the history of the American teaching profession in order to better understand the current and future milieu of teaching. This entry examines early teaching, development of the system of teaching credentials in the United States, the debate surrounding the professionalization of teaching, and issues that have and will continue to affect teaching in the twenty-first century.

Early Teaching

The earliest of educators were often members of the clergy, such as priests and rabbis, or were slaves from conquered states employed in the households of wealthy Greeks and Romans. In Greece, several of the most notable teachers of all time, Socrates, Plato, and Aristotle, emerged during the fifth and fourth centuries BCE, generating foundations of teaching that are still used today. Although formal education in China dates back to 2000 BCE, in Europe, it was not until the Middle Ages that formal institutions of learning were established by the Roman Catholic Church.

According to some, formalized education in the United States was launched in 1647 with the passage of a Massachusetts law requiring each town of fifty or more families to establish a school. Fictional portrayals of early schooling would have many believe that teachers were young, single women, when the domain of teaching actually belonged almost exclusively to young men. For these young men, teaching was considered a means for social mobility for those who could not find work; however, it was also considered *temporary work*, with the majority of teachers leaving the field after only five years. It was not until the 1850s, a period commonly referred to as the “feminization of teaching,” that women began entering the teaching force in great numbers, the prevailing attitude being that women possessed the caring skills and attitudes necessary to nurture and guide young minds. Prior to this time, teachers were hired based upon the ability to control and dominate predominantly male students, and little formalized training was expected or required.

By the early twentieth century, teacher training institutions, such as normal schools, began to evolve into degree-granting institutions and colleges predominantly geared toward the preparation of elementary

school teachers. Throughout the course of the twentieth century, states enacted legislation extending compulsory education through the age of sixteen. During this time, high school graduations escalated from a scant 6 percent to almost 88 percent, radically increasing the need for secondary school teachers equipped to teach select disciplines. This expansion of the American public school system created the need for more and more educators, and vast numbers of women sought teaching credentials to enter the field, mostly at the elementary school level. High schools, however, remained the province of male teachers.

Teaching Certification

Requirements set forth for teaching were modest up until the mid-nineteenth century. Getting a teaching job often necessitated little more than a review of the moral character of the individual, and, in some cases, a test of general knowledge and/or a test of basic reading, writing, and arithmetic skills. However, by 1867, most states required local testing for state certification for teaching. Teacher training was sporadic and varied; some localities offered their own programs, whereas others relied on teacher training institutes and colleges, such as Teachers College at Columbia University, founded in 1887. By the onset of the twentieth century, a wide range of bona fide teacher education undergraduate and graduate schools and programs emerged throughout the United States. Completion of teacher education coursework, which replaced local testing, became the means by which teaching certification was granted.

Many of these programs came under scrutiny in 1983 with the release of *A Nation at Risk* and again in 1996 with the release of the National Commission on Teaching and America’s Future reports by the U.S. Department of Education calling for educational reform. *A Nation at Risk* called for the establishment of more arduous national teacher preparation standards; the Commission’s report enacted six goals directly related to teaching and the professional development of teachers. Although few argue the merits of these goals, they have not been instituted everywhere. All fifty states and the District of Columbia require the licensing of public school teachers; however, the

requirements for licensure vary by state. Licensing measures are intended to strengthen the quality of teaching, but the escalating shortage of teachers has forced many states and/or districts to implement alternative licensing measures to supplement the dwindling teaching workforce, particularly in large urban school districts.

Alternative, temporary, provisional, and/or emergency licensing programs allow individuals without preparation or licensure to teach. Such programs allow districts with high teacher vacancies to hire and retain uncertified or unlicensed teachers as a stopgap measure. Teacher shortages are prevalent in large urban schools; rural schools; regions in the South and West; and in specific subject areas, such as science, mathematics, and special and bilingual education. Alternative licensing programs for teaching are quite varied and include four- to six-week courses, mentoring by a master teacher, and/or taking education courses to supplement a current degree. Even though other feasible measures to eradicate the teacher shortage have not been forthcoming, many believe that alternative licensing programs widen the chasm between raising teaching standards and staffing classrooms.

Teaching as a Profession

Schools are labor-intensive organizations, with 75 percent to 80 percent of schools' budgets allocated for personnel cost, and how teachers are treated greatly affects their performances, personal satisfaction, and ultimately their decision to remain in a district or the teaching profession altogether. Since the early 1900s, those in teaching have fought for professional status; however, efforts in that area have proved fruitless for a variety of reasons. Many believe that the "feminization of teaching" in the 1850s left a legacy that the profession of teaching still endures to this day; that is, the stigmatization associated with the diminished stature of women in the workforce that imposes on teaching the categorization of little more than a domestic occupation requiring administrative control. Current demographics show that the composition of the field of teaching is 75.1 percent females and 24.9 percent males.

Others believe that teaching will remain an occupation or semi-profession until issues regarding control over the professional licensing of teachers, the competencies and qualifications for teaching, and the standards upon which licensing will be based are resolved. Meanwhile, the debate continues as teaching salaries remain noncompetitive with those of similarly educated individuals in other professions, an issue that serves to deter entry into or persistence in the field of teaching.

Teaching in the Twenty-First Century

The quality of education that children receive can have a tremendous impact on the quality of life they have and their ability to become contributing members of a global society. The ever-increasing diversity of American schools has added to the challenge, as the more diverse the group, the more complicated teaching becomes. Today in the United States, the field of education is struggling in a climate of change, criticism, and economic limits resulting in the steady erosion of confidence in schools.

In that vein, the Elementary and Secondary Education Act of 1965 was revised to become the No Child Left Behind (NCLB) Act of 2001, an effort intended to improve the American public education system, and teaching was at the heart of the legislation. Among the provisions of the nearly 1,000-page NCLB bill was the directive that every child be taught by highly qualified teachers, as teacher subject-matter knowledge has been correlated with student learning. Teachers are deemed to have Highly Qualified Teacher (HQT) status if they hold a bachelor's degree in the subject area in which they teach, demonstrate subject-area knowledge of the subjects they are assigned to teach, and obtain full state teacher certification. All teachers were required to obtain HQT status by 2006; however, not all states were able to meet this mandate. Currently, teaching proficiency is being gauged by the results of standardized tests; schools persistently rated as failing, as indicated by test scores, are mandated to replace certain teachers, change the curriculum, or risk restructuring or state takeover. In NCLB, teaching is clearly viewed as both the cause and the solution to many societal problems facing America today.

Undoubtedly, many factors affect student achievement, and some of the more important factors are what teachers believe, know, and can do. However, teachers deal with a plethora of issues in their schools and classrooms over which they have no control. Limited English proficiency, special needs, poverty, drug and alcohol abuse, overcrowded classrooms, inadequate classroom supplies, outdated textbooks, and increased violence are some of the factors affecting teaching daily. With the national emphasis on improved instruction, it is critical to recognize the complexity and importance of quality teaching for high-performing schools; however, it is difficult to attract and retain well-qualified teachers in schools labeled as failing.

NCLB has had a significant impact on teaching practices in many schools, as teachers are often required to teach to the test to avoid sanctions. Some believe that this has resulted in a narrowing of the curriculum and effective teaching practices, thus altering the school experience for students and teachers alike.

TECHNOLITERACY

Basic technoliteracy involves learning how to use and socially manage the wide range of tools and material artifacts that are fashioned by humanity to modify the natural environment in order to meet people's perceived wants and needs. Historically, this functional form of technoliteracy has been more narrowly conceived as the proper domain of public schools' vocational programs, such as delivered in home economics courses concerned with the proper use of household technologies; shop-floor courses that teach carpentry, metalwork, and the manipulation of automotive repair tools; and typewriting, word-processing, and computer-programming courses designed to familiarize students with various professional office machines.

Since John Dewey's *Democracy and Education* (1916), however, theorists of educational foundations have maintained critiques of the curricular attempt to reduce technoliteracy to such functional and vocational exercises. Consequently, critical theories and programs of technoliteracy have arisen that are additionally concerned with both generating pedagogical attention to the systemic aspects of technology and facilitating the comprehension of technology as complex networks of social, cultural, economic, political, and historical processes that govern the creation and operation of technological artifacts proper. Accordingly, contemporary movements for critical technoliteracy seek to expand technological studies across the curriculum toward helping students achieve democratic and socially reconstructive understandings about the costs and benefits of our modern technological age as well

as its possible futures. This entry looks at technoliteracy from the perspectives of public education, international policy, and scholarly research.

Technoliteracy in Public Schools

The past few decades have seen the worldwide, exponential growth of information-communication technologies, emergent digital media, and other types of high-tech scientific innovation related to the rise of a technologically induced global network society in which new forms of culture, politics, and technologically mediated existence are increasingly the norm. During this same time, trends in U.S. educational policy have been toward the correlative expansion of merely functional versions of technoliteracy that have sought simply to train students in standardized computer and information skills and to transform schools into a marketplace for corporate technological goods and services.

In 1983, the U.S. government released the report *A Nation at Risk*, which first articulated a vision of American students as unprepared to meet the requirements of the coming high-tech information age and recommended that a basic computer science course for personal and work-related purposes become mandatory within school curricula. By 1996, with the nascent World Wide Web generating major socio-cultural transformation, the U.S. Department of Education began to refer to technological literacy as the new basic skill and to call for the saturation of public schools with computer-associated technology along with requisite training in this technology for both students and teachers alike.

Most recently, the No Child Left Behind Act of 2001 and 2004's U.S. National Education Technology Plan have reinforced and extended this view of functional and market-based technoliteracy. Both policies advocate for information-communication technology and other forms of new media to be infused in innovative ways across the curriculum such that every student, regardless of race, ethnicity, gender, family income, geographic location, or disability, will have mastered computer-based competency standards by the end of the eighth grade. Notably, in all of these policies, little attention is paid to the need to educate students to understand the more critical and complex

aspects of technology as part of the process of realizing a more technoliterate citizenry and good society.

International Policy

A reductive policy approach to technoliteracy is not mirrored at the international level, where the United Nations has developed the educational goal of "science and technological literacy for all" (STL) as part of its Project 2000+ campaign on behalf of equitable social and community-building practices. Project 2000+ began in 1993 as the brainchild of UNESCO and eleven major international agencies with a combined mission to prepare citizens worldwide to understand, deliberate on, and implement technological strategies in their everyday lives around sustainable development issues such as population, health, environmental well-being, and cultural welfare.

Although Project 2000+ actively incorporates pedagogical strategies concerned with the management and use of information-communication technologies, it is important to recognize that STL is specifically committed to promoting multiple ways of knowing and deploying appropriate technologies—technologies that can be defined as the simplest, most sustainable means of responding to a given human end. In this context, STL attempts to make people conscious of the potential for new technologies to exacerbate divides between rich and poor, male and female, and the global North and South. STL also supports education into the nature of and need for local cultural tools as well as the way in which global technological trends can be meaningfully embedded within vernacular traditions and values. Therefore, even though the United Nations finds that technoliteracy is a universal goal of mounting importance due to present global technological transformation, Project 2000+ programs in STL require that various individuals, cultural groups, and states will formulate the questions through which they gain literacy into global technology differently and for diverse reasons.

Research Areas

Although U.S. policy that conceives of technoliteracy as a type of vocational competency in the use and development of information-communication

technologies differs markedly from the international STL movement, scholars continue to work on critical theories of technoliteracy that draw upon founding work in the field by intellectual figures such as Dewey, Paulo Freire, Ivan Illich, Marshall McLuhan, Herbert Marcuse, and Neil Postman. A key document in this respect is “A Pedagogy of Multiliteracies: Designing Social Futures” by the New London Group (1996), a leading amalgam of technoliteracy scholars from the United States, United Kingdom, and Australia.

Through the concept of multiliteracies, the New London Group attempts to highlight how dramatic developments in contemporary technology are affecting a hybridic shift and increase in the communication of the world’s cultural and linguistic diversity. For these reasons, the New London Group believes that traditional literacy programs should also evolve to help students learn how to critically reflect upon and navigate their immersion in diverse linguistic, visual, audio, spatial, gestural, and multimodal forms of technological environments such that people become empowered to have more creative choice about their life’s work and are thus able to help design their own social futures.

In similar fashion, there has been much significant work done in theorizing forms of critical media literacy, critical computer literacy, and critical multimedia literacy as part of a pedagogical movement for a more robustly democratic and socioculturally reconstructive form of technoliteracy. Therefore, although standards-based, vocational forms of technoliteracy continue to dominate professional education on the large, they are countered significantly by attempts to legitimate culturally sensitive, sustainable, and other critical forms of technoliteracy both domestically and internationally. These latter forms hope to fashion the enhancement of a literacy of critique so that students can begin to name the technological system that constitutes their lives as citizens, describe and grasp the rapid technological changes occurring as defining features of a burgeoning global network society, and learn to engage experimentally in creative and counterhegemonic practices in the interests of a more radically democratic and self-reflective world.

TECHNOLOGIES IN EDUCATION

Educational technology is commonly associated with computing. In fact, there are many other educational technologies that play an important role in education—some dating as far back as antiquity. This entry explores that history as the context for a larger discussion of the revolution in education created by the computer and the Internet.

Early Tools

The term *tabula rasa*, which is now used as a metaphor to describe the idea that humans are born with no built-in knowledge of the world, literally refers to the Latin term for a “scraped tablet.” Although the term is associated with the phrase “blank slate,” it actually refers to a smooth wax slate on which Roman schoolchildren inscribed their lessons. It was an educational technology.

Historically, the most important educational technology has been the book. Books became practical when paper was introduced into Europe from China during the medieval period. When books were written by hand, they were expensive, cumbersome, and often inaccurate. The introduction of movable type in the late fifteenth century changed the nature of the book as a cultural and technological phenomenon.

What is commonly described as the Gutenberg Revolution (c. 1450) made possible the distribution of relatively inexpensive and highly accurate texts. Its creator, Johannes Gutenberg (c. 1398–1468), was a goldsmith from Mainz, Germany. His invention of the printed book represented the merging of several independent ideas, including movable type cast from

metal, oil-based ink, and a wooden press for creating an impression.

The Impact of Printing

The effect of the introduction of printing on education in Europe was profound. Essentially, it redefined educational discourse at all levels. Knowledge was no longer limited to what could be remembered in one's memory, or recorded in cumbersome handwritten documents. It was now possible to distribute relatively inexpensive and highly accurate texts on almost any subject. These texts could include elaborate illustrations, diagrams, charts, and tables that would have been much more difficult, if not impossible, to reproduce by hand. In addition, as a technology, typographic sources lent themselves to careful editing and proofing. Unlike a hand-copied text, each copy of which had to be proofed, a single master text could be proofed once and then reproduced (printed) on an unlimited basis.

Within a generation, European universities abandoned much of their emphasis on oral approaches to instruction that emphasized memorization and recitation. Their curricula increasingly depended on textually based models. Books became means for extending memory, as well as precision in thought. During the early Renaissance, humanist educators sought to establish definitive editions of important classical texts, such as those from Plato and Aristotle, as well as those from a host of lesser luminaries.

Many believe that the introduction of inexpensive printing made possible the Protestant Reformation, as well as many of the advances that came in fields such as medicine, cartography, architecture, and physics during the Renaissance and early modern era. How effective would Luther have been if he had not been able to circulate his ideas through broadsheets and inexpensive books? Would the scientific advances in medicine and cartography during the Renaissance have been possible without the technology of the book? Would Nicolaus Copernicus's or Isaac Newton's works have been possible without the resources provided by printing?

Pictures Arrive

Mass-produced illustrations probably first appeared in illustrated and hieroglyphic Bibles. Luther's early

Bible, for example, was illustrated. In addition, Luther and others were responsible for the development of the first catechisms. These religious primers became the basis for the development of secular primers during the sixteenth century.

By the middle of the seventeenth century, new ways of using illustrations began to redefine educational texts. Perhaps the most important example was the work of the Czech educator, John Amos Comenius (1592–1670). In 1658, he created the *Orbis Sensualium Pictus*, which many people consider to be the first illustrated textbook for children.

In the *Orbis Pictus*, Comenius included detailed illustrations that provided a visual context for printed material included in his text. This material, which was printed in Latin as well as German, represented an astonishing pedagogical advance, one that was based almost entirely on the technology of the book.

Comenius's influence can be seen in primers and textbooks from the late seventeenth and early eighteenth centuries. *The New England Primer*, first published in 1692, clearly is modeled on the *Orbis Pictus* in its use of illustrations. Textbooks became increasingly widespread by the middle of the eighteenth century. They created a pedagogical discourse that emphasized the written over the spoken word. By the time of the American Revolution, textbooks had become the single most important formal source of curriculum in the schools. As a technology, textbooks create a uniform curriculum across schools. It is no accident that works such as Noah Webster's 1781 three-volume *A Grammatical Institute of the English Language* (the first volume of which was the famous "Blue-Back Speller") emphasized not only basic literacy, but ideological and political knowledge as well. Webster was interested in creating educated Americans—members of a new and revolutionary culture—not loyal British subjects. His texts emphasized English as it was spoken in North America, not in Great Britain.

Blocks and Blackboards

Although textbooks remained the single most important technology used in schools during the eighteenth and nineteenth centuries, other technologies gradually made their way into the classroom. As early

as 1692, John Locke (1632–1704) wrote in “Some Thoughts on Education” about the use of alphabet blocks in the education of children.

By the middle of the nineteenth century, educators such as Friedrich Froebel (1782–1852) were developing school curricula around the use of pedagogical devices ranging from construction blocks to weaving activities and even an early type of Tinkertoy® construction system. Similar types of learning devices were introduced by the Italian physician and educator Maria Montessori (1870–1952).

Perhaps the most enduring educational technology of the nineteenth century was the blackboard. Larry Cuban has noted that its persistence in the classroom is indicative of its dependability and functionality. Early blackboards were made from pine covered with a carbon and egg-white writing surface. Slate, introduced later, was replaced in the twentieth century by easier-to-read green boards and eventually by white boards, which are plastic surfaces on which erasable, felt-tipped pens are used.

Audiovisual Modes

By the end of the nineteenth century, educators were experimenting with other new technologies, such as the phonograph. At about the same time, lantern slides began to be widely used. Pioneers in audiovisual education, such as the St. Louis public schools, made slide sets available for classroom instruction as early as 1905. In 1911, Thomas Alva Edison (1847–1931) released a series of silent historical films that he hoped would be used in classrooms. By the 1930s, educational radio broadcasts were also being used in classrooms. It was at this time that the filmstrip was invented, introduced for the first time at the Century of Progress Exhibit in Chicago in 1933.

In general, despite wide experimentation with technology, most innovations have had far less impact in the classroom than was originally anticipated. During the 1950s and 1960s, educational television and videotape were thought to have the potential to revolutionize education. But as Larry Cuban has pointed out, educational technologies such as radio, film, and television actually have had only a marginal impact on classroom instruction.

Why is this the case? One possible explanation is that teaching is far more a social process than a technical one. What may count the most in the classroom is the interaction that takes place between teachers and students. Rather than teachers simply being conduits for knowledge, and students receivers of information, a much more complex process of social interaction is at work. Technologies, whether in the form of radio, film, or television, are of relatively little importance in the curriculum as compared to what teachers do in the classroom. Essentially, technologies can be useful to skilled educators, but they have not fundamentally changed the nature of most teaching and learning.

The Computer Revolution

This is not necessarily the case, however, with the most recent educational technology—the computer. Computing devices are as ancient as the abacus, but modern computing as we know it has existed only since the end of World War II. At that time, machines such as the ENIAC (Electronic Numerical Integrator and Computer) were developed by the engineering school at the University of Pennsylvania. An extremely limited machine compared to modern computers, the ENIAC was designed to calculate ballistics for use in the military.

As computers became increasingly widespread in government, business, and higher education during the 1950s and 1960s, their use was largely limited to mathematical calculations and business functions. Because of their prohibitively high cost, their use in education was almost entirely limited to specialized areas such as statistics and the sciences. This began to change in the late 1970s with the introduction of relatively inexpensive microcomputers, or, as they eventually came to be known (as they increased in power), desktop computers.

The first really practical desktop computers were introduced in the 1970s by the Apple Corporation. Founded in 1976, the first Apple computer, the Apple I, was a personal computer kit that had to be assembled by the owner. The Apple II, which was introduced in April 1977, was the first really practical desktop machine. Because of its size and relatively low cost, the machine made computing a possibility

for private individuals, as well as various types of educational institutions. By the early 1980s, rivals such as Microsoft and IBM began to compete with Apple for domination of the personal computer market.

Desktop computing, as with earlier educational technologies, was considered by many educators to have the potential to revolutionize the classroom. Eugene F. Provenzo, Jr., in his book *Beyond the Gutenberg Galaxy: Microcomputers and the Emergence of Post-Typographic Culture* (1986), postulated that the desktop or microcomputer revolution (happening during the 1980s) functioned in many respects like the Gutenberg Revolution nearly 500 years earlier. As was the case with the introduction of the book in the sixteenth century, the widespread availability of the computer created a new set of users who suddenly had access to new types of information and tools, and, as a result, were correspondingly empowered. The new technology provided by computers likewise created new ways of learning, as well as radical innovations in terms of representing and manipulating scientific and humanistic knowledge.

Much of this, as was the case with the revolution in printing, is now taken for granted. Research and the acquisition of knowledge have changed dramatically in the past twenty-five to thirty years as a result of the widespread introduction and use of computing. A library card catalog is essentially obsolete, no longer even available in most libraries. Library catalogs are now largely electronic, as are many of the collections to which they are linked. Students and teachers at all levels now have access to information and data through computers that a generation ago could be accessed only by specialized scholars working in archives and university collections. Anyone in the world can access the great libraries of the world and, increasingly, large parts of their collections. The Internet search engine Google is rapidly evolving into a world library or an encyclopedia or database. Most of the world's essential knowledge will be available online. More traditional knowledge systems are becoming obsolete. For example, what is the relevance of a traditional text-based encyclopedia such as *Encyclopedia Britannica* when much of the same information is available online in forms such as Wikipedia? What happens to traditional intellectual

authorities such as Britannica, which seeks out the best experts available on a subject, when they are challenged by an "open source" reference work, in which volunteers constantly edit, revise, and update articles, as is the case with Wikipedia?

The Power of the Internet

Why is the computer such a potentially powerful educational technology? The question is more complicated than may at first seem to be the case. A minimum of three to four revolutions in computing have taken place since the end of World War II. All of them have affected education—some more than others. Mainframe computing, which lasted from the mid-1940s to the late 1970s, has already been discussed. To a large degree, its impact was confined to science and government, with a limited impact on universities and colleges. The introduction of desktop computing during the late 1970s made computing available on a practical basis for the first time in K–12 schools.

With the introduction of the Internet and World Wide Web in the early 1990s, educational computing went through another major evolution—making unprecedented access to information and communication resources possible for the general public. The Internet originated in 1969 when the U.S. Army established an online computer-based communication system known as the Advanced Research Projects Agency Network (ARPANET). The primary concept behind the ARPANET was to develop a networked series of computers that could survive a nuclear attack. Evolving rapidly, the system was made available to university researchers through the National Science Foundation in 1983 and became accessible to the general public in 1985.

Initial access to the Internet was limited due to the complexity of its design and protocols. In December 1990, however, a major innovation occurred when Tim Berners Lee, who was working at the European particle physics laboratory in Bern, Switzerland, developed a graphical-oriented computer browsing system that made it easier to communicate when using the Internet. Known as the World Wide Web, this graphical user interface uses hypertext markup language that allows hyperlinks to connect text, visual,

and sound files. Today, approximately 1 billion of the 6 billion people in the world make regular use of the Internet. Use varies widely, however, based on geographic location and level of economic development. In North America, for example, Internet use is nearly 70 percent, whereas in Africa, usage is only 3 percent.

In industrialized countries such as the United States, computer access is becoming sufficiently widespread that its use in education is taken for granted. Even though appropriate training of teachers to use the technology varies widely, and resources are not by any means equal, the availability of computers as an educational technology in the schools is becoming universally accessible. Accessibility, however, does not necessarily guarantee equal use. Serious issues underlie how computers are used in different settings. At the elementary level, boys are often allowed greater access to computers than girls. “Skill and drill” educational programs using computers are often emphasized with minority students and students from lower socioeconomic groups, whereas more creative uses are emphasized with other students.

A New Educational Environment

How do the desktop computing revolution that began in the late 1970s and the Internet revolution of the early 1990s combine to create a new environment for teaching and learning? To begin with, teachers and students are no longer limited by their geographical location. Access to information and communication is potentially available on a worldwide basis. Individuals can communicate via e-mail, exchange data, and access both formal and informal informational networks. As television in an earlier generation provided viewers with a “window on the world,” computers connected to the Internet and World Wide Web provide users with access to knowledge and communication on a global basis.

Augmenting Intelligence

In addition, educational computing has the potential to augment the intelligence of users. The concept of the computer augmenting intelligence comes from the work of Douglas C. Engelbart. In the early 1960s, when

Engelbart was an engineer working at Xero Park, a research center affiliated with Stanford University and funded by the Xerox Corporation, he published a series of seminal essays on computing. In these works, he outlined for the first time the basic principles of word processing, the use of screen icons, as well as concepts such as the computer mouse and digital scanning.

In a 1963 essay, Engelbart also theorized that human beings could augment, or enhance, their intelligence by using a computer. This concept of augmentation was similar to the idea of using a mechanical device such as eyeglasses to improve one’s vision, or a tool such as a pair of pliers to increase one’s grip. The idea of a tool for augmenting one’s intellect was not necessarily new, although Engelbart was the first to clearly articulate the concept. The printed book, for example, is an intellectual augmentation device because it expands the user’s knowledge base as well as the user’s ability to precisely recall information and data.

Computer augmentation of our intelligence occurs all the time. Handheld calculators are, in fact, computers that allow us to add, subtract, multiply, and do square roots at a level that would be impossible to do in our heads and difficult with pencil and paper. Grammar and spell-check systems, now common with word processing systems, are intellectual augmentation devices. Using one makes it possible for a relatively weak grammarian and/or speller to produce a written document that is significantly better than he or she could produce simply by writing with pen and paper, or using a typewriter.

Computers can also augment our physical selves. In the case of children with special needs, adaptive computer technologies make it possible for them to have access to information and ideas that would not otherwise be available. A vision-impaired child can use a computer that magnifies text on a screen, or that reads text aloud. A paralyzed child can use eye movement that is tracked by the computer to manipulate a keyboard, making it possible to type or search the Internet.

Changing Classrooms

Robert Taylor, in an early work on educational computing, identified multiple ways in which computers are used in classroom instruction—the idea of the computer

as Tool, Tutor, and Tutee. In the Tool function, a computer is used to do something, such as draw a picture, write a sentence, or multiply a number. The Tutor function involves the learner being taught something by the computer, such as a math program that teaches and reinforces multiplication and division skills. The third function, Tutee, involves the user programming the computer to do something. This last function is relatively rare compared to the other two functions.

Taylor's model is useful in that it emphasizes the idea that not all educational computing functions are the same, and that they imply different levels of involvement and control on the part of the student. The Tool function, for example, places the student largely in control, whereas the Tutee function emphasizes the learner being acted upon by the computer program.

Other important distinctions in educational computing have been raised by Cleborne Maddux. In a widely cited article from the mid-1980s, Maddux makes a distinction between Type I and Type II uses of computers. Type I use involves the computer being used to do something that has always been done in education, but that is superseded by the computer, such as using the computer to do word processing in place of typing. A Type II use represents a totally new use of the computer, such as a simulation program that allowed a student to practice emergency procedures for flying a disabled airliner. Prior to computers, such an activity would have been impossible.

More Than a Tool

What occurs when a student uses a computer to learn something raises a number of interesting questions. If a student uses a computer to draw, is he or she actually learning to draw or simply learning how to draw with a computer? In this context, it can be argued that the computer is simply a tool, just as a pencil is a tool that allows an artist to create. As with any medium (chalk, ink, oils, acrylics, or charcoal), the medium used changes the nature of what is created. This is certainly the case with the computer. No medium is neutral, but represents a particular way of creating and constructing the world.

According to the German philosopher Martin Heidegger (1889–1976), any technology amplifies or

reduces the experience that it mediates. Thus, a telephone amplifies the spoken word while virtually eliminating the visual in its use. Television and film emphasize the visual. Educators must consider what it is that the computer mediates during the learning process. What does it amplify? What does it reduce? As mentioned earlier, calculators are used because they accurately add, subtract, multiply, and divide. Is being able to accurately add, subtract, multiply, and divide so important to learn if students have access to calculators? How well do students need to be able to spell if they have access to a spell-checker? How much time needs to be spent on grammar in a writing course if students can use a grammar checker? Educators have to decide what role the technology represented by the computer is to play in the teaching and learning that goes on in a classroom.

How does the fundamental character of the classroom change as a result of the computer? This is a basic question raised by a number of educational theorists. C. A. Bowers, in his book *Let Them Eat Data* (2000), for example, argues that we need to understand computers in terms of how they mediate and change the educational environment of classrooms and schools. Like Heidegger, Bowers believes that the computer is not a neutral technology, but one that profoundly shapes our way of knowing and understanding the world. Bowers argues that computer use reinforces certain “root” metaphors that reinforce specific ways of looking at culture and nature. Knowledge, for example, is data driven instead of being based on intuition or faith.

The Cosmopedia

Theorists such as the French hypertext theorist Pierre Levy argue that as a result of the development of inexpensive computers and the Internet, we have entered a new knowledge space that he refers to as the *cosmopedia*. According to Levy, the computer makes possible the development of a shared or “collective intelligence.” The cosmopedia links people together in vast networks that go beyond traditional text and static images to include video, sound, interactive simulation, interactive maps, expert systems, dynamic ideographs, virtual reality, artificial

life, and so on. Levy believes that the cosmopedia can break down the artificial boundaries between the disciplines, making it possible to fold almost any field into another. Thus, traditional ways of knowing and learning are profoundly challenged. Also, new types of intellectual authority may emerge. Thus, an individual can establish a blog or other type of Web site that allows his or her ideas to be heard in ways that were previously not possible. According to Levy, we are standing on new cultural ground as our intellectual traditions mutate into something very different from those experienced by previous generations.

Issues in Social Foundations

Computers in the classroom raise fundamental questions that are traditionally related to the social foundations of education: (a) Who has access to computers? Are computers used in the same way across different socioeconomic, racial, cultural, and geographical groups? What type of training is given with that access—drill versus skill? (b) What assumptions underlie certain models of programming? What types of interfaces are used? Do certain interfaces privilege or favor one group over another? (c) How is the process of writing changed when one learns to do it using a computer rather than a pen and paper? (d) How is the process of researching a topic changed when students have access to the Internet and the World Wide Web? (e) What is the appropriate use of computers?

The use of the computer can shape, in critical ways, how students think and approach the tasks of learning. Elementary and secondary school children now have access to information resources that were previously available only to college and university students a generation ago. How does this affect something as traditional as writing a term paper? Although students have greater access to sources of useful information, they also have a greater potential to plagiarize written material. Teachers now find it increasingly necessary to do global online searches of sections of their students' work to see if it has been copied.

Computers also have an effect on social interactions between teachers and students. At the elementary and secondary level, teachers can post homework assignments to a Web site, which means that parents

can monitor the work that their children are expected to complete. At the university level, office hours have become less important as a means by which students communicate with professors. Contact with students increasingly takes place online. Although convenient, this process changes the fundamental nature of interaction between the student and the professor. One is not likely to ask students via e-mail about their family background, their study habits, or their personal lives as one might during an informal chat during office hours. Much may be lost as a result.

The process of teaching and learning in schools is undergoing a profound redefinition. For some, this process, much like the Gutenberg Revolution, represents a "singularity." The concept of a singularity is drawn from the work of science writer Vernor Vinge and describes an event that is so profoundly important that the world is redefined as a result. The invention of movable type was a singularity, as was the creation and explosion of the first atomic bomb. The computer revolution that began with the development of main-frame machines and continued with inexpensive desktop computing and the widespread implementation and use of the Internet and World Wide Web is almost certainly another example of a singularity, or possibly multiple singularities.

The emergence of a singularity is a relatively rare event, although, as technology continues to evolve rapidly, it may create a situation in which singularities are more common. The Human Genome Project, for example, which is already revolutionizing fields such as biology and medicine, is almost certainly a singularity, as is the related technology of genetic cloning.

To a significant degree, computers and their increasingly widespread use in our culture and educational system change the nature of educational discourse. These changes are not neutral, but represent very specific ways of knowing and understanding the world. Being aware of this process is fundamental to understanding what can and cannot be accomplished in the teaching and learning process in our schools. As such, the question of technology and its impact on education becomes one of the most critical issues that all educators must address.

TELEVISION, PUBLIC EDUCATIONAL

Proposed by, lobbied for, and signed by President Lyndon Johnson in 1967, the Public Television Act, which created the Corporation for Public Broadcasting, was the impetus for public educational television as it exists in the United States today. The issue of funding was not resolved in this act, an issue that continues to be problematic. The Corporation for Public Broadcasting (CPB), although created by federal law, is a private, nonprofit corporation. The CPB receives money from Congress to fund the Public Broadcasting Service (PBS), which was created in 1968, as well as National Public Radio and Public Radio International. Its funding has frequently been controversial in Congress, with opposition, primarily among conservatives, centering on the cultural and educational programs which the CPB supports.

PBS airs most of the educational public television in the United States. PBS, like CPB, is a private, nonprofit organization. Ownership is shared among its 354 noncommercial member stations nationwide. PBS does not actually produce programs, but rather distributes them so that they can be aired.

Educational programming on PBS is created and produced by a number of companies. The Sesame Workshop, formerly the Children's Television Workshop, was established in 1968 and is responsible for the program that many Americans automatically associate with educational television, *Sesame Street*. Created by educators and psychologists with the education of urban preschool students as the focus, *Sesame Street* began in 1969 and is still on the air today. *Sesame Street's* characters, both human and puppet, increase in diversity to be inclusive of their audiences.

During the 1970s, shows teaching everything from cooking (*The French Chef* with Julia Child), remodeling (*This Old House*), and yoga (*Lilias, Yoga and You*) came to complement spelling, math, and character-building programs such as *The Electric*

Company and *Mister Rogers' Neighborhood*. In the sciences, *NOVA*, which first aired in 1974, continues to be a favorite among viewers and teachers alike. For audiences interested in business, PBS began offering *Wall Street Week* in 1970, another program that continues to air.

From its earliest inception, PBS and its content suppliers relied on programs produced by the British Broadcasting Corporation, and that history is still evident in series such as *Masterpiece Theater* and *Mystery*. Although public television cannot properly be said to have competitors, as cable networks such as A&E and the History Channel have emerged and created shows that follow the educational format established by PBS, PBS has lost some viewers.

TESTING, HISTORY OF EDUCATIONAL

At the beginning of the twentieth century, most Americans did not know about scientifically developed tests. This situation changed after World War I. Wartime leaders implemented extensive intelligence and vocational testing programs to help them categorize the numerous military recruits with whom they were dealing. Popular newspapers and magazines raised awareness about testing when they informed the general public that the soldiers' scores on the new assessment devices were unexpectedly low.

Once the war was over, former military psychologists accepted jobs in the schools. They implemented academic testing programs that were similar to those that they had employed in the armed services. Publishers supplied the school psychologists with tests in areas such as reading, writing, and mathematics. The publishers also provided specialized tests to industrialists and businesspersons. The numerous scholastic and business customers that they were able

to nurture provided the postwar testing publishers with a solid foundation for growth.

Scientific testing was presented as efficient, cost-effective, and objective. Impressed with these positive features, influential leaders in government and business supported it. Most parents, who wanted to be reassured that their children were making educational progress, also supported it. At the same time, many professional educators opposed testing. They thought it was an unreliable and invalid assessment of students. Furthermore, they saw it as a challenge to their professional independence and expertise. Although confrontations between these groups continued, scientific testing became a critical component of American education. This entry looks at the history of education-related testing.

Early Intelligence Tests

Nineteenth-century teachers had evaluated student learning through recitation. This was a classroom practice in which the students took turns orally recapitulating key pieces of information about a subject that they had studied. The teacher determined whether the students had demonstrated sufficient learning. A group of disgruntled educators began to criticize recitation for being too subjective. They urged teachers to employ the new approach to assessment with which psychologists were experimenting.

Many scientifically minded educators were extremely impressed by Alfred Binet (1857–1911), a French psychologist who had created a distinctive intelligence exam. The 1908 version of Binet's test relied on a limited number of simple tasks. For example, Binet thought that people had the intelligence of three-year-old children if they could restate numbers; describe pictures; identify their personal family names; repeat sentences of six syllables; and point to their noses, eyes, and mouths. Binet devised more demanding tasks to determine whether examinees demonstrated advanced degrees of intelligence. Because of its straightforwardness, ease of administration, and consistent results, Binet's intelligence test became the template for instruments with which teachers could measure the academic accomplishments of their students.

Early Academic Tests

During the first half of the twentieth century, Edward Thorndike (1874–1949) was the most famous spokesperson for academic assessment and the assessment-centered approach to teaching. The distinctive tests that he and his colleagues developed closely resembled the classroom practices that they purported to measure. This correspondence bolstered the confidence of those teachers and parents who were skeptical about the novel instruments.

The tests that Thorndike championed were attractive for several additional reasons. For example, some of them could be administered to groups of students and scored with special effort-reducing devices. Another advantage was that many of the tests relied on statistical techniques that standardized the performances of students. School administrators who employed standardized tests could compare the learning demonstrated by two students, even if those students had used different textbooks or studied with different instructors. Although many educators thought that scientifically based tests would produce accurate estimates of learning, some of them also hoped that reliance on them would elevate the teaching profession to a more prestigious position in American society.

Tests were devised for all grade levels and in multiple areas of the curriculum. Additionally, they incorporated multiple types of tasks. For example, early reading tests assessed students' abilities to use phonics, recognize words, interpret the meaning of sentences, form inferences, and employ illustrations as aids to comprehension. Tests of mathematics, writing, social studies, English, and science contained similarly diverse tasks. Some of these tests could be administered only to individual students, others only to groups, and still others had the flexibility to be given to either. Although most of the new tests were estimates of student achievement, a good number were diagnostic tools that could facilitate remedial instruction.

Those critics who distrusted the assessment that had been provided by teachers and school officials were extremely optimistic about tests. They thought that the new instruments could measure student learning more accurately than the teachers and school administrators could evaluate it. Some of them thought that tests could help create a business-like

atmosphere in which school budgets would be linked to student performance. A few of the critics suggested that the scores earned by students on standardized tests should serve as the basis for giving merit raises to teachers or renewed contracts to administrators.

Impact of World War I

World War I military leaders had asked psychologists to design tests that would differentiate those recruits who would be successful as soldiers. To the surprise of many persons, the scores on these tests revealed that a significant portion of the recruits lacked the intelligence to perform some of their critical duties. Conservative politicians used these data to dramatize the need for greater military preparedness. Many of them railed against the public educational system, which they thought had failed to meet a cardinal commitment to national defense.

Two types of intelligence tests were developed by the military psychologists. The Alpha Test was a written exam that could be used with large groups. The other exam, the Beta Test, was an interactive measure that was designed for soldiers who were illiterate or unable to communicate effectively in English. Although the press publicized the disappointing scores that soldiers earned on these general exams, it ignored their performance on many of the other tests that the army psychologists had created. Some of the alternative tests assessed the recruits' aptitudes for the different military trades and vocations. Some of them measured the degrees to which soldiers already might have mastered the skills that were required for specific jobs. After the war, the military's vocational exams were adapted so that they could be administered to job applicants or employees in industry, commerce, and business. They also were modified for use with high school and vocational school students.

Influence of Entrepreneurs

Once they had confirmed that academic and vocational testing could be profitable, textbook publishers began to develop large inventories of materials for these markets. By the 1940s, thousands of distinctive tests were available and were administered to millions of students. Some of the most profitable products

were completed by high school students as part of their application to selective colleges or academic programs. The Educational Testing Service, which was founded in 1947, quickly established itself as the dominant force in this market. As an indication of its success, the Educational Testing Service was earning annual income in excess of \$100 million just 30 years after it had been founded.

Although the opponents of standardized testing attacked the entire testing industry, they frequently focused their criticism on the Educational Testing Service. They claimed that it was secretive, monopolistic, unethical, and unfair to students from racial minority groups. They were able to air these views in newspapers and magazines. As a result of the ensuing publicity, the New York legislature passed a “Truth in Testing Law” that required publishers to disclose the content on their tests. This 1970s state law enabled critics to uncover several incorrect items in these tests. Even while they were enduring sustained assaults, the Educational Testing Service and the testing industry in general continued to grow.

Test-Based Accountability

During the 1980s, a series of reports alleged that a crisis was threatening American education. By far, the most influential publication was *A Nation at Risk*. The authors of this 1983 federal report pointed to low test scores as evidence of weaknesses in the schools. Believing that the value of testing already had been demonstrated, they called for additional and more extensive testing to monitor the health of the educational system. Influential business leaders endorsed this report’s conclusions, including the recommendation for greater assessment.

Also impressed by the report, numerous state legislatures implemented testing programs to help them determine whether high school students should graduate, teachers should receive bonuses, or school administrators should be awarded new contracts. Because their consequences were so severe, these initiatives were characterized as high-stakes testing plans.

The National Educational Association, which was the largest professional organization representing teachers, repeatedly condemned high-stakes testing. However, polls demonstrated that the teachers had

misgauged the attitudes of the general public. Once they realized that they lacked the nation’s confidence, the members of the National Education Association attempted to garner greater public support. They promised that they would devise teacher-endorsed assessment procedures that were more useful, cost-effective, practical, reliable, valid, and fair. However, the antitesting factions were unable to fulfill their commitment. As a result, their credibility dropped even further. Meanwhile, a bipartisan coalition supported testing. Backed by this broad political alliance, Presidents George H. W. Bush, Bill Clinton, and George W. Bush made standardized testing a key component of their plans for improving education.

TEXTBOOKS, HISTORY OF

Textbooks are an invention of the early modern period and reflect the emergence of the new technology of the book, as well as the realization that children have separate needs and lives from adults. Over the years, textbooks have covered more and more subjects, and they have become increasingly subject to controversy. This entry looks at the history of textbooks, particularly in the United States, and examines some of the more recent and powerful controversies.

Early Texts

Although catechisms were common by the end of the sixteenth century, the first modern textbook is widely recognized as being John Amos Comenius’s *Orbis Sensualium Pictus*. The *Orbis Pictus* was approximately 400 pages, with an illustrated text, originally published in both Czech and Latin. It literally had as its purpose introducing the child to all of the major

objects and things found in the world. The *Orbis Pictus* is important because it identifies the child not only as a subject to be educated, but also as someone who can be shaped by the technology of print and an illustrated text. The influence of Comenius's work is clear when one looks at the first textbook used in the American colonies, *The New England Primer*.

The New England Primer was first published about 1690 by Benjamin Harris. A small book that could easily be held in the palm of a child's hand, the text was heavily illustrated and incorporated many elements into its content, such as an illustrated alphabet, found in the *Orbis Pictus*. The book, as textbooks in general, reflected the values and beliefs of the culture for which it was produced: in this case, a conservative Protestant and biblically oriented tradition. The book begins with a prayer, followed with lists of words, many with religious overtones, such as benediction and purification, for the children to recite. Even its famous rhyming alphabet was religious in nature.

Early textbooks were primers, spellers, or reading books. Primers provided learners with a basic introduction to reading, whereas spelling books dealt with more advanced word and sentence construction. Spellers typically concluded with simple reading passages—in particular, fables. Readers, as their name suggests, provided advanced reading material, often increasingly difficult in its content.

A New Nation

Prior to the American Revolution, British textbooks were used in colonial schools such as those by Lindley Murray. With the success of the American Revolution, the need to develop American textbooks with distinctive American versus British themes came to be seen as increasingly urgent. Most important of these efforts was the work of Noah Webster (1758–1843), who published the three-volume *Grammatical Institutes of the English Language* in 1783. This work, whose first volume eventually came to be known as “The Blue Back Speller” because of its blue covers, was deliberately political in its content (anti-British and pro-American).

Later known as *The American Spelling Book*, and, after 1829, as the *Elementary Spelling Book*, Webster's

spellers continued to be used into the twentieth century and sold tens of millions of copies. Webster's speller was not the only textbook published after the Revolution that had a political agenda. Jedidiah Morse's *Geography Made Easy* (1784) very consciously promoted political, social, and moral values—ones that were consciously American.

By the beginning of the nineteenth century, more than a dozen different primers, readers, spellers, and arithmetic books were being published in the United States. Among them were Nicholas Pike's *New and Complete System of Arithmetic* (1788) and Nathan Daboll's *School Master's Assistant* (1800). Operating under the assumption that students could already read, the arithmetic books taught that there were “rules” for every problem. Even in the arithmetic books, patriotic heroes such as George Washington appeared in the word problems.

An Expanding Field

In 1836, a professor from Ohio, William Holmes McGuffey (1800–1873), published a multivolume collection that included a primer and a set of six readers that came to dominate the American textbook market for the next fifty years. The first of *McGuffey's Eclectic Readers* largely reflected the moral values of the day. One distinction that set them apart was their emphasis on pacifism. The readers also included literary selections from Aesop's Fables, Shakespeare, George Gordon (Lord Byron), Washington Irving, and Nathaniel Hawthorne.

Geography textbooks such as Arnold Henry Guyot's *Physical Geography* (1866) likewise reflected the biases of their authors and the beliefs of the society by dividing and ranking the races of people. Blacks were typically depicted as being childlike and unintelligent—stereotypes that continued well into the twentieth century. Religious prejudices were also found in textbooks. Jews and Catholics were often depicted in a discriminatory way: the Pope as a tyrant and Roman Catholicism as a threat to the American democracy. So serious was the prejudice against Catholics that by the 1840s, the Catholic Church began to produce its own textbooks to be used in parochial schools.

Textbooks have often been the source of controversy in American culture because they reflected regional values. Prior to the Civil War, there was a general feeling on the part of the South, for example, that most textbooks were antisouthern and reflected a northern bias against institutions such as slavery. This is not surprising because most of the textbook authors in the United States at that time came from the northern states. During the Civil War, the production and sale of distinctively southern textbooks became an important issue for the Confederate states.

Textbooks and Values

Textbooks are almost never value free: A primer teaches a child to read while introducing social values; a reader provides role models in its stories; and an American history textbook is written from a particular political point of view. The issue of the cultural content of textbooks remained an important issue during the twentieth century and even into the current era. During the late 1930s, the Progressive educator Harold Rugg (1886–1960) produced a series of American history textbooks that strongly emphasized critical thinking and the criticism of the failure of capitalism as reflected in the economic Depression that was holding the country in its grip. A systematic campaign was organized throughout the country to have his books removed from the schools.

Until very recently, history textbooks have ignored the accomplishments and roles of women in American history. The history of men, instead, was emphasized, particularly in textbooks published prior to the 1970s. In doing so, a null curriculum was promoted—in other words, the teaching of a way of knowing and understanding by not teaching about it. Cities, much less slums, rarely appeared in readers: Non-Black, non-Hispanic, non-Native American children always seemed to be playing on neat lawns in front of houses surrounded by white picket fences. Slowly, the situation changed as history books began to mention more women and Black historical figures.

During the late 1960s, textbook critics such as Mel and Norma Gabler of Longview, Texas, and founders of Educational Research Analysts, a textbook evaluation group, consistently called for a more conservative

political content in textbooks that reflected their rural, middle-class, and conservative Christian values. Their impact was particularly important, because they strongly influenced the adoption of textbooks at the state level. This practice, which occurs primarily in the southern states, strongly influences textbook publishers because the state committee determines whether or not public funds can be used for the purchase of textbooks at the local level.

These adoption committees and procedures are particularly important for publishers in states such as Texas, California, and Florida because of their size. A large state such as Texas, for example, guarantees millions of dollars in sales for a publisher. As a result, most publishers are not willing to risk their investment by producing textbooks that could potentially offend a broad spectrum of the population. As a result, textbooks—particularly in subjects such as history and literature—follow safe and long-established traditions, try at all costs to avoid controversy, and try to appeal to the largest audiences possible. As such, they represent consensus and often conservative works.

More textbooks are sold each year than any other type of book. As textbook authors and editors try to please the many different ethnic, religious, and cultural groups in the United States, the result, more often than not, is that textbook content is more likely to be bland and acceptable rather than critical and provocative. What makes a particular textbook acceptable to an individual parent or community may make it unacceptable to another parent or in another part of the country. The pressure from special interest groups is particularly strong when considering elementary and secondary textbooks. Because the profits from these books are potentially the greatest for publishers, they are going to produce books that appeal to the largest number of people.

Increasing Controversy

Attempts to keep textbooks out of controversies do not always succeed. In March 1974, in Kanawha County, West Virginia, a controversy erupted over the content of 325 language arts textbooks that appeared on a list submitted by five teachers to the board of education for adoption. The protestors objected to the

textbooks because they considered some of the authors (such as the radical African American Eldridge Cleaver) whose work was included in them to be unsuitable. They also objected to the violence, sad themes, and “dirty language” they found in the books.

What became known as the “battle of the books” raged on into the fall. Textbook protesters kept 8,000 (out of 42,000) students from attending school on September 3, 1974. Wildcat strikes broke out among local businesses and industries that supported the protestors. When the school board’s attempts at compromise with the protestors failed, they were forced to completely close the schools to protect the students. The school board removed the most controversial books from the approved list and had the books shelved in the library rather than being used in the classrooms. But the protestors were not happy with the board’s compromise: Students were removed from the schools and buses were fired upon. The Upper Kanawah County Valley Mayors Association obtained arrest warrants for the superintendent and the school board, charging them with contributing to the delinquency of minors by adopting “un-Christian” and “anti-American” textbooks.

The school board responded by drawing up a set of guidelines for textbook adoption. The acceptable books could not contain profane language, had to encourage loyalty to the United States, and show respect for the sanctity of the home and one’s parents. By the beginning of 1975, the controversy had quieted down. Even though unusually violent, the controversy did, however, highlight the fact that dramatically different viewpoints about what should be taught in the school can exist within a particular community.

Controversies over textbooks continue to appear on a regular basis and will almost certainly continue to do so in the future. They are, by definition, the most public and easily available material found in the curriculum and can be easily subject to political and social criticism. As the most publicly visible evidence of the curriculum being taught in the schools, they are particularly fascinating to those interested in studying the educational values of a culture.

TITLE IX

The 1960s and 1970s were a tumultuous time in America’s history. Many changes occurred within the population, the culture, and the politics of that time period. Women were demanding equal rights, and one of the primary areas in which they wanted this equality was education. In 1972, the educational amendments passed in the U.S. Congress including Title IX, which promised that “No person in the United States shall, on the basis of sex, be excluded from participation in, be denied benefits of, or be subjected to discrimination under any education program or activity receiving Federal financial assistance.” This entry looks at the law and its impact.

What the Law Says

Although Title IX covers all programs that receive federal funds, the main focus has been on athletics, specifically college athletics. This seemed to be based on the assumption that athletics was where the greatest disparity existed between men and women. Before Title IX, the *Encyclopedia of Women’s Sports* found

that only 1 percent of the average athletic budget went to women's sports. Stereotypes of female athletes led many women to avoid sports altogether. In education, many colleges maintained quotas that limited the number of women who could enter certain programs. Even newspaper classified advertisements separated jobs by gender.

These disparities caused many women's organizations and leaders to call for the federal government to address the gender discrimination. In the summer of 1970, Representative Edith Green (D-Oregon) chaired a special subcommittee on education. The goal of these hearings was to amend gender discrimination in federally financed programs, including higher education. The hearing covered more than 1,000 pages of inequity grievances that ranged from classified advertisement separation to gender stereotypes. The women who presented these grievances made demands for equality in employment procedures, salary, federal income tax, and Social Security benefits. The result of these hearings was the Education Amendments Act of 1972, which passed through Congress and was signed on June 23, 1972, by President Richard Nixon.

In order for schools or programs to be deemed in compliance, they must adhere to one of the three options (or prongs) listed in Title IX: (1) The number of available opportunities for each gender must be proportional to the number of each gender's interest and numbers on campus; (2) the school must show a history of program expansion in response to interest and abilities of each gender; (3) the school must show that its present programs address interest and abilities of each gender. Thirteen programs are typically addressed to evaluate compliance, and they include, but are not limited to, practice facilities, times, coaching staff, and financial assistance.

Impact and Critique

Because the wording of Title IX was so vague, the prongs so flexible, and the original enforcement so lax, it has received many criticisms and setbacks during its tumultuous history. College administrators, coaches, and male athletes argue that Title IX costs more money and forces some men's programs to be

cut. Many of these dissenters also disagree with the federal government's threat and mandate to withhold federal funds if schools are not found in compliance. During the late 1990s and early part of the twenty-first century, lawsuits have been presented arguing that the proportionality clause hurts other men's programs. The majority of these lawsuits have ruled in favor of the female plaintiffs. In 1996 and as recently as 2002, Congress has upheld the three-prong test, with only one of the prongs needed for compliance.

Even with its dissenters, delays, and slow enforcement, Title IX has made tremendous improvements for women and has opened the doors to education and athletics at all levels of schooling for women. In academics, Title IX has opened the doors to many more professional degrees for women. Terry H. Anderson reported that in 1970, women made up only 1 percent of engineers, 2 percent of dentists, 3 percent of lawyers, and 7 percent of physicians, whereas recent statistics now report that in 2003, women accounted for 9 percent of civil engineers, 7 percent of electrical engineers, 28 percent of lawyers, and 30 percent of physicians. Nelly Stromquist found that in 1971, women made up the following percentages of degrees: 44 percent of bachelor's, 40 percent of master's, 16 percent of doctoral, and 6 percent of professional degrees (including chiropractic, dentistry, law, medicine, pharmacy, podiatry, theology, and veterinary medicine). By 1989, these numbers had increased to 52 percent, 52 percent, 36 percent, and 36 percent, respectively.

In athletics, Title IX has opened the doors to education at all levels of schooling. Linda Jean Carpenter and Vivian Acosta have found in their research that in 1971, there were only 30,000 college women participating in sports. In 2002–2003, the highest number to date of high school and college students participated in athletics, and women made up 41 percent of these. In 2002, 42 percent of all college athletes were women (150,000). In the 1970s, 294,000 high school girls participated in sports compared to 3.7 million high school boys. In 2002, the numbers were 2,856,358 and 3,988,783 for girls and boys, respectively. In 1972, the average number of female teams per college was only 2.50, whereas in 2004, this number increased to 8.32.

Title IX has helped women gain better access to both education and athletics. This access has helped women achieve equal treatment with men but also has enabled them to improve their own self-concepts. Today's young women are continuing to build on the work of their predecessors as they continue their achievements in both athletics and academics.

TRACKING AND DETRACKING

Tracking is an instructional management practice in which students are assessed on achievement or intelligence and then assigned to differentiated curricula to match their abilities. The importance of tracking stems from its impact on student achievement and its broader implications for schools. Today, many countries throughout the world implement tracking in their schools. However, tracking is still viewed as a

highly controversial practice because it is perceived as a source of educational inequality. In some cases, schools have actively sought to “detrack” their curricula by creating more heterogeneous classrooms. This entry provides a brief history of tracking, surveys leading perspectives on its advantages and disadvantages, and discusses the issues raised by detracking.

Historical Background

Tracking has a long history and close connections with the purposes of education. Socrates, through his spokesperson Plato, provides one of the earliest examples that links differentiated education directly to social needs. In his ideal state, the Republic, Socrates argued that society requires three classes of citizens. Using the analogy of citizens as likened to bronze, silver, and gold, these classes were (1) artisans or workers, (2) guardians, and (3) rulers. Because each role in the hierarchical social structure required different skills, education was to be differentiated on that basis.

Socrates' “Myth of the Metals” may seem quaint, if not outright undemocratic, by today's standards. However, his notions were significantly more progressive than those of many later thinkers. In particular, Socrates believed that individuals would be happiest if they were able to use their natural abilities. He also believed that a person's assignment as a worker, guardian, or ruler should be determined according to those abilities. A person's station in life was not inherited on the basis of family position or wealth. In making these points, Socrates anticipated that questions of fairness and equality would long remain central in debates over how education should be used in addressing social needs.

In the United States, tracking as a widespread practice can be traced back to the era of urbanization, industrialization, and the resulting growth of the common schools. As early as the mid-nineteenth century, educational leaders argued vigorously that tracking was efficient for what historian David Tyack called “the One Best System.” As schools became larger and more bureaucratic, educational leaders sought more differentiated forms of school organization. Yet beyond efficiency, tailoring instruction and curriculum to the abilities of varying pupils was seen as a morally justifiable course of action, for educational

proponents argued that the same levels of education for all disadvantage both faster-learning and slower-learning students alike.

The Logic of Tracking

The logic of tracking can be traced from two different perspectives—the pedagogical and the public.

Pedagogical Perspective

In most schools and classrooms, students are likely to differ in their intellectual abilities, interests, and achievements. Recognizing such inequities, many learning specialists have tried to keep students at roughly similar levels of achievement by using curricular or pedagogical strategies. Mastery learning approaches, for example, seek to reduce inequities by extending time and resources for low achievers. In mastery learning, materials are subdivided into units, and students are given a test at the end of each unit. If students do not reach mastery on the test, they are provided with more time and more teaching until they have achieved mastery on a retest. By doing so, mastery learning is intended to ensure minimal levels of achievement. However, providing extra time for slower-learning students to master each unit seems to introduce new forms of inequality. Striving for similar achievement levels leads to unequal time and resources, whereas equal time and resources leads to unequal achievement. In short, educators face a time-equality-outcome dilemma. If extra teaching time for slower students is needed, will teachers have to neglect fast learners? Will faster-learning students be held back while waiting for slower-learning students, or will the slower-learning students be left behind? Tracking is often viewed as a way to address these questions.

Public Perspective

Policy makers and the public at large may view tracking as necessary for three reasons. First, students naturally vary in their abilities. Second, education should address a wide range of social needs. Third, schools can best accommodate individual abilities and prepare students for a productive career by sorting

them according to their abilities. In short, tracking is seen as a way to produce the skills and knowledge needed for a differentiated workforce.

Criticisms of Tracking

Although many educators and members of the public support the need for educational tracking, critics also abound. In particular, critics of tracking argue that low-track classes tend to receive inferior instruction compared to the high-track classes, and that over time, this unequal allocation of instructional resources results in greater disparity in academic achievement. So, what are the outcomes of tracking that concern these critics? These are discussed below.

Curricular Content

First, critics worry that curriculum content in low-track classes focuses exclusively on fragmented and irrelevant information; that is, information at the lower levels of Bloom's Taxonomy. In contrast, curriculum content in high-track classes presents broader, more complex, and more demanding concepts. These qualitative differences may be especially pronounced with today's popular high-stakes tests, where low-track classes are likely to receive commercial "test prep" curricula.

Instructional Activities

Critics also worry that teachers of high-track classes spend a larger proportion of class time on instruction, whereas teachers of low-track classes spend relatively greater amounts of class time dealing with management and classroom behavior. Instructional activities in high-track classes often involve high levels of cognitive content, whereas instructional activities in low-track classes emphasize following the rules. In other words, the fast get the lecture and the slow get lectured.

Teacher Placement

Skeptics also worry that differences in instruction are compounded by teacher assignments. Many studies have suggested that more experienced teachers

and teachers who are regarded as more successful are disproportionately assigned to the higher tracks, whereas teachers with less experience, less training, and generally weaker reputations are often assigned to teach lower-track classes.

Teacher Attitudes Toward Tracking

Skeptics are also concerned that teachers assigned to higher tracks may put more time and energy into their teaching than their low-track counterparts. More time may be spent in class preparation because teachers are more challenged by teaching in a high track. Conversely, low-track teachers may become demoralized because they perceive themselves as less successful. As a case of what psychologists call *need achievement*, low perceptions of success may reduce the motivation of lower-track teachers.

Teacher–Student Relations

By the same token, critics worry that by tracking students, teachers view high-track students positively and low-track students negatively, leading teachers to hold high expectations for high-track students and low expectations for low-track students. This concern is the well-known “Pygmalion in the classroom” effect. High-track students respond to high expectations with improved achievement. Conversely, low-track students respond to low expectations with reduced motivation and achievement levels, creating a self-fulfilling prophecy.

Peer Relations

Finally, critics cite studies that have examined how tracking affects patterns of student friendship. Specifically, students are likely to make friends with others in the same track rather than between tracks. In fact, high-track students use their perceptions of student academic rank as a major criterion for choosing their friends. High-track students form cohesive cliques, often helping each other with homework or preparing for exams. For low-track students, peer acceptability is often associated with negative attitudes toward school and disruptive behavior in the

classroom. In some situations, failure may even become a badge of honor.

Detracking

In light of the criticisms described above, both individuals and groups have advocated “detracking.” Detracking is a process in which students from homogeneous classrooms are reshuffled into heterogeneous instructional groupings. Advocates of detracking believe that heterogeneous classrooms can challenge teachers to influence a wide range of students’ learning, thereby increasing the rewards of teaching. They also believe that this empowerment can enhance low-ability student achievement without diminishing the achievement of high-ability students. Finally, advocates argue that detracking can increase nonacademic school outcomes, such as respect for diversity.

Nevertheless, supporters of detracking reform face significant challenges. The first challenge may stem from parents. Many parents believe that tracking practices raise their children’s opportunities to achieve success in the future. It is not uncommon for parents to intervene by lobbying schools to retain tracking and to ensure that their children are assigned to tracks in a favorable way. At the very least, parents of academically advanced students or parents with high socioeconomic status are likely to feel threatened by detracking policies. Another challenge may come from teachers who view tracking as an efficient way to reduce an already overburdened workload. Whereas some teachers may see heterogeneity as a source of job satisfaction, others may see it as demanding, burdensome accommodations.

Although considerable research has suggested that tracking often contributes to unequal achievement outcomes, researchers have yet to thoroughly examine the effects of detracking on school practices. Research is needed to determine whether detracking is able to reduce the learning gaps between high and low achievers, and, if so, which dynamics are at work. Evaluation of curriculum and instructional strategies, forms of school organization, and community outreach is also needed.

TRIBAL COLLEGES

Navajo Community College (now Diné College) began offering classes in Arizona as the first tribally controlled native college in 1969. Three years later, the American Indian Higher Education Consortium (AIHEC) was founded, and the group soon lobbied for more stable and better funding. When the Tribally Controlled Community College Assistance Act was passed in 1978, seventeen tribal colleges existed. Today, thirty-five tribal colleges serving about 13 percent of the 170,000 American Indian students in college are listed as governing members of AIHEC from fourteen states and one Canadian province. This entry looks at their history and current practice.

Education of Native Americans

The federal government, responsible for the education of American Indians under various treaties, deferred to private religious institutions at first in this area. Later, when the federal government took over direct control, the Bureau of Indian Affairs (BIA) stood in the way of development of tribally controlled institutions. For many years, the goal of Native American education was to assimilate the Indians into White society. Most Indian schools trained in industrial arts and farming, but a few students were selected for study at White colleges. When financial assistance for American Indian students expanded in the 1960s, few took advantage given the high dropout rate from high school and the unwelcoming environment at mainstream colleges and universities.

These dropout rates and the success of the Rough Rock Demonstration School, funded by the non-BIA Office of Economic Opportunity, convinced the Navajo (Diné) to seek funds for a junior college. The college was chartered by the tribe in 1968 and offered classes in 1969. This college served as a model for further development as American Indians pushed for self-determination.

The idea of an American Indian university was not a new one, and several institutions had served a small portion of the native students. But the development of local tribally controlled colleges that focused on tribal culture was new. President Lyndon Johnson's War on Poverty helped tribes gain some financial and administrative support through the Office of Economic Opportunity, which was not part of the BIA. By the time Congress passed the 1971 Navajo Community College Act, a couple of other colleges had been created.

Current Practice

The tribal colleges in the United States were made land-grant institutions in 1994. Two of the colleges are operated by the Office of Indian Education programs of the BIA. Despite various laws and the development of funding sources, funding remains a major issue. Other issues have included accreditation, faculty development, development of culturally relevant curriculum and preparation for interaction within the

larger dominant society, articulation or ease of transfer to other institutions, support of students from very difficult circumstances, and appropriate working relations with larger land-grant and university partners.

Despite challenges, tribal colleges continue to develop as unique institutions of learning linked to people, land, air, water, and animals. American Indian students traditionally have been the least represented in higher education. These developing institutions are helping to change this and are developing communities while serving as models for the rest of higher education.

Tribal colleges have dual missions that reflect the history of native peoples in light of the dominant culture: to provide quality education that prepares youth to participate in the twenty-first-century world, and to infuse into the curriculum and activities the language, culture, and traditional wisdom of elders. Although native peoples are diverse, they share a holistic and harmonistic worldview that stresses connections; this thinking is often at odds with Western traditions that feature disconnected knowledge bases or disciplines.

In the native worldview, family, clan, and community are places of meaning and relationships. Tribal colleges are important centers for native knowledge and research. The emphasis on community means that they offer adult education services, general equivalency high school preparation, and a myriad of services necessary to create opportunity for their mostly American Indian student population. The students are mostly first-generation college students with an average age of more than 31 years. About two thirds of the students are women, and more than half are single parents.

Challenges

The differing knowledge structures have led to problems when students transfer to such colleges. Some tribal colleges now offer four-year degrees and beyond. As mainstream colleges seek ways to reconnect to their communities and serve all students, the tribal colleges are serving as role models.

Attempting to stay true to mission and serve American Indian student needs creates issues with accrediting agencies. Accrediting agencies are used to

Western institutions with hierarchical structures and high stress on formal credentials. Tribal colleges often stress little formal authority and consensus building. Tribal college pedagogy calls for elders to teach tribal ways. Seldom do they have requisite formal degrees.

Accreditation relates to funding. Colleges often charge some tuition or fees to supplement inadequate government funding. Accreditation allows students to receive federal financial assistance. Accreditation also makes the institutions legitimate in the eyes of legislators, who approve funding. Congress has approved per-pupil funding of \$6,000, but only about \$4,447 is usually received. This is much less than comparable institutions.

TRIVIU AND QUADRIVIU

During the medieval period, the seven liberal arts were divided into three verbal arts, or *trivium*, and four mathematical arts, called the *quadrivium*. The trivium is comprised of grammar, rhetoric, and dialectic, and the quadrivium consists of arithmetic, music,

geometry, and astronomy. The trivium and quadrivium represent the historic evolution of the classical education of ancient Greece and Rome, as well as laying the groundwork for the birth of academe. Traditionally, a mnemonic has been used to introduce the subjects of the trivium and quadrivium: Grammar speaks, dialectic teaches truth, rhetoric adorns words, music sings, arithmetic counts, geometry measures, and astronomy studies stars.

The quadrivium has roots in ancient Greece among the Pythagoreans, whose belief that number is an ordering principle of the universe led them to seek out mathematical harmonies through systematic, philosophical analysis. Thus, arithmetic is the philosophy of number rather than the computational subject that later assumed the name. Addition, subtraction, multiplication, and division would, by the medieval period, be called *algorism*, whereas the problems of unity, equality, ratio, and proportion were regarded as the proper objects of arithmetical study. Similarly, the study of music engaged questions about the relation of number to sound and sound to harmony. Boethius's laconic remark that geometry is the study of immobile magnitude and of forms circumscribes that topic well. Finally, astronomy is the study of the movement of heavenly bodies.

The trivium began in earnest with the rhetorical tradition of ancient Greece, although the systematic study of rhetoric was an invention of Plato's in response to the rhetorical philosophy of the sophists.

Rhetoric began as the practical study of oratory, intended to prepare Athenian citizens to take part in assemblies or to litigate at court. By the thirteenth century, rhetoric had turned to the art of embellishment. Circumlocution and amplification—the practice of superfluous speech or writing—took on such importance as to mark virtually all of the poetry of the period with endless digressions and distracting linguistic ornamentation. Grammar was considered the foundational discipline upon which all other disciplines were built. Grammar, the study of language and meaning, was the student's first contact with the word, which is the principle of the trivium much as unity is the principle of the quadrivium. The student of grammar learned spelling, reading, and writing in his early years, and introduction to philosophical topics comprised the study of grammar for young men. The third subject of the trivium, dialectic, is the study of reasoning. Dialectical argument takes as premises answers put forward by one party in response to probative questions of another. The questioner then reasons from the given premises to a conclusion. The difficulty of dialectical argument lies in the fact that the answerers must accept the premises that the questioners form out of their responses. If no agreement can be established, dialectical argument cannot proceed.

U

UNITED NATIONS CONVENTION ON THE RIGHTS OF THE CHILD

The United Nations Convention on the Rights of the Child establishes a system of rights for the world's children. It provides a mechanism for gradual improvement in the governments' observance of those rights through national reports to the United Nations and periodic reviews by the United Nations Committee on the Rights of the Child. The fifty-four Articles of the Convention and its two Optional Protocols constitute an integrated system of common international standards for government conduct regarding children (under age eighteen) and their families.

Here are some of the primary rights protected by the Convention. It protects parents' roles in relation to their children and asks governments to help them in those roles. Children are protected against discrimination of any kind related to themselves or their parents. Children's rights to life, identity, nationality, and name are protected. Governments must try to protect children from physical or mental violence, injury, or abuse. Governments may not separate children from their parents, except in the child's best interests, and should try to facilitate the reunification of children separated from their parents. Children may hold and express their own views, and may participate in official matters affecting their status. To the extent that a government's resources permit, it should protect children's health and remedy their illnesses and injuries; provide

for disability-related special needs; help parents provide children with a standard of living adequate for their development; honor children's cultural, religious, or linguistic identities; offer play and recreational activities; and protect children from exploitative labor, drugs, sexual abuse, slavery, and so on. Children in public custody are protected from torture, capital punishment, life imprisonment, or other abuse, and may not be confined without due process. Children near armed conflict must be protected as much as possible, and may not be permitted to perform combat roles.

With regard to education, governments, to the extent that resources permit, must provide free and compulsory primary education to all children and encourage the development of secondary and higher education in various forms with access open to all. Governments should work to encourage regular school attendance and graduation. International cooperation is encouraged to eliminate ignorance and illiteracy, and to facilitate acquisition of scientific and technical knowledge and modern teaching methods.

Governments should direct children's education toward the fullest possible development of their personalities, talents, and mental and physical abilities; respect for human rights and fundamental freedoms; respect for the child's parents, cultural and national identity, language, and values; and preparation for a responsible life in a free society, in the spirit of understanding, peace, tolerance, equality of sexes, and friendship among all peoples.

The convention was signed initially in New York on November 20, 1989, and entered into force in 1990; 192 countries have agreed to be bound by its terms. Only the United States and Somalia have not yet accepted the convention. However, the United States has ratified the Optional Protocols to the Convention on The Involvement of Children in Armed Conflict and on the Rights of the Child on the Sale of Children, Child Prostitution, and Child Pornography. The convention is the most widely accepted statement of law on any issue, with almost universal participation.

UNITED NEGRO COLLEGE FUND

The United Negro College Fund is the nation's largest and oldest fund-raising organization for African American education. It provides operating funds and scholarships for 39 historically Black colleges and universities. This entry looks at its history and contributions.

When Frederick D. Patterson became president of Tuskegee Institute in 1935, he quickly realized that his institution—and Black colleges in general—were in the midst of a fund-raising crisis. He found it difficult to run Tuskegee in an efficient manner while meeting the needs of poor students. Moreover, Patterson observed that he and all of the other Black college presidents were competing for the same dwindling pool of funds from foundations. In 1943, in response to this critical situation, Patterson crafted the idea of a united appeal for private Black colleges. He sought to push giving in a new direction by reaching out to the average citizen rather than focusing exclusively on a small number of wealthy donors.

On April 25, 1944, he established the United Negro College Fund (UNCF) with twenty-seven member

colleges and a combined enrollment of 14,000 students. Initially, the UNCF was merely a new face on twentieth-century industrial philanthropy. Philanthropists such as Julius Rosenwald and John D. Rockefeller, Jr. provided seed money for the organization, and in fact, Rockefeller, Jr. initially maintained a tight grip on its everyday activities. During the mid-1940s, the UNCF publicly acted and represented itself in a conservative manner, portraying Black college students as loyal, hardworking citizens—an image that Rockefeller, Jr. could use to bring in large sums of philanthropic support.

With the landmark *Brown v. Board of Education* decision in 1954, the UNCF changed its public image. In light of the Court's pronouncement that segregated environments were inferior, the UNCF faced the dilemma of how to represent its all-Black campuses without seeming to be against integration. At this time, the UNCF's African American leadership focused on the benefits of attending Black colleges, as well as the possibility of integration.

