- *Dossier*: this section ‘offers the learner the opportunity to select materials to document and illustrate achievements or experiences

recorded in the Language Biography or Passport' (CoE, 2004a, p. 8). The Dossier is a combination of personal documents consisting of, for example, certified documents showing the results the language user/learner has achieved in the course of his/her studies, the studies he/she made during a student exchange programme, if attended; and documents that present samples of language use originating from projects and presentations the user has participated in.

It is important to note that the ELP has two basic functions:

- The *pedagogic function* is to guide and support the user in the process of language learning. The focus is on development of learner autonomy in the process of life-long learning, on raising intercultural awareness, and on encouraging reflective learning;
- The *reporting function* of the ELP is to record proficiency in languages. The ELP user documents his/her own plurilingual background and intercultural experiences. Concrete evidence is provided of all languages that have been learnt at school or outside school, and an overview of official diplomas (such as exam documents and language course certificates).

Schärer (2004) is a consolidated report on the implementation of the ELP during the period 2001–2004. In 36 out of 46 CoE member states ELP's are in one way or another developed, piloted or implemented with country-specific characteristics. Since the introduction in 2001 over 1,250,000 learners worked with an ELP. A description of some examples of ELP's in use can be found in Little (2002). Several guides are made available for developers, teachers, teacher trainers and others who are interested in familiarizing themselves with the ELP (e.g. Little and Perclová, 2001; Schneider and Lenz, 2001). Developers can submit their language portfolios to an ELP Validation Committee that verifies the conformity of portfolio models with the *Principles and Guidelines* (CoE, 2004a). Submitted models that are conforming to the *Rules for Accreditation* (CoE, 2002) are granted a specific accreditation number. In 2004 more than 64 ELP models were validated, and more than 29 ELP models were piloted or under development in the near future (cf. Schärer, 2004). To date (February 2006) 71 different ELP models (online versions included) have been validated and put into use in 23 CoE member states.

## WORK IN PROGRESS

### *The Manual Project*

The growing acceptance of the standards presented in the CEFR has created a situation in which public bodies, examination institutes, language schools and university departments concerned with the teaching and testing of languages are increasingly interested in relating their

curricula and examinations to the Common Reference Levels. A pilot version of a Manual for relating language examinations to the CEFR (CoE, 2003) was developed in order to assist member states of the CoE, national and international providers of examinations in relating their certificates and diplomas to the CEFR in a reliable and proven manner.

In 2002, an authoring group of experts in the field of language assessment was nominated to draft, revise, and deliver a pilot version of the Manual. An initial set of illustrative reference material already calibrated to the CEFR has been made available (CD-ROM and DVD) for the piloting. Several international benchmarking events are underway to examine the procedures and eventually to produce further CEFR calibrated reference material for a variety of languages. A range of language examining bodies and institutions from different CoE member countries and diversified educational contexts has been approached to participate in the pilot phase. They are asked to provide feedback from the piloting and to prepare full-scale case study reports for selection of examples of good practice.

The preliminary draft of the Manual (CoE, 2005b) envisages the process of linking an examination to the CEFR in three stages:

Stage 1: *Specification*: define the coverage of the examination in categories of the CEFR;

Stage 2: *Standardisation*: ensure a consistent interpretation of the Common Reference Levels, using illustrative test items and samples of performances already calibrated to the CEFR elsewhere;

Stage 3: *Empirical Validation*: check that the results produced by the examination relate to the levels of the CEFR in the way foreseen.

The general aims of the Manual project are to improve the quality of language education and to achieve transparency and comparability in language assessment. The project is intended to assist ministries of education and examination bodies to plan and measure student progress and to facilitate transparency and comparability in language assessment.

The specific objective is to prepare illustrative reference material and to provide guidance (tools and procedures) for relating language examinations to the CEFR. The outcomes of the work in progress, expected for 2008, are:

- A final version of a Manual for relating language examinations to the CEFR;
- A standard setting reference supplement to the Manual;
- Sets of illustrative reference material for different languages (CEFR benchmarked test items and performance samples);
- Case study reports from the piloting phase, with examples of best practices.

As of January 2006 a number of materials are already developed to support the piloting: a reference supplement, a DVD with French

spoken performance sample, and a multilingual CD-ROM with listening/reading items.

### **Reference Supplement to the Preliminary Pilot Version of the Manual**

The Reference Supplement (CoE, 2004b) accompanies the Pilot Manual (CoE, 2003). Its aim is to provide the users of the Pilot Manual with additional information concerning standard setting and empirical validation procedures, which will help them in their efforts to relate their certificates and diplomas to the CEFR.

### **DVD with French Spoken Performance Samples Illustrating the CEFR Levels**

Users piloting the Manual have been encouraged to contribute towards collecting a set of videos and scripts of learner performances. Such performances should be graded and documented in relation to CEFR levels following the procedures outlined in the Manual. A representative selection from samples collected will be very useful in illustrating future editions of the Manual for different languages, in different educational sectors and including speakers of different mother-tongues. A *Guide* for the organisation of a seminar to calibrate examples of spoken performances in line with the scales of the CEFR is available (Lepage and North, 2005, p. 4). It is based on the experiences gathered during a seminar organised in Sèvres, France, by the Centre International d'Etudes Pédagogiques (CIEP) and Eurocentres aimed at calibrating samples of oral performances in French to the CEFR levels (North and Lepage, 2005, p. 1). A DVD resulting from this seminar is already available (CoE/CIEP/Eurocentres, 2005).

### **CD-ROM with Listening and Reading Items**

The materials made available on a CD-ROM (CoE, 2005c) are intended to facilitate the standardisation process for reading and listening described in the preliminary pilot version of the Manual. The illustrative items and tasks contained in this CD-ROM are for English, French, German, Italian, and Spanish. They have been kindly supplied by examination providers operating in different contexts and for different languages: Cambridge ESOL, Goethe-Institut, WBT, TestDaF, CIEP, a recent EU-funded project with a pan-European perspective (DIALANG), and a national examination system from a Ministry of Education (YKI, Finnish Matriculation Examination Board).

To facilitate the use of the CD-ROM, the institutions characterised their items and tasks according to an agreed framework—the summary page of the Grid developed by the Dutch CEFR Construct Project in order to analyse texts, items and tasks in terms of the CEFR descriptive scheme and levels. The Project aimed to help test developers and other

language professionals to construct or relate test items to the CEFR. Since the CEFR is not directly relevant for the construction of test specifications, or the evaluation of test items, it was necessary to supplement guidance provided in the CEFR itself with information from other sources on what reading and listening tests might contain. One major outcome of the Project was an Internet-based Grid which can be used to help characterise reading and listening texts, items and tasks, and this Grid has been used in this way with the samples on the CD-ROM. The Grid can be accessed at: [www.ling.lancs.ac.uk/cefgrid](http://www.ling.lancs.ac.uk/cefgrid).