By the mid-1960s, several philanthropic organizations, including Ford and Carnegie, began to question whether Black colleges should exist at all. Some of the reports issued by foundations contained blistering attacks, creating the need for a robust defense by the UNCF. Gradually, the UNCF began to embrace a new Black-centered image and to become more activist in the public stances it took. Spurred by a growing Black middle class, the 1970s brought about more change and a greater national presence for the UNCF. It was at this time that the UNCF coined the phrase "A Mind Is a Terrible Thing to Waste"—a slogan that invoked a sense of compassion and obligation in many Americans who might not have given previously to Black education.

No longer relying primarily on money from large philanthropies, the UNCF began to draw from a broader donor pool throughout the country. The 1980s and 1990s were a time of growth for the UNCF. New leadership shaped the organization into an efficient entity and designed more effective fundraising strategies that helped raise \$1.6 billion for the member colleges. Perhaps the UNCF's greatest accomplishment was securing a \$1 billion gift from the Bill and Melinda Gates Foundation in 1999. Through this gift,

the UNCF is able to offer scholarships to students in a fashion unparalleled by any other organization.

URBAN EDUCATION

In the United States, almost one third of all school-age children attend schools in large urban districts. It is in these urban schools where the diversity of cultures and languages is highest and where students fail to thrive. Thus, urban education is often viewed as a problem, or a set of problems, to be solved. However, it is helpful to see urban education as a manifestation of our cultural and social arrangements for education. Schools require much of parents, including that they know and accept the assumptions on which schooling works. Schools require people to accept that they are to be assimilated and acculturated if they are to succeed in schools. As Valenzuela demonstrates in his 1999 book *Subtractive Schooling*, middle-class families often experience schooling as “additive,” adding knowledge and skills to that which they already have, whereas poor families often experience schooling as “subtractive,” taking away cultural beliefs, languages, and knowledges that are part of their lives, experiences, and cultures.

Urban education, like schooling in general, is about maintaining the dominant culture. When education came to be seen as a community responsibility, it was because the powerful in those communities were concerned about “dissolute” families—those who were not living the way the powerful wished. In small rural communities that were relatively homogeneous, this often meant those who were not church going, or who drank or engaged in adultery, and so on. In the United States, immigration has been a constant force, and

often the “dissolute” families were those who had a different religious or cultural heritage. Thus, education from the beginning was in the middle of cultural politics. Moreover, as Scott has argued, domination can create the social practices that the dominant use to justify the domination. Thus, difference is both across cultures and created by structures of power. This is nowhere more evident than in U.S. cities. The early urban centers were small by today’s standards and were mostly defined as commercial transportation centers. New York and Boston, for example, were originally ports for export of raw materials to Europe and the import of finished goods into the colonies, a pattern that was a central issue in the American Revolution. The Industrial Revolution spawned urbanization and large plants required large workforces. The Industrial Revolution also outstripped the available workforce in the United States, and in order to keep a labor surplus, which would help suppress wages, industrialists pressed for more open immigration. Thus, urbanization, industrialization, and immigration have been intertwined processes, which over time have led to the view that urban education is all about problems.

Indeed, the basic structure of public education was formed in urban centers dealing with immigration in the mid to late nineteenth century. As Katz showed in his 1971 study, the early private schools were being affected by immigration. These schools were being pressed to respond to the wishes of immigrant groups. Particularly threatening to the Protestant ruling elite was a massive influx of Catholics. These leaders saw that the Catholics paying tuition to these private schools had the potential of changing these schools so that they served the immigrant religions, cultures, and languages. This led to the formation of public schools that were under the control of the Protestant elites and that in many ways represented Protestant values. In part, public schools were seen as part of the mission to convert immigrants to Protestantism and, where this did not occur, to imbue them more implicitly with Protestant values. These same values were cloaked in notions of nationalism and patriotism, in which the newly organized urban public schools were seen as instrumental.

The origins of public urban schools set the precedent that the public schools were to be seen as instruments

of public policy and in service of the government and elite interests. A second example of this can be seen in the turbulent 1950s and 1960s in the United States. African Americans had been essentially ghettoized in urban centers through patterns of residential segregation created in part by the racist policies of banks and mortgage companies. Of course, in the South, segregation by race was *de jure*—codified in law. As the civil rights movement gained momentum, it was clear that dramatic action needed to take place if patterns of segregation were to be changed. The nonviolent protests were filmed by the relatively new television media and showed the violence perpetrated by the police in response to them. In the North and West, urban riots captured the attention of the nation so much that President Lyndon Johnson created the Kerner Commission to investigate the riots. The National Advisory Commission on Civil Disorders noted in a 1968 report that riots were often precipitated by police actions, that 90 percent of those killed at the hands of authorities were Black civilians, and that the rioters clearly seemed to want to be included in the social system and to have the material benefits enjoyed by other Americans. Instead of rejecting American society, it is clear that they were wanting to find a place for themselves in American culture.

The Commission concluded that integration was the best way to improve urban children's education and proposed a massive program for improving urban schools. In the years that followed, federal legislation did begin to address the improvements, but in doing so also solidified the image of urban schools as poverty schools. With court-ordered school desegregation, Whites left urban areas and urban schools in such massive numbers that a new term was coined: White flight. Thus, urban areas and urban schools came to be increasingly populated by the poor and those of colors other than White.

A third major development in urban education is still playing out today. The recent school era, which began with the National Commission on Excellence in Education's report in the early 1980s titled *A Nation at Risk*, was a backlash to the efforts to use educational policy to advance educational equity. In this backlash, educational excellence and equity were seen

as polar opposites. *A Nation at Risk* argued that a failing economy was due to education accepting mediocrity (that is, equity) as the goal and called for efforts at school reform to promote excellence. From this have flowed efforts to reform schools and school districts; establish standards; and, more recently, require accountability in the form of high-stakes testing. In many ways, this reform era has been about the reassertion of control over urban schools by the state and federal governments. This undercuts local control of schools by the citizens whose children attend them. Many scholars on the Left feel that in urban areas, school reform is as much about disenfranchising urban residents as it is about improving the quality of education in local schools. This view maintains that current reforms are actually more about privatizing education than anything else. Through mechanisms such as charter schools and vouchers, privatization is seen as a use of public funds for private gains. That these critics see privatization as an abdication of public responsibility for urban education seems clear.

Miller and Woock wrote in their 1970 text *Social Foundations of Urban Education* that the turbulent urban school relations and the "desperate efforts" to make inner-city schools work was only one aspect of a much larger urban crisis. Besides education, urban ills included rising crime, inadequate police forces, civil disruptions, and inadequate funding, not to mention outdated school buildings, pollution, and lack of effective transit systems. What is clear is that the urban "crisis" is not that at all. A crisis implies a dramatic coming together of forces at a point in time that must be acted upon. Yet in this case, the crisis is of long standing. Miller and Woock date it back to the 1950s, but it could easily be dated back to the turn of the twentieth century as well. Furthermore, the crisis is usually perceived by pundits, politicians, and the public as emerging from forces within the cities. However, Castells argued in 1977 that the crisis results from forces around the cities, including metropolitanization, suburbanization, and social-political fragmentation. More recently, we could add deindustrialization. What is important here is that the problems of cities and of urban education are the result of the exodus of political power; people (especially those

in the middle and upper classes); financial and social institutions; work; and capital (tax bases, income, etc.) from the cities. That is to say, the problems associated with urban education and the urban crisis can be solved only by addressing developments outside of the city. Policies and programs within the city and about city schools cannot then solve these problems.

The fact that the problems of urban education are derivative of things gone elsewhere only means that reform limited to the city will have little effect. It does not mean that the problems are any less real or salient. It does mean that it is necessary to rethink how one approaches understanding and improving urban education. The traditional efforts to reform urban education have involved development of remedial and compensatory education programs, improved student behavior and discipline, dropout reduction programs, improved preparation of teachers, desegregation (where possible), decentralization of decision making, fostering of parent and community involvement, equalizing of school finances, provision of increased social services through the schools, and local school reform efforts. As above, the current efforts at systemic (districtwide) reform and standards and accountability policy are linked in two key ways. First, they emerge because it seems clear that the traditional efforts have not resulted in enduring improvements. Consistent with the neoconservative logic, the result has been to mandate standards and accountability and let the schools figure out how best to achieve the desired results. Second, accountability and systemic reform are both centralization efforts that are based on a mistrust of local school efforts, educators, and local communities.

Considerable debate exists on the effectiveness of current reforms for urban education. Many reforms are seen as being more coercive than constructive. As Miron documents, efforts at reform in cities are pushed by an entrepreneurial coalition that seeks to link urban education more tightly to the needs of business for an undereducated and thus low-paid working class for the services economy. It is likely that reform efforts will not be effective unless broader issues about the economy, social class, race, and privilege are addressed. Whatever the case, it is clear that

in years to come, this will be a potentially hotly contested area.

URBAN SCHOOLS, HISTORY OF

There is a widespread belief today that city schools are a persistent dilemma. Less than fifty years ago, city school systems were judged much less harshly than at present, and in some cases, they were considered to be quite good. It was only in the latter half of the twentieth century that urban schools came to be seen as a major problem. Historians of urban schools have illuminated the process of evolution that

has transformed urban education in the United States. This entry will examine the principal themes in the development of urban schooling, identifying many of the major historical works that have informed our understanding of changes it has undergone.

Early Schools

To fully appreciate the changes that have occurred in city schools, it is important to begin at the earliest stage of American history. In 1973, Carl Kaestle published a groundbreaking study of the early schools in New York. Following the Revolutionary War, schools appear to have been church-sponsored or conducted by individual masters who taught for a fee. New England had the longest tradition of schools established by community or governmental authority, and these too were predominantly religious in purpose. In New York, small proprietary schools served all segments of the population, although there certainly were distinctions in wealth and status that characterized both students and institutions. Public funding often was intended to assist the education of the poorest students.

By the start of the nineteenth century, the largest American cities had acquired loosely structured systems of private, church-sponsored, and publicly supported schools linked to different classes of the population. In the decades leading up to the Civil War, cities grew rapidly, propelled by industrialization, improved transportation, and large-scale immigration. This is a major theme in Kaestle's work on New York and in other studies of school systems from that era. Charity schooling for the poor became a dominant theme, but there was considerable pressure to create public institutions to broaden the reach of popular education. At the same time, industrialization and the growth of trade transformed the social profile of these and other cities, making the small-scale private institutions of the past seemingly archaic. As several historians have noted, the appearance of poor and unskilled working-class city dwellers gave rise to a new atmosphere of diversity and cultural dissonance.

Schools and Social Benefit

By and large, the nineteenth century was an era of institution building, and urban schools were in the

forefront of campaigns to ensure greater social stability through education. Whether maintained by private groups (such as the New York Public School Society) or public agencies (like the public schools in Boston), "free" (no tuition) primary schools served the children of the poor. As illustrated in a series of studies, these efforts were coordinated by an emerging bureaucracy. Eventually, these institutions developed into fully articulated public educational systems.

As a number of studies demonstrate, however, not all groups made full use of these opportunities; those in the social and cultural mainstream came to embrace the schools most enthusiastically. In other places, such as New York, the transition to public education was fraught with difficulty, as exhibited in Diane Ravitch's 1974 account of battles over education in that city's history. There was conflict on cultural and religious grounds, especially among Catholics, who decided to form their own school systems. Taxpayers objected to rising costs, challenging expensive new institutions, such as public kindergartens and high schools, along with other reforms, as seen in a number of studies. Gradually, however, sustained agitation by reformers resulted in acceptance of change in most places.

A new class of administrators came to lead the urban schools, professional superintendents who strove to build systems in keeping with the latest innovations sweeping the country. These men (and very few women) created professional networks whereby information and ideas were exchanged. These developments are major themes in David Tyack's comprehensive 1974 study of urban schooling in the United States, *The One Best System*.

As pointed out in numerous studies, certain schools or classes were designated for children deemed "slow," or prone to chronic misbehavior. Only a relatively small number of students ever attended secondary schools, but these institutions came to be seen as important repositories of learning and culture, evident in David Labaree's 1988 study of secondary education in Philadelphia. Curricular innovation, often under the banner of progressive reform, created programs of study to link schools to the job market, along with innovative administrative reforms, as in the famous "platoon schools" of Gary, Indiana.

Centralization Trends

The early twentieth century was a time of rapid growth for most American cities. In education, new controversies erupted over matters of curriculum and various mechanisms for the control of schools, often affecting local political arrangements. Studies of controversies surrounding reform in several cities at this time by Julia Wrigley, William Reese, and others, most of which were published in the 1980s, point to the origins of these conflicts in urban politics. Still other studies, published later by Kate Rousmaniere and other historians, highlight the role of teachers in these debates. At the same time, parochial (religious) school systems grew in parallel to the public schools as seen most recently in the work of Mary Ellen Vinyard. All of these developments made for a period of great ferment.

In most cities, public schools were first organized in a decentralized fashion, with control often focused at the local level, usually the city ward. Eventually, this led to an atmosphere rife with conflict and corruption. Reformers aimed to take the schools out of politics by instituting highly centralized administrative systems. The creation of the modern school superintendency in the early twentieth century marked the apogee of this reform impulse. This was documented in David Tyack and Elisabeth Hansot's study of prominent educational statesmen.

Political battles raged in some districts, as dissenting groups challenged the newly dominant management ethos. Teachers formed unions, debated intelligence testing, and demanded curricular reforms to help students. But the basic structure of authority in urban school systems remained intact. Although it was seriously tested at times, such as during the financial crisis of the Great Depression, as described in Jeffrey Mirel's 1993 account of Detroit in the 1930s, the prevailing progressive model of school administration thrived in most city school systems well into the second half of the twentieth century.

Dramatic Postwar Change

Following World War II, the urban scene changed dramatically. The major thrust of urban development shifted due to suburbanization, the movement of

people out of the large cities to adjacent communities outside the urban core. The urban population remained culturally diverse, but its composition shifted, and cities did not benefit uniformly from the general affluence of the postwar period.

Millions of southern Blacks were displaced by new farm technology and migrated to the North and West. Large ghettos developed in most major American cities, and when suburbanization accelerated in the 1950s and 1960s, it often became known as White flight. Urban school systems became highly segregated because of changing residential patterns in the cities. This led to glaring disparities in education, and dramatic protests erupted over the unequal resources available to various groups of students.

Many of the newcomers to the cities during this period were quite poor and could hardly afford to support the rising costs of high-quality urban schools. As a result, urban educational systems began to face dire budget shortfalls in the 1960s and 1970s, just about the time that their student populations became predominantly African American or other minority groups. Political battles raged over issues of equity and discrimination in urban education, and the poor schooling was often afforded children in minority communities. It was a period of activism in urban Black and Latino communities, and much protest focused on educational questions. A number of studies have focused on these issues, the most recent being Jack Dougherty's examination of Milwaukee. This body of work considers the struggles that took shape in different cities, noting a variety of approaches to the problems that were seemingly endemic to the times.

The decade of the 1970s saw a number of developments that further aggravated these matters. First, government-enforced desegregation plans and middle-class fears about crime and deteriorating urban neighborhoods contributed to an accelerated rate of suburbanization in many parts of the country. There is a sizable literature on the desegregation era, much of it summarized and assessed recently by Charles Clotfelter. Second, although Black migration from the South slowed, new immigrant groups started to appear in major American cities in large numbers. The largest groups were those who spoke Spanish, most of whom came from Mexico, Central America, or the Caribbean

(Puerto Rico in particular). This posed yet a new challenge, one of educating an increasingly diverse population while dealing with long-standing problems of racial segregation and poverty, as shown in the work of Guadalupe San Miguel.

Urban Stresses

In addition to these changes, the economic base of major cities began to shift as well. In the 1960s, manufacturing employment began to decline substantially, a process often described as “deindustrialization,” and this trend accelerated in the 1970s and 1980s. The resulting loss of employment brought a host of other problems, many with dire implications for education. Since 1970, the number of female-headed households in American cities has grown enormously, as marriages became difficult to sustain in the wake of rising unemployment. Illegal drug sales, violent crime, and teen pregnancy also have increased sharply in the wake of these developments.

With the virtual collapse of urban industrial employment, Black communities that traditionally relied upon the factory for employment entered a state of crisis. These changes had a palpable impact on urban schooling, as demonstrated in a number of studies. In many inner-city communities, destitution and isolation contributed to an atmosphere of nihilistic self-destruction, where illegal activities became important to indigenous peer culture. Dropout rates among urban teenagers climbed to more than 50 percent in many large American cities, as thousands of adolescents turned to the street in the absence of stable and meaningful employment.

Although downtown areas of the big cities have continued to develop economically, and there has been movement of middle- and upper-class Whites back into the urban core, the overall pattern of metropolitan development has isolated minority groups while eroding the fiscal base of local school systems. This process has been documented in many of the works cited earlier, and by sociologists such as William Julius Wilson. As a consequence, in most large urban districts today, a substantial majority of students come from minority backgrounds and are at a disadvantage regarding school success. With these

circumstances, the democratic tenet of the nation’s public school tradition—that education is to be shared by all members of the society—is considerably less viable today than it was for previous generations of urban children.

U.S. DEPARTMENT OF EDUCATION

In 1867, Congress established a national Department of Education to collect and provide information to promote school improvement. Education soon lost its cabinet-level status, and federal education-related functions passed over time to a variety of agencies. The U.S. Constitution makes no mention of a federal role in education, and states have continuously argued that education is their responsibility. Until the mid-1960s, the role of the federal government expanded gradually, with the primary purpose being to pass funds from the national level to states, districts, and higher education.

In the 1960s, federal programs to reduce poverty and protect civil rights resulted in a dramatic increase in federal funding for education and regulations to ensure that the rights of racial minorities were protected. In the 1970s, the civil rights functions expanded to cover discrimination based on gender, disability, and language.

In 1976, then-candidate for president Jimmy Carter pledged to establish a cabinet-level Department of Education. With opponents fearing an expanded federal role in education and many interest groups concerned about a loss of influence, legislation establishing the department passed by the narrowest of margins in 1980. The new department encompassed education programs previously housed in the Office of Education and the Office for Civil Rights in the Department of Health, Education, and Welfare. However, many education-related programs—including those dealing with Indian education, school breakfast and lunch, pre-kindergarten child development, and research on

learning and curriculum development—remained in other federal agencies.

In 1981, President Reagan proposed that the Department of Education be abolished. Although this effort was not successful, the debates made clear that there was little interest in changing the federal role in education, except to increase funding for existing programs. Efforts during the 1990s to initiate new federal programs that would significantly affect state and local authorities found little support.

In 2002, the role of the federal government in education, and thus the functions of the department, changed substantially with the enactment of the No Child Left Behind Act (NCLB). NCLB, the major source of federal support for public education, imposed requirements on districts and schools to ensure that all students make continuous progress toward achieving state standards and that all teachers are “fully qualified.” NCLB and other federal policies implemented from 2001–2006 further broadened the department’s influence by tying federal funding to state and local adoption of specific educational curricula and practices and by promoting the establishment of options to conventional public schools.

Despite significant growth in federal expenditures for public education since the establishment of the Department of Education, funds administered by the department account for only about 8 percent of total funding of public schools and for less than 50 percent of federal expenditures on education.

V

VALUES EDUCATION

Values education suggests a range of stances toward the broad goal of moral development in young people. It may express a desire for intentional education about values to complement education about facts or imply an insistence that education (and schooling) be viewed as value-laden. Some would argue that the term is redundant, that education is always about values.

Values education is also used today throughout the English-speaking world as a synonym for character education, broadly construed as the inculcation or development of prosocial character traits in children and adolescents. As a distinctive approach to moral education, however, values education is typically associated with values clarification and, less often, with a family of other efforts that share a focus on critical reflection in the process of moral development. This entry looks at values education, its critique, and some alternatives.

What It Is

Values clarification was born with the publication of Rath, Harmin, and Simon's *Values and Teaching* in 1966. It was perhaps the best known effort in a significant movement by educators to question the tenets and tactics of traditional moral inculcation. Its temper matched the political temper of the time, that is, questioning authority. In its formal version, it involved an effort to systematize reflection on ethical concerns.

In this, it can be allied with Kohlberg's work in moral reasoning, with Edward Fenton's analytic approach to *The New Social Studies* (1967), with efforts to implement Deweyan democratic schooling, and with service learning accompanied by critical reflection. It can also be allied with what Fritz Oser calls a "discourse perspective" regarding moral education. What distinguishes values clarification from these other critical and reflective values education approaches is its clear focus on the individual as the locus of value recognition and determination and on its determined neutrality with respect to an individual's value choices.

A discussion of values clarification highlights the issues that can arise when values education is invoked. Rath, Harmin, and Simon ground values clarification in concern for children and adolescents who lack self-direction and purposefulness. They seek to develop purposefulness in children with the parallel development of conscious habits of choosing and prizing as well as (consciously) acting in concert with one's choices. They favor the process of valuing over the transmission of predetermined values because they explicitly question the possibility of universalizable truth in any particular social, cultural, political, or epistemological claims. They maintain instead, echoing Dewey, that habits of intelligent choice will better serve those who seek to lead examined lives.

Teachers implementing values clarification present students with values choices that prompt a careful consideration of and decision about potentially conflicting states of affairs. Teachers remain open and neutral with respect to students' responses—and

ensure that other students maintain a similar openness. Willing, feeling, thinking, and intending all inevitably occur as students determine their “values.” In fact, Rath, Harmon, and Simon operationalize the concept of values as that which emerges from this self-reflective thought/action process.

Critiques

Critics argue that claims for the effectiveness of values clarification have not been documented in research and that the strategy is not congruent with its stated theoretical roots in the philosophy of John Dewey. Like the proponents of values clarification, Dewey focuses on valuing and valuation as processes. However, Dewey sees these processes as transactional—between self and environment—rather than as self-referential.

It is the charge of moral relativism that has been most often—and most convincingly—leveled against values clarification. The fact that there seems to be, in principle, no common solution available to values conflicts implies an unacceptable relativism. Individual preference and/or social convention replace an *a priori* moral point of view. Some argue that the very possibility of the moral is devalued.

In a related critique, many condemn values clarification on the grounds that this is an atomistic rather than a relational approach to an intrinsically relational phenomenon. Values clarification is seen as so individualistic that it is self-referential and thus cannot, by definition, be moral. This criticism links us back to the question of its Deweyan roots, because Dewey’s moral self is a social self constituted by and acting within relations with others and the world.

Alternative Moral Approaches

What of the other values education efforts noted at the outset share a focus on critical reflection in understanding the moral? How do they frame values, conceptualize the moral agent, respond to the specter of relativism, regard the role of reason, balance the process of valuation with its products, link value and action, and act for value determination and propagation?

Kohlbergian moral reasoning maintains the promise of universalizability but maintains the

individual-in-thought as the unit of moral analysis. Fenton’s analytic approach to social studies, like contemporary approaches to the moral dimensions of the school curriculum, takes advantage of values clarification’s strengths, such as juxtaposition and interpretation, while avoiding the self-referential aspects by employing analysis with respect to texts and events. Nonetheless, it remains academic rather than action oriented.

Educators attempting to construct democratic classrooms and schools focus not on clarifying values as individual preferences, but on creating “publics” in the Deweyan sense. This results in what Alfie Kohn calls a “reasoned relativism,” where shared values are socially constructed in the process of lived action and communication.

Defined as an educational approach that combines meaningful community service with content instruction and reflection, service learning is widely touted as an approach that counters individualism, incorporates reflection, and results in community-building moral action. Still, as a moral education approach, it is agnostic on the question of universalizability.

Fritz Oser calls for “sensible universalizability” and maintains that a discourse approach such as values clarification can prompt moral growth by shedding light on a person’s moral sense and exposing conflicts between that and moral consensus. Such conflicts are the spaces out of which moral truth emerges. In both “sensible universalizability” and “reasoned relativism,” reasoning is required and simplistic relativism is rejected.

None of the approaches to values education noted above requires the kind of determined neutrality of the teacher that values clarification does; neutrality is not itself a value. Still, like values clarification, all seek a kind of epistemological fairness and openness.

In the end, this may be the key to understanding values education as it emerged in the 1960s and 1970s—as a locution to represent moral education efforts distinctively different from traditional moral inculcation in their focus on critical, democratic reflection.

VENDING MACHINES IN SCHOOLS

The question of vending machines in schools is one that has provoked controversy on several fronts. Among the areas of concern are the commercialization of the school environment, the nutritional quality of the food offered in the vending machines, and the more complex question of how revenues from vending are directed. Vending of food in schools falls under the category of "competitive foods." In this case, the competition is with food served in the school lunch or breakfast program. According to the Centers for Disease Control and Prevention's School Health Policies and Programs Study (SHPPS) 2000 survey, 43 percent of elementary schools, 89.4 percent of middle/junior high schools, and 98.2 percent of senior high schools had either a vending machine or another competitive venue where students could purchase food or beverages. The U.S. Department of Agriculture (USDA), which administers the school meal programs, has only limited authority over the competitive food, including vending.

Recently, many states passed or are considering legislation that would restrict vending choices and/or limit the hours that vending machines can be operational. The 2004 Reauthorization of the Child Nutrition Act (which covers school meals) requires

that each school district create a local wellness policy to address physical activity and nutrition, and many school districts are using these policies to address vending at the district level. One example is California's SB 12, which requires all food sold or served on school grounds in middle or junior high and high schools to be approved for compliance with nutrition standards, including limits on the number of calories per serving (vending is prohibited in elementary schools).

In addition to the concerns about nutrition, questions have been raised about issues of commercialization and funding of schools. Some critics believe that schools should be commercial-free zones and that vending machines in schools are part of a corporate effort to promote brand loyalty. These critics note that because children are required to be in school, they are put in the position of being a captive audience for a particular brand or brands. The critics argue that this is not an appropriate role for the nation's public schools.

Supporters of school vending note that the revenues provided by these programs can be critical to the operation of schools and school districts. With students exposed to advertising in many venues outside of school, they note that what students see in school is not new or different. They also argue that these programs build links between businesses and the school community.

These arguments are linked to larger issues of school funding. Some argue that the revenue raised from vending and other competitive food is critical to the operation of schools, including the child nutrition programs as well as curricular and extracurricular activities. Others argue that if this is the case, it is a reflection of other problems with funding of education, particularly in our poorest schools. They add that schools should not be balancing their budgets through sales to students—especially sales of unhealthy food. Critics also note that students who purchase such products include low-income students, who are the most vulnerable to poor nutrition.

There is general agreement on all sides of the debate that vending is not appropriate at the elementary school level, whereas there is more divergence with respect to sales at the middle and high school

level. Some advocates of healthier nutrition have argued that because many school leaders see the revenue as vital, it would be too hard to get rid of vending altogether and that the best alternative is to replace unhealthy vending with healthy vending while also addressing other issues. A number of studies have shown that, in general, there is not a sustained loss of revenue when healthier choices are implemented in the vending machines. School districts that include students in the process of choosing new, healthy products that meet nutritional guidelines have had particular success in matching or exceeding revenues.

With the growing numbers of states and districts putting restrictions in place, many producers are creating new or modified products and package size that meets the new restrictions. The American Beverage Association in 2006 announced new voluntary guidelines as well. These are not binding on schools or bottlers, but seek to limit further restriction by setting some standards.

Although the issues regarding commercialization and equity are far from resolved, the nutrition question received new attention in April 2007 when the Institute of Medicine released its report on nutrition standards for all food served in schools.

The report set new voluntary standards for school districts to adhere to and should potentially influence the USDA if it receives any expanded authority over this area.

VIDEO GAMES AND LEARNING

Video games represent a relatively new form of electronic media—one that has existed for only about twenty-five years. More than other forms of media such as radio, television, and film, video games are rapidly evolving. New technologies make the games increasingly realistic and engaging. This is a particularly important point to take into account when looking at them from an educational perspective. This entry looks at their history, their military application, and their impact on young people.

Historical Background

Just how rapidly video games have evolved in recent years can best be understood by examining their history. Magnavox's Odyssey, the first home video game system sold to the public, was introduced in May 1972. Atari's Pong (a simple electronic tennis game) appeared in arcades the following November. A home version of the game was introduced in 1974. During the late 1970s, games such as *Space Invaders* and *Galaxians*, with their rows of descending alien invaders, became enormously popular. In 1985, Nintendo, a Japanese arcade game manufacturer, introduced the Nintendo Entertainment System. This system became the most successful gaming console of its era, with more than 60 million machines sold. Nintendo soon dominated the video game market in the United States.

Early Nintendo games from the late 1980s and early 1990s, such as *Bad Dudes* and *Mortal Kombat*, used a "godlike" technology (i.e., tiny figures represented on the screen and observed from above). By the mid-1990s, increased processing speeds and more powerful software made it possible to create games that moved the player from the "godlike" to a first-person perspective (actually allowing the player to assume the viewpoint of the game's character). Because games that emphasized a first-person perspective often involved shooting weapons such as guns, this type of game rapidly became known as "first-person shooter."

Violence—always an important theme in video games—was given increasing emphasis as the games

became more and more realistic. People then began to express concerns about the extreme violence in video games. In December 1993, the U.S. Senate held hearings chaired by Senator Joseph Lieberman that led to the implementation of an industry-driven video game ratings board. Paralleling studies about the impact on viewers of television and film violence, questions were raised about whether video games teach players to act violently.

As in the case of television and film violence, a great deal of controversy has arisen as to whether or not violent video games teach people to be more aggressive. In other words, do people learn from and replicate the violence they experience as players in video games in the real world? Recent meta-analysis studies by Craig Anderson and Brad J. Bushman suggest that video games do increase aggression significantly. In an analysis of thirty-two research studies on the effects of violent video games, involving forty-six independent samples of participants and 3,800 subjects, more than half of whom were children, it was found that playing violent video games contributed to increasingly aggressive behavior, aggressive affect, physiological arousal, and aggressive cognition, as well as reduced prosocial behavior. The results of these studies also showed that the effects of playing these games were the same, whether adult or child, male or female.

Anderson and Bushman go on to argue that each time players play a game, they are involved in one or more learning trials. In this context, at the most basic level, video games can be understood as being powerful teaching machines. In the case of a typical first-person shooter, for example, the user plays the game and learns its lessons through behavioral reinforcement (shooting accurately and receiving points). If the user learns the “lesson” of the game, he or she receives a high score and “wins.”

Military Applications

It is no accident that the U.S. military uses video game-based simulations to train soldiers. The widespread use of games is a confirmation of the idea that the video game—specifically, the first-person shooter—is a teaching machine. The connection

between the use of simulations and video games and the military is by no means new. In the early 1980s, military recruits at Fort Eustis, Virginia, played the video arcade game *Battle Zone* in which realistically silhouetted enemy tanks, helicopters, and armored personnel carriers were targeted and destroyed. President Ronald Reagan, the military’s commander in chief during this period, argued that video games probably helped people prepare for the military.

The use of first-person-shooter video games to train military personnel began in the mid-1990s. In 1995, under financial pressure to keep costs down while providing the best training possible, the Marine Corps turned to off-the-shelf video and computer games to determine if they could be adapted for military use. Games such as *Doom II* were adapted specifically to the Marine Corps’s needs.

In the Marine version of *Doom II*, military images and weapons were superimposed over the original game, using digital photographs. The game is played with a four-man team—just like an actual marine combat or “fire unit.” Compared to training people with live ammunition, instruction through the use of a game such as *Doom II* provides an inexpensive and safe means by which to train recruits with hours of practice at relatively little cost.

With the success of the Marine Corps’ program of using off-the-shelf versions of video games to train recruits, the U.S. military has become increasingly involved in using video games to teach soldiers the basics of combat. Late in the summer of 1999, the Secretary of the Army, Louis Caldera, announced that the Army was giving the University of Southern California \$45 million to set up a research center, the Institute for Creative Technologies, to create military simulations. Part of the idea behind the program was that technology developed for the military could also be used by the entertainment industry. Caldera described this as “a win-win for everyone.”

The military uses first-person shooters and simulation technology because it believes that these video games are a highly effective means of training people to kill. Using simulations to train people in the military makes perfect sense. Having Navy pilots practice landings on an aircraft carrier in a flight simulator is an excellent way to give them preflight experience

before they get into the cockpit of an actual plane. Highly realistic combat simulations are probably the best way to give military trainees a sense of what warfare is really like without putting them personally at risk. Whether or not these same technologies should be easily available to the general public, and particularly to children and adolescents under the age of seventeen, is a much more problematic issue.

Impact on Children

In this context, it is particularly disturbing to note that Eric Harris, who, along with Dylan Klebold, was responsible for the Columbine High School shootings in April 1999, created his own customized version of the game *Doom*. Harris's version had two shooters, extra weapons, unlimited ammunition, and victims who could not fight back. His modification of the game clearly mapped the key features of the Columbine shooting that he and Klebold carried out. Although it cannot be shown that playing *Doom* necessarily caused them to undertake the massacre, it can be argued that while they practiced their violent scenario in the video game, they almost certainly became more skilled at acting it out in the real world.

Video games are not necessarily bad for children. They can provide an important source of entertainment and instruction. James P. Gee, in his book *What Video Games Have to Teach Us About Learning and Literacy*, argues convincingly that video games are very powerful tools for teaching and that they can, in fact, direct us to important models of effective instruction. These include cognitive functions such as identity information, problem solving, and learning from nonverbal cues, to name just a few. Thus, in the debate over video game violence, what must be considered is not whether playing games is an appropriate means of instruction—virtually all of the literature in the field would seem to confirm that they are, in fact, highly effective teaching machines—but whether or not the content of what they teach is appropriate. In the end, this becomes an issue of curricular content and what narratives and stories we wish to present to learners in our classrooms and our society.

Violence in Schools

Two teenagers armed with guns and bombs walked into Columbine High School in April 1999. Thirteen were killed before the two turned their guns on themselves. The media took charge of the images and sound bites. Dozens of school shooting incidents have taken place in the near-decade that followed. These included shootings at both the K–12 level and the university level, the most noteworthy being the Virginia Tech massacre on April 16, 2007, in which thirty-three people were killed or wounded. As a result, beginning with Columbine, but by no means only as a result of that rampage, reduced tolerance of misbehavior and greater external control of students, particularly at the K–12 level, has become the normal course in schools across the United States. Metal detectors, uniforms, gates, bars, locks, video surveillance, armed security, and police presence have become part of the setting in our schools.

Although school violence is a problem that requires vigilance, schools continue to be one of the most secure places for children. Extreme forms of violence are rare. Both “hard” responses—such as metal detectors, added security personnel, and zero tolerance for weapons possession—as well as “soft” solutions—such as more counseling, conflict resolution programs, and better communications between school and home—have been implemented to improve school safety. Simultaneously, some reports suggest that schools are not safe. Some educators believe that by relying on self-reported data from school divisions, the government statistics underestimate the violence found in schools. This entry discusses the safety of schools in America.

School Policies

Secondary school administrators have addressed public concern by implementing violence prevention programs that instruct students in social-cognitive skills such as anger management; installing zero tolerance policies that expel or suspend students for being involved in fights or for carrying a weapon to school; and heightening school security. Additionally, administrators have worked to keep students safe while simultaneously preserving the democratic freedoms of both teachers and students.

However, consistent school safety policies are not found across the United States. Although 97 percent of schools require visitors to sign in, only 67 percent control access to the school building, and 34 percent control access to the school grounds. Only 1 percent of U.S. schools use metal detectors, according to a National Center for Education Statistics report in 2004. That investigation found that activities designed to increase school safety include counseling services, behavioral intervention, community programs, hotlines, teacher professional development, random dog checks, security cameras, use of clear or mesh book bags, and drug testing. In an effort to make their schools safer, many districts have taken great strides. Some researchers find that school crime overall has decreased significantly during the past decade, and schools are generally more prepared than ever to deal with school safety threats.

What Is a Safe School?

Some believe that a safe school is one in which the total school environment allows students, teachers, administrators, staff, and visitors to interact in a positive, nonthreatening manner that reflects the educational mission of the school while fostering positive relationships and personal growth. Significant effects on the school climate and the ways in which students resolve problems are attributed to the decisions of individual teachers about classroom management theories or their choices of management practices and strategies. In a school free from violence, fear, and intimidation, acceptance and caring are promoted. Expectations for student behavior in this type of environment are clearly stated, consistently enforced, and justly applied.

More than just physical safety, school safety also implies intellectual and emotional safety. With intellectual safety, students know that they can say, “I don’t understand,” and no one will laugh at them. They also realize they can think, doubt, and question what they are learning, and even make mistakes in a secure environment. A safety net is provided by classroom rules and procedures wherein individuals are free to express their concerns and ideas.

Emotional safety is also important. Some researchers have found that violent events such as those at Columbine were preceded by incidents when the eventually violent students were teased, bullied, or ostracized by others or when they were isolated from other students.

Are America’s Schools Safe?

In its 2004 report, the National Center for Education Statistics isolated a number of indicators for school crime and safety. The first, titled “Violent Deaths at School and Away from School,” suggests that the violence mentioned above occurs more often away from school than it does in school. School years from July 1, 1992, to June 30, 2000, were examined. It was found that youth ages fifteen to nineteen were at least seventy times more likely to be murdered away from school than at school. In this indicator, a school-associated violent death is a homicide, suicide, legal

intervention (involving a law enforcement officer), or unintentional firearm-related death in which the fatal injury occurred on the campus of a functioning elementary or secondary school in the United States.

Readiness and ability to learn can be affected in students who experience some form of school violence. Researchers share their concerns about the fact that vulnerability to attacks also has a detrimental effect on the school environment. Needless to say, teaching and learning are made difficult by the presence of weapons at school. Bullying contributes to an environment of fear and intimidation in schools. Learning environments are also affected by numerous physical fights.

In 2004, NCES reported that students in Grades 9–12 who reported carrying a weapon anywhere declined from 22 to 17 percent. Those students reporting that they had carried a weapon to school declined from 12 to 6 percent. These statistics were obtained for the years 1993 to 2003. In 2003, 17 percent of students in Grades 9–12 reported that they had carried a weapon anywhere, and approximately 6 percent reported that they had carried a weapon on school property.

Simultaneously, NCES advises that in 2003, 7 percent of students ages twelve to eighteen reported that they had been bullied at school during the past six months prior to the investigation; the percentage of students who reported being bullied increased between 1999 and 2001. However, no difference was detected between 2001 and 2003.

Interestingly, the percentage of students in Grades 9–12 who reported taking part in a physical fight on school property declined from 16 percent in 1993 to 13 percent in 2003. In 2003, 33 percent of students in Grades 9–12 reported being in a fight anywhere, and 13 percent said that they had been in a fight on school property.

To fulfill their potential in classrooms, youth should be safe and secure in schools. In 2005, the National Education Association Report on School Safety submitted data demonstrating that schools were among the safest places in American society for children. The percentage of students victimized provides an important measure of how safe our schools are and how this has changed over time. Indicator 2 of

the NCES report, *Incidence of Victimization at School and Away From School*, states that between 1992 and 2002, the victimization rate for students ages twelve to eighteen generally declined for thefts, violent crimes, and serious violent crimes at school and away from school. However, this same age group of students was more likely to be the victim of theft at school than away from school in most years between 1992 and 2002.

Because it has received increased attention from policy makers because of its impact on students' learning, school safety is of concern to many. Some researchers argue that schools with lower levels of school violence provide better learning environments for students. These same researchers have concluded that maintaining a safe learning environment, measured by indicators of school disciplinary infractions, has a statistically significant effect on students' grade achievement.

The media's linking of school shootings as a "trend" has tended to exacerbate the public's fears about the safety of children and youth in schools. Educators, parents, and students are concerned about what they perceive as increased levels of violent incidences within schools and the ensuing repercussions upon student performance. Some researchers argue that children living with danger often develop defenses against their fears. These fears interfere with their development because the energy spent on these defenses is not available for learning.

Although school building safety with reference to health issues is of concern, safety with reference to occurrences of violent incidents in or near schools is of deeper concern. It has been noted that a discrepancy between public perceptions and documented occurrences of school violence may be accounted for by the fact that the media have increased coverage of school violence by 240 percent during the period 1990 to 2000. Subsequently, Americans believe that youngsters are responsible for 43 percent of homicides, when they actually perpetrate only 9 percent of such crimes.

VISUAL INSTRUCTION MOVEMENT

Visual instruction, as a movement, has its roots in the efforts of reformist educators and theorists, who revolted against formalism and verbalism in educational practice during the nineteenth and early twentieth centuries and sought to emphasize the role of the senses in learning. Although the term *visual instruction* did not evolve until 1906, many developments and trends were already crystallizing into a distinctly new movement in American education.

The visual instruction movement sought to emphasize the role of the senses in learning. The movement was characterized initially by the use of common educational apparatuses such as timepieces, maps and globes, slates and blackboards, and textbooks. Later, the introduction of film led to the formation of organizations and distribution channels within school districts, universities, and state bureaus of visual instruction that concentrated on the collection and distribution of a wide variety of visual media. The federal government used film to disseminate information and support military training during World War I. This entry provides a brief summary.

Early Visual Media

Prior to the Civil War, common educational apparatuses used were timepieces, maps, globes, slates and blackboards, textbooks, and the abacus or numeral frames—most of which were extremely simple and required very little engineering in their manufacture. Visual apparatuses or aids, in terms of their early role in elementary and secondary schools, also included field trips to museums—providing such aids as exhibits, charts, photographs, illustrations, lantern slides, and maps.

As the Civil War came to an end, there was a flood of educational publications in the form of journals, reviews, and weeklies. States began to publish their own educational journals to keep teachers informed. Commercial producers and distributors of such new visual media as stereographs, lantern slides, maps, models, slide films, and motion picture films envisioned an extended market for their wares and eventually christened this new movement *visual education*. All contained articles and advertisements from the school furniture and apparatus companies with enticing illustrations and glowing sales claims—all of which were likely instrumental in persuading many in education to see inherent instructional value in the new apparatuses that were becoming available.

The film industry began in Chicago in 1907, when Albert S. Howell, a farm boy from Michigan who had studied engineering at night, and Donald H. Bell, a movie projectionist, developed one of the first precision film projectors. The first films for instructional uses were usually theatrical films for general purpose or entertainment interest. Later, as the motion picture industry began to expand, it was thought that theatrical films had educational value as well. The earliest forms of educational film were the newsreel, travelogues, and scientific motion pictures.

The use of film in education was brought about by the success and popularity of illustrated lectures on the lyceum and Chautauqua lecture circuit, establishing academic respectability for the use of lantern slides and film in the classroom. World War I provided impetus to the visual instruction movement by the effectiveness and extensive use of films: The

Committee on Public Information used film media to disseminate information concerning activities of the federal government, and the War and Navy departments had organized film divisions for the twofold purpose of supplying informational films to the public and preparing officers and men for war.

A Movement Emerges

As educators gradually began to recognize the significance of instructional films, visual instruction as an important new movement in American education emerged as the use of aids in the classroom gained momentum. The theoretical foundation supporting film use was built on the concept that the film medium brought reality and concreteness—breathing visual reality into the spoken and printed word, stirring emotions and interest, and requiring far less time than traditional instructional methods of the time.

State agencies established separate visual instruction divisions to support the statewide use of visual film, publish visual instruction materials, and serve as lending libraries for visual materials and a resource for training teachers and administrators. The first school use of motion pictures was in 1910 in the City of Rochester (NY) public schools, where the school board adopted films for regular instructional use. In 1917, the Chicago school system organized a visual education department, and in the years following World War I, other large school systems established similar departments or bureaus.

During the 1920s, there emerged a growing realization that current, text-based instructional practices were inadequate to meet the needs of increased school enrollments. Teachers were beginning to carry larger teaching loads and, in many instances, had grown dissatisfied with older teaching methods—seeing them as slow, ineffective, and often wasteful. As a result, many educators gradually became receptive to the faster, more direct teaching process provided by instructional films.

On the other hand, there were the teachers who had misgivings about this new technology. Opposition to new educational apparatuses revolved around issues such as the perception that they were too complicated; nightmares of schools being converted into

educational factories where the teacher would be little more than a mechanic manipulating the apparatuses; or the fear that motion pictures would bring commercialization into the classroom and used more for showmanship, status, or prestige symbols by schools rather than as effective teaching tools.

F. Dean McClusky, Director of Visual Education in Pennsylvania during this period, urged that teachers be given an opportunity to learn the advantages and disadvantages of visual instruction through formal and informal training, and that such courses of study should be introduced into normal schools.

VISUAL LITERACY

An increasing focus on visual communication—through intersecting developments in transnational media, the Internet, television, and film—makes critical analysis and comprehension of the image world a high priority for educators. Visual literacy traces its roots to linguistic literacy, based on the idea that educating people to understand the codes and contexts of language leads to an ability to read and comprehend written and spoken verbal communication.

Some theorists equate the linguistic text and the visual quite directly, whereas others seek an alternate discursive space for visual literacy. The theorist Richard Howells, for example, is in the former group, arguing that reading an image involves the same

complex system of decoding that reading a written text entails. Howells warns of a visual illiteracy that is presented as a dangerous proposition in our modern image-world. Other theorists argue for a visual literacy that recognizes the great difference in encoding and reception of the visual and linguistic, not identifying a visual “text” to be literally read. All theorists who work in the field of visual literacy agree about the need for an increased focus on the visual in education with specific goals in mind.

Two of the possible goals for visual literacy outlined by Paul Messaris include the expanded appreciation of the aesthetic form in art and the skills to identify manipulation and deception in visual images. A third possible goal of visual literacy is to encourage active production of visual materials using the elements and codes of images to create meaning, leading students to become producers as well as consumers of the visual.

Aesthetic Appreciation

The most basic goal of visual literacy, especially as imagined by those in the fields of art history and art appreciation, is the learned aesthetic appreciation of images and art objects. This branch of visual literacy is concerned with reading the image, or artwork, for what it is and not for why the image was created and for what ends. For still images, this focuses on learning basic elements of the visual such as color, texture, pattern, space, shape, and form.

Moving images, in the form of television or film, are appreciated for the creator’s technical skill in production, lighting, editing, framing, and visual storytelling. Proponents of education in visual literacy for appreciation believe that increased knowledge of technique and production will lead to greater understanding of the creative process and appreciation for aesthetic qualities in the visual.

Awareness of Visual Manipulation

Another, very different, stated goal of visual literacy advocates is the production of savvy and astute interpreters of meaning and manipulation in images. This involves the ways that images can be digitally

manipulated to intentionally distort appearances and the ways that images manipulate the emotions and comprehension in the viewer. Understanding how meaning is created in still and moving images is a work of cultural image deconstruction that examines relationships of power and persuasion. This involves understanding who produces the image, for whom it was intended, and what the message or intention might be. This form of visual literacy can be applied to classic Impressionist paintings of nude women, the persuasive visuals in advertising, and the framing and editing of television and film.

Understanding the intentionality and message behind advertising and media images is meant to create educated and skeptical visual consumers. The processes of digital manipulation of images in advertising can reveal that models with seemingly perfect skin and bodies have been digitally airbrushed and altered to create an illusion of perfection. In deconstructing advertisements for various brands of beer, students might see the underlying messages about the masculinity of beer drinkers, the sexual appeal of drinking, and the sexual availability of inebriated women. In both cases, visual literacy would seek to make transparent what ideas are being sold through these images and the possible social effects of such manipulation.

Manipulation in other visual media may be subtler, but issues of power and intentionality are central to reading meaning. Feminist criticism has led to increased understanding of the gaze in visual art and media, who is doing the looking and who is being examined. The eye of the viewer or camera is the gaze focused on the object of the work. Some researchers theorize that the lens of the film camera is the male gaze, investigating, objectifying, and often violating the female in the frame. The understanding of the gaze as a tool of power allows viewers to better understand with whom they are intended to identify in an image and how that relates to objectification and authority.

Visual Production

A final direction of visual literacy is to encourage the production of visual materials, using visual methods and codes learned through the appreciation of visual

creation and the awareness of visual manipulation. In linguistic literacy, it is expected that students will learn to read and produce texts. With the visual, students are generally viewers and consumers of images without the opportunity to create meaning of their own through production. This allows consumers to become active agents, responding to the deconstruction of images with the construction of their own meanings. Usually, students are marginally encouraged to create visual pieces in art classrooms, but there is a movement within visual literacy for greater production of student news programs, documentaries, Web sites, and digital images.

Although there is internal disagreement about the goals of visual literacy, and the analogy of linguistic and visual reading, the field is unified in its call for a greater emphasis on the study and production of images. The increased visual nature of media, based upon the preeminence of television and the Internet as tools of communication, means that students will be called upon to be able to understand and analyze the images around them. Visual literacy can provide the formal and cultural tools to make sense of the purpose and intention of imagery. With the appreciation of aesthetics, awareness of manipulation, and production of images, visual literacy has the possibility of creating knowledgeable and skeptical visual consumers, and skilled and savvy visual producers.

VULNERABILITY

As a social function, vulnerability is an issue that needs to be better understood by those interested in social and cultural issues in education. The main theoretical work addressing this issue is the American anthropologist Jules Henry's 1966 essay "Vulnerability and Education." According to Henry, one of the primary purposes of schooling is to condition people to feel vulnerable, making it easier for the social system to shape and control them through fear.

According to Henry, if society could not make people fear losing their status, their property, and their safety, it could not exist. He believes that people who do not feel vulnerable, who are not subject to some degree of fear, are not subject to control. How many people would run stoplights with their cars if it were not for the fear of receiving a traffic ticket or being injured? In this instance, fear is part of self-preservation, as well as of conforming to societal demands, rules, and laws. The fear of a parking ticket leads people to put money into parking meters. This is not the same as the case of obeying a stoplight signal, where self-preservation may also be an important factor at work.

Individuals can be made vulnerable through physical coercion, as well as by threatening them with the loss of their reputations. Also, they may feel vulnerable about the threat of being excluded from a social group that is important to them. This may be a group of friends, family, or social organization. In the most extreme cases, this process takes on forms such as shunning in Amish culture, which is applied to individuals who do not conform to traditional religious rules and customs.

According to this theory, schools play a critical role in communicating to students that they are vulnerable and that they must conform to certain societal norms or they will fail in school and in their lives. Students are threatened that if they do not behave and conform to the rules of the school, they will be thrown out, and so on. Students are told that if they do not study, they will fail a quiz or exam, and they will not make the grades necessary to get accepted by a

college or university and to eventually get a good job and make a decent living.

Furthermore, Henry asserts that students are made to feel vulnerable not only to get them to learn, but also to get them to physically submit. Teachers are, by definition, at least until secondary school, larger and physically stronger than their students. Within limits, they are allowed to intimidate and physically threaten students in order to make them conform to required standards and behaviors. Perhaps more important, they are able to make students feel vulnerable by threatening their reputations, making them look foolish with their peers, or withholding respect and overtly positive attention.

According to Henry, as they get older, students learn to resist the process of being made vulnerable and subject to societal control. They do so through active opposition and resistance, as well as through mechanisms such as sham—seemingly accepting direction and control while consciously subverting the actions of those controlling them.

Although a limited degree of vulnerability among students is probably desirable in order to keep a society functioning, it can be taken too far. According to Henry, when society (or teachers) make people feel too vulnerable, this can lead to dysfunction and even madness. As a result, the needs of the social system are not met. Clearly, there is a very fine balance necessary in terms of how much people can be

deliberately made to feel vulnerable, and how much making them feel vulnerable becomes dysfunctional.

For teachers, making students feel somewhat vulnerable can be useful but must be carefully regulated. Thus, making students fear failure on an exam may motivate them to study but, if taken to extremes, could cause them to become dysfunctional and fail.

Students are not the only individuals in schools who may be made to feel vulnerable. Teachers and administrators are expected to conform with school system policies, actions, and curricula with which they may not agree. However, they support these things because of their fear of losing advancement in their careers or possibly even the right to work. Thus, the principles of vulnerability that they use to control their students are applied to them to create a functioning, if imperfect, social system.

WALDORF EDUCATION

Waldorf education, which is synonymous with Steiner education, is based on an anthroposophical view of the human being, that is, a being of body, soul, and spirit. The school system's founder, Rudolf Steiner (1861–1925), a philosopher, literary scholar, architect, and educator, was born in rural Austria, south of Vienna. The first Waldorf School was built twelve years after Steiner published his essay “The Education of the Child in the Light of Anthroposophy” in 1907. “Waldorf” comes from the name of the cigarette factory that hosted the first Steiner school in 1919 in Stuttgart, Germany. This educational movement later took root in America in 1928 when the Rudolf Steiner School was established in New York City.

The central focus for a Waldorf teacher is the development of a person's essence, independent of external appearance, by instilling in pupils an appreciation of their background and their role as members of humanity and as world citizens. The teacher's aim is to draw out the students' inherent capacities by creating a classroom atmosphere that fills them with wonder and enthusiasm. The pedagogy of Waldorf schools derives from a model that recognizes the developmental stages of the child. The Waldorf philosophy views education as an art form, where each subject is presented through direct experience and augmented with visual arts, poetry, music, drama, and movement. The goal of Waldorf education is to enable students to have

the freedom and full ability to choose their individual paths through life.

The Waldorf kindergarten cultivates and supports the preschool child's inborn attitude, a basic reverence for the world as an interesting and good place to live. Early in elementary school, there is more stress on using artistic elements in different forms (rhythm, movement, color, recitation, song, and music) as a way to learn, understand, and relate to the world. Through the use of what is beautiful in the world, the students are believed to build an understanding of different subjects. In high school, students are led to a more conscious cultivation of an observing, reflecting, and experimentally scientific disposition toward the world, focusing on understanding what is true based on personal experience, critical thinking, and judgment.

Reviews of Waldorf's success are mixed. Many cite the lack of phonics and reading as cause for test scores that lag behind public school students up to sixth grade. However, some reports have cited Waldorf's use of the arts, block periods of study, crafts, and learning without textbooks as reasons why some students have scored higher on standardized tests, including SAT exams, than traditional students from middle through high school. Many opponents also state that Steiner's anthroposophy is a form of religion, and therefore, Waldorf schools should not receive federal funding. In 2005, however, the case of *PLANS Inc. v. Sacramento City Unified School District, Twin Ridges Elementary School District*, which was brought before the federal court in

California, failed to provide any evidence that anthroposophy is a religion.

On the Web site for the Association of Waldorf Schools of North America, one finds a listing of at least thirty publicly funded schools in North America using Waldorf methods or Waldorf “inspiration,” serving perhaps 5,000 to 6,000 students.

WHITENESS AND EDUCATION

White studies became popularized in the mid-1990s as an effort to understand and critique the role of White identity in society and across disciplines. The groundbreaking work of Ruth Frankenberg, *White Women, Race Matters: The Social Construction of Whiteness* (1993), explored and defined Whiteness in relation to White women’s experiences with power and privilege. It was the first study that examined Whiteness from the perspectives of Whites. Previously, notions of race were primarily explored and discussed by scholars of color, in particular Afro-centric (Black critical) scholars of color as a way of legitimizing experiences of oppression in relation to Whites. White studies has its roots in social sciences and has been engaged more recently as a tool for understanding the continued racial inequities in education.

Whiteness in education became popularized in the late 1990s with the release of such edited books as *Off White: Readings on Race, Power, and Society* by Michelle Fine, Lois Weis, Linda Powell Pruitt, and

April Burns, and *Critical White Studies: Looking Beyond the Mirror* by Richard Delgado and Jean Stefancic. Since then, the topic has been explored in a multitude of areas in education, including educational leadership, language and literacy, adult education, and curriculum and instruction. A fairly new ideology, the concept of Whiteness in education is still emerging and growing as scholars continue to explore and define the concept and how it operates within education.

Whiteness can be defined as a system of privilege based on race whereby White ideology is viewed as a reference point from which all other identities are compared. Whiteness is the act of silencing the discourse about race as nonexistent through a “colorblind” consciousness that often serves to normalize White experiences. A colorblind perspective attempts to transcend race by claiming not to see race as a factor; however, this inadvertently undermines the lived realities that individuals experience across race lines. The term *Whiteness* refers to the ideology that White identity has become the ideal and is viewed as the norm, whereby other identities such as African American, Native American, Hispanic, and Asian are viewed as multicultural subcultures within society.

White ways of knowing are seen as natural and taken for granted rather than as a construct that often undermines and dominates those from identities other than White. Whiteness can also include the notion of White supremacy, which serves to legitimize a racial hierarchy. A central concept in White studies or the Whiteness literature is the notion of White privilege, which is privileges or the preferential treatment afforded to those who are White in relation to non-Whites. However, it is important to note that even White individuals can and do experience oppression in relation to the ruling class of Whites.

Antiracist studies, critical race theory, and Whiteness studies work together to dismantle the power and privilege of White identity by exploring and legitimizing its prevalence in an effort to shift the power structures that have historically gone uncritiqued, unquestioned. Such scholars and theorists are working to unmask the naturalization or taken for grantedness of race in knowledge construction and the process of teaching and learning. This consciousness

allows educators to examine the role that race plays and how it privileges so that society can work toward shifting these power structures. For example, the continued disproportionate representation of students of color within special education, referral to remedial programming, dropout rates, and positioning of such students as at risk and predisposed for failure are all ways that legitimize unequal treatment by race. Within this system, achievement or success is contingent upon mastering White ways of knowing. As a result, it is quite possible that biases in education used to sort and categorize individuals based on “ability” may be a privileging of race and culture rather than a universal truth about ability and knowledge construction.

Educators in the field of White studies often experience much resistance to the notion of Whiteness because of its complexity and the emotional response. Whiteness is often misunderstood by those in the mainstream as a racist ideology because it confronts the realities of race, which are often unspoken or silenced. However, the aim of Whiteness studies is not to legitimize race as a tool to perpetuate racism but to use it as a tool or lens to recognize and understand how race is constructed from a cultural, social, and political standpoint so that a space is provided for dialog to create a more just society and, in particular, a more eclectic understanding of teaching and learning.

WHITE PRIVILEGE

White privilege refers to a certain set of rights, advantages, exemptions, or immunities available primarily to White persons of European ancestry. The degree to which such privilege is available to be enjoyed may depend on the particular government's social, cultural, political, and economic context in operation at the time. Therefore, White privilege is sensitive to time and location. For example, contemporary American society is rooted in a historical system of legalized discrimination against people of color. Skin color and country of origin were once used to determine one's right to property (both material and intellectual) ownership and social, political, and economic mobility. In fact, Africans brought to America as chattel slaves were counted as property and were written into the U.S. Constitution as three-fifths human.

Some scholars have even referred to “Whiteness” as property. All people were categorized according to a color-coded classification system, which developed into a hierarchy of social positions ranging from White at the top to Black at the bottom. In addition, observed phenotypic characteristics became the basis upon which expectations of behavior and treatment were determined. The amount of potential reward or benefit available to individuals relied heavily on the appearance of Whiteness and the ability to reflect behaviors and values associated with Whiteness.

Although such legalized discrimination is now unconstitutional, the vestiges of historical racism, prejudice, and bias linger throughout American society. White supremacy is the psychological and material result of centuries of institutionalized White dominance over the minds, bodies, land, and resources of people of color. White privilege is thus the socioeconomic legacy of White ancestors to their White children and is maintained via social, political, and economic institutions and arrangements whose rules ensure Whiteness as the primary qualification for access. Sometimes, the liberal rhetoric of western democratic societies that purport freedom, justice, and equality for all regardless of race, ethnicity, gender, sex, sexual orientation, creed, ancestry,

and other microcultural markers can mask the ways in which White privilege is alleged to work in practice in everyday life.

If one accepts the notion that Whiteness sets the standard for moral, intellectual, and sociocultural behavior, then non-Whites and “others” are placed in the precarious position of always having to prove their worth and value according to Whiteness. A corollary relationship is found between males and females. Male-dominated societies are said to confer privilege upon men, placing women in the insecure position of having their fates determined by men who freely judge women’s worth and value according to such things as sex appeal or ability to bear children. Evidence that women are paid differently for comparable jobs, are underrepresented in higher level political and business positions, and suffer higher rates of sexual assault than men is used to indicate the reality of male privilege. Females seeking success in male-dominated endeavors may have to strategically reconcile presentation of their masculine and feminine personas.

Similarly, evidence indicating the existence of White privilege can either persuade skeptics or simply describe how it manifests itself in the social, political, and economic spheres. One of the most powerful and privileged bodies of the executive branch of the U.S. government, the U.S. Senate, has 100 senators, of whom 99 are White. More than 97 percent of the chief executive officers of America’s corporate businesses are White males. Black and Brown (Latino) males constitute approximately 13 percent of the general population and more than 65 percent of the American prison population. The three largest public school districts in the country (New York City, Los Angeles, and Chicago) are overwhelmingly attended by children of color and poor children. All three struggle to retain and graduate about one half of the students from the twelfth grade. Suggested further readings can provide additional critical and historical analysis of the theoretical and conceptual issues related to White privilege. They can also give further insight into the very practical and seemingly trivial ways that White privilege can affect the everyday lives of White people and people of color.

WOMEN, HIGHER EDUCATION OF

In 2004, women constituted 57 percent of all undergraduate enrollments in U.S. higher education and 59 percent of graduate enrollments, whereas women make up 43 percent of tenured faculty and slightly more than 20 percent of college and university presidents. Female students and faculty are not proportionally distributed across academic fields, although the trend toward women entering fields

traditionally dominated by men is increasing slightly. Female faculty and administrators are more likely to be in community colleges than in four-year institutions and less likely to be at research universities than in any other postsecondary education sector. Federal policies (e.g., Title IX and affirmative action) have been responsible for substantial increases in women's participation in higher education, and White women have benefited disproportionately compared to women of color. Women's status on campus influences and is influenced by campus climate, the pattern of perceptions, and attitudes related to gender. This entry looks at the record of women in postsecondary education and briefly examines issues of campus climate.

Historical Perspectives

Higher education in the United States dates to the founding of Harvard College in 1636; women entered postsecondary education two centuries later through the establishment of academies and seminaries for women in the 1820s and 1830s. There is some debate about which institution should be counted as the first women's college, with arguments for Mount Holyoke (founded as Mount Holyoke Female Seminary in 1837, becoming Mount Holyoke College in 1893) and for Wesleyan College (chartered Georgia Female College in 1836, opened in 1839). By 1880, there were 155 women's colleges, a number that peaked at 214 in 1960 and has declined since as women's colleges have merged with men's and coeducational institutions or made strategic decisions to admit men. In 2006, there were fewer than 75 women's colleges, educating less than 1 percent of college-going women. Most participate in the Women's College Coalition (<http://www.womenscolleges.org>).

Coeducation—the practice of educating male and female students at the same institution—has a more clear-cut history, beginning when Oberlin College admitted women to its collegiate department in 1837. Coeducation at public colleges and universities happened later in the nineteenth century, beginning with the University of Iowa, which was coeducational from its 1855 inception. There was significant resistance to coeducation at several leading public institutions, including the University of Michigan.

The Civil War resulted in a dearth of available college-age men, which in turn led a number of institutions to admit female students, a trend that continued after the war was over. The Morrill Land Grant Act of 1862 provided funding for public institutions and did not make any requirements for or against women's education. The normal schools, also public, made a substantive contribution to the higher education of women, enrolling coeducational classes from their start. Public, historically Black colleges and universities (HBCUs) were often coeducational from their start, and private Fisk University was founded in 1866 to educate male and female students.

Historically, women of color have had less access to higher education than have White women. The private women's colleges admitted very few known African American students, and legal racial segregation kept many public and private institutions closed to non-White women until the Supreme Court's decision on *Brown v. Board of Education* was enforced. African American and Latina students currently attend college at lower rates than do their White and Asian American peers. American Indian women are more likely than American Indian men to go on to higher education, but they remain less likely than women from any other racial group to attend college. As a group, Asian American women are as likely as White women to attend college, but within the Asian American community, differences in college attendance rates are apparent by ethnicity and generation in the United States (e.g., a third-generation Korean American is more likely to attend college than a first-generation Hmong woman).

Other groups of women have faced substantial challenges to attend higher education. Discrimination against Catholic students, and a desire to educate Catholic women in distinctly Catholic environments, led to the establishment of Catholic women's colleges. Jewish women and men faced tacit and explicit quotas in admissions to selective private colleges throughout the early twentieth century. Women and men from working-class and poor backgrounds have struggled and continue to struggle to gain access to and to afford a college education, as have immigrants to the United States. Women with disabilities are attending college in increasing numbers due to changes in public policy, but they remain underrepresented in four-year institutions.

Access Policies

Affirmative action and Title IX have played key roles in increasing women's access to higher education in general and specific programs within it. Affirmative action, a policy that aims to correct for historic underrepresentation of members of particular racial, ethnic, or gender groups, and its companion practice, Equal Employment Opportunity, were created in Executive Order 11246 (1965, amended to include gender in 1967) issued by President Lyndon B. Johnson. Women—and White women in particular—have benefited in university hiring practices through these policies. Faculty searches that were formerly conducted out of view through predominantly male networks of scholars were opened for public posting and administrative oversight, with accountability for recruiting a diverse applicant pool and advancing qualified female and minority candidates through the process. Affirmative action in selective college admissions had a similar effect, although it did not mandate that all-male institutions admit female students.

Title IX of the Education Amendments of 1972 did require public institutions—and any other institution receiving federal financial assistance, which includes student financial aid and thus includes all but a few postsecondary institutions—to open their doors to women. Within institutions, programs and activities that had been previously sex-segregated (including intramural recreation and intercollegiate athletics; military training programs such as the Reserve Officers Training Corps, or ROTC; marching bands; and certain majors such as nursing) were compelled to allow male and female students the opportunity to participate.

Although Title IX is now known largely for its ongoing impact on collegiate athletics, it is important to note that it had a much more sweeping effect on higher education and women's opportunities; known paths to elite leadership ranks (such as the Ivy League colleges and the national military academies) were opened to women for the first time. Title IX is not without controversy, and debates about its relevance arise among calls for more single-sex public education for boys and girls, but its impact on higher education is profound and enduring.

Status of Women

Women make up the majority of student enrollments in higher education, a trend that is predicted to continue. Proponents of gender equity point out that women remain underrepresented in fields of study that lead to high-paying careers in science, mathematics, engineering, and technology and are overrepresented in traditionally female professional preparation programs in teaching, nursing, and clerical support. Progress toward equity has been made in graduate and professional programs in medicine, law, and business, and enrollments in life sciences undergraduate and graduate programs have also leveled off at about 50 percent female.

Female faculty remain underrepresented overall and especially in science, mathematics, engineering, and technology. Women are less likely to have tenure or be in tenure-track faculty positions than are men, less likely to be in research universities, more likely to teach in community colleges, and less likely to be in full-time positions in any sector of postsecondary education. An explanation for this underrepresentation, called the “pipeline argument,” has been advanced; it asserts that once female undergraduate and graduate enrollments rise in areas where women have traditionally been underrepresented, then the proportion of female faculty in these areas will rise in time.

The pipeline argument alone cannot account for gender patterns in faculty work, but it does lend itself to the metaphor of a “leaky pipeline,” which seeks to explain what factors in postsecondary education and society work to reduce the number of tenured female faculty. Factors often cited include campus climate, work-family priority conflicts, an increase in the use of part-time and non-tenure-track faculty across higher education, sex discrimination, and race discrimination that compounds other factors for women of color.

The pipeline argument has also been used in attempts to explain the disproportionately low number of women in college presidencies. Additional factors proposed as challenges to women's academic leadership include the fact that most college and university boards of trustees are overwhelmingly male, and persistent cultural stereotypes of leaders as White men. Women of color leading predominantly White institutions face additional challenges and have few role models.

Campus Climate

Running across discussions of women's status in higher education is the issue of gender climate on campus. Campus climate describes attitudes and perceptions that define the cultural context of an institution and its members. Gender climate, in particular, refers to common patterns in beliefs, perceptions, and behaviors related to sex differences and gender norms on campus. Campus climates have been described as warm and welcoming to members of both sexes and individuals who display a range of gender identities, or as cool and unwelcoming. Bernice Sandler (<http://www.bernicesandler.com>) and her colleagues coined the term *chilly climate* to describe hostile or indifferent campus climates for women and girls.

A key element to understanding and assessing campus climate lies in its nature as both objective or measurable and subjective or perceived. Factors that contribute to a warm climate include policies and practices that clearly prohibit sex and gender discrimination and that effectively prevent harassment based on sex and/or gender; equitable treatment of women and girls in the curriculum; the presence of female role models among faculty, student leaders, and administrators; and a history of welcoming and including women on campus. Factors that contribute to a chilly climate include an absence of any of the warming factors, plus the presence or perceived presence of sexual and gender harassment and discrimination, inequitable treatment of women, and persistent "micro-aggressions" that convey the message that women are not central to the mission and function of the institution.

Although campus climate is largely intangible, it has been shown to affect satisfaction, persistence, and achievement. Person-environment models of college persistence and professional achievement explain the mechanisms through which chilly or hostile campus climate dampens women's expectations of themselves and leads to diminished outcomes. Chilly climate in particular academic fields and in administration contributes to the leaky pipeline rationale for the dearth of tenured women in the sciences and in senior campus leadership. Women's colleges, where the gender climate is arguably the warmest for women, historically

have very high levels of student and alumnae satisfaction and have produced graduates who achieve at disproportionately high levels in academic, business, education, and leadership fields, including those in which women have been and remain underrepresented.

WOMEN'S COLLEGES, HISTORIC

In the nineteenth century, American women found few opportunities to pursue any higher learning because collegiate education was available only to men. During this century, most women who chose to attend college went to a women's college, and the majority of those women enrolled at one of the "Seven Sister" schools in the Northeast. These schools are Mt. Holyoke (1837), Vassar (1865), Wellesley (1875), Smith (1875), Radcliffe (1878), Bryn Mawr (1885), and Barnard (1889). From their experimental nineteenth-century origins to their presently declining numbers, these colleges provided unique environments that fostered rigorous intellectual growth. This entry briefly recounts their history and accomplishments.

Becoming Colleges

In the early nineteenth century, common schools rapidly cropped up across the country and provided instruction in the basic rudimentary skills (reading, writing, and arithmetic), but these new schools

required cheap labor to run them. Society looked to hard-working young women of middling backgrounds to fill this role. Although academies and seminaries both offered higher learning to students, seminaries emphasized their mission to prepare young women for teaching. These seminaries evolved into the Seven Sisters.

Other schools followed the precedent set by Mount Holyoke Seminary, which administered rigorous entrance examinations and offered a three-year course that did not include instruction in domestic pursuits or refinement of polite manners. Mount Holyoke, like its post-Civil War successors (such as Vassar and Wellesley), never offered a classical curriculum, but it maintained an English curriculum composed of history, philosophy, modern languages, and natural sciences. These schools followed the seminary model, with only one large building that housed students, faculty, classrooms, chapel, and dining room, providing a familial, domestic atmosphere that allowed faculty to strictly supervise students.

Smith College offered the first four-year course of study, which included the classics and higher mathematics. In the latter part of the nineteenth century, a hybrid form of women's colleges developed in response to pressure to educate women. Radcliffe (associated with Harvard University) and Barnard (affiliated with Columbia) were able to educate women without admitting them outright to their male counterpart. This movement protected the elite status of men's colleges and continued to keep men and women separated.

Expanding Influence

Critics of early women's colleges argued that higher learning would "unsex" women, lead them away from traditional feminine aspirations, damage their reproductive organs, inculcate masculine behaviors and desires, and ultimately lead them away from their proper place within the home. This criticism intensified in the early twentieth century, as a backlash against the women's movement into the public sphere centered on women's colleges. The opposition argued that women contributed to a form of "race suicide" (a term popularized by Theodore Roosevelt) by choosing education and careers over their family.

Women's colleges aimed to preserve their students' femininity in a variety of different ways. Mary Lyon (founder of Mount Holyoke) hoped to create a more progressive understanding of womanhood that encompassed female agency, independence, and critical thinking, whereas other institutions, including Vassar, hoped to preserve a Victorian sense of womanhood by organizing the school in a familial hierarchy. The male president served as a father figure, and female professors operated as mother figures who shaped behavior, habits, and religious life through daily interactions. Bryn Mawr was the first to organize central academic buildings surrounded by smaller homes for the students (each as a private household) in an effort to recreate a refined, proper home.

Both the students and the faculty shaped their own experiences in these colleges and created their own sense of community. The female faculty at these institutions found the opportunity to become professionals as the colleges provided an important entry point into academia. They developed close personal and professional relationships with one another as they worked and lived together. Likewise, students thrived in this environment. They learned and exercised leadership skills that they took with them into their future endeavors. They stratified themselves according to class, but this system took on significant gendered implications within this female world. Upper-classmen played the masculine roles in dances and plays, whereas freshmen played the traditionally feminine roles. With the sexual revolution of the 1920s, women wanted to be viewed as independent sexual beings, and this produced a fear of female intimacy at women's colleges. This, in turn, shifted student culture from its previous internal all-female focus toward an external, heterosexual program (men were involved more frequently in on- and off-campus activities).

Tide of Change

By the 1930s, the elite women's colleges of the Northeast positioned themselves as the "Seven Sister Schools" (the counterpart to the men's Ivy League schools) as the composition of the student body came primarily from the elite strata of American society. As

the twentieth century rolled on, however, enrollment increased at women's colleges, but the percentage of women who enrolled in women's colleges declined. This had to do with several factors.

In the post–World War II period, veterans took advantage of the GI Bill and enrolled in colleges and universities in unprecedented numbers. More women were admitted to postsecondary schools, but although the number of female college students increased, the influx of male students was so considerable that the proportion of women decreased.

Due to a growing economy in the 1960s, there was increased aid for higher education, and colleges had the opportunity to expand and to be more selective. Diversification occurred among students and faculty in response to the national civil rights movement, and as a result, many men's colleges responded by admitting female undergraduates. In the early 1970s, the economy experienced a period of high inflation; by admitting women, men's colleges could increase their enrollments and prevent further economic stress. In this climate, women's colleges coped in four different ways: (1) go coeducational; (2) develop a coordinate relationship with a nearby institution; (3) create programs to attract more revenue; and (4) close, merge, or be taken over by another institution (Harvard subsumed Radcliffe College).

WORK-BASED LEARNING

Work-based learning (WBL) is part of planned programs where students are able to experience the workplace without having to commit to their employers for an extended period of time. Students learn about different aspects of an industry, an industry cluster, or a particular business and simultaneously acquire general workplace and employability skills. WBL employs situated cognition because it allows students to recognize the usefulness of what they are learning in school. To facilitate the transition from school to work for students, WBL includes work-based, school-based, and connecting activities that develop a link between vocational and academic knowledge and skills, between teachers and employers, and between high schools and various postsecondary institutions. Many different forms of work-based learning exist, and all have multiple benefits for both students and employers.

Cooperative Education and Apprenticeships

Cooperative education involves school-related, paid work experience for high school or college students whose main objectives are career exploration; the development of employability skills like decision making, problem solving, and teamwork; and the mastery of specific job skills. Its most common form is *cooperative work experience*, which combines classroom instruction with employment. Students usually work part-time during the semester or full-time during their vacations. To make sure that the link with school-based learning is maintained, students, employers, and instructors sign an agreement, and instructors monitor and record skills development carefully.

Depending on agreements between states, industry groups, and schools, some programs offer a cooperative skills certificate or certificate of proficiency, which allows students to enter the job market as skilled workers. A less common form of cooperative education is *youth jobs*, which is work experience not connected to a specific industry or to vocational courses and mainly designed to develop transferable employability skills.

Youth apprenticeship, also known as *school-to-apprenticeship*, is a two-year program for high school juniors and seniors to enhance their classroom knowledge while participating in *registered apprenticeships* and completing their high school graduation requirements at the same time. The programs usually follow state curricula and are designed to meet applicable state standards. At the completion of the program, students receive their high school diplomas as well as an occupational proficiency certificate. These credentials then give them the option of entering the workforce, a traditional apprenticeship, or a postsecondary institution. Hours earned during youth apprenticeships are often transferable to other programs.

Registered apprenticeships are part of a government credentialing system for developing occupation-specific skills and competencies. Apprentices, who are usually high school graduates, receive on-the-job training from a skilled worker and mentor along with theoretical instruction. Under the National Apprenticeship Act, all formal apprenticeships are registered with the U.S. Department of Labor's Office of Apprenticeship Training to ensure that programs provide high-quality training and meet federal and state admission and certification standards. Apprenticeships last from one to six years depending on industry needs, and apprentices are paid a wage that increases with experience. After the successful completion of their programs, apprentices are given a nationally recognized certificate of completion.

Service Learning and Internships

Service learning combines community service with academic learning for high school or college students. It is closely related to classroom objectives and is designed to enhance students' knowledge and skills, apply a real-world context to academic skills, and develop civic responsibility and personal growth. In service learning projects, students typically identify and analyze a community need and plan, implement, and evaluate a project addressing this need. True service learning differs from volunteerism because it seeks to meet a predetermined set of learning objectives; students benefit academically as well as socially; and students have the opportunity to reflect

on and develop a better understanding of their experiences through journal writing, discussions, or classroom presentation.

Internships are structured workplace experiences, mostly for postsecondary students, that take place over a number of weeks or months to help students gain experience in a specific occupation. In an internship, a mentor, usually an experienced worker, helps students apply their classroom knowledge to the workplace and develop critical thinking and problem-solving skills. During an internship, students complete a number of preplanned activities to achieve a set of competencies related to acquiring a better understanding of an occupation. Internships are supervised by instructors at the student's educational institution, who also visit the student on site. Students generally have to submit periodic reports that include lists of tasks completed, reflections on their experiences, and mentor evaluations. Internships often conclude with summative evaluations from the mentor and the student's supervisor.

Other Approaches

School-based enterprises, also known as *youth entrepreneurship*, *youth-run enterprises*, or *school-sponsored enterprises*, involve groups of high school or college students who produce goods or services for sale. Students establish a business from the ground up. They develop a business plan, conduct market research, set up ties with the community and the local Chamber of Commerce, design advertising, and eventually function as owners of the business. The role of the school district or college is to underwrite and support such experiences.

School-based enterprises are especially helpful to demonstrate the need for integration of academic and vocational skills. Students learn time management, problem solving, and teamwork. Running a real business increases their understanding of how the economy functions and how organizations respond to challenges. A major advantage is that since no one's livelihood is linked to this enterprise, students are free to experiment and also to make mistakes that would not be possible in an out-of-school setting.

Other forms of WBL include *career mentorships*, *job shadowing*, *practica or clinical internships*, and

work-site field trips. Career mentorships are long-term relationships between a student and an older person with similar career interests. The older mentor is meant to be someone who offers support and advice as the student engages in career development activities. Job shadowing requires a student to follow an experienced worker at his or her workplace for a day or two to gain insight into an occupation or industry. Job shadowing does not teach any job-specific skills but allows students to explore occupations and assists in making a career choice. Practica or clinical internships are short-term activities, often in the medical field, designed to let students complete a project or apply and practice a specific skill in a work environment. Performance-based measures are used to ascertain that students are indeed able to perform the designated skill. Work-site field trips are employer-led tours of work sites and provide information of job requirements and work processes. Such visits allow students to explore occupational clusters and help with their career development.

Benefits

As part of WBL, students can experience learning in a realistic environment. They can gain insight into their job preferences, develop career interests, explore possible future careers, and develop greater responsibility for their own learning once they see how academic knowledge relates to workplace skills. The transition from school to work is also made smoother through work-based learning. For one, students experience firsthand which knowledge, skills, and attitudes are needed to be successful in the workplace. They also learn to see themselves in the role of an employee and become more confident in their abilities, including human relations skills and social competence in general. Work-based learning also strengthens academic skills. The ability to apply knowledge in real-life settings leads to better retention, and the integration of academic and technical knowledge helps students develop problem-solving abilities, self-regulated learning techniques, and higher-order thinking skills.

WBL can help employers recruit qualified employees. It not only creates a pool of qualified workers but also allows employers to observe future employees in action. The integration of academic and technical learning can help employers train employees for exactly the tasks for which they will be needed, and applicants familiar with the inner workings of a company or an industry tend to have higher initial productivity and lower turnover rates. Furthermore, agreements with schools give employers a voice in curriculum development to ensure that industry standards are given consideration when WBL programs are developed.

Another benefit is realized for companies that are interested in good relations with the community where they are located. WBL affords employers the opportunity to be seen as a part of the community by raising the skill and employability levels of its young people and, along with that, the economic viability of the area. Finally, WBL can help companies increase workforce diversity, which in turn helps future generations of students become acquainted with the cultural diversity they will likely encounter in the workplace.

Biographies of Important Figures in Education

Biographies of Important Figures in Education

ADDAMS, JANE (1860–1935)

Jane Addams made important contributions to education, sociology, social work, human rights, and labor reform based on knowledge gained through activism in these areas. She was cofounder of Hull House, an 1891 social settlement established in Chicago. Like many well-educated progressives of her era, Addams believed that living in a community with the poor was the best way to work with them to address negative consequences of living in poverty. Even though Addams believed education could alleviate poverty, she was critical of esoteric aims for education. She focused on tying education to community needs by offering classes at Hull House in areas such as literacy, health, nutrition, the arts, and education for the trades.

Whereas Addams was heralded as a saint for her work with poor and immigrant communities, she was criticized heavily for efforts toward other social causes reflecting the humanitarian perspective that pervaded her thoughts and actions. She worked with John Dewey to promote progressive education and joined W. E. B. Du Bois as one of the many cofounders of the NAACP. Addams was among the founders of the American Civil Liberties Union, a proponent of women's suffrage, and a pacifist who campaigned against World War I. She was also involved in economic reform and children's rights, based on her disdain for the exploitation of workers.

Addams was a prolific writer, *Twenty Years at Hull-House With Autobiographical Notes* (1910) being one of her best-known works. She received the Nobel Peace Prize in 1931, four years before her death.

ALLEN, ELIZABETH ALMIRA (1854–1919)

Elizabeth Almira Allen, elected first female president of the New Jersey Teachers Association (NJTA) in 1913, helped introduce one of the first tenure laws and teacher pension systems in the nation and advocated for better pay for women and their leadership of NJTA.

Born on February 27, 1854, Allen was thirteen when she entered the Model School of Trenton, which was associated with the State Normal School. Upon graduation, she began teaching in Atlantic City. In 1871, she took a position in Hoboken, eventually becoming principal of the elementary and high schools. For decades, she also worked at the Hoboken Normal and Training School. In 1882, at age twenty-eight, she became vice president of the New Jersey

Teachers Association, precursor to the New Jersey Education Association. In 1896, her efforts led the state legislature to establish a half-pay annuity for teachers with twenty years of service who were no longer able to teach. The fund was financed by a 1 percent reduction from the salaries of those who chose to participate.

Over time, controversies over Allen's management of the Teachers' Retirement Fund led to loss of support for Allen and her forces within the NJTA. Allen died on May 3, 1919, exhausted from the attacks against the pension system that she had helped create.

APPLE, MICHAEL WHITMAN (1942–)

Michael Whitman Apple is among the most prominent critical educational theorists working in the United States and a leading social activist. A former elementary and high school teacher, he was vice president and president of the Teachers Union in Paterson and Pitman, New Jersey, from 1962 to 1966. Apple received his bachelor's degree in education in 1967 from Glassboro State College, his master's in curriculum philosophy at Columbia University in 1968, and his EdD in 1970 from Columbia University.

His unpublished doctoral dissertation, "Relevance and Curriculum: A Study in Phenomenological Sociology of Knowledge," can be seen as the starting point for much of his subsequent work. In 1970, he joined the Department of Curriculum and Instruction and Educational Policy Studies, University of Wisconsin, Madison. In 1991, he became chair.

A profoundly complex figure—his thinking is broader than any label—his organic intellectuality

draws from analytic philosophy, the new sociology of education, and political science. A prolific writer, his works include *Education and Power*, *Teachers and Texts*, *Official Knowledge*, *Cultural Politics and Education*, *Democratic Schools* (coauthored with James Beane), *Educating the Right Way*, and without any doubt one of the most important educational works of the modern era, *Ideology and Curriculum*.

Apple's work exhibits three major (r)evolutionary stages in thinking—what has been described elsewhere as "Appleian trilogies" (Paraskeva, 2007): (a) issues of power, identity, cultural politics, curriculum theory, and research; (b) critical teaching; and (c) the development of democratic schools.

ARISTOTLE (384–322 BCE)

Aristotle's thought and writing ranged widely from philosophy to the natural and physical sciences. He was founder of a school in Athens, and his influence on generations of philosophers and scientists extends to the present day. Right or wrong, Aristotle's writing on ethics has influenced and will continue to influence character education programs in the public schools.

Aristotle was born in northern Greece, and his father was a doctor to the king of Macedonia. Aristotle moved to Athens to study with Plato at the Academy. Upon Plato's death, he lived in Assos; afterward, Phillip of Macedonia asked him to tutor his son Alexander. In 335, he returned to Athens to start his own school, known as the Lyceum. After Alexander's sudden death, he feared he might meet the same fate as Socrates and be executed for crimes of impiety.

Therefore, Aristotle fled into exile, only to die a year later.

Two of Aristotle's most important works were *Nicomachean Ethics* and *Politics*. His ethical thought contains three discernible components: a reflective comprehension of the good life, the notion that the good life stems from virtuous character, and the idea that what is good is also virtuous. Aristotle's *Politics* has several interconnected threads: a political entity should desire the good life for all of its citizens; democracy is a better form of government than other forms because it uses the wisdom of the many over the few; slavery can be justified; and Plato's ideas in the *Republic* would destabilize friendship, increase social unrest, and undercut private property.

ARMSTRONG, SAMUEL CHAPMAN (1839–1893)

Samuel Chapman Armstrong founded the Hampton Institute, which was, in its time, considered a model for the education of African Americans. Armstrong, however, believed that Blacks were educable but inferior, and his goal was to train them for work in the trades and accommodation to White attitudes.

He was born January 30, 1839, in Maui, Hawaiian Islands, to missionaries Richard and Clarisa Armstrong. His father developed a vocational and industrial educational program for the local indigent people employed mostly in sawmills and sugar plantations. Samuel Armstrong attended the Royal School at Punahou before enrolling at Williams College in Rhode Island.

In 1862, he joined the Union Army, frequently working with Black soldiers. Viewing himself as a patriot and humanitarian, he joined the Freedman's Bureau following the war. Drawing from family experience, he advocated vocational and industrial education aimed to situate the restless Black population,

stabilize the South, and ultimately help reunite the divided country.

Financed by the American Missionary Association and assorted philanthropists, he established Hampton Institute in Virginia in 1868 as a teacher training program. Armstrong developed a Hampton philosophy and curriculum that included teaching the dignity of labor, learning of vocational and domestic trades, extensive Bible study, a bootstrap philosophy, cleanliness, manners, and forgiveness for the South's racial legacy. Dignitaries frequently visited Hampton, viewing it as a model for Negro education. Hampton choral groups and handpicked students were sent on road shows to advertise the school and its accommodationist views.

Armstrong was far more than a school principal or president. He was a racial ideologist, political theorist, and social engineer. His views were clearly articulated in voluminous writings in the *Southern Workman*, a Hampton publication.

He viewed the Black race as intellectually inferior yet capable of learning. He wrote that Blacks belonged to the "savage races" who were "mentally sluggish" and "indolent." For Armstrong, character deficiency was the central problem. He wrote, "His worst master is still over him—his passions. . . . His main trouble is not ignorance, but deficiency of character. . . . The question with him is not one of brains, but of right instincts" (*Southern Workman*, December 1877). Hence, the solution was hard work alongside the inculcation of sobriety, piety, and thrift. Armstrong saw his as a civilizing mission.

Armstrong understood the political economy of Black labor. He wrote, "There is no source whatever of a suitable supply in lieu of Negro labor. . . . The Negro is important to the country's prosperity" (*Southern Workman*, January 1878).

Finally, as a social engineer, Armstrong foresaw that America would have a permanently diverse population. He believed that racial feelings would have to be moderated, and a place and a fit would have to be found for the Blacks. Armstrong understood that training some people of color could provide the necessary middle or comprador class that would anchor the group for decades to come.

ARNOLD, MATTHEW (1822–1888)

Matthew Arnold was a Victorian poet, critic, humanist, school inspector, and self-professed “liberal tempered by experience.” He wrote frequently and influentially on the topic of education, and his work challenged the traditional notions of society, education, and the way literature is taught.

With contemporaries such as Tennyson and Rosetti, he viewed poetry as the highest criticism of life. In his seminal work *Culture and Anarchy*, he adds to the scholarly discussion of politics and culture and their interrelationships. Acting as a critic of his own society, Arnold attempted to make the one-sided nature of the political and intellectual debates hyper-visible, with the hope of achieving a more just society as well as better schools.

From 1851–1886, Arnold served as Inspector of schools and became Chief Inspector. With this work, he traveled to inspect nonconformist schools as well as several European schools, and he reported his findings (as did Horace Mann). An underlying theme in all of his work on education is his desire for education to be better organized. In addition, for Arnold, education was the bulwark against anarchy, and he thought it should be a national matter, not just a local one. Significantly, even in the current time, he challenges the routinized and industrialized view of teaching (such as teaching to the test, which he considered “anti-educational” and “narrow”) and the lack of a core curriculum that he thought would render forth better critical thinking skills.

He emphasized the humanities in university education, and his work led to better teacher education for elementary teachers and influenced what became the university core curriculum as well. His three most profound essays are “Democracy,” “Equality,” and “The Function of Criticism at the Present Time.”

BAGLEY, WILLIAM CHANDLER (1874–1946)

For more than thirty years, William Chandler Bagley was the nation’s leading thinker on teacher education. He also was a historian of education and an educational philosopher. In 1938, he became known as the founder of Essentialism in educational theory. His primary field, however, was teaching teachers, and his educational theory cannot be understood apart from his commitment to teacher education.

Bagley was born on March 15, 1874, in Detroit, Michigan. He graduated from Detroit’s Capitol High School in 1891 and attended Michigan Agricultural College from 1891 to 1895. He began his career as a teacher in the fall of 1895 when he taught in a one-room school in the Upper Peninsula of Michigan. He completed his master’s degree in psychology at the University of Wisconsin in Madison in 1898. He then moved to Cornell University in Ithaca, New York, where he studied with psychologist Edward Bradford Titchener. He completed his Ph.D. degree in 1901.

In 1901, Bagley took his knowledge of psychology with him to St. Louis, Missouri, where he was an elementary school principal from 1901–1902. In 1902, he and his family moved to Dillon, Montana. He taught teachers from 1902 to 1906 at Dillon’s Montana State Normal School. He left Dillon in 1906 to accept a faculty position at the acclaimed Oswego State Normal School in Oswego, New York. Bagley remained at Oswego for only two years, however, before moving to the University of Illinois in 1908.

While at the University of Illinois from 1908 to 1917, Bagley worked to establish the university's first teacher training program for high school teachers. He was successful at creating the School of Education at the University of Illinois in 1916. Bagley soon left Illinois, however, to teach and conduct research at Teachers College, Columbia University. This Teachers College position offered Bagley the opportunity to focus his efforts on improving the nation's teacher training schools. He lived in the New York City area until his death on July 1, 1946.

For nearly fifty years, Bagley remained deeply committed to teaching teachers. He continued an American tradition in teacher education that began most prominently at Oswego in the 1860s with Edward Austin Sheldon. He published dozens of books and hundreds of articles during his almost fifty-year career. His major works include *The Educative Process* (1905), *Determinism in Education* (1925), and *Education and Emergent Man* (1934). He was both a scholar who labored to understand the history and philosophy of education and a practitioner who put these ideas into practice by helping to improve the nation's body of teachers.

BANKS, JAMES A. (1941–)

James A. Banks is one of the leading academic figures in the field of multicultural education. He has been referred to as “the father of multicultural education” for his pioneering and current work in the field. He is the Kerry and Linda Killinger Professor of Diversity Studies and the Director of the Center for

Multicultural Education at the University of Washington in Seattle.

Born in the Arkansas Delta during the era of Jim Crow, Banks attended segregated elementary and secondary schools. One of his early teachers told him, “James Albert, you carry the weight of the race on your shoulders.” It is a responsibility Professor Banks has met admirably. The work of James A. Banks exemplifies an academic career devoted to supporting the notion that education should be a vehicle that advances a broad concept of knowledge and contributes to social justice in all societies. Banks reminds readers that the promise education has held for many students, it must hold for all. He envisions the United States as a nation that has the potential to have a multiculturally and globally literate population that contributes to the welfare of the United States and the world.

Professor Banks has researched and written about topics such as social justice in education; racial equality/inequality in schools; the multicultural curriculum; and ethnic, national, and global dimensions of identity. He has authored twenty books and more than 100 journal articles. Among his books are *Teaching Strategies for Ethnic Studies* (8th ed., Allyn & Bacon); *Multicultural Education, Transformative Knowledge and Action* (Teachers College Press); *Diversity and Citizenship Education: Global Perspectives* (Jossey-Bass); *Cultural Diversity and Education: Foundations, Curriculum and Teaching* (4th ed., Allyn & Bacon); and *The Selected Works of James A. Banks* (Routledge).

Professor Banks is the editor, with Cherry McGee Banks, of the *Handbook of Research on Multicultural Education*, published in 1997, with a second edition in 2004. This volume was the first research handbook published in the field of multicultural education and received the Book Award from the National Association of Multicultural Education.

Professor Banks received the Distinguished Scholar/Researcher Award (1986), Distinguished Career Award (1996), and Social Justice in Education Award (2004) from the American Educational Research Association. He received the Teachers of English to Speakers of Other Languages President's Award in 1998 and the National Council for the Social

Studies Distinguished Career Research Award in 2001. He is past president of the National Council for the Social Studies as well as past president of the American Educational Research Association. Professor Banks has lectured widely across the United States and internationally. He is also a member of the National Academy of Education.

BELL, TERREL HOWARD (1921–1996)

An educator who spent much of his life working in public institutions, Terrel (Ted) Bell served as the second U.S. Secretary of Education during the first term of President Ronald Reagan (1981–1984). Although Reagan had promised to eliminate this federal department, Bell was convinced of the need for a prominent federal role in U.S. education. Stymied by bureaucratic infighting during much of the early years, Bell was able to establish a national commission in 1981 to examine the condition of U.S. education. He did so over the objections of many of Reagan's domestic policy advisors.

In April 1983, after continued delays, the National Commission on Excellence in Education (NCEE) released its final report. *A Nation at Risk* decried the condition of American education, deeming it so inferior that it was literally placing the United States at risk—both economically and militarily. President Reagan embraced the tone of the report, but not the substance. Nevertheless, thanks to the report's focus on academic excellence and alarmist tone, policy makers throughout the United States pursued various reforms hoping to improve American schools. The report also made it politically impossible for President Reagan to eliminate the Department of Education.

Bell resigned in December 1984 and returned to his native Utah, where he continued to work as a professor of education and educational consultant. He died in 1996.

BERNSTEIN, BASIL (1924–2000)

For more than four decades, Basil Bernstein was an important sociologist whose work influenced a generation of sociologists of education and linguists. Bernstein spent his academic career at the University of London's Institute of Education, retiring as Karl Mannheim Professor in the Sociology of Education.

Bernstein's early work on social class differences in language distinguished between the restricted communication code of the working class and the elaborated code of the middle class. His critics labeled him a deficit theorist, alleging that he was arguing that working-class language was deficient. Bernstein rejected this interpretation, arguing that difference became deficit because of unequal power relations.

Bernstein's later work examined the connection between communication codes and the processes of schooling. He analyzed the processes of schooling and how they related to social class reproduction, concluding that unequal educational processes reproduced social inequalities.

Whatever the criticisms of his work, it is undeniable that Bernstein's work represents a powerful attempt to investigate significant issues in the sociology of education. His work provides a systematic analysis of codes, educational structures, and processes and their relationship to social reproduction and identity.

BINET, ALFRED (1857–1911)

Alfred Binet was a French psychologist who, along with Theodore Simon, developed the first intelligence test. Binet was influenced by the writings of John Stuart Mill on intelligence and by the mental and physical growth of his two daughters. During his lifetime, Alfred Binet wrote several hundred articles and books that ultimately shaped psychology as he defined his conception of intelligence by emphasizing attention span and intellectual development for tests of thematic apperception.

While employed at the Sorbonne's Laboratory of Experimental Psychology, Binet began his collaboration with Simon that led to their study and identification of mentally challenged children. The Binet-Simon Scale was developed to measure intelligence by asking children to complete thirty tasks, which correlated to what an observed child should normally be able to accomplish at consecutive numerical ages, with each level having increased difficulty. Binet believed that both qualitative and quantitative measures should be used in the development of intelligence testing to advocate the education of children.

He argued that intelligence develops at a variety of rates and is influenced by both environment and genetics. Lewis Terman expanded on the Binet-Simon Scale by creating the Stanford-Binet Intelligence Test to measure IQ.

Binet wrote in French, but his works have contemporary English translations. His most notable works include *La Psychologie du Raisonnement* (1886), *Études de Psychologie Expérimentale* (1888), *Introduction à la Psychologie Expérimentale* (1894), *Les Idées sur les Enfants* (1900), *Étude Expérimentale de l'intelligence* (1905), and *Les Enfants Anormaux* (1907).

BLOOM, BENJAMIN SAMUEL (1913–1999)

Benjamin Samuel Bloom is remembered by students of learning theory as the creator of Bloom's taxonomy, which attempted to define and classify educational skills and goals. His work continues to influence those involved in education in setting curricula and in creating and identifying appropriate assessments of learning.

Bloom was born February 21, 1913, in Lansford, Pennsylvania. He earned bachelor's and master's degrees from Pennsylvania State University before earning his Ph.D. at the University of Chicago in 1942. After earning his doctorate, he taught and did research at that institution until 1983, when he moved to Northwestern University. Bloom retired from Northwestern in 1989 and died in 1999.

The best known of his many publications is *Taxonomy of Educational Objectives: The Classification of Educational Goals Handbook I: Cognitive Domain*, originally published in 1956. Working with a group of psychologists, Bloom addressed three "domains" related to learning: cognitive, affective, and

psychomotor. Concentrating on the cognitive domain, Bloom's taxonomy posits six levels, each requiring greater cognitive skills than the preceding one.

The taxonomy begins with the basic level of *knowledge*. At this level, the concentration is on basic definitions. *Comprehension* is the next cognitive level and requires such skills as interpretation of meaning, comparison, contrast, and summary. *Application* then requires problem solving and other demonstrations of knowledge. The more creative capacities of *analysis* include the identification of patterns or potential alternate meanings. At the level of *synthesis*, examples of competencies are generalization and prediction. At the highest level, *evaluation* is concerned with the assessment of the value of information, identification of bias or other flaws with information, and making further decisions based on information.

BLOW, SUSAN ELIZABETH (1843–1916)

Susan Elizabeth Blow (1843–1916) was an influential theorist in the late-nineteenth-century Kindergarten Movement, a leading proponent of Froebelian methods, and the first director of a public kindergarten in the United States. Blow translated from German the system of Froebel's *Mother Play* for American classrooms, established a normal school for kindergarten teachers, and was a major figure in turn-of-the-century debates on the future of early childhood education.

Susan Blow was born in Carondelet, a section of St. Louis, Missouri, to a wealthy and politically prominent family. Her grandfather, Peter Blow, was the owner of slaves; notably, Dred Scott. Her father was a state senator and ambassador to Brazil. Blow

attended the prestigious McCauley School in New Orleans and the Henrietta Haines Female Academy in New York City.

She encountered the educational philosophy of Friedrich Froebel while traveling in Europe and later studied with two leading Froebelians, Maria Kraus-Boelte and Baroness von Marenholtz-Bulow. When she returned to St. Louis, she worked with Superintendent of Schools William Torrey Harris to incorporate kindergartens within the public school system. The Des Peres Kindergarten, the first public kindergarten in the United States, opened in St. Louis with Blow as director in 1873.

Throughout her career, Blow resisted arguments to integrate emerging theories of developmental psychology within kindergarten training and practice. In a joint series of lectures with Patty Smith Hill at Teachers College Columbia (TCC) in 1903, she advocated the "Uniform Plan," which permitted no deviations from Froebel's logical sequence of symbolic play. Hill's progressivism prevailed, marking a major theoretical transition for American early childhood education. Blow's orthodoxy was now seen as out of date. However, her reputation as the foremost American authority on Froebel endured, and she continued to write and lecture on early childhood education until her death in 1916.

BOND, HORACE MANN (1904–1972)

Horace Mann Bond was one of the first educational researchers in the twentieth century to link structural inequalities in American society to the academic

achievement of African American youth. His critiques of the use of IQ test scores to justify inadequate schooling for African American youth helped lay the intellectual foundation for the *Brown v. Board of Education* Supreme Court decision in 1954.

Bond graduated from Lincoln University at the age of eighteen and eventually earned his master's and doctoral degrees from the University of Chicago. Early in his academic career, Bond wrote articles in African American magazines and journals criticizing White psychologists who argued that low IQ scores by African Americans reflected innate intellectual limitations. Bond argued that the social environment played a critical role in students' performance on IQ tests and overall academic achievement. Although most White psychologists ignored his views in the 1920s, in the decades to follow, other African American and White researchers would go on to undermine the belief in African American intellectual inferiority.

In the 1930s, Bond extended his research to an analysis of how economic and social factors denied equal educational opportunities to African Americans. His two books, *The Education of the Negro in the American Social Order* (1930) and *Negro Education in Alabama: A Study of Cotton and Steel* (1939), represented the culmination of this research and today are considered pioneering works in the history of American education. In Bond's later educational career, he became a prominent administrator at several Black colleges.

Alan Stoskopf

philosophy in 1954, but his initial studies of Algerian peasants in 1958 led him in the direction of ethnology. Bourdieu later became the director of the Center of European Sociology in 1968.

By this time, Bourdieu had turned his focus from Algeria to the French educational system, working with Jean-Claude Passeron to critique education's role in the creation of class hierarchy in France in their books *The Inheritors* (1964) and again in *Reproduction in Education, Society, and Culture* (1970).

Moving on to theoretical ground, Bourdieu developed a theory of social practice in *Outline of a Theory of Practice* (1972), creating the concept of "habitus" as the internalization of social and cultural structures that guided an individual's actions. Bourdieu combined this theory and his empirical concerns with culture and education in his most influential sociological study, *Distinction: A Social Critique of the Judgment of Taste* (1979), which argued that education and culture became the means of maintaining one's class position in the social hierarchy by giving people "cultural capital."

Bourdieu later explored a series of empirical problems broadly connected to his interest in culture and power, including his studies of *Language and Symbolic Power* (1982) and *Masculine Domination* (1998). Throughout his life, Bourdieu was also engaged in his own particular form of social activism, presented in his books *In Other Words* (1987) and *Acts of Resistance* (1998).

BOURDIEU, PIERRE (1930–2002)

Pierre Bourdieu was one of the most influential and prolific social scientists of the late twentieth century, and his work examined the role that education played in the social hierarchy. He received his doctorate in

BOWERS, C. A. (CHET) (1935–)

Chet Bowers was an environmentalist long before it was fashionable. As a teacher and scholar at the University of Oregon and Portland State University, his work since the 1970s has focused on the developing ecological crisis, the role of education in reproducing it, and the deep cultural roots that underlie it. A contrarian, he eschews the labels of liberal and progressive, and at times claims rather to

be a conservative, because he wants to conserve older traditions of sustainability and community.

While most scholars on the left have focused on capitalism as the source of social and ecological problems, Bowers argues that the roots are much deeper, in the set of metaphorical assumptions he calls “modernity.” These assumptions, or “root metaphors,” have developed over centuries, primarily in Western culture, he says, and include individualism, mechanism, anthropocentrism, and a faith in progress as inevitable and progressive.

Professors and teachers, even those who consider themselves radicals, Bowers points out, reproduce these assumptions in their everyday language in the classroom. For example, a teacher who asks students to “think for themselves” reproduces individualism. This has led him into conflict with prominent followers of Paulo Freire’s critical pedagogy, which Bowers considers part of modernity. The assumptions of modernity, he argues, underlie both the ecological crisis and the increasing fragmentation of community that is exemplified in rising drug abuse and child neglect.

He points out that modern culture has forgotten many of the beliefs and practices of older cultures, which carried assumptions that have produced more sustainable ecosystems and communities. He is sometimes accused of romanticizing indigenous cultures, but his point is more to illustrate the problem with modernity than to advocate for a particular cultural practice.

Recently, he has emphasized the importance of the “commons”—what is held in common ownership rather than being privatized. This includes both the natural—air, water, and so on—and the cultural—the skills and knowledge that are passed down through generations.

BRUNER, JEROME S. (1915–)

One of the most influential psychologists of the twentieth century, Jerome S. Bruner played a major role in the modern “cognitive revolution.” Perhaps his most important contribution was that he helped establish cognitive psychology as an alternative to the behaviorist approach of figures such as Watson and Skinner.

Born in New York City in 1915, Bruner went to Duke University and then Harvard, where he received his Ph.D. in 1947. As a professor at Harvard, he helped found the Center for Cognitive Studies. In 1970, Bruner left Harvard to teach at Oxford University. A decade later, he was back in the United States, where he eventually became a faculty member at the New School for Social Research in New York City.

In the field of education, his landmark book *The Process of Education* (1960) elaborated on the work of Piaget and advanced his own personal theory of psychology and learning. As a curriculum innovator, he participated in designing and implementing the MACOS (Man: A Course of Study) project during the mid-1960s. Drawing on the emerging behavioral sciences, the curriculum attempted to address the following three questions: “What is uniquely human about human beings? How did they get that way? How could they be made more so?” By the mid-1970s, the curriculum was being criticized by conservatives as elitist.

While at Oxford during the early 1970s, Bruner began to pay more attention to the social and political context of learning. Criticizing elements of the “cognitive revolution,” Bruner’s new interest in cultural psychology was reflected in his book *The Culture of Education* (1996).

CALLAHAN, RAYMOND EUGENE (1921–)

Raymond Eugene Callahan is an education historian whose interest in the social underpinnings of education at the end of the nineteenth century culminated in the publication of *Education and the Cult of Efficiency: A Study of the Social Forces That Have Shaped the Administration of Public Schools* (1962).

Born in St. Louis, Missouri, in 1921, Callahan attended the city's public schools, worked in factories, and then enlisted in the military during World War II. This duty entitled him to the provisions of the GI Bill for completing his education.

Callahan earned a bachelor's degree from Washington University in St. Louis in 1948; was a fifth-grade teacher for a year; then re-enrolled at Washington University, where he earned a master's degree in history a few years later under the guidance of Dietrich Gerhard, a noted central European scholar. Callahan would always refer to Gerhard as "my great teacher." Later, George S. Counts and John L. Childs were added to form a trinity of Callahan's admired professors.

The mix of public school teaching experience and an intellectual interest in history led him to enroll at Teachers College, Columbia University, to study under George S. Counts, who was one of the architects of the concept of the social foundations of education. Callahan completed the course work in 1951 and took a job at Butler University in Indianapolis, Indiana, before the awarding of his EdD in 1952. He then got a position at his alma mater, Washington University, where he spent the remainder of his professional career.

One of Callahan's first projects was a textbook in the social foundations titled *An Introduction to Education in American Society: A Text With Readings* that was published in 1956. Counts wrote a foreword. The book sold well and underwent several editions through 1967. Callahan referred to the text as "the book that got me out of pre-fabricated housing." He then turned his attention to more serious scholarship. The catalyst for this change came in part with the reorganization of Washington University's Department of Education into the Graduate Institute of Education in 1955. Robert J. Schaefer was brought from Harvard to be its first director.

Callahan was interested in the dramatic growth in public school education at the end of the nineteenth century. The leadership of the schools, the philosophical basis of administration, the curriculum, and societal expectations for the enterprise within the context of corporate America were placed into a subset of historical questions that Callahan began to explore. Warren Button, an early student and graduate assistant of Callahan, would recall Saturdays of reading, thinking, discussion, and writing in a cloud of cigar smoke. The result was *Education and the Cult of Efficiency: A Study of the Social Forces That Have Shaped the Administration of Public Schools*, which was published in 1962 and underwent more than twenty-five printings. The reaction to the book, dedicated to Counts, was immediately positive.

Callahan became president of the History of Education Society for 1963–1964 and delivered the Simpson Lecture at Harvard in 1964. He continued to teach, guide future historians of education, and conduct research up to his retirement from Washington University.

CARSON, RACHEL (1907–1964)

Rachel Carson, a marine biologist and science writer, is best known for her last book, *Silent Spring* (1962), a groundbreaking book that exposed the destructiveness of manufactured pesticides on the natural world and began a worldwide environmental revolution. Perhaps more than any other modern author, Carson was the first major writer to bring the importance of ecological and sustainable thinking to the general public. As a result, even though her work is primarily as a scientist, she is of critical importance to those interested in the social and cultural foundations of education.

Born on May 27, 1907, in rural Springdale, Pennsylvania, Carson reflected that she was “born with a fascination for the ocean” and credited her love of nature to her mother. Carson, who published her first story at age ten, continued her interest in writing through high school and at the Pennsylvania College for Women (later Chatham College), where a brilliant college biology teacher encouraged her to apply her passion for science to zoology and to pursue advanced studies at Johns Hopkins University. Carson enrolled at Johns Hopkins in the fall of 1929 after completing a summer fellowship at the Marine Biological Laboratory at Woods Hole.

Family financial problems delayed completion of Carson’s master’s degree until 1932 and dashed her hopes of completing a doctorate. When her father died in 1935, she became responsible for her own and her mother’s support, and found a temporary position at the U.S. Bureau of Fisheries to write radio scripts on marine life. A job at the Bureau as an aquatic biologist became permanent in 1936, when she and her mother moved to Silver Spring, Maryland. In 1949, she was appointed editor-in-chief for Fish and Wildlife Services, where she continued until 1952, when the financial success of her publications allowed her to devote all her time to writing and to build a summer cottage on the shore of Southport Island, Maine, where she could observe the marine life she dearly loved.

Beginning in 1937, Carson’s articles on the sea and the natural world appeared in national magazines. Her first book, *Under the Sea-Wind*, was published

in 1941. After receiving a fellowship and an award for “the best science writing in a magazine,” Carson finished *The Sea Around Us* in 1952, a book that set a record by remaining on the best-seller lists for eighteen months. *The Edge of the Sea* followed in 1955. An article she wrote for parents and dedicated to her adopted nephew, “Help Your Child to Wonder,” was published in 1956, which was later reprinted as the book *The Sense of Wonder*.

Carson’s concern about pesticides’ effects on the natural world began early in her career and culminated in the publication of *Silent Spring*. This history-changing book warned of “the dangers of misuse and overuse” of chemical pesticides and eventually led to the banning of DDT. Although Carson was personally and professionally castigated by the chemical industry and the U.S. Department of Agriculture, she won numerous prestigious national awards and recognition for her work. A film, *The Silent Spring of Rachel Carson*, aired on CBS in 1963. In 1964, Rachel Carson died of cancer and heart failure. She was awarded the President’s Medal of Freedom posthumously in 1980.

CHILDS, JOHN L. (1889–1985)

Educator and activist John L. Childs argued that education was linked to a host of social, economic, and environmental issues, so that society had to be reformed if education was to change.

Born in Eau Claire, Wisconsin, Childs attended the University of Wisconsin, Madison, where he earned a journalism degree in 1911. After working for the Young Men's Christian Association (YMCA) for five years, Childs and his wife, Grace Mary Fowler, sailed for China in 1915 to work as YMCA missionaries in Beijing.

In 1922, Childs returned to the United States to begin graduate work at Union Theological Seminary. After returning to China, Childs eventually came back to New York to work on his Ph.D. at Teachers College, Columbia University. Shortly after finishing his doctoral dissertation, Childs became a professor at Teachers College in 1931.

Childs entered the profession at the beginning of the Depression. He soon became a leading advocate of a philosophy of social reconstruction, believing that social, environmental, and economic conditions had to be considered when attempting to understand and address issues facing education and the schools. For him, educational reconstruction and social reconstruction were clearly connected. One could not be undertaken without the other.

Childs's most important work was *Education and Morals*, which was published in 1950. As a pragmatist, he believed that engagement in political issues was a moral responsibility. Similarly, he believed that any important decision made by teachers (often affecting students) was likewise a moral decision. In *American Pragmatism and Education: An Interpretation and Criticism*, published in 1956, Childs outlined the basics of pragmatism and its application to American education. Childs retired from Teachers College in 1955.

CHOMSKY, AVRAM NOAM (1928–)

Avram Noam Chomsky is a linguist, philosopher, and political activist who is well-known both for his work in linguistics and for his writings about contemporary issues, which are essential inquiries into illegitimate forms of authority and the abuse of power in modern politics. He views education as part of a process that rewards obedience and conformity and promotes those who are most faithful to established institutions.

Chomsky was born to a working-class family in an ethnically diverse immigrant community in Philadelphia, Pennsylvania, in 1928. His parents, both of them Hebrew teachers, had immigrated to the United States from Russia in 1913. His father, William (Zev) Chomsky, who had earned his doctorate from Johns Hopkins and went on to become a distinguished scholar of Hebrew grammar, began working at Gratz College in 1924. Gratz ranks not only as the oldest academic institution of Jewish studies in North America, but also as the continent's oldest teacher training college.

Whereas young Noam developed his interest in the study of language from his father, his political sensitivities reflect more of his mother's influence, who was considerably further to the left in her political orientation than her husband. Members of his extended family also shared commitments to leftist politics, and many of them participated in various forms of working-class activism common to the Depression era.

Chomsky's formal education began shortly before his second birthday at the Oak Lane Country Day School, a Deweyite experimental school operated by Temple University. Dewey's educational vision bore a strong resemblance to that of Karl Wilhelm von Humboldt, whose linguistic and political writings shaped Chomsky's views in those same areas. Oak Lane provided Chomsky and the other students with the freedom to pursue their own interests and to expand their knowledge without coercion.

Chomsky's interests, of course, had been decidedly influenced by his parents and his extended family. At the age of ten, he published an article in the Oak Lane student newspaper on the Spanish Civil War that

addressed the fall of Barcelona and the defeat of the Spanish anarchosyndicalist movements that he found inspiring. By the age of twelve, he was reading his father's scholarly writings on Hebrew grammar and the history of its study.

It was also at the age of twelve that Chomsky left Oak Lane and entered Central High School in Philadelphia, where his experiences heavily informed his later critique of state-sponsored schooling. Although labeled a good student because of his high grades, he recognized early the patterns of authoritarianism, regimentation, and indoctrination that serve elite interests. For Chomsky, the primary objective of state-sponsored schooling has always been to sort and select for obedience and conformity. Those most able to tolerate the authoritarian and inane patterns of traditional schooling, those who embrace the obedience and conformity demanded of them, can best be trusted to move "up the ladder" and into the university system, which, in his estimation, likewise rewards obedience and conformity. Those demonstrating the greatest allegiance to the established institutional structures and prevailing dogmas are promoted to positions that enable them to exercise power in the service of reproducing those same structures and dogmas.

Ideally, in Chomsky's view, public schools should provide people with the skills and opportunities to pursue knowledge as a matter of "intellectual self-defense" against the violence and exploitation aimed against them by members of privileged classes. Similar to the Italian socialist Antonio Gramsci, Chomsky regards all humans as intellectuals, that is, as persons who find the greatest satisfaction in life through the free and autonomous application of their own native abilities toward understanding and acting in the world. The fact that intellectuals are viewed as members of some specialized class should, in Chomsky's view, be regarded as a social defect to be overcome.

Nevertheless, he claims that members of this class bear a special burden within what he sees as a marginally democratic U.S. society. Their specialized training, their near-limitless access to resources, and the time that they have at their disposal places them under a greater responsibility to pursue the truth and report it to audiences who matter—persons or groups

affected by the issues addressed in that pursuit—than those who do not enjoy those privileges. In a more genuinely democratic society, teachers in public schools would focus most of their energies on helping students develop those skills of truth-seeking for themselves.

Chomsky earned his own position within the academy through his revolutionary work in the field of linguistics. Although his exposure to the study of language through the writings of his father laid the foundation of that work, Chomsky studied linguistics, philosophy, and mathematics at the University of Pennsylvania beginning in 1945. He completed a BA honor's thesis titled "Morphophonemics of Modern Hebrew" that laid the groundwork for his later doctoral studies at Penn and Harvard University. Shortly after earning his Ph.D. from Penn, Chomsky was made an assistant professor at Massachusetts Institute of Technology. His book *Syntactic Structures*, published in 1957, elicited a tremendous response within the linguistic community and established him as one of its leading figures.

Throughout his high school and college years, Chomsky never abandoned his anarchosyndicalist/libertarian socialist political leanings and activism. Given his stature as an intellectual figure within linguistics, his vocal opposition to the Vietnam War attracted wide attention. The 1960s witnessed the publication of Chomsky's first books on politics and contemporary events. In 1969, he published *American Power and the New Mandarins*, and he has published, on average, one book per year on contemporary political issues ever since.

In 1979, Paul Robinson wrote in *The New York Review of Books* that Chomsky was "arguably the most important intellectual alive." Chomsky has never embraced such a characterization of himself, denouncing anything that might contribute toward the development of any "cult of the personality." His collaborative work with Edward S. Herman, *Manufacturing Consent* (2002), now in a new and updated edition, remains a highly useful book for understanding the interweavings of state, corporate, and media power. Of particular relevance for scholars in the cultural and social foundations of education is Donald Macedo's *Chomsky on Miseducation* (2000),

which contains numerous essays as well as an important interview with Chomsky conducted by Macedo.

CLAPP, ELSIE RIPLEY (1879–1965)

Elsie Ripley Clapp, an activist on behalf of children and the poor, taught at schools established to teach the children of jobless workers during the Depression. A student of John Dewey, she also made significant contributions to progressive education.

Born in Brooklyn Heights, New York, she was educated at Barnard, Vassar, and Columbia. Elsie held a bachelor's degree in English and a master's in philosophy, studying under John Dewey and F. J. E. Woodbridge. Always an activist for children, Clapp

worked with the International Workers of the World in 1913, where she taught the children of striking workers. She supported the work of Margaret Sanger and championed the rights of poor children.

Although she taught in numerous private schools, her best-known documented work was in rural Kentucky and West Virginia. Upon the advice of her friend and mentor John Dewey, Elsie took progressive education to two rural public schools, the Ballard Memorial School near Louisville and the Arthurdale School in West Virginia. She documented her work in two books, *Community Schools in Action* (1939) and *The Use of Resources in Education* (1952). Clapp was chosen to head the Arthurdale School by Eleanor Roosevelt, who believed this New Deal community needed a progressive school. The school was populated by children of coal miners displaced by the Depression with an overarching aim to build community.

Active in progressive education circles, Elsie also edited the journal *Progressive Education* from 1937–1939 and in that short span brought an aesthetic dimension to the journal with focus on art, the child, and the community school.

COLEMAN, JAMES S. (1926–1995)

James S. Coleman was a sociologist and author of studies that fueled controversy around the mandatory busing issue in the 1960s and 1970s: one study providing the rationale for mandatory busing of students to achieve integrated schools, and the other declaring those efforts a failure.

Born on May 12, 1926, Coleman earned a doctorate in sociology from Columbia University in 1955 and began a long teaching career at the University in Chicago the following year. From 1959 to 1973, he

taught and did research at Johns Hopkins University, returning to the University of Chicago in 1973. Despite producing a broad range of research and scholarship, including the publication of thirty books, Coleman is best remembered for two studies.

His 1966 report to Congress, known as the Coleman Report, presented research that showed African American children would learn more and faster in integrated classrooms. Although his conclusions were carefully qualified, this research was used as an argument for wide-scale mandatory busing to achieve racial balance in many schools and correct the de facto segregation that had been found to exist in many American school districts. The controversy and acrimony that this effort generated placed Coleman's work at the center of a firestorm.

Later, in 1975, after "White flight" and other issues had plagued the efforts of this movement, Coleman issued a report pronouncing the mandatory busing movement a failure. This, too, was extremely controversial to the point that the American Sociological Society considered expelling him. Coleman felt his most important work was his 1990 book, *Foundations of Social Theory*, in which he studied the organization and functioning of communities. Coleman died of prostate cancer on March 25, 1995.

COMENIUS, JOHN AMOS (KOMENSKY) (1592–1670)

The father of modern pedagogy, Comenius argued that teachers should use developmentally appropriate instructional methods that tap into children's sense

perceptions. He called for a universal educational system, a standardized curriculum and textbooks, trained teachers, and a common language for all (Latin). Although Comenius lived in turbulent times and suffered many personal losses, he remained optimistic about the future of humankind. His most important works include the *Didactica Magna* (*The Great Didactic*) (1632), the *Janua Linguarum Reserata* (*The Gates of Tongues Unlocked and Opened*) (1631), and the *Orbis Sensualium Pictus* (*World in Pictures*) (1658), one of the first picture books for children.

John Amos Komensky was born March 28, 1592, in Nivnice, Moravia (Czechoslovakia). His parents were members of a Protestant religious group persecuted during the Thirty Years War (1618–1648). Living in a time of great political upheaval, Comenius experienced many hardships. His father, mother, and two sisters died of plague when he was twelve. In 1621, he lost his home, his writings, and all of his belongings when soldiers took over the town in which he lived. The same year, his pregnant wife and two of his children died of plague. A refugee most of his life, Comenius traveled throughout Europe, but never returned to his homeland. He died November 15, 1670, in Amsterdam.

Comenius believed in the power of intellect, piety, and systematic learning to improve the human condition. Troubled by the conflict and human suffering surrounding him, he sought to unify people of all nations and faiths. He proposed that pansophy—lifelong study of systematized, encyclopedic knowledge—could lead humans toward shared understanding and global peace. Comenius argued that teachers should put less emphasis on rhetoric (memorization, words, and grammar) and more emphasis on arousing the student's interest by appealing to the senses.

In *The Great Didactic* (1632), he proposed an age-graded system of education: nursery school (0–6 years), elementary school (6–12), Latin school (13–18), and Academy (19–24). Comenius believed that elementary education should be made available to everyone regardless of gender, nationality, or economic status. The *Janua Linguarum Reserata* (1631) described Comenius's method for teaching Latin using the vernacular (the student's native language). The *Orbis Sensualium Pictus* (1658) was a smaller version of the *Janua* and included 150 woodcuts

depicting everyday objects and settings. Elements within each image were numbered and described in Latin and in the vernacular (Spanish, English, German). The *Orbis* was reprinted in many languages and was widely used for more than two centuries.

COMER, JAMES P. (1934–)

James P. Comer, MD, is the creator of the Comer School Development Program (SDP), a comprehensive school reform model used in more than 500 schools throughout the United States. Currently, Dr. Comer serves as the Maurice Falk Professor of Child Psychiatry at the Yale University School of Medicine's Child Study Center.

Comer was born in 1934 in the town of East Chicago, Indiana. Although his parents had limited education, they pushed him and his siblings to achieve in school and to pursue college educations. Comer went on to complete his undergraduate education at Indiana University and his medical training at Howard University in Washington, D.C. Following this, he received a master's degree in public health from the University of Michigan and pursued residency training in psychiatry at the Yale University School of Medicine and its Child Development Center.

In 1968, Comer received an invitation from Dr. Albert Solnit of the Yale Child Development Center to direct a school intervention project funded

by a grant from the Ford Foundation. That school intervention project yielded a model of reform known as the Comer School Development Program (SDP) or simply "the Comer Process." This process is based on principles of child, adolescent, and adult development, and it encourages parents, teachers, administrators, and students to work in a collaborative and cooperative atmosphere based on students' needs. The SDP has taken root all over the United States and has become one of the most important reform models in the history of American education.

Comer's primary work with the SDP has been a reflection of his research on the social conditions facing the poor and minority communities and the link that these conditions have with public policies and institutions. In doing so, Comer has recognized the critical influence of education on adult life and the role that family and community context has on children's future success in school.

COOPER, ANNA JULIA HAYWOOD (1858–1964)

Educator and pioneer of civil and women's rights, Anna Julia Haywood Cooper was the fourth Black woman in U.S. history to earn a Ph.D. Her life exemplified commitment to education, women's rights, racial uplift, and social transformation.

Born into slavery, Cooper was educated and later served as an instructor at St. Augustine's Normal School and Collegiate Institute. After receiving her MA from Oberlin College, Cooper was hired in 1891 to teach at M Street High School in Washington, D.C.; she was named principal in 1902.

While at M Street, Cooper wrote her book *A Voice From the South: By a Woman From the South* (1892),

considered to be a pioneering Black feminist text. In this work, Cooper explored Black women's racial and gender oppression, education, self-determination, literary representations of Blackness, and voting rights for all women.

Although M Street graduates were successful in obtaining admission to prestigious colleges and universities, the D.C. board of education denied Cooper's principal reappointment when she refused to lower academic standards for her students. She remained at M Street as an instructor, however.

COUNTS, GEORGE SYLVESTER (1889–1974)

For a period of more than fifty years, George Sylvester Counts was a major figure in American education. He was, for much of his life, on the left side among educational progressives during the twentieth century. He is most closely identified with the education movement described as social reconstructionism and is considered by many to have been its leading voice throughout his long and distinguished career. He was also the preeminent American scholar on Soviet education and culture.

Counts's activism was uncommon for an academic. The ideas he encountered while studying at the University of Chicago lured him in this direction, at least on the intellectual plane. Although his doctoral dissertation was a study of arithmetic tests and the psychology of arithmetic, he was influenced by the writings of Thorsten Veblen. Upon graduation, he quickly turned to educational and social

criticism, abandoning his early interest in standard deviations, regression equations, and coefficients of correlation.

Counts's career in higher education spanned more than a half-century. During that time, he authored twenty-nine books on American society and education as well as Soviet life and education. In 1957, his book *The Challenge of Soviet Education* was granted the American Library Association's Liberty and Justice Award. It represented an example of Counts's foresight because shortly after its publication *Sputnik* was launched, an event that dramatically altered the face of American education in response to the Soviet challenge.

His writings reflect several seminal works in American education, and his earliest books represented some of the first attempts at analyzing the effects of social class on the nation's schools. Among these were *The Selective Character of American Secondary Education* (1922), *The Senior High School Curriculum* (1926), *The Social Composition of Boards of Education: A Study in the Social Control of Public Education* (1927), and *Secondary Education and Industrialism* (1929). *School and Society in Chicago* (1928) became very popular as one of the earliest examinations of the inner workings of a large city school system. His coauthored book *Principles of Education* (1924) was widely used as a text in American schools of education.

The book that most defines his legacy and for which he is best remembered is *Dare the School Build a New Social Order?* (1932). A small book of only fifty-two pages, it was the compilation of three addresses given to educators in the midst of the Great Depression. It was a call to action to teachers across the land, boldly seeking to enlist them in the cause of social justice. It envisioned a teaching profession elevated in its own social status and importance resulting from the leadership it would provide to communities and their schools. The power and impact of his ideas, married to the heft of his delivery, left the convention delegates of the Progressive Education Association in a silence that, for Counts, was more meaningful than applause. In fact, members suspended the remainder of the convention's business to ponder and react to Counts's ideas.

Moreover, his words reflect a perspective that applies no less to our own contemporary circumstance. For example, he wrote the following:

We can view a world order rushing toward collapse with no more concern than the outcome of a horse race; we can see injustice, crime and misery in their most terrible forms all about us and, if we are not directly affected, register the emotions of a scientist studying white rats in a laboratory. . . . In my opinion, this is a confession of complete moral and spiritual bankruptcy. (Counts, 1932, p. 20)

Counts began his career in higher education at Delaware College (now the University of Delaware) as department head before moving to Harris Teachers College in St. Louis for a year. He was then lured to the University of Washington, followed by Yale, the University of Chicago, and finally Teachers College, Columbia University, in 1927, where he stayed until retirement in 1955. After that, he continued teaching for many years—at the University of Pittsburgh, University of Colorado, Michigan State University, Northwestern University, and Southern Illinois University from 1962 until 1971—when he permanently retired at the age of eighty-two.

When he was recruited to Teachers College, Columbia University, it was to serve as the assistant director of the International Institute, which led him to become interested in the Soviet Union. It remained a lifelong project that he pursued alongside his research and teaching about U.S. education. A memorable journey in 1929 was when he drove a Model A Ford more than 6,000 miles across most of the Soviet Union, much of it alone and many miles on unpaved roads. This feat culminated in the book, *A Ford Crosses Soviet Russia* (1930).

Counts's activist posture brought about his recruitment as candidate for president of the American Federation of Teachers, a post he won in 1939. Counts led the effort to purge the AFT of communist influence, particularly among some of its largest and most influential locals. He can be credited in part with saving the AFT because its parent union, the AFL, was poised to expel AFT locals under communist control.

COVELLO, LEONARD (1887–1983)

Leonard Covello was the twentieth-century's leading theorist and practitioner of community-centered schooling. He dedicated much of his career to the development of Benjamin Franklin High School for Boys in East Harlem and promoted that school's role in the educational improvement of the entire community.

The son of a southern-Italian family that immigrated to East Harlem in the mid-1890s, Covello attended New York City schools in an era of Anglo-conformity. His personal experience of the anti-immigrant bias of these institutions shaped his lifelong commitment to intercultural education and cultural democracy. Following his graduation from Columbia University in 1911, Covello embarked on a teaching career in Romance languages in the city high schools. From 1914 to 1934, with the exception of a two-year hiatus for military service in World War I, he taught at DeWitt Clinton High School, where he chaired the Department of Italian and led a successful citywide campaign to give Italian parity with other modern foreign languages.

Covello played an instrumental role in establishing Benjamin Franklin High School, a high school for boys in East Harlem, where he served as principal from 1934 to 1956. Dedicated to the local democratic

development of East Harlem's constituent ethnic groups and the revitalization of this stressed immigrant district, Covello organized a pioneering community school infrastructure at BFHS that included a community advisory council with multiple subcommittees, adult education and recreational services, a school-based community newspaper, and a set of street units for social clubs and community research bureaus.

Every facet of the community program was education centered, explicitly designed to reinforce the high school's instructional program. Community advisory committees and social clubs, for instance, educated East Harlem parents about interethnic tolerance at the same time their sons were learning these lessons in the high school's intercultural program. School-community partnerships with East Harlem social agencies and large-scale community organizing efforts, such as housing, health, and citizenship campaigns, mobilized local educational resources in the service of the high school.

Although community-centered schooling did not last beyond Covello's retirement, his project, viewed in hindsight, offers an inspiring vision of "active" citizenship as a public purpose of the U.S. schooling system. The major repository for the Covello-era BFHS is the Leonard Covello Papers, MSS 40, housed in the Balch Institute Collections of the Historical Society of Pennsylvania, Philadelphia. Covello articulated his philosophy of community-centered schooling in numerous publications, including his autobiography, *The Heart Is the Teacher* (1958), and his 1944 Ph.D. dissertation, "The Social Background of the Italo-American School Child" (1967).

CREMIN, LAWRENCE ARTHUR (1925–1990)

Lawrence A. Cremin, one of the most important historians of U.S. education, served as a faculty member and administrator at Teachers College, Columbia University, for more than four decades. His three-volume history of education in the United States, titled *American Education*, examined the development of education from the colonial period to the late twentieth century. The second volume, examining the period from 1783 to 1876, received the Pulitzer Prize for History in 1981.

Cremin's other books included *The Transformation of the School: Progressivism in American Education, 1876–1957*, which received the 1962 Bancroft Prize in American history and is recognized as the definitive history of American progressive education. His final book, *Popular Education and Its Discontents*, examined the expansion of American education and its resultant successes and problems.

A graduate of the City College of New York, Cremin received his Ph.D. in history from Columbia in 1949. He began his career at Teachers College, Columbia University, and in 1961 became the Frederick A. P. Barnard Professor of Education. He also held a joint appointment in Columbia's history department. After a number of administrative positions, he became the college's seventh president in 1974, during a period of declining enrollments and fiscal problems. A strong supporter of disciplinary approaches to the study of education, Cremin shifted Teachers College's historical commitment from an interdisciplinary foundation of education approach to a more discipline-centered approach in philosophy, history, and the social sciences. By the end of his presidency in 1984, he had developed significant new programs, restored financial health, and reestablished the college's distinctive position. He returned to teaching and research in 1985, while also becoming president of the Spencer Foundation.

Cremin's approach to educational history expanded the historical study of American education through a more multidimensional analysis than previous school-centered approaches. Through an

examination of other institutions and agencies that educate and international educational trends, he provided in-depth analyses of the evolution of education in the larger context of society. Unlike earlier histories of American education, which uncritically celebrated its successes, Cremin provided a more comprehensive, balanced, and critical view. Nonetheless, his work is associated with the democratic-liberal school of U.S. educational history, which views the development of U.S. education as an extension of democratic and meritocratic processes.

CUBBERLEY, ELLWOOD P. (1868–1941)

Ellwood Cubberley was instrumental in founding both school administration and the history of education as professional fields of study. He joined the faculty of Stanford University in 1898 and subsequently served as dean of its School of Education from 1917 to 1933. As editor of the Riverside Textbooks in Education series for Houghton Mifflin, Cubberley edited more than 100 monographs and general textbooks in a wide range of educational fields. He wrote textbooks in the fields of school administration (for both the principal's and superintendent's positions), history of European and American education, and introduction to teaching and education as well as school survey

reports. His classes and seminars attracted men who would go on to positions of leadership in education at the state, regional, and national levels.

Cubberley's particular gift was as a synthesizer of an emerging literature within a social efficiency movement in education that drew on the business model of organization and production characteristic of an emerging corporate economy, on scientific management theory, and on behavioral theories of learning and measurement of learning. Using this literature, he developed an influential rationale and design for a bureaucratic organization of schooling at the state and school district levels characterized by an emphasis on ideological and vocational preparation of students for entry into the various class strata in a corporate capitalist economy, on governing boards comprised of leading businessmen and professionals, on administration by professionally educated experts, and on decision making based on quantitative data. Cubberley advocated increases in public school funding as well as such organizational reforms as consolidation of rural school districts and the development of junior high schools. He stressed the need to develop curricular tracks that would prepare students efficiently for their markedly differing adult social and economic roles.

Ideologically, Cubberley argued for schools to develop in students a social consciousness characterized by a sense of interdependence among the various social classes and a belief that interests of social classes within a corporate capitalist society are compatible. Sharing ethnic and racial prejudices that infused the social efficiency literature, he was a vigorous proponent of school Americanization programs that would replace what he perceived to be the deficit values and beliefs of southern and eastern European immigrant families with what he defined to be Anglo-Teutonic political and cultural values, beliefs, and behaviors. Hence, schools were to serve as central institutions for maintaining social cohesion and suppressing class conflict as well as for vocational preparation.

In terms of shaping teachers' and administrators' beliefs through strengthened professional education and development, Cubberley advocated a controlled professional freedom that combined acquisition and

use of a knowledge base commensurate with one's position in the school system hierarchy as teacher, building administrator, or central office administrator, on one hand, with a clear understanding of the limits on the decisions that one in that particular position is authorized to make, on the other. His extensive work as author and editor of textbooks in a range of developing fields of professional education suggests an understanding on his part that, within bureaucratic school systems, control of professional knowledge bases within schools of education and related professional development programs in schools could serve as a source of considerable power.

CURRY, JABEZ LAMAR MONROE (1825–1903)

Jabez Lamar Monroe Curry was an educator and politician who started his career as a passionate defender of slavery, arguing that it was good both for the South and for African Americans. After the Civil War, he became resigned to the liberation of African Americans and was among the White leaders of educational initiatives for Blacks focused on industrial training.

Curry was born to William Curry and Susan Winn on June 5, 1825, in Lincoln County, northeastern Georgia. By 1834, William owned 7,000 acres and forty-two slaves. Jabez was educated at both the

Willington Academy and the Double Branches School, with advanced tutoring by University of Dublin graduate Daniel W. Finn in Latin, Greek, algebra, and geometry. The family relocated to Alabama in 1837. He later attended Franklin College (now the University of Georgia), excelling in classical studies before entering Harvard Law School, class of 1845.

Boundless curiosity, superior training, and Harvard exposure helped sculpt a capable intellectual and fiery orator. His sociopolitical commitments were to slavery, states rights, and secession. Following a very brief military deployment, Curry was elected to the Alabama state legislature in 1847. From 1850–1853 he was absent from politics as he prospered in the family business. In 1853, he was reelected to the Alabama legislature as a states' rights advocate. In 1857, he was elected to the U.S. House of Representatives, where he developed a passionate defense of slavery. His recurring theme held that slavery brought civilization and great prosperity to the South. He further argued that slavery had a salutary effect on Blacks.

In January 1861, Curry was elected deputy from Alabama to the new Confederate States of America. He was later assigned to the Confederate Army as commissioner of habeas corpus investigating “disloyalty” among the civilian population.

Following the Civil War, Curry was jailed for inciting rebellion and exchanging illegal currency. Negotiating a \$250 payment, he was pardoned. His hardened political polemics now gave way to uttering the Holy Scriptures. He was soon selected president of Howard Baptist College in Marion, Alabama (1865–1868), and became ordained. Having revived Howard financially, Curry accepted a professorship in history and English literature at Richmond College, Virginia (1868–1881).

During the late 1860s and early 1870s, Curry spoke out passionately against the “horrors” of Reconstruction and the dangers of miscegenation. Additionally, he delivered regular sermons and emerged as a high-profile Southern intellectual.

During the 1880s, he moved between education and politics, serving as general agent for the Peabody Fund, which provided philanthropic support for Southern education, and ambassador to Spain

(1885–1888). The civic-minded and patriotic Curry was resigned to the new social order. In his mature years, Curry understood that the “Negro problem” had to be addressed for the country to prosper. He came to view accommodationist Negro education and education for poor Southern Whites as steps toward nation-building.

In 1891, Curry became general agent of the Slater Fund, dedicated to industrial training for Blacks. He supported and praised Hampton and Tuskegee and spent his last productive years as part of the interlocking directorate of White architects of Black education.

DAVIS, JACKSON (1882–1947)

Jackson Davis was a long-time official with the General Education Board (GEB), a Rockefeller-funded philanthropy mainly remembered for its work with Southern Black schooling. Over his more than thirty years with the GEB, Davis rose to the post of vice president and toiled as an advocate for improved schooling for African American children and youth.

After graduating from college in 1902, he spent the next eight years leading various school and youth organizations. During his Henrico County, Virginia, public schools superintendency (1905–1909), he came to the notice of the GEB and, as well, recruited the first Jeanes Teacher. In 1910, Davis became the initial GEB-funded Director of Negro Education, serving in the Virginia State Department of Education.

Davis's success with Virginia's schools for African Americans and his work in recruiting and training additional directors for other states led to his appointment in 1915 as the GEB's general field agent.

Assuming general guidance of the GEB's Southern Program, Davis began a refashioning of the organization's work with Black schools. Principally, under his leadership, GEB policies turned away from strict allegiance to industrial schooling. Among other efforts, Davis directed the establishment of a regularized system for the accreditation of Black high schools and reinvigorated the Southern state departments of education as official allies to Black schools. These efforts, mainly hidden from general public notice, garnered him much less notice than other contemporary progressive Whites such as Edwin Embree and Will Alexander. He died, still faithfully serving the GEB, in 1947.

DE HOSTOS, EUGENIO MARIA (1839–1903)

Eugenio Maria de Hostos, a lifelong Puerto Rican patriot and advocate for democracy throughout Latin America, put together and led the public school system in the Dominican Republic. He was also an advocate of equal education opportunity for women.

Born January 11, 1839, in Rio Canas, Puerto Rico, de Hostos attended the University of Bilbao and the Central University in Spain before studying law at the University of Madrid. He was disappointed that neither Puerto Rico nor Cuba were granted independence when the Spanish monarchy was overthrown in 1868. In 1869, he moved to New York City and became editor of *La Revolution*, the paper of the

Cuban independence movement. He also served as a writer for the newspaper *Puerto Rico*.

The following year, he began a four-year tour of Latin America to gain popular support for Cuban independence. At the same time, he engaged in a variety of educational, philosophical, and political activities. In 1873, while in Chile, de Hostos published *The Scientific Education of Women*, which called for women to receive education on the same level as men. At the same time, he authored a widely respected essay on Hamlet, which included an analysis of the need to fight for freedom. In 1875, he participated in a failed revolutionary attempt to sail to Cuba to fight for independence.

By 1877, de Hostos had moved to Venezuela, where he taught at a college in Caracas and worked as a school principal. The following year, he was asked to lead national education reform in the Dominican Republic. He established the first public elementary schools in that country, helped prepare teachers at the National University, and crafted the Dominican Republic's laws regarding public education. Such was his success that Chile invited him to redesign their national education system, and so he moved to Santiago, Chile, in 1888 to undertake this endeavor.

When the Cuban Revolution began in 1898, de Hostos went to New York and then to Puerto Rico to advocate for independence for that colony. In January 1899, he and other Puerto Rican patriots presented a proposal for independence to President McKinley.

When it became clear that Puerto Rico would become a U.S. territory, de Hostos returned to the Dominican Republic, where he became Inspector General of Education, a post he held until his death. He was a prolific author, writing at least fifty books in his lifetime, many of which were only published posthumously. He is often compared to John Dewey, and his writing is thought to have influenced Paulo Freire, Jean Piaget, and Lev Vygotsky.

DEWEY, JOHN (1859–1952)

John Dewey was a highly influential twentieth-century American philosopher and perhaps the nation's foremost educational theorist. Along with Charles S. Peirce (1839–1914) and William James (1842–1910), he forged an American philosophy known variously as pragmatism, experimentalism, or, as he preferred, instrumentalism. He also helped create an educational theory known as progressivism. In addition to being a prolific author and a philosophy professor, he was socially and politically active in seeking to improve children's schooling, secure professors' academic freedom, outlaw international war, protect workers' rights, extend women's civil liberties, and enact immigrant and minority political freedoms.

Dewey was born into a middle-class evangelical Congregational Church family in Burlington, Vermont, and pursued his undergraduate education in his hometown at the University of Vermont. After earning his bachelor's degree in philosophy and spending several years as a high school teacher in Pennsylvania and Vermont, he pursued his doctorate at Johns Hopkins University and later taught at the universities of Michigan, Minnesota, and Chicago, as well as Columbia.

During his lifetime, he wrote approximately one thousand articles, ninety poems, and forty books. With the exception of his poems, which were edited by Jo Ann Boydston in *The Poems of John Dewey* and his essay "What Psychology Can Do for the Teacher" in Reginald Archambault's *John Dewey on Education*, all of his published writings are in *The Collected Works of John Dewey*. The books for which he is best remembered are *The School and Society* (1899); *The Child and the Curriculum* (1902); *How We Think* (1910); *Democracy and Education* (1916); *Reconstruction in Philosophy* (1920); *Human Nature and Conduct* (1922); *Experience and Nature* (1925); *The Public and Its Problems* (1927); *The Quest for Certainty* (1929); *Individualism, Old and New* (1930); *Ethics* (1932); *Art as Experience* (1934); *Logic* (1938); *Experience and Education* (1938); and *Freedom and Culture* (1939).

Although his books have made a lasting impression on students of his philosophy, Dewey wrote many significant essays, too, such as “The Reflex Arc Concept in Psychology” (1896); “Professional Spirit Among Teachers” (1913); “Nationalizing Education” (1916); “The Prospects of the Liberal College” (1924); “Progressive Education and the Science of Education” (1928); “From Absolutism to Experimentalism” (1930); “Why I Am Not a Communist” (1934); “Democracy Is Radical” (1937); “Propositions, Warranted Assertibility, and Truth” (1941); and “Has Philosophy a Future?” (1948). Ironically, both his first major scholarly work—his doctoral dissertation—and his last virtually completed volume—a book-length manuscript that was tentatively titled *Naturalism*—have been lost.

From the titles mentioned, however, it is easy to see that the scope of his scholarly interests was extensive, including, but not limited to, education, psychology, aesthetics, ethics, epistemology, logic, religion, politics, and democracy. These diverse motifs were linked in his thought and may be approached through one of several entry points, such as his social, political, educational, ethical, or aesthetic theory. Conversely, his ideas may be entered via ideas that are associated with his philosophical assumptions and methodology, such as naturalism, pragmatism, experimentalism, or instrumentalism.

In this entry, Dewey’s ideas are woven or melded together to form a cohesive pattern of reflections. That is to say, the flow of his reflections and emphases are commingled in order to highlight his thinking during his post-Christian and postidealism philosophical stages. In particular, the entry examines his naturalistic philosophy rather than his early supernaturalistic philosophy. As a proponent of naturalism, Dewey rejected his earlier ideas of a personal God, a revealed religion, a predetermined self, and a transcendental meaning system. Instead, he argued that everything, including religion and ethics, is better understood from a Darwinian, naturalistic perspective.

The universe, humans, and society are best understood as naturally evolving dynamic entities that interact with and influence meaning making and purposive living. Natural development, however, provides opportunities for intelligent experimentation and

choices. Dewey’s experimentalism, rooted in his broad view of science, led him to stress the connection between thinking, learning, and teaching. His pragmatism influenced him to conclude that thinking, learning, and acting are merely different aspects of a single process or experience.

The nonlinear facets of scientific or reflective thinking that Dewey identified, if his ideas may be overly simplified, occur first as a person encounters a genuine problem or develops personal doubt or uncertainty. The person, in essence, is perturbed, disconcerted, or nonplussed because of some experience she or he has had. If the person is guided to escape this disequilibrium intelligently, she or he may, second, start finding facts, attempting to synthesize them, searching for ways of interpreting them, and identifying the basic problem that stimulated the initial confusion.

Next, the person continues to think, reflect, and learn as she or he seeks a solution to the problem and, perhaps unconsciously, to regain equilibrium. Deweyan thinking and learning, at this juncture, involves developing hypotheses and narrowing them down to one that will be tested. After this hypothesis is chosen, a fourth facet of thinking develops: the actual testing of the selected hypothesis. This need to test or experiment—and so, the term *experimentalism*—includes going through empirical data intellectually, looking for connections among the facts, considering the strengths and weaknesses of the hypothesis, and taking into account the potential or probable results or consequences when evaluating the hypothesis.