#### FUTURE DIRECTIONS: THE IMPACT OF THE CEFR

As a consequence of socio-economically or politically determined processes of migration and minorisation traditional patterns of language use and language learning have change considerably in Europe. More than 800 million Europeans provide a large variety of different ethnic, cultural and language backgrounds. The CEFR is a reference document that makes it possible to compare the language proficiencies of individuals/groups. However, its objectives go further than this. The CEFR indicates how a language is acquired, taught, learnt and can be assessed. Promoting consciousness of and reflection on the use of language are two other important objectives.

The CEFR is meant to be a transparent, flexible, and open instrument directed towards different forms of language use and language learning in formal or informal contexts (Trim 1997). The CEFR can provide a basis for the acknowledgement of the language qualifications that are used in the different European countries. Moreover, the implementation of the CEFR also implies the acknowledgement of the potential of the non-formal language knowledge of those Europeans who grow up in multilingual home situations.

#### *Citizen Level*

The European Language Portfolio (ELP), based on the CEFR, uses its communicative and actional approach making the Common Reference Levels available to all citizens for (self-)assessment, planning and reporting. The Ministers of Education of the Member States of the Council of Europe recommended in 2000 that governments, in keeping with their education policy, support the introduction of a European Language Portfolio (Resolution, 2000). Different models of the ELP are developed in Council of Europe member States according to the age of the learners and national/regional contexts.

### *National Level*

National institutes, language schools and textbook authors are using the CEFR. Publishers claim a relationship with the Common Reference Levels. The CEFR is also widely used by the national ministries of education for curriculum development and teacher training, and increasingly for the development of tests and examinations. Illustrative are the objectives set in France by the French Ministry of Education for the academic year 2007/2008 and onwards. The educational levels are expected to correspond with the CEFR levels as follows:

- *End of primary education: level A1 of the CEFR in the language studied;*
- *End of compulsory schooling: level B1 of the CEFR in the first language studied and A2 in the second language studied;*
- *Baccalaureate level: level B2 of the CEFR in the first language studied and B1 in the second language studied.*

Currently, the Common Reference Levels are being described in linguistic details for specific languages, referred to as *Reference level descriptions for national or regional languages*. Illustrative examples are *Profile Deutsch* (2002) or *Niveau B2 pour le Français* (Beacco, 2004). All these documents and tools are becoming part of the CEFR-toolkit being developed by the CoE.

### *European Level*

In addition to Council of Europe actions, the European Union (EU) promotes the CEFR in a European Action plan 2004–2006 '*Promoting Language Learning and Linguistic Diversity*'. The European Commission (COM, 2003) recommends the Common Reference Levels as an appropriate basis for schemes to describe the language skills of European citizens.

The 25 European Union member states have called for the establishment of a *European Indicator of Language Competence* on the basis of the CEFR (COM, 2005, p. 7). The purpose of the indicator is to measure overall foreign language competences in each member state. It is intended to have high levels of accuracy and reliability, with political acceptance to follow. The objective is to provide European Union member states with hard data on which any necessary adjustment in their approach to foreign language teaching and learning can be based.

Because of increasing mobility in Europe, old language borders are disappearing and new language borders are arising. Recently a so-called *Europass* was introduced in Europe. Europass is a scheme which aims to facilitate mobility for those wishing to work or study abroad. Europass includes the electronic Language Passport—one of the three

Appendix 1 Common reference levels: Self-assessment grid

|   |                    | A1  | A2  |
|---|--------------------|---|---|
| U<br>N<br>D<br>E<br>R<br>S<br>T<br>A<br>N<br>D<br>I<br>N<br>G | Listening          | I can recognise familiar words and very basic phrases concerning myself, my family and immediate concrete surroundings when people speak slowly and clearly.  | I can understand phrases and the highest frequency vocabulary related to areas of most immediate personal relevance (e.g. very basic personal and family information, shopping, local area, employment). I can catch the main point in short, clear, simple messages and announcements. |
|   | Reading            | I can understand familiar names, words and very simple sentences, for example on notices and posters or in catalogues.  | I can read very short, simple texts. I can find specific, predictable information in simple everyday material such as advertisements, prospectuses, menus and timetables and I can understand short simple personal letters.  |
| S<br>P<br>E<br>A<br>K<br>I<br>N<br>G                          | Spoken interaction | I can interact in a simple way provided the other person is prepared to repeat or rephrase things at a slower rate of speech and help me formulate what I'm trying to say. I can ask and answer simple questions in areas of immediate need or on very familiar topics. | I can communicate in simple and routine tasks requiring a simple and direct exchange of information on familiar topics and activities. I can handle very short social exchanges, even though I can't usually understand enough to keep the conversation going myself.                   |
|   | Spoken production  | I can use simple phrases and sentences to describe where I live and people I know.  | I can use a series of phrases and sentences to describe in simple terms my family and other people, living conditions, my educational background and my present or most recent job.   |
| W<br>R<br>I<br>T<br>I<br>N<br>G                               | Writing            | I can write a short, simple postcard, for example sending holiday greetings. I can fill in forms with personal details, for example entering my name, nationality and address on a hotel registration form.   | I can write short, simple notes and messages relating to matters in areas of immediate needs. I can write a very simple personal letter, for example thanking someone for something.  |

Appendix 1 Continued

|   |                    | B1  | B2  |
|---|--------------------|---|---|
| U<br>N<br>D<br>E<br>R<br>S<br>T<br>A<br>N<br>D<br>I<br>N<br>G | Listening          | I can understand the main points of clear standard speech on familiar matters regularly encountered in work, school, leisure, etc. I can understand the main point of many radio or TV programmes on current affairs or topics of personal or professional interest when the delivery is relatively slow and clear. | I can understand extended speech and lectures and follow even complex lines of argument provided the topic is reasonably familiar. I can understand most TV news and current affairs programmes. I can understand the majority of films in standard dialect.  |
|   | Reading            | I can understand texts that consist mainly of high frequency everyday or job-related language. I can understand the description of events, feelings and wishes in personal letters.   | I can read articles and reports concerned with contemporary problems in which the writers adopt particular attitudes or viewpoints. I can understand contemporary literary prose.   |
| S<br>P<br>E<br>A<br>K<br>I<br>N<br>G                          | Spoken interaction | I can deal with most situations likely to arise whilst travelling in an area where the language is spoken. I can enter unprepared into conversation on topics that are familiar, of personal interest or pertinent to everyday life (e.g. family, hobbies, work, travel and current events).                        | I can interact with a degree of fluency and spontaneity that makes regular interaction with native speakers quite possible. I can take an active part in discussion in familiar contexts, accounting for and sustaining my views.   |
|   | Spoken production  | I can connect phrases in a simple way in order to describe experiences and events, my dreams, hopes and ambitions. I can briefly give reasons and explanations for opinions and plans. I can narrate a story or relate the plot of a book or film and describe my reactions.  | I can present clear, detailed descriptions on a wide range of subjects related to my field of interest. I can explain a viewpoint on a topical issue giving the advantages and disadvantages of various options.  |
| W<br>R<br>I<br>T<br>I<br>N<br>G                               | Writing            | I can write simple connected text on topics which are familiar or of personal interest. I can write personal letters describing experiences and impressions.  | I can write clear, detailed text on a wide range of subjects related to my interests. I can write an essay or report, passing on information or giving reasons in support of or against a particular point of view. I can write letters highlighting the personal significance of events and experiences. |

## Appendix 1 Continued

|   |                    | C1   | C2   |
|---|--------------------|--|--|
| U<br>N<br>D<br>E<br>R<br>S<br>T<br>A<br>N<br>D<br>I<br>N<br>G | Listening          | I can understand extended speech even when it is not clearly structured and when relationships are only implied and not signalled explicitly. I can understand television programmes and films without too much effort.  | I have no difficulty in understanding any kind of spoken language, whether live or broadcast, even when delivered at fast native speed, provided. I have some time to get familiar with the accent.  |
|   | Reading            | I can understand long and complex factual and literary texts, appreciating distinctions of style. I can understand specialised articles and longer technical instructions, even when they do not relate to my field.   | I can read with ease virtually all forms of the written language, including abstract, structurally or linguistically complex texts such as manuals, specialised articles and literary works.   |
| S<br>P<br>E<br>A<br>K<br>I<br>N<br>G                          | Spoken interaction | I can express myself fluently and spontaneously without much obvious searching for expressions. I can use language flexibly and effectively for social and professional purposes. I can formulate ideas and opinions with precision and relate my contribution skilfully to those of other speakers. | I can take part effortlessly in any conversation or discussion and have a good familiarity with idiomatic expressions and colloquialisms. I can express myself fluently and convey finer shades of meaning precisely. If I do have a problem I can backtrack and restructure around the difficulty so smoothly that other people are hardly aware of it. |
|   | Spoken production  | I can present clear, detailed descriptions of complex subjects integrating sub-themes, developing particular points and rounding off with an appropriate conclusion.   | I can present a clear, smoothly-flowing description or argument in a style appropriate to the context and with an effective logical structure which helps the recipient to notice and remember significant points.   |
| W<br>R<br>I<br>T<br>I<br>N<br>G                               | Writing            | I can express myself in clear, well-structured text, expressing points of view at some length. I can write about complex subjects in a letter, an essay or a report, underlining what I consider to be the salient issues. I can select style appropriate to the reader in mind.                     | I can write clear, smoothly-flowing text in an appropriate style. I can write complex letters, reports or articles which present a case with an effective logical structure which helps the recipient to notice and remember significant points. I can write summaries and reviews of professional or literary works.                                    |

elements of the ELP—and uses the Common Reference Levels also in the Europass Curriculum Vitae—the only CV accepted for job applications at the EU, and increasingly adopted across Europe.

## INNOVATIVE SECOND AND FOREIGN LANGUAGE EDUCATION IN THE MIDDLE EAST AND NORTH AFRICA

### INTRODUCTION

The Middle East and North Africa form a vast region stretching from the Atlantic Ocean in the West to Pakistan in the East and the Caucasus and/or Central Asia in the north. At present, the region comprises more than 23 independent countries, the majority of which are Arab states. With the exception of Turkey, Iran, and Israel where the predominant languages are Turkish, Farsi, and Hebrew respectively, the overwhelming majority of people in this region use Arabic.

The educational systems in the region vary from country to country. As Akkari (2004, p. 144) puts it “each country’s educational past and current experiences are different, but several important similarities exist.” He adds that since each country’s experiences, culture, and history are different, each country of the region will have to devise its own plan for educational reform. As far as second language education is concerned, it can be traced back to the early decades of the twentieth century, when different parts of the region came under the British and French mandates. It is never an easy task to handle the language situation in every single country of the area; therefore, an attempt is made in this article to consider the cases of a few representative countries.

### EARLY DEVELOPMENTS

The Middle East and North Africa are two regions that are often grouped together because they have many things in common. Historically, the region has attracted the attention of historians since early times because of its significant position. The area is believed to be inhabited by 6.3% of the world’s population. The modern history of the region has its origins in the events of the First World War and the postwar settlement (Kedouri, 1978; Longrigg, 1978). With the exception of Iran, Turkey, and Israel, the area is inhabited by the Arabs who are of Semitic origin, and who use Arabic as their native tongue. People inhabiting the Arab countries can be seen as a diglossic speech community, where two varieties of the same language are used side by

side; colloquial Arabic which exists as the vernacular varieties of the major Arab-speaking countries, and classical Arabic, the language of the Qur'an, which provides a common standard written form for all vernacular variants, and a common medium for affairs of state, religion, and education throughout the Arabic-speaking countries (Al-Khatib, 2006).

By the end of the nineteenth century, the whole of North Africa, Tunisia, Algeria, and Morocco, came in the grip of French colonization. France's harsh occupation of these countries was a reflection of its conception of that region as an extension of itself. Algeria is a case in point where French became the official language of the country and Arabic was forbidden to be used there. Even after independence in the 1950s and 1960s, countries in the Moroccan region continued to use French as a tool of modernization and development (Battenburg, 1997). At present, however, the case has been changed, as the French language is now replaced by Arabic in all public schools and indigenous history and culture are excluded from the curricula. Arabization continues its spread into society at large. Moreover, a competition between English and French in these countries began to take place in a later stage. Several early developments concerning English language teaching in Tunisia were to influence the growing competition between English and French in later years (for more information on this issue see Battenburg, 1997).