Finally, thinking and learning move to testing the hypothesis in a real experiment or situation. If the actual experiment results in the predicted outcomes, then the person solves the problem and has her or his equilibrium restored. If not, the person begins to review his or her prior thinking to search for additional data, other explanations for them, and alternative hypotheses. This approach to thinking and experimenting is, on one level and to varying degrees, a normal part of living and professional life.

When Dewey added his teaching theory to his thinking and learning theories, the responsibilities of the school and teacher emerge; school staff and

individual teachers are responsible for fostering the thinking and learning of students. From his viewpoint, their responsibilities are best accomplished by designing, creating, renewing, and reconstructing school and classroom environments so that they continue to cultivate each child's thinking and learning in ways that eventually lead to adult ways of understanding the multiple forms of inquiry and creativity.

As children enter school, however, the teacher does not begin with the teaching of adult forms of understanding of chemistry, history, mathematics, language, and so forth. Instead, the teacher begins with the learning that students bring with them to school and extends this understanding wider and deeper into the various subjects studied, enabling students to better see the connections and usefulness of what is learned.

In addition, Dewey argued that students are born learners with natural and cultivated impulses that need to be directed and transformed into reflectively developed desires and purposes. Thus, he was very interested in a progressive rather than a traditional approach to education and curriculum. Hence, his views—although frequently distorted by his admirers and detractors—became associated with educational progressivism. For him, progressivism involved focusing on understanding students' interests and impulses; engaging them in well-planned and stimulating learning activities; developing their understanding into adult forms of inquiry and creativity; cultivating their abilities to think and to solve problems for themselves; and nurturing their dispositions to work together democratically toward personal, professional, and social goals.

He was highly critical of progressive educators who allowed students to be directed only or largely by their unreflective impulses and developed individualistic students who had little understanding of their democratic social relationships and responsibilities in schools and society. Thus, he objected to their idea of an individualistically oriented and child-centered school in preference for a democratically oriented and socially centered one that meets the needs of each student.

In the process of learning, Dewey thought that students should come to understand that knowledge claims are, at their best, warranted assertions, conclusions that are the most reliable that can be reached with the available theory and data. Some opinions are

without any support but harmless and, on occasion, even meaningful. Others may be unwarranted and harmful, or at least counterproductive. Still others may have no more warrant than dozens of other opinions or interpretations because the evidence and arguments that support them are inadequate, insufficient, or partial.

A study of history reveals that some opinions are increasingly discredited and others are progressively corroborated by scholars, researchers, and experts. Some opinions are so well supported that they may be acted upon with a very high degree of confidence. As he noted in *The Quest for Certainty*, Dewey believed that a high level of confidence or warrant meant that people can be secure but not certain about many claims that are made in a variety of realms of inquiry, such as chemistry, mathematics, history, and even ethics. Certainty is unwarranted because the universe is a dynamic, changing entity, and personal knowledge of it is both partial and problematic.

In his instrumentalist view of knowing, it was important to note that determining the warrant of a claim is a public, social, and ongoing process, never an individual, private, and completed matter. Consequently, students need to learn that when they make choices and pursue related actions, their commitment to these selections and endeavors should be in proportion to the public warrant that exists. The most highly warranted beliefs ought to be understood as they are in scientific experimentation or as instruments for producing new ideas, theories, hypotheses, and, notably, findings.

Dewey's instrumentalism extends to all realms of understanding. Historical findings, religious experience, aesthetic criticism, chemical studies, moral judgments, and statistical analyses are increasingly warranted or secure when theories regarding them are powerful, data are substantial, and arguments are cogent. But more is involved in claims of knowing. The consequences or outcomes of inquiries are related to his democratic philosophy of valuation. Are the consequences of acting on the knowledge we have for the common good of society, both in the present and in the future?

In summary, then, his view of instrumentalism is not only a way of examining knowledge claims and determining warranted assertions but also a means of providing grounds for learning, thinking, choosing,

behaving, and living, both individually and collectively. So, his theories of learning, thinking, teaching, and knowing are connected for students and teachers in schools as well as for citizens and leaders in communities and societies. He believed that a democratic society should be increasingly a part of every facet of life, including families, schools, communities, social agencies, religious institutions, and private businesses. Democratic values and reflective thinking should permeate the thinking and actions of politicians, communities, businesses, schools, and individuals.

Dewey believed, too, that if schools, communities, and societies are to become educational and democratic entities, they must examine reflectively and shape democratically the experiences that children, youth, and adults have throughout school and life. In *Experience and Education* and other writings, there are probably two major ways of conceptualizing experiences—the paradigmatically different and the developmentally distinct. At least three paradigmatic kinds of experiences drew his attention. Among the various experiences that exist, Dewey argued that they fall into three categories: miseducative, noneducative, and educative. These three paradigms of experience vary from the least desirable (miseducative) to the most desirable (educative). In between these two categories falls a type of experience that may be neither harmful nor helpful, detrimental nor fruitful per se in the life of a person or society. Erasing boards, sharpening pencils, putting paper into a printer, surfing the Internet, changing television channels, answering the telephone, planting a flower, eating an orange, and so on may fall into this category much of the time. On the other hand, any one of these activities might be miseducative or educative when certain other criteria or conditions are in force or met. What are these distinguishing criteria or conditions? How did Dewey distinguish miseducative and educative experiences?

The concepts of personal and societal growth are the main criteria that distinguish miseducative and educative experiences for Dewey. Conspicuously, growth for him involves community, not just individual, development and is the never-ending goal of both formal and informal education. By growth, he suggested several subcriteria, such as an increasing awareness of facts and ideas; a connecting of new learning with prior learning; an understanding of more

sophisticated ideas and experiences; and a refining of the abilities to reflect, solve problems, and make intelligent choices. According to *Democracy and Education*, growth also has liberating qualities in that it enhances and expands a person's and society's understanding and choices. Thus, growth is intrinsically connected to values, particularly democratic and intellectual ones.

So, what does growth suggest for miseducative and educative experiences? Although some experiences may be either at times if circumstances are conducive, others are more likely and more consistently miseducative and others educative. For example, poorly conceived and executed teaching of writing or trigonometry may be quite miseducative. So, too, would be the learning of stereotypes and misinformation. On the other hand, learning about the issues, complexities, and beauties of art, astronomy, and Mexico would ordinarily be educative, expanding, and liberating. Schools—but also families, communities, and societies—are responsible for ensuring that learning is focused primarily on educative activities and experiences.

Designing, fostering, and delivering of relevant environments and experiences become the arts of teaching and living in a democratically oriented school and country. Of course, some room for noneducative activities is important if they do not undermine or overwhelm the importance of educative ones. Miseducative activities and experiences cannot always be avoided for numerous reasons, but they can be diminished, minimized, or neutralized to an extent in reflective schools and societies if Dewey is correct.

The second major way of conceptualizing Dewey's theory overlaps with the idea of educative experiences and entails looking at them as developmentally distinct matters. The development of experience coincides with and accompanies the development of students. From a developmental perspective, experiences fall along a continuum of authentically labeled experiences, extending to embrace his conceptions of (1) "experience," (2) "an experience," and (3) "aesthetic experience." Although not literally a part of this continuum because they are only honorifically described by the word *experience*, two other categories of thought illuminate Dewey's thinking on this broad topic, that is, what may be called the

courteously labeled experiences of (1) the anesthetic and (2) the nonaesthetic. When these five categories are combined, they range from deadening activities (anesthetic) to enlivening experiences (aesthetic).

The courteously labeled experiences are dulling and numbing (anesthetic) or, perhaps, disconnected and aimless (nonaesthetic). The authentically labeled experiences include those activities that involve interactive and connected learning and reflection (experience); enhance experience to make it memorable, fulfilling, and complete (an experience); and enrich an experience by stimulating the enjoyable processes and outcomes of making sense, perceiving holistically, and feeling consummated (aesthetic experience).

In summary, Dewey's ideas about learning, thinking, teaching, knowing, and acting form an intellectual gestalt that is founded on his naturalistic, pragmatic, experimental, or instrumentalist philosophy. To the extent that his ideas are warranted, they offer the educator important considerations for her or his theorizing and practice. To the degree that they are unwarranted, the educator is advised to search for different grounds and support.

DEWEY, MELVIL (1851–1931)

Melvil Dewey devised the Dewey Decimal System, as it came to be called, which is still the primary classification system at most school and public libraries. He also was among the early leaders of the

American Library Association and was the first editor of the *Library Journal*.

Dewey was born in Adams Center, New York. He earned his BA from Amherst College in 1874 and completed his MA there in 1877. During his time at Amherst, he worked in the college library and visited many other libraries to compare their organizational systems and procedures with those in place at Amherst. In 1876, he published a pamphlet titled "A Classification and Subject Index for Cataloguing and Arranging the Books and Pamphlets of a Library."

The system he described is made up of ten main categories that are divided into ten subcategories. Each subcategory then has ten subclasses of its own. This system was almost immediately popularized. Moving to Boston in 1876, Dewey arranged the librarians' conference in October of that year, which led to the formation of the American Library Association (ALA). Dewey became the new association's secretary, and later its president and treasurer. That same year, *Library Journal* began publication, with Dewey as its editor. In 1883, Dewey became the librarian at Columbia College, where he founded the Columbia School of Library Economy in 1887. This was the first library school in the United States. Dewey also advocated use of the metric system and English-language spelling reform.

Although he is credited with opening the library profession to women, his personal views on gender, ethnicity, and race led to professional difficulties in his own time and would be considered sexist and racist today.

DU BOIS, WILLIAM EDGAR BURGHARDT (1868–1963)

William Edward Burghardt Du Bois wrote extensively on the subject of education but has been recognized

only recently as a significant contributor to the field of educational thought. Well ahead of other figures in the fields of sociology and education, Du Bois understood that education was a two-edged sword that could be used to either liberate or subjugate specific social and cultural groups. For example, in his 1903 essay, “The Training of Negroes for Social Power,” Du Bois wrote that many of the people who were involved in educating Blacks were interested in making them a subject caste “to be led, but not to lead themselves.”

Du Bois was an elitist who believed that only a selected few, and “not the majority of men,” were capable of “higher training.” He felt this was true for both Blacks and Whites—an idea he outlined in detail for Blacks in Chapter Two (“The Talented Tenth”) of the 1903 book *The Negro Problem*. In this essay, republished the same year in his own book, *The Souls of Black Folks*, Du Bois called for the most talented tenth of the Black population to be educated to the largest degree possible so that they could assume leadership of their less-talented brothers and sisters. In doing so, Du Bois was echoing an idea put forward in antiquity by Plato and following the American Revolution by Thomas Jefferson.

For Du Bois, education was not simply limited to schooling. Instead, he felt it also included the training found in one’s home and daily life and in one’s social class. Education was essential to Du Bois because he believed it to be the principal means available for Black empowerment. Along with the ballot, he felt that education would defend the Negro from a “second slavery.”

Du Bois advocated the concept of a meritocracy. Although his views were clearly elitist, they were not undemocratic and provided an important counterpoint to the “Hampton model” of education advocated by Samuel Chapman Armstrong and his protégé, Booker T. Washington. Under the Hampton model, Blacks were taught trade-related skills, which would give them a place in the emerging industrial economy. They were not seen as being sufficiently developed as a people, however, to assume higher levels of education that would have directed them toward positions as lawyers, businessmen, doctors, university professors, and political leaders.

In fact, as pointed out by the historian James Anderson, during its first twenty years, approximately 84 percent of Hampton’s 723 graduates became teachers. Hampton did not offer a trade certificate until 1895. In 1900, only 45 of its 656 students were enrolled in the trade school program, and only 4 students were listed as majoring in agriculture. In reality, Hampton took students who had completed an elementary school program and gave them two years of coursework that provided them with the training to become elementary school teachers.

While training in manual and shop skills was provided to both male and female students at Hampton (initially under the leadership of Armstrong), and later at Tuskegee (founded by Washington), as part of its “industrial” model, its actual purpose was not, according to Anderson, to develop skilled workers in these areas, but instead to inculcate into these future teachers the importance of hard work and the “dignity of labor.” In his 1903 *The Souls of Black Folks*, Du Bois published his essay “Of Mr. Booker T. Washington and Others.” Specifically, Du Bois argued that as a result of the Hampton model, and its implementation by Washington, three things had occurred: the disfranchisement of the Negro, the legal creation of a distinct status of civil inferiority for the Negro, and the steady withdrawal of aid from institutions for the higher training of the Negro.

Du Bois felt that Washington’s actions were essentially contradictory. In the case of education, he argued that while Washington advocated common school and industrial training for Blacks, he discouraged the development of Black higher education. Those opposing Washington and his policies, according to Du Bois, asked for three things: the right to vote, civic equality, and the education of youth according to ability. Du Bois’s criticism of Washington in *The Souls of Black Folks* represented the greatest challenge the “Tuskegee Machine” had faced. By the beginning of World War I, as a result of Du Bois’s efforts and those of other Black leaders, Washington’s model had been overturned.

Du Bois, as a key member of the National Association for the Advancement of Colored People (NAACP) and, more specifically, in his editorship of

The Crisis magazine (1910–1934), wrote regularly about elementary and secondary education, as well as higher education. He argued, for example, that segregating Black and White children from one another in school was to virtually guarantee “their separation through life.” At the same time, Du Bois was enough of a pragmatist to realize that racial prejudice was so strong in many parts of the country that the integration of the schools from a practical point of view was impossible.

In his article “The Tragedy of Jim Crow,” which appeared in the July 1923 issue of *The Crisis*, Du Bois stated that segregation in the schools was “the greatest possible menace to democracy.” At the same time, he believed that even with their lack of resources, Black schools were an infinitely better place for Black children to be in than in White-dominated and -controlled institutions. In the end, although favoring the idea of desegregation in education, Du Bois supported such programs only if they were founded on the basis of true equality for the races.

Du Bois experimented with writing Black-oriented textbooks during the 1930s and continued to comment on educational ideas throughout his life. Although not specifically a philosopher of education, he developed a significant body of educational writings that is increasingly becoming appreciated and valued in the social and cultural foundations of education.

DURKHEIM, ÉMILE (1858–1917)

Émile Durkheim, a Frenchman, was the founder of modern sociology, emphasizing empirical studies of society to develop sociology as a rigorous, modern science. He founded France’s first social science research journal, the *Année Sociologique*, in 1898. Durkheim’s academic success led to his appointment as Professor of the Science of Education at the Sorbonne in 1906. Durkheim’s position at the Sorbonne was changed by the French Ministry of Education in 1913 to Professor of the Science of Education and Sociology, giving sociology a prestigious presence at the highest levels of the French university system.

Durkheim’s major sociological concern was how societies were held together, specifically how different kinds of social organizations and social relationships created what he called “social solidarity.” Durkheim was particularly concerned with the lack of social solidarity in modern society, which led to what Durkheim called *anomie*, or the absence of social norms that leaves individuals isolated from one another.

Durkheim’s efforts to analyze and solve this problem were reflected in his sociology and in his involvement in French educational reforms, which he hoped would create a secular, civic morality for the French republic. Shortly after losing his son André in World War I in 1916, Durkheim suffered a stroke while giving a speech opposing the war and died. His major works were *The Division of Labor in Society* (1893), *The Rules of Sociological Method* (1895), *Suicide: A Study in Sociology* (1897), and *The Elementary Forms of Religious Life* (1912).

EISNER, ELLIOT (1933–)

Elliot Eisner is Emeritus Professor of Art and Education at Stanford University. Trained as a painter, Eisner then earned a Ph.D. in education from the University of Chicago (1962). His scholarship has focused on arts education, curriculum studies, educational evaluation, and qualitative research.

Eisner has been an advocate throughout his career for the inclusion of artistic thinking in academic discourse. In “Ten Lessons the Arts Teach,” he argued that

1. The arts teach children to make good judgments about qualitative relationships.
2. The arts teach children that problems can have more than one solution.
3. The arts celebrate multiple perspectives.
4. The arts teach children that in complex forms of problem solving, purposes are seldom fixed, but change with circumstances.
5. The arts make vivid the fact that words do not exhaust what we can know.
6. The arts teach students that small differences can have large effects.
7. The arts teach students to think through and within a material.
8. The arts help children to say what cannot be said.
9. The arts enable us to have experience we can have from no other source and through such experience to discover the range and variety of what we are capable of feeling.
10. The arts’ important position in the school curriculum symbolizes to the young what adults believe is important.

Eisner believes that art education should be discipline-based and that the arts merely provide an emotional outlet for children. Art education has to be content-oriented if it is going to contribute to a child’s education. His influence can be seen in the fact that during the 1990s, discipline-based art education

became the norm in the United States, with almost every state in the United States using this model.

Eisner has published more than 300 articles and 16 books, including *The Educational Imagination* (1979), *Evaluation: A Personal View* (1985), *The Enlightened Eye: Qualitative Inquiry and the Enhancement of Educational Practice* (1990), and *The Kind of Schools We Need* (1998).

EMERSON, RALPH WALDO (1803–1882)

Ralph Waldo Emerson was a preacher, philosopher, poet, outspoken critic, sage, and the leading advocate of the American Transcendentalist movement, although reducing Emerson to “transcendentalist” would ultimately be a disservice to someone who vehemently opposed categorization, a process that he thought limited scope, influence, and potential. Even though Emerson criticized formal schooling, a tuition that ultimately impeded intuition, his work remains relevant to educators today.

Emerson assailed standardization and conformity, bemoaning a society wedded to the past, still dependent upon Europe for innovation and growth. For Emerson, life was change and required a departure from the comfortable past. “New arts destroy the old,” he wrote in “Circles.” Unlike today’s market-based reformers who rate schools by test scores, Emerson believed schools should be judged by examining society, refusing to see the distinction between the two. He once remarked that “a vicious society cannot have virtuous schools.”

Although Emerson is best known for his essays, collected and published several times during his life (1841, 1844, 1850, 1860), he also produced a number of poems (1847, 1867, 1876) and delivered hundreds of lectures.

FOUCAULT, MICHEL (1926–1984)

Michel Foucault, French philosopher and intellectual historian, emerged as one of the more controversial thinkers in the Western world during the twentieth century, shaping much of postmodern philosophical thought. Foucault demonstrated the socially constructed and historically contingent nature of both persons and disciplines, including his detailed account of the creation and sexualization of the modern subject. His impact has been palpable in the academy, where his writings are studied in disciplines as diverse as the social sciences, philosophy, psychology, and queer theory.

Foucault's early works focused on psychology and were influenced by Karl Marx, the existential philosophers, and Friedrich Nietzsche. He was most indebted, however, to Martin Heidegger's conceptualization that humans have no pre-given essence. Foucault particularly drew on Heidegger's notion that people self-interpret as they move through the concrete situations of their lives, becoming what they make of themselves.

The more or less standard divisions of Foucault's works follow from his chosen methodologies: *archaeology*, which characterizes his work from 1961–1969; *genealogy*, which forms the basis of his most widely read books and interviews published from 1971–1976; and *ethics*, which characterizes his last two books, both published in 1984, as well as his last interviews.

Foucault developed his archaeological methods from his studies in psychiatry (*History of Madness in the Classical Age*, 1961, his doctoral dissertation),

medicine (*The Birth of the Clinic*, 1963), and the social sciences (*The Order of Things*, 1966). *The Archaeology of Knowledge* (1969) was his reflection on the historical and philosophical importance of the archaeological method.

As developed by Foucault, the *archaeological method* is a critical inquiry directed at disciplines in the human sciences that seeks to elucidate the ways in which discourse and expert opinion come to constitute what is perceived as learned practice and how that practice, in turn, infiltrates and shapes human behavior. Thus, for Foucault, discourse is more than the singular channels of oral and written communication among experts in a particular discipline. He understood discourse as composed not only of words but also of the disciplinary boundaries that limit what is acceptable within that communication. In other words, discourse, as conceptualized by Foucault, is composed not only of what is said, but also of what is left unsaid—that which the accepted boundaries of the discipline prohibit, dismiss, or leave unquestioned.

The starting point for the archaeologist's research, then, is anything within the discipline that is considered natural, obvious, or incontrovertible. The goal is not to assess its "truth" or to offer an alternative theory, but to expose the circumstances within which this "truth" was manufactured through discourse. Attentive to confusion, accidents, aberrations, and insurrections, the archaeologist seeks out discourse that has been disqualified, labeled insufficient, or located low in the hierarchy of knowledge in order to include it in the discipline's history. The archaeological method shows that disciplines are far more randomly constructed and personality-dependent than their practitioners' scientific posturing suggests.

Foucault's genealogical method challenged traditional philosophical methods and assumptions by demonstrating how morals, ideals, and concepts that appear to be predetermined and inevitable are formed through conglomerations of blind forces: accidents, petty malice, suppressed deviations, complete reversals, errors, and false appraisals, all of which take place within relationships of power. His conceptions of truth, knowledge, power relations, and the construction of the subject, widely considered to be his greatest contributions to philosophical thought, are raised most

definitively in *Discipline and Punish* (1975) and *The History of Sexuality, Volume One* (1976).

Discipline and Punish details how lawful punishment has changed from violent, retributive justice to disciplinary techniques that operate through internalization of norms that operate within power relations. Foucault refused concepts of power that posited a binary structure of dominators and the dominated. Rather, he spoke of a web of relations composed of both power and resistance, a force field that is dispersed, heteromorphous, and multivocal. This web of power relations subjects individuals through normalizing power that “disciplines” individuals to become simultaneously more productive and more docile. Because disciplinary techniques work most effectively when the individual is complicit in the process, the individual must perceive the norms as integral to his or her self-image. The modern “soul” emerges: a creation of discourse, thoroughly imprinted by history, the “interiority” of a disciplined and docile body.

In *The History of Sexuality, Volume One*, Foucault examined the role played by norm-based sexuality, which came to be regarded as truth about “natural” sexual natures. Foucault’s premise is that power has operated primarily not by repressing sexuality but by creating a proliferation of expert discourse—religious, medical, psychiatric, and governmental—that determined the modern forms sexuality has taken. By creating the dualities of healthy/ill, normal/perverse, and legal/criminal, the terms themselves become an effective means of social control through marginalizing and medicalizing “deviancy.” Hence, individuals internalize the “truths” about sexuality that have been manufactured through the discourse of these various expert groups, understanding themselves in light of those internalized “truths” and despising in themselves anything that contravenes them. One of the most significant philosophical consequences of his genealogical work is this: If a subject cannot be prediscursive, then truth must be a product of history and the forces that have shaped the ideas that come to be known as truth.

In his last two volumes of *The History of Sexuality* (1984), Foucault shifted his attention from power/knowledge to *ethics*, which, for Foucault, meant how the individual constitutes himself or herself as a moral agent. He was particularly interested in creating one’s

self as a work of art, rather than conforming to moral codes. Exploring Greek and Roman sexuality and ethics suggested to Foucault that contemporary mechanisms that create and instill norms are culturally specific, creating a gap into which differing conceptions of self-constitution might enter in the future.

Foucault’s work has been difficult to appropriate for education, in part because he said little about it explicitly, except in *Discipline and Punish*, where he makes a scathing comparison between schools and penitentiaries. As a result, most of what can be said about Foucault and education must be constructed from related analyses of his work. Feminist theorists took the lead in these analyses by producing insightful critiques that not only furthered feminist thought, but served as exemplars for using Foucauldian critique in education.

Philosophers of education have engaged Foucauldian analytics to interrogate the complex power relations pervading educational institutions, professional discourse on educational reform, and the ways in which teachers and students alike are held in the sway of powerful forces like curriculum, evaluation, and assessment.

FREIRE, PAULO (1921–1997)

Paulo Freire was a Brazilian educator who is one of the twentieth century’s most important educational theorists. His ideas have been globally influential upon a wide variety of social and educational movements, and they have played a central role in founding the contemporary international movement in education known as critical pedagogy.

During his lifetime, he directed literacy programs aimed at empowering the poor and dispossessed, first in Brazil—for which he was jailed as a subversive in 1964 after a military coup took power—and then throughout the developing world during his period of exile from Brazil (lasting until 1980) when he worked for organizations such as UNESCO, the World Council of Churches, and the Institute for Cultural Action. From 1989 until 1991, he served as the city of São Paulo's Secretary of Education, an experience chronicled in his book *Pedagogy of the City* (1993).

Freire's pedagogical approach includes, but is not limited to, a highly innovative and successful adult literacy method, the "culture circle," which he helped develop in the 1950s and 1960s, as well as his critique of authoritarian "banking pedagogy" in conjunction with his demand for an emancipatory, radically dialogical, and problem-posing form of education as outlined in his most famous work, *Pedagogy of the Oppressed* (1972). Freire continually responded to critics and friends over the course of his lifetime, thereby developing a series of books that sought to update and resituate his pedagogical praxis in order to take account of changing political conditions and progressive advances in theories such as feminism, multiculturalism, and postmodernism.

Certain themes are common across the Freirean oeuvre, such as his critique that schools are never value-neutral or apolitical institutions; his belief that there is a dialectical relationship between practice and thought; his humanistic love and belief in people's creative freedom; his ethical demand that educators work to excoriate and transform the dehumanizing forces at work in the world; and his conclusion that the goal of true education should be critical consciousness as generated through the active, equal learning of teachers and students together as part of their attempt to realize the dream of a truly democratic community.

Many of Freire's books incorporate experiments with style in order to highlight the dialogical and personal nature of his texts. These include books of letters, such as *Pedagogy in Process* (1978), an account of his literacy campaign in service of Amílcar Cabral's independence movement in Guinea-Bissau, and *Letters to Christina* (1996), in which he reflects autobiographically on his career in pedagogy, politics,

and philosophy. He also published a number of conversational "talking books," including *A Pedagogy for Liberation* (1987) with Ira Shor, the first of Freire's books to examine at length the applicability of his ideas to schooling in the developed world; *Literacy: Reading the Word and the World* (1987) with Donaldo Macedo, which critiqued technocratic forms of reading and writing as ways in which dominant interests are always served and socially reproduced; and *We Make the Road by Walking* (1990) with Myles Horton, wherein Freire shares and contrasts his views about social justice education with the legendary cofounder of the Highlander Folk School in Tennessee.

Upon his death, he was at work on a book of eco-pedagogy, parts of which have since been released as *Pedagogy of Indignation* (2004); he hoped it would rearticulate his commitment to the need to educate for planetary sustainability and create societies that embodied a love and respect for all creatures and the experience of nature.

FROEBEL, FRIEDRICH (1782–1852)

Friedrich Froebel is best known for his book *The Education of Man* (1826) and for being the founder of the kindergarten movement. In the book, he described his educational philosophy in which all life was based on an eternal law of unity. Because Froebel believed that God was the "Divine Unity," everything was interconnected because the spirit of God infused all things. The purpose of education was to teach children how to observe and understand the world in which they lived. According to him, children should not have ideas forced on them but should be encouraged to realize their own natural potential.

Froebel opened his first kindergarten in Blankenberg, Germany, in 1837. His curriculum emphasized that children best learn through play. He developed a series of twenty toys and activities called “Gifts” and “Occupations” that were supposed to help the child gain an understanding of the world. The second Gift, in particular, demonstrated the philosophical nature of Froebel’s curriculum. It consisted of a wooden sphere, a cube, and a cylinder. The sphere was rounded on all sides. The cube, its opposite, had carefully defined edges. The roundness of the sphere and the flat edges of the cube were combined in the cylinder, demonstrating, in Hegelian terms, thesis and antithesis combined to result in a synthesis. The most popular of the Gifts, however, were the third through sixth, which were a series of building blocks. The interrelated blocks taught the child to “distinguish, name, and classify,” according to Froebel, as well as providing the child with tools to help him shape and master the world in which he lived.

Although the kindergarten movement died out in Germany because of political opposition, widespread interest in kindergarten education developed in the United States by the time of the Civil War. The first successful public kindergarten was begun by Susan Blow in 1873 at the Des Peres School in St. Louis, Missouri. As the kindergarten movement spread, Froebel’s “Gifts” and “Occupations,” and in particular, his building blocks, came to be considered important tools for children’s play and learning experiences.

GARDNER, HOWARD (1943–)

In his groundbreaking 1983 book, *Frames of Mind*, Gardner challenged educators to change how they define and value intelligence. His theory of multiple

intelligences continues to shape curriculum and instruction.

Gardner was born July 11, 1943, in Scranton, PA. He earned a bachelor’s degree at Harvard University, completed his Ph.D. in social psychology there in 1971, and continues to teach and conduct research at that institution.

Frames of Mind begins with Gardner’s discussion of the two intelligences that have classically been thought of as comprising all of intelligence: linguistic intelligence and logical/mathematical intelligence. These first two intelligences involve the ability to communicate through language and the ability to solve problems and understand and use mathematical functions. He goes on to argue for five additional intelligences.

Spatial intelligence, which involves understanding objects in relation to one another, might typically be associated with artistic ability. Bodily/kinesthetic intelligence can be understood as relating to athletic ability. Musical intelligence relates to the ability to understand, distinguish, and recall types of musical sound and notes. Interpersonal intelligence is concerned with knowledge of how others might feel, be motivated, or act. Intrapersonal intelligence is defined as the individual’s ability to understand his or her own thoughts and emotions. In the mid-1990s, Gardner posited an eighth intelligence, naturalistic intelligence. This intelligence is concerned with the ability to understand and distinguish between living things and objects in nature. Discussion of this intelligence appears in his 1999 book, *Intelligences Reframed: Multiple Intelligences for the 21st Century*.

In recent years, Gardner has responded to many criticisms of his theories. Additionally, he continues to try to clarify his theories, which some educators and laypeople alike either confound or misunderstand. Gardner has won numerous prestigious grants and honors and continues to be among the forefront of American educational theorists.

GOODMAN, PAUL (1911–1972)

Paul Goodman was a poet, novelist, psychoanalyst, social critic, and educational innovator whose critique of American schools, *Growing Up Absurd* (1960), was a bible for educational radicals during the 1960s. Goodman condemned American schools for repressing children's creative instincts while leaving them incompetent to do anything worthwhile as adults. Combining a countercultural lifestyle with New Left political ideals, Goodman became a guru to youthful 1960s rebels.

Goodman was a complex man who reconciled seeming contradictions in his personal life and his political ideas that often baffled both critics and followers. He was an anarchist who promoted large-scale government social programs, a socialist who called for market-oriented reforms, and a radical who looked to liberals as natural allies and called himself a "Neolithic conservative." He was an avant-garde artist devoted to the classics, a cultural pluralist who advocated a core cultural canon, and an openly gay man who confronted homophobia while counseling his followers to practice pragmatic politics. Goodman sought to combine utopian ideals with practical proposals, trying to resuscitate old ideas by applying them to new situations, building on the old to make something radically new. He sought ways of making revolutionary change within an evolutionary framework.

Goodman claimed that anarchism—which he described as a program of universal human rights implemented through locally controlled participatory democracies—represents the best ideals of humanity from the stone age to the present day. He portrayed history as the struggles of ordinary people trying to develop ever more sophisticated cultures while retaining the simple political virtues of small-scale, cooperative Neolithic communities. Goodman condemned the neurotic will-to-power of individuals and elites for deforming society and warping history. Citing colonial New England towns as an example of locally controlled, participatory democracy, he argued that anarchism was the underlying premise and promise of the American way of life.

Goodman's educational ideas followed from his political commitments. Citing John Dewey's progressivism as the best twentieth-century version of his ideals, Goodman promoted free expression through dedicated craftsmanship and individual liberation through social cooperation. Goodman was a devotee of the Great Books—he received a Ph.D. from the University of Chicago with a dissertation on Aristotle's *Poetics*—but advocated an inclusive, evolving cultural canon for a multicultural American society. He was a proponent of open classes and open, locally controlled schools, combining this view with an apprenticeship model of education based on medieval guilds that encouraged individual innovation within traditional standards of excellence.

Although his writings were well received, Goodman labored for most of his life in relative obscurity and poverty, often complaining that he was "the most widely unknown writer who is so highly esteemed by only a few." Then, from the mid-1960s until his untimely death in 1972, Goodman enjoyed a period of celebrity as the "Father of the New Left." When the New Left declined in the late 1960s, Goodman complained that New Leftists had focused too much on personal liberation and too little on social and intellectual competence—they did not understand that anarchism was not an excuse for selfish individualism but a vehicle for self-disciplined socialism. But he tempered his disappointment with an overriding belief that no democratic revolution is ever lost, only postponed.

Goodman's other best-known works include *Empire City* (1942, 1946, 1959), a five-volume novel satirizing social repression in America; *Communitas* (1947), a manual on decentralized city planning with his brother Percival; *Gestalt Psychology* (1951), a theoretical analysis and practical handbook on liberation psychotherapy with Frederick Perls and Ralph Hefferline; *People or Personnel* (1964), essays in social criticism and participatory democracy; and *The Open Look* (1969), a collection of poetry.

GRAMSCI, ANTONIO (1891–1937)

Antonio Gramsci, one of the most important Marxists, theorized on many aspects of Italian society and culture in the early part of the twentieth century. Among his key ideas were the notions that a system of political and cultural dominance, which he called hegemony, maintained an elite in power and that education was a tool of that elite to control the rest of society.

Gramsci was born into a society that was geographically divided between the rich industrial North and the poorer, rural South. Gramsci did well enough in school to earn himself a scholarship at the University of Turin. It was here, in prewar Italian society, that he developed his communist ideas. He became politically active and worked as a journalist and party member of the Italian Socialist Party. During this time, the Russian Revolution took place in 1917, with the proletariat overthrowing the bourgeoisie. His ideas were becoming more radical and vocal, so much so that Mussolini threw Gramsci into jail. Gramsci spent the last nine years of his life behind bars, ironically writing his most important work in the *Prison Notebooks*, the majority of which was smuggled out of jail and later published in Russia.

Gramsci's key idea was hegemony, a notion that underlined how a dominant system of political and cultural values, beliefs, and morality controlled society and helped maintain those in power. Education helped maintain the ideological hegemony. Gramsci highlighted how education systems were divided between classical and vocational methods of schooling. The classical schools were for the dominant classes and the intellectuals, and the vocational schools for the working classes.

Gramsci saw how schooling and the number of people being educated was growing. He suggested that vocational schools were becoming more specialized to deal with newer, modern methods of industrial activity. This created new forms of indoctrination and exploitation, both in the classroom and the workplace. Gramsci pondered on how this change in education would shape Italy's future. Would this be an opportunity for simple social reform or more radical revolution?

Gramsci was interested in the role and function of the intellectual. If revolution was to take place, then academic intellectuals would have to be won over with ideological arguments. The school and the teacher were agents in this process. Gramsci wrote about the moral development of pupils and the aims that the school set itself. Unfortunately for Gramsci, this was being hegemonically controlled during the 1920s and 1930s by the Italian fascist state.

Gramsci's solution to this education problem was for schools to be organized like a college, along progressive lines, free from state control and discipline. The common school would be built upon the comprehensive principle, reflected in aspects of culture and therefore in Gramsci's belief, ultimately changing society along socialist lines. Whether educational change could lead to revolution is, of course, debatable. One thing that Gramsci considered was why European working classes had failed to develop revolutionary consciousness post-1917. Hegemony controlled that impulse, and education was one means of preserving the powerful elites, he thought.

Gramsci's theories are still important today and can be applied to educational contexts. His theoretical framework offers an argument for how the powerful arrive and stay in power and provides a wider understanding about how the possibility of a hegemonic shift can theoretically change education systems, cultures, and societies.

GREENE, MAXINE (1917–)

Maxine Greene uses her skills as philosopher, imaginer, and inquirer to explore the meaning of

human existence and the means to engage in epistemology. Through her inquiries into sociology, history, and especially philosophy and literature, she explores living in awareness and “wide-awakeness” in order to advance social justice. To engage in such living, Greene argues, requires active attention to the beautiful spaces of souls and landscapes as well as shadows and darkness. Although it might be easier to withdraw from literal and metaphorical burned-out buildings, doing so disconnects oneself from a significant realm of human experience, she believes.

The full range of human experience is not available to most individuals, but it can be explored, according to Greene, through literature and the arts. The arts represent full expressions of experience and imagination, and fundamentally provide ideal vehicles to learn capacities for living. Her thinking about existence and the power of imagination have been brought to life through her study; her academic appointments, including at Teachers College; her essays and books; and her founding appointment as the philosopher-in-residence of the Lincoln Center Institute for the Arts in Education. This entry summarizes her accomplishments.

Greene received her doctorate in education from New York University in 1955. After teaching at New York University, Montclair State College, and Brooklyn College, she joined the faculty at Teachers College, Columbia University, where she is the William F. Russell Professor in the Foundations of Education (emerita). In 1976, Greene became philosopher-in-residence of the Lincoln Center Institute for the Arts in Education. In 2003, she founded the Maxine Greene Foundation for Social Imagination, the Arts, and Education, which supports the creation of and engagement with works of art with the goal of enabling people to actively envision and create humane communities. She is past president of the American Educational Research Association, the Philosophy of Education Society, and the American Educational Studies Association.

Greene found herself perpetually an outsider, as echoed in much of her life and an early book, *Teacher as Stranger: Educational Philosophy for the Modern Age* (1973). As a young woman growing up in New York City, she longed to be a writer rather than assume the traditionally feminine career of teaching;

writing was a foreign occupation to her family and friends. She traveled alone in 1963 to the civil rights march on Washington. Her full-time appointment in 1973 to the faculty of Teachers College established her as a lone female voice among her male philosophy of education colleagues, who found her “too literary.”

Throughout her prolific writing, her distinctive language continues to set her apart from her contemporaries. Her persistent references to art objects, particularly literature, reaffirm her conviction that, through art, the full imagination of the human spirit is manifest. In her teaching, Greene desires to educate rebels who speak, write, and resist in their own voices, rather than mimic her ideas and language.

Known for her lyrical and expansive style, Greene has influenced several generations of social and cultural foundations scholars with her writings and lectures. She views the social foundations of education as a network of social epistemology, spurring her readers and students to live by the social constructions of our world and to do so in full awareness and exploration of such constructions. By living in full awareness, the individual can choose which social constructs to refuse, accept, or disrupt.

Although Greene does not regard herself as a feminist, generations of feminist students and readers have regarded her work and her life as emblematic of pushing past boundaries imposed upon women. Freedom, Greene contends, is locating the limits of one’s existence and then breaking through such limits. It is an identification of the fabric of shared reality, and then actively deciding how one lives in that reality.

For several decades, Greene has conducted a series of salons in her home adjacent to Central Park. At each salon, a wide range of participants discuss a work of literature chosen by Greene. Some participants are former students, others are academic colleagues, and many are socially engaged intellectuals from a range of New York City and international institutions. Through literature, they consider the possibilities of imagination. These salons characterize her ambition to communally investigate the possibilities of social existence.

For Greene, a life of freedom involves identifying limits and then breaking through those limits; freedom without boundaries is incomprehensible. Through her

writing and teaching, she identifies arenas of social control and mechanisms for rebelling against such controls in the service of social justice. Rebellion for rebellion's sake is not the point—all must be done in the service of social justice. All of this from a woman who recognizes that her own position, particularly as an academic, is a comfortable one. By example and by her writing, she teaches people to push themselves into locations of discomfort from where they can stretch beyond their own limits and imaginations, as well as the limits of the world around them.

GRUMET, MADELEINE (1940–)

Madeleine Grumet, a curriculum theorist, professor, feminist, and former dean of education at the University of North Carolina, addresses how societal influences and norms influence schooling practices as well as the educational process. In her seminal work, *Bitter Milk: Women and Teaching*, she reveals that “knowledge evolves in human relationships.” In addition, she makes the influence of gender and sexism hypervisible within teaching and knowledge

construction itself. Building on Merleau-Ponty's phenomenological work as well as psychoanalytic and feminist theories, she argues that there is a “body knowledge,” which is developed in the intersubjective realm of the body and the body consciousness, social relations, and negotiations.

Grumet strives to bridge the divide between the public and private worlds as she drives educators and scholars to construct new ways of knowing and being. While focusing on gender in educational experiences, such as teaching and learning, Grumet explores and uses autobiographical narratives to depict the ways that schools (acting as external barriers and obstacles) diminish students and silence the body in the academic discourse.

HALEY, MARGARET (1861–1939)

Margaret Haley was an early-twentieth-century educator and union leader who was concerned about social reform, particularly with regard to the working conditions of teachers. For three decades, Haley led the Chicago Teachers' Federation, the first teachers' labor union in America. During her tenure, she campaigned for increases in teacher salaries, pensions, and tenure laws.

Haley's notable career in education was launched in a one-room schoolhouse in Illinois when she was sixteen. During the weekends and summers when Haley was not teaching, she attended a normal school in Morris, Illinois. In 1883, Haley and her Irish Catholic immigrant family relocated to Chicago, where she started teaching in the Hendricks School in a poverty-stricken area. She taught there for sixteen years and also studied briefly under the direction of Francis Wayland Parker, a leader in progressive educational practice.

When she was thirty-six, Haley joined the newly founded Chicago Teacher's Federation and became a representative of the organization. Her participation evolved and she became involved in a variety of legal cases, including one that focused on large corporations that escaped paying property taxes that Haley knew the Chicago Treasury could use the money to pay for increases in teacher salaries. Haley became a leader at the state and national levels in the education profession and advocated for a democratic voice of teachers in their professional careers.

HALL, G. STANLEY (1844–1924)

G. Stanley Hall founded the American child study movement, shifted the American school curriculum to the developing nature of the child as part of early progressive educational reforms, advanced psychology and human development as integral dimensions in the study of education and its professional practice, supported the beginnings of the educational testing movement, and furthered the study of education and higher education as academic multidisciplinary fields of study. During his lifetime, his theories and practices were known as Hallianism, as his biographer Dorothy Ross describes.

Born on February 1, 1844, Hall grew up in rural western Massachusetts. After preparatory studies, he completed his bachelor of arts at Williams College in 1867. Seeking to become a Congregational minister, his academic career led him to divinity studies at Union Theological Seminary. Yet Hall's growing

intellectual appetite pushed him toward more philosophical interests, especially positivism and evolution. Upon the advice of American theologian Henry Ward Beecher and others there, he went to study philosophy at the University of Berlin.

With the Franco-Prussian War, he returned to Union and finished his bachelor's in divinity in 1871. As pastoral duties did not suit him, he took a faculty position at Antioch College the next year until 1876. He further embraced there the philosophical ideas of Hegel, the evolutionism of Spencer, and the psychology of Wundt. This mix of academic "fads" of that day led him next to study psychology under William James at Harvard, where he earned the first American Ph.D. in the developing discipline in 1878.

Eventually, Hall gained lecturer positions in pedagogy at Harvard in 1881 and in psychology at Johns Hopkins University in 1882 through offering public lecture series on education to enthusiastic teachers in Boston and Baltimore. This emergent study of psychology, of which Hall became one of the first major proponents, thus was derived from philosophical, historical, scientific, and educational studies and literatures. His successes resulted in being appointed professor of psychology and pedagogics at Johns Hopkins in 1884.

As one of the first professors of education in the country, he launched the evolutionist branch of what became early educational progressivism, complementing Hegelianism and Herbartianism. In 1888, he became president of Clark University in Worcester, Massachusetts, and held its professorship of psychology and education. In these positions, his critiques of educational practice, critical studies of education, a major journal, degree programs in education and higher education, master's and doctoral graduates, and the central place of psychology in the early study of education secured his founding role in launching the multidisciplinary field of education as one of the modern social sciences.

Hall became the founder of the American child study movement at Johns Hopkins. His assessment of educational practices in a series of articles led him to proclaim a new "natural" method of education, following his idea of the child's evolutionary nature rather than the old cram method of content study in 1882. In bringing psychological development to education,

Hall championed the slogan “the child’s nature as it actually is” for the movement, which focused on the study of children’s behaviors in an article for the *North American Review* in 1883. His first empirical studies centered on children’s knowledge and their learning through an observation questionnaire method.

The force of his lectures and studies also played a major role in developing the study of education. His major book, *Bibliography of Education*, offered one of the first taxonomies of the field in 1886. At Clark University, he furthered child study through beginning the first modern educational research journal, *The Pedagogical Seminary: An International Record of Educational Literature, Institutions, and Progress* (currently *The Journal of Genetic Psychology*) in 1891. Two years later, he began an annual education summer school and then graduate degree programs in education and higher education.

His fundamental two-volume works on *Adolescence* in 1904 and *Educational Problems* in 1911, as well as three other books for teachers, shifted pedagogical focus to child development and learning in schools. Hall called his natural method “a slow Copernican revolution” in his 1923 autobiography, yet “its effects” were “legion” in creating the “*pedocentric* school,” according to educational historian Lawrence Cremin in his 1958 classic book, *The Transformation of the School*. Unfortunately, he argued against coeducation and women’s higher education generally, because of his pervasive “evolutionism” and fear of race suicide. Nonetheless, child study led to pedagogical reform and was one force along with the significant influence of his Johns Hopkins student, John Dewey, and others in the later social progressive changes to public schooling.

Not only did Hall influence schooling, he greatly furthered the academic study of education by beginning the first graduate program in education at Clark University, leading to it becoming a multidisciplinary field of study in the social sciences at other universities. In his courses and lectures, he argued for a more theoretical approach to education and teacher education, grounding it in psychology and human development. His doctoral graduates as faculty championed the role of psychology in teaching education at major research and state universities.

Hall’s study of children’s psychology also led his doctoral students, Henry Herbert Goddard and Lewis Terman, to develop American intelligence testing. Concerning the study of higher education, he launched the first program and spoke often of its condition and problems as president. Finally, Hall retired from the presidency in 1920, and died on April 24, 1924.

HARRIS, WILLIAM TORREY (1835–1909)

William Torrey Harris, educator, philosopher, and policy maker, influenced the foundation for the American public school system that exists today. As Commissioner of Education from 1889 to 1906, Harris advocated for equal education, the grade-school system, and free universities. He was also instrumental in establishing the first permanent kindergartens in the United States.

Under Harris, the curriculum was broadened to include the arts and modern history in addition to basic literature, science, and mathematics. Although

he believed that all children should be allowed to realize their full potential, his philosophy left no room for questioning. Students learned in an environment governed by rules of silence, punctuality, and rote learning. The teacher was the fundamental authority, and Harris set the stage for teacher credentialing.

Harris was an ardent follower of German philosopher George W. F. Hegel. Inherent in Hegelianism is an ideal, the idea that the perfect is knowable, if not attainable. The educational system fashioned by Harris is based in Hegelianism.

Additionally, Harris was president and life director of the National Educational Association from 1875 until his death; a member of its select Committee of Ten, then the Committee of Fifteen, which determined educational policy for the nation's schools; and president of the National Association of School Superintendents. Founder and editor of the *Journal of Speculative Philosophy*, Harris wrote *Logic: A Book on the Genesis of the Categories of the Mind* (1890), *Psychologic Foundations of Education* (1898), *Elementary Education* (1900 and 1904), and *The School City* (1906).

HERBART, JOHANN FRIEDRICH (1776–1841)

Johann Friedrich Herbart is best known for the educational movement known as Herbartianism that took hold after 1865 when Tuiskon Ziller, a professor at Leipzig, published *Grundlegung zur Lehre vom erziehenden Unterricht (Basics of the Doctrine of Instruction as a Moral Force)*, but he also wrote purely philosophical and psychological works, and he was an influence on Wilhelm Max Wundt, Fechner, and Helmhotz. He is of importance to the theoreticians of education because he was, as John Dewey noted in *Democracy and Education*, the first to observe that education was an activity that could be studied directly.

When he began his university studies at Jena, Herder, Goethe, Schiller, and Johann Gottlieb Fichte were there. His initial interest was jurisprudence, but he soon abandoned it in favor of philosophy. He did not become a disciple of Fichte. Rather, Herbart was a realist when the fashion was idealism, but, like Fichte, he was impressed by Pestalozzi's educational work. He left Jena in 1796 to serve as tutor to the three sons of Herr von Steiger, Interlaken's governor. He visited Pestalozzi at Burgdorf in 1799. The five letters he wrote to Herr von Steiger, the works he subsequently published on Pestalozzi, and his subsequent work demonstrate that his long-standing attention to education, including the school he established in Königsberg, was an integral part of his philosophical agenda.

He received his doctorate from Göttingen in 1802 and taught there until 1809, when he was called to Königsberg to succeed Immanuel Kant. After his unsuccessful application to succeed Georg Wilhelm Friedrich Hegel at Berlin, he returned to Göttingen in 1833, where he remained until his death.

Although he did receive some modest attention in William Torrey Harris's *Journal of Speculative Philosophy*, Herbart received considerable attention as a theoretician of education at the end of the nineteenth century when Americans, notably Charles DeGarmo and Charles and Frank McMurry, returned from their study in Germany where they were introduced to Herbartian teachings from Ziller, Wilhelm Rein, and Stoy. Subsequently, educators were applying the five formal steps of instruction and the culture epoch theory to the rapidly expanding public schools in the United States.

HILL, PATTY SMITH (1868–1946)

Patty Smith Hill was a leader in the kindergarten movement of the late nineteenth and early twentieth centuries. Hill was an outspoken advocate for progressive education within the International Kindergarten Union (IKU), was influential in professionalizing teacher training, and was the first woman to head a department at Teachers College Columbia (TCC). At TCC, she established laboratory classrooms, conducted research on children at play, and developed degree programs for early childhood educators. Hill published articles on instruction; composed stories and songs for children, including “Happy Birthday to You”; and designed developmentally appropriate classroom furniture and equipment. The “Patty Hill Blocks” were a fixture in many kindergarten classrooms throughout the twentieth century.

Patty Smith Hill was born in Anchorage, Kentucky, and completed her kindergarten training at the Louisville Collegiate Institute. She became head teacher of the Holcombe Mission Kindergarten in Louisville in 1888. Following summer institutes with Colonel Francis Parker and G. Stanley Hall, she began to depart from the Froebelian orthodoxy of the traditional kindergarten. In 1893, she demonstrated her teaching methods at the World Columbian Exposition and attended John Dewey’s classes at the University of Chicago.

By the end of the century, she had become a leading figure in debates within the kindergarten movement. In 1903, she and the Froebelian Susan Blow were invited to offer a joint series of lectures at TCC. The progressive views of Hill, “that young radical from the South,” prevailed. She was appointed to the TCC faculty in 1905, elected president of the IKU in 1908, and became head of TCC’s Department of Kindergarten Education in 1910. Her edited collections, *Experimental Studies in Kindergarten Education* and *A Conduct Curriculum for the Kindergarten and First Grade*, became foundational texts within the field of early childhood education.

HOOKS, BELL (1952–)

bell hooks is the pen name of Gloria Jean Watkins, who is recognized nationally and internationally as an African American intellectual, feminist, social activist, and educator. Her work focuses on how race, class, and gender play a role in social, economic, and political systems.

hooks was born in Hopkinsville, Kentucky. Prior to completing her doctorate at the University of California, Santa Cruz, in 1983, she worked as an English professor and senior lecturer in the Ethnic Studies Department at the University of Southern California. During her three years there, she released her first published work, a collection of poems titled *And There We Wept* (1978), written under her pen name, bell hooks.

In 1981, she published her first major work *Ain’t I a Woman? Black Women and Feminism*, which discusses how issues of racism and sexism affect Black women, the education system, and the media. More specifically, the work addresses how these systems among others marginalize Black women and disregard issues of class, race, and gender within feminism.

Since *Ain’t I a Woman*, she has published more than thirty books, written scholarly and mainstream articles, and appeared in several documentary films. Some of hooks’s other works include *Breaking Bread: Insurgent Black Intellectual Life* (1991) (with Cornel West), *Teaching to Transgress: Education as the Practice of Freedom* (1994), and *Witness* (2006). In addition to her scholarly publications, hooks has written four children’s books. In 2004, she joined

the faculty of Berea College in Berea, Kentucky, as a Distinguished Professor in Residence.

HU SHIH (1891–1962)

Hu Shih (known in Mandarin Chinese as Hu Shi) was among the main liberal thinkers in the Chinese Revolution in the decades of the 1920s and 1930s. A philosopher and educator, Hu Shih played a critical role in introducing Western philosophical ideas into Chinese culture, in particular the pragmatist theories of the American philosopher John Dewey.

In July 1910, Hu Shih passed the American-sponsored Boxer Indemnity scholarship examinations. Late in 1910, he sailed to the United States, where he remained to study until 1917. In September 1910, he enrolled in the College of Agriculture at Cornell University following the then-prevalent Chinese belief that literature and philosophy were not of any practical use. Abandoning his work in the sciences, he transferred in 1912 to the College of Arts and Sciences, where he majored in philosophy. Completing his bachelor's degree in early 1914, he moved on the following fall to the Sage School at Cornell to graduate studies in philosophy.

Discovering John Dewey's work in 1915, Hu Shih decided to move to Columbia University to continue his studies under Dewey's guidance, thus beginning his lifelong interest in pragmatic evolutionary change. His dissertation, titled "The Development of the Logical Method in Ancient China," was clearly influenced by Dewey.

In June 1917, Hu Shih returned to China. There he accepted a professorship in philosophy at the prestigious Peking National University (now known as

Beijing University)—the leading center for China's intellectual revolutionaries. Hu Shih was interested in the search for a "practical philosophy." Beginning in 1917, he wrote for *New Youth*, the most influential, avant-garde review of the period. He campaigned for a "literary revolution," calling public attention to supplementing the obscurely styled classical literature with spoken language.

Hu Shih's work contributed significantly to the New Culture Movement, which started in the early republican period (1911). The movement had as its purpose introducing to China Western concepts such as democracy, equality, and liberty. In addition, it also introduced a modern system of writing and the latest scientific and technological discoveries of the period. The period from 1917 to 1923, which saw the New Culture Movement at its height, has been called by some "The Chinese Renaissance." For many, it represents one of the most intellectually revolutionary periods in Chinese history since the time of Confucius.

The New Culture thinkers like Hu Shih were prolific, publishing their theories of government, education, culture, economics, and Western science in books and journals. Never before in Chinese history had political and social issues been discussed so openly and so publicly. Soon, Chinese students were publishing their own journals and attacking all the traditions of China: Confucianism, *hsiao* (filial piety), the Chinese classics, and Neo-Confucian science. In the journals of the New Culture Movement and their student followers, few sectors of Chinese culture were free from ridicule or criticism.

Although Hu Shih continued throughout the 1920s and 1930s to participate actively in culture and politics, his influence went into gradual decline as his ideas lost relevance in the escalating fever of revolution. However, his contribution to scholarship regarding China's literature and history continued to play an important role, particularly in the inspiration of other writers.

Dewey thought highly of the literary reforms initiated by Hu Shih and others, praising the resolution by the Federation of Educational Associations in 1919 to use spoken language for textbooks in elementary schools. He and his followers in China felt that the school should be the basic unit in the reconstruction of China. Modern education in China needed to begin

from the child's interests and emphasize individual development through the child-centered curriculum. Socialization in the school would select appropriate elements of the present society for incorporation into school life to promote social progress. These characteristics of progressive education were aimed at preparing the child for participation in and helping to build a democratic society.

The educational ideas of Dewey and Hu Shih had a lasting influence on Chinese education for thirty years, and their social philosophy and general philosophy also influenced part of the Chinese people. However, in 1951, the People's Education Press in Shanghai published "The Introduction to the Criticism of Dewey," which not only deplored Dewey's influence but also attacked Hu Shih as Dewey's spokesman. In 1954 and 1955, more than 3 million words were published by the Communists for purging both Hu Shih's and Dewey's ideas.

HUEBNER, DWAYNE (1923–)

Dwayne Huebner is a philosopher and curriculum theorist who helped shepherd the reconceptualist movement of the late 1960s and 1970s. Through Huebner's work, curriculum scholars began to consider language, environment, politics, and history as critical elements within their theorizing.

Language was a significant element within Huebner's curriculum theorizing. He rejected the scientific and empirical basis of curriculum theorizing, including such basic traditional curriculum concepts as learning and purpose. He argued that such technical terms limited the curriculum process to things that

were finite and measurable. Instead, Huebner argued for a new language that was influenced by phenomenology and existential philosophy.

Huebner also argued that although the language of politics could provide educators a means through which they could address problems of power, educators have no strong ideology through which to use a political language to make a difference in education. Instead, educators typically search for empirical truths and scientific generalizations, and this pursuit prevents them from using their collective power for good.

Huebner's work, in many ways, focused on the complex and moral nature of the environment. He posited that curriculum workers create environments, and these spaces should be designed so that students and teachers can engage in mutual and loving relationships.

Huebner left curriculum studies in 1982 to pursue Christian education at Yale Divinity School. Nevertheless, his influence continued to be felt through the work of his immediate students such as William Pinar and Michael Apple and through the ideas he introduced regarding the reconceptualization of curriculum.

ILICH, IVAN (1926–2002)

Ivan Illich was a historian, theologian, and social critic who dedicated his life to understanding people and the joys and hardships that all humans share. He called for the disestablishment of compulsory

education, arguing that it should be replaced with student-driven learning webs. This entry summarizes his life and contributions.

Born in Vienna, Austria, in 1926, Illich moved frequently in his youth. His mother was Jewish, so in order to avoid the increasing Nazi persecution in the late 1930s, he and his younger brothers sought refuge in Italy. It was at this time that Illich became a priest, choosing to devote himself to Christ and the Catholic Church. He studied theology and philosophy at Rome's Gregorian University and later earned his doctorate in the philosophy of history at the University of Salzburg.

In 1951, Illich left Europe and came to the United States to serve as assistant pastor at Incarnation Parish in Washington Heights and later at an Irish-Puerto Rican parish in New York City. There, working with the immigrant Puerto Rican community, he became acutely aware of social justice issues and honed his talents as an activist. Working his way up the hierarchy of the Catholic Church, he was appointed as the Vice-Rector of the Catholic University of Puerto Rico at Ponce in 1955. During his tenure at the Catholic University, Illich's primary responsibility was to introduce American priests to Latin American and Puerto Rican culture. This led to the creation of the Institute of Intercultural Communications. At this point in his career, Illich became increasingly critical of what he believed was cultural colonialism on the part of industrialized countries in North America and Western Europe.

After leaving Puerto Rico, Illich founded the Center of Intercultural Documentation in Cuernavaca, Mexico, in 1961. At the Center, Illich undertook his first systematic critiques of the export to Latin America of materialistic, consumer-oriented capitalism by industrialized countries such as the United States. Although Illich's faith never wavered, he became very critical of the Catholic Church as an institution. He saw the Church operating with very clear political, social, and economic agendas. He found this aspect of the institution to be contradictory to his vision of the true aim of the Church: to care for and love mankind. Because of his criticism of the Church, Illich was reprimanded by Catholic leaders. He was eventually granted a formal leave from the

Church. As a result of Illich's departure from the traditional priesthood, the Church ended its formal relationship with the Center as a place for training clergy.

However, the Center remained a force in the social justice movement and became an increasingly important center for community development and educational reform. Based upon seminars and workshops with Paul Goodman, Paulo Freire, Joel Spring, and others, Illich published his most influential work in the social foundations of education: *Deschooling Society*.

Illich's two most influential works with respect to the social foundations of education are *Deschooling Society* and *In the Vineyard of the Text: A Commentary to Hugh's Didascalicon*. In *Deschooling Society*, Illich argued for the disestablishment of compulsory schooling. Just as he felt that the Church as an institution was perverting grace and salvation, he felt that compulsory schooling was perverting learning and education. Illich was critical of what he believed were the hidden agendas associated with compulsory schooling, including social and economic stratification, intellectual dependence, and homogeneous modes of thinking.

According to Illich, school had replaced academic notions of lifelong learning with notions of control, accreditation, and uniformity. He believed in student-guided education. He thought that what he called *learning webs* should be the foundation of one's educational experience. Illich's ideas about webs of collective knowledge were particularly prescient because he was suggesting something like the Worldwide Web and similar types of networked information sources.

Illich's *In the Vineyard of the Text: A Commentary to Hugh's Didascalicon* contributes to the social foundations of education with its historical analysis of technology and how it has affected literacy. Illich discusses the revolution of typographic literacy in the fifteenth century and the evolution from typographic literacy to posttypographic literacy. Illich's talent for critical thought and analysis, coupled with his determination as an activist to make the world a better place, allowed him the means by which to deconstruct compulsory schooling and literacy. His impact as a theorist and activist continues to be felt.

ISAACS, SUSAN B.
(1885–1948)

An influential educational theorist, teacher, and psychologist, Susan B. Isaacs was born in Lancashire, England. She studied philosophy and psychology at Manchester University. She earned a first-class degree from Manchester University in 1912 and went on to a research position at the Psychology Laboratory at the University of Cambridge. From 1913–1914, she taught at Darlington Training College, a preparation program for early childhood educators. From 1914–1915, she returned to teach at Manchester University.

Influenced by Froebel, John Dewey, and Sigmund Freud, Isaacs believed that early childhood experiences were very important educational experiences. In 1921, Isaacs completed the first of many books, titled *An Introduction to Psychology*. In 1922, Isaacs completed the qualification process to see patients as a psychoanalyst and began her practice, which she would continue until her death. In 1924, she and her husband founded Malting House. A progressive school, the curriculum was centered on experience rather than instruction. In 1927, Isaacs left the school to focus on research, writing, and her patients in her psychoanalytic practice. In 1929, she began writing an advice column under the name Ursula Wise. She continued this column until 1940. In 1933, she was offered the chance to direct the Department of Child Development at the University of London, and she held this post until 1944. During the evacuation of London during World War II, Isaacs studied the psychological problems of children who were relocated as a result. Susan Isaacs died in 1948 after a long battle with cancer.

JACKSON, PHILIP W.
(1928–)

Philip W. Jackson is best known for instigating the study of the “hidden curriculum” in schools. His best known work is *Life in Classrooms*, although he has written and edited numerous books, essays, and articles throughout his career.

Jackson was born in Vineland, New Jersey. He studied at Glassboro State College and went on to earn his M.Ed. at Temple University. In 1954, he completed his Ph.D. at Teacher’s College, Columbia University. He went on to teach educational psychology at Wayne State University and the University of Chicago. At Chicago, he led the laboratory nursery school and became director of laboratory schools. He served as chair of the Department of Education and Human Development and Dean of the Graduate School of Education.

Since 1973, he has been the David Lee Shillinglaw Distinguished Service Professor in the Departments of Education and Psychology. Jackson has also taught as a visiting faculty member at Teachers College, Harvard University, Queens College, and New York University. His work continues to interest scholars and has served as the focus of books, articles, and dissertations.

JEFFERSON, THOMAS (1743–1826)

With historic accomplishments ranging from Founding Father and third president of the United States, author of the Declaration of Independence, architect of the Louisiana Purchase, and visionary of the Lewis and Clark expedition, Thomas Jefferson also made great contributions to education in America.

Jefferson was born in 1743 in Albemarle County, Virginia, to a wealthy and prominent family. He attended the College of William and Mary from 1760–1762, then studied law. He was admitted to practice law in Virginia in 1767 and the following year was elected to the Virginia House of Burgesses, which began his political career. He was propelled onto the national scene in 1774 with the publication of *A Summary View of the Rights of British America* and in 1775 was elected to the Continental Congress.

Jefferson believed that a stable democracy was possible only with an educated citizenry and was a lifetime advocate of free public education. He had a uniquely American conception of education as a tool for democracy, from the elementary schools through the university level. In 1778, as a member of the Virginia House of Delegates, he wrote *A Bill for the More General Diffusion of Knowledge*. Although his plan was not adopted, it provided for free basic universal education, free education at an advanced level for selected students, and free tuition to William and Mary College for a more limited number of students.

Jefferson's Enlightenment-era philosophy did not apply to everyone, however. Jefferson was a plantation owner and held slaves. He also did not include women in his proposals for universal education.

After his second term as president ended in 1809, Jefferson concentrated on a variety of other projects. An intellectual and scholar of history, philosophy, architecture, languages, and the natural sciences, Jefferson amassed the largest private library collection in the United States, totaling more than 6,400 volumes. In 1815, Jefferson sold his library to the United States in order to replace the books destroyed when the British burned the Library of Congress.

In 1816, construction on the University of Virginia began. Jefferson worked tirelessly, personally designing the original campus and working to raise funds. Jefferson saw this vision completed in 1825. He died on July 4, 1826. In creating his own epitaph, Jefferson closed with the line “Father of the University of Virginia.”

JOHNSON, MARIETTA PIERCE (1864–1938)

Founder of the School of Organic Education in Fairhope, Alabama, Marietta Johnson built an international reputation as a progressive educator. Johnson viewed the Organic School as an ongoing experiment, an original demonstration of her idea that students should be educated as complete organisms with balanced attention to body, mind, and spirit. As director of the most child-centered school in the United States, she spoke throughout the nation, lectured abroad, and took her place in the front ranks of founders of progressive schools.

Under Johnson's guidance, the Organic School opened in 1907 as an experimental school in an experimental community. The small town of Fairhope was a single-tax colony dedicated to the principles of collective land ownership advocated by Henry George in *Progress and Poverty* (1879). Johnson and her husband, who were socialists, moved to the Gulf Coast from Minnesota in 1902 and felt immediately at home in the utopian community of idealists, artists, and freethinkers.

Johnson arrived in her late thirties as a seasoned teacher and normal school instructor who was undergoing an educational conversion. She embarked on a

self-directed reading program that led her to the thought of Rousseau, Froebel, Dewey, and developmental psychologists. Soon, she rejected traditional teaching methods in favor of a new pedagogy, one keyed to the needs and interests of students. For the rest of her career, she would downplay external standards—along with grades, report cards, and other competitive measures—and emphasize instead the internal standard of doing one's best.

Directing the Organic School gave Johnson the chance to put her ideas into practice. Everyday, students at the school spent an hour folk dancing and another hour working in the shop. She postponed formal reading instruction until students reached age eight or nine. Much teaching and learning took place out of doors. This extremely child-centered pedagogy, infused with left-of-center politics, perfectly suited its community. Financial support from the single-tax colony and several philanthropists allowed local children to attend the Organic School tuition free, while well-to-do boarding students enrolled from throughout the country.

The success of the school during the 1910s and 1920s was so encouraging that Johnson set the goal of developing a model for reforming public education nationwide. A group of socially prominent women in the New York City area organized a foundation to sponsor her work, booking as many lectures and other engagements as she could handle. A full-page interview in the *New York Times* in 1913 brought her tremendous public exposure and set the stage for a visit by John Dewey, who gave Johnson and her school a rave review in *Schools of To-Morrow* (1915).

In 1919, she cofounded the Progressive Education Association, an organization of university teacher educators and leaders of progressive schools, hoping that it would become another avenue for promoting organic education. Her lectures and workshops for parents and teachers, which kept her on the road and numbered in the hundreds over the course of her career, stimulated the establishment of several other schools on the organic model.

The Great Depression of the 1930s, however, wreaked financial havoc on the Organic School, and Johnson lost status within the progressive education movement. Despite her long-standing commitment to

social reform, her version of child-centered education came across as out of touch with the times. In addition, Fairhope's commitment to experimentation and reform weakened as the town grew and the founding generation passed. In the years following Johnson's death in 1938, the Organic School lost the support of the community and drifted away from her genuinely radical pedagogy. Now a full century old, the school is struggling to reclaim its heritage.

JOHNSTON, FRANCES BENJAMIN (1864–1952)

Frances Benjamin Johnston, during the latter part of the nineteenth century, became one of the first and most prominent American female photographers in the United States. Her 1899 photographs of children and youth at work in the Washington, D.C., schools were her most significant work that related to American schooling and were honored at an international showing in Paris. They are probably the most extensive portrayals of turn-of-the-century American education that exist.

Initially interested in drawing and painting, she studied at the Academie Julien in Paris. Upon her

return to the United States, she settled in Washington, D.C., and transferred her artistic talents to photography. By 1895, she opened a studio in Washington, D.C., and quickly attracted clients from among the city's social and governmental elite on the basis of the quality of her portraiture. Indeed, she gained a reputation as the "photographer of the American court." She soon added to her status by becoming a documentary photographer and author of articles, illustrated with her photographs, in popular magazines of the day. During the latter part of her life, she focused her attention on architecture, particularly historic homes and gardens in the southern states.

Johnston's photographs of D.C. schooling were part of the U.S. exhibit of American education at the 1900 International Exhibition in Paris. They portrayed students and teachers at work in most curriculum areas, academic and vocational, at all school levels from kindergarten to normal school, and in schools in all parts of the city. Photographs showed children studying with ubiquitous schoolroom objects such as chalkboards, maps, and notebooks as well as class groups in ordinarily uncommon settings such as field trips to a creek, a nearby store, and federal buildings. Also, many of these photographs included details of school architecture. Inasmuch as D.C. was racially segregated with separate schools for Blacks and Whites, these photographs illuminate distinctions in the schooling provided for these two groups. For this collection of photographs, exhibition judges awarded Johnston a Gold Medal.

She also gained substantial notice for her photographs of students at Hampton Institute, Carlisle Indian School, and Tuskegee Institute. The Hampton photos were included in a separate and popular Paris Exposition display about American Negroes. Included in this collection were images of students engaged in several types of "industrial" activities (e.g., carpentry) as well as in academic courses. These exceptional photographs won Johnston a special Grand Prix.

Although Johnston's photographs of American education gained recognition in Europe, they were ignored for many years in the United States. After she donated her papers and extant negatives and photographs to the Library of Congress, her work was

discovered by historians of photography and of the history of American education.

KALLEN, HORACE MEYER (1882–1974)

Horace Meyer Kallen crafted a political vision in which valuing the culture of others could coexist with a commitment to democratic principles. Kallen's form of pluralism is the progenitor of the multicultural movements of the 1970s.

As an early- to mid-twentieth-century social and political philosopher, Kallen's scholarship was greatly informed by the American milieu of the time. Within the context of the turbulent social upheavals wrought by the massive influx of new immigrants at the turn of the nineteenth century, he defended the notion of equality among various kinds of cultural forms of life. Kallen's definition of cultural pluralism is the seminal account, rejecting the simplistic homogeneity implied by America as a melting pot.

The dilemma of cultural pluralism in a democracy is reconciling tolerance of cultural diversity with privileging liberty, freedom, and respect for others. Kallen saw no *prima facie* contradiction in wholeheartedly embracing both. In his conception of the American ideal, groups are self-contained, able to both fully realize their cultural uniqueness and happily coexist with other groups. Kallen argued that given the major significance that cultural identity holds for individual meaning, it is an implicit demand of democracy that cultural identity be allowed expression. Furthermore, the definition of an American is not based on a singular identity but rather on the amalgamation that a hyphenated nationality represents.

KILPATRICK, WILLIAM HEARD (1871–1965)

William Heard Kilpatrick was a progressive educator and influential interpreter of John Dewey's educational philosophy. A native of Georgia, Kilpatrick began his career teaching in the public schools and at Mercer University (GA). In 1908, he became a doctoral student at Teachers College, Columbia University. John Dewey, his major professor, said of him, "He was the best student I ever had." In 1911, Kilpatrick attained a full-time faculty appointment in philosophy of education at Teachers College.

Kilpatrick's rise in educational circles began with the 1918 publication of his article "The Project Method" in the *Teachers College Record*. Kilpatrick's progressive education message maintained that schools must be child-centered, democratic, and socially oriented. His popularity was such that the New York City press called him "Columbia's Million-Dollar Professor" because of the tuition his 35,000 students (1911–1937) generated for Columbia University. In his retirement, Kilpatrick was the first president of the John Dewey Society.

Kilpatrick's major works include *Foundations of Method* (1925), *Selfhood and Civilization: A Study of the Self-Other Process* (1941), and *Philosophy of Education* (1951). Lasting innovations derived from his work include classroom projects, activity-based learning, cooperative learning, and the experiential elements of the middle school movement. These student-centered practices, along with Kilpatrick's unswerving commitment to democratic principles in the schools, form the bedrock of his legacy.

KINCHELOE, JOE (1950–)

Joe Kincheloe is the Canada Research Chair in Critical Pedagogy at McGill University, where he has founded with his partner, Shirley Steinberg, the Paulo and Nita Freire International Project for Critical Pedagogy. Kincheloe is regarded as having been a formative influence upon the development of critical pedagogy over the past two decades, during which time he has used critical complexity theory to explore the manner in which pedagogical acts are constructed out of the social, cultural, political, economic, and cognitive dimensions of experience.

An eclectic scholar with a diverse array of interests and a prodigious outpouring of books and essays on a wide variety of topics broadly related to the generation of emancipatory educational research, Kincheloe is a leading expert who has helped to shape fields such as critical qualitative research methods and epistemology, critical multiculturalism, subjugated and indigenous knowledge studies, curriculum theory, media pedagogy, and cultural studies.