In the context of Jordan, Palestine, Iraq, Egypt, and Sudan, the case is rather different. English language teaching in these countries can be traced back to the 1920s when they came under the British mandate. All evidence suggests that English was gaining prominence in all aspects of the people's life. A few decades later (i.e., from the 1950s onward), most of these countries became the main supplier of skilful manpower (i.e., teachers, engineers, doctors, etc.) to the Arab oil-producing countries which witnessed major, rapid developments that affected all aspects of life, including language education in general and teaching English as a foreign language (EFL) in particular.

In Israel, the language situation is notable for its unique and distinctive complexity. The Israeli population is a linguistically and culturally diverse community. Three main languages—Hebrew, Standard Arabic, and English—are spoken in the country. Although, according to the Israeli law, the official languages of the country are Hebrew and Arabic, English is also spoken by a large percentage of the population. English has a semiofficial status, and is used mainly for foreign communication exchange. It is also mandatory as a second language in schools and universities. Since the early 1990s, due to the massive immigration to Israel from the former Soviet Union, Russian became also a widely spoken language in Israel. Additionally, many other

languages like Yiddish, Ladino, French, Romanian, Polish, and so on are known by large sectors of the Israeli population (cf. Spolsky, 1996).

### MAJOR CONTRIBUTIONS

We consider here a representative number of cases covering a wide geographical area of the region. We selected Jordan, Tunisia, and Turkey as representative of the Middle East and North Africa due to the fact that what is taking place at present in these countries illustrates themes and topics which characterize the latest developments in the fields of language teaching and language planning.

Just like many other countries in the region, in Jordan all students who finish public secondary school education must have had at least eight years of instruction in English as a school subject. This was the case until 2000, when a new curriculum for the basic stages of education was developed. This new curriculum introduced various reforms with respect to the teaching of English as a second language. Among these is the introduction of teaching English as a school subject to the first four grades. As part of the Ministry's scheme for improving English at the elementary school level, it was first tried in a representative number of Government elementary schools. After successful completion of the first Phase, the period of instruction in English as a school subject has become twelve instead of eight years. Thus, with the introduction of the new reforms, English has become compulsory in all elementary, preparatory, and secondary Jordanian private and public schooling. Certain objectives for each stage were drawn up for each linguistic skill: speaking, listening, reading, and writing. A number of private schools have very exacting standards where all other subjects are taught in English, though some of them are less restrictive about the type of material being taught or the background of their teaching staff.

As far as the objectives of the philosophy of education are concerned, they, as reported by Abu-Absi (1997, p. 199), remain the same, namely they are still to be both educational and instrumental, enabling students to acquire a level of competence which allows them to pursue their education or to use English as a medium of communication with the outside world.

Tunisia is a typical francophone country where French is predominant and used as a second language. The reason why this country has been chosen to be the subject of consideration is that although it is the smallest country in the region, it can be seen as the commercial, financial, and cultural centre as well as the most educationally advanced country in that particular region. All evidence suggests that English is gaining prominence in both academic and business circles.

This was first noted by Battenburg (1997) who points out that along with the progress in Arabization today, English is emerging as another linguistic option. After examining two periods in postprotectorate Tunisia, the introduction of English (1956–1980) and the spread of English (1980–present), he points out that “recent developments in Tunisia in English language policy and planning suggests that the decline in French linguistic influence may be accompanied by a future decrease in French political and economic status (p. 281).” In another report in which Battenburg (2006) speaks of his experience as a university professor in Tunisian universities, he contends that his students’ English language proficiency level is impressive, despite the fact that English is their fourth language after Tunisian Arabic, classical Arabic, and French. He adds that in spite of the fact that Tunisia has a level of linguistic homogeneity probably not found anywhere else in the world (an estimated 99% speak Tunisian Arabic), Tunisians have a remarkable ability to learn other languages. This predisposition for language acquisition, according to Battenburg, has been aided by two related factors: first, Tunisians have had a history of invasions and contact with neighboring countries due to its geographical position; second, as a small country with limited natural resources, Tunisians are obliged to communicate with speakers of other languages, particularly for purposes of trade and tourism.

However, among the main challenges encountered by the process of Anglicizing the country, he remarked that just like many of the other developing countries in the region, textbooks as well as other educational tools are in short supply in Tunisia. English Departments there are divided into three programs: literature, linguistics, and civilization. The challenge in Tunisian English departments is to offer a university degree in English within an Arab country using a French educational system (Battenburg, 2006).

In Turkey, which can be seen as a land bridge connecting Europe to Asia, the situation is not that different from other countries in the region, as it has been described by many authors and official resources (e.g., Brown, 2003; Kose, Canturk, and Ulsever, 2002; Tercanlioglu, 2004). All students entering university are supposed to have studied English in elementary and secondary school. However, in public schools much of that instruction has been by teachers who speak English as a second language themselves. For many students, English is not used outside the classroom, so they have little opportunity to practice their second language skills. However, the case of private schooling is different. The increasingly prosperous Turkish middle classes are more eager than ever to learn English. Dozens of private secondary schools and a few universities use English as the language of instruction. In discussing the heavy demand for English teaching

and learning activities in Turkey, Kose, Canturk, and Ulsever (2002, p. 1) note:

There is an ever-increasing demand for English teaching and learning activities in Turkey, with the implementation of new eight-year compulsory primary education in 1998. Eight-Yearly Development Plan (1999–2006) estimates the English teacher need of the Turkey as approximately 60,000. In order to meet this demand the Turkish Ministry of National Education (MNE) and Eskisehir Anadolu University signed a protocol in February 2000. Anadoul University is authorized to initiate a four-year Distance English Teacher Education program.

#### WORK IN PROGRESS

The literature on foreign language education in various countries of the region has, in recent years, been overflowing with examples of highly critical self-examinations and with proposed solutions to the problems which these analyses have identified (see, e.g., Al-Khatib, 2005; Bataineh and Zghoul, 2006; Battenburg, 2006; Fay, 2006; Hasan, 2000, 2006; Kose, Canturk, and Ulsever, 2002; Mahmoud, 2000; Rababah, 2001, 2003; Spaven and Murphy, 2000; Talebinezhad and Aliakbari, 2001; Zughoul, 2003, among others). Some of the areas which have received special attention in the current research include: educational policy, language transference and interlanguage development, material preparation, teacher training, and pedagogical approaches.

In the context of Jordan, two collections of papers covering a wide range of issues relating to EFL teaching and bilingualism were edited by Al-Khatib (2000, 2006). These studies are the first serious attempts to tackle bilingual education and EFL learning from an Arab point of view, and introduce to the outside reader new literature on foreign language teaching across varied settings of the region.

Several studies were conducted in the region on second language pedagogy. Ruba Bataineh and Lamma Zghoul (2006) examine the critical thinking skills of 50 students enrolled at the Master's TEFL program at Yarmouk University, Jordan. They use the Cornell Critical Thinking Test, Level Z to test the students' use, or lack thereof, of the critical thinking skills of deduction, semantics, credibility, induction, definition, assumption, and identification. They observed that the respondents performed poorly on the test. They also noticed that gender, age, and grade point average are of great effect in the process. Hasan's (2006) article on 'Analyzing Bilingual Classroom Discourse', presents an analysis and discussion of spoken discourse in the EFL classroom at Damascus University. The study looks at the mechanism

of classroom interaction; e.g., the use of questions, initiations, repetitions, and expansions. The results show that classroom language is artificial and this can be exemplified by the teacher's simplified input, his/her use of display questions that restrict students' responses, and his/her great number of initiations. In another article, Hasan (2000) discusses the different types of listening problems encountered by the EFL classroom as reported by Syrian university students learning EFL.

In educational policy, Zughoul (2003) traces the effect of globalization on second language education. He outlines the impact the language of globalization has had on different societies/cultures and the kind of reactions this language has generated among various cultures. The author reached the conclusion that despite the hegemonic and imperialistic nature of English (as the language of globalization), it is still badly needed in the Arab World for the purposes of communicating with the outside world, education, acquisition of technology, and development at large. He adds that teaching English as a language of globalization necessitates changes in the older approaches and calls for changes in the curriculum to respond to the needs of the learner and society. Talebinezhad and Aliakbari (2001) make similar observations in the context of Iran, noting that the worldwide growing interest in English stresses the need for a new approach to English language teaching.

Concerning material preparation, Spaven and Murphy (2000) conducted a study in the context of the United Arab Emirates (UAE) on teaching information skills in English as a second language. In order to develop suitable curriculum for their students, they have had to re-examine their views on librarianship and lifelong learning. Based on the findings of their study, the authors concluded that teaching information skills in a second language need not be onerous if we bring the enthusiasm they have for their profession to their customers. The English Translation program in Iranian Universities was the subject of another study carried out by Razmjou (2001). The purpose of this study was to develop some guidelines to modify the present curriculum for a BA in English Translation in Iranian universities. Based on the results of the study, guidelines are suggested for skill development and content improvement for a translation curriculum.

A significant amount of work on language transference and interlanguage development has been carried out in different parts of the Middle East and North Africa. One important investigation was carried out by Mahmoud (2000) who tackled the problem of language transfer among Arabic-speaking students learning EFL. The author highlights the problem of using two main varieties of Arabic in each Arab country by Arab students and attempts to find an answer to the question of which variety of Arabic students transfer from. He discovered that there is no

significant difference between the means of the number of clauses produced in both cases and suggested that further research is still needed to determine which variety Arab students tend to transfer from in their writing. Some of these studies have tackled this issue from a translation point of view. In an article describing the English Language Translation Program (LTP) as implemented in Israeli high schools, Kozminsky, Weizman, and Horowitz (1998) found that the LTP students improved the metalanguage skills related to translation, and also gained 5 extra percentage points in the regular English matriculation exams at the end of grade 12, compared to the non-LTP controls. Administrative, pedagogical, and conceptual problems in implementing the program are discussed in detail in the article. Similarly, in another study of the difficulties encountered by EFL students in the UAE in translating Arabic 'fa' into English, Saeed and Fareh (2006) examined several types of tests to identify the salient functions that this marker has in Arabic discourse. The difficulties that Arab EFL learners encounter in translating this marker into English were identified and rank ordered in terms of difficulty. Sane Yagi (2000) from Sultan Qabus University in Oman, examines the progress made by EFL students when simultaneous interpretation (SI) tasks are used. He discovered that SI does significantly improve learners' competence in both grammar and vocabulary.

In an article on "Moods and Myths about speaking British English In Turkey", Fay (2006) attempts to draw attention to the predominance of British English in the ESL community in Turkey, and then look at some of the perceptions of teachers and students involved with this choice. Based on the findings of his study, a number of significant suggestions are made to apply the results of the analysis to curriculum and syllabus design in general and within the specific context of the Turkish second language education programs. Also in the context of Turkey, another study was carried out by Brown (2003) in an attempt to shed light on the Turkish Ozel Lisesi bilingual education program. He reached the conclusion that this model of bilingual education has been rather successful in developing a program that suits its context.

#### PROBLEMS AND DIFFICULTIES

Not all languages have benefited equally from the efforts and resources invested in foreign/second language learning in the region. English and—to a lesser extent—French has received the most attention and support to date at the level of both formal and nonformal education. Teaching English in particular is gaining importance at an accelerated rate in the region, not only because the language has been regarded as a valuable resource for the people's modernization drive, but because

it has a great impact on all aspects of their daily life. Therefore, in what follows we confine ourselves to discussing the problems/difficulties encountered by teaching these two languages, though the teaching of other languages like German, Spanish, and Italian may experience the same problems.

Since the 1970s, English language education in several countries of the Middle East and North Africa has been declared by many to be in crisis. This crisis is characterized by high rates of failure, low student proficiency in English, and in some cases low rates of student retention. Many researchers attribute these problems to various reasons: the linguistic and cultural gaps between home and school (Al-Khatib, 2005; Rababah, 2001, 2003), shortage of teaching staff (Kose, Canturk, and Ulsever (2002, p. 1), shortage of textbooks (Abd El Rahman, 2006), inefficiency of language programs or in some cases resistance to innovative teaching methods in public schools and universities (Abd El Rahman, 2006; Akkari, 2004; Battaineh and Zghoul, 2006; Sarayrah, 2003). It appears, from the literature that most of the countries in the region have a lot of problems and difficulties in common.

Careful examination of the literature shows that the problems and difficulties facing foreign and second language education in the region can be summarized as follows:

- Inadequate national education policy/strategy
- Limited financial resources or—in some countries—financial resources which are not commensurate with the basic requirements for second language education programs.
- Insufficient moral or financial support from the government and collaboration with the private sector to develop new training programs for teachers.
- Lack of experience/expertise and limited technical capacity of local staff.
- Difficulties in recruiting or keeping qualified instructors; high turn-over of experts and well trained teachers.
- Decreasing number of highly qualified teachers (experts) because of the lack of research/training institutions in some countries.