A major focus for Kincheloe has been the creation of what he terms "postformal" thinking and inquiry. Kincheloe's postformalism mounts a bricolage of multiple research methods and transformative critiques of the conditions that have given rise to a Newtonian/Cartesian paradigm of scientific objectivity and positivism, on one hand, while also politicizing naturalistic accounts of cognitive development that he feels create reductive and hegemonic psychological structures in education, on the other hand. Some of his recent book-length work includes *Critical Constructivism Primer* (2005), *Critical Pedagogy Primer* (2004), *Teachers as Researchers: Qualitative Inquiry as a Path to Empowerment* (2nd ed., 2002) and *The Post-Formal Reader* (with Steinberg and Hinchey, eds., 1999).

KOHLBERG, LAWRENCE (1927–1987)

Remembered by students of education for his theory which posits six stages of moral development, Lawrence Kohlberg was born October 25, 1927, in Bronxville, New York. He earned a BA at the University of Chicago and in 1958 completed his Ph.D. at that institution as well. After teaching at Yale and the University of Chicago, Kohlberg moved to Harvard in 1968 as professor of education and social psychology. The following year, he published an article titled “Stage and Sequence: The Cognitive-Developmental Approach to Socialization.” This article, which appeared in the *Handbook of Socialization Theory and Research*, is considered a seminal work in the field of developmental psychology.

Influenced by Jean Piaget, Kohlberg offers six stages of moral development to explain the evolution of the development of “principled conscience.” The first stage, when a child understands only punishment and reward, gives way to higher levels of moral development as the individual matures. The early stages of development are labeled “re-conventional” under this theory. The next grouping of stages are labeled “conventional,” and the highest levels of moral reasoning are labeled “postconventional” and include understanding of universal principles.

KOZOL, JONATHAN (1936–)

Jonathan Kozol's first book, *Death at an Early Age*, was published in 1967. It was a damning

indictment of American education and its treatment of minority children. In it, Kozol, a Harvard graduate, describes his experience teaching in, and being fired from, an economically poor and segregated Boston public school. Functioning largely outside of the academic establishment, Kozol has spent the forty years since the publication of *Death at an Early Age* as a critical observer of public education—primarily concerned with issues of racial and social inequality.

In works such as *Savage Inequalities: Children in America's Schools* (1991) and *The Shame of the Nation: The Restoration of Apartheid Schooling in America* (2005), Kozol addresses the consistently unequal funding provided to urban versus suburban schools. The research for his books has been based primarily on careful observation and interviews. Through the information he collects, he creates powerful narratives about the lives of the children and the conditions of the schools in which they learn.

Kozol has been criticized for a lack of objectivity in his research and for not having academic and research credentials. Although a polemical writer, he is, in fact, a powerful and thoughtful voice who has focused carefully and systematically on structural inequalities in American culture and its schools. He may be criticized for occasional inconsistencies in his arguments, but he has documented and examined throughout his work the unequal treatment of the poor in our schools, and has tried through reason and moral suasion to point out the need for the United States to develop a more just and equitable educational system.

LADSON-BILLINGS, GLORIA (1947–)

Gloria Ladson-Billings serves as the Kellner Family Chair in Urban Education and Professor of Curriculum and Instruction and Educational Policy Studies at the University of Wisconsin–Madison. She is also affiliated with the African Studies Program. Her research interests center on educational anthropology, cultural studies, and critical race theory applications to education. Noted for her concept of “culturally relevant pedagogy,” she continues to study the successful teaching of African American students. She helped to develop Teaching for Diversity, the university’s teacher education program focused on teaching racially, culturally, and socioeconomically diverse students.

Ladson-Billings is the author of several books and numerous scholarly journal articles. Some prominent book titles include *Educational Research in the Public Interest: Social Justice, Action and Policy* (co-authored with William F. Tate, 2006); *Beyond the Big House: African American Educators on Teacher Education* (2005); *Crossing Over to Canaan: The Journey of New Teachers in Diverse Classrooms* (2001); and *The Dreamkeepers: Successful Teachers of African American Children* (1994). In 1997, she coedited the *Dictionary of Multicultural Education* with Carl A. Grant.

The winner of many awards for scholarship and service, she is past president of the American Educational Research Association (2005–2006). She received the George and Louise Spindler Award from the Council on Anthropology and Education in 2004. She was inducted into the National Academy of Education in 2005 and received the University of Wisconsin’s Woman of Color Award in 2006. Also, she received an honorary doctoral degree from Umea University, Sweden.

LOCKE, JOHN (1632–1704)

John Locke is considered the father of the empirical tradition in philosophy, and his ideas about democracy are at the heart of the founding documents of America. His ideas about education are focused around the widely known metaphor of tabula rasa, or blank slate. He thought that knowledge or learning was impressed upon youngsters and that teachers and parents thus played a crucial role in their moral education. The ideas in his seventeenth-century works are still pertinent today.

Locke was born in Somerset, England, in 1632. He was educated at the Westminster School and then at Christ Church College, Oxford. At Oxford, he studied natural philosophy and earned both his bachelor’s and master’s degrees. He went on to earn his medical degree and became a private physician and advisor for the Earl of Shaftesbury and his family.

In 1683, Shaftesbury, who was active in politics, fell on the wrong side of the controversy surrounding the ascension to the throne of the Catholic James II. Shaftesbury was forced into exile in the Netherlands and brought Locke with him. Shaftesbury died soon after he arrived in the Lowlands. Locke remained there until James II was deposed and William and Mary of Orange came to the throne in 1689. On returning to England, Locke was able to secure a government post and publish his key contributions to philosophy, including “Some Thoughts Concerning Education.” He died in 1704.

To fully appreciate Locke’s ideas on education, one must first understand the broader agenda that his work represents. Locke is remembered for two great contributions to philosophy. First, he is the father of the empirical tradition in Anglo-American philosophy. The empiricist beliefs that are accessible through the senses—that there is no essential disconnect between the mind and the body, and that truths must be learned rather than innately delivered—have dominated the philosophic quest since Locke’s time.

His second widely known contribution is in the field of political philosophy, where he sought to show,

in a quasi-historical sense, how civil society came to be founded, and within this context explained which rights belong naturally to the governed and which rights must necessarily be retained by the sovereign. In doing so, he formulated the conception of democracy that lies at the heart of modern liberal democratic institutions. Indeed, the claim in the U.S. Declaration of Independence that all men are entitled to life, liberty, and the pursuit of happiness was borrowed from Locke.

The marriage of the core ideals of empiricism and self-governance are seen in Locke's key work in educational philosophy, "Some Thoughts Concerning Education." Originally published in 1693, this work is not a guide for democratic education, but rather education for democracy. Although he was typical of his time in concentrating on education for the privileged classes, Locke was ahead of his time in that he was concerned with the whole child as a physical, moral, and intellectual being. What Locke describes is the way in which children should be raised, not merely educated, to have the physical, moral, and intellectual stamina necessary for the world as envisioned in his other philosophical works.

Locke's view of the necessity and role of education is captured in his use of the term *tabula rasa*—literally, blank slate or tablet—which he introduces in his 1694 *Essay Concerning Human Understanding*. According to him, the individual is a medium on which knowledge and learning are inscribed or impressed. This conception is also present in "Some Thoughts Concerning Education." Here, Locke talks about what children are, and what they need from their parents, teachers, and other role models.

He compares children to travelers in a strange country, and it is the role of the educator to guide them and illuminate their world. This description, echoed in the conception of the *tabula rasa*, does come with one vital caveat that sets Locke apart from many of his contemporaries' thoughts on the topic. Locke argues passionately that children should be respected and treated as rational beings. Locke's nearest philosophical rival, Thomas Hobbes, is noted for succinctly expressing the more common view of the time, in that he included the mentally disabled, the mentally ill, and children in a singular category of intellect.

Locke begins by giving much detailed advice on the physical care of the young in "Some Thoughts Concerning Education." He offers recommendations on the topics of nutrition, clothing, and general health. However, it is his second major topic, moral education, or education for virtue, to which this concern, and his subsequent concern for academic or professional education, are subsumed. On the topic of virtue, Locke goes to lengths to explain what will lead a young man to become virtuous. For parents and educators, he offers admonitions against hypocrisy and corporal punishment. This places modeling at the center of Locke's conception of education for virtue and sets the bar very high for those charged with this task.

The topic of learning in an academic setting is reserved for last. Locke chooses to make no apologies for this and offers a charged and colorful critique of existing educational practices with reference to the use of punishments, rewards, and misplaced efforts at curriculum design. While his remarks on many academic practices are scathing, to qualify Locke as an anti-academic would, of course, be an error. What Locke is concerned with is the methods and priorities by which education takes place.

Locke does have specific advice for what children should know and how they should be taught. He stresses, for example, that children should be taught to read as early as possible in their lives. The role of the parent or teacher in this situation is to not only teach the child to read, but also structure the instruction in such a way that the child will one day enjoy reading, rather than view it as a chore. This idea permeates the multiple examples offered on the topic of educational methodology.

Locke goes on to detail ways in which learning can be structured to appeal to children. He also offers a sequence of what topics should be covered, from initial reading instruction through abstract reasoning, philosophy, and accounting. Locke's practical streak, which is sometimes more hidden in his political philosophy, is evident in recommending this last topic in education.

Locke's overall contribution to educational thought in modern times is great. The themes of his work underlie much of the current debates in the field. In "Some Thoughts Concerning Education," he initiates

dialogues about developmental stages of children, intrinsic versus extrinsic motivation, appropriate curriculum and instructional methodologies, and meeting the needs of individual learners.

MACDONALD, JAMES (1924–1982)

James Macdonald was a curriculum theorist who helped to shape the reconceptualist movement of curriculum studies throughout his work in the 1960s and 1970s. For Macdonald, curriculum was like a microcosm of life itself and posed similar social, moral, and spiritual challenges. He believed curriculum theorizing was a creative act stemming from the critical question, “How shall we live together?”

Macdonald spoke out against the discipline-based curriculum work of the 1960s that identified phenomena and people as objects within categories within systems and argued instead for an aesthetic rationality where curriculum workers addressed issues at an intuitive level and allowed individuals to transcend existing systems and categories. Macdonald further argued that curriculum workers needed to move beyond the discipline-based structure of their work in order to create a more person-oriented curriculum that could respond to issues of social injustice.

In 1971, Macdonald mapped out a curriculum theory in which he identified three categories of theorists: one category in which theorists used theory as a guide for curriculum development and research as a tool for evaluating curriculum; a second in which theorists used scientific theory to identify and define variables within curriculum development; and a third category in which theorists used theory to think more

creatively about curriculum. He associated himself with the third group.

Macdonald’s challenges to current practices in curriculum work of the 1960s and early 1970s helped to usher in the new movement of curriculum studies where scholars would look at work in schools through phenomenological, autobiographic, and theological lenses.

MANN, HORACE (1796–1859)

Horace Mann is justly remembered as the father of the public school system. Committed to a progressive religious vision of the American republic, he devoted his life to shaping institutions that would shape the nation.

Born into a modest farming family in Franklin, Massachusetts, Mann received little formal schooling. The most significant influence on his developing mind was the town’s orthodox minister, Nathaniel Emmons. Breaking with Calvinism during adolescence, Mann embraced liberal Christianity and a passion for personal betterment. With the help of tutors, he quickly mastered sufficient Latin and Greek to enter Brown University; three years later, he graduated class valedictorian.

After two unsuccessful years teaching the classics, Mann entered Litchfield Law School. Passing the bar in 1823, he set up office in Dedham. He soon made a name for himself, and in 1827 was elected to the state legislature. Strongly supportive of scientifically grounded moral reform, Mann was the moving force behind the establishment of the state’s first public asylum for the insane. Based upon the principles of moral treatment perfected in America by the physicians of the Hartford Retreat, this experience introduced Mann

to physiological and pedagogic theories that would inform his future ideas on education.

Mann's political success—he eventually became president of the Massachusetts Senate—was accompanied by private sufferings. The death of his first wife in 1832 took an enormous emotional toll; his hair is said to have turned gray overnight. At the same time, Mann inherited crippling debts that forced him to live out of his law office for three years. Although he received support from Elizabeth and Mary Peabody and the famed Unitarian minister William Ellery Channing, Mann's rise from despair seems to have been secured through his missionary-like commitment to the cause of education.

After a ten-year campaign highlighting the deplorable condition of Massachusetts schools, James Carter, an important champion of public schooling, persuaded the legislature to establish a state board of education. But if Carter expected to be appointed secretary, powerful friends of education realized that the board's limited charge (collecting facts and diffusing information) necessitated a leader with Mann's moral force and legal knowledge.

Why did Mann abandon his political career for such a poorly paid and nebulous appointment? In his diary, he speaks of a religious awakening brought on by reading George Combe's *Constitution of Man*. Grounded in principles governing the innate structure and development of the brain, Combe's phrenological text drew moral imperatives from physiological laws. Knowledge of God's workmanship was the key to Christian duty and human happiness. By revealing practical ways to regulate the passions and strengthen reason, it promised the possibility of educating the population for rational and virtuous citizenship in the new urban industrial world. To this end, Combe and his co-worker James Simpson had formulated a comprehensive plan for a national system of public schooling in Great Britain. Embracing child-centered pedagogy, a scientific curriculum, standardized systems of administration, and teacher training, the scheme eventually fell foul of religious opposition to nondenominational instruction.

However, as Mann's crusade demonstrated, the phrenologists' plan was perfectly suited for Protestant New England. Resonating with nativist ideals, it provided a compelling political script fusing Christian

duty, personal improvement, and social progress. On his appointment as secretary in 1837, the first book Mann turned to was Simpson's *Necessity of Education*. The following year, Combe visited Boston and the two men developed a lifelong bond. A true disciple, all of Mann's subsequent writings bear the stamp of Combe's philosophy.

To promote his cause, Mann toured the state collecting information, establishing a network of local support groups, and delivering lectures on the importance of education to the future of the republic. As a panacea for social ills, he promised a system of tax-supported common schools to meet the needs of all children, irrespective of class or creed. Eschewing privilege, distinctions were to be founded solely on merit. Mann did recognize significant moral and intellectual differences between the sexes, but demanded a full, if distinct, education for women in order that they could fulfill their unique sphere of influence in society.

In the *Common School Journal*, Mann promoted scientifically informed instruction; in his annual reports, he presented statistics designed to pressure local action and government legislation. His first major initiatives included founding normal schools, establishing school libraries, and improving facilities. Although such sweeping changes inevitably stirred political and religious opposition, he was able to marshal the broad support necessary to cement the authority of the board and the basic elements of his statewide plan.

But Mann had his sights on more far-reaching reforms. After touring Europe, he publicized the Prussian system, making a powerful case for the superiority of child-centered practices over the hard-line methods of traditional teachers. This caused a good deal of controversy among a group of Boston masters, but Mann's subsequent exposé of their questionable successes and harsh discipline only added to his case. By the end of his twelve-year tenure, he could boast a standardized curriculum, teacher training, and a statewide system of administration—all of which he codified in legal statutes that would serve a template for the advancement of public schooling across America.

In 1848, Mann was elected to the House of Representatives, where he fought a bitter six-year battle against the expansion of slavery. Tiring of Washington, he mounted an unsuccessful bid for the

Massachusetts governorship before accepting the presidency of Antioch College in Ohio. Ever the phrenologist, he spent the last five years of his life cultivating the physical, intellectual, and moral qualities of the West's future leaders. He banned alcohol, tobacco, and coffee; offered instruction in the laws of physiology, political economy, and moral philosophy; and ensured that only the virtuous received diplomas. Secure in the achievement of his life's work, he famously used his final baccalaureate address to implore students not to "die until they have won some victory for humanity."

MARTIN, JANE ROLAND (1929–)

Jane Roland Martin challenged the presumed gender neutrality of the late-twentieth-century analytic philosophy of education with her 1981 critique of R. S. Peters's ideal of the educated person. She proposed the democratic necessity of constructing a "gender-sensitive" educational ideal, meaning that philosophers and educators should take gender into account when it is of educational consequence and ignore it when it is of no educational consequence.

Citing epistemological inequality that excludes, distorts, and marginalizes women as subjects and objects of educational thought, she analyzed the ideal of the educated woman as formulated by Plato, Jean-Jacques Rousseau, Mary Wollstonecraft, Catharine Beecher, and Charlotte Perkins Gilman and concluded that education itself requires radical redefinition. Focused upon "productive processes of society," Martin argued, education reflects preoccupation with matters of cultural, political, and economic significance, but also should reflect the significance for both men *and* women of "reproductive processes of society" that historically philosophers have designated as women's characteristic social functions alone: bearing

and rearing children; managing households; and offering various sorts of care, concern, and connection in daily life.

Martin's subsequent prolific writings have reformulated this normative claim by critically investigating its conceptual significance for transformation of *both* sexes' schooling, higher education, and general cultural transmission through "multiple educational agency," as well as for "culture-crossing" individuals' educational metamorphoses.

Also influential, Martin's contributions to the analytic philosophy of education before 1981 formulated conceptual foundations for interdisciplinary curriculum theory: hidden curriculum, basics, disciplines, subjects, choice and chance, knowing how and knowing that.

McGUFFEY, WILLIAM HOLMES (1800–1873)

William Holmes McGuffey was the author of the *McGuffey Readers* (their unofficial title), which epitomized the transformation of school reading texts

over the first third of the nineteenth century. Designed to replace spelling books as the child's introduction to reading, they were child-friendly, featuring large type, numerous illustrations, and short tales about children in familiar settings. Over time, they have sold some 135 million individual copies.

Born in Washington, Pennsylvania, McGuffey attended Washington College and then went on to teach Latin and Greek at Miami University, Ohio, from 1826 to 1836, becoming active in midwestern educational circles that included such reformers as the textbook writer Albert Pickett and Alexander Kinmont.

In 1836, Truman and Smith published McGuffey's *First Eclectic Reader* and *Second Eclectic Reader*, soon issuing four additional graded readers. Their comprehensibility to children, McGuffey's midwestern location, and the publishers' excellent marketing contributed to their great success. Although McGuffey's association with the series had ceased by 1843, the readers dominated the market in the second half of the nineteenth century. They were constantly revised by their publishers and are still in print.

McGuffey's early books borrowed heavily from competitors: McGuffey and his publisher had to settle out of court a suit brought by the textbook author Samuel Worcester and his publisher. McGuffey finished his career at the University of Virginia (1845–1873), where he was a professor of moral philosophy.

McLAREN, PETER (1948–)

Peter McLaren, Professor of Education at the University of California, Los Angeles, is a leading educational theorist who, since the 1980s, has played a central role in the development of critical pedagogy

worldwide and the organization of what he terms the "educational left." Tremendously prolific as an author, and known for his virtuosic rhetoric and conceptual imagination, McLaren has made wide-ranging contributions over the course of his career to myriad educational discourses including critical ethnography and qualitative research, educational policy debates, ritual and performance studies, literacy theory, multiculturalism and the development of postcolonial pedagogy, cultural studies, critical media pedagogy, and curriculum studies, as well as work on globalization in education.

McLaren spent much of his early career in founding what he terms critical, or resistance, postmodernism in education through the deployment of novel syntheses of Frankfurt and Birmingham School critical theory, French poststructuralism, the Freirean and Deweyan philosophic traditions, and other radical ideas. Since 1994, he has turned toward a more specifically Marxist humanist analysis that seeks to illuminate the crucial function played by political economy and the relations of production in blocking truly democratic forms of schooling, culture, and general politics across society.

Although his work since the later 1990s should be understood as an evolution, and not rejection, of his earlier work, McLaren has become an outspoken critic of scholars' wide reliance upon faddish forms of postmodernism, which he believes often result in an inattention to the underlying reality of economic exploitation or unwittingly play into Rightist political agendas through the postmodern desire to deconstruct and de-universalize all forms of macro social analysis and struggle.

Consequently, beginning with books such as *Revolutionary Multiculturalism* (1997) and *Che Guevara, Paulo Freire and the Pedagogy of Revolution* (2000), up to the more recent *Capitalists and Conquerors* (2005) and *Life in Schools* (5th ed., 2006), McLaren has sought to delineate a "revolutionary critical pedagogy" that challenges the domestication of critical work in education under capitalism, works internationally to organize resistance to imperialist and neoliberal policies, and attempts to resituate the necessity for sustained Marxist critique both popularly and within educational research proper.

Despite his radical goals, McLaren's theories appear to be finding wide audiences. In 2005, La Fundacion McLaren de Pedagogía Critica was inaugurated to more widely establish knowledge of his work throughout Mexico as a basis for political action, and in 2006, the Venezuelan Ministry of Higher Education created the Peter McLaren Chair for the Study of Critical Pedagogy at the Universidad Bolivariana de Venezuela.

MEIER, DEBORAH (1931–)

A former kindergarten teacher, Deborah Meier has worked for more than forty years as a teacher, principal, and activist. Educated at Antioch College and the University of Chicago, Meier spent most of her career working to understand and remedy schooling through educational reforms.

Meier began her career as an elementary and Head Start teacher in New York, Philadelphia, and Chicago. In 1974, the superintendent of New York City's schools, Tony Alvarado, asked her to implement her theories in a Harlem school that was known for having extremely low test scores. In response to this request, Meier founded Central Park East, which emphasized active learning. Her school also fostered democratic community, increased teacher autonomy, and encouraged parents' feedback and participation in their children's schooling. As a result of her efforts, overall student test scores increased considerably. She documented her efforts and the success of the school in her well-known book, *The Power of Their Ideas*.

Following this success, she opened two more elementary schools and one secondary school in cooperation with the Coalition of Essential Schools, an organization based on the principles that every child can learn, schools should foster democracy and equity, and school practices should meet the needs of individual

students. Her schools have been lauded as models of urban reform and boast high standards, nurturing adults, and high college-going rates for their graduates.

Meier has written extensively on school reform and educational policies from the perspective that all children can learn and be successful. She affirms the importance of democratic community, active student learning, teacher autonomy, and hope in public schooling.

MERLEAU-PONTY, MAURICE (1908–1961)

Maurice Merleau-Ponty was an existential philosopher (influenced by Husserl) along with his contemporaries Sartre and de Beauvoir; however, Merleau-Ponty's work defied traditional conventions and even challenged Sartre's anguish, conflicting relations, and uncompromising Marxism and Cartesian ontology. Merleau-Ponty emphasized the embodied experience, especially the perception, and he argued that phenomena could not be comprehended fully with philosophical traditions and norms because of the leakiness and complexity of what he referred to as equally disappointing alternatives, empiricism and intellectualism. His ideas about knowledge have influenced educators.

Along with Saussure, Merleau-Ponty was one of the philosophical innovators who brought structuralism and linguistics into an interdependent relationship with phenomenology, and his work refuted Western

idealism and sought to (re)articulate the various relationships of subject and object in the intersubjective state, self, and world, as well as many other dualisms through an account of the lived and existential body within *The Phenomenology of Perception*.

For contemporary educational scholars, such as Madeleine Grumet, Merleau-Ponty's emphasis on the body—or the body-subject, as he refers to it—and theory of the body are too often underestimated by educators who tend to view the body as simply an “object” that a transcendent mind orders to perform various activities, so that students may get back to their “mental” work. Merleau-Ponty's philosophies ground knowledge within the body's experiences in conjunction with the world.

With philosophical analyses of perceptions, embodied experiences, difficulties of human existence, and the body and intersubjectivity, Merleau-Ponty's phenomenological works are gaining more attention within contemporary educational research and scholarship because he challenges dualisms and offers a more holistic approach to educational philosophy and curriculum. Educators who embrace Merleau-Ponty's philosophy challenge the mind/body split and incorporate the body into the curriculum and classroom in a multitude of ways—from discussing the misogynistic body philosophy from Plato and the early Greeks (which has guided educational “norms” and practices)—to discussing the pregnant body; able and disabled bodies; and how the body is “disruptive” and “leaky” in schools with regard to race, class, gender, ability, ethnicity, and sexuality, to actually using and integrating the body in the learning process with individual and collaborative hands-on experiences—such as dancing to learn mathematical patterns, building muscles and using the muscles on the body itself, and/or performing a play.

MILL, JOHN STUART (1806–1873)

Although it was not his professional career, John Stuart Mill wrote widely and influentially on philosophy, supporting the rights of the individual against the rights of society. Today, he is considered an important thinker in the utilitarian school.

Mill was born in London, England. He was taught by his father, who in turn had been much influenced by the utilitarian philosophy of Jeremy Bentham. Mill was given a classical education, focusing on Greek, Latin, and mathematics. From an early age, Mill also learned philosophy. He was influenced by the Romantic philosophy of Wordsworth as well as the French philosopher Auguste Comte.

Mill worked until his retirement as an administrator for the East India Company, writing philosophy and lecturing in his spare time. In retirement, he ran successfully for Parliament. His best known treatise is *On Liberty*. Here he addresses the balance between the rights of societies and the rights of individuals and asserts that only in cases of necessity should the rights of the individual be curtailed. In his writing and lectures, Mill also examined logic and mathematics as well as social issues such as women's suffrage, political reform, and economics.

Mill never wrote a unified treatise on education, but in his 1867 inaugural address at the University of St. Andrews, Scotland, Mill outlined his views on education in liberal societies. Although his definition of education encompasses everything that might have an impact on human development, his focus is on society working to positively affect those factors. In Mill's view, parents are largely responsible for structuring the education of their children. Mill asserted an obligation of societies to educate their children, but was not specific as to particular ways this might be achieved.

MONTAIGNE, MICHEL DE (1533–1592)

Referred to as the French Socrates, Renaissance humanist thinker Michel de Montaigne ranks among the more influential philosophers in the Western world. His writings, called *essays*, are central contributions to philosophy and education.

Born February 28, 1533, he was given a classical education and then studied law. He became a city counselor in Bordeaux, a post he held until he took over the running of his family's estate in 1571. In 1572, he began his essays, a series of discussions on many topics that were published in 1580, 1588, and 1595. He broke with Western philosophical tradition in that he wrote in French rather than in Latin.

Although his writings have been considered discursive and sometimes rambling, the central message that the reader should take from Montaigne is one of skepticism and questioning. In his essay on education, titled "Of the Education of Children: That It Is Folly to Measure Truth and Error by Our Own Capacity," Montaigne stresses the importance of the teacher and at the same time insists that the teacher, however competent, must be sure to move at the same pace as the student.

Montaigne does not prescribe what is to be taught, as other philosophers of education have done, but rather is concerned with the pace and methodology. He reiterates the importance of skepticism, but with useful limits. In other works, he also argued that religious beliefs must be accepted on faith alone, which contrasted sharply with the efforts of other intellectuals of his time to ground religious teachings in logic and reason. Montaigne is often studied in contrast with René Descartes, although Montaigne's writings did indeed influence this other great philosopher.

John P. Renaud

MONTESSORI, MARIA (1870–1952)

Maria Montessori was a physician, an educational reformer, and an advocate for children and peace. She

is best known for designing the educational system known as the Montessori Method, which flourishes today in more than 8,000 schools on five continents.

The first Montessori School, known as the Casa dei Bambini, was opened in 1907 as part of an urban renewal project located in the poor district of San Lorenzo in Rome. The well-publicized success of her experiments in the Casa marked a decisive turning point in her life. In 1907, she left the practice of medicine and devoted the remainder of her life to education. From this point, until her death in 1952, Montessori traveled the world establishing Montessori schools; training centers for teachers; and the professional society charged with perpetuating the integrity of the method, The Association Montessori Internationale.

Having spent the better part of her life as a war refugee, Montessori was inspired by the belief that education based on the developmental needs of children could create a new generation of adults who, through proper formation, would be able to forge a new vision for peace. She called this "the science of peace," and it infused all aspects of her method of education.

Kramer, R. (1988). *Maria Montessori: A biography*. Reading, MA: Addison Wesley.

NEWMAN, JOHN HENRY (1801–1890)

John Henry Newman was a priest, a theologian, and an educator. First an Anglican priest and eventually a Roman Catholic cardinal, Newman wrote on the relationship between faith and reason, and his *The Idea of a University* continues to be an important work on higher education.

Newman was born in London on February 21, 1801, to John Newman and Jemima Fourdrinier Newman and baptized into the Anglican Church on April 9 of the same year. In 1808, he was sent to the private school at Ealing to begin his education. In 1817, he entered Trinity College, Oxford, and was eventually elected a

fellow of Oriel College, Oxford, in 1822. Ordained a priest in the Anglican Church, Newman was eventually called in 1828 to serve as the vicar of St. Mary's Church, the university church for Oxford.

Newman was initially characterized as a young man of equally deep commitment to the learned life and the religious life. However, the early to mid-1800s were times of great theological transition. As a result, some of Newman's earliest writings reflect how his historically orthodox understanding of Anglicanism called him to question the currents of liberalism he believed were beginning to infiltrate the Church.

Newman's concern with liberalism led to his involvement in what became known as the Oxford or Tractarian Movement. This movement, and the individuals who helped to guide it, believed the Church was called to pass from one generation to the next the essential components of doctrine that allowed the Church to be of service to the world. They believed that doctrine was not simply an exercise of intellect but one that also led to religious devotion. Initially, these concerns propelled Newman to argue that the Anglican Church was the rightful bearer of Church doctrine. However, his views began to change and he eventually became convinced that the rightful bearer of Church doctrine was actually the Catholic Church.

In 1845, he was received into the Catholic Church and eventually ordained a priest in 1847. Newman's reputation as an educator led to his appointment in 1851 as the founding rector of the Catholic University of Ireland, a post in which Newman found both success and failure. In addition to his efforts in education, he helped to establish an oratory in Birmingham, England, and was named a cardinal in 1879. He died in 1890 and was declared venerable in 1991. Movements are also underway to recognize Newman as a saint.

Newman continued to write prolifically over the course of his career. Regardless of the particular concern of any given writing, the questions that inspired the Oxford or Tractarian Movement were never far from his mind.

These questions even found their way into Newman's writings about education. Defenders of the tradition of Western civilization often include Newman's efforts among their canon of great books. However, a closer reading of *Fifteen Sermons*, *The Idea of a University*, and *My Campaign in Ireland*

demonstrates that the relationship shared by doctrine and religious devotion defines Newman's thinking. Published two years prior to his conversion to Catholicism, Newman's *Fifteen Sermons* details his beliefs concerning the rightful relationship shared by faith and reason. Although *The Idea of a University* was not published under a single cover until 1873, the lectures that led to this volume include an argument for the need for Christian higher education in Ireland. *My Campaign in Ireland* is essentially a record of the successes and the failures Newman encountered as he sought to establish a place in Ireland for an institution of Christian higher education.

NIETO, SONIA (1943–)

Sonia Nieto's research has focused on the education of culturally and linguistically diverse students, multicultural education, bilingual education, teacher education, educational equity, and curriculum reform.

A graduate of the New York City public schools, she began her career as a fourth-grade teacher in the Northeast's first completely bilingual school. In addition to numerous articles, her books include *Affirming Diversity: The Sociopolitical Context of Multicultural Education* (1992), *The Light in Their Eyes: Creating Multicultural Learning Communities* (1999), and *What Keeps Teachers Going?* (2003). She also edited the books, *Puerto Rican Students in U.S. Schools* (2000) and *Why We Teach* (2005).

Nieto has worked tirelessly toward educational equity for all students by serving on national and international boards and commissions, including the Massachusetts Advocacy Center, Facing History and Ourselves, and Educators for Social Responsibility. Nieto's work has been particularly important in the areas of teacher training and multicultural education.

Through her twenty-six years as a professor in language, literacy, and multicultural education at the University of Massachusetts at Amherst, she has advocated for children and families. She has firmly espoused the ideas that all children can learn, that the role of families is paramount in children's learning, that all people have culture, that a student's language and culture should be honored, that multicultural education benefits all children and all people, and that education can be a force for positive social change.

NODDINGS, NEL (1929–)

Nel Noddings is among the leading philosophers of education in the United States. At a practical level, and in books such as *The Challenge to Care in Schools*, she argues that schools need to become more caring places.

Noddings began her career as a sixth-grade teacher and then took a position in secondary mathematics. After completing a master's degree in mathematics

at Rutgers University, she earned a doctorate of education from Stanford University.

Noddings has made many contributions to mathematics education and the philosophy of education. She is best known for her work on the ethics of care. Rejecting more traditional philosophical models, Noddings posited an alternative approach to ethics based on a feminist model of care—that is, the care a mother might have for a child. Her approach, which has been described as *relational ethics* because of its emphasis on relationships, maintains that caring involves three principles: receptivity, relatedness, and responsiveness. Through a process of what she describes as “engrossment,” the teacher receives what the cared-for (i.e., the student) is feeling and wants to express. Drawing on the work of John Dewey, Noddings argues that the teacher and students should be involved in a process of interaction in which each affects the other through a process of moral interdependence. According to her, students are more likely to trust teachers whom they perceive not as trying to interfere or impose their beliefs on them, but as concerned with nurturing and guiding them. Through dialogue with their students, teachers develop an understanding of them as individuals and how best to work with them to help them achieve their educational needs. During this process of caring and guiding, teachers work at becoming more skilled and competent in what they do.

For Noddings, caring relationships provide the most appropriate basis for moral education. Students learn to care for others and their needs as they are cared for. Her general approach clearly resonates with many of Dewey's progressive models and provides a challenging alternative to the current standards movement and the extreme regulation and control of the curriculum. Ultimately, in her system, teachers achieve agency and the ability to grow and develop as they nurture, guide, and help sustain the students under their charge.

OGBU, JOHN UZO (1939–2003)

John Uzo Ogbu was an anthropology professor known for his theories on race and intelligence and their relationship to academic and economic achievement. Born in the village of Umudomi in the Onicha Government Area of Nigeria, he taught at the University of California, Berkeley, from 1970 until his death in 2003.

Ogbu's pivotal work was regarding "voluntary and involuntary minority" groups. Ogbu observed that minority groups who are academically successful in spite of discrimination are characterized as "voluntary minorities" (immigrants who chose to come to the United States) versus "involuntary" or "caste-like" minorities (born in the United States). He believed that "involuntary minorities" often adopt an "oppositional identity" to the mainstream culture, which inhibits their ability to navigate through dominant economic and academic systems. He also examined the historical treatment of these minorities in society at large in both social and economic domains as well as in education.

In 1996, Ogbu played a role in the debate about the use of African American vernacular English. At the time, he was a member of a task force on African American education in Oakland. He observed that the "standard" or "proper" English required in the classroom differed from Black vernacular English spoken at home and outside school and encouraged the teaching of Ebonics as a way to help African American students transition to traditional English.

Some of his works include "Black-American Students and the Academic Racial Stratification in the United States: Why Inequality Persists" (2002), and "Understanding the School Performance of Urban Blacks: Some Essential Background Knowledge" (1997).

ORTEGA Y GASSET, JOSÉ (1883–1955)

José Ortega y Gasset was a Spanish professor, philosopher, publisher, editor, essayist, and political leader. A passionate, uncompromising, and complex thinker, he was the most significant person to come from Spain in the first half of the twentieth century. Ortega y Gasset was a prolific writer; his work took the form not only of books, but also of essays, journal articles, and even articles for the newspapers.

Ortega y Gasset was educated in Spain, obtaining his Ph.D. from the University of Madrid in 1904. He went on to postdoctoral studies in Germany, returning in 1910 to a professorship in Madrid, where he served until he left Spain at the outbreak of the Spanish Civil War. From that point on, his life moved between posts in South America, North America, and Europe until his death in 1955.

Ortega y Gasset's incisive critique of higher education matured throughout his lifetime and remains relevant to contemporary discourse on the nature and proper function of colleges and universities. Over the course of his life, he moved from an early Neo-Kantian idealism to a vitalistic middle period that placed much greater emphasis on the emerging life of the average individual in a culture. His mature educational conceptions were his most pungent: A university existed to *teach the essentials* (abstract "research" and advanced science did not qualify) and to *teach those essentials to the average person* so that the main body of a society might learn the contours of its own culture in its own historical setting. Only then would these students be able to critique that culture and forge creative new possibilities within their own circumstances.

The mission of higher education, then, ought to be to provoke a creative crisis or turmoil in individuals so

that they might find their own way in their own generation. And much of what was to be found in the modern university by 1930 was, in Ortega y Gasset's estimation, an enormous roadblock to this larger end.

Ortega y Gasset's prolific writings include *Mission of the University* (1944), *History as a System: Essays Toward a Philosophy of History* (1941), and *The Dehumanization of Art; and Other Essays on Art, Culture, and Literature* (1956).

OWEN, ROBERT (1771–1858)

Robert Owen, a wealthy cotton manufacturer turned Utopian visionary, had an important influence on schooling in early nineteenth-century Britain. Convinced that character was determined by the social environment, he instituted disciplinary practices designed to regulate habits and improve industrial efficiency. His success in shaping behavior convinced him that education could be used to engineer a more moral world.

At New Lanark, a Scottish village dominated by the local cotton mill, Owen attempted to regulate almost every aspect of his workers' lives. Central to his scheme was the village infant school, where he sought to shape character during the impressionable early years of childhood. In an atmosphere of reason and kindness, boys and girls learned an ethic of cooperation and the basic lessons of science. Owen's pedagogy, if not his religious and political views, caught the attention of leading reformers. During the 1820s and 1830s, infant education swept Britain, promising a cure for the social ills of urban-industrial life by instructing working-class children in the rudiments of reason and morality.

By this time, Owen's thought had taken a radical turn. Disgusted by the economic and social effects of

capitalism, he promoted the construction of self-supporting socialist villages. Again, education was the key. Eschewing self-interest, members of the community would be taught to embrace reason, cooperation, and the well-being of all. However, as witnessed in the ill-fated society at New Harmony, Indiana, Owen's dream inevitably fell foul of human nature.

PEABODY, ELIZABETH PALMER (1804–1894)

Elizabeth Palmer Peabody was an American transcendentalist, lecturer in the Concord School of Philosophy, and the leader of the campaign to establish kindergartens in the United States during the second half of the nineteenth century. Committed to reform and highly erudite, Peabody wrote essays on social and educational reform, translated classic and European philosophic texts, served as the editor of the transcendentalist journal *The Dial*, founded and edited *The Kindergarten Messenger*, and was the president of the American Froebel Union.

Peabody was born in Billerica, Massachusetts, and grew up in Salem, Massachusetts. She attended her mother's academy for girls and later studied with Ralph Waldo Emerson and William Ellery Channing. In 1825, Peabody founded the Beacon Hill School in Boston with her sister, Mary, who later became the wife of Horace Mann. Peabody's work at the school attracted the attention of Bronson Alcott, and in 1830, she agreed to join his experimental Temple School in Concord.

Alcott's classroom discussions of sex and the gospels caused a public controversy, but Peabody defended him in her *Record of a School* published in 1835. Their collaboration ended in 1837 when Peabody returned to Boston to open a transcendentalist bookstore; organize philosophic discussion groups;

and become active in abolitionist, suffragist, and common school causes.

In 1860, in Boston, Elizabeth Peabody and Mary Peabody Mann opened the first English-speaking kindergarten in the United States. In 1863, they published *Guide to the Kindergarten and Moral Culture of Infancy*, which was widely considered the most authoritative work in English on the theory and practice of the kindergarten during the 1860s and 1870s. In the late 1860s, Peabody visited German kindergartens and recruited Froebel's students to train kindergarten teachers in Boston, New York City, Los Angeles, and Washington, D.C. Peabody organized a demonstration kindergarten class for the American Centennial Exposition in Philadelphia in 1876, formed a national network for kindergarten teachers, and remained active in the cause well into her eighties.

PESTALOZZI, JOHANN HEINRICH (1746–1827)

Johann Heinrich Pestalozzi was a Christian humanist concerned about the debilitating effects of the Industrial Revolution on the traditional family. He attempted to use the school as a tool for self-fulfillment but, politically astute, sought to balance freedom with the role of the citizen. His work was influenced by the Enlightenment and romanticism.

Politically and romantically, Pestalozzi championed the rights of the poor and their children, clearly a theme in his most noted work *Leonard and Gertrude*

(1781). In this work, he emphasized the importance of creating an environment of safety and emotional security. Pestalozzi put Rousseau's *Emile* (1762) into practice. He accepted Rousseau's principle of the innate goodness of children and his idea that education could serve as the foundation for social reform. Like Comenius and Rousseau, Pestalozzi grounded learning in the senses and was attentive to the culture and local environment of the children. This formed the basis for his object lessons, characterized by his attention to form, number, and name.

Pestalozzi's pedagogical approach attracted many, including common school reformers Henry Barnard and Horace Mann, who were intrigued by his moral yet compassionate nurturing school. Pestalozzi's early work in the United States was planted by William Maclure and Joseph Neef, later influencing Edward Sheldon at Oswego, New York. Pestalozzi's interest in occupations as educational is clearly evident in the work of progressive educators, including John Dewey and William H. Kilpatrick.

PIAGET, JEAN (1896–1980)

Jean Piaget was a Swiss-born biologist, psychologist, and philosopher who developed the theory of cognitive development for children. Piaget was the codirector of the Jean-Jacques Rousseau Institute in Geneva, Switzerland; director of the International Office of Education; and on staff at the Universities of Paris and Geneva.

Piaget's academic work led him to the conclusion that life consisted of *totalities* affecting the thinking processes. Turning to the discipline of psychology, Piaget studied under Carl Jung and worked with Alfred Binet's colleague Theodore Simon to understand intelligence testing. Professor Piaget worked with and studied both children and the teaching

process. His writings ultimately influenced a variety of academic disciplines, such as developmental psychology, education, primatology, philosophy, artificial intelligence, and cognitive and human intelligence.

Piaget's theory of cognitive development identified four stages: infancy, preschool, childhood, and adolescence. At each stage, a child's understanding is affected by the world in which the child resides. Knowledge is derived from both within and outside the child. The child tests the accumulated knowledge at each stage to reject, modify, or reconstruct the information by assimilation and accommodation processing before advancing to the next stage. The knowledge is organized into schemes for future use.

Piaget was a prolific writer. His major writings include *The Origins of Intelligence in Children* (1936), *Intelligence and Affectivity* (1954), *The Psychology of Intelligence* (1963), *Genetic Epistemology* (1970), and *Memory and Intelligence* (1973).

PIERCE, JOHN DAVIS (1792–1882)

The first Superintendent of Public Instruction in the state of Michigan, the Reverend John Davis Pierce was among the vanguard of educationalists in nineteenth-century America. Pierce combined his unique educational vision with Victor Cousin's writings on the Prussian system of public education to create a comprehensive system of schooling. Michigan's system of education and the policies developed by Pierce became the model for many states in the Midwest and West.

What is most remarkable about Pierce's accomplishments is that, unlike his contemporaries in the field of education, who established their systems of public instruction in the more established states of the East Coast, Pierce carved a public school system, a state university, an agricultural college, and a state teacher's college out of the wilderness of the Michigan Territory.

Convinced that the organization of schools should unite all levels of schooling in a system provided at public expense and under state control, Pierce was able to convince the authors of Michigan's constitution to create a special department of public education controlled by the state and governed by a state officer—the Superintendent of Public Instruction. Appointed to this new post, Pierce became the first in the United States to hold such an office under a state constitution (1836) and oversee a constitutionally distinct department of education.

In addition, rather than having the sixteenth-section lands created by the Northwest Ordinance to fund schools allocated to the townships, Michigan's ordinance of admissions was worded so that these school lands were conveyed to the state. Consequently, a state school system rather than a local system of schooling was developed. To ensure that these would be "public" schools, Pierce saw to it that Michigan's constitution became the first to include a specific prohibition against appropriating funds for the use of sectarian or religious institutions.

Pierce was also determined to create a system of public instruction capped by a single state university. Rather than creating a pool of money from the lands granted to the territory by the U.S. Congress that would be available to any and all who would seek to establish a college, Pierce structured higher education funding into a specific trust to be used only by a single college—the University of Michigan. In addition, Pierce would see to it that the University of Michigan was the only institution able to grant degrees in the state until 1850. He believed that this would make Michigan's state university a stronger institution, avoiding the competition from various interests that would otherwise dilute the state's resources. Like the primary schools, the university was to be open to all citizens. As a result, the University of Michigan

became the first Western state university founded and constitutionally maintained on nonsectarian principles.

To create an intermediate level of schooling and provide access to all citizens, Pierce formed university branches with the dual purpose of preparing teachers for the common schools and more advanced students for admission to the university. These intermediate academies became the first public institutions in the United States engaged in the training of teachers. Established in 1837, these schools were opened prior to the first public normal school in the United States, which opened in Lexington, Massachusetts, in 1839. These schools would be the forerunners of public high schools that would emerge in Michigan and across the country in the 1860s and 1870s.

Recognizing the need for a method of communicating with his far-flung school system, Pierce established the *Monthly Journal of Education* in 1838. This publication was the first educational journal west of the Appalachians and the first in the United States to circulate to a whole school system. It preceded by almost a year the publication of the *Common School Journal* by Horace Mann in Massachusetts.

Leaving his post in 1841, Pierce continued to influence the development of public education until his death in 1882. He led the way in founding the first normal school west of the Alleghenies in 1849 (today Eastern Michigan University) and the first state-supported agricultural school in 1855 (today Michigan State University). He also played an influential role in the founding and development of the Michigan Schoolmasters Club, a predecessor of today's North Central Association.

PINAR, WILLIAM F. (1948–)

William F. Pinar has been the key scholar to transform much of the scholarship in curriculum studies from issues of design and development to a field focused on understanding through the use of phenomenology and existentialism. Since the publication of his seminal work, *Curriculum Theorizing: The Reconceptualists* in 1975, Pinar has ushered in a powerful movement in

curriculum studies that has resulted in a significant shift in the philosophical composition of curriculum scholars, numerous publications devoted to reconceptualized curriculum theorizing, and multiple curriculum associations.

Two primary ideological forces have characterized much of Pinar's work: curriculum as *currere* and the significance of autobiographical inquiry. Pinar worked with Madeline Grumet to articulate the concept of curriculum as *currere*—the course to be run. *Currere* involves an existential experience allowing individuals to see themselves more clearly and thus to be able to run the course more fully aware. Pinar identified four steps within *currere*: regressive, progressive, analytical, and synthetical. These steps involve autobiographical inquiry in order to understand the educational experience. In doing this, teachers and their students can imagine possible futures.

Pinar has a long history of publications, including 22 authored or edited books such as *The Synoptic Text Today and Other Essays: Curriculum Development After the Reconceptualization* (2006), *What Is Curriculum Theory?* (2004), and *Autobiography, Politics, and Sexuality: Essays in Curriculum Theory* (1994). In addition to his numerous publications, Pinar's work is evident through the publications and critical work of the many students he has mentored.

PLATO (c. 427–347 BCE)

Plato was a thinker in ancient Greece who often wrote in a dialogue format that featured his own teacher, the philosopher Socrates. Plato's legacy, which includes ideas about education and knowledge, has influenced Western thought from his lifetime to the present.

Plato was born into a patrician, Athenian family, and he likely had a future in politics, but instead he became enthralled with philosophy as a student of Socrates. After Socrates' execution in 399 BCE, Plato traveled around the Mediterranean. Upon returning to Athens, he opened the Academy as a center of learning. Except for two trips to Sicily, he remained in Athens teaching until his death.

Plato's writing primarily used the dialogue format. Several of the most significant dialogues from each era follow. The early works (*Crito*, *Ion*, *Meno*, and *Gorgias*) are considered the best repository of the philosophy of Socrates. These works demonstrated a distinct interest in ethics. The middle works (*Phaedo*, *Republic*, and *Phaedrus*) begin to display Plato's own philosophical thinking. The focus of this period moved to issues of truth and justice. The final period of works (*Sophist*, *Philebus*, and *Timaeus*) sees Plato taking a look back at issues that he had previously confronted in a more logical manner.

For scholars of education, the *Republic* is likely the most familiar dialogue as it speaks directly to how a population should educate its citizens. A key tenet of Plato's thinking on education was that training on character needed to come before training of the intellect. In modern times, Plato's views have been regarded as elitist and undemocratic because he thought certain types of education should be restricted to people with the best capacities for knowledge.

POSTMAN, NEIL (1931–2003)

Neil Postman was a teacher, a scholar, a journal editor, a general semanticist, a social and cultural critic, a time-binder, a media ecologist, and a public intellectual. Time-binding, which Postman both studied and practiced, refers to humanity's ability to connect to the

past, present, and future via language, something Postman accomplished with 18 books and more than 200 articles. His accessible style helped him reach multiple audiences, and in addition to scholarly work, he published in periodicals such as *The New York Times Magazine*, *Harper's*, *Time*, *The Washington Post*, and *Le Monde*.

Although Postman developed and taught in New York University's Media Ecology Program, focusing his attention on America's evolving media landscape, he also devoted significant time to the education of children. "Children," explained Postman in *The Disappearance of Childhood* (1982), "are the living messages we send to a time we will not see." Over time, Postman grew increasingly concerned about the condition of that message, as he believed television, "the first curriculum," and other forms of media were affecting humanity's ability to think critically and independently. Postman feared that technology was replacing culture (*Technopoly*, 1993), but he never wrote as if it were a forgone conclusion, and he believed that schools could engender a critical consciousness while preserving America's cultural heritage (*The End of Education*, 1995).

His significant works include *Television and the Teaching of English* (1961); *Teaching as a Subversive Activity* (1969), coauthored with Charles Weingartner; *Teaching as a Conserving Activity* (1979); *Conscientious Objections* (1988); and *Building a Bridge to the 18th Century* (1999).

PRATT, CAROLINE (1867–1954)

Caroline Pratt built an educational philosophy on observations of children and is remembered as a visionary in the education of young children and the inventor of unit blocks.

Born and raised in Fayetteville, New York, Pratt began her career in education at seventeen, teaching in a one-room rural school. Her formal education consisted of two years at Teachers College in New York City. She rejected the then-popular method of kindergarten education advocated by Friedrich Froebel as inappropriate for young children and instead graduated with a certificate in manual training. While teaching at a normal school in Philadelphia, Pratt met Helen Marot, a liberal librarian who became her life-long companion.

Pratt and Marot moved to Greenwich Village, New York, in 1901, where Pratt taught manual training. In 1914, Pratt began the Play School with six 5-year-olds from working-class families. Although she resisted being labeled with any specific educational ideology, her school was considered to be the quintessential example of progressive education. The curriculum was centered on children recreating their experiences through play, primarily with unit blocks. These blocks remain a staple in many early childhood classrooms.

Pratt was an early advocate of field trips, which provided direct experience in learning. The school was a democratic environment in which students held grade-specific jobs. Teachers facilitated a child-centered environment. As grade levels were added, the school grew to pre-kindergarten through eighth grade.

In 1939, she was recognized for her work in bringing her educational practices to public schools in the New York area. She retired as principal emerita in 1945. Many private progressive schools came and went during the early part of the twentieth century, but her school, renamed the City and Country School, still thrives in Greenwich Village.

RAVITCH, DIANE (1938–)

Diane Ravitch is a historian of education and educational reformer who has written extensively on all aspects of American culture that relate to education.

She was born the third of eight children in Houston, Texas, where she attended public elementary and secondary school. She completed her BA degree at Wellesley College in 1960. After having children and spending time at home as a mother, she completed her Ph.D. degree in history at Columbia University's Graduate School of Arts and Sciences in 1975. Her mentor was educational historian Lawrence Cremin, who later became president of Columbia's Teachers College.

In 1974, while completing the requirements for her degree, Ravitch published her first book, *The Great School Wars: A History of the New York City Public Schools*. The book was accepted in 1975 as her dissertation, the first published work to be accepted as a doctoral dissertation at Teachers College.

Ravitch served as adjunct professor of history and education at Teachers College from 1975 to 1991. She published her second major book, *The Revisionists Revised: A Critique of the Radical Attack on the Schools*, in 1978. In this work, she criticized 1960s-era historians for their depiction of schools as oppressive institutions that merely reproduced class distinctions. In contrast to this negative interpretation, Ravitch described how schools can and have served as liberating institutions that provide opportunities for students to rise out of their impoverished situations. The book inspired much heated conversation, which helped to raise Ravitch's name to a nationwide audience.

In 1983, Ravitch published a third book on the history of education, but this time she expanded her topic to cover the entire United States. The result was *The Troubled Crusade: American Education*,

1945–1980. During the mid-1980s, Ravitch began to direct her research more toward policy makers and less toward an audience of strictly scholars and historians. Major changes were taking place in American education and politics during this time.

The highly influential *A Nation at Risk* report was released in 1983, and Ravitch became deeply involved in many of the reform movements that grew out of it. The policy-minded turn in her work is evident in her next book, *The Schools We Deserve: Reflections on the Educational Crisis of Our Time*, which appeared in 1985. As the subtitle of the book indicates, Ravitch's ideal was no longer the publication of straightforward history; rather, her goal was to influence education in practical ways by producing scholarship that spoke directly to policy makers and others who have an impact everyday on the teaching of children and youth in America's schools.

In 1988, Ravitch was the lead writer of the California Framework for History–Social Science Education. As part of this work, she became an outspoken advocate for the revival of history in the school curriculum and was a founder of the National Council for History Education. This work coincided with the publication of *What Do Our 17-Year-Olds Know?*, which she coauthored with Chester Finn, Jr.

Ravitch's work on educational policy continued to gain national attention, which culminated in her appointment as Assistant Secretary of Education by President George H. W. Bush in 1991. At this point, Ravitch left Teachers College to serve as Assistant Secretary from 1991 to 1993. During this time, she helped to create the Department of Education's Office of Educational Research and Improvement. As Assistant Secretary, she also spearheaded the federal government's effort to promote the creation of state and national academic standards.

After the completion of two years as Assistant Secretary, Ravitch accepted an invitation to become a Visiting Senior Fellow at the Brookings Institution in Washington, D.C., where she wrote *National Standards in American Education: A Citizen's Guide*. In 1994, she returned to New York City, where she joined the faculty at New York University as a Research Professor of Education, a position she continues to hold

today. Ravitch remains affiliated with the Brookings Institution as holder of the Brown Chair on Education Studies and a nonresident Visiting Fellow.

During the late 1990s, Ravitch returned her attention to writing on the history of education. In 2000, she published *Left Back: A Century of Battles Over School Reform*, which continues to be discussed widely in both history and education policy circles. She also recently published *The Language Police: How Pressure Groups Restrict What Students Learn*, which describes the distorted world of textbook creation and provides suggestions on how it may be improved. In addition to these and other single-authored works, Ravitch has edited fourteen books.

Ravitch has received numerous awards, including membership in societies such as the National Academy of Education (1979), the Society of American Historians (1984), and the American Academy of Arts and Sciences (1985). In 2005, she received the John Dewey Award for Excellence in Education from the United Federation of Teachers. She also has received honorary degrees from eight institutions, including Williams College, Amherst College, and the State University of New York.

RICE, JOSEPH MAYER (1857–1934)

Joseph Mayer Rice, born in Philadelphia, was a pediatrician and school reformer of the 1890s who wrote a series of articles on teaching methods used in urban school systems. Educational historians describe him as a pioneer of educational measurement and the progressive movement in education. Others have argued that he is the first modern education reporter.

Rice's interest in physical fitness programs in New York City public schools led to an interest in the schools as educational institutions. In 1888, he embarked on a career-altering journey to study psychology and pedagogy in Germany, a place known at the time as the center for such study. After his return to the United States, Rice examined the state of American education in a series of articles in the *Forum* in 1892 and 1893, criticizing U.S. education as unscientific and comparing it to instruction in the Middle Ages.

During a six-month trip from Boston to Minneapolis, Rice visited schools in thirty-six cities to document instructional methods, note general conditions of the schools, and investigate how schools were managed. Rice's criteria for evaluating a school included the appearance of the room, attitude of the teachers toward children, manner of recitation, the busy-work given, the teacher's pedagogical knowledge, attendance at school meetings, and efforts at intellectual self-improvement. Despite citing these complex variables, Rice made judgments about schools based mostly on how they used "new education" methods in place of antiquated mechanical methods, which amounted to the memorization of facts. "New education" focused on the learner, and whether interest, meaning, and understanding were being developed.

Rice's report was highly critical, citing only four school systems, located in the Midwest, as approaching the educational ideal based on the German schools he had visited. This investigation, although rudimentary by today's standards of educational measurement, is often considered a seminal part of the progressive or reform movement of the early 1900s because it brought the idea of reform to public consciousness, eventually leading to organization and action for this

cause. Additionally, the prevailing educational theories and classroom methods of the 1800s that came under Rice's scrutiny did little to enlighten an educational system dealing with increasing numbers of students enrolling in public schools, including many immigrants in urban settings.

Rice's findings were published in what is often cited as the first widely read series of articles on American education. Although European educational pioneers such as Pestalozzi, Herbart, and Froebel had written about progressive education decades earlier, Rice's work was essential to American society during a time of change in the schools' role that emphasized the importance of education for a successful future. Educational historian Lawrence Cremin, in *The Transformation of the School* (1961), cites Rice as one of the fathers of progressive education.

Rice is also recognized as an originator of comparative methodology in educational research. His spelling investigation of thousands of children that began in 1895 is often considered the first full-scale comparative "experiment" ever done in schools and published. This research, described in Rice's "The Futility of the Spelling Grind" (1897), is less memorable for its results than for its lasting impact in the world of educational measurement. The most commonly established conclusion from Rice's data seems to be a lack of relationship between minutes per day devoted to drill in spelling and achievement in spelling.

Although Rice's work has raised concerns with reliability, validity, and variability, his efforts to conduct widespread testing were pioneering in an era before modern statistical methodologies were available. Rice's intuitive comments on the challenges of experimentation using school groups rather than random assignment and other insights on educational measurement came at a time when such an exercise was considered unnecessary or irrelevant. Even though Rice's study laid the groundwork for research by Thorndike and Terman, it is clear from Rice's later writings that he believed his mark on educational reform and measurement did not receive the recognition he felt it deserved in academic circles.

RICHMAN, JULIA **(1855–1912)**

Julia Richman was a nationally recognized nineteenth-century educator and reformer in the New York City school system, the first female and first Jew to be appointed a district superintendent in the city's schools. Richman's reform efforts focused on the Americanization of immigrant children, as she believed strongly in the school's ability to socialize immigrants for a successful life in the United States. Working with the schools of New York City's Lower East Side immigrant communities, she enacted such progressive practices as English-language immersion classes and continuous, rather than yearly or social, promotion.

Eschewing the expectations of her traditional Jewish middle-class upbringing, Richman chose to pursue a lifelong career in education. She graduated from normal school at age 17, entering the New York City public schools as a grammar school teacher; Richman was later appointed to the position of grammar school principal, which preceded her appointment to district superintendent.

Throughout her career, Richman advocated the socializing capacity of the public school and worked to refashion immigrant children into American citizens. To that end, Richman's reforms were both educational and social, from teaching particular aspects of hygiene and American culture to immigrant children to training immigrant students in specific vocational skills.

ROGERS, CARL R. **(1902–1987)**

Carl R. Rogers was an American psychologist, psychotherapist, and the acknowledged father of humanist psychology, which he named both client-centered and later person-centered psychotherapy. Rogers developed his theories of psychotherapy as a professor at a series of universities that included Ohio State, the University of Chicago, and the University of Wisconsin before joining the staff at the Western Behavioral Studies Institute and later founding his Center for Studies of the Person in La Jolla, California.

Professor Rogers's ideas centered on the client or person and developed from his travels and experiences in China, the seminary, and the study of children at Columbia Teachers College. In *On Becoming a Person* (1961), Rogers detailed how he abandoned preconceived categories to interpret human behaviors in favor of listening to the client by establishing an accepting, empathetic relationship to gain insight that would enable the person to reshape his or her life and reduce the deployment of defense mechanisms, particularly distortion and denial. Rogers was frequently criticized for his failure to analyze and diagnose. Rogers's ideas were built on the earlier theories of Abraham Maslow in encouraging individuals to seek a positive direction, achieve self-actualization, gain maturity, and become more socialized.

Rogers was the founder of the American Association for Applied Psychology and the American Academy of Psychotherapists, and also the president of the American Psychological Association. His writings include *Client-Centered Therapy* (1951), *Person to Person: The Problem of Being Human* (1967), *Freedom to Learn* (1969), and *Carl Rogers on Personal Power* (1977).

ROGERS, WILLIAM BARTON (1804–1882)

William Barton Rogers is best known as the conceptual founder of the Massachusetts Institute of Technology (MIT). A common thread that runs through his writings is the social dislocation of laboring classes affected by industrialization. His educational reform efforts were directed at addressing this dislocation by way of formal instruction in the practical and theoretical branches of science.

Born in Philadelphia to a family of scientists (his father and three brothers all were professors of science), his early studies were largely scientific at home under his father's instruction. At age fifteen, he enrolled at the College of William and Mary; later taught at his alma mater; and, in 1835, became professor of natural philosophy at the University of Virginia until 1853. While in the South, he directed the first geological survey of Virginia, published widely on geological and natural philosophical topics, and drafted two major proposals for schools of science or "polytechnic institutes."

Rogers's ideas about developments in antebellum education and society informed the founding of MIT in 1861. The specific plan he advocated for MIT included three major components: a society of arts, a museum of technology, and a school of science. Of the three branches, the school of science attracted the most attention and became the primary focus of the public's response to the idea of the Institute. Rogers became the Institute's first president as well as professor of physics and geology. He died in the midst of delivering a commencement speech at the Institute in 1882.

ROSENBLATT, LOUISE (1904–2004)

Louise Rosenblatt holds a unique position in the fields of education and literary studies. This legendary authority engaged in teaching teachers of literature and in researching the teaching of literature. In 1992, her peers elected her to membership in the Reading Hall of Fame.

Her 1938 publication *Literature as Exploration* is still in print and is one of the most widely cited works of its type. In this and dozens of other publications such as *The Reader, the Text, the Poem: The Transactional Theory of the Literary Work* (1978), she outlines a theory of reading as a transactional process. According to her, the reader brings to the text his or her past experience and present personality. This revolutionary idea—based in an anthropological and social perspective—challenged the authority of the author and emphasized the importance of the reader and his or her experience in the interpretation of a text.

Rosenblatt began her career teaching courses in introductory literature and composition. It was out of this context that she developed her particular approach to reading that proposed that efferent and aesthetic purposes for reading influence the meaning and comprehension of a text. She wanted to be remembered for "teaching for democracy."

Rosenblatt attended Barnard College, the women's college at Columbia University in New York City. Her roommate in college was Margaret Mead, the world-renowned anthropologist. She completed her doctoral studies in comparative literature at the Sorbonne (University of Paris) in 1931. She taught at Barnard College (from 1927 to 1938), Brooklyn College (from 1938 to 1948), and New York University's School of Education (from 1948 to 1972). Upon retirement, she taught doctoral candidates at Rutgers University, Michigan State

University, the University of Pennsylvania, and the University of Miami.

ROUSSEAU, JEAN-JACQUES (1712–1778)

Best known as a philosopher, Jean-Jacques Rousseau wanted to be a composer and moved from his home in Geneva to Paris, where he spent most of his life, to pursue this career. He had some success, but he became more interested in political debates through his association with Diderot.

Rousseau began writing, and his first major work was *Discourse on the Origin of Inequality*. His most widely known work is the *Social Contract*, published in 1762. In it, Rousseau contends that sovereignty should be extended over the citizenry and that the general will is communicated through legislative objectives. This general will supports liberty, equality, and fraternity among the populace. One can see how these ideas would be exploited during the excesses of the French Revolution.

Throughout his work, Rousseau maintained that people were good-natured, though often led astray and corrupted by society. He acknowledged that corruption came from within people, but it was sustained and enlarged by societal pressures such as competition. However, Rousseau was not pessimistic on the prospect for improvement in humankind. Quite the contrary, he thought that individual people had the potential to contribute to a new and different basis for society that would engender a better future for all people. For Rousseau, a main avenue for this revolution in thought and action would come from education, which he detailed in his *Émile*, also published in 1762.

RUGG, HAROLD (1886–1960)

Harold Rugg was a professor at the University of Chicago and Columbia University, and his work as a curriculum writer was linked with several educational ideologies from the twentieth century. These included not only scientific curriculum-making and child-centered education, but especially social reconstructionism. His greatest contribution was the articulation of a fused social studies curriculum conceived out of several individual disciplines.

Into this kind of reconstructionist, interdisciplinary approach to curriculum, begun in the 1920s and extending into the 1940s, Rugg injected a new vision of America. His six-volume textbook series, *Man in a Changing Society* (1929–1937) for junior high school students, represented the apex of his achievements as a curriculum reformer. Cutting across these textbooks and his other curriculum writings was the thinking of a social progressive. Eschewing the dry memorization of isolated and meaningless facts in school knowledge, Rugg sought a means to challenge students to think about drawing interconnections between the great economic, social, and political ideas of the age. With a reformist zeal, Rugg drew together a series of generalizations from history and the social sciences that he felt represented the “glue” for higher-thinking process.

Unlike most other curriculum writers in the social studies, Rugg placed special emphasis on the importance of understanding the dynamics of propaganda and the manipulation of public opinion under both democracy and dictatorship. The tone of social protest that laced much of his curriculum material encouraged a growing conservative opposition to his work during the late 1930s.

Although receding into the background with the advent of World War II, Rugg's curriculum ideals re-emerged once again during the tumultuous 1960s.

SALMON, LUCY MAYNARD (1853–1927)

Lucy Maynard Salmon was a highly accomplished academic leader during the Progressive Era, at a time when opportunities for women were extremely limited. During her forty-year Vassar College career, she earned a reputation as a nationally prominent historian, suffrage advocate, author, and teacher.

Having earned bachelor's and master's degrees from the University of Michigan in 1876 and 1883, respectively, Salmon took advanced graduate studies from Bryn Mawr professor, and future U.S. president, Woodrow Wilson. Before she began an academic career, Salmon worked in K–12 education. She taught high school in McGregor, Iowa; later, she became the principal of the high school. She also taught at the State Normal School in Terre Haute, Indiana. A pioneer educator, Salmon continued her career in education by teaching history at Vassar College from 1887–1927.

In her work, Salmon clearly dismissed the notion that memory by itself was a primary value of history learning. She insisted that historical studies should cover a broad range of topics and that critical thinking skills and independent research should be encouraged for both mature and young students. Salmon's beliefs about the nature of history and her pedagogical practices constitute an important aspect of her legacy.

A leader in many fields, Salmon helped found the American Association of University Women, the American Association of University Professors, and the Middle States Council for the Social Studies. Clearly a

prominent academic leader, Salmon was the only woman to serve on the American Historical Association's Committee of Seven and the first woman to be elected to its Executive Council. An advocate of the new social history, Salmon's teaching methods were novel at the time and continue to be relevant today.

SANCHEZ, GEORGE I. (1906–1972)

George I. Sanchez was a leader and mentor to leaders in the Mexican American community who came after him, but his contributions to equity issues for Mexican Americans remain little known to the general public. Sanchez's contributions were recognized by a retrospective at the University of California School of Law at Berkeley in 1984, which recognized him as the single most influential person in the area of law in the pursuit of equity for Hispanics.

Sanchez was born in New Mexico Territory and was educated in Albuquerque and Jerome, Arizona. He received his bachelor's degree in Spanish from the University of New Mexico, his master's in educational psychology from the University of Texas, and his doctorate in educational administration from the University of California, Berkeley. His master's thesis concerned the use of intelligence testing with Spanish-speaking students. His master's and doctorate were funded by grants from the General Education Board (GEB), a Rockefeller foundation.

After Sanchez completed his doctorate in 1934, he returned to New Mexico, where he served as Director of Information and Statistics for the New Mexico Education Agency, a position funded by the GEB. As the president of the New Mexico Teachers Association, he was a leader in an early fight for equity in school funding for rural and urban districts. During the latter part of the 1930s, he served as a research

associate for the Julius Rosenwald Fund, a fund that was noted for building more than 6,000 schools for African Americans in the South. His field research for the Rosenwald Fund led to his book *Mexico: A Revolution by Education*. From 1937–1938, he served as director of the Instituto Pedagógica Nacional, a normal school for secondary teachers in Venezuela.

In 1940, his book *Forgotten People: A Study of New Mexicans*, which resulted from his work for the Carnegie Foundation, was published; he became president-elect of the League of Latin American Citizens; and he accepted a position at the University of Texas in Austin as a full professor with tenure. During the 1940s, he wrote Spanish textbooks, taught, wrote *The People: A Study of the Navajo*, served for a time as a part-time consultant for the U.S. Office of Civil Defense on Latin America, and began his interest in attaining equity through the courts.

After World War II, he became interested in a California equity case, *Mendez v. Westminster* (1946). This inspired him to walk several school districts with a young lawyer, James De Anda, within the Colorado Common School District near Austin, Texas, and note the discrepancies between schools built for “Latinos” and those built for “Anglos.” The information he gathered resulted in a lawsuit that ended in an agreed judgment. The judge ruled that the Texas State Board of Education must adopt a formal policy against the discrimination of Spanish-surname children on the basis of the surname. This policy was cited in future discrimination cases.

In the early 1950s, Sanchez worked with Carlos Cadena and Gustavo Garcia on developing the brief for the first case to go before the U.S. Supreme Court concerning discrimination against Hispanics, *Hernandez v. Texas* (1954), which was decided unanimously in favor of the plaintiff two weeks before *Brown v. Board of Education*. These two cases gave legal precedents to attorneys fighting against discrimination.

Until he died in 1972, Sanchez was called as an expert witness in equity cases concerning Mexican Americans, especially schoolchildren. His master’s thesis, “A Study of Scores of Spanish-Speaking Children on Repeated Tests,” was the first study of its kind for many years and served as the landmark case in that area. As a result of this thesis, he often was called as an expert witness.

In 1995, the University of Texas at Austin named the College of Education the George I. Sanchez College of Education. Schools in Texas and California also have been named for him. During his lifetime, he served as a member of the editorial board of *The Nation’s Schools*; as a consultant to the U.S. Office of the Interior, the U.S. Office of Education on migrants, and the Navajo Tribal Council; as a member of John F. Kennedy’s Committee of Fifty on New Frontier Policy in the Americas; as a board member of the Migrant Children’s Fund; and as a member of the National Advisory Committee for the Peace Corps.

SARASON, SEYMOUR B. (1919–)

Considered the founder of community psychology and a leader in the practice of clinical psychology, Seymour Sarason was born in Brooklyn, New York, and earned his BA from the University of Newark. He earned an MA and Ph.D. from Clark University, completing the latter degree in 1942. From 1942–1946,

he served as chief psychologist at the Southbury Training School in Connecticut. He then taught at Yale University from 1946 until his retirement in 1989.

In the area of education, he studied anxiety and children as well as the problems of the mentally challenged in schools. His interests included the preparation of teachers and the culture of schools. He was an advocate of the application of psychological principles to the problems of schooling. The best known of his more than thirty books are his 1971 work, *The Culture of the School and the Problem of Change* and *Schooling in America: Scapegoat and Salvation*, which was published in 1983. In the first of these, he took up the complex relationships between students and teachers and teachers and administrators. In 1996, the American Educational Research Association held a symposium celebrating the 25th anniversary of the initial publication of *The Culture of the School and the Problem of Change*. That same year, a third edition of the book, under the title *Revisiting the Culture of the School and the Problem of Change*, was published. During his long career, he has been honored by the American Psychological Association four times, including the Gold Medal Award for Life Contribution by a Psychologist in the Public Interest. Sarason also received two awards from the American Association on Mental Deficiency.

SCHEFFLER, ISRAEL (1923–)

Israel Scheffler has been a key figure in philosophy of education in the United States and, indeed, along with R. S. Peters in Great Britain, is the preeminent philosopher of education in the English-speaking world in the second half of the twentieth century.

Scheffler has made four major contributions to philosophy of education. First is his introduction of methods of logical analysis—attention to language, clarity, objectivity of method, and careful and rigorous argumentation. Second is his utilization of these methods to pursue issues of value in an effort to develop our most defensible conceptions of education, teaching, and so on, so as to have the best possible understanding of education, and of educational aims and ideals, which in turn most adequately serve educational practice. Third is his development of specific accounts of key educational concepts: (1) *education*, namely, the conception of education aimed at the fostering of rationality; and (2) *teaching*, namely, as an activity restricted by manner such that the teacher must submit his or her teaching and the substance of what is taught to the independent judgment of the student, respect the student's sense of reason and reasonableness, and treat students with respect, and as a concept with a deeply moral component that cannot be understood or analyzed behavioristically. Fourth is his demonstration of the benefits to be gained by bringing philosophy of education into close contact with general philosophy, and the mistake of removing philosophy of education from contact with its parent discipline.

As with any broad philosophical position, there is room for critical reaction, and philosophers have criticized various aspects of Scheffler's views. In particular, some have questioned whether philosophy of education should be viewed as solely a matter of rigorous logical analysis; whether philosophy of education need be as intimately connected with general philosophy as Scheffler suggests; whether teaching is rightly analyzed in moral rather than behavioral or other terms; and whether the fostering of rationality really is as basic to education as Scheffler argues.

Whatever the case, Scheffler has set a standard for serious work in philosophy of education that, in its way, is his most important contribution of all.