However, due to the diversity of the region, the problems and difficulties facing second language education differ from country to country. While many challenges remain in the development of successful language teaching programs for the region, such problems merit more attention and energy on the part of program developers with regard to the type of materials (textbooks) to be used by the students. Textbooks can be made more rigorous or relevant by incorporating real-life material. Jordan's current school textbooks for English language teaching are a case in point, as they have drawn on the results of linguistic and pedagogic research, and are a great improvement over the English

language textbooks of the past. Petra's series of textbooks, which are used in Jordanian public schooling—published by Longman Group Limited in cooperation with the Ministry of Education in Jordan—is one example of such linguistic and cultural adaptation.

#### FUTURE DIRECTIONS

Having considered the history and development of second language education over the past few decades, we have seen that the process entails a wealth of problems and difficulties, and the nature of language teaching itself is still in need of more specific attention. It has been observed that until very recently, the focus of second language education has been on the nature of language acquisition and language learning. No remarkable effort has yet been made to carry out systematic empirical research into the way teachers actually go about doing this work in real-life situations and the effect of such situations on second language teaching practice. To appreciate how meanings are encoded in words, learners need to take a look at the actual sociocultural contexts in which these words are used. For improving the quality of second language teaching in the region, more effort, therefore, still needs to be applied to moving future research forward in the direction of using sociocultural theory as its framework.

Similarly, the development of study materials for communication education should receive a high priority in policy formation and planning. On a wider scale, education authorities can carry out language education programs by incorporating intercultural communication learning as one of the core components of the curriculum. Thus, future work on second language education should raise the awareness of policy makers and the public at large about this issue. In other words, researchers must strive to instill a deep awareness of the importance of studying the language in relation to its sociocultural background.

Insofar as the learners themselves are concerned, it has been noticed that EFL learners face significant problems in learning all language skills: listening, speaking, reading, and writing. The pedagogical implications cited in the great majority of previous studies indicate how serious the problem is, and that this situation requires a solution. One important solution is that instead of merely arguing that learners are in need of more practice in the various language skills, future research has to come up with a practical set of suggestions and recommendations on *how* students could build their language skills, and through *what* means.

Furthermore, with the emergence of multiple electronic modalities for communication, such as e-mails, voice mail, SMS, among others, language is expected to be one of the many aspects of life affected by

the new technological developments taking place around the world. Intercultural communication at present relies increasingly on e-mail, which is predominantly an English language medium. The language of electronically mediated communication is still a neglected research area. Therefore, future research on EFL and ESP is needed and must be directed toward the most effective ways in which the language can be taught to students using English for diverse scientific purposes. Among these is the use of English for electronically mediated communication.

INNOVATIVE SECOND AND FOREIGN LANGUAGE  
EDUCATION IN SOUTHEAST ASIA

INTRODUCTION

Southeast Asia, situated between India and China, represents approximately 9% of the world's population (580 million), and more than 15% of the world's languages. With a heritage of over 2,000 years, Southeast Asia contains all the religions and cultures of the world, giving it a distinctive character of cultural diversity and plurality. Modern Southeast Asia consists of ten countries belonging to the regional organization called the Association of Southeast Asian Nations (ASEAN) formed in 1967. With its population of more than half a billion, a total area of 4.5 million square kilometers, a combined gross domestic product of US\$737 billion, and a total trade of US\$720 billion, the ASEAN region cooperates on economic growth, social progress, and cultural development. Thumboo (1998) provides country studies of each ASEAN nation in terms of their rich cultures and the likely directions of their development.

Among the ten ASEAN countries comprising Brunei, Indonesia, Kampuchea (Cambodia), Laos, Malaysia, Myanmar (Burma), the Philippines, Singapore, Thailand, and Vietnam, four will be examined in terms of the research on the status and role of the second language and on innovative teaching/learning strategies employed in the instruction of the second language. The four countries—Brunei, Malaysia, the Philippines, and Singapore—have had a long internal history with English, a natural second language because of an extended formal association with Britain (till 1984 in the case of Brunei), with British colonialism (till 1957 in the case of Malaysia; till 1963 in the case of Singapore), and with American colonialization (till 1946 in the case of the Philippines). The fifth, Indonesia, went through a Dutch colonization period (lasting till 1949) but in recent decades has turned increasingly to English as an additional language especially with independence in 1949. As for the rest of the ASEAN countries, Kampuchea (which was a protectorate of France till 1863, went through six different regimes thereafter, and did not have access to English until the Soviet Union collapsed in 1989), Lao People's Democratic Republic (Lao PDR) which had French influence and later Russian influence until 1995, Myanmar (which was a British colony till 1948), Thailand

(which was never colonized) and Vietnam (which attained national independence from France in 1954), English is considered a foreign language, albeit an important one. In fact, in some ASEAN countries (e.g., Myanmar, Thailand, and Vietnam), English is a compulsory foreign language taught in schools.

English is taken to be the “second language” in all of the four “English associated” nations, although its status and role will differ from country to country. The first point to note in this survey of innovative second language education in Southeast Asia is that all of the nations in focus here are multiracial, multilingual, and multicultural; the diversity of population in each and its geographical distribution affect the patterns of language acquisition and use among the young school-going populace. The second point is that these ASEAN countries have, in recent years, undergone impressive economic growth and rapid sociocultural transformation through the use of English, a language which enables these industrializing economies to continue plugging into the international grid of finance and industry but at the same time seems to threaten their national identity. This trend continues especially in this era where globalization is the new catchphrase. The experiences and practices of second language education in such multilingual communities provide new perspectives, whether one focuses on language policy and development, curriculum planning and practice, materials and media development, teacher training, or language learning.

Research on the topic of how English language education has been handled in the four ASEAN English-knowing countries, and some innovative practices are reviewed below. A statement at the end will highlight future developments for these member countries and the remaining ASEAN countries of Southeast Asia which are not covered in this review.

#### EARLY DEVELOPMENTS: RESEARCH IN THE 1980S

Preliminary discussion of the English language education in Southeast Asia started with a series of SEAMEO RELC publications (a well-recognized acronym in the region, which stands for Southeast Asian Ministers of Education Organization (SEAMEO) Regional Language Centre (RELC)). The early editors of monographs and anthologies selected and published papers presented at the Regional Language Centre (RELC) annual seminars on themes such as language education in multilingual societies (Yap, 1978), language teaching issues in multilingual environments in Southeast Asia (Noss, 1982), and varieties of English in Southeast Asia (Noss, 1983). Most of the papers concentrated on the learner in the context of language learning in multilingual societies, and on the relationship between language and identity.