Harvey Siegel

SCHÖN, DONALD ALAN (1930–1997)

Donald Alan Schön, skilled first as a philosopher, is most known for his work with the development of reflective practice and learning systems within communities. His innovative ideas of a learning society and reflection-in-action have become important, well-known terms in education. Schön's work is grounded in John Dewey's theory of inquiry. Starting with Dewey's concept of thinking in problematic situations, he moved beyond this by clarifying the process of practical inquiry. His life's work was devoted to encouraging individuals to be constantly effective in practice.

Schön was born in Boston and raised in Brookline and Worcester. He graduated from Brookline High School in 1947 and Phi Beta Kappa from Yale in 1951. He studied philosophy at Yale and at the Sorbonne. He received a Woodrow Wilson Fellowship and continued his education at Harvard, where he earned his master's and doctorate in philosophy. The focus of his doctoral dissertation was John Dewey's theory of inquiry.

Schön taught philosophy at the University of California, Los Angeles, briefly before serving two years in the U.S. Army. He also lectured periodically during this time as an assistant professor of Philosophy at the University of Kansas City. In 1963, he joined the Department of Commerce in the Kennedy administration and directed a new Institute for Applied Technology in the Bureau of Standards. In 1966, he left government service and returned to Cambridge, where he cofounded and directed the Organization for Social and Technological Innovation (OSTI), a nonprofit social research and development firm.

Schön believed that change was a fundamental feature in life and that change was necessary in order to develop social systems that could learn and adapt. He argued for the need to learn, understand, guide, influence, and manage these transformations. Schön wanted people to become adept at learning, a theme he wrote about in *Beyond the Stable State*.

In 1972, Schön was appointed Ford Professor of Urban Planning and Education at the Massachusetts Institute of Technology (MIT), a position he maintained until his retirement in 1992.

He was committed to developing alternatives in which actual practices acquired from experience (rather than science) constituted the core of professional knowledge. It was this thinking, conceptualized in his 1983 book *The Reflective Practitioner*, that created a new model for higher education. In 1987, Schön published *Educating the Reflective Practitioner* in which he created a model for reflection-in-action and examined implications for improving professional education.

From 1990–1992, Schön served as the Chair of MIT's Department of Urban Studies and Planning. He died from leukemia at age 66. At the time of his death, he was Ford Professor Emeritus and senior lecturer in MIT's School of Architecture and Planning.

SCHUBERT, WILLIAM H. (1944–)

William H. Schubert is professor of Education, University Scholar, coordinator of the Ph.D. in

Curriculum Studies, and formerly the chair of Curriculum and Instruction at the University of Illinois at Chicago (UIC), where he has worked since 1975.

Schubert grew up on a farm within a family of educators in Butler, Indiana; received his bachelor's degree from Manchester College (1966); received his master's degree from Indiana University (1967); taught in Downers Grove, Illinois; and received his Ph.D. from the University of Illinois at Urbana-Champaign (1975).

Schubert's scholarship, teaching, and service focus on curriculum theory, history, and development, especially on the place of teachers, learners, and nonschool educators in progressive endeavors. He has authored more than 150 articles and book chapters; presented 200 papers at scholarly conferences; and (with colleagues) has written and edited 14 books, including *Curriculum Books: The First Eighty Years* (1980); *Conceptions of Curriculum Knowledge: Focus on Teachers and Students* (1982); *Toward Excellence in Curriculum Inquiry* (1985); *Curriculum: Perspective, Paradigm, and Possibility* (1986/1997); *Reflections From the Heart of Curriculum Inquiry* (1991); *Teacher Lore: Learning From Our Own Experience* (1992); *The American Curriculum* (1993); *Turning Points in Curriculum* (2000/2007); and *Curriculum Books: The First Hundred Years* (2002).

Schubert has chaired more than 40 doctoral dissertations (and served on more than 100 others). His award-winning teaching uses original role-playing he commonly calls "guest speakers" to portray diverse curriculum orientations, a style he also uses in consulting and writing. Five of his frequently used fictionalized personae include a social behaviorist, an experientialist, an intellectual traditionalist, a critical reconstructionist, and a postmodernist.

Schubert's recognitions and awards include president of The Society for the Study of Curriculum History, president of the John Dewey Society, president of the Society of Professors of Education, factotum of Professors of Curriculum, chair of the American Educational Research Association (AERA) Special Interest Group on Critical Issues in Curriculum, secretary and program chair of the AERA Curriculum Studies Division, and vice president of AERA. He is associate editor of *Educational Theory* and currently serves or has served on the editorial boards of

Educational Studies, Phenomenology and Pedagogy, Teaching Education, Journal of Curriculum Theorizing, Journal of Curriculum and Supervision, Journal of Curriculum and Pedagogy, Curriculum and Teaching, Taboo, and Educational Horizons, as well as being a member of the ASCD Publications Committee. Schubert is an elected member of Professors of Curriculum and The International Academy of Education. He received the AERA Lifetime Achievement Award in 2004 and the Mary Anne Raywid Award from the Society of Professors of Education in 2007.

Schubert works to keep alive basic curriculum questions: What's worthwhile? What is worth knowing, needing, experiencing, doing, being, becoming, overcoming, sharing, and contributing? Why, how, when, where, and with what consequences? Who decides these matters, and who should decide them? Who benefits? Who should benefit more fully? Schubert strongly believes that we need to embody such questions in all of the educational situations of our lives—past, present, and possible.

SCHWAB, JOSEPH J. (1909–1988)

Joseph J. Schwab developed the Biological Sciences Curriculum Study, which proposed changes to the way biology was taught at most high schools by centering the curriculum on key biological concepts.

Schwab was born in Columbus, Mississippi; studied at the University of Chicago as an undergraduate; and went on to earn his Ph.D. in biology there in 1938. He taught at the University of Chicago from 1938–1974, where he was professor of both biology and education. His articles on the philosophy and teaching of science appeared in the 1962 book *The Teaching of Science*. His primary work on educational theory appeared in *Science, Curriculum, and Liberal*

Education, which was published in 1978. He is also noted for his 1969 book *College Curriculum and Student Protest*, his analysis of the campus protests of the 1960s. During his long retirement, he held fellowships at Harvard University and the Center for the Study of Democratic Institutions.

SCHWEITZER, ALBERT (1875–1965)

Nobel Peace Laureate Albert Schweitzer helped readers think intelligently and imaginatively about the values and purposes of education. Schweitzer's decision to dedicate his life to medical service in equatorial Africa came after years of study and reflection in other disciplines.

As a young man, Schweitzer was a noted Biblical scholar, minister, organist, and author of a number of philosophical and theological works before choosing to study medicine in 1905 at the age of 30. He encouraged others to “find their own Lambaréné” in their lives and communities, where they could construct and enact their own moral narratives. Schweitzer's legacy for current educational practice is in three particular areas: education for service, education for environmental awareness, and education for hospitality and community.

First, Schweitzer's philosophy of life and his actions demonstrate that education should teach people how to serve others and their world rather than to be mere consumers. Second, through an interpretation of his principle “Reverence for Life,” Schweitzer offers an understanding of the environment as more than home and neighborhood, as nature itself, an

organic, living source of all that has value. Finally, education in learning the arts of hospitality helps people to form meaningful, respectful, fulfilling communities of learning.

SIZER, THEODORE R. (1932–)

Theodore R. Sizer is the founder and Chair Emeritus of the Coalition of Essential Schools (CES), a national network of schools and centers engaged in restructuring and redesigning schools to promote better learning. Sizer and his school-based colleagues have rejected top-down models of educational reform for reform that is shaped by the local school community and conforms to a set of ten common principles that emphasizes equity, personalization, and intellectual vibrancy for all children.

After receiving his BA from Yale in 1953, Sizer spent two years in active military duty and taught at the high school level before completing his Ph.D. in education and American history at Harvard University in 1963. He became Dean of the Harvard Graduate School of Education in 1964 and, subsequently, Headmaster of Phillips Academy in Andover, Massachusetts, in 1972. In 1981, he became a director of the project, “A Study of High Schools,” a five-year investigation of teaching, learning, and school history and design. This work led to his publishing of *Horace's Compromise* (1984), the story of Horace, a fictitious high school English teacher who is deeply committed to teaching well, but is overwhelmed by the demands of a job that has curtailed his time with students.

In 1984, a group of twelve schools in seven states agreed to redesign themselves on the basis ofSizer’s ideas and formed the Coalition of Essential Schools. Sizer, who had relocated to Brown University the year before, formed a team of colleagues to support these schools in their efforts. Within a decade, more than 100 public and private schools had affiliated with CES, and the movement began to influence basic-level educational reform strongly, and to a lesser degree, university partnerships and state educational policies. In 1992, Sizer published *Horace’s School*, which described the vision and general plan for the redesign of American high schools to become smaller, safer, more personalized learning environments.

In the third book of the series, *Horace’s Hope* (1997), Sizer reflects on his visits to several CES schools and on their progress in the adoption of common principles over a decade of reform. A national CES office, funded by the Annenberg Foundation, was established in the mid-1990s to develop regional CES centers throughout the country. By 2003, nineteen regional centers were offering direct support to schools in the areas of school design, classroom practice, leadership, and community connections.

Sizer, a founding director of the Annenberg Institute for School Reform, has continued his reform efforts by partnering with his wife, Nancy Faust Sizer, in coleading a CES charter school and publishing *The Students Are Watching: Schools and the Moral Contract* (1999). In his memoir, *The Red Pencil* (2004), Sizer draws upon his fifty years in schooling to alert policy makers to heed the differences between learning and teaching, question who has authentic authority over the child, and challenge the prevailing fetish for order in schooling.

SKINNER, BURRHUS FREDERIC (1904–1990)

Burrhus Frederic (B. F.) Skinner is known as the leading proponent of behaviorism. First introduced in 1913 by John B. Watson, the theory of behaviorism focuses on observable events as the basis for understanding human thought and learning. Behaviorism rejects the ideas of internal mental states or the subconscious as legitimate means of psychological knowledge. Skinner expanded on these ideas, inventing the “Skinner Box” to test his theories on animals. The Skinner Box allowed animals to choose between a series of levers, with the correct choice leading to a reward, usually food. Skinner also created and tested the educational theory of programmed learning. Programmed learning is designed to let students proceed at their own pace and rewards them for correct answers. Skinner wrote about this application of his theories in *The Analysis of Behavior: A Program for Self-Instruction* (1961) and *The Technology of Teaching* (1968).

Skinner was born in Susquehanna, Pennsylvania. He earned his Ph.D. in psychology at Harvard in 1931 and taught and did research at that institution for most of his career, retiring as Professor Emeritus at Harvard in 1974.

Although he wrote extensively in his field, Skinner was made famous outside the world of academic psychology by the 1948 publication of his controversial book *Walden Two*. Here, Skinner posited a utopian world based on his behaviorist theories. His other widely read and equally controversial work, *Beyond Freedom and Dignity*, was published in 1971.

SOCRATES (469–399 BCE)

Socrates, one of the most significant thinkers and teachers of the ancient Western world, lived in Athens during the time of its greatness under Pericles, as well as the greatly troubled years of conflict and decline that followed Athenian defeat in the Peloponnesian War. Most of what is known about Socrates comes to us through the memory and pen of Plato, his most notable student, since Socrates apparently wrote no works himself. His name, however, has been attached to the style of teaching he apparently developed: the Socratic method.

Living a simple life, Socrates embodied the spirit of the inquiring mind and the natural teacher. He sought to engage his hearers in dialogues about topics that would take them beyond the mundane issues of life and lead them to true self-knowledge, fearlessly probing the nature of truth, beauty, virtue, and even the gods themselves. His practice of using searching questions, often laced with irony, to provoke listeners to first state the obvious, and then lead them via further questioning and conversation to a more profound understanding of the matter under consideration, is still known as the Socratic method.

It stood in stark contrast to the more formal instruction of the sophists (“wise ones”) of Athens, who apparently claimed to offer—at a price—an education that would provide the young men of Athens with final answers to all the questions of life. Socrates rejected the label of sophist, preferring the more humble title of philosopher (“the brotherly love of a friend for wisdom”). He also rejected the sophists’ formalization and commodification of learning, believing that their instruction brought any possibility of true learning to an end. Learning and discourse ought to be never-ending, he said, telling the Athenians that “the life which is unexamined is not worth living.”

In time, Socrates’ teaching and method brought him into conflict not only with the sophists, but also with the rulers of Athens. His willingness to question all things, including the nature of civic virtue and even the religion of Athens, was viewed by his opponents and enemies with consternation and alarm; his

undeniable influence over many of the young men of Athens, whom he instructed at little or no charge, led to envy and wrath. He was formally charged with corrupting the youth of Athens by making them question the traditional knowledge of the Athenians, and with impiety for daring to ask questions about the gods.

Socrates defended himself calmly and with fearless wisdom, yet was found guilty. Already 70 years of age, he resolutely refused lesser penalties and chose death by drinking hemlock. True to his calling to the very end, he engaged his friends, students, and even his jailer in his final discourses, ceasing only when his life did.

SPENCER, HERBERT (1820–1903)

Herbert Spencer was an English philosopher, political theorist, and contributor to the disciplines of ethics, metaphysics, religion, politics, rhetoric, biology, and psychology. He was known as the Father of Social Darwinism because he coined the phrase *survival of the fittest*. Spencer argued that the impact of social policy on man must be studied; he promoted the rights of both women and children and believed that science and philosophy contributed to the development of individualism and progress.

Spencer’s *Principles of Psychology* (1855) established a theory of the mind that stressed that human intelligence developed as a response to the individual’s physical environment. With the support of Thomas Huxley, Spencer was able to publish his theories of evolution and the laws of progress, which in turn influenced Charles Darwin. According to Spencer, evolution is lifelong as matter is refined into increasingly complex and coherent forms. His views on social justice advocated individual responsibility for actions and behavior and the right of each person to do as he or she wished as long as it did not harm the rights of others.

Some of Spencer's beliefs were manipulated by conservative politicians, libertarians, and social theorists. For example, he meant the phrase *survival of the fittest* to reflect man against a changing environment, not against his own kind. The frequency and variety of his writings would later influence a number of prominent authors, including George Eliot, Thomas Hardy, Leo Tolstoy, D. H. Lawrence, Jack London, and H. G. Wells. Herbert Spencer's *System of Synthetic Philosophy* includes *First Principles* and volumes on the principles of biology, psychology, sociology, and ethics. Published posthumously was his *Autobiography* (1904).

STEINER, RUDOLF (1861–1925)

Austrian Rudolf Steiner was a poet, philosopher, educator, literary scholar, activist, and social innovator. He founded the Anthroposophical movement, meaning wisdom (sophia) of humankind (anthro), which was based on the idea that the spiritual world is accessible through a path of spiritual self-development. Practical applications of this movement included biodynamic farming, anthroposophical medicine, eurythmy (an artistic movement form), Bothmer gymnastics, and Waldorf education.

In 1907, Steiner wrote an essay, "Education in the Light of Spiritual Science," in which he described phases of child development from an anthroposophical perspective and outlined how these could be the basis for a holistic approach to schooling. In 1919, the first Steiner school was founded to serve the workers' children in the Waldorf Astoria cigarette factory in Stuttgart, Germany. Over the past century, the Waldorf School Movement has established itself as the largest independent school movement with more than 1,000

Waldorf schools worldwide, including schools in the townships of South Africa; the slums of São Paulo, Brazil; and a shared school between Israelis and Palestinians in the Middle East.

Although Steiner's views on multiculturalism are controversial, he was early in raising issues of the challenges of a multicultural society and asserted the need for a spirituality that could unite all people regardless of their culture or religious background. A progressive social theorist, Steiner's threefold social order has served as the basis for a number of economic and philanthropic institutions, including the Rudolf Steiner Foundation for innovations in finance that is aimed at supporting the environment, financing social growth, and enriching human life.

TERMAN, LEWIS MADISON (1877–1957)

Lewis Madison Terman, Stanford University professor of Cognitive Psychology, is best known for publication of the *Stanford Revision of the Binet-Simon Scale* (1916), known commonly as the Stanford-Binet Test, which established the intelligence quotient (IQ) as a measure of one's intellectual aptitude.

Hailing from a large farming family—the twelfth of fourteen children—Terman's early life was characterized by his intellectual desire despite his rural setting and family background. Terman strongly believed that one's IQ was inherited and was the strongest predictor of success in life.

Until Terman's work, intelligence testing concentrated on identifying those in lower strata. In the 1920s, Terman began a longitudinal study—the first of its kind—on gifted children (referred to as "Terman's termites"); this study continues today as the longest-running study in American education. Its early results

established that gifted children were not weak and sickly social misfits, as previously believed, but were generally taller, in better health, better developed physically, and better adapted socially than other children.

Terman later joined in the eugenics movement, and his published writings argued for measures to reverse society's perceived deterioration, primarily through controlling reproduction. Terman stated it was more important for man to "control his biological evolution" than to capture the energy of the atom. This agenda promoted the enforcement of compulsory sterilization for those with low IQ scores in many U.S. states, and the absence of a public recanting of his position continues to taint Terman's legacy and work.

THOREAU, HENRY DAVID (1817–1862)

Henry David Thoreau is best known for his writing as an American transcendentalist. However, Thoreau's contribution to society reaches beyond this label. In addition to his life as an author, Henry David Thoreau was a naturalist, abolitionist, pacifist, poet, philosopher, individualist, educator, and scholar. Thoreau is also considered by many as an influential force behind movements such as environmentalism, ecology, and anarchism.

Born David Henry Thoreau in 1817, Thoreau rearranged his name upon graduation in 1837 from

Harvard College, where he studied science, philosophy, and mathematics. While on a break from his undergraduate work in 1835, Thoreau took his first job as a teacher in Canton, Massachusetts. After graduating, Thoreau accepted his first faculty position at the Concord Academy in his hometown of Concord, Massachusetts. Upon his dismissal for failure to comply with the school's corporal punishment policy, Thoreau opened and operated a grammar school in Concord with his brother John from 1838–1841. When his school closed because of his brother's death, Thoreau continued to work as a tutor for the extended family of Ralph Waldo Emerson.

Thoreau met Emerson and joined his circle of friends in the late 1830s. With Emerson's motivation, Thoreau's first essay was published in 1842. Emerson's tutelage and Thoreau's writing continued throughout the years between Thoreau's graduation from Harvard until 1845, when Thoreau moved into the forest at Walden Pond to write what would later become his most notable work—*Walden, or A Life in the Woods*—written from 1845–1847 and published in 1854. Throughout his remaining years, Thoreau would continue to read and write on topics ranging from nature to politics. His most famous essay, "On the Duty of Civil Disobedience" (1849), was written in response to the night he spent in jail for refusal to pay delinquent taxes as a way to show his opposition to slavery and the Mexican-American War.

Overall, Thoreau made significant contributions to many fields, including education. His life and work have influenced many future generations of writers, scholars, philosophers, educators, and leaders. His most well-known quote and critique of traditional education comes from his own journal: "What does education often do?—It makes a straight-cut ditch of a free meandering brook." Until his death in 1862, Thoreau continued to philosophize and write about alternatives to what he saw as flawed and unjust systems.

**THORNDIKE, EDWARD LEE
(1874–1949)**

Edward Lee Thorndike was an American author, educational psychologist, and researcher of animal and human intelligence. While a student at Wesleyan and Harvard Universities, he developed theories about the relationship of responses to intelligence in fish, young chickens, and primates. Thorndike's study on how cats escape from puzzle boxes led him to conclude that animal responses are more likely to recur based on satisfaction than on innate animal insight. His conclusions led Thorndike to the study of human intelligence in children.

Believing that progress in education could be measured and that repetition and reward contribute to learning, Thorndike developed intelligence testing in reading, English composition, writing, and drawing, and also at grade levels. During World War I, he developed measurements to test both abilities and achievements for U.S. Army personnel, which led to the creation of intelligence tests based on completions, arithmetic, vocabulary, and directions (the CAVD). Professor Thorndike's Law of Effect stated that responses receiving satisfaction are increased and responses associated with discomfort are weakened. The result was psychological connectionism, which concluded that the increased frequency of stimulus/response systems were indicative of higher intellect. Thorndike rejected the notion that intelligence could be independent of cultural background.

Thorndike's *Educational Psychology* (1913) was instrumental in creating a discipline that had not previously existed. Other important works by Thorndike include *Introduction to the Theory of Mental and Social Measurements* (1904); *The Elements of Psychology* (1905); *Animal Intelligence* (1911); *The Measurement of Intelligence* (1927); *The Fundamentals of Learning* (1932); *The Psychology of*

Wants, Interests, and Attitudes (1935); and *Human Nature and the Social Order* (1940).

**TORRANCE, ELLIS PAUL
(1915–2003)**

Ellis Paul Torrance, known as the "Father of Creativity," was an American psychologist whose primary contribution to the field of education was establishing a quantitative measure of creativity that could be used to identify students for special educational programs, such as those for the gifted and talented. The Torrance Test of Creative Thinking (TTCT) firmly established the attitude that intelligence quotient (IQ) score is not the sole means by which to measure intelligence.

Upon completion of his doctoral degree from the University of Michigan, Torrance began a teaching career that spanned from 1957 to 1984; the majority of his career was spent at the University of Georgia, where the Torrance Center for Creativity and Talent Development is now located.

The TTCT involves a set of simple measures of divergent thinking and other problem-solving skills scored on (1) *fluency*, or the total number of interpretable, meaningful, and relevant ideas generated in response to the stimulus; (2) *flexibility*, or the number of different categories of relevant responses; (3) *originality*, or the statistical rarity of the responses among the test subjects; and (4) *elaboration*, or the amount of detail in the responses.

The use of the TTCT in identifying students for gifted and talented programs has become widespread because of the response of many district and state

programs toward using a variety of methods to identify students, particularly those from underrepresented populations whose true aptitude may not be accurately represented by IQ score alone.

TYLER, RALPH WINIFRED (1902–1994)

Ralph Winifred Tyler developed a theory about curricular reform, called the Tyler Rationale, that is credited with creating the field of educational evaluation and still stands as a model for planning a curriculum.

Born in Chicago, Tyler grew up in Nebraska and was a high school science teacher in Pierre, South Dakota, before earning his Ph.D. from the University of Chicago in 1927. While working at the Bureau of Educational Research and Service at Ohio State University (1929–1938), Tyler became director of the legendary Eight-Year Study (1934–1942). Tyler then returned to the University of Chicago's Department of Education (1938–1948) and also served as Dean of the Division of Social Sciences (1948–1953). In 1953, he became the first Director of the Center for Advanced Study in the Behavioral Sciences at Stanford University, a position he held until 1966.

In 1949, Tyler published his *Basic Principles of Curriculum and Instruction*, which went through thirty-eight printings. His theories about curriculum

reform outlined in the work became known as the "Tyler Rationale," which consisted of four basic parts:

1. Defining appropriate learning objectives
2. Introducing useful learning experiences
3. Organizing learning experiences to maximize their effect
4. Evaluating the process and revising the aspects that did not prove effective

Tyler chaired the committee that eventually developed the National Assessment of Educational Progress. He also influenced the underlying structure and guidelines for expenditures for the Elementary and Secondary Education Act of 1965. Tyler was the first president of the National Academy of Education, an organization he helped found.

VYGOTSKY, LEV (1896–1934)

Lev Vygotsky was a groundbreaking Russian psychologist who studied child development, language acquisition, learning, and conceptual thought while working at the Institute of Psychology in Moscow from 1924–1934. His best-known work, *Thought and Language* (1934), was published shortly after he died of tuberculosis, but it was quickly suppressed by Stalin's regime in 1936.

Vygotsky analyzed language by using what he called a developmental approach, arguing that thought and language became fused in human child development at a relatively early age, resulting in the development of more complex thought processes. Vygotsky's analysis was built around a critique of Jean Piaget's analysis of child development, and Vygotsky specifically argued that children internalized social speech to form the scaffolding for conceptual thought. This

led Vygotsky to emphasize the importance of social interaction for learning and development, creating his theory of the “zone of proximal development.” This theory argued that mental development should be measured by accounting for what problems children could solve with the assistance of adults, in addition to what children could do by themselves.

Although Vygotsky’s students continued to build on his work after his death, he remained relatively unknown outside of the Soviet Union until 1962, when *Thought and Language* was translated into English. Interest in Vygotsky’s studies expanded further with the compilation and publication of a series of his essays on mental development and education, titled *Mind in Society* (1978).

Steven E. Rowe

WASHINGTON, BOOKER TALIAFERRO (1856–1915)

Booker Taliaferro Washington was the founder and head of the then-Tuskegee Normal and Industrial Institute in Tuskegee, Alabama, and he was a proponent of the trades-oriented education that that school provided for African Americans. Indeed, although Washington acknowledged the benefits of a more classical liberal education, he found liberal education to be of limited usefulness and denounced it as learning without the dignity of labor. He faced criticism for this educational approach and for being an accommodationist on race relations, but his achievements are nevertheless extraordinary.

Washington was born a slave on a farm in Franklin County, Virginia, in 1856. His birth parents were an enslaved Black mother and a White father about whom Washington knew almost nothing. He spent the first several years of his life in slavery on the Virginia farm until the Emancipation Proclamation declared his and his family’s freedom in 1865.

A large part of Washington’s colorful life is recounted by him in his 1901 autobiography, *Up From Slavery*. Although Washington published other autobiographical works, this one is his best known. In it,

he details the most notable events of his life, from the relatively brief time he spent in slavery as a youth, to his educational exploits during his adolescence, and well into his career. Washington gives an account of his experiences at Hampton Institute (now Hampton University) and the extraordinary influence that the lessons he learned and the people he met there had on his philosophy of life. Moreover, he describes the numerous occasions when he undertook the tasks of spreading the seeds of success for his institution and offering his advice on improving race relations in America.

Washington’s value system and outlook were shaped in his youth, especially during his years at Hampton. One person during this time who had a significant effect on Washington’s life was Viola Ruffner, a White woman for whom he worked as a live-in servant. He claims to have learned valuable lessons from her that helped him to succeed at Hampton and in life. The person who left the greatest impression on Washington, though, was General Samuel Armstrong. As principal of Hampton, Armstrong’s educational and moral leadership seem to have affected Washington’s personal philosophy the most. Washington believed that Armstrong was noble and unselfish; showed eternal devotion to his students and all of his undertakings; and, even though he was White, never displayed any indecorous feelings toward people of any race.

So profound were Armstrong’s and Hampton’s overall influence on Washington that the ideals of Hampton under Armstrong later formed the foundation of Washington’s Tuskegee Institute and his precepts of self-help and racial uplift. At Tuskegee, Washington developed a normal school that espoused a program of industrial education patterned primarily after the “Hampton idea” or “model.” He believed that Blacks should obtain needed industrial skills to ensure their economic prosperity and, ultimately, the future of the race by rendering themselves indispensable to the development of the country.

Washington’s Tuskegee was particularly tailored toward the needs (as he perceived them) of southern Blacks both because this population would primarily supply the institute’s student body and because he thought the rural South was where Blacks would be most successful. What he prescribed was that the education of the “hand, head, and heart” must go together.

Although Armstrong's Hampton model provided the most immediate source of inspiration for Tuskegee, the vision for Washington's institute was shaped by other sources as well. For example, Washington's demand that industrial learning be correlated with academic instruction was a manifestation of his adaptation of Johann Pestalozzi's philosophy and of Friedrich Froebel's "object studies." He seemed to believe that their ideas could be applied to the context in which southern Blacks lived. It is also noteworthy that there are some philosophical parallels between Washington's doctrine and some major components of John Dewey's body of work, although the Tuskegee model reached its apex long before Dewey's impact was widely felt.

Washington's prescriptions were not restricted to the realm of education. He believed that political involvement on the part of masses of Blacks distracted them from the more crucial task of improving their industrial skills. He spoke derisively of the political agitation by Blacks during Reconstruction, and he lamented what he saw as Black people's childlike dependence on the federal government even though he felt that the government had failed to adequately provide for Blacks in the educational arena. Furthermore, Washington urged Blacks to cooperate with Whites instead of fighting them. At the same time, he told Whites that it was important for them to avoid passing quick or harsh judgments upon African Americans because of the unparalleled obstacles faced by members of the race.

He also used his unusually powerful position to exert a great deal of political influence. Most of it was directed toward negotiating for institutional support, political placements, and favorable press coverage, exercised both publicly and especially behind the scenes. Washington advised Presidents Theodore Roosevelt and William Taft, expended an enormous amount of effort securing federal positions for his favored sons and daughters, blessed the ascendancy of his like-minded peers and tried to block the progress of those who threatened his power and belief system, and exerted pressure on many of the organs of the Black community in an attempt to gain their favor. More constructively, he was also involved overtly and covertly in efforts to overcome racial injustice.

Washington's ultimate goal was to assist the citizens of the United States in attaining human equality. In an attempt to reach this goal, every aspect of his life was guided by one basic tenet: work to be the best at what you do, and human nature will recognize and reward your meritorious efforts regardless of your race. Despite his espousal of such a noble ideal, his life's work is not without significant criticism. Washington has been widely dismissed as being too obliging to his White contemporaries, accused of failing to examine the plight of Black people from a broad intellectual perspective, and criticized for discouraging Blacks from exercising their political rights.

These characterizations of Washington's ideas and practices have led many observers to describe him as an accommodationist. Washington's leadership of Tuskegee helped to earn him the accommodationist label, in that the educational program served as a compromise between the desires of White philanthropists and industrialists, many northern White citizens, and most southern Whites. Industrial education was also appealing—at least initially—to a great many Blacks as an indirect means of attaining prosperity and racial progress.

Washington's contributions to the uplift of African Americans and to the betterment of American society are extraordinary; he worked consistently and tirelessly to pursue his agenda until just before his death in 1915. Nevertheless, his great influence on society seems to have had conflicting outcomes: His strategies brought substantial success to Blacks and to poor Whites, but his insistence on the primacy of his method and on the unconditional approval of it apparently stifled the emergence of new ideas.

Furthermore, his undying faith in human kindness and, more importantly, his uncritical acceptance of the notion of achieving enfranchisement through the channel of American capitalism were limiting assumptions. Although his plan for racial uplift had a narrow base of application, he was motivated by a vision of hope and liberation that made it possible for him to struggle against the force of racism in the first place.

**WEBSTER, NOAH
(1758–1843)**

Noah Webster, the American lexicographer, was the first to write a dictionary of American English. He was also famous among his contemporaries for his schoolbooks, particularly his spelling books.

At a time when children learned to read, write, and spell through the oral spelling of the “alphabet method,” Webster’s *American Spelling Book* of 1787 (a revision of his first effort of 1783) became for forty years the text most used for teaching children to read. Webster sold its copyright in 1818 to devote himself to his two-volume *An American Dictionary of the English Language*, published in 1828.

Aware that his old speller was losing ground to its competitors, Webster collaborated with a teacher named Aaron Ely to compose a radically new speller in 1829. Titled *The Elementary Spelling Book* and known as the “blue-back speller” from its colored covers, it became the country’s most popular book for teaching spelling in schools and at spelling bees until about 1900. Webster’s other schoolbooks, which included history, geography, and biology, were too innovative to be successful.

Webster also attempted to improve English spelling. His re-spellings of classes of words—exemplified by *center* (for the British *centre*), *honor* (*honour*), and *music* (*musick*)—were widely accepted because they appeared in his spellers and the popular *McGuffey*

Readers. They distinguish American from British spelling to this day.

**WEIL, SIMONE
(1909–1943)**

Simone Weil is best known as a preeminent French philosopher and author who was also a factory and field laborer; a political activist and theorist; a revolutionary; and, in the last years of her life, a mystic. Weil’s compendium of work has significance for several fields; for education, her premises on the connection of thought and action and on the value of work for the development of the mind and spirit are particularly relevant.

Born in Paris to a well-to-do, professional family, Weil was a brilliant student who received her baccalaureate in philosophy in 1925. She advanced successfully through the *Ecole Normale Supérieure* and began her teaching career as a professor of philosophy in 1931.

From the time of her first published writing in 1929 until her death, Weil examined the relationship of thought and action and sought the direct experiences of the material world through manual labor and political activism to understand better the world of ideas and value. From 1933–1935, Weil left teaching to work in factories and became an outspoken advocate for workers and trade unions. During this period, she also immersed herself in the political and economic structures of Europe, and in particular, the increasing militarism of Germany. In 1936, she joined a militia in Spain’s civil war; however, burns incurred in a camp accident forced Weil to return to Paris in late 1936.

Unable to return to teaching because of her deteriorating health, Weil concentrated her writing during this period on war and oppression.

By the close of the 1930s, however, Weil had turned her focus to spiritual values, and she began to include in her writing specific Christian assumptions gleaned from her discussions with a priest and a farmer in 1941. Forced to flee France in 1942, Weil ultimately resettled in London, where she wrote for the Free French Committee. She developed her mystical theology, as revealed in two of her best known texts, *Waiting for God* and *The Need for Roots*. In August 1943, Weil was hospitalized and died of tuberculosis and malnutrition in London.

WHEELOCK, LUCY (1857–1946)

Lucy Wheelock was an early-childhood educator, member of the late-nineteenth-century Kindergarten Movement, and founder of Wheelock College. Wheelock developed an innovative model kindergarten, wrote stories for children and articles on classroom pedagogy, and was appointed to the Education Committee of the League of Nations. During turn-of-the-century debates on the future of early childhood education, Wheelock played the role of mediator between the old guard Froebelians and the progressives.

Wheelock was born in Cambridge, Vermont. Her mother was a teacher and her father was a Congregationalist minister and superintendent of schools. She attended Underhill Academy in Vermont, Reading High School in Massachusetts, and Chauncey-Hall School in Boston. She completed her kindergarten training with Ella S. Hatch, a protégé of Elizabeth Palmer Peabody. In 1879, Wheelock became the kindergarten teacher at Chauncey-Hall and developed an innovative approach to the curriculum that attracted national attention. In 1888, she was asked to establish a training school, later Wheelock College, designed to prepare young women for kindergarten teaching.

As president of the International Kindergarten Union (IKU) from 1895–1899, Wheelock attempted to unite emerging factions within the Kindergarten Movement. Wheelock believed that a true Frobelianism was open to experimentation and methodological evolution and could accommodate modern advances in child study and psychology. Although she was able to hold the IKU together for a time, orthodox Froebelians were ultimately unwilling to accept Wheelock's revisionism and left the organization. In her later years, Wheelock wrote articles on parent education and home-school relations and became active in the National Congress of Mothers, later the Parent Teacher Association. After her retirement in 1939, Wheelock's school was incorporated as Wheelock College.

WHITEHEAD, ALFRED NORTH (1861–1947)

Alfred North Whitehead, an educator throughout his life, is best known for the three-volume work

Principia Mathematica (1910–13), which he wrote with his one-time student, Bertrand Russell.

Born in East Kent, England, Whitehead earned his BA from Trinity College, Cambridge, in 1884 and his doctorate from the same institution in 1905. While his interest in mathematics dominated his early career, Whitehead became interested in education and the philosophy of education. In 1916, he delivered a lecture titled “The Aims of Education: A Plea for Reform” that was sharply critical of the educational practices of the time. He asserted that understanding must be the goal of education, and how this is achieved will necessarily be affected by the individual. A book by the same title, which is a collection of essays written between 1912 and 1922, was published in 1929.

Because of his technical use of language, dense writing style, and absence of a single treatise that encapsulates his entire philosophy of education, many find it difficult to access Whitehead’s ideas. In addition to his written work and lectures, Whitehead advised the British government on several educational initiatives and, from 1919 to 1924, served as chair of the Governing Board of the University of London’s teachers’ college.

In 1924, Whitehead went to teach at Harvard University, where his work focused on metaphysics and the nature of knowledge. His cosmological philosophy was developed during this time. He retired from Harvard as Professor Emeritus in 1937.

WIGGIN, KATE DOUGLAS (1855–1923)

Kate Douglas Wiggin was an activist in the nineteenth-century Kindergarten Movement and the author of the children’s classic *Rebecca of Sunnybrook Farm*. Wiggin became the head teacher of the first free

kindergarten in San Francisco and founded the California Teacher Training School. She wrote songs and stories for children, lectured on children’s rights and welfare, and published articles on curriculum and pedagogy. Wiggin spoke before the National Education Association on the rights of children in 1892 and participated in the kindergarten demonstrations at the World Columbian Exposition in Chicago in 1893. Her essays and novels depicting the natural goodness and intelligence of children influenced generations of early childhood teachers and educational reformers.

Kate Douglas Wiggin was born in Philadelphia as Katharine D. Smith. She spent most of her childhood in Maine and drew on her experience in small-town New England to create the characters and nurturing communities presented in her novels. Wiggin and her family moved to California in 1873, where she completed kindergarten training with Emma Marwedel, a leading disciple of Friedrich Froebel and a protégé of Elizabeth Palmer Peabody. In 1878, Wiggin became head teacher of the Silver Street Kindergarten in the impoverished Tar Flats district of San Francisco. Under her direction, Silver Street expanded to provide evening classes, social services, and teacher training. In 1881, she married Samuel Bradley Wiggin and gave up classroom teaching but continued to lecture and direct the school until 1893.

In the 1880s, Wiggin began to write stories about children to support her work at Silver Street. *The Birds’ Christmas Carol*, her first novel, was published in 1888. After the sudden death of Samuel Wiggin in 1889, she supported herself through her writing, lectures, and public readings. On the lecture circuit, she was often paired with notable authors like Mark Twain and William Dean Howells, who became mentors and lifelong friends.

Wiggin married for a second time in 1895, retired from active involvement in the Kindergarten Movement, and devoted herself to her writing. The publication of *Rebecca of Sunnybrook Farm* in 1903 made Wiggin an international celebrity. However, long before *Rebecca*, she was well-known to early-childhood educators and reformers as a “kindergarten pioneer” and the author of *Timothy’s Quest* (1890), depicting the experiences of homeless children; *The Story of Patsy* (1891), about a child with special

needs; and *The Rights of Children: A Book of Nursery Logic* (1892).

WILLIS, PAUL (1945–)

Paul Willis is a British cultural theorist and critical ethnographer whose landmark book, *Learning to Labour* (1977), is credited with transforming critical studies of education through its use of ethnography to theorize how social class is reproduced through the “lived culture” of youth.

Through an exploration of counter school culture among working class “lads” in an industrialized English town in the 1970s, Willis demonstrated that, in contrast to deterministic Marxist analyses prominent at the time, social class status was not reproduced *passively* through schooling; rather, structural forces were mediated through the cultural milieu of social agents who could see through the conditions of their existence. In the lads’ case, their critique of meritocracy, individualism, and credentialism manifested in an opposition to school authority that was expressed through stylized resistant practices aimed at both teachers and conformist students. The limitations of their critique, along with their virulent racism and sexism and an embrace of the masculinity they attributed to manual labor, ultimately consigned the youth, ironically through their own complicity, to working-class futures.

Learning to Labour was critiqued for its lack of theorization of the lads’ brutal sexism and for being too beholden to neo-Marxism despite protests otherwise. Willis responded to these criticisms in his extensive body of ethnographic and theoretical work focused

on the creativity and radical potential of cultural production within powerful structural constraints. His books include *Profane Culture* (1978), *Common Culture* (1990), and *The Ethnographic Imagination* (2001). Willis, of working-class origins himself, was among the first generation of scholars at the legendary Birmingham Centre for Contemporary Cultural Studies (as a student and later a research fellow). He has subsequently worked in public policy and in academia in the United Kingdom and elsewhere.

WOLLSTONECRAFT, MARY (1759–1797)

Author of the first known argument in English for universal, secular, government-financed coeducation of rich and poor together, Mary Wollstonecraft is more famous as a philosophical “mother” of feminism who castigates both conservative Edmund Burke’s and liberal Jean-Jacques Rousseau’s misogyny as illogical and immoral. A prolific early modern cultural critic and theorist of education, she critiques both sexes’ monarchist miseducation in *A Vindication of the Rights of Men* and *A Vindication of the Rights of Woman*; narrates moral teaching in response to the property system’s hidden curriculum in *Original Stories From Real Life*, illustrated by William Blake; and charts autobiographically a single mother’s outward and inward journey of self-education in *Letters Written During a Short Residence in Sweden, Norway, and Denmark*.

Indebted to Catherine Macaulay’s less-developed proposal of coeducation and to her own teaching experiences as eldest daughter, schoolmistress, governess, and public educator-in-print, Wollstonecraft’s coeducational thought experiment in the second *Vindication* formulates critical approaches and concerns that remain in broad outlines those of an

English-speaking feminist tradition of coeducational thought.

Many biographers have retold Wollstonecraft's unusually well-documented, self-educative life, including her early passionate partnership with Fanny Blood; her learning from several mentors; and her late, joyfully egalitarian, mutually educative marriage to political philosopher William Godwin, who admired her educational wisdom and shared her principled resistance against marriage as well as childhood memories of domestic violence. Wollstonecraft died upon birth of their daughter, *Frankenstein's* author, Mary Shelley, whose work reflects study of her mother's educational writings.

WOODSON, CARTER GODWIN (1875–1950)

Carter Godwin Woodson is a pioneer of African and African American history and research. A lifelong bachelor, he openly declared “marriage” to his life's work of dispelling racist myths perpetuated by White scholars about African Americans and their history.

The oldest of nine children of former slaves, Woodson received sparse formal education prior to entering high school at the age of 20 because he had to work on the family farm and later in the West Virginia coal mines. Bright and focused, he completed the four-year high school curriculum in two years and went on to take a bachelor's degree from Berea

College in Kentucky and both bachelor's and master's degrees from the University of Chicago. He then became the second African American to earn a Ph.D. in history from Harvard University in 1912.

Woodson was a high school teacher and principal, college professor and dean, and multilingual world traveler who prolifically wrote and published historical research. Of the sixteen books he authored, *The Miseducation of the Negro* (1933) became a classic and is a perennial best seller with several hundred thousand copies in print seventy-five years later. It is a testament to the enduring message that an oppressed people cannot depend upon their oppressors for liberatory education. Woodson's research found that many Negroes who were “educated” to professional status in Eurocentric American institutions were denied full access to American society, exhibited self-defeatist behavior, and returned to their communities less empathetic and committed to the plight of the oppressed.

Woodson established the Association for the Study of Negro Life and History (1915), founded the *Journal of Negro History* (1916), the Associated Publishers (1921), and the *Negro History Bulletin* (1937). In February 1926, he initiated Negro History Week, which later became Black History Month in the 1960s. He believed that correcting American miseducation could not be left to ivory tower scholarship; myths about African inferiority and their lack of contribution to world history must be debunked before the popular masses.

YOUNG, ELLA FLAGG (1845–1918)

Ella Flagg Young, who served as superintendent of the Chicago Schools from 1909–1915, may have been the most famous and well-respected public educator of her era. Her assumption of the Chicago superintendency marked the first time any woman had risen to such a powerful position of school leadership. In 1910, a year after becoming superintendent, rapidly growing ranks of female teachers in the National Education Association elected her as the association's first female president.

Previously, Young had been a remarkably popular professor at the University of Chicago, teaching alongside John Dewey. In this position, she authored several influential books of educational theory. Through these and numerous other forms of public service, Young deeply influenced generations of students, educators, social progressives, and woman's suffragists who found inspiration in her life, work, and thought.

Born in 1845 in Albany, New York, N. Ella Flagg, as she was first known, joined her parents, an older sister, and an older brother in moving to Chicago so that her father, Theodore, a skilled metalworker, might find steady work in this explosively expanding midwestern city. Although Young reputedly did not attend elementary school because of chronic illness, she studied at home with her mother, Jane Flagg, reading voraciously and discussing social issues of the day. During her early teens, her lack of formal schooling notwithstanding, she enrolled in a newly created normal program at Chicago High School, quickly demonstrating exceptional pedagogical gifts. She independently established her own teaching internship so that she could further refine her skills.

In 1862, at the age of 16, she began teaching in her own classroom in a school with more than 1,300 students and located in a squalid, congested part of town. Within two weeks, Young's mother died prematurely of an unexplained cause. Young responded to this great personal loss by investing herself even more fully in her work, a pattern that would recur throughout the rest of her life. Over the next few years,

Young's annual salary leaped upward in comparison with those of her peers.

Her reputation for outstanding teaching led the superintendent to appoint her in 1865 to serve as principal of a newly created school of practice. In this capacity, she worked with normal school students as they practiced their pedagogical skills in a fully functioning elementary school. Despite a bitter disagreement with the school board after which she resigned from the principalship of the school of practice, a brief failed marriage, the great Chicago fire (which destroyed her home), and the deaths of her brother and father, Young nevertheless continued devoting herself fully to her work during these years, eventually returning to the principalship in 1876.

In 1886, her exceptional administrative work was profiled in a nationally circulated magazine, which raised her visibility substantially. Shortly thereafter, the school board appointed her to an assistant superintendency, a position she held for twelve years. She resigned from this work in 1899 when she sharply disagreed with the superintendent on a growing number of matters. Having already taken doctoral coursework with John Dewey at the University of Chicago, Young then finished her dissertation and joined the ranks of the University of Chicago faculty.

She and Dewey jointly published a series of books on educational theory. She also worked closely with him in establishing and running the university laboratory school. Then, after sustained disagreements with university administrators, both Dewey and Young resigned in 1904. Young and her life partner, Laura Brayton, traveled abroad to study the schools of Europe. Upon their return in 1905, the Chicago school board invited Young to serve as principal of the Chicago Normal School, to which she readily agreed. Then, in 1909, after a contentious and nearly failed search, the school board unanimously selected her for the Chicago superintendency.

The announcement that Young would take the helm of Chicago's schools prompted newspapers across the country to feature stories on this unprecedented achievement for a woman. Suffrage activists in the United States and abroad celebrated the news in newsletters and stump speeches. For the next several years, Young enjoyed broad public support and

political peace on the school board as she raced to implement a host of progressive reforms, such as the creation of councils through which teachers governed their schools, significant teacher pay increases, the development of penny lunch programs, the first establishment of sex education courses anywhere in the country, the desegregation of schools, and the creation of groundbreaking programs addressing the unique vocational and social needs of girls.

She resigned briefly in 1913 when the board took a decidedly conservative turn. Massive rallies of teachers, students, suffragists, and other progressive allies prompted sufficient political pressure for the board to relent temporarily. After renewed board resistance, however, she resigned for good in 1915, this time making front-page headlines around the world. She spent the remainder of her years promoting war bonds, chiding President Wilson for his lukewarm support for suffrage, writing a book on the role of schools in a democracy, and traveling extensively with her partner. She died in 1918 during the flu pandemic.

Looking back, John Dewey regarded Young as the “wisest educator” he had ever encountered. He noted in his writings that his ideas about democracy and education were heavily influenced by her. Margaret Haley, who for decades led the Chicago Teachers

Federation, reflected that Young, more than anyone she had known, possessed astonishing executive ability in which she instantly combined theory and practice. Teachers celebrated Young’s groundbreaking pedagogical, theoretical, and administrative contributions. And suffragists everywhere found inspiration in her service and political skill. However, this very public figure saved none of her personal effects and requested that her closest friends guard the privacy of her legacy. Consequently, memory of her achievements faded over the twentieth century until a recent resurgence of interest among scholars.

Toward a Renewed Definition of the Social Foundations of Education

Toward a Renewed Definition of the Social Foundations of Education

The social foundations of education is among the most interdisciplinary fields in education and the social sciences. This fact is reflected in the unusual range of articles found in this encyclopedia. It also explains why there is so much discussion as to what constitutes the field.

What Is the Social Foundations of Education?

Use of the phrase “social foundations of education” dates back to the mid-1920s. It was probably first used by George S. Counts and J. Crosby Chapman in their 1924 book *The Principles of Education*. They organized “25 problems” under the following four major headings:

- What Is the Place of Education in Individual and Social Life?
- What Are the Psychological Foundations of Education?
- What Are the Sociological Foundations of Education?
- What Principles Govern the Conduct of the School?¹

More recently, the Council of Learned Societies in Education defines the foundations of education as follows:

Foundations of Education refers to a broadly-conceived field of educational study that derives its character and methods from a number of academic disciplines, combinations of disciplines, and area studies, including: history, philosophy, sociology,

anthropology, religion, political science, economics, psychology, cultural studies, gender studies, comparative and international education, educational studies, and educational policy studies. . . . The purpose of foundations study is to bring these disciplinary resources to bear in developing interpretive, normative, and critical perspectives on education, both inside and outside of schools.²

The idea of distinguishing in the social foundations of education “interpretive,” “normative,” and “critical” perspectives in education is important. According to the *Standards*, the interpretive perspective assists “students in examining, understanding, and explaining education within different contexts.”³ Thus, although schools are critical to understanding and studying the process of education in the culture, they are only one of many social and cultural forces at work in defining the educational process.

The idea of a normative perspective suggests that education needs to be understood in the context of values. As argued in the *Standards*:

Foundational Studies probe the nature of assumptions about education and schooling. They examine the relation of policy analysis to values and the extent to which educational policymaking reflects values. Finally, they encourage students to develop their own value positions regarding education on the basis of critical study and their own reflections.⁴

Editor’s Note: The field of the social foundations of education is at a critical point in its development. This encyclopedia, in some regards, reflects the maturity of the field. Its diverse content and methodological arguments also reflect the divisions or “fault lines” within the field. The following essay attempts to provide an overview of the field, as well as suggest a new direction for it, based upon the emergence of cultural studies as an area.

In this context, the social foundations of education encourage students to define their own philosophical approach to schooling, as well as develop a personal set of ethics and norms.

Finally, the critical perspectives “employ narrative interpretations to assist students to develop inquiry skills, to question educational assumptions and arrangements, and to identify contradictions and inconsistencies among social and educational values, policies and practices.”⁵

Although the *Standards* are intended as a curricular device for defining the educational requirements of students studying education as an academic and professional field, underlying them are a number of assumptions that go against traditional norms in university culture, as well as the society at large.

To begin with, the social foundations of education is essentially an interdisciplinary field. American university and collegiate structures historically have given lip service to interdisciplinary work in the social sciences and the humanities, but, in fact, tend to operate through tight departmental and disciplinary models as separate and isolated entities. Sociologists, for example, are rarely engaged in educational or research exchanges with colleagues in related fields such as history, political science, or anthropology, let alone schools of education. The same situation is often found in other disciplines as well. Exceptions to this tendency can be found in some of the country’s smaller liberal arts colleges, where cross-disciplinary programs are a necessity, because of limited resources.

A single disciplinary model such as history or English literature often dominates interdisciplinary programs such as American studies or African American studies. In selected institutions, some fields, such as communications, seem to employ an interdisciplinary approach, but even in these programs, the concept of interdisciplinary work is often suspect. Professional status comes from affiliation with a discipline more than from a commitment to a line of interdisciplinary inquiry focused around a subject such as education.

Thus, even within schools of education, which are among the most interdisciplinary units within universities and colleges, interdisciplinary modes of inquiry and instruction are often rejected. Counseling psychologists revert to their home discipline of psychology as

a means of achieving authority and status, both within their department and school settings as well as within the larger colleges or universities. Similar behavior is often found among scholars in areas such as special education, or those individuals who perceive themselves as pure historians, philosophers, or sociologists, strictly pursuing their disciplinary inquiry in a department or school of education.

In the latter case, people associated with the social foundations in universities and colleges may, in fact, reject the institutions in which they work and even fellow social foundations scholars—that is, foundation specialists in disciplines other than their own, as well as their more methods- and classroom-based colleagues in teacher education—in favor of a disciplinary affiliation.

The Council of Learned Societies, in their *Standards* report, recognizes that there is considerable diversity in the foundations field and significant debate over what issues and methodological approaches should shape the field. As they explain:

From its origin in the 1930s, Foundations of Education has been subjected to a variety of interpretations and approaches. There are those who have promoted the idea that Foundations of Education should be assembled around educational issues, using the issues as curriculum-selecting and curriculum-organizing principles. Some have insisted that interdisciplinary and generalist concerns should supersede the commitments of Foundations of Education scholars to specific disciplines. Others have held to the priority of close disciplinary ties for Foundations of Education scholars. Some have promoted the desirability of curriculum liaisons between Foundations of Education scholars and teacher educators in other fields, for example, administration, counseling and guidance, urban education, and curriculum and instruction. Still others have argued for the establishment of working ties between Foundations of Education scholars and community groups and for involvement in areas of concern that go beyond the school enterprise.⁶

The Council of Learned Societies in Education points to the fact that there “are distinguished advocates for all of these approaches.”⁷ Which approach is most appropriate is clearly a subjective judgment.⁸

The Origins of the Social Foundations of Education

Steve Tozer has chronicled the origins of the social foundations as thoroughly as any scholar in the field. He explains that prior to the 1930s, there were basically two kinds of foundations courses in the United States. One involved single-discipline coursework in a subject

such as philosophy of education, history of education, or sociology of education. Scholars such as R. M. MacIver in sociology, Ellwood Cubberly in history, and W. H. Kilpatrick in philosophy used the lenses of the social sciences and humanities to study and teach about education in cultural context.⁹

The second type of foundations course was a fundamentals or basics of teaching practice. This tradition was reflected in books such as Levi Seely's *The Foundations of Education* (1901), which was "an introduction to teaching practice, rather than an effort to use foundational disciplines to study school and society."¹⁰

Interest in social foundations issues began to coalesce among the faculty at Teachers College, Columbia University, during the late 1920s. In 1928, a group began to meet, chaired by William Heard Kilpatrick, that came to be known as the Teachers College Discussion Group. Many of the most well-known and respected scholars interested in education from the period were part of the group, including Harold Rugg, John L. Childs, R. Bruce Raup, George Counts, Jesse H. Newlon, and Goodwin Watson. Later, they were joined by Kenneth D. Benne and R. Freeman Butts.

As mentioned previously, George Counts and J. Crosby Chapman talked about the psychological and sociological foundations of education as early as 1924, and George Counts published *The Social Foundations of Education* in 1934, but the social foundations of education as we know it today can be traced back to the mid-1930s and specific curricular reforms at Teachers College. Prior to this time, the foundations requirement for the master's degree at Teachers College required the completion of eight credits in several different departments, including: history of education, philosophy of education, psychology, educational sociology, educational economics, and comparative education.

Although this approach provided grounding in individual disciplinary fields, it had the disadvantage of overspecialization and not providing students with the opportunity to adequately explore and understand "the foundational conditions and problems of contemporary society."¹¹ Under the direction of William H. Kilpatrick, the faculty at Teachers College created a new eight-credit course (Education 200F) that all students were required to take. The course was first offered during the winter term of 1934–1935. The creators of the course described their approach as involving a

shift from a mechanistic and atomistic outlook upon life to an organic one. This shift is the result of documentary and experimental research reaching back a century. Although much of the technical study of this shift in psychological and philosophical outlook is carried on in the second semester of the course, every possible opportunity is taken during the first semester to employ it in the building of our understanding of the contemporary world.¹²

The purpose of Education 200F, and foundational study in general, was to give students a "proficiency in the design, construction and operation of schools."¹³ The course was based on the assumption that the educational system and its schools reflected the social, cultural, and political forces at work in the society. As R. Freeman Butts explained in the introduction to the book of readings developed for the first semester of the course: "Schools and other educational institutions inevitably reflect the culture in which they operate. The culture invariably impinges upon the schools whether in times of slow or rapid social change, whether in times of greater or lesser social tension."¹⁴

The creators of the Education 200F course assumed that in order to understand the work of the schools, it was critical to realize that they were essentially social institutions. Education always needed to be understood as "a function of time, place and circumstance."¹⁵ In this context, education and schooling were understood as being deeply cultural. Butts, in a piece written very late in his career, recalled a typical syllabus for the course as follows:

Ed. 200FA—Education and Society

- I. Education and Culture
- II. American Democracy Faces the Future
- III. Economics and Democracy
- IV. Democracy and Political Power
- V. Democracy and a Stable World Order
- VI. Intergroup Relations
- VII. The Social Role of Education in the World Today

Ed. 200FB—Education and the Individual

- I. Education and Human Nature
- II. Communication
- III. Adjustive Behavior
- IV. Intelligence and Learning
- V. Art and Aesthetics
- VI. Moral and Religious Experience
- VII. The Role of the Profession as a Vocation¹⁶

The course met for three hours each week. As Butts recalled, during the first hour, the faculty members teaching the course assembled as a panel for a deliberation and made presentations to the class. The second hour was taken up with discussion in small groups; and in the third hour, efforts were made to arrive at a decision with the large group. The main class typically had from 300 to 400 students. Discussion groups (the second hour) were made up of ten students each, with a student-appointed discussion leader for each group.¹⁷ The course description in the *Teachers College Announcement* for 1938–1939 explained that in regard to the course: “The effort is made so to deal with the area common to the various fields of educational endeavor as to provide for them all a basic understanding and a common outlook and language of discourse.”¹⁸

Kilpatrick’s study group met biweekly from the late 1920s to the beginning of World War II. The Education 200F course at Teachers College, as well as the creation of the modern social foundations of education as a field, evolved from this group. Kenneth Benne, who joined the group in 1937, recalled that its members

came to believe that all teachers should become students of the issues of contemporary society and culture and of the relations of these issues to questions of educational aims, methods, and programs. They also believed that a cross-disciplinary approach was conducive to adequate treatment of these issues. In keeping with this thinking, they brought the psychological, sociological, economic, historical and philosophical perspectives together into a division of educational foundations and brought in a recommendation that the requirement for those pursuing a graduate degree of work in scattered courses in psychology or philosophy or history be replaced by the cross-disciplinary courses in educational foundations.¹⁹

The model of social foundations of education established by Kilpatrick’s discussion group at Teachers College rapidly made its way into other institutions during the period following World War II. By the early 1950s, for example, the University of Illinois had an extremely active program in place that was interdisciplinary in nature. Under the leadership of figures such as Archibald W. Anderson, Kenneth D. Benne, Othanel Smith, Foster McMurray, and Bill Stanley, they articulated a clear vision of the social foundations of education and its relationship to other fields. As they explained in their 1951 book, *The Theoretical Foundations of Education*:

Social foundations, as a field, is concerned with those aspects and problems of society which need to be taken into account in determining educational policy, especially as this policy concerns the social role of the school, and in determining broader social policies which affect educational policy. . . . This definition of the field distinguishes it from educational history and philosophy on the one hand, and from educational sociology on the other.²⁰

Although the faculty at Illinois felt that there should be a “close relationship and some overlapping” between the problems studied in subjects such as the history and philosophy of education, they argued that “the problems of social foundations are the problems of policy-formation and policy-evaluation set by contemporary social conditions.”²¹ Essentially, educational

philosophers, historians, sociologists, and anthropologists who are foundations scholars are potentially concerned with very different issues from people in those same disciplines who study educational issues.

The Social Foundations in Its Early Years at Teachers College

Historically, the social foundations of education model has been under attack almost from its inception. Part of this may be because of the field's progressive and liberal roots. Whatever the case, the experiment with Education 200F had barely gotten underway before it started garnering severe criticism. R. Freeman Butts, who arrived at Teachers College in 1935 as a postdoctoral student and a member of the Education 200F team, recalled how the social foundations faculty at Teachers College were swept up in political activities not only outside of the college, but inside it as well. The social foundations faculty found itself frequently challenging what it felt were "arbitrary" administrative decisions at the college. Butts recalls the following:

Jack Childs leading the fight for the right of cafeteria workers to unionize; or George Counts counterattacking the relentless pressure and tactics of the Communist popular front; or Harold Rugg fighting the American Legion onslaught upon his books; or Edward Reisner struggling with the identity problem raised by interventionism, isolationism, war with Germany, and America Firstism; or George Hartmann's convictions leading him to Peace Now in the face of overwhelming antagonism; or Ernest Johnson flailing at reactionary religionist attacks upon the public schools; or Harold Clark's extravagant predictions about the uses of the ocean thirty years before the population explosion was headline news; and so on and on.²²

Clearly, the social foundations faculty at Teachers College during the 1930s was an activist group, engaged in contemporary political and social issues in the culture.

Butts recalls how, when he took over as the chairman of the social foundations department in 1948, there was a crisis developing over personnel. Eight of

the fourteen full-time faculty members of the program would retire by 1955. Those retiring were the "key framers and molders" of the original social foundations model, including luminaries such as John Childs and George Counts.²³ In addition, curricular reforms in the college led to a reduction from eight to six in the number of course credits in the social foundations of education required for master's students in the college's programs.²⁴

During the 1949–1950 academic year, the foundations department at Teachers College hammered out a set of guidelines for its programs that was eventually approved by the Committee on Policy, Program and Budget and by the trustees of the college. According to the guidelines,

The task of educational foundations centers upon a basic and comprehensive study of the culture and of human behavior as these are related to the total educational enterprise. It assumes that every member of the educational profession should have a fundamental understanding of the relations of education to the deepest values, traditions, and conflicts in society and to the basic characteristics of human behavior. This understanding is foundational for the superior professional worker in all of his activities as educator and citizen in a democracy, no matter what his specific professional job may be. The foundations task is as profoundly important as any other aspect of the professional preparation of educators. It is a central task of the professional preparation of educators and not merely a peripheral or a "service" function.

Educational foundations undertakes to bring together three types of resources to help educators study the central question, "What is the educational task in our culture?" To approach this question with scholarship, thoroughness, and creativeness, on one hand, and with awareness of practical realities in school and society on the other, the educational foundations draws upon three resources: the university disciplines, community and citizen activities, and the institutions of education. It is the special task of Foundations to keep these routes open and to cultivate the resources to the highest possible levels in the attainment of educational direction and power.

To reduce all of these matters to one shorter statement, the foundations process which absorbs from all these resources and tries to give unity to the educational effort is one which (1) deals with questions of educational direction, policy, and action in areas of unresolved problems in the culture, in such a way (2) that every available, pertinent, and scholarly resource is brought authentically into the effort, (3) with a definite view to attaining the greatest possible personal commitment to democratic beliefs, purposes, and goals, and (4) to extending the effort to gain the maximum possible community of understanding, purpose, and commitment. It need hardly be said that this is an effort to make a discipline of the democratic process, particularly as this becomes the concern of educators in a democracy.

This is our view of the nature of the foundations task and its role in the professional preparation of educators. We believe that Teachers College is committed to this view. We believe it has been of prime significance in enabling Teachers College to achieve and maintain its leadership in the educational profession of the nation and the world. We believe it is one of the important characteristics that distinguishes the university study of education from a normal school approach. We believe that this view, largely originated and nourished at Teachers College, has spread wherever institutions are trying to develop the university study of education as a means of re-directing the social and cultural role of education.²⁵

The above “guidelines” are probably the best evidence we have of the social foundations of education program at Teachers College in its nadir. In reference to Education 200F, Butts described it as entering a “decline and fall in the 1950s.”²⁶ It seems fair to conclude that the success and influence of the course corresponded to the influence of the social foundations faculty.

Criticisms of the Social Foundations Model

The early 1950s were a difficult period for progressively minded educators such as the social foundations faculty at Teachers College. Several factors were at play. Following World War II, the country

became increasingly conservative. McCarthyism was challenging the foundations of liberal and progressive thought. More specifically, a series of critiques of the public educational system and particularly Deweyan progressive models was becoming widespread. Critics such as Arthur Bestor, Jr., Mortimer Smith, Harry J. Fuller, and Albert Lynd²⁷ criticized public schools for being too lax in their curricula and too much under the influence of progressive educational models.

Of the critiques that came out during the late 1940s and early 1950s, the most substantive was that of Arthur Bestor, Jr., a history professor at the University of Illinois. Bestor had attended the New Lincoln School at Teachers College and had taught at Teachers College. In his 1952 article, “Life Adjustment in Education,” published in the *American Association of University Professors Bulletin*, he wrote a scathing critique of contemporary education and the lack of serious academic content in many of its courses.²⁸ Bestor’s critique was expanded into a book the following year titled *Educational Wastelands: The Retreat From Learning in Our Public Schools*.

Bestor’s work attacked schools of education at both the college and university levels as well as criticized the influence of progressive education on the schools at the K–12 level. His criticism focused in particular on the Life Adjustment curriculum, which had been widely adapted in secondary school programs across the country. It emphasized social development and skills over academic content in the curriculum.

Bestor’s work was strongly grounded in a disciplinary model. Although he saw a place in academic study for understanding the processes of teaching and learning, he believed that departments and schools of education had no business getting involved in questions related to the aims and purposes of education.

Pedagogy itself—that is to say, the careful investigation of the processes of teaching and learning—is a legitimate field of study. But its exact nature and its limitations need to be fully understood. Like the various branches of engineering, pedagogy is an applied science. It answers practical questions, not ultimate and philosophical ones. It tells how something can be

taught most effectively, but it provides no basis whatever for deciding what should be taught. In this it is like civil engineering, which tells how a dam can be constructed across a given river, but not whether it ought to be built. A specialist in pedagogy is entitled to respect when he talks about the most effective methods of teaching a given subject in the elementary or secondary school. The question of what subjects should be taught is a totally different one. It cannot be answered on the basis of pedagogical considerations alone, for it involves the ultimate purposes of education.²⁹

According to Bestor, American colleges and universities were, by definition, devoted to education, and every department in the university, in a certain sense, was “a department of education.” Referring to his affiliation as a history professor at the University of Illinois, he explained that

My own department is actually a department of education in historical thinking. The term Department of History is merely a convenient abbreviation. The division that calls itself a Department of Education is in reality a department of education in pedagogical methods, that is a Department of Pedagogy. It has no right to imply, by its name, that it has a greater concern with education than any other department.³⁰

Programs and departments in the social foundations of education represented a direct contradiction of Bestor’s model that emphasized the disciplines.

Bestor’s criticism of progressive educational models was, at least in part, a result of his own immediate experience. He attended the Lincoln School at Teachers College during the 1920s and felt that although he had received excellent instruction in history, his course in “social studies” was an inferior “hodgepodge.” While claiming to throw insight on contemporary problems, the course encouraged superficial opinions lacking “balanced and critical judgment.”³¹ As he explained: “Freedom to think was elbowed aside by freedom not to think.”³² “Indoctrination,” rather than education, dominated the course, which Bestor and his classmates referred to as a “social stew.”

Bestor believed that progressive educators such as the social foundations specialists at Teachers College were creating a “regressive” model of education:

Experts in pedagogy were feeling their oats, were abandoning their proper task of improving instruction, and were brazenly undertaking to redefine the aims of education itself. By disregarding or flatly rejecting the considered educational views of the scholarly, scientific, and professional world, these new educationists succeeded in converting the division between secondary and higher education from a mere organizational fact into a momentous intellectual schism. Progressive education became regressive education, because, instead of advancing, it began to undermine the great traditions of liberal education and to substitute for them lesser aims, confused aims, or no aims at all.³³

Bestor did believe that there was a legitimate place for “interdisciplinary investigation and teaching” in departments and schools of education, but that these needed to be based in a disciplinary foundation. In regards to the great philosopher and educationist John Dewey, he explained that Dewey was

himself a philosopher, and he brought philosophy to bear upon educational problems. Today, however, the so-called “philosophy of education” offered in most departments of pedagogy has lost touch with living philosophical thought, for it is taught mainly by men trained not in philosophy itself but merely in their predecessors’ courses in the philosophy of education. What began as the free and creative speculation of philosophic minds upon educational questions has congealed into educational dogma passed on from generation to generation by men who no longer speculate but merely expound.³⁴

Bestor proposed a new curriculum for teacher education based upon liberal arts and science rather than pedagogy. Although he did not specifically talk about social foundations as a field, his critique dismissed the field and eliminated its role in the university curriculum. Essentially, cultural and social knowledge about education, its aims and purposes, were to be the subject of disciplinary scholars, not professors of education.

Other critics followed Bestor. The launch of the Soviet Union satellite *Sputnik* in October 1957 led to a reevaluation of American public education in which the need to develop disciplinary scientists in fields such as science and mathematics was seen as being a matter of national security. Education became so closely linked to the concept of military defense that figures such as Navy Admiral Hyman Rickover began to act as educational advocates. The rhetoric of war was widely used, as is clear in the following comments made by Rickover during this period:

We are engaged in a grim duel. We are beginning to recognize the threat to American technical supremacy which could materialize if Russia succeeds in her ambitious program of achieving world scientific and engineering supremacy by turning out vast numbers of well-trained scientists and engineers. . . . We have let our educational problem grow much too big for comfort and safety. We are beginning to see now that we must solve it without delay.³⁵

As pointed out by the educational historian Diane Ravitch, the “furor” over *Sputnik* and the “crisis in education” led to the National Science Foundation’s involvement in secondary school curriculum development in fields such as mathematics, biology, chemistry, and the social sciences. Eventually, a wide range of innovative curricula were developed including “the new math,” “the new social studies,” and innovative natural and physical science programs such as Biological Science Study Committee (BSSC) and the Physical Science Study Committee (PSSC).³⁶ These models led to a greater disciplinary influence on the public schools and their curriculum.

At the same time, within departments and schools of education, there was a move toward greater disciplinary orientation. At Teachers College, Lawrence Cremin took over as chair of the department of social and philosophical foundations in 1958. According to R. Freeman Butts, Cremin, like the educational philosopher Harry Broudy, considered “the term ‘foundations’ as being too ambiguous and fuzzy.”³⁷ Under Cremin’s leadership, the separate foundational disciplines went their own way, except for a general

departmental seminar for all doctoral candidates. Psychology split off and became a separate division in the college.

Cremin was the preeminent educational historian of his generation. Although he took the Education 200F course as a graduate student, and even served as an assistant in the Raupe-Benne-Butts section of the course, he did not seem to have embraced the more general social foundations model of Kilpatrick and his discussion group. Instead, he chose the path of gaining status for the field through disciplinary affiliation (history).

In doing so, Cremin was more in sync with contemporary educational critics than those who were still holding on to the older tradition of the social foundations of education. Some critics continued to call for greater academic rigor in foundational studies. In the early 1960s, for example, James D. Koerner argued that philosophical approaches to education tended to be vague and could not be substantiated. As a result, he believed that the subject did not deserve the attention of those interested in becoming teachers.³⁸ Critics like Koerner, however, received relatively little attention.

More important criticisms came from other sources. James Bryant Conant, the president of Harvard and a chemist by academic training, argued in 1963 in *The Education of American Teachers* that courses in the social foundations of education did not constitute an area of serious study. They represented, instead, an “attempt to patch together scraps of history, philosophy, political theory, sociology and pedagogical ideology.”³⁹ For Conant, the field was “worthless” and “superficial,” and he believed that courses in the field needed to be eliminated from the curriculum of schools of education because they gave the programs in which they were housed a bad reputation. Conant explained that

If I were participating in faculty appointments in an institution that certifies future teachers, I should do all in my power to see to it that all who gave courses in the philosophy of education were approved by the philosophy department as well as the department or faculty of education. *Graduate schools of education should cease trying to train professors of the philosophy of education without the active and responsible participation of the departments of philosophy.*⁴⁰

Like Bestor, Conant felt that disciplinary knowledge provided the necessary standards for addressing questions about the nature and purpose of education. Any other approach was simply a form of dilettantism. The disciplinary specialist would be the necessary midwife to give birth to meaningful social thought in education. As Conant explained, an important opportunity was at hand:

Well-trained philosophers who turn their attention to problems of American education have an opportunity to make a real contribution to overhauling the philosophic foundations of education, which today consist of crumbling pillars of the past placed on a sand of ignorance and pretension.⁴¹

According to him, the future teacher

would do well to study philosophy under a real philosopher. An additional course in the philosophy of education would be desirable but not essential. The same is true of a course in the history of education. Again, the professor should be an intermediary or middleman; he should be approved by a department of education and a department of history or an outside committee containing eminent historians. The explanation of the history of the schools of the United States under the guidance of a first-rate American historian would be a valuable experience for any teacher. It would strengthen his understanding of the political basis of our educational system and relate what he should have learned in his American history courses to his own professional work. Some of the material presented might be considered sociological rather than historical. If a competent sociologist is investigating social problems closely related to the schools and is ready to give a course in educational sociology, the desirability of such a course is evident. As to whether the present group of professors who consider themselves educational sociologists should perpetuate themselves, I have the gravest doubts. I would wish that all who claim to be working in sociology would get together in the graduate training and appointment of professors who claim to use sociological methods in discussing school and youth problems.⁴²

Disciplinary models for the social foundations of education increasingly dominated the field in the 1960s and 1970s. Although I believe some of this had to do with attempts to develop methodological rigor for the field, the disciplinary orientation taken by many foundations professors represented an attempt on their part to achieve greater status and personal acceptance across their institutions. Lawrence Cremin had accomplished this through an appointment early in his career as a professor of history at Columbia University. Bias against the study of education and the devaluation of the education of teachers meant that there was little likelihood of these individuals gaining much recognition or status outside of their programs.