Halliday's (1978) paper looked at language largely as a resource (a "meaning potential" for serving a range of different functions) and the value that is placed on this resource in the educational process. Halliday argued that "If the context is a multilingual one, the principle of "learn language, learn through language" applies with no less force . . . Teachers and educators who recommend teaching school subjects in a second language are applying the same principle; they want to use that language as a window on new realities. This is what lies behind the view that if we want primary school children to learn a new language, we should use that language for teaching a school subject" (Halliday, 1978, p. 110). This suggestion has been followed in many Southeast Asian countries, where English is recognized as a valuable resource and used for teaching school subjects.

On a societal level, Llanzon (1978) presented the view that language education in Southeast Asian countries should have two crucial concerns: the learning and use of English and the national language in relation to their cultural underpinnings. In the same volume, Sibayan (1978, p. 23) posed the question "When can all subjects in the curriculum be taught in Pilipino?" expressing the hope that eventually Pilipino could replace English in practically all domains. Gonzalez (1982, p. 89) raised the issues connected with English, an official language of the Philippines, *vis-à-vis* "its association with a colonial past and its maintenance in Philippine society."

Although in these early deliberations there was a deep appreciation of the importance of national languages in building a cohesive society, by the time of the 1983 RELC publication, the focus had shifted to varieties of English in Southeast Asia. Already in 1980, Platt and Weber had discussed the sub-varieties of English in Singapore and Malaysia in terms of their features, functions, and status. Five papers on Southeast Asian varieties of English are found in the RELC volume. Three of the varieties described—from Malaysia (Wong, 1983), the Philippines (Gonzalez, 1983), and Singapore (Tay and Gupta, 1983)—fit the category of "new varieties" in that they were used for intranational communication and have some native speakers, who were usually bilingual. Two other papers, one on the Indonesian variety of English and the other on the Thai variety discussed the complexity of the description and interpretation of a foreign variety of English.

Such a discussion in the early 1980s soon gave rise to several publications on the developments in the roles, functions, status, and features of English in Southeast Asia and the possible pedagogical implications. Among the Malaysians working in this early period were Asmah Haji Omar (1982) and Asiah Abu Samah (1984). In Singapore, Mary Tay was active (see the volume published in 1993, a collection of ten essays from this period), and David Bloom (1986). Gonzalez

(1983) and Llamzon (1983) called attention to a new variety called Philippine English.

While most of these early developments were exciting, the next decade was to see significant contributions to innovative second language learning and teaching in some ASEAN contexts, based on their specific circumstances.

#### MAJOR CONTRIBUTIONS IN THE 1990S

Seminal publications with chapters from leading scholars of Southeast Asia dealing with macro and micro issues of English language education, and its impact on other language education, were published in the 1990s: *English and Language Planning: a Southeast Asian Contribution* (Kandiah and Kwan-Terry, 1994); *Language, Society and Education in Singapore: Issues and Development* (Gopinathan, Pakir, Ho, and Vanithamani 1994, 1st edition, and 1998, 2nd edition); *Towards Global Multilingualism: European Models and Asian Realities* (Khoo, Kreher, and Wong, 1993), being a few examples.

Most of the research in the 1990s focused on understanding second language educational policies in multilingual settings, especially with regard to the status and function of English in the countries as well as the attitudes towards it; e.g., in Singapore, English is one of the four official languages, (the others being Mandarin, Malay, and Tamil) and the working language of the country. In the Philippines and more universally in Singapore, English is the medium of instruction in schools and universities. Where English is used so centrally in education, we would expect to find new research and theory that could inform educators coming from monolingual situations who view second language education from another perspective.

In the area of reading and writing, two important anthologies were published, both edited by Tickoo (1994, 1995). The 1994 Southeast Asian collection especially is informative. Attempts were made to explain patterns in bilingual reading among students in Singapore and reading comprehension ability of bilingual primary five and six children in Brunei. Reading initiative programs in Malaysia, Singapore, and Brunei took new directions. For example, the Singapore experience with a successful model called the Reading and English Acquisition Programme (REAP) employed a modified Language Experience Approach to reading in Singapore classroom. The implementation of REAP in 1985 resulted in effective teaching for lower primary classes in 183 schools (PI-P3) which prepared the way for effective teaching in the upper primary classes with a follow-up program called Active Communicative Teaching (ACT), introduced in 120 schools in 1986, the year when the first group of pupils in Phase I REAP reached the

ACT level (Mok, 1994). The results were encouraging: evaluated formatively and summatively each year, the program came under external scrutiny after a 3-year experimentation. The conclusion was that "there were clear differences between REAP and non-REAP pupils." For instance, REAP children were found to be ahead by over 7 months in their reading comprehension in P3. Attracted by the success of REAP in Singapore, the Brunei Ministry of Education commissioned an adaptation for local primary schools. The version developed by Ng (1994) was named RELA (for Reading and Language Acquisition) and introduced in 1989.

A preliminary gathering of material on composition research in Malaysia revealed that only two major endeavors had really been made: the Process Writing Project of the Curriculum Development Centre of the Ministry of Education and the University of Malaya Project on academic and professional writing. This was not surprising in light of the fact that Malaysian educators have taken the view that English is needed only as "a window on the world"; thus reading rather than writing has been emphasized (Chitravelu, 1994, p. 100).

On the other hand, in Singapore, much more experimentation had taken place in terms of the theory and practice of writing. Working with the centrally controlled English Language Syllabus, departmental handbooks, and textbooks, teachers were often requested to give feedback. Constant appraisals of textbooks, class instruction, and implementation records, all gave rise to a dynamic educational practice which emphasized reading and writing. The process paradigm of the 1980s had not yet given way fully to the meaning constructivist approach of the early 1990s in Singapore classrooms (see Varghese, 1995, p. 72, for a brief discussion of the different approaches in the teaching of writing). On the contrary, there seemed to have been some evidence of the necessity to see both as one integrated "cognitively oriented, process-based approach" (Varghese, 1994, p. 311). Varghese's later study of six top percentile students led her to conclude that good writers are reflective writers, who deliberate "metacognitively about the task and their goals in writing" (Varghese, 1995, p. 82).

In a sophisticated discussion on writing and the process of knowledge creation, Abraham (1995) looked at the effect of new technologies (e.g., the printing press and the word processor) on conceptualizations of writing, knowledge, and of education. The paper offered a theoretically coherent argument for equating writing with thinking, but ended with the perplexing question of whether it was pedagogically possible to teach writing/thinking as a skill.