In 1968, several graduates from Teachers College established the American Educational Studies Association as part of an attempt to renew the more traditional approach to the social foundations of education. One of the founders, John Laska, considered the controversy over whether or not the social foundations of education was a discipline to be a pointless discussion. As he explained in an article published in *Teachers College Record* in the late 1960s:

Much futile discussion has taken place over whether education does or does not constitute a discipline. Rather than enter into this essentially sterile controversy, the founding members of the American Educational Studies Association have chosen to use the general term "field" to designate their area of study. Thus, if it can be agreed that, for example, demography, genetics, and ecology constitute fields of study (though perhaps not disciplines), there should be no difficulty in regarding the academic study of education as a field of study, reserving for later years the question of whether it has attained disciplinary status or not.⁴³

This was in a period that also saw the establishment and growth of groups such as the History of Education Society and the Philosophy of Education Society.

History Versus Social Foundations

The educational historian Sol Cohen has provided a useful discussion of the history of American education.

At the beginning of his essay, “The History of the History of American Education: The Uses of the Past,” he clearly states that the main problem confronting educational historians who work in schools and departments of education is

the degree to which historians of education should be detached from or engaged in the educational and social problems of the day; that is, questions about what used to be called the “function” of history in a school or department of education.⁴⁴

Cohen considers this a perennial controversy. Is the work of a historian in a faculty of education “liberal,” “technical,” “professional,” or “social reconstructionist”?⁴⁵ This is a question that faces all professors in the social foundations, whether they are historians, sociologists, or philosophers. In the case of historians of education, I believe that, to a large degree, they decided to go the “professional” route as part of a process of disciplinary affiliation and the quest for personal professional status. There are many explanations for this, some of which have to do with efforts made in the general discipline of history during the 1950s.

In 1954, the Ford Foundation called a conference of historians to look at the possibility of promoting historical research about the role of education in the development of American culture. Only historians in departments of history were invited to the meeting. They included Arthur Schlesinger, Sr., Merle Curti, Samuel Eliot Morison, Richard Hofstadter, Ralph Gabriel, Walter Metzger, Paul H. Buck, and Richard J. Storr.⁴⁶ No “specialists” in the field were invited to the conference. In other words, no one working in an education department or school was included.

The group assumed that no really serious work had been conducted in the history of American education—that the work done largely by educational historians working in education programs had been uncritical, largely celebratory, and not of much value. In October 1959, a conference on early American education was sponsored by the Fund for Advancement of Education. The colonial historian Bernard Bailyn presented a paper, “Education in the Forming of American Society.” This essay was subsequently published as a monograph of the same title.⁴⁷

In a foreword to Bailyn’s work, Lester J. Cappon argued that the history of American education needed to be restudied because it had

suffered at the hands of specialists who, with the development of public education at heart, sought historical arguments to strengthen their “cause.” If there was a story of the past worth writing, it was viewed from the narrow concept of formal instruction. If schooling was institutionalized in the schoolhouse of the nineteenth century, its antecedent must be lurking in a comparable building and curriculum of the colonial period.⁴⁸

In the words of Bailyn, “the past was simply the present writ small.”⁴⁹

Bailyn argued that the histories of education written by “educational missionaries” at the turn of the century reflected their professional interests and did not represent critical histories. He argued further that their histories were focused almost exclusively on the role of formal institutions in the educational process. As pointed out by Sol Cohen, Bailyn’s interpretation almost completely disregarded the pioneering work of scholars such as Paul Monroe, who taught at Teachers College at the beginning of the century, and his students, including Edgar Knight, Stuart Noble, Frederick Eby, Edward Reisner, Thomas Woody, Willystine Goodsell, and Harlan Updegraff, as well as a subsequent generation (many trained as academic historians) such as Edgar B. Wesley, Adolph Meyer, Allen O. Hansen, Herman G. Richey, Newton Edwards, Charles F. Arrowood, and Harry Good.⁵⁰

In 1961, Lawrence Cremin had been invited to become a member of the Committee on the Role of Education in American History. This was the same year that he published his breakthrough study *The Transformation of the School: Progressivism in American Education*.⁵¹ In 1965, Cremin published *The Wonderful World of Ellwood Patterson Cubberley*.⁵² It was subtitled “An Essay on the Historiography of American Education.” Cremin followed Bailyn’s lead by arguing that Ellwood Patterson Cubberley’s book *Public Education in the United States* had set an uncritical and jingoistic model for the interpretation of American educational history—one that schools and departments of education had never been able to escape.

Although Cubberley's work can certainly be criticized, I believe that it was being used, to a certain extent, to provide a justification for a new history of education that was separate from the tradition of a department or school of education. I think that Cremin had decided to throw his lot in with the academic historians. He was rejecting the social foundations tradition in which he had been trained and nurtured at Teachers College for a disciplinary alliance.

Cohen cites an argument that Wilson Smith, a professor of history at Johns Hopkins University, made in a 1961 article that the new historians of education would be distinguished by two characteristics. The first would be "their use of broader historical references, and [their] wider, more humanistic, professional commitment." They would also move beyond a simply "useful" or "functional" approach in their work and become a "servant of disciplined thinking" and a "representative of humane learning."⁵³

Cohen maintains that the new educational historians personified by Bailyn and Cremin ignored two generations of educational historians. They did so, according to him, for highly complex reasons. What was really at work was a rejection of the tradition of the social foundations of education—that is, the people who trained Cremin at Teachers College. According to Cohen, historians of education such as Cremin

during the 1950s and early 1960s, for what seemed like good reason at the time, decided to overlook or repress not only contemporary historians of education, but the long conversation about the function of the history of education—"liberal," "technical," or "social constructionist"—which had taken place in the three decades between Cubberley and themselves.⁵⁴

It is no accident that as all of this was taking place, Cremin and others were laying down the foundation for the History of Education Society. In 1948, a small group of educational historians, including Archibald Anderson at the University of Illinois, R. Freeman Butts at Teachers College, John Brubacher at Yale University, and Claude Eggersten at the University of Michigan, convinced the National Society of Colleges of Teacher Education (NSCTE) to sponsor a history of education section with its own journal.⁵⁵ From the

beginning, there was strong disagreement among the group's membership as to whether or not the primary purpose underlying the history of education should be to make it functional as a means of addressing contemporary questions and problems, or to follow a more traditional academic model based in "liberal study." As Stuart Noble maintained in his support of the more traditional liberal study approach, it was not "necessary or desirable to teach the subject with the motive of relevancy to current problems. I am positive in the conviction that the history of education should be taught with the liberal rather than the functional values in mind."⁵⁶

In 1960, more than a decade after the founding of the History of Education Society, Cremin tried to settle the argument by founding a new History of Education Society based around the idea that it was part of liberal studies. Cremin's rejection of the older social foundations of education model fit well into the reform agenda proposed a couple of years later by Conant in *The Education of American Teachers*. In 1968, Division F (History and the Historiography of Education) was established as part of the American Educational Research Association.

Throughout the 1960s and 1970s, a disciplinary model for the social foundations of education prevailed. Under this model, the development of groups such as the History of Education Society, the Philosophy of Education Society, and Division F of the American Educational Research Association occurred. Further developments took place in the history of education with the emergence of the revisionist and radical revisionist movements. Many traditional social foundations of education specialists found themselves gravitating to the American Educational Studies Association and Division G (Social and Cultural Context of Education) in the American Educational Research Association. Others moved between various disciplinary groups and the more general organizations.

It was very clear that by the late 1970s and early 1980s, the social foundations of education was a highly divided field. This situation was further complicated by the emergence of competition from scholars interested in curriculum inquiry, critical theory, and cultural studies—an issue that is discussed later in this essay.

Disciplinary Versus Social Foundation Models

As was demonstrated with the example of the history of education, the relationship between disciplinary areas of knowledge and the social foundations of education has been an issue throughout its history. Unlike more disciplinary-based fields, “the problems of education and of society are basically indivisible except for individual diagnosis and study.”⁵⁷ Educational problems are situational. They require seeing the interrelationship of things. Thus, a single disciplinary approach cannot address the needs of education.⁵⁸ As R. Freeman Butts explained, the solution of educational issues requires “judgment, generalization, and the application of knowledge from a variety of sources. The greater the specialization of knowledge, the greater the need for generality, integration, and interdisciplinary study.”⁵⁹

How does one determine the appropriate use of disciplinary knowledge? Erving Johanningmeier argues that social foundation specialists in education have always had to face this problem. This process, according to him, is more difficult than it may seem at first. As he explains,

If we do not adhere to the standards of the discipline, we are in danger of making misapplications that can result in unsound and useless conclusions and applications as well as criticism from the practitioners of those disciplines. We become amateurs subject to the criticism of experts.⁶⁰

At the same time, Johanningmeier points out that “Seeking our status and credibility through knowledge of our neighbors’ affairs distracts us from our own field and the problems we should be examining.”⁶¹

What Johanningmeier is referring to is perhaps the inevitable problem facing any interdisciplinary line of research. In a field such as the social foundations, one needs to be grounded in not just a discipline and its related political and methodological issues, but also the larger field of social foundations of education. If one is truly interdisciplinary from a methodological and interpretive point of view, one can find oneself stretched across a wide range of methods and disciplines. A researcher interested in visual sources in the history of American education, for example, can easily

find him- or herself bridging research issues ranging from visual anthropology to communication studies to semiotics and qualitative methods.

Johanningmeier makes the important point that when the social foundations scholar applies a discipline to education as a field, he or she is dealing directly with the question of applying research to practice. Noting the philosopher William James’s belief that teaching is an art rather than a science, Johanningmeier quoted James’s admonition

that you make a very great mistake, if you think that psychology being the science of the mind’s laws, is something from which you can deduce definite programmes and methods of instruction for immediate school use. Psychology is a science, and teaching is an art; and sciences never generate arts directly out of themselves.⁶²

As Johanningmeier points out, psychology by itself cannot convert theory into practice. Instead, there is the need for what James referred to as an “inventive mine.”⁶³

Those who use disciplinary-based models of inquiry tend to assume that they possess a superior rigor and insight compared to those in an interdisciplinary field such as the social foundations of education. What disciplinary specialists do not realize is that they are doing something that is significantly different. Johanningmeier quotes Foster McMurray, who wrote in 1955 that an educational sociologist, in doing his or her work, is making a contribution to sociology rather than to education. This is not to say that his or her contribution is not important beyond the discipline, but that it is not necessarily the same thing that a social foundations of education researcher does when he or she uses sociological methods in his or her work. According to McMurray,

In the same way that application of pure science to industrial process is not found by simple deduction from basic knowledge, but is rather the product of creative invention, so the “meaning” of the social sciences for education must be discovered by activities of a higher intellectual order than following suggestions, analogous, or supposed “implications” from foundational sciences.⁶⁴

According to McMurray, the “true” discipline of education cannot arise only by applying the questions of a discipline such as history or sociology within a school setting.⁶⁵

There are several reasons why a singular disciplinary model is inadequate for the field of education and, more specifically, the social foundations of education. Most important is the fact that schools are, by their very nature, multifaceted and complex. No single discipline is capable of capturing all that goes on in schools. An interdisciplinary model is required.

This does not mean that the social foundations needs to reject disciplinary approaches. They are, in fact, essential to the main task of the social foundations. As Johanningmeier explains, although “the disciplines are ancillary to our task,” they are, from a practical point of view, “indispensable.”⁶⁶ Yet, at the same time, they can be regarded as “enemies” because their disciplinary focus tends to reject interdisciplinary models, which are fundamental to the very idea of the social foundations.⁶⁷

Nash, Shiman, and Conrad maintain that the preoccupation of many social foundations scholars with imitating the disciplines has caused them to lose focus of their primary purpose—at least as defined by the original founders of the field, such as Counts and Kilpatrick. As they explained in the mid-1970s:

What ails the social and humanistic foundations of education is the slavish tendency to ape the disciplines. It is time to admit the obvious: We in the foundational areas have for so long attempted to borrow legitimacy for our own subject matter from the academic disciplines that we have seriously neglected the day-to-day professional concerns of the undergraduate and graduate constituents we serve. Casual attendance at our professional conferences and the most perfunctory perusal of our technical journals embarrassingly reveal the current sad state of foundational studies: preoccupation with the most tendentious and narrow academic issues. Burning topical concerns such as busing, mainstreaming, career education, “back-to-the-basics vs. open education,” and teacher militancy are often collapsed into—or ignored in favor of—the most abstruse, “scholarly” discussions of sociology of knowledge, historical revisionism,

language analysis, and existential phenomenology. Also, like our cherished counterparts in the disciplines, we are often more comfortable interminably debating and critiquing each other on trivial technical issues than we are in radically reorganizing and integrating our subject matters and exploring vital and more varied instructional procedures.⁶⁸

Many in the social foundations, according to Nash and colleagues, pay lip service to the idea of interdisciplinary work, but in fact “still cling tenaciously to the boundaries of the established disciplines.”⁶⁹ In doing so, they deny the fundamental interdisciplinary character of the field—the very basis on which it was founded.

The desire to develop disciplinary affiliations is perhaps understandable. Most social foundations professors find themselves as outsiders in the schools and departments of education where they teach. They are typically in small number and are surrounded by colleagues with many different agendas, orientations, and interests. Their work is often difficult to understand and does not easily fit in with traditions of empirical and scientific research that are more commonly embraced by researchers in fields such as educational psychology, statistics, and quantitative research. Practitioners, with their field-based orientation, often consider their social foundations colleagues to be disconnected from the real world of the schools.

In addition to the above problems, social foundations professors, because of their disciplinary orientation, are potentially considered to be “fraternizing with the enemy.” Particularly in larger university settings, arts and sciences disciplinary specialists have a history of devaluing and attacking professional schools, and more specifically, departments and schools of education.⁷⁰ Somehow, the education of teachers is not considered to be a responsibility for the overall institution (including arts and sciences professors and their content courses), but strictly the responsibility of professors in the education school. There is little awareness of the fact that students in most schools of education get the great bulk of their education outside of the school of education. They don’t seem to realize that what can be accomplished within a program is often limited by certification requirements and so on. In many schools—particularly state

universities—teacher education programs fund more specialized disciplinary programs in the arts and sciences. In fact, there is a failure in many state institutions—particularly smaller, regionally based schools that have been designated recently as universities—to face up to the fact that they began as teacher education colleges or normal schools and, to a very large degree, still have that function today.

Social foundations of education professors are also faced with the temptation of trying to gain professional status in their disciplines, rather than in the professional schools and departments where most of them work. Even when such status is offered, it is often conditional and subject to unconscious biases.

Disciplinary Power, Hegemony, and the Social Foundations of Education

It can be argued that, in the medieval scholastic sense, disciplines such as history, philosophy, sociology, and anthropology are the handmaidens of the social foundations of education. Such an approach would be a challenge to most disciplines. By adopting an interdisciplinary model, the social foundations of education challenges the exclusive authority of an individual discipline. In doing so, there is the potential threat of an outsider asking about the validity of specific disciplinary models, as well as the extent to which they serve selected personal agendas and needs.

Disciplinary association is not simply an academic issue, but is also deeply rooted in issues of power and authority in both the university and the culture at large. In this regard, the concept of hegemony provides an extremely interesting lens through which to examine the potential of disciplinary systems to limit the freedom and latitude of interdisciplinary approaches such as the social foundations of education.

Hegemony is a concept that was first developed by the Italian Marxist theorist Antonio Gramsci (1891–1937). For Gramsci, hegemony represented the diffusion or permeation throughout the culture of a specific system of values, attitudes, and beliefs that had the effect of supporting the existing power structure in the culture. According to Peter McLaren,

Hegemony refers to the maintenance of domination not by the sheer exercise of force but primarily

through consensual social practices, social forms, and social structures produced in specific sites such as the church, the state, the school, the mass media, the political system and the family. . . . Hegemony refers to the moral and intellectual leadership of a dominant class over a subordinate class achieved not through coercion (i.e., threat of imprisonment or torture) or the willful construction of rules and regulations (as in a dictatorship or fascist regime), but rather through the general winning of consent of the subordinate class to the authority of the dominant class.⁷¹

The concept of hegemony is particularly interesting because the very people whom it oppresses often embrace it. As a result, they unconsciously contribute to their own oppression. One might argue that this is the case with certain disciplinary specialists in the social foundations of education who strongly embrace a disciplinary approach to gain greater academic status, while they are discriminated against for working with the “people in education.”

Hegemonic systems set the character and content of discourse in a culture and in a disciplinary field. They do this, according to Douglas Kellner, in that they “define the limits of discourse, by setting the political agenda, by defining the issues and terms of debate, and by excluding oppositional ideas.”⁷²

R. Freeman Butts and the “ABCs of the Foundations of Education”

In an article published in *Education Theory* in 1973, R. Freeman Butts attempted to set forth a complex, multilayered model for the social foundations of education. The model included multiple disciplines (history, philosophy, psychology, sociology, anthropology, political science, economics, and comparative international studies) stacked on top of each other. Each discipline was divided along different axes—literally referred to by Butts as the “ABCs of the Foundations of Education.” These included

Social and Cultural Problems of Modernizing Societies

Issue-Laden Trends of Modern Education

Humanistic and Behavioral Disciplines.⁷³

For a discipline like history, Butts's model not only was based around the X, Y, Z axes of the ABCs of the Foundations of Education, but was further defined by twelve intersecting vectors (my own term) or forces. These were, on the first vector, "Research-Minded," "Achievement Versus Learner Oriented," "Differentiated," "Practical and Professional," "Secular and Scientific," and "Large-Scale Organization." The second intersecting vector consisted of "Ethnic and Racial Integration," "Religious and Cultural Pluralism," "Technical and Intellectual Specialization," "Rural Transformation and Industrial Urbanization," "Popular Participation in Public Affairs," and "Nation Building and National Development."⁷⁴

At first, Butts's model, which he tried to present visually, is extremely confusing. What he was trying to get at was a multivariate model of the forces that shape

education and culture—each being situated in a foundational discipline—history, philosophy, psychology, sociology, anthropology, political science, economics, and comparative international studies. In turn, he tried to demonstrate, by stacking the disciplines (history, philosophy, psychology, sociology, anthropology, political science, economics, and comparative international studies), that they are ultimately interconnected.

Although Butts's model never caught on, I believe that he was on to something. He tried to demonstrate the interrelatedness of forces and issues that shape education. He believed that it was possible to decode the meaning of these forces through the disciplines, ultimately integrating the findings in a multidisciplinary model based in the social foundations of education. In a certain sense, what he was postulating was a complex social/ecological system.

Figure 1 The ABCs of the Foundations of Education

Butts recognized the limitations and possibilities inherent in his model. As he explained,

Approaching the foundational study through the several disciplines has the undoubted merit that it can achieve a depth of understanding in a single field of knowledge and provide the methodological tools for thinking about education and society in a particular way, historical, philosophical, psychological, sociological. But the trouble is that the more successful the disciplinary approach is in the eyes of the scholar the less useful it may be for the non-specialist student. The disciplinary specialist needs a conceptual framework to guide the selection of instructional materials that will be relevant to the interplay between education and society. . . . Approaching foundational study through the other avenues, social problems or educational issues, has the immediate advantage of greater relevance for the common problems facing educators, but the danger is that the study may be superficial and shallow with too little depth of real knowledge as the basis for making judgments or enlisting commitment for reform. If a problem approach is used, the most valid scholarly knowledge of the several disciplines must be relied upon, but this too requires a well-formulated framework of thought to serve as a principle of selection for instructional materials to be plumbed from the depths of the disciplines.⁷⁵

Butts essentially argued that the social foundations of education must provide a conceptual model to function. While it needs the methodological tools provided by the disciplines, disciplinary inquiry cannot answer meaningful educational questions unless it goes beyond the boundaries of a single field. In other words, interdisciplinary approaches are unavoidable if much meaning is to be found in the disciplinary inquiry.

The image of Chang and Eng, the famous Siamese twins who toured with P. T. Barnum during the second half of the nineteenth century, comes to mind when we consider the ultimate connection between the disciplines and the social foundations of education. Chang and Eng were bound together for life. Essentially, the social foundations cannot afford to sever its connections with the disciplines, no matter how much discomfort those disciplines may cause. The problem is

that the disciplines can continue on their own without the necessity of the social foundations of education. In doing so, however, the study of education and its connection to professional training and critical social change and reform becomes extremely limited.

Toward a Redefinition of the Social Foundations of Education

The social foundations of education is at a critical point in its history. There is a very real possibility that the field could fall into oblivion—or, at best, be incorporated into specialized disciplinary fields such as history, philosophy, and sociology. This would be unfortunate because the interdisciplinary nature of the field has the potential to serve the needs of the culture and the educational community more than restricted disciplinary models. Throughout the second half of this essay, I call for a renewed definition of the social foundations of education. In doing so, the integration of insights from the field of cultural studies can provide the basis for a new approach to the field. It can not only respect disciplinary insights and methods, but also be linked in a dynamic and meaningful way to the original founding principles of the social foundations of education.

Undertaking a discussion of cultural studies and its relationship to the social foundations of education requires an examination of the meaning of the term *culture*. In its most conservative meaning, culture can be defined as a “standard of aesthetic excellence,”⁷⁶ what the nineteenth-century English critic Matthew Arnold defined as “the best that has been said and thought in the world.”⁷⁷ For the poet T. S. Eliot, culture represented “all the characteristic activities and interests of a people.”⁷⁸ In the United States, this definition could include New Orleans jazz, the poetry of Robert Frost, the music of Elvis Presley, the design of the Empire State Building, a McDonald’s hamburger, or the New York Philharmonic. The anthropologist Edward T. Hall describes culture in the following way:

Culture is man’s medium; there is not one aspect of human life that is not touched and altered by culture. This means personality, how people express themselves (including shows of emotion), the way they

think, how they move, how problems are served, how their cities are planned and laid out, how transportation systems function and are organized, as well as how economic and government systems are put together and function.⁷⁹

However, it is frequently the most obvious and taken-for-granted, and therefore the least studied, aspects of culture that influence behavior in the deepest and most subtle ways.

For John Clarke, Stuart Hall, Tony Jefferson, and Brian Roberts, culture represents

the shared principles of life characteristic of particular classes, groups or social milieux. Cultures are produced as groups make sense of their social existence in the course of everyday experience. Culture is intimate, therefore, with the world of practical action. It suffices, for most of the time, for managing everyday life. Since, however, this everyday world is itself problematic, culture must perforce take complex and heterogeneous forms, not at all free from contradictions.⁸⁰

The study of culture as a phenomenon is at the root of foundational studies in education. Therefore, it is not surprising that cultural studies as a field should suggest the direction for a redefinition of the social and cultural foundations as a field.

Defining cultural studies, as a field, is a difficult task. Advocates of the field consciously avoid a disciplinary approach, maintaining that such models are limiting and often represent entrenched power groups. According to Kathy Hytten,

As a counter logic, cultural studies advocates suggest that the segmentation of knowledge into neat disciplinary packages and categories is what precipitates the need for alternative ways of understanding and exploring the world, as the narrow confines and highly specific methodological approaches of any one particular discipline are not adequate to capture the complexity of something as multi-faceted as culture.⁸¹

Although there is a deliberately open-ended quality to cultural studies, it does not lack a focus. Cultural studies is concerned with understanding what can be

termed the “web” of culture—its interrelationships and connectedness. In doing so, cultural studies identifies relationships involving power, domination, control, and authority. It does so, not through the study of just traditional culture, but also through the study of popular culture. It considers what is valued and what is not valued by the culture, as well as at a culture’s signs and symbols—where, and how, and who generates them. Cultural studies assumes that culture is dynamic and changing, and that there are many cultures that define a larger culture or society such as is found in the United States or Great Britain.

Hytten summarizes cultural studies as involving “the study of culture: what it is and how it is constructed, transmitted, contested, negotiated and conceived.”⁸² In addition, she points to four characteristics that particularly distinguish cultural studies as an approach: (1) Cultural studies assumes that culture is a dynamic process; (2) cultural studies makes little or no distinction between high-brow and popular culture; (3) cultural studies understands that culture and power are linked; and (4) cultural studies demands new ways of studying culture that transcend traditional methods and disciplinary boundaries.⁸³ These four characteristics effectively position cultural studies as a challenge to more traditional disciplinary approaches to knowledge and education.

For example, arguing that cultural studies is a dynamic process challenges the notion of many traditional humanists and disciplinary specialists who believe that there is an essential body of knowledge that defines the meaning of Western culture. This approach is represented in the work of literary scholars such as E. D. Hirsch, Jr. and Alan Bloom.⁸⁴ According to Hirsch, cultural literacy is defined within a narrow range of traditions and experiences.

Significantly, cultural studies does not necessarily reject the traditions of knowledge such as the “Western canon.” The field even recognizes that some cultural traditions may be of more value than others. As Stanley Aronowitz and Henry Giroux explain,

To acknowledge different forms of literacy is not to suggest that they should all be given equal weight. On the contrary, it is to argue that their differences are to be weighed against the capacity they have for enabling people to locate themselves in their own

histories while simultaneously establishing the conditions for them to function as part of a wider democratic culture. This represents a form of literacy that is not merely epistemological, but also deeply political and eminently pedagogical.⁸⁵

Hirsch and Bloom, as representatives of a much more conservative model, would maintain that culture represents less of a dialogic process, and is more fixed. In this context, Hirsch and Bloom would subscribe to the nineteenth-century English critic Matthew Arnold's model of culture as being "the best that has been said and thought in the world."⁸⁶

Theorists in cultural studies, rather than simply accepting an Arnoldian selection of "the best that has been thought and said," would ask whose values are being represented in the selection? Why? Is the selection of certain topics a manifestation of selected cultural and political groups replicating or extending their power and privilege? Thus, according to Giroux, culture "is not seen as monolithic and unchanging, but as a site of multiple and heterogenous borders where different histories, languages, experiences and voices intermingle amidst diverse relations of power and privilege."⁸⁷

Cultural studies rejects elitist models of culture that privilege certain groups over others. Thus, it includes not just elite culture, but also popular culture sources. These sources, such as film, television, comics, and advertising, are often highly problematic for traditional scholars. Much of the discomfort on the part of traditional academics over the introduction of cultural studies into the curriculum of colleges and universities has not so much to do with the content of the material, as with what other material is being displaced. The American culture wars that began during the late 1980s were largely over whose values and belief systems would be represented in the culture.⁸⁸

This brings us to the notion that power and culture are linked. Cultural studies theorists recognize, like the English philosopher Francis Bacon, that knowledge is power. Defining what culture is is ultimately a political act that reinforces specific lines of power and authority. This explains why the work produced by artists is often a touchstone of controversy in a culture. Artistic representations have the potential to reinforce or challenge existing lines of culture power and authority.

Hyttén argues that the four guiding assumptions outlined above (culture as dynamic, no absolute distinction between high and low culture, culture and power as linked, and the importance of transcending disciplinary boundaries) represent

an intellectual and political practice that is concerned with understanding culture as something which is multi-faceted and helps to condition the dominant expectations, values, beliefs and norms toward being and acting in the world. As a practice, cultural studies is contextualist, critical and interventionist.⁸⁹

Cultural Studies and the Social Foundations of Education

The field of cultural studies began to achieve prominence in the United States during the mid-1980s. As an academic area, it can trace its origins back to the 1960s and the founding of the Birmingham Centre for Contemporary Cultural Studies. From its beginning, the Centre's approach was interdisciplinary. Led by figures such as Raymond Williams, Richard Hoggart, and Edward Thompson, the Centre's roots were in adult and working-class education.⁹⁰

As Lawrence Grossberg has pointed out, it is ironic that all of the founding figures of cultural studies, including Richard Hoggart, Raymond Williams, E. P. Thompson, and Stuart Hall, started their work in education, outside of traditional academic university settings.⁹¹ Yet despite this fact, education, and more specifically the social foundations of education, was slow to incorporate cultural studies models into its programs.

I believe that there are several explanations for this phenomenon. To begin with, the social foundations of education was already asking many of the same questions that are being addressed in cultural studies.⁹² In fact, each of the four characteristics identified by Hyttén as being associated with cultural studies (Cultural studies assumes that culture is a dynamic process; cultural studies makes little or no distinction between high-brow and popular culture; cultural studies understands that culture and power are linked; and cultural studies demands new ways of studying culture that transcend traditional methods and disciplinary boundaries) can be accommodated easily within

the assumptions of the founders of the social foundations of education.

For example, cultural studies assumes that culture is a dynamic process. This concept is inherent in the social reconstructionist model that underlies the basic philosophy of the Teachers College social foundations faculty. The need to “reconstruct” the culture, or, as George S. Counts argued, that the “schools build a new social order,” implies, by definition, the idea that schools and the culture are inevitably involved in the process of change. In other words, they are part of a dynamic social process.

One need only look at the work of Counts to see an example of this assumption. In *Dare the Schools Build a New Social Order?* he argued that

We live in troublous times; we live in an age of profound change; we live in an age of revolution. Indeed it is highly doubtful whether man ever lived in a more eventful period than the present. In order to match our epoch we would probably have to go back to the fall of the ancient empires or even to that unrecorded age when men first abandoned the natural arts of hunting and fishing and trapping and began to experiment with agriculture and the settled life. Today we are witnessing the rise of a civilization quite without precedent in human history—a civilization founded on science, technology, and machinery, possessing the most extraordinary power, and rapidly making of the entire world a single great society. Because of forces already released, whether in the field of economics, politics, morals, religion, or art, the old molds are being broken. And the peoples of the earth are everywhere seething with strange ideas and passions. If life were peaceful and quiet and undisturbed by great issues, we might with some show of wisdom center our attention on the nature of the child. But with the world as it is, we cannot afford for a single instant to remove our eyes from the social scene or shift our attention from the peculiar needs of the age.⁹³

Likewise in the introduction to the textbook *Readings in the Foundations of Education*, which was created by the Kilpatrick discussion group for Education 200F, change and how it affects schools and the culture at large was presented as being an unavoidable and current issue

for educators. As the editors of the book explained: “The present age of industrialism and high technology is peculiarly dynamic, that in fact not only in America but practically the entire world it has entered a period of most profound social and cultural transition.”⁹⁴

Hyttén’s second assumption, that cultural studies make little or no distinction between high-brow and popular culture, is reflected in the fact that the content of a course such as Education 200F at Teachers College recognized society’s “shift from a mechanistic and atomistic outlook upon life to an organic one.”⁹⁵

In this context, although the idea of popular culture was almost certainly unknown to the founders of the social foundations, the concept of moving beyond mechanistic models toward organic ones strongly resonates with the notion that there was a need to understand both high and low culture. In the Education 200F *Readings* textbook, the inclusion of essays such as “Literature as Art and Propaganda,” “Social Propaganda as Art Education,” and other similar topics suggests that there was at least the beginning of an understanding on the part of the Teachers College faculty that issues involving the relationship between popular culture, the educational system, and the larger culture were important. Mass media—more specifically, electronic media—had just been introduced into American culture by the mid-1930s. Commercial radio was introduced in the late 1920s and commercial television would reach mainstream audiences during the late 1940s or early 1950s—fifteen to twenty years after the core formulation of the social foundations had taken place.

Hyttén’s third assumption, that cultural studies understand that culture and power are linked, is an issue that Counts was clearly aware of. Once again we need only turn to *Dare the Schools Build a New Social Order?* where he states that “ruling classes never surrender their power voluntarily.”⁹⁶ Likewise, when he asks, “In whose interests and for what purposes are the vast material riches, the unrivaled industrial equipment, and the science and technology of the nation to be used?”⁹⁷ Counts was interrogating the meaning of power and authority in American society in ways that would be readily understood by anyone coming from a cultural studies perspective.

Finally, Hyttén’s argument that cultural studies demand new ways of studying culture that transcend

traditional methods and disciplinary boundaries is implicit in the very definition of the field of the social foundations of education. To repeat the guidelines statement made by the social and philosophical foundations department at Teachers College more than fifty years ago: “As with the field of cultural studies, the interdisciplinary character of the Social Foundations of Education was defined at its inception.”

Critical Pedagogy and Cultural Studies of Education

The tradition of critical pedagogy traces its roots back to the late 1970s and early 1980s. Writers such as Henry Giroux, Stanley Aronowitz, and Peter McLaren started to draw on such theorists as Michael Young, Basil Bernstein, Raymond Williams, Stuart Hall, Richard Johnson, Paul Willis, Antonio Gramsci, and Paulo Freire, as well as members of the Frankfurt school of critical theory (Theodor Adorno, Max Horkheimer, and Walter Benjamin).⁹⁸ Giroux, Aronowitz, and McLaren also began to question whether or not schools were neutral, the extent to which they perpetuated privilege, and the extent to which they were part of larger systems of power and authority within the culture.

Their work was not entirely original. Disciplinary-based social foundations scholars such as the revisionist and radical revisionist historians of education had asked similar questions more than a decade earlier. Their work nonetheless represents an important breakthrough. By the late 1970s, Giroux, in particular, had become increasingly interested in culture as part of a political and social process. He moved beyond a traditional Marxist analysis of culture, rejecting it because of its overemphasis on economics.⁹⁹ In works such as *Education Under Siege* (coauthored with Stanley Aronowitz), Giroux argued that schools were part of a “democratic public sphere.” According to Aronowitz and Giroux, this meant that several steps needed to be taken. The first was

to specify what we as a community want education to be. This means acknowledging both the importance as well as the limits of the language of critique. It means moving beyond analyses of the ideological and

material conditions of public schooling to the language of possibility. In this case, we move to the terrain of hope and agency, to the sphere of struggle and action, one steeped in a vision which chooses life and offers constructive alternatives.¹⁰⁰

The second step involved “rethinking the purpose of education” and

reformulating the social and ideological role of educators. We believe that educators at all levels of schooling have to be seen as intellectuals, who as mediators, legitimators, and producers of ideas and social practices, perform a pedagogical function that is eminently political in nature. By viewing educators as intellectuals, we want to expand the theoretical insights provided by Freire and Gramsci on the role of the intellectual in modern society and, specifically, of the role of educators in public schools and in higher education. In effect, we want to offer a set of categories that will allow for a better understanding of intellectual work, the preconditions for its existence, and the political role it does and can serve.¹⁰¹

Aronowitz and Giroux, and particularly Giroux, had probably discovered the work of the Italian Marxist Antonio Gramsci. This is important, because Gramsci not only posits the idea of hegemony, but counterhegemony, which implicitly included the concept of resistance. For both Aronowitz and Giroux, the idea of a counterhegemony posits the possibilities of a language of hope and reform.

Interestingly, Aronowitz and Giroux believe that their work resonates with that of earlier educational progressives such as Dewey and Kilpatrick. As they explain,

Progressive education—the core American doctrine of liberal educational humanism—contains a language of possibility for fruitful intervention into contemporary educational battles, because it poses the relationship of power and knowledge in a positive as well as critical way. To begin with, we want to make a distinction between the progressive education movement as it evolved in the early decades of the century, reemerged later in the 1960s, and the ideas of its leading theorists John Dewey and the Columbia

School (Kirkpatrick, Rugg, Hook and Mikeljohn). The movement never achieved hegemony within school ideology but was appropriated, piecemeal, into a hybrid discourse of liberal reform which dominated our schools since the turn of the century. Moreover, in its latter incarnation, radical school reform of the 1960s adopted an anti-intellectual stance that helped prepare the victory of the right.¹⁰²

Aronowitz and Giroux credit progressives such as Dewey with having a vision of what schools ought to be, but take him to task for not “making a social and political analysis of what schools are.”¹⁰³

I believe that Aronowitz and Giroux, and particularly Giroux, fail to sufficiently take into account the importance of earlier theoreticians in the social foundations of education—specifically, those in the Kilpatrick discussion group such as George S. Counts.

In *Teachers as Intellectuals*, for example, Giroux argues that teachers need to become “transformative intellectuals,” ones who will

combine reflection and action in the interest of empowering students with the skills and knowledge needed to address injustices and to be critical actors committed to developing a world free of oppression and exploitation. Such intellectuals are not merely concerned with promoting individual achievement or advancing students along career ladders, they are concerned with empowering students so they can read the world critically and change it when necessary.¹⁰⁴

Returning to the idea of schools as “democratic public spheres” that he developed with Aronowitz in *Education Under Siege*, Giroux argues in *Teachers as Intellectuals* that “both teachers and students need to work together to forge a new emancipatory vision of community and society.”¹⁰⁵ According to Giroux, teachers as intellectuals

must take active responsibility for raising serious questions about what they teach, how they are to teach, and what the larger goals are for which they are striving. This means that they must take a responsible role in shaping the purposes and conditions of schooling. Such a task is impossible within a division of labor in

which teachers have little influence over the ideological and economic conditions of their work.¹⁰⁶

There is absolutely nothing wrong with old wine in new bottles. Giroux’s concept of teachers being “transformative intellectuals” sounds a great deal like George S. Counts’s argument for teachers becoming a social force in his 1932 *Dare the Schools Build a New Social Order?* As Counts argued,

Teachers, if they could increase sufficiently their stock of courage, intelligence, and vision, might become a social force of some magnitude. About this eventuality I am not over sanguine, but a society lacking leadership as ours does, might even accept the guidance of teachers. Through powerful organizations they might at least reach the public conscience and come to exercise a larger measure of control over the schools than hitherto. They would then have to assume some responsibility for the more fundamental forms of imposition which, according to my argument, cannot be avoided.¹⁰⁷

Counts believed that teachers should not only be politically and socially proactive, but consciously seek power as well. As he explained,

That the teachers should deliberately reach for power and then make the most of their conquest is my firm conviction. To the extent that they are permitted to fashion the curriculum and the procedures of the school they will definitely and positively influence the social attitudes, ideals, and behavior of the coming generation. In doing this they should resort to no subterfuge or false modesty. They should say neither that they are merely teaching the truth nor that they are unwilling to wield power in their own right. The first position is false and the second is a confession of incompetence. It is my observation that the men and women who have affected the course of human events are those who have not hesitated to use the power that has come to them. Representing as they do, not the interests of the moment or of any special class, but rather the common and abiding interests of the people, teachers are under heavy social obligation to protect and further those interests. In this they occupy a relatively

unique position in society. Also since the profession should embrace scientists and scholars of the highest rank, as well as teachers working at all levels of the educational system, it has at its disposal, as no other group, the knowledge and wisdom of the ages. It is scarcely thinkable that these men and women would ever act as selfishly or bungle as badly as have the so-called “practical” men of our generation—the politicians, the financiers, the industrialists. If all of these facts are taken into account, instead of shunning power, the profession should rather seek power and then strive to use that power fully and wisely and in the interests of the great masses of the people.¹⁰⁸

Counts, along with William Heard Kilpatrick, is widely considered to be the singular force in the development of the Education 200F course at Teachers College and perhaps as much as any single figure, the founder of the field of the social foundations of education. The basic premise and title of his “revolutionary” pamphlet *Dare the Schools Build a New Social Order?* calls for a radical pedagogy that complements theorists such as Giroux and could easily have been written during the 1980s or in our own era. According to Counts, writing during the early years of the Great Depression, teachers

must be prepared to stand on their own feet and win for their ideas the support of the masses of the people. Education as a force for social regeneration must march hand in hand with the living and creative forces of the social order. In their own lives teachers must bridge the gap between school and society and play some part in the fashioning of those great common purposes which should bind the two together.¹⁰⁹

As a result of science, technology, and culture, human civilization was transforming itself into a “single great society.”¹¹⁰

Included in Aronowitz and Giroux’s idea of the school as a democratic sphere is the need “to specify what we as a community want education to be.” Implicit in this notion is the belief that the schools must be part of an active political process, not simply passive containers of knowledge. This is an idea that clearly resonates with Counts, who argued that

If the schools are to be really effective, they must become centers for the building, and not merely for the contemplation, of our civilization. This does not mean that we should endeavor to promote particular reforms through the educational system. We should, however, give to our children a vision of the possibilities which lie ahead and endeavor to enlist their loyalties and enthusiasms in the realization of the vision. Also our social institutions and practices, all of them, should be critically examined in the light of such a vision.¹¹¹

Education and Cultural Studies

By the late 1980s and early 1990s, Giroux’s work had evolved beyond a focus on critical pedagogy into a broader cultural studies model. By the middle of the 1990s, he had published his essay, “Is There a Place for Cultural Studies in Colleges of Education?”¹¹² This piece was followed in 1997 by a book coedited with Patrick Shannon, *Education and Cultural Studies: Toward a Performative Practice*.¹¹³

At the beginning of “Is There a Place for Cultural Studies in Colleges of Education?” Giroux asks the question of “why so few academics have incorporated cultural studies into the language of education reform, particularly as it applies to colleges and schools of education.”¹¹⁴ Although I think that there is validity in his argument that there is a long tradition of educational reform emphasizing the practical and the immediate over the reflective and the intellectual, and that “within such a tradition, management issues become more important than understanding and furthering schools as democratic public spheres,”¹¹⁵ I also believe that Giroux and many others interested in the cultural studies of education have consistently ignored the intellectual traditions of the social foundations of education. Once again, I do not object to Giroux and others adopting a cultural studies model of education. I obviously think that the model is important and well worth attention. My objection is that by not connecting their model to the intellectual traditions of the social foundations of education begun at Teachers College more than fifty years before, they contribute to the fragmentation among those groups interested in social and cultural issues related to schooling.

As argued in earlier sections of this essay, the founders of the social foundations of education laid out an intellectual agenda in the 1930s and 1940s that, if not precisely the same, included most of the key elements of a cultural studies approach to education. Certainly, popular culture and an understanding of the need to study media—particularly electronic media—as an educational force was not part of their agenda (these forces had not sufficiently emerged in the culture to have attention given to them). The themes of culture as dynamic and changing, of the need for educators and academics to be political and cultural leaders, of the need for them to go beyond disciplinary borders in the study of education, as well as the realization that education involves issues of power and authority, were all concerns of the Kilpatrick discussion groups. They were also themes within the traditions of the social foundations of education that emerged from Teachers College.

Giroux demonstrates little awareness of this tradition. Perhaps this is because of his academic training and experience. Giroux taught as a high school teacher from 1969–1975. His graduate training culminated with the completion of a doctorate of arts from Carnegie-Mellon University's College of Humanities and Social Sciences in 1977 with a major in curriculum theory, sociology of education, and history. His dissertation was titled "Themes in Modern European History: A Study in the Process of Writing History." At least at the doctoral level, Giroux's training was not in the social and cultural foundations of education, yet it is this area that, historically, has been most linked to cultural studies issues.

In his writing, both on critical theory and pedagogy, as well as on cultural studies and education, Giroux makes virtually no reference to the social foundations of education as a field, nor to the key writers in the field. His approach is to draw on literary and cultural theorists—ones whom I suspect he knew and with whom he was comfortable from studies in literature and critical theory as part of his doctoral program. I think Giroux's originality is that of the outsider coming to the field of education and bringing with him a new set of theoretical insights and perspectives. I believe that his main limitation is that he is not sufficiently connected to intellectual traditions such as the

social foundations. By coming from the outside, and by not integrating his work with existing traditions, Giroux contributes to the division over the social foundations of education and its role in departments and schools of education.

Other people have contributed to the problem. William Pinar's important reconceptualist work in curriculum theory led to the creation of the *Journal of Curriculum Theorizing* and the Bergamo Conference on Curriculum Theory and Classroom Practice (widely known as Bergamo because of its location at a conference center by that name located near Dayton, Ohio). This conference has influenced people to move away from the social foundations of education. People have also been focusing on disciplinary affiliations rather than on the broader social foundations model.

Foundational Questions for the Field of Educational and Cultural Studies

Kathy Hytten asks the fundamental question for anyone interested in the social foundations of education or cultural studies in education: "What should be the ultimate purposes of education in a democratic society?"¹¹⁶ She points to the fact that this question and others like it are seldom addressed in schools of education. She notes,

Asking about ultimate purposes is a metaphysical question, one that requires us to consider the reasons why we do something—the why, or the end goal. Yet too often in education, we neglect metaphysical questions and focus instead on engineering ones.¹¹⁷

Hytten's "engineering questions" are goal oriented: "Should students be able to choose their schools? How can we efficiently implement an educational strategy such as cooperative learning? What is the best way to teach biology? How can we better assess students?"¹¹⁸ What these questions avoid, according to Hytten, is the question, What is the purpose of schooling?

The following outline is intended to provide a core set of questions around which a new model of education and cultural studies can be formulated. Many of the questions are obvious to those engaged in the social foundations of education and its related disciplinary fields.

The idea for such a series of questions is by no means original. In 1960, for example, the educational anthropologist and sociologist Jules Henry developed “A Cross-Cultural Outline of Education,” which included many of the same essential questions and concepts outlined below. In 1969, Philip W. Perdue outlined many of the key questions for the field in an article, “What Are the Foundational Questions?”¹¹⁹ More recently, Joe Kincheloe and Shirley Steinberg have used a similar approach in their book *Thirteen Questions*, in which they provide contrasting interpretations of thirteen key questions in the field of education and cultural studies. Their insight that “teacher education often ignores questions of educational meaning, focusing its attention on techniques of delivering information,”¹²⁰ is important and addresses one of the most important limitations of how we prepare teachers for the real world.

The approach taken by Steinberg and Kincheloe is also closely related to what Macmillan and Garrison refer to as *ereotetic* teaching—that is, teaching that relies on questioning as a central pedagogic technique.¹²¹ Although it is hoped that the questions and concepts outlined below are useful to those engaged in teaching in educational foundations, they are also intended to provide a guide for critical inquiry and the means by which to establish a preliminary map of the field of educational and cultural studies.

Like any map, this set of questions provides an overview or metaphor for the field. Earlier theorists provide useful guidelines. For example, Philip W. Perdue maintained that the criteria for the selection of such questions should include the following:

They are abstract or theoretical.

They have broad application to many specific or practical situations.

For their solution, they draw upon data in more than one field.

They have the potential for generating new data.

They are problems in *education*, not in philosophy, sociology, psychology, or any other discipline, although they may generate data which will be useful to other disciplines.¹²²

Perdue’s criteria are worth careful consideration. They also suggest that the development of such a list is

subject to constant revision, as new territories are explored and older, more defined geographies and landscapes are reexamined. It is hoped that these questions will provide a starting point for further discussion and debate.

The questions that are included are divided into two groups. The first group is an example of questions about the nature and purpose of schooling and education that critical educational social theorists have asked in recent years. I include them as examples of the types of questions that have been proposed by many of those working in critical and cultural studies of education. The list is not definitive and is intended simply to provide a “scrapbook” of some of the questions that are being asked by researchers and theoreticians in the field. They are not organized in any particular order. Often, the questions were grouped in clusters. As a result, in most instances, I have kept them grouped together.

The second list draws on many of the questions in the first list. I have reworked some questions and added new questions as I tried to construct a rough taxonomy of inquiry for the field. It is not in any way meant to be definitive, but simply a starting point, a framework, for building an *ereotetic* system—a foundational set of questions for educational and cultural studies.

Questions From Critical Pedagogy and Cultural Studies

In developing the second set of questions, I have been guided by Peter McLaren’s notion that in the case of questions involving critical pedagogy, they need to be ones that must

take as their point of departure the real, concrete problems facing students and teachers today. . . .

Questions which are relevant and pertinent to the human condition, questions which are formulated as part of a larger struggle for human liberation—are those which must be asked of history itself.¹²³

The first set of questions that have been asked in recent years is as follows:

Upon what criteria do we base our decisions about what type of society our schools should work to create? How do we decide what we need to know or not to know? What is the nature of the process that certifies certain

information as valuable school knowledge? How do we apply the knowledge gained in schools to our own lives and the larger society?¹²⁴

How do students and teachers come to construct their views of reality?¹²⁵

Why are some constructions of educational reality embraced and officially legitimated by the dominant culture, while others are repressed?¹²⁶

What should be taught in the schools?¹²⁷

What do schools teach, what should they teach, and who should decide?¹²⁸

Is the primary purpose of schooling to instill basic skills or to foster critical thinking?¹²⁹

Should education aim to mold future citizens, engender personal development, or inspire academic achievement?¹³⁰

Must education have an aim?¹³¹

What beliefs, values, or attitudes are learned from the way classrooms are? That is, what lessons are acquired but taken for granted, taught but not planned?¹³²

What is a good teacher? good teaching? What does it mean to be a good teacher? Are teachers as good as they used to be? Do we have reason to think teachers are not as good? What made them good? How do we define good? Is there a model for good teaching? a system of meaning that we can attach to good teaching? Are there different types of good teachers? What stories do we hear from teachers about good teaching? what stories from students? Is good teaching intuitive? Is it learned? How symbiotic should schooling and teaching be? What does learning have to do with teaching? Can one really *teach* anything? What is the responsibility of the learner? What is the text of teaching? of good teaching? Can we define good teaching?¹³³

What is good teaching in the context of gender, class, ethnicity, and generation?¹³⁴

What kinds of teaching contribute to the building of democracy in the present as well as the future? What might encourage students and teachers to imagine in deep and compassionate terms, the possibilities offered by their own identities and the identities of others? How might teaching engage everyone involved in social justice and in the attainment of civil rights? What kind of values allows students and teachers to work together in dignified ways? What conditions allow teaching and learning to be meaningful, creative, and pleasurable? If we can imagine schooling as a wonderful place, what kinds of identities would

be available to teachers, students, and the larger communities? If education could (be) lived as a utopia, what kinds of practices, values and beliefs, and relationships would sustain it? What if teachers and students could shed the stereotypes that trap them? How would their work and their lives be different?¹³⁵

What are the moral variants against which we shall construct ourselves as social agents of change? How can problems related to class, race, gender, and power be translated into questions of educational quality and excellence? In what way can we reposition ourselves as educators against the dominant culture in order to reconstitute our own identities and experiences and those of our students? How can educators construct a pedagogical project that legitimates a critical form of intellectual practice? How is it possible to acknowledge difference and multiple forms of identity and still address the issues of will and political struggle? What diversity do we silence in the name of a liberatory pedagogy? How can educators come to recognize injustices which have been perpetrated in the name of education? How can they come to face their own participation in the employ of an often oppressive system that appears to rob students of their basic rights? In what ways can teachers work to support a pedagogy responsible for collectively forging a democratic public culture? How can educators link a theory of schooling to a pedagogy of the body and desire? What are the limits of the knowledge/power/subjectivity relation? How do we develop a public discourse that integrates the language of power and purpose with the language of intimacy, friendship, and caring? How do we speak in the name of emancipation without showing scorn for those who are caught in the grip of domination or ignorance, regardless of their class position? Since we don't know what is historically possible until it has been tried, how can educators begin to empower students to imagine a future in which hope becomes practical and where freedom can be dreamed, struggled for, and eventually won?¹³⁶

Who controls different modes of communication, and in whose interest do they operate? More succinctly put, do the modes of communication operate in the interest of oppression or liberation?¹³⁷

Should the schools develop young people to fit into present society as it is, or does the school have a revolutionary mission to develop young people who will seek to improve the society?¹³⁸

What is learned in schools?¹³⁹

What counts as curriculum knowledge? How is such knowledge produced? How is such knowledge transmitted in the classroom?¹⁴⁰

Who has access to legitimate forms of knowledge?
Whose interest does this knowledge serve?¹⁴¹

How are social and political contradictions and tensions mediated through acceptable forms of classroom knowledge and social relationships?¹⁴²

How do prevailing methods of evaluation serve to legitimize existing forms of knowledge?¹⁴³

How can we make schooling meaningful so as to make it critical and how can we make it critical so as to make it emancipatory?¹⁴⁴

What should be the ultimate purpose of education in a democratic society?¹⁴⁵

Basic Questions

What follows is a series of basic questions for the social and cultural foundations of education. As mentioned earlier, some of these questions draw on those listed above. Others have been reworded and some are completely new.¹⁴⁶

What is taught in the schools? Who determines the curriculum? Does the content reflect a specific social or political set of values? Is the censorship of certain ideas necessary to protect students from “dangerous” or inappropriate ideas? What should be included in textbooks?

What are the fundamental images or metaphors used to define the culture? Are there certain core or “root” metaphors that are used in the culture and the educational system? What do these images and metaphors reflect?

What is the focus or primary purpose of education in a specific culture or society? Is it to produce loyal subjects or citizens? Is it to pass on traditions? Is it to produce workers? Is it to control the individual or groups? Is it to maximize the potential of individuals or groups?

Who is it that teaches? Men? Women? High-status individuals? Low-status individuals? Do the people who teach create or control the curriculum they teach?

Should the schools act as agents for social change or as a means of maintaining the status quo? To what extent should teachers act as agents for promoting change or for maintaining the dominant values and beliefs of the culture? Should teachers be restricted in what they are allowed to teach their students?

Who is to be educated? In a democratic society such as the United States, is equal education for all possible or even

desirable? Does the gifted child need the same support and resources as the average child or the handicapped child? What is equitable? Should ethnic groups and language minorities receive different training from other groups?

What makes a good school? Does the definition of a good school differ depending on the social and economic background of its students? Can we compare schools with different types of clients who have different types of needs?

What narratives should be emphasized in the curriculum of the schools? Whose stories are to be told? What cultures are to be represented? What should be the end and purpose of instruction?

What types of obligations do the schools have beyond simply educating students? Should schools address the moral development of students, for example, or provide health services? What should be the focus of the school?

Should schooling be compulsory? If so, for how long? What is considered a sufficient education? Should students be compelled to learn things they or their parents oppose on moral and personal grounds?

Should private schools be encouraged or discouraged? Should they receive direct or indirect support from the government? Do private schools benefit certain groups in the culture? If yes, how?

What role should religion play in schooling? Should selected religious practices or sects be allowed in the schools? Should certain religious groups be excluded? What is equitable?

Who should control the schools? Should the schools be controlled by parents, administrators, or state and federal governments? Should education and the schools be under the control of an elite? Who is capable of making the most informed decisions concerning what is needed by the educational system?

What constitutes the necessary and proper means of training teachers? Who should be allowed to teach? To what extent should teachers have the right to act according to the dictates of their own values?

To what extent should the schools be used as a means of correcting or compensating for past social injustices? Should the schools be used to desegregate the society and bring about greater equality?

To what extent should the schools provide instruction that has been provided in the past by the family and other social groups? Should subjects such as sex education or personal ethics and values be taught in the schools?

To what extent are the media, in the form of television, movies, popular music, video games, and computers, taking the place of more traditional family and school-based instruction? Is most of the education children receive coming from media sources? How is this type of education different from other types of learning? How is it related to commercial interests in our society?

Who benefits most from new educational technologies such as computers? Do the privileged have the most to gain from new computer technologies like the Internet? Are there differences in the services provided to students based on their social or economic class? Is the use of technology encouraged more for boys than girls?

What is considered useful knowledge? Whose knowledge is taught in the classroom? Is there a “canon” that is taught? Where does it come from? Does its adoption benefit certain groups over others?

How does race affect what goes on in the schools? Does the racial background of the student affect how and what he or she is taught? Are there hidden curricula at work in schools and the culture reflecting racial bias and privilege?

How does ethnicity affect what goes on in the schools? Are certain ethnic groups treated differently based on their background and experience? Or are all ethnic groups treated the same?

How does gender affect what goes on in the schools? Are men educated differently from women? Are women subjected to treatment and experiences that are different from those of men? Are alternative sexual orientations discriminated against?

How does social class affect the experience of students in the schools? Are students from lower socioeconomic groups treated differently from children whose parents are part of the culture’s power bloc?

What types of citizens do our schools and the culture want to create? What knowledge is necessary to make people active and productive citizens?

What constitutes good teaching? How are teachers trained? What is considered good teaching? Why is it considered good teaching?

Should schools provide social services? Is it the obligation of schools to provide free lunch and health care programs for students in need?

What are the rights of teachers? What can teachers do or not do? How much control should the society have over teachers in the classroom? in their private lives?

What is the role of business in shaping and influencing the content of education? What type of influence should business have in shaping the curriculum of the schools? Should students be trained for specific jobs demanded by the business system?

What is the significance of the fact that women have dominated the teaching profession since the middle of the nineteenth century? Has the fact that teaching has been a feminized profession affected the status of teachers—both historically and in contemporary culture? Why are the majority of teachers women? Why are there fewer men and minorities in the teaching profession than in the general population?

Should there be national standards and guidelines for the curriculum of the schools? Should the content of curriculum be controlled at the local and state level or by the federal government? Who should determine what gets taught in the schools?

What role does popular culture play in the shaping of attitudes about schools, teachers, and students? Is the representation of schools, teachers, and students accurate, or does it distort the reality of their experience?

Should teachers be nationally licensed and certified? Should teachers be “board certified” the way a specialist is in the field of medicine? What should constitute certification?

How is technology used as part of the educational system? What discourses does it encourage or discourage? Is educational technology neutral? Does it benefit some more than others?

I would argue that we need to reconceptualize the field of the social foundations of education around questions such as these. I believe that the formulation of key questions about the nature and purpose of education and schooling, about how people are acculturated, and about how these processes relate to larger issues of race, gender, and social and economic class are essential to a reconceptualized model of social foundations of education. Cultural studies provide an understanding of the structures of power in a culture, as well as the mechanisms by which cultural meaning is created and controlled. In doing so, a theoretical model and set of methods are provided for formulating key questions in the field. To quote Hytten,

In developing new ways of thinking about pedagogy and curriculum, cultural studies of education attends to basic questions about the knowledge most worth learning, while at the same time opening up spaces for students to study larger social questions that transcend typical disciplinary boundaries.¹⁴⁷

I agree with Perdew's nearly thirty-year-old criticism that the true foundations "must be more relevant, more analytical, and more integrative." Those of us interested in the social foundations of education, cultural studies of education, educational studies, or whatever term we want to use to describe our field, must draw on the disciplines for methods and insights, but, at the same time, not be blinded by their inherent limitations. We need to develop truly meaningful transdisciplinary models that confront the balkanization of the academic disciplines and their avoidance of critical questions about the foundations of American culture and society.

Conclusion

The title of this essay, "Education and Cultural Studies: Toward a Renewed Definition of the Social Foundations of Education," might have also been called "Back to the Future." I believe that many of the elements underlying the original founding of the field of the social foundations of education are inherent in a "renewed" model of the social foundations—one that emphasizes a cultural studies approach.

Of course, this is not to argue that the social foundations of education and education and cultural studies are necessarily the same thing. There is a separation of nearly half a century between the fruition of each field. Methodological advances, new texts and sources, innovative interpretive paradigms and schemas, and accumulated knowledge in the field of educational research make them different. Yet in many regards, what cultural studies in education attempts to do fulfills many of the main ideals pursued by the founders of the field of social foundations.

If cultural studies is to provide a basis for the renewal of the social foundations of education, then its practitioners will have to involve themselves not only with the faculty who teach throughout departments

and schools of education, but also with their colleagues in the liberal arts. In addition, they will have to address how their work is meaningful for those actually working in schools—school administrators, teachers, and parents. I think this is a very difficult task that requires both enormous energy and insight.

A renewed social foundations of education that draws upon a cultural studies model cannot be simply the study of popular culture and media, corporate pedagogy, radical pedagogy, and revolutionary multiculturalism. Although these are fascinating and important topics, they represent only a very small part of the issues that need to be addressed as part of a renewed definition of the social foundations of education.

Educational and cultural studies needs to expand the issues it addresses. It needs to include, as Kathy Hytten suggests, more issues that "dominate the broader educational discourse" such as school choice, alternative assessment, national standards, grouping practices, testing, school business partnerships, and technology.¹⁴⁸

I admire much of the work done in critical pedagogy and cultural studies in education. Yet critical pedagogy and, more recently, cultural studies of education, despite their promise, are situated largely on the fringes of educational practice. Thus, concepts developed by these approaches are rarely integrated into courses in methods, or specialized areas such as special education or educational technology. Teachers, and the educational system in general, fail to ask questions about how they perceive the classrooms in which they work, how students interpret the information that is presented to them, and how knowledge is mediated between teachers and students.¹⁴⁹ This is perhaps the great failure of teacher education in the United States. Through its failure to address cultural questions, it has been unable to train the teachers it educates to be reflective thinkers about what they do, about the character and concerns of the students they teach, and about the communities in which they work.

It is interesting that we insist on teaching elementary school teachers the fundamentals of addition, subtraction, multiplication, and division, and how to introduce young children to basic mathematics, but we do not systematically introduce them to concepts that will help them be reflective social practitioners.

Like Hytten, I believe that the cultural studies of education provides a “compelling vision” of education that contributes to educational practices and that has the potential to both empower and liberate individuals. A cultural studies approach to education has a number of implications for educators. First, it forces them to “acknowledge the value-ladenness of their positions and of knowledge itself.” Second, it assumes that “educators need to relate curricula more directly to students’ lives, aspirations, and cultures.” Third, in a cultural studies model, “issues of diversity need to be more paramount in schools. Specifically, students need to know how power and privilege get constructed in society—often in problematic ways.” Fourth, in a cultural studies model, “educators should teach students how to express themselves and gain more control over their daily lives so that they are not passive consumers of disabling social messages.” Fifth, and finally, a cultural studies model compels educators to “experiment with new models for teaching and learning that better connect what occurs in the classroom to efforts at social transformation.”¹⁵⁰

If we are to adopt a cultural studies of education model for renewing the social foundations of education, we must also recognize the limitations of both cultural studies and the social foundations. In a very powerful, and I believe essentially fair critique, the educational and social/ecological theorist C. A. Bowers challenges the work of educational and cultural theorists such as Henry Giroux and Peter McLaren. Although arguing that he is in full agreement with them on many social justice issues—specifically, issues involving gender, minority cultures, and the economic underclass—he questions why they ignore issues involving

the right of future generations to experience life in an uncontaminated environment, the need for cultures to sustain patterns of moral reciprocity along with knowledge and activities that result in a more ecologically sustainable footprint, and the need for more ecologically centered cultural groups to assess which technological and linguistic innovations can be assimilated and rejected.¹⁵¹

Bowers argues that emancipatory theorists such as McLaren and Giroux, along with their predecessors

Freire and Dewey, reject tradition by associating it with “the legacy of a feudal social order that limited human choice and development.”¹⁵² Bowers questions their epistemological assumption based on the Western philosophical tradition “that the individual is the basic social unit that engages in rational thought and has direct, culturally unmediated experiences.”¹⁵³ For Bowers, tradition is not an impediment, nor is change necessarily desirable or good. These are assumptions that he believes are built into the work of theorists such as McLaren and Giroux, as well as a critical pedagogue such as Paulo Freire.

Bowers, for example, takes to task Giroux’s notion of teachers being “transformative intellectuals” and change agents for the culture. As he explains,

According to Giroux’s way of thinking, all members of society, regardless of cultural background and degree of participation in their primary and secondary cultures, must be willing to yield to the moral judgments of students and their teachers. In the 1930s, George Counts urged teachers to become a selfless vanguard dedicated to the task of creating a new social order. More recently, the world has witnessed several examples of student-led revolutionary movements that set out to overturn all traditions. Few people today would agree that the Red Guard and the youthful followers of Pol Pot created democratic public spheres that provided for greater social equality and the discovery of new personal identities.¹⁵⁴

Bowers goes on to criticize McLaren, Giroux, and their followers’ assumptions about the nature of progress and their rejection of traditional and “conservative” (i.e., conserving) models of culture.

Bowers presents a note of caution for any renewed definition of the social foundations of education. If we are to use a question-based model to reformulate the social foundations of education—one that emphasizes a cultural studies approach—then we must “interrogate” (to use a favorite phrase of Giroux’s) what assumptions underlie our questions, as well as our interpretations of them. No construction of knowledge is neutral. Bowers’s recent work on social ecology and education emphasizes Western education, and more specifically, the failure of American colleges and universities to

recognize their bias against traditional forms of knowledge. It represents a powerful critique that should help us realize the potential limitations of new formulations concerning culture and education and provide us with insight that allows us to go beyond our perspectives and points of view in renewing our definition of the social foundations of education.¹⁵⁵

During the mid-1970s, Nash, Shiman, and Conrad proposed a set of recommendations for reforming the social foundations of education. In doing so, they did not reject the disciplines, but emphasized the concept of moving toward constructs for the field that went beyond disciplinary models.¹⁵⁶ More recently, Lee Shulman has analyzed the foundations in the education of professionals. Beginning with a discussion of the work of Abraham Flexner and the development of a foundational/disciplinary model for medical teaching at the beginning of the twentieth century (i.e., two years of basic science before practical courses begin), Shulman criticizes the foundational courses in medical education as eventually becoming “disconnected, disintegrated and unrelated to practice.”¹⁵⁷

After reviewing John Dewey’s approach to the foundations at the University of Chicago in the late 1890s, Shulman makes a case for a reconceptualization of the foundations of education (both psychological and philosophical). He argues specifically for “a withering away of the field of educational foundations as we know it as separate, disconnected studies in psychology, history, sociology, and philosophy of education.”¹⁵⁸ For Shulman,

the foundation must be seen as an integral part of the connective tissue that gives shape and meaning to the education of teachers—as the framework for connecting and integrating the knowledge acquired in the liberal arts and sciences with the practice of pedagogy.¹⁵⁹

Shulman argues that the “true foundation disciplines are not what we call foundations.” Instead, they are the “arts and sciences themselves.”¹⁶⁰ Rejecting the architectural metaphor for the foundations in which disciplinary coursework provides the base upon which professional training is laid, Shulman proposes an alternative metaphor of the steel skeleton for a skyscraper, one that is “much more powerful than a solid

foundation because it is integral to the structure. It weaves itself through it; it becomes part of the very structure it is trying to support.”¹⁶¹

Shulman’s model suggests that foundational scholars in psychology, history, philosophy, anthropology, and sociology of education should not think of themselves as providing a base, but a scaffolding or framework for the understanding of pedagogy and education. This metaphor is even more useful because it also suggests the notion of a connectedness, or an understanding of the pattern or patterns that connect the phenomenon of education.

Shulman goes on to propose five principles for rethinking the general foundations of education:

1. We must teach foundations in a way that is bound up with the content of instruction. It does not make sense to separate the content from the pedagogy now any more than it did for Dewey in 1896.
2. The best way to think about the foundations is as that set of ideas and experiences through which we forge connections between what students learned in the arts and sciences and the pedagogy that they are going to be learning with us.
3. Cases should become an important tool for teaching foundations. Cases can be selected, crafted, sequenced. If we can learn to make them more vivid and interactive, we can derive all of the virtues of their situatedness and their connectedness, and have the opportunity to add the moral to the intellectual in the teaching of pedagogy.
4. We must use what we call the foundations to create vivid, compelling images of the possible in education, images of the long-term moral as well as intellectual possibilities of being an educated person in a good society.
5. Our foundations work should continually present students with the opportunity to test the correspondence between their own thinking and doing and these images of the possible they generate.¹⁶²

Shulman’s proposed principles seem reasonable. I would suggest including them in any reconsideration of the social foundations of education and the cultural studies of education.

I believe, however, that a larger reform needs to be considered, one that goes beyond the integration of the social foundations of education and the cultural studies of education. I suggest going beyond departments and

schools of education, going beyond departments and disciplines, to ask the question: How do we teach undergraduates and graduate students in professional schools?

Shulman's argument that the true foundations disciplines are arts and sciences is ultimately a sound one. The majority of undergraduate instruction for students in education comes from outside the field of education. What meaning do these courses have for students? If they are simply a selection of general education requirements, they may or may not serve the purpose of broadly educating them and preparing them for work as professionals. I do not believe, for example, that it is sufficient to have students take an introductory American history course, and then assume that they are going to connect it to their studies in education. Nor do I believe that we can expect undergraduates to connect their studies in biology, mathematics, or philosophy in a similar way. A course here and there across the liberal arts does not sufficiently connect what students need to know and understand.

I believe we need to connect our courses together using a truly interdisciplinary approach. Imagine a course that fulfilled a general education requirement that required students to consider the relationship between schooling and culture. Imagine a course that posed fundamental questions of the type discussed earlier in this work.

Imagine students going back to their courses in American history, sociology, philosophy, or biology and asking these various questions within the context of these disciplines. Why not introduce in a general course in the social foundations and cultural studies of education the concept of "privilege"? The issue of privilege and its role in education could be posed as follows: How does privilege advantage certain individuals over others in our educational system? Are men privileged over women? If so, how? Does privilege enter into the equation of race or ethnicity? If so, how do racial or ethnic privileges manifest themselves in school settings? What are the implications for our culture and democracy? What are the implications for working in educational settings? for the development of curriculum? And so on.

These questions, which could be outlined and discussed on a preliminary basis in a general social foundations course, then could be linked to a scaffolding or network of additional coursework and inquiry. An African American or American literature course could

examine discrimination (the denial or opposite of privilege) in a work such as Harriet Beecher Stowe's *Uncle Tom's Cabin* or Richard Wright's *Native Son*. Reference back to the key concept or question from the general foundations course would be part of the discussion.

Likewise, a sociology course could include a strand on privilege, perhaps considering the work of theorists such as Emile Durkheim or Antonio Gramsci. A biology course could look at issues of racial representation and scientific bias beginning with phrenology. In psychology, one could look at not only pseudoscientific systems like phrenology, but also at how psychological testing has been used and abused by different groups to promote privilege among select populations in the culture.

Integrative discussion groups and courses could provide the opportunity to pull seemingly disparate sources together. Combined with intensive writing and research projects, such courses could stress an understanding of the connectedness of things in the web of culture.

Methods courses in education could be linked much more closely to disciplinary knowledge from the liberal arts. Classroom management, for example, could be understood in the context of issues of privilege that operate on a racial, ethnic, or gender level.

Initially, such coordination and integration would be difficult. I think it is liable to fail because of the natural tendency of individuals not to revamp their thinking and teaching. Disciplinary specialists, by definition, are fascinated by their subject. They take its importance for granted. They see its connections within itself as a field. They are not necessarily, nor even likely to be, interested in broader questions that may be crucial to an undergraduate.

Similarly, methods instructors, teaching in an education program, may consider stressing the connection of what they are doing with knowledge in the disciplines as a distraction. They may also see it as threatening because it challenges myths and assumptions that they hold dear. Age and the problems of breaking set traditions and habits may be contributing factors. I cannot imagine a colleague near the end of his or her career, whether in a discipline or in a practice-oriented course in education, easily adopting a radical model such as the one proposed. Certainly, some people will be able to change, but many will not be able to alter ingrained habits and ways of looking at the world.

Yet such a model has the promise of providing a much more powerful and meaningful education for our students. It overcomes Whitehead's objection to schooling that emphasizes the acquisition of "inert knowledge":

Culture is activity of thought, and receptiveness to beauty and humane feeling. Scraps of information have nothing to do with it. A merely well-informed man is the most useless bore on God's earth. What we should aim at producing is men who possess both culture and expert knowledge in some special direction. Their expert knowledge will give them the ground to start from, and their culture will lead them as deep as philosophy and as high as art. We have to remember that the valuable intellectual development is self development, and that it mostly takes place between the ages of sixteen and thirty.¹⁶³

"Inert ideas"—ideas that are simply digested by students without "being utilized, or tested, or thrown into fresh combinations"¹⁶⁴—are useless in the meaningful education of the individual.

Technologies are available that could help us in the process of realizing an interdisciplinary and "connected" model of the type outlined above. Robert M. Hutchins developed his famous *Synopticon* to accompany the *Great Books of the Western World*.¹⁶⁵ The *Synopticon*, according to Hutchins, was

begun as an index and then turned into a means of helping the reader find paths through the books, has ended, in addition to making these contributions as a tool for reference, research, and study, as a preliminary summation of the issues around which the Great Conversation has revolved, together with indications of the course of the debate at this moment. Once again, the *Synopticon* argues no case and presents no point of view. It will not interpret any book to the reader; it will not tell him which author is right and which wrong on any question. It simply supplies him with suggestions as to how he may conveniently peruse the study of any important topic through the range of Western intellectual history.¹⁶⁶

The philosopher Mortimer Adler was primarily responsible for the development of the *Synopticon*. Including 102 categories or "chapters," topics dealt with in the index were as diverse as "Temperance,"

"Sign and Symbol," and "Slavery." Under the category of "Poetry," for example, there are nine major topics, including "The nature of poetry: its distinction from other arts," "The origin and development of poetry: the materials of myth and legend," and so on.¹⁶⁷ Under the category of "The nature of poetry: its distinction from other arts," are references to authors such as Plato, Aristotle, Lucretius, Epictetus, Augustine, Aquinas, Dante, Hobbes, Montaigne, Shakespeare, Cervantes, Bacon, Descartes, Milton, Pascal, Swift, Fielding, Kant, Boswell, Hegel, Goethe, Darwin, Dostoevsky, and Freud.¹⁶⁸

Implicit in Adler's *Synopticon* is a desire to create links between different authors writing on the same or related topics. Such a model could be adopted for the type of curriculum I am proposing by focusing on the creation of an index that dealt with key topics and questions. Such a "Synopticon" could be developed for students in education, but also in other professional fields as well. It could be used in professional schools such as business, communications, social work, or public health. By emphasizing the connectedness of ideas and knowledge, as well as critical thinking, such a system could move beyond the concept of a core or foundational knowledge to one that resonates much more closely with Shulman's metaphor of scaffolding. Such an approach could represent a model for radically reconceptualizing how we teach undergraduates in professional schools and programs. If actually implemented, it could not only encourage a much more integrated model of instruction, but also draw on the strengths of the liberal arts while addressing the fundamental needs of the professional program.

Computers, with their capability of networking and linking information and ideas, as well as making possible the frequent update of materials, are ideally suited to support such a curriculum. The potential to redefine professional education and change the nature of college instruction is enormous. How applicable such a general model would be to graduate education is open to debate.

In conclusion, I would like to argue that the social foundations of education, integrated with a cultural studies model of education, has the potential to not only extend our understanding of the meaning of schooling and its role in American society, but also act as the

structure for creating a renewed model of education and instruction for professional fields such as education.

8. R. Freeman Butts quotes Martin Levit in a paper prepared in 1971 for the American Association of Colleges of Teacher Education titled "An Inquiry Approach for Foundational Studies":

Foundational studies should be focused on the critical, comparative and comprehensive evaluation of socio-educational policies. . . . No discipline is able to validate its truth-claims by its own resources. . . . No discipline contains or is connected with enough warranted premises to make, by itself, justified recommendations for educational policies and programs. . . . Because this is so, we stand in great need of more comprehensive and interconnected perspectives as a foundation for more rational educational policies.

See R. Freeman Butts, "Reconstruction in Foundations Studies," *Educational Theory*, Vol. 23, No. 1, Winter 1973, p. 28. For Thomas Howell and Nobuo Shimahara: "The social foundations of education are understood to be interdisciplinary attempts to study education in multi-sided perspectives. They are built upon the contributions of various disciplines in the social sciences and humanities." 58. According to Henry Giroux, David Shumway, Paul Smith, and James Sosnoski:

What is studied under the aegis of an academic discipline at any given time is not a natural subject matter, but a field which is itself constituted in the practice of the discipline. Such a field is not arbitrary in the sense that it develops randomly or on whim; rather, a field can be called arbitrary because it is contingent on historical circumstance. Hence it reflects cultural, social, and institutional demands. This is true of all academic fields, but especially so in fields outside the natural sciences. To understand why this is the case, it is necessary to look more closely at the formation of academic disciplines.

See Henry Giroux, David Shumway, Paul Smith, and James Sosnoski, "The Need for Cultural Studies: Resisting Intellectuals and Oppositional Public Spheres," *Dalhousie Review*, Vol. 64 (1984), pp. 472–486.

Todd Gitlin defines hegemony as a ruling class's (or alliance's) domination of subordinate classes and groups through the elaboration and penetration of ideology (ideas and assumptions) into their common sense and everyday practice; it is the systematic (but not necessarily or even usually deliberate) engineering of mass consent to the established order. No hard and fast lines can be drawn between the mechanisms of hegemony and the mechanisms of coercion. . . . In any given society, hegemony and coercion are interwoven.

92. There are many elements in the original conception of the social foundations of education that clearly resonate with a cultural studies model. In the following summary by Tozer and McAninch of the new model of the social foundations of education that the Kilpatrick discussion group incorporated into Education 200F at Teachers College during the mid-1930s, one can clearly see approaches that are fundamental to a cultural studies approach, including the ideas of cross-disciplinary and critical studies:

Social foundations of education is grounded in a rigorous study of society; it is cross-disciplinary, an integrated—rather than a simply eclectic—course of study; it is critical—that is, it exposes students to coherently argued critiques of social and educational processes, institutions and ideas; it reflects an

explicitly articulated point of view which gives organization and integration to the materials studied and which seeks to help “each student . . . build his own point of view” as a result of interacting with the arguments and issues in the text. (Tozer and McAninch, *op. cit.*, p. 10)

 156. Among the alternatives to disciplinarity that they proposed were the following:
 - a. Foundational experiences should be taught by genuine interdisciplinarians, or at least by faculty who have an interest in more than one narrow knowledge area.
 - b. Foundational studies should demonstrate how concepts and procedures link, and how all practice is ultimately and unmistakably based on theory.
 - c. Foundational studies should be down-to-earth rather than esoteric.
 - d. Foundational studies should be problem-based.
- Foundational studies should help students to appreciate the value of original and bold policy formulation in education.
- e. Foundational studies should enable students to do considerable values and beliefs clarifying.
 - f. Foundational studies will have to be taught with a sense of social purpose and conviction.
 - g. Foundational studies must be delivered within an instructional context that is more varied than lecture discussion.

A Visual History of American Education

A Visual History of American Education

Eugene F. Provenzo, Jr.

Introduction

There is no comprehensive visual history of American education. This lack is a remarkable oversight considering the extraordinary materials that are available. These materials include not only photographs but also line drawings, architectural blueprints, report cards, certificates of merit, paintings, book illustrations, and cartoons. A large section of this third volume of the *Encyclopedia of the Social and Cultural Foundations of Education* is devoted to these sources.

These visual sources stand as important documents by themselves, but they also complement many of the entries in this encyclopedia. The purpose of including these materials is, as much as possible, to visually re-create what American schools looked like, to show who the people were who attended and worked in these schools, and to provide samples of the books and materials they used.

The images included are necessarily selective. Although drawn from many sources, the images in the encyclopedia are almost exclusively from publicly available sources—particularly those that can be found on the Internet. Among the most important of these sources are the Prints and Photographs Division of the Library of Congress (<http://www.loc.gov/rr/print/catalog.html>) and the Still Pictures Branch of the National Archives and Records Administration (<http://www.archives.gov/research/order/still-pictures.html>).

Many of the topics covered in the entries in Volumes 1 and 2 of the encyclopedia have corresponding visual materials that are included in this visual history of education. The photographs included in the visual history are cross-referenced at the end of many of the entries.

1. Colonial Beginnings

The first images are taken from the earliest textbooks, specifically *The New England Primer*. No known original copy of *The New England Primer* still exists. Published in the early 1690s, it very much reflected the values and beliefs of late Puritan culture. The primer opens with an *alphabaderium*, or a pictorial alphabet.

Its content is religious, and the primer begins by reminding the reader that all suffer from original sin (e.g., Letter A begins with “In Adam’s Fall, We sinned all”). The alphabet goes on to warn readers of their mortality and to encourage them to read the Bible. Simple syllables are introduced first, followed by words

Image 1.1 The title page of a 1777 edition of *The New England Primer*. Earlier editions of the primer unfortunately have not survived.

Source: *The New England Primer*. (1777). Boston: Edward Draper.

Image 1.2 Works such as *The New England Primer* reflected the culture of which they were a part. Religious imagery, including portrayals of humanity's fallibility and mortality, were regularly emphasized. Specific references to the Bible were also common, as can be seen in the sample page from the primer included above.

Source: *The New England Primer*. (1777). Boston: Edward Draper.

of one, two, three, four, five, and six syllables. Many of the words included are religious and make reference to sins that the child is supposed to avoid, such as *fornication*—a reference to specific injunctions provided in the New Testament (e.g., 1 Thessalonians 4; 1 Corinthians 6, etc.). Other words are less provocative

but also could be used in a religious context, such as *celebration* and *consolation*.

The New England Primer's use of illustrations continues a tradition that can be traced back to a number of earlier publications. Hornbooks, for example, which were used in both England and the American colonies,

<i>Words of five Syllables.</i>	
Ad-mi-ra-ti-on	Admiration
Be-ne-fi-ci-al	Beneficial
Con-so-la-ti-on	Consolation
De-cla-ra-ti-on	Declaration
Ex-hor-ta-ti-on	Exhortation
For-ni-ca-ti-on	Fornication
Ge-ne-ra-ti-on	Generation
Ha-bi-ta-ti-on	Habitation
In-vi-ta-ti-on	Invitation

were a single sheet of paper on which were printed the alphabet and brief texts such as the Lord's Prayer. This sheet was then mounted on a wooden paddle or handle and covered with a piece of translucent, oiled cow's horn (hence the name). This layer protected the surface of the printed material in much the same way as a piece of clear plastic would. Illustrations of hornbooks are found from the early seventeenth century. Although hornbooks were evidently in wide use during the sixteenth century, few

copies survive since they were passed from child to child and almost certainly given hard and steady use. Probably the most important source for *The New England Primer* was the *Orbis Sensualium Pictus*, which was first published in 1658 by the Czech philosopher John Amos Comenius (1592–1670). The book includes parallel columns of Latin and vernacular text that is correlated with detailed illustrations of objects from real life.

The development of textbooks during the late seventeenth century is part of what theorists such as Philippe Aires refer to as the discovery of modern childhood. Since children were surviving more frequently into adulthood, educational resources were increasingly committed to them. New markets began to emerge that focused on childhood: toys, children's books, and textbooks.

An early textbook author from colonial New England was Ezekiel Cheever (1614 or 1615–1708),

who taught for seventy years, the last thirty-eight as the master of the Boston Latin Grammar School. Cheever was the author of a Latin textbook, *A Short Introduction to the Latin Tongue* (published sometime before 1650), which is almost certainly the first schoolbook of any type published in the American colonies. There is no portrait of Cheever, but his signature does survive on a number of documents.

Image 1.8 Signature of the most famous of the New England schoolmasters, Ezekiel Cheever.

Source: Winsor, J. (Ed.) (1881). *The memorial history of Boston, including Suffolk County, Massachusetts, 1630–1880* (Vol. 2). Boston: Osgood.

Image 1.9 Illustrations of colonial teachers are extremely rare. A portrait survives of John Lovell (1710–1784), a successor to Cheever at the Boston Latin Grammar School. Lovell, who was a graduate of Harvard, became head of the school in 1734. He was remembered by his students as a gentle teacher even though the Revolutionaries (i.e., Whigs) described him as a flogging despot. The portrait that survives of him shows a well-fed and prosperous-looking individual, wearing a turban—a popular affectation of the period. It was based on a painting by Nathaniel Smibert.

2. Early Textbooks

With the exception of works such as *The New England Primer*, the textbooks that were used during the colonial period were largely written and published in England. During the American Revolution, there was a clear need to develop new textbooks that would

reflect not only the ideology of the Revolution, but also its new heroes. By the beginning of the eighteenth century, the number of schools was rapidly increasing, with a corresponding growth in the need for textbooks.

Image 2.1 Frontispiece from Noah Webster's "Blue-Back Speller." Although this edition is from 1832, the frontispiece was used in many earlier versions, as well as in other textbooks such as the Lyman Cobb's speller.

Source: Webster, N. (1832). Frontispiece. In *The elementary spelling book: Being an improvement on the American spelling book*. Boston: Carter, Hendee.

Noah Webster's *A Grammatical Institute of the English Language*, which would eventually become known as the "Blue-Back Speller" because of its blue cover, was first published in 1783. It was followed by a grammar in 1784 and a reader in 1785. In the frontispiece to the speller, Minerva, the ancient Greek goddess of wisdom, is pointing a youth to a temple on which is

inscribed "Knowledge" and "Fame." On the front of the temple is a statue of what is almost certainly the Roman goddess of liberty.

In British textbooks, it was typical to include a portrait of the king in the frontispiece. In the United States, this tradition was modified to include images of heroes from the American Revolution. An example

Image 2.2 Frontispiece from Jesse Torrey, Jr.'s 1825 Familiar Spelling Book.

Source: Torrey, J., Jr. (1825). Frontispiece. In *Familiar spelling book: Being a new practical system for teaching English pronunciation and spelling*. Philadelphia: J. Grigg.

of this practice can be seen in the 1825 spelling book by Jesse Torrey, Jr., in which Benjamin Franklin, George Washington, and the Marquis de Lafayette are pictured.

Early textbooks also included illustrations of teachers. An 1833 spelling book by B. D. Emerson, *The*

New National Spelling Book, for example, includes an idealized portrait of a teacher helping a student read surrounded by other admiring students. In general, textbooks tended to include more iconic and nationalistic images of Images such as Minerva, Liberty, and Columbia rather than of teachers.

Image 2.3 Frontispiece from B. D. Emerson's *The New National Spelling Book and Pronouncing Tutor*.

Source: Emerson, B. D. (1833). Frontispiece. In *The new national spelling book and pronouncing tutor*. Philadelphia: Hogan & Thompson.

3. Teachers in the Early and Middle Nineteenth Century

There are tens of thousands of images of both etchings and photographs that can be found of teachers during the nineteenth century. Often these images are highly romanticized and do not give a clear idea of what the actual work of teachers was like. Most of the illustrations from the beginning of the common school movement come from textbooks. These illustrations, such as those from Bolle's *Spelling Book*, were almost certainly not based on actual observations but are probably drawn from the

memories or imaginations of the artists who created them. During the 1830s and 1840s many more women (particularly young women) were introduced into the teaching profession. A male teacher is shown with a group of students in an 1883 child's guide. An illustration of a young female teacher was included in the first edition of the McGuffey Reader (Image 3.3).

A few years later in 1833 a male schoolteacher is shown with a group of students in *The Child's Guide*.

Image 3.1 An 1831 illustration of a female teacher working in a summer school from Bolle's *Spelling Book*.
Source: Johnson, C. (1904). *Old time schools and school books* (p. 135). New York: Macmillan.

Actual photographs of teachers in classrooms—particularly of teachers at work—were extremely rare until after the Civil War. Probably the best visual record of what teachers at work looked like in the United States comes from *Harper's Weekly*. In the November 9, 1867, issue of the magazine, the front page is completely taken up with an illustration of a district schoolteacher. In an article on the following page, the author estimates that of the approximately 150,000 teachers in the United States, 100,000 of them are women—a fact reflecting the increasing

feminization of the teaching profession with the growth of the common schools.

The idealization of the teacher, which is clear in the *Harper's Weekly* illustration, is also expressed in the same article, which explains that “every ‘village school-marm,’—every district teacher—has a dual existence, a life in and out of the school. The teacher is supposed to be an epitome of all knowledge, and a combination of ‘whatsoever things are pure, whatsoever things are lovely, whatsoever things are of good report’” (1867, p. 706).

Image 3.2 A male teacher showing students a chestnut bur.

Source: Johnson, C. (1904). *Old time schools and school books* (p. 255). New York: Macmillan.

Image 3.3 Illustration of a young teacher reading with her students.

Source: McGuffey, W. H. (1838). *The eclectic first reader for children* (p. 6). Cincinnati, OH: Truman and Smith.

A few years later in 1873, *Harper's* published another image of a district schoolteacher. This 1873 image illustrates an article titled the "New School-Mistress" and describes how the United States, more than any other country, "makes use of the softening

influence of woman's guidance on the young" (p. 817). The author objects to the fact that female teachers do not receive the respect that they deserve and that they are typically paid one third less than their male counterparts.

Image 3.4 *A district schoolteacher.*

Source: [Illustration of a district school teacher]. (1867, November 9). *Harper's Weekly*, 11(567), 705.

Some of the most famous images of teaching and schools from the period following the American Civil War were created by Winslow Homer (1836–1910) for *Harper's Weekly*. Homer had received much of his early training in a lithography company in

New York City and had begun doing illustrations for *Harper's Weekly* during the Civil War. Homer's *Snap-the-Whip*, for example, is among the most beloved American paintings of the nineteenth century. Painted using oils in 1872, the work depicts

Image 3.5 Illustration from "The New School-Mistress."

Source: The new school-mistress. (1873, September 20). *Harper's Weekly*, 46(873), 817.

nine boys outside of a red one-room schoolhouse playing snap-the-whip. The painting was reproduced as an engraving in the September 20, 1873, edition of *Harper's Weekly* and is one of a number of paintings Homer made of rural school life, which include *The Red Schoolhouse* (1873, National Art Gallery) the *Country School* (1873, Saint Louis

Art Museum), and the *Blackboard* (1877, National Gallery of Art).

In November of 1873, Homer did the illustration *The Morning Bell* for *Harper's Weekly*, which accompanied a poem of the same name. The illustration shows students making a solemn procession, lunch-pails in hand, as the school bell rings. Homer's

Image 3.6 *Snap-the-Whip*.

Source: Homer, W. (Painter). (1873, September 20). *Snap-the-whip* [Painting]. *Harper's Weekly*, 46(873), 824–825.

images, done in the field in great detail, provide what is almost certainly the best record of what actual rural schools looked like from the middle of the nineteenth century.

Other illustrators contributed images of teachers and schools to *Harper's Weekly*. An illustration titled *The Young Orator* by Frederick Stuart Church shows

a barefoot young boy giving a speech before a class in a village that includes a student evidently being punished for some misbehavior. The illustration accompanies an article by Eugene Lawrence (1874), "The Opening of the Public Schools," which criticizes both the South, for its poor Negro schools, and the Catholic Church and its priests, who all over the country "are

never weary of denouncing the American system of education, and, in fact, all that is especially American in our politics and manners” (p. 769).

Images of students being disciplined by teachers are rare but can be seen in an 1866 illustration from *Harper's Weekly* titled *Caught Napping* (Image 3.10).

Equally rare for this period are depictions of Black teachers at work. In Image 3.11, a Black female teacher in the New York City schools provides her students with object lessons using geometric solids. The experience of a teacher being interviewed for a job is provided by an 1877 illustration from *Harper's Weekly*.

4. The Common School Movement

By the middle of the 1830s, a campaign for free public elementary education had emerged in the United States. Known as the common school movement, it was led by reformers in states such as Massachusetts and Connecticut.

The common schools were part of the process of building a nation. The country was increasingly moving from agriculture to manufacturing. Between 1820 and 1850, the number of people in Massachusetts working mainly on farms dropped from 58 percent to 15 percent. Up until that time, schools were either private or run by local townships. Statewide involvement in education had not yet developed. With the growth of industry, people needed to develop greater literacy skills. In addition, particularly as immigration increased, it was seen as being important to educate foreign-born children in American ways and traditions.

In New York City, for example, a system of free schools for the poor had been in operation since 1805. These schools were extremely crowded and did

not in any way represent a comprehensive public school system. They implemented a monitoring program based on the English systems of Andrew Bell (1753–1832) and Joseph Lancaster (1778–1838) in which students at the upper level of the program were used to teach younger learners.

Lancaster described the instructional model for the illustration in Image 4.4 of a monitorial classroom as follows:

The parallelogram at the head of the school, represents the platform, on which the master's desk is placed. The numbers represent the classes of children as seated in the order of their proficiency in learning. The surface of the form and desks are represented in the plan as nearly filled with boys, occupied in writing on their slates: The boys are represented at the desks. There is a dot at the front of each desk in every class, intended to represent the monitor of the class, whose business is to move up and down the desks, and examine the performance and progress of the boys in writing on their slate.

Image 4.1 In Massachusetts, the leader of the reform efforts of the common school movement was Horace Mann (1796–1859). First trained as a lawyer, Mann was a social reformer who in 1837 accepted the position of Secretary of the Massachusetts State Board of Education. At left is a portrait of Mann taken between 1844 and 1859.

Source: Call No. DAG, No. 106. (1844–1859). Available from Library of Congress Prints and Photographs Division.

Monitorial models were not used in township and district schools such as the one shown in Image 4.3, nor did they become the instructional model primarily used in the common schools.

School architecture, until the common school movement, was not particularly well thought out or

systematic. Henry Barnard (1811–1900), the Secretary of Education in Connecticut from 1838 to 1842, published the first pattern book on school architecture in 1848. Ten years earlier in 1838 he had given an address on the disgraceful physical conditions found in American schools and had begun to develop designs

for school improvement. A large number of these images were eventually reproduced in his journal, the *American Journal of Education*, which he edited from 1855 to 1881.

Many of the buildings that were built during this period were highly ambitious and reflected civic pride

on the part of their creators. This pride was certainly reflected in the case of the Latin and English school built in Boston and in the case of the public high school in St. Louis (Images 4.8 and 4.9).

Other buildings reflected the belief that schooling was a mystical or transcendent process. Many buildings

literally imitated Greek temples or Christian churches (Images 4.10 and 4.11). Implied, of course, was the idea that schooling was a sacred and reverential task.

Included among the illustrations in the *American Journal of Education* are designs for teacher training

colleges or normal schools. The buildings for these schools still exist on the campuses of many state colleges and universities across the United States. The *American Journal of Education* also includes interesting examples of teaching devices such as orreries

(i.e., models of the solar system) and globes, as well as alphabet tables.

New designs for libraries also accompanied the development of new school buildings. Like many of the school buildings that were built during this period,

libraries were important sources of civic pride in many cities.

Many innovations in educational thought emerged during the common school era. Among the most interesting was phrenology, which provided educators

a primitive theory of psychology and personality development. In Mann's Sixth Report to the Massachusetts Board of Education, he drew heavily on phrenological

theory. In fact, he seems to have been trying to develop something like a psychological understanding of schooling, long before the field had been established.

5. The McGuffey Readers and Textbook Depictions of Teachers

The common school movement brought with it the need for teaching materials and in particular for textbooks. The most successful of the textbooks written for the common schools were the McGuffey readers. William Holmes McGuffey (1800–1873), a professor at the University of Ohio, published the *First Eclectic Reader* and the *Second*

Eclectic Reader in 1836. A *Primer* was published the following year. Additional readers followed, which included a sixth reader in 1857 and a high school reader in 1863. The McGuffey readers were used by schools well into the twentieth century and are even sometimes used today by home schoolers.

Image 5.1 Illustration for the story “The Truant” included in McGuffey’s Third Eclectic Reader.

Source: McGuffey, W. H. (1879). *Third eclectic reader* (p. 27). New York: Van Antwerp, Bragg and Company.

Lessons included in the McGuffey readers were often moral in nature, urging children to behave and to work hard and warning them of the consequences of misbehaving. Typical is the story of “The Truant,” included in the *Third Eclectic Reader*; in which a boy named James skips school to go out with his friend in a rented boat. The boat is swamped by a wave and the boys are saved from

disaster by some men who at the last moment “reached them just in time to save them from a watery grave” (p. 29). After being taken to a house where their clothes were dried, they were sent home to their parents. James was very sorry for what he did and “became a regular at school, learned to attend to his books, and, above all, to obey his parents perfectly” (p. 29).

Image 5.2 An illustrated alphabet included in McGuffey's Eclectic Spelling Book.

Source: McGuffey, W. H. (1879). *Eclectic spelling book* (p. 10). New York: Van Antwerp, Bragg and Company.

Illustrations from the McGuffey readers recalled some of the visual formats and models used in earlier textbooks, such as in *The New England Primer*. In the *First Eclectic Reader*, for example, there is a visual alphabet. In addition, models of penmanship were presented to students.

Glimpses of the work of teachers were provided in the frontispieces of textbooks. Interestingly, during the 1830s and early 1840s, the teachers depicted are men (Image 5.4). Women were just beginning to enter the profession in large numbers at this time.

6. Catholic Schools and the Separation of Church and State

Not everyone embraced the idea of the common schools. Prior to and following the Civil War, Catholics—many of whom were recently arrived immigrants—perceived the public schools as institutions that imposed protestant values on their children. This perception was almost certainly accurate. Despite the principle of the separation of church and state, the common schools had infused into them a general set

of protestant values. What they did not do, however, was represent any one specific protestant sect.

As a result, it was very likely that a Catholic child would be required to read selections from the Protestant King James edition of the Bible or to recite prayers such as the Lord's Prayer, which is not part of the Catholic tradition. In addition, teachers would rarely have been Catholic; and since there was a general

Image 6.1 *The Propagation Society. More Free Than Welcome.* This 1855 Currier & Ives print reflects the fears of many Americans during the middle of the nineteenth century who felt that the Catholic Church represented a threat to American values through Irish immigration and Catholic education.

Source: Currier, N. (Illustrator). (1855). *The Propagation Society. More free than welcome* [Illustration]. New York: Currier & Ives Printer. Available from the Library of Congress Prints and Photographs Division.

anti-Catholic and anti-Papal sentiment in the country, there was a legitimate fear on the part of Catholic parents that their children would be discriminated against and drawn away from their faith by protestant instructors.

Catholic schools developed their main following in urban areas such as New York City and Boston. During the early 1840s, Catholic leadership under

Bishop John Hughes requested financial support from the state's Common School Fund to establish Catholic schools. The logic was that since Catholics paid taxes and since they believed that they could not get a fair education for their children in the public schools, they had no choice but to set up their own schools.

This request was the beginning of a debate that continues into the current era over school vouchers

Image 6.2 *Fort Sumter.*

and the use of public funds to support private education. Non-Catholics overwhelmingly opposed such efforts to gain public funding. Nowhere are their sentiments clearer than in the brilliant series of cartoons illustrated by Thomas Nast and published in *Harper's Weekly* magazine shortly after the Civil War.

Nast's cartoons were part of a larger debate about the separation of church and state that extended back to the Revolutionary period. In a letter written in 1802, Thomas Jefferson had stated that the First

Amendment of the American Constitution created a "wall of separation" between church and state. He felt that because religion was such an important and divisive issue and the American people came from such diverse backgrounds, no religion could be allowed to dominate the government's institutions. This model of the church–state relationship gradually became the law of the land as legislation was enacted to maintain the barrier between state and church functions.

7. The Education of African Americans

Following the slave revolts in the early 1830s, laws were passed throughout the South that made it illegal for slaves to learn how to read. When groups of slaves began to be freed during the Civil War, there soon developed a concern about educating them. As early as 1862, White teachers were sent into captured

Southern territory to educate former slaves. By the end of the war, approximately three thousand teachers had been sent South.

The earliest educational experiment took place in Port Royal, Georgia, in 1862. Union troops had driven Confederate planters from the Sea Islands of Georgia

and from the immediate area surrounding Port Royal. General Thomas W. Sherman, the leader of the occupying forces, found himself having to develop a plan for resettling recently liberated slaves. Besides receiving money for food and clothes, they were to be taught to read by teachers sent from the North. It is estimated that by 1872, the Freedman's Bureau had educated 250,000 former slaves in 4,000 schools.

The process of teaching freed slaves to read was often sentimentalized in popular magazines such as *Harper's*

Weekly. Drawings done on site in freedmen's schools following the war show the complexity of the classes of new learners, many of them adults, not just children.

The Freedman's Bureau Schools represented an important effort to provide newly freed African Americans with the rudiments of literacy. More sophisticated schools, including colleges and universities, were soon established. Fisk in Nashville, Tennessee; Talladega in Alabama; and Atlanta University were all started in 1865. At first, their

Image 7.3 *Interior of Primary School for Freedmen in Charge of Mrs. Green at Vicksburg, Mississippi.*

curriculums were limited, functioning more as secondary academies and teacher training or normal schools than as colleges. As resources and experience grew, so did the sophistication of their curriculums.

In 1866, Howard University was established in Washington, D.C. It was the first African American school to offer a full college curriculum. The most influential school as a model for other early Black colleges and universities was Hampton Normal and Agricultural School of Virginia, which was established in 1868 by the American Missionary Association. Under the leadership of Samuel Chapman Armstrong (1839–1893), who had commanded a Black regiment during the Civil War, the school was consciously based on missionary models of education intended to uplift “primitive” people. The school emphasized what was referred to as *industrial education*, which was a combination of agricultural courses, domestic skills, and elementary teacher training. It

was assumed that education beyond this level was something most African Americans could not achieve.

What became known as the Hampton model was used by the school’s most famous graduate, Booker T. Washington (1856–1915), in 1881 to establish Tuskegee Institute in Alabama. Washington considered the pursuit of equality on the part of African Americans as “extremist folly.” He believed that African Americans were an emerging race, one which was destined for secondary service rather than leadership positions in American society.

The most complete visual record of Hampton and the Hampton or Tuskegee model at work can be seen in the photographs of the school taken by Frances Benjamin Johnston (1864–1952). Johnston was the most prominent woman photographer in the United States at the turn of the century. Originally trained as a painter, she came to Washington in the mid-1880s

Image 7.5 *Colored Scholars Learning Their Lessons on the Street (Richmond, Virginia).*

and opened a professional photography studio about 1890. Within a few years, she was the city's main photographer of the rich and famous including the family of Theodore Roosevelt.

Johnston's photographs of Hampton were taken in December 1899 for display as part of the exhibit of the American Negroes at the Paris 1900 International Exposition. When Johnston arrived at

Hampton to take her photographs in December 1899, there were approximately 1,000 students attending the school, including about 135 Native Americans. According to Hampton's newspaper, the *Southern Workman and Hampton School Record*, Johnston's photographs were supposed to contrast the new life between the Negroes and the Native Americans that the school was creating along with

the old and then show how Hampton had helped produce this change. They are beautiful images that record the history of an institution that is important in the history of American education. However, critics have also noted that they represent a type of visual propaganda, which assigned African

Americans and Native Americans to a secondary and discriminatory status while seemingly advancing their needs as a people.

In addition to being exhibited as part of the Exhibit of American Negroes, Johnston's images of Hampton were widely disseminated in a series of articles about the

Image 7.7 *A cooking class in the Domestic Science Building at Hampton Institute.*

school published by Albert Shaw and Booker T. Washington in *The American Review of Reviews*. In Shaw's article "'Learning by Doing' at Hampton," published in the review (1900, vol. 21), Shaw argued that the students attending Hampton, having emerged out of a culture and tradition of slavery, "needed to be taught

and trained in good conduct, the rudiments of book knowledge, and the plain tasks that go with farming, the ordinary handicrafts, and the duties of home and family" (p. 420). Students educated at Hampton, and subsequently at Tuskegee, were taught manual trades, which included classes in tailoring, harness making, plastering, shoe

Image 7.8 *Mixing fertilizers in an agricultural class at Hampton Institute.*

making, blacksmithing, cabinetry, bricklaying, printing and modern agriculture for the men, and dressmaking, cooking, cotton spinning, and rug weaving for the women. Johnston also made visits to Tuskegee Institute, where she recorded models of education similar to those found at Hampton.

On occasion, Johnston would go out into the community around Tuskegee to photograph schools such as the Annie Davis School. Photographs of schools such as the Annie Davis School are different from other pho-

tographs of rural Black schools during this period that survived (Image 7.12). Most show a high degree of poverty, reflected in crude furniture and limited educational materials. Typical is the photograph of a “Negro” school near Albany, Georgia, that was included in an article written by W. E. B. Du Bois that appeared in the magazine *The World’s Work* (Image 7.13).

Similar conditions to those found by Du Bois in Georgia in 1901 were also found by Lewis Hine in schools in rural Kentucky fifteen years later.

8. The Education of Native Americans

Discrimination was not limited to African Americans during the late nineteenth and early twentieth centuries. Native Americans were often treated as a lesser people who needed to be acculturated.

Between the time of the American Revolution and the end of the Civil War, nearly 400 treaties were made by the federal government with tribal

groups. These treaties involved the government taking control of 1 billion acres of land (roughly four-tenths of the total of the United States). A total of 155 million acres were reserved for reservations, a number that eventually would be cut in half. As part of the treaty agreements, the federal government would provide education, medical help, and agricultural

Source: Johnston, F. B. (Photographer). (1901). LOT 12369. Available from Library of Congress Prints and Photographs Division.

and land management services to the Native American populations.

Schools were supposed to educate and assimilate Native American tribes. Funds for Native American schools first became available in 1819 with the establishment of the Office of Indian Affairs. Between 1819 and 1824, eighteen Native American schools were established across the country, primarily as part of religious missions.

Prior to the Civil War, tribal groups provided significant resistance to the educational efforts of missionaries.

Many of the approaches used with African Americans were applied to Native Americans as well. This is particularly the case with the Hampton or Tuskegee model, which was taken directly from Hampton Institute and applied to schools such as the Carlisle Indian Barracks School in Carlisle, Pennsylvania.

Image 8.2 *Breakfast lesson in the home economics class for women, Carlisle Indian School, Carlisle, Pennsylvania.*

The Carlisle Indian Barracks School was founded by Captain Richard Henry Pratt (1840–1924) in 1879. It is no surprise that Pratt's model was based directly on Hampton since he had worked at the school with groups of Native American students prior to his founding Carlisle. Johnston visited the school sometime between 1900 and 1903 and, as was the case with Hampton and Tuskegee, left behind an important set of images depicting the activities of the school.

How were students transformed as a result of attending a school such as Carlisle? On a superficial

level, a sense of some of the personal changes that must have taken place can be gained by looking at images from illustrated newspapers and popular magazines such as *Harper's Monthly Magazine* (Images 8.8 and 8.9). The transformation of one Native American girl can be seen in an 1884 illustration from *Frank Leslie's Illustrated Newspaper* (Image 8.10).

The diversity of Native American populations attending government schools can be seen in images taken of locations from Alaska to the Everglades.

9. Frontier Teachers and Schools

As Native Americans were increasingly moved onto reservations and sent to government-sponsored schools, pioneer settlers began to move into the frontier regions of the United States. Normally, frontier settlements are thought of as being limited to the western part of the country, but frontier settlements were also found in places such as Florida. In fact, the first public school in Miami-Dade County did not open until 1886. The school was in Lake Worth, now part of modern Palm Beach County. At that time, the

county was much larger, extending from Lake Okeechobee south to the Monroe County line, an area roughly the size of Massachusetts. Only 332 people were listed in the 1885 state census, including 47 families with children.

Conditions were primitive in all of the frontier schools. It is the one condition they held most in common, along with a preponderance of youthful teachers and often unusual methods of transportation for getting students to school.

Image 9.5 *Blanche Lamont and her students in Hecla, Montana, October 1893.* The most famous picture of a pioneer or frontier teacher is of Blanche Lamont taken in 1893 in Hecla, Montana. Lamont came to a tragic end just a short time after the photograph was taken. In 1895, her nude mutilated body and that of a female friend were found in the belfry of the Emmanuel Baptist Church in San Francisco. A mutual friend of the two women, Theodore Durrant, was eventually tried for their murders, found guilty, and executed for the crime.

10. Kindergartens

While new physical frontiers were being explored and conquered during the nineteenth century, similar intellectual and educational territory was opened up as well. One of the most interesting of these new educational regions was the kindergarten.

The idea of kindergarten was conceived by the German educator, Friedrich Froebel (1782–1852) and was a reflection of his belief that education should help children realize their natural, inner potential. The first English-speaking kindergarten in

the United States was opened in Boston in 1860 by Elizabeth Palmer Peabody (1804–1894). Milton Bradley (1836–1911), the board game manufacturer learned about the kindergarten through Peabody and began to manufacture kindergarten and art materials that could be used by teachers. Of particular

importance was the dissemination of the twenty “gifts and occupations,” which are the foundation of the kindergarten curriculum. The ten initial Gifts were objects such as blocks, which the child could manipulate to learn about how things functioned and worked in the world. The ten Occupations were more

typically tasks and activities using simple materials and tools such as paper and scissors or wax and clay for molding and sculpting, although at times the difference between the Gifts and Occupations is obscure.

The Froebel concept of Gifts and Occupations was not only educationally sophisticated, but also profoundly philosophical in nature. In the case of the second Gift, Froebel had the child feel a cube, a sphere, and a cylinder while blindfolded. In doing so, he was

Image 10.7 *The interior of the kindergarten building at the Philadelphia Centennial Exposition.*

following the philosopher Georg Friedrich Hegel's (1770–1831) dictum that thesis versus antithesis yields synthesis. According to Froebel, the cube has totally flat sides (thesis); the sphere, round sides (antithesis); and the cylinder, flat and round sides (synthesis).

Froebel believed that a cylinder demonstrated the existence of a universal spirit—one that unified the opposites of the thesis and antithesis.

The first public school kindergarten was opened in 1873 by Susan Blow (1843–1916) in St. Louis,

Missouri. Dissemination of the kindergarten concept was greatly aided by the 1876 Philadelphia Centennial Exposition. Two demonstration kindergartens were on display at the exposition in 1876. Extensive photographs displayed at the exposition provided details

on the work that was being done in the St. Louis Public Schools.

Kindergartens became widespread throughout much of the United States during the 1880s and 1890s. Many of them were associated with orphan asylums and

settlement houses and were seen as a means of improving the lives and experiences of poor children.

African American kindergartens were begun in various settings, including one that was part of the Haines Normal and Industrial Institute in Augusta, Georgia.

Progressive educators such as John Dewey embraced the kindergarten as an important educational innovation and included kindergarten instruction in progressive schools. By the time of World War I, kindergartens were becoming common in public education throughout the United States.

11. International Expositions

The dissemination of many of the major educational innovations developed in the second half of the nineteenth century occurred through the international expositions. As mentioned earlier, the first wide-scale display of innovative kindergarten programs

and kindergarten material took place at the 1876 Philadelphia Centennial Exposition. Manual systems of industrial training from Russia were also introduced and were widely adopted in American schools.

Image 11.1 A lathe included in the exhibit of the Moscow Imperial Technical Institute, Philadelphia Centennial Exposition, 1876.

Source: [Image of a lathe]. (1876). *The Scientific American Supplement*, No. 46, p. 721.

The U.S. exhibits in the government building included models of school buildings and extensive collections of statistical data. Individual school districts sent extensive collections of photographs,

student papers, and other materials related to the classroom.

Major educational displays were included at the 1893 World's Columbian Exposition and at the 1904

Louisiana Purchase Exposition. In fact, the Louisiana Purchase Exposition had education as its main theme.

As the host of the 1904 Louisiana Purchase Exposition, the St. Louis Public Schools made a particular

effort with their exhibit. It included not only extensive photographs of traditional classrooms, but also photographs of students with special needs as well as photographs of gymnastic training and immigrant education classes.

One of the most interesting results of the 1904 Louisiana Purchase Exposition was the attempt to perpetuate its exhibits through the creation of a schoolwide educational museum and audiovisual department—the first of its type in American public schools. The theme

of the Educational Museum of the St. Louis Public Schools was “Bring the World to the Child” and was begun shortly after the exposition closed. The museum is widely considered the first schoolwide audiovisual program in American schools. In addition to the actual

12. Frances Benjamin Johnston and the Washington, D.C., Schools

The international expositions were responsible for producing a remarkable number of outstanding photographs dealing with the subject of education. Frances Benjamin Johnston, for example, in addition to her photographs of Hampton Institute for the 1900 Paris Exposition, also created a detailed portfolio of images

of the Washington, D.C., schools. These images are particularly interesting. They were intended to highlight innovations and new progressive models that were being integrated into the curriculum. Included in the photographs were students in art classes, science classes, and on field trips.

13. Exhibit of American Negroes: *Exposition Universelle de 1900*

The 1900 Paris Exposition included a display titled *The Exhibit of American Negroes*, which was a collaborative creation of the Black colleges and universities and the Library of Congress. The driving forces behind the

exhibit were the Black sociologist and historian W. E. B. Du Bois and Thomas J. Calloway, a prominent lawyer and educational administrator. The exhibit had four purposes, as noted in Du Bois's 1900 "The American

Negro at Paris” (*The American Monthly Review of Reviews*, vol. 2, no. 5, p. 576): First, it was concerned with showing the history of the American Negro; second, it attempted to describe “his present condition”; third, “his education”; and fourth, “his literature.”

The Exhibit of American Negroes was awarded numerous medals by the organizers of the exposition, including a Grand Prix for the overall collection. The materials in the exhibit were highly diverse and included hundreds of pictures from Black colleges,

14. Immigration and Education

Immigration has been constant throughout American history. Two million new Irish immigrants came to the United States during the years before the Civil War. Between 1860 and 1890, the population more than doubled from 31 million to 63 million people. Fourteen

million of these people—one quarter of the population growth—were immigrants.

Immigrants brought with them new languages and customs. The public schools were seen as a means of assimilating and Americanizing the country's new

Image 14.1 *German immigrants embarking for New York on a Hamburg steamer.*

arrivals—particularly their children. Figures such as Horace Mann believed that the future of the republic depended on the assimilation and Americanization of the immigrant child.

There was a constant fear that uneducated children, particularly those of the Irish who were overwhelmingly Catholic, would divert their political allegiance to the Pope. The overt bias at work against immigrant

children is quite evident in the work of Thomas Nast and his 1871 cartoon, *The Good-for-Nothing in Miss Columbia's Public Schools*.

Major immigration restrictions were put on many groups by the end of the nineteenth century. The

Chinese, for example, who had been encouraged to come to the United States as workers beginning in the 1840s, were excluded by law from entry into the country in 1882 as a result of congressional legislation. The great fear was that American culture would

literally be swallowed and consumed by newly arrived immigrant groups.

A glimpse into a classroom of Chinese immigrants in New York City in 1879 is found in the etching (Image 14.5) from *Harper's Weekly*.

Yet despite frequent expressions of prejudice, immigrant groups continued to come to the United States, embracing their new nation and its traditions.

Literacy increasingly became the criterion by which people were accepted into the country—the literacy test

became a hurdle to be overcome in order to realize the American dream. It is not surprising that, at least in the first half of the twentieth century, newly arrived immigrants emphasized education for their children and saw it as an important means to gaining acceptance.

Pluralism, the idea of one people from many (*e pluribus unum*), became a widely supported ideology—one that assumed, however, that the immigrant would become assimilated into the mainstream of American culture. Assimilating agencies for

immigrant children were by no means limited to the public schools but also included organizations such as the YMCA and the YWCA.

Photographs of immigrant children look much the same as those of traditional classes. Lewis Hine, for example, documented many immigrant classes around the country.

15. Progressive Reform and Schooling

The historian Frederick Turner argued in a famous speech (“The Significance of the Frontier in American History,” 1893), on the role of the American frontier in the development of the United States that by the

early 1890s the Western frontier was both physically and psychologically closed—a fact partially confirmed by population statistics from the 1890 Census. It was clear that growth in the United States was

Image 15.1 *A tenement alley, The Mott Street Barracks, in the Bowery District of New York City. This engraving and the ones that follow are based on photographs taken by Jacob Riis.*

taking place in the cities. New waves of immigrants were coming to the United States, and schools were their main means of entry into the culture. In the urban parts of the country, such as in New York and Chicago,

there was concern for greater social justice and civic improvement. Encompassing many different models and philosophies, this movement came to be known as the Progressive Reform Movement.

Image 15.4 *Poverty Gappers Playing, Coney Island.* Illustration included in Jacob Riis's *The Children of the Poor*.

Image 15.5 *Playgrounds were not the only safe place created for children as part of the Reform Movement. Boys' Clubs provided children a refuge at night from the harsh environment of the street. Shown here is a Boys' Club reading room.*

Source: Riis, J. (1902). *A Boys' Club reading room* [Illustration]. In *The children of the poor* (p. 222). New York: Scribner's Sons.

In New York City, images such as Jacob Riis (1849–1914), a Danish immigrant and journalist, crusaded for the improvement of housing conditions and education for the immigrant poor. In his most famous book, *How the Other Half Lives* (1890), Riis wrote about

the actual living conditions of people in the worst neighborhoods in the city, often photographing the conditions under which they lived. Believing that better housing conditions were essential, he also argued that schools played a vital role in improving the lives of the children.

Image 15.6 *Carpenter's shop in the Avenue C Working Boys' Club.*

Source: Riis, J. (1902). *The carpenter's shop in the Avenue C Working Boys' Club* [Illustration]. In *The children of the poor* (p. 226). New York: Scribner's Sons.

Publicly supervised urban playgrounds were among the most important innovations for children to emerge from the Progressive Reform Movement. The Poverty Gap playground on 28th Street between 9th and 19th Avenue in Lower Manhattan, while very primitive by

modern standards, was among the first urban playgrounds in the United States. Riis recalled visiting the playground one Saturday. Over 200 children were “digging, swinging, see-sawing, and cavorting about,” while quietly protected by a policeman and various playground attendants.

Image 15.7 *Frontispiece showing children saluting the flag.*

Source: Riis, J. (1902). Frontispiece. In *The children of the poor*. New York: Scribner's Sons.

Hine was concerned not only with the lives of poor children and the conditions under which they lived but also with the process by which they were made Americans. This concern can be seen clearly in Image 15.7, an image of young children saluting the flag in an elementary school in New York City.

In Chicago, Jane Addams (1860–1935), a leader of the Settlement House Movement, also was interested in improving the living conditions of immigrants and the urban poor. The Settlement House Movement had its origins in England. The idea was that social activists working in impoverished communities would

Image 15.8 *A back alley in the Hull House neighborhood of Chicago.*

Source: Addams, J. (1912). *Twenty years at Hull-House, with autobiographical notes* (p. 95). New York: Macmillan.

provide help and services as part of a process of social uplift. At Hull House, Addams undertook activities such as helping parents improve the health of their children, finding them meaningful work, and helping them improve the physical conditions in which they lived. Her program was educational in the broadest sense, providing an important alternative to traditional public schooling, as well as being one of the first systematic efforts to provide adult and lifelong education in the United States.

Philosopher John Dewey (1859–1952), a good friend of Addams, was also working in Chicago. Dewey was the single most important educational image to emerge from the Progressive Reform Movement. He was trained as a philosopher at Johns Hopkins University. His first academic position was in the Philosophy Department at the University of Michigan. In 1894, he took a position at the University of Chicago to head a combined Department of Psychology, Philosophy and Education. While at Chicago, Dewey established an

experimental school that eventually became known as the Laboratory School. The school was a center for educational innovation and emphasized the idea of learning by doing. Dewey was trying to integrate the school with the actual interests and experiences of the children who attended it and with the community in which they lived.

The textile room and the garden are two examples of experiential learning at the school. In the textile room, children learned about spinning, dying, weaving, and

the production of cloth. Samples of different types of clothes were available for the students to work with and to study. Activities involving reading, writing, and the use of mathematics were integrated into the textile curriculum. Children kept animals on the grounds of the school and planted gardens. Learning was directly related to things that inherently interested them.

Related to Dewey's idea of learning by doing was the idea of replicating or modeling structures in one's community. Children at the Laboratory School also

constructed tabletop villages. In New York, at Teachers College's Horace Mann School, this involved the creation of a block city by children in the nursery grades showing the major features of the island of Manhattan. In Chicago, children constructed medieval villages as part of the fifth-grade Community Life Project.

Children at the fourth-grade level created detailed reports on ancient civilizations, which included posters on Greek ships and their development.

Many schools—particularly private progressive schools such as the Park School of Buffalo, New York; the John Burroughs School in St. Louis; and the Shady Hill School in Boston—began to adopt Dewey's model. At the Park School in Buffalo, efforts were made to have the school be as farm-like or park-like as possible, making outdoor learning connected to nature a major emphasis.

Progressive education was not limited to private schools but gradually made its way into public school venues as well. In Gary, Indiana, important innovations were undertaken by the system's superintendent, Willard A. Wirt. Wirt had been a student of John Dewey at the University of Chicago and was interested in providing not only a positive learning environment for children, but also one that was efficient in terms of the use of the school plant and facilities. His approach involved grouping students into "platoons" that would learn together in the most engaging and efficient ways possible. Known as the Gary Plan, Wirt's model received widespread support from both liberals and conservatives and was influential during the period prior to World War I in many school systems around the country.

16. Lewis W. Hine and the Child Labor Movement

The Progressive Reform Movement took on many forms and had many advocates. One of the most interesting progressive reformers was Lewis W. Hine (1874–1940). Hine is most well-known for his photographs of child labor, which were taken for the National Child Labor Committee (NCLC) in the period immediately prior to

World War I. His interest in photography developed while he was a teacher at the Ethical Culture School in New York City. He believed that photography could be used effectively by students while on field trips to create a permanent record that could then be further studied and reviewed in the classroom.

Image 16.1 *“Mrs. Dora Stainers, 562 1/2 Decatur St. 39 years old. Began spinning in an Atlanta mill at 7 years, and is in this mill work for 32 years. Only 4 days of schooling in her life. Began at 20 cents a day. The most she ever made was \$1.75 a day & now she is earning \$1 a day when she works. She is looking for a job. Her little girl Lilie is the same age she was when she started work, but the mother says, ‘I ain’t goin to put her to work if I can help it. I’m goin’ to give her as much education as I can so she can do better than I did.’ Mrs. Stainers is a woman of exceptional ability considering her training. In contrast to her is formed [?] another woman (this name was withheld) who has been working in Atlanta mills for 10 yrs. She began at 10 yrs. of age, married at 12, broke down, and may never be able to work again. Her mother went to work in the cotton mill very young.” March 1915.*

Source: Hine, L. W. (Photographer). (1908). LOT 7479. Available from Library of Congress Prints and Photographs Division.

In 1907, Hine started working part time for Paul Kellogg and the social reform magazine, *Charities and Commons*. In 1908, he went to work for the NCLC as a writer and photographer. The NCLC was concerned with investigating the abuse of children in factories, farms, and other work sites; with the enforcement of existing child labor laws; and with the

passage of better laws to protect children from being exploited in the workforce.

The NCLC was started in 1904 by Felix Adler, head of the Ethical Culture School in New York City—the same school where Hine taught. The NCLC was primarily concerned with establishing stringent child labor laws. The committee, particularly with the aid of Hine's

photographs, brought to the attention of the nation the unhealthy working conditions that existed for many children. As a result of the NCLC's efforts, laws began to be passed at the state level. By 1914, thirty-five states had a minimum working age of fourteen. Federal laws restricting child labor soon followed.

Hine traveled around the country for nearly fifteen years taking photographs for the NCLC. His photographs provide clear documentation of how children were being exploited. Over 5,000 of his photographs can be found in

the Library of Congress—mostly images from his work for the NCLC. They provide a record of children working in factories, in agricultural settings, and as messengers and newsboys. They cover much of the country, particularly New England, the Midwest, and the South.

Among Hine's most famous images are photographs of boys and girls working at mechanized spinning machines in cotton factories in North and South Carolina, as well as child coal miners in Pennsylvania and West Virginia. Along with his photographs in the

NCLC collection at the Library of Congress, are detailed captions, ones which transform what in some cases are seemingly static portraits. For example, see the detailed caption for a photograph of a seven-year-old girl named Lilie Stainers with her mother Dora, taken by Hine on one of his trips to Georgia in 1915.

Hine's most powerful photographs are the ones where he shows children actually at work. In 1908, for example, he went to rural North Carolina and photographed children working in cotton mills as thread

and yarn spinners and doffers, whose job it was to remove bolts of cloth or spindles full of thread from weaving and spinning machines.

Hine often photographed how children had been injured in their work in the factories. In the earlier (Image 16.5) photograph he records the case of an illiterate thirteen-year-old doffer named Alfred Pagett who had lost one of his fingers in a spinning machine the week before his photograph was taken by Hine.

Image 16.9 Students between fourteen and sixteen years of age on their way to school, Watson School, Flint Village, Fall River, Massachusetts.

Source: Hine, L. W. (Photographer). (1916). Going to school. About 14–16 years. Watson School—Flint Village. Location: Fall River, Massachusetts [Photograph] (LOT 7483). Available from Library of Congress Prints and Photographs Division.

Hine's photographs were often incorporated into posters, which were widely circulated around the country. For example, the poster below (Image 16.13) was displayed at the NCLC meeting in New Orleans in 1914 and was also republished in the social reform magazine *The Survey Graphic*.

Poor working conditions for children and lack of educational opportunities seemed to be common across the country. Hine's photographs show similar conditions for children, whether in the rural South or in New England.

One of his most famous images of a child laborer is that of Addie Card, a twelve-year-old spinner and school dropout from North Pownal, Vermont (Image 16.6).

In towns and cities across the country, Hine found children working throughout the day and late into night, in dangerous and unwholesome environments, doing menial jobs such as delivering telegrams and selling newspapers. He was particularly fond of newspaper vendors—both boys and girls—of whom he took hundreds of photographs over the years.

Image 16.10 “Recess Games in Charge of Grade Teacher of Jefferson School. See *Miss Folks’ Report*. Location: Muskogee, Oklahoma.”

Source: Hine, L. W. (Photographer). (1917). LOT 7475. Available from Library of Congress Prints and Photographs Division.

Image 16.11 “Antone Fontes. Said 11 years old, and worked here last year. Lives in E. Providence, R.I. Location: Makepeace near Wareham, Massachusetts.”

Source: Hine, L. W. (Photographer). (1911). LOT 7475. Available from Library of Congress Prints and Photographs Division.

Hine was deeply bothered by the fact that so many children were out working in their communities and were often truant from school, despite compulsory education laws, which in the majority of states required elementary school attendance to at least the age of twelve. Hine recorded not only examples of children who were truant from school, but also even examples of them being brought before local courts for their absence from school.

Hine also chronicled the conditions of Black schools, and their extreme overcrowding and dilapidated condition as can be seen in Image 16.8, a photograph of a “colored” school in Muskogee, Oklahoma.

Photographs of children on their way to school or participating in activities such as recess are relatively rare in the photographic record. Hine provides examples of these types of activities in the preceding photographs (Images 16.9 & 16.10).

Many of the abuses recorded by Hine were in the agricultural areas, where children were commonly found doing migratory labor.

Hine's photographs were used to campaign for improved education and for the passage of protective labor laws. At national meetings, his images were combined together in photomontage formats on posters. Typically, they were used to help argue that the failure of providing wholesome environments and decent education for children would follow them

throughout their lives and ultimately be to the detriment of American society.

Protests over the exploitation of children and the intolerable working conditions for them can be seen in photographs included below of immigrant children at a 1909 labor parade in New York City. Their efforts, as well as those of Hine and the NCLC, were not fully realized until the 1930s, when the first minimum wage laws were established and children under fourteen years of age were largely prohibited by law from working full time.

Image 16.14 *“Photograph shows half-length portrait of two girls wearing banners with slogan ‘ABOLISH CH[ILD] SLAVERY!!’ in English and in Yiddish, one carrying an American flag; spectators stand nearby. The photograph was probably taken during the May 1, 1909 labor parade in New York City.”*

17. Reading and Libraries

The desire to read for both children and adults is one of the recurring themes in the history of American schooling. Scenes showing people engaged in the process of reading or being taught to read are found throughout the visual historical record.

The first step in learning to read involves learning the alphabet, then simple syllables, and finally, the sounding out of words. The frontispieces of nineteenth-century spelling books provide us with some of the best examples of reading instruction as it occurred in the classroom.

Image 17.1 *Articulation (teacher working with students on pronunciation).*

Image 17.2 *Teacher and students.*

Source: Watson, J. M. (1862). Frontispiece. In *The national elementary speller*. New York: Barnes.

Magazines such as *Harper's Weekly* often sentimentalized the process of learning to read, as is the case with an illustration of an African American boy contemplating what he has read (Image 17.5). In a similar fashion, there is a romantic tone underlying the picture of a man absorbed in reading from the rural Adirondacks shown in Image 17.6.

A striking portrait of one of the great American benefactors can be seen in the photograph of the industrialist and philanthropist Andrew Carnegie (Image 17.7). After he sold the Carnegie Steel Company to J. P. Morgan in 1901, he devoted the rest of his life to philanthropic efforts, among the most important being the establishment of public libraries throughout the United States. He

did so with the idea that libraries were means of social uplift for hardworking immigrants like himself and that they could provide immigrants with the cultural knowledge necessary to become Americans.

Not all of the books contained traditional text. Braille, for example, was an alternative for the blind, as can be seen in the photograph of the deaf and blind advocate Helen Keller (Image 17.11).

Image 17.5 *A Brown Study.*

Source: *A brown study* [Illustration]. (1870, March 5). *Harper's Weekly*,

Others were read to, as with the tradition of the Cuban lector, who would be hired to read aloud to cigar rollers as they plied their craft in places such as New York City, Key West, and Tampa.

Libraries included not only public libraries but also institutional libraries. Although the Library of

Congress is open to the public, it is essentially the main library for the country's legislature.

Other photographs provide us with glimpses into the institutional character of libraries, as is the case with the following photographs of turn-of-the-century libraries in Los Angeles and New York City.

Image 17.7 *Andrew Carnegie (1835–1919), the public library benefactor, reading, 1913.*

Literacy campaigns were heavily promoted during the Great Depression. Posters produced by artists for the Works Project Administration were common.

Large numbers of photographs documenting children learning how to read can be found in photographs from the Farm Security Administration during the first years of World War II.

18. Educational Cartoons and Advertisements

The *American School Board Journal*, which was founded in 1891, is an extremely valuable source of cartoon material on issues facing public schools in the United States. It is also a rich source of advertising material that provides historians with many examples of technical innovations and materials that were being introduced into the schools.

The magazine's editorial cartoons, which were included regularly on its covers, dealt with issues ranging from salaries for teachers to whether or not teachers should unionize. In the following 1903 cartoon, a plea is made for basing teacher salaries not on supply and demand, but on providing teachers with a fair and livable salary.

Image 18.1 *Who Is Next?*

Source: *Who is next?* [Cover cartoon]. (1903). *The American School Board Journal*, 26(7).

Image 18.2 *Why Not Both?*

Source: *Why not both?* [Cover cartoon]. (1918). *The American School Board Journal*, 57(5).

Many of the issues emphasized in the magazine's cartoons reflected current educational and social needs. Teacher shortages resulting from men going off to fight in World War I led the magazine to suggest that having married women enter the classroom (prohibited in many

states) was a solution to the teacher shortage along with hiring less-experienced teachers.

The issue of unionism was addressed in a 1920 cartoon that suggested that if teachers were to follow the route of organized labor, they would be taking the "low road."

Image 18.3 *Teachers at the Cross Roads.*

Source: *Teachers at the cross roads* [Cover cartoon]. (1920). *The American School Board Journal*, 60(1).

Image 18.4 *The Better Way.*

Source: *The better way* [Cover cartoon]. (1923). *The American School Board Journal*, 47(5).

The journal reflected a conservatism that was almost certainly consistent with its readership of school board members. A 1923 cartoon suggested that a principal who was dismissed by the school board and the superintendent should simply leave his job, politely accepting the school system's decision.

Image 18.5 *The School Strike and Its Remedy.*

Source: *The school strike and its remedy* [Cover cartoon]. (1924). *The American School Board Journal*, 69(2).

Other cartoons are highly authoritarian in their philosophy and suggest that it is the responsibility of principals and school boards to keep students from exercising power.

Lines of authority are also clearly drawn. Teachers who complain and who do not follow the rules of the hierarchy are to be ignored.

Image 18.6 *One Strike Deserves Another.*

Source: *One strike deserves another* [Cover cartoon]. (1927). *The American School Board Journal*, 74(6).

Other editorial cartoons celebrate simple duties and responsibilities such as the work of the student traffic guard. In doing so, they function more as idealized illustrations than as actual cartoons.

In addition to its own cartoons, *The American School Board Journal* regularly included cartoons

dealing with educational issues from newspapers around the country.

Advertisements included in *The American School Board Journal* include everything from slide projectors to pencil sharpeners, fire alarms to playground equipment, and even school lockers.

19. Pledge of Allegiance

Depictions of the American flag and of children pledging allegiance to the flag are common in the images that survive of schooling. The pledge was created as a means of encouraging children—particularly immigrant students—to be more patriotic. It was introduced on a national basis in 1893 as part of the Columbus Day celebrations at the World's Columbian Exposition in Chicago.

The pledge, and its accompanying reverential treatment of the flag, became a standard part of American school culture within a few years.

Frances Benjamin Johnston included a photograph of students at the Eighth Division School pledging

Image 19.1 An 1894 advertisement for *The Caxton School Series*. Published by the Caxton School Supply House. These textbooks reflect the increasing emphasis on the American flag as a patriotic symbol for the schools and American children.

allegiance to the flag in her photographs of Washington, D.C., schools for the Paris 1900 International Exposition.

Groups who were often discriminated against by American society are often portrayed in flag ceremonies,

pledging their allegiance. This can be seen in photographs of Asian American students about to be sent to detention camps during World War II, as well as African Americans who had to deal with issues of racial segregation and discrimination.

20. Printed Records and Photographs of School Activities and Personnel

There are many traditions and practices in schools that are not formally recorded in the traditional histories of schooling. These activities involve objects such as rewards of merit, report cards, graduation certificates,

and teacher licenses. Rewards of merit, for example, were commonly given to children during the nineteenth and early twentieth centuries to reward special talent, attendance, or high academic performance. Some

Image 20.1 *An early-nineteenth-century reward of merit.*

Source: [Image of a school reward card]. (1873). Cincinnati, Ohio: Gibson. Available from Library of Congress Prints and Photographs Division.

rewards are simply printed cards, while others are more elaborate and sophisticated examples of the printer's art.

Also of interest, and part of the tradition of schools, are comic photographs showing students being disciplined or chastised, group photographs of classrooms

and teachers, and images documenting special events such as Arbor Day.

Comic images of students and teachers at school were not limited to cartoons, but were often found in stereoptic (i.e., 3-D) pictures that were popular during the late nineteenth and early twentieth centuries.

Image 20.3 *God Bless Our School.*

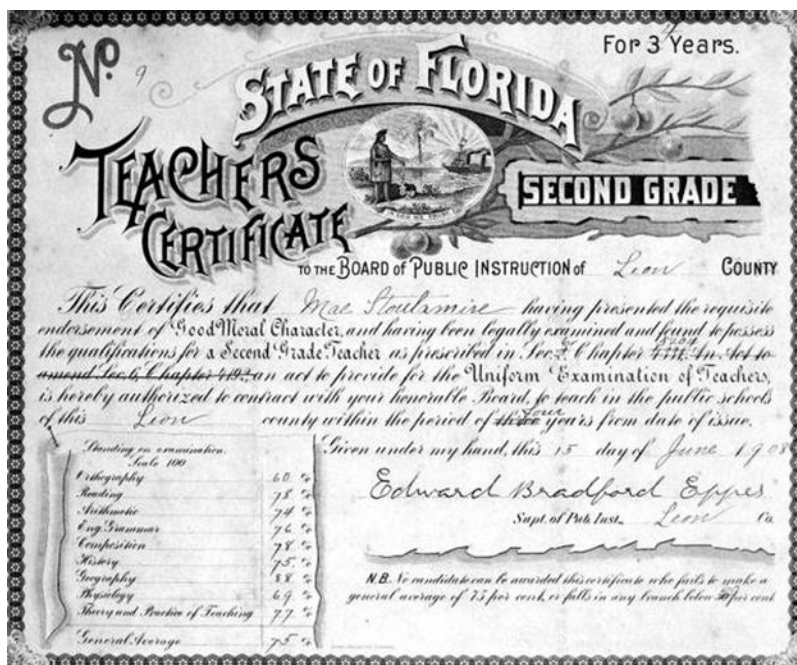

Image 20.4 *State of Florida second-grade teacher certificate for Mae Stoutamire.*

Source: [Image of a teacher certificate]. (n.d.). Available from Florida State Archives: <http://www.floridamemory.com/PhotographicCollection>

Class photographs of students with their teachers have been a tradition since the late nineteenth century and continue today. The following examples from St. Louis are typical of the types of photographs that

survive. Group photographs of teachers are obviously less frequent than are of student photographs.

In addition to class photographs, pictures showing school holidays and field trips were also common themes.

21. Students With Special Needs

Photographers have paid relatively little attention to students with special needs. Most of the images that survive concerning their history focus on buildings,

visitors from the outside, and reformers. Included below is a sample of images that focus on deaf and blind students.

22. Transportation

The consolidation of rural schools during the Great Depression led to an increased use of school buses throughout the country. This phenomenon was

documented in detail by the Farm Security Administration photographs. Just how important a shift this was is indicated by the fact that in 1913,

Image 22.1 *Horse-drawn school bus, Jacksonville, Florida, 1898.*

one half of the children in the country were enrolled in 212,000 one-room school buildings. By the end of the century, only 428 one-room, single-teacher

schoolhouses were still in operation. Safe roads and dependable buses made the consolidation of rural schools possible.

23. Compulsory Education and Truancy

The first compulsory education law in North America was passed by the Massachusetts Bay Colony during the early colonial era. Massachusetts passed the first statewide law in 1852. Under the 1852 law, children under fifteen who were working had to have gone to school for at least three months prior to their employment. Prior to the Civil War, similar compulsory

education laws were passed in Rhode Island, Connecticut, Vermont, New Hampshire, Maine, and Pennsylvania.

During the late nineteenth century, factory owners, and often parents, encouraged children to be truant since they provided both inexpensive workers and needed income for families who might not otherwise

Image 23.1 *The night school at the Children's Aid Society.*

be able to cope. In urban areas, various child welfare agencies were formed to protect children and to make sure that they received at least a minimal education. In New York, Minister Charles Loring Brace (1826–1890) founded the Children's Aid Society, which established night schools, lodging houses for newsboys, and reading rooms for poor children.

Truant officers began to be a fixture in American cities by the end of the nineteenth century. Typically, these were local law officers who reported to the local school system but who were primarily concerned with keeping misbehaving youth under regulation and control. Illustrations and photographs of them are rare. A group picture of them in Boston was taken by Lewis W. Hine in 1909.

Image 23.3 *“Leroy Raley, 215 Noble St., a 10-year-old truant newsboy, who was photographed during school hours. Said: ‘Someone stole my clothes so I couldn’t go to school.’ Location: Oklahoma City, Oklahoma.”*

Image 23.5 *Juvenile Court. Small boy who is habitual truant. A street boy. Thursday, May 5, 1910. Location: St. Louis, Missouri.*

Source: Hine, L. W. (Photographer) (1910). Juvenile court. Small boy who is habitual truant. A street boy. Thursday, May 5, 1910. Location: St. Louis, Missouri [Photograph] (LOT 7483). Available from Library of Congress Prints and Photographs Division.

Hine provides the best available photographic record of truant children in urban areas. Most of his photographs were taken between 1909 and 1917. Newsboys were often truants who were able to earn a bit of money with very little interference.

Truant officers largely died out in American schools by the end of the Great Depression. This end did not mean that other means of controlling and regulating students were not available. One of the most important ways of regulating students was the report card, which had become a regular of American schools by the 1920s.

CANTERBURY SCHOOL
NEW MILFORD, CONNECTICUT

Record of John Kennedy, Form II
From November 1 to December 6, 1930.

Any average from 90% to 100% is accounted "Very Good"; from 80% to 90% "Good"; from 70% to 80% "Fair"; from 60% to 70% "Poor"; and below 60% "Unsatisfactory".			
SUBJECT	DAILY WORK	EFFORT AND APPLICATION	FORM AVERAGE
English II	86	Good	71.69
Latin II	55	Poor	64.55
History II	77	Good	67.00
Mathematics II	85	Good	61.69
Science II	72	Good	66.62
Religion II	75	Fair	78.46
AVERAGE:	77.00		

This report is not quite so good as the last one. The damage was done chiefly by "Poor" effort in Latin, in which Jack got a mark of 55. He can do better than this. In fact, his average should be well in the 80's.

H.H.

24. The Farm Security Administration's Photographs of Schools

During the Great Depression, a remarkable record of photographs was created showing the condition of schools (particularly rural schools) in the United

States. Under the supervision of the New Deal agencies, the Farm Security Administration (FSA), thousands of photographs were taken to show the economic

Image 24.1 *Ozark school building, Arkansas.*

conditions in the country and to document the recovery that was underway. Dozens of photographers were hired for the FSA photographic project. Among the most famous were Walker Evans, Dorothea Lange,

Russell Lee, Arthur Rothstein, Ben Shahn, Jack Delano, Marion Post Wolcott, Gordon Parks, John Vachon, and Carl Mydans. As they spread out across the country to take their photographs, they were given

specific subject guidelines to follow by the project's director Roy Stryker. Under the heading of "Schools," for example, Stryker listed "the buildings inside and

out," "the teachers," "the pupils—at work and at play—going to school," "special schools," and "consolidated school buses." Approximately 200,000

Image 24.5 *Interior of one-room schoolhouse. Crawford County, Wisconsin.*

photographs were taken for the project between 1935 and 1943. Of these, several thousand images were of schools and of students and teachers at work.

Since the FSA photographers focused on rural conditions, it is not surprising that the single most important subject dominating the school photographs are

Image 24.7 *Rural schoolroom, Wisconsin.*

one-room school buildings and their eventual replacement by consolidated school districts.

Many of the photographs show extremely primitive conditions in poorer rural areas. In September 1935, for

example, Shahn (1898–1969) photographed a dilapidated one-room schoolhouse in rural Arkansas. The building has no paint and the walls inside are unfinished. A primitive blackboard provides evidence of what is being taught.

Some of the rural schools were much more prosperous. A series of photographs taken by Vachon (1914–1975) in rural Crawford County, Wisconsin,

show a pleasant, one-room schoolhouse (almost certainly red) with a bell tower on top and an inviting front porch. Inside is a pleasant airy classroom with

desks bolted to the floor in rows, a large woodstove, a blackboard, a globe, and a glass-enclosed bookcase. A teacher works with students of different ages,

generally with different lessons for different age groups. The students vary in age; some are no older than six or seven, while others are in their early teens.

The students are clean and well dressed, suggesting that at least a moderate level of prosperity is to be found in the local community.

The FSA photographs often included candid pictures that are rare in educational photographs, which are often staged, serving an official purpose. Edwin

Image 24.15 *"Schoolteachers and pupils in Negro rural school. This year, despite the fact the white school received free books, none arrived for the Negros. The teacher was so afraid of losing her job that she would not make any inquiries about the books, and the children were sharing the few books some could buy. Creek County, Oklahoma."*

Roskam (1903–1985), for example, provided photographs of teenage girls on a street corner outside their school in Chicago.

The condition of Black or “Negro” schools is documented throughout the photographs. Although

the FSA photographs include images of both poor and prosperous White schools, there are few images of prosperous or even moderately comfortable Black schools. Most are crowded. Equipment such as desks, chairs, and blackboards are consistently

Image 24.17 “Negro children at a rural school in Creek County, Oklahoma, gathered around the stove as the room warms up in the morning. The thermometer registered fifty degrees throughout the entire morning session of school. Creek County, Oklahoma.”

makeshift, suggesting the lack of resources available to the various Black communities across the country.

Numerous photographs of teachers from across the country included in the FSA files provide information on the day-to-day work lives of teachers.

The best equipped schools for the Black students and teachers portrayed in the FSA photographs are in urban areas such as in Washington, D.C., and New York City.

Photographs of blackboards and bulletin boards included as part of the FSA photographs document some of the activities that took place in the schools.

Photographs of cloak and mud rooms give a more intimate sense of the lives of the children who attended the rural schools that make up the great majority of the FSA photographs. Many of the photographs suggest a bygone era, when students walked to school and carried their lunches with them in pails and buckets.

The FSA photographers were specifically charged with documenting rural conditions. Although they were primarily supposed to record conditions in public schools, private schools and their programs also appear in the FSA files. For example, an extensive photo series was included to document the Lincoln School at

Image 24.21 *Chemistry teacher at Woodrow Wilson High School, Washington, D.C.*

Teachers College, Columbia University, in which progressive educational models were clearly at work.

The FSA photographs include extensive images of sports and athletic activities, as well as pictures of marching bands, military cadets in uniform,

and even students in front of their lockers. The mundane images found in the photographs suggest a society less complex than found today. School loyalty is assumed, and hierarchies among students are clear.

Image 24.23 *“One-room school in Ojo Sarco, New Mexico, an isolated mountainous Spanish-American community. The school has eight grades and two teachers. The teachers have little equipment with which to work, and the ABCs, penmanship, and grammar are taught at the blackboard.”*

25. Civil Rights

Opposition to desegregation was commonplace throughout not only the American South but also the North during the first half of the twentieth century. Evidence of opposition to the integration of Black students into White schools can be seen, for example, in the following photograph of protests by White students in the 1930s.

Evidence of segregation and discrimination is clearly seen in the FSA photographs taken during the 1930s and 1940s. Photographers were encouraged to take pictures of billboards and signs that showed discrimination.

Although the 1954 *Brown v. Board of Education* decision made racial equality the law of the land, its full

Image 25.1 *Students, being controlled by police, protesting the transfer of Black students to their school, 1933.*

implementation took several decades—some would argue that even today the process is far from complete. Protests over school integration can be seen in photographs from Little Rock, Arkansas, to Clinton, Tennessee.

On August 28, 1963, inspired by demonstrations earlier in the year, 250,000 people, mostly African

Americans, descended on the Mall in Washington, D.C., to demand equal rights as part of the March for Jobs and Freedom. The march is remembered for Martin Luther King's "I Have a Dream" speech—certainly the most important speech of the Civil Rights Movement and a defining moment in American history.

Image 25.3 *A cafe near the Tobacco Market, Durham, North Carolina.*

Source: O'Halloran, T. J. (Photographer) (1956). [Photograph of Clinton High School, Clinton, Tennessee]. Available from Library of Congress Prints and Photographs Division.

Many different types of signs—both handmade and mass-produced—were carried in the march. Groups such as the United Auto Workers produced signs with slogans such as “UAW Says Jobs and Freedom for Every American,” while a young Black woman carried a sign reading “Not ‘Negroes’ but AfroAmericans! We must Be

Accorded Full Rights as Americans Not in the Future but Now.” The photograph included below, taken by Warren K. Lefler, shows protestors with some of the mass-produced placards that were carried in the march, including ones that demanded “Equal Rights,” “Integrated Schools,” “Ending Bias,” and “Decent Housing.”

This compilation of visual sources ends with the history of American education in 1963 with the March for Jobs and Freedom in Washington, D.C., because this event is considered to have been a turning point in modern American history, as well as because it is at about this time that the available

public domain record of visual sources begins to decline. Although visual sources on schools can be found up to the present, most are still being held privately and are in copyright. This practice is a natural process that will change with the passage of time as more recent collections become available to