In the middle of the 1990s, several books on language, society, and education in Singapore, Brunei, Malaysia, and the Philippines were published. Jones and Ozog's (1993) volume on bilingualism and

national development, and the Khoo, Kreher, and Wong (1993) volume on European models and Asian realities in the movement towards global multilingualism discussed the languages in contact phenomenon and its implications for teaching and learning.

Gopinathan, Pakir, Ho, and Vanithamani (1994) had seven chapters on language in education in Singapore. Three were on English, and among those, Ho (1994) examined at a macrolevel how much of English language teaching in Singapore drew on theories and practice of researchers from abroad. But, he noted that in the movement of such ideas from one culture system to another, modifications and adjustments take place naturally, fitting into the needs of the recipient country, its goals and targets in education, and the local institutional structures as well as existing infrastructure. Ho's excellent chapter argued persuasively that the English language curriculum in Singapore had maintained "a balance between extreme swings of the language pedagogy pendulum" keeping clearly within sight the core-periphery distinction and the necessary process of indigenization within the practice of curriculum planning.

Pakir (1992a, 1993a), and Pakir and Low (1995) highlighted the notion that English in Singapore was rapidly moving from a much used second language in the country to an institutionalized first school language, affecting changing language acquisition and use patterns. Pakir (1993b) suggested that the conceptual framework, the strands in pedagogy, curriculum planning, and syllabus design, must take cognizance of the fact that the English language had indigenized, and there had been a shift in orientation from language form to language use. It was further suggested that definitions of "first language," "second language," and "mother tongue" be re-examined in such a multilingual context as Singapore's. The sociolinguistic trends and prospects were deemed to be exciting as the dynamic language situation would give rise to different teaching strategies and processes unique to the country.

English and language planning in Southeast Asia (Kandiah and Kwan-Terry, 1994) are described in a volume designed to be of interest to those who are involved in planning for English for other countries of the world wherever the language, as an additional second language, interacts with other indigenous languages. Two papers dwell on the macro- and microperspectives in the language management of English and education. The country papers on the role and status of English in the Philippines, on visible and invisible second language planning in Singapore, and on the typology and roles of English in Malaysia, examine the basis upon which the whole enterprise of innovative second language education is based in each of these countries.

Gill (1995) published the proceedings of a conference which considered international English language education covering the internationalization of the language and its practical implications. Some focus was given to varieties of English and their appropriateness for international communication, as well as to English for cross-cultural communication. The development of language skills at various levels, the design and development of curriculum, teaching methods, texts, teaching aids, and innovations in testing and evaluation were discussed in the context of English as an international language and a language for cross-cultural communication. Some of the interesting presentations touch on sociopragmatic factors in learner discourse, semantic mapping in the teaching of reading and writing in Malaysian secondary English classrooms, cross-cultural differences in using English as an international language, designing materials with local color and feel, and giving reading support to weak readers in rural areas. The volume makes for an interesting foray into national and international responses to the challenge of international English language education.

Gopinathan, Pakir, Ho, and Vanithama (1998) published a second edition of the book that focused on language in education in Singapore presented in different perspectives. It surveys the questions of language and identity, language and culture, language and power, and also language and education. In a chapter that appeared in the book, James (1998) studied the relation of English and the pedagogy system in Singapore from a sociolinguistic perspective. In the same book, Varghese (1998) surveyed the instruction of reading and writing within the framework of CLT and the application of practices from this framework in the context of Singapore schools. A third edition of the book, also edited by Gopinathan, Pakir, Ho, and Vanithama was published in the year 2003, with new chapters to reflect the growing demand for new information and research in the field.

From these publications it was clear that second language contexts characteristic of these countries gave new perspectives on language learning as new language teaching situations obtained in the 1990s.

#### RECENT MAJOR CONTRIBUTIONS

With the advent of the twenty-first century, new perspectives and research on the status and role of English as the second language or most important foreign language in Southeast Asia have been presented. "English-knowing bilingualism" first described within the unique Singapore educational context (Pakir, 1991, 1992b) and arising from multilingual communities using English as a main medium of instruction is now observable in the rest of Southeast Asia, especially

the Philippines, Malaysia, and Brunei and also to countries where English has been traditionally viewed as a foreign language (e.g., in the rest of the ASEAN countries and in East Asia in general). Although the term “English-knowing bilingualism” was somewhat specific to Singapore when first introduced, where it described a situation in which English is the first school language in the country but used with a second school language which is ethnically defined (e.g., Mandarin for the Chinese, Malay for the Malays, and Tamil for the Indians), it is now used regularly in the literature on language and language-in-education in the Southeast Asian and general Pacific Basin (Kaplan and Baldauf, 2003).

The new millennium of globalization has ushered in a major rethinking in language policy and development, curriculum planning and practice, materials and media development, teacher training, and language learning. With this new era of nations coming together and working hand in hand, English as an international lingua franca has become a reality. The English language is widely recognized as the lingua franca especially among the ASEAN countries. Inevitably, this new status and role ascribed to the English language brings forth a change in how English is being taught and learnt. An up-to-date survey of language policies and language education in 16 countries in East Asia (Ho and Wong, 2003) describes current changes in the language education situation in each location. “East Asia” here refers to Southeast Asia (all ten countries) and Northeast Asia (China, Japan, Korea, Hong Kong SAR, Taiwan, Mongolia). The papers in this volume bear testimony to differing contexts and responses among East Asian nations to their language situation and pursuing varying educational thrusts. A theme of the book—the role of foreign languages in each country and the spread and status of English as a second or foreign language—is more fully developed in a subsequent publication, *English Language Teaching in East Asia Today: Changing Policies and Practices* (Ho and Wong, 2004). It gives an excellent country-by-country introduction to trends, developments, and limitations of English Language Teaching (ELT) in East Asia, including the ten ASEAN countries.

Although English continues to be considered a second language in the four ASEAN countries—Brunei, Malaysia, Philippines, and Singapore—which are in focus here, there is an even greater need for English to be acquired for reasons such as economic and access to information on Science and technology in this era of globalization, especially for the rest of the ASEAN nations and East Asian nations. The general shift from a “structuralist approach” to the Communicative Language Teaching (CLT) approach by the late 1990s in Southeast

Asia meant that the focus of ELT is currently towards communicative competence, skills-based learning, and the integration of language and real-life knowledge.

In Brunei, the Bilingual Education System (*Sistem Pendidikan Dwibahasa*) continues. The language of instruction in lower Primary (1–3) is Malay, and English is the language of instruction in Math, Science, and Geography from Primary 4. In terms of ELT, the English language syllabus for primary schools follows a CLT approach. In 1999, a primary school computer project, which uses computers to teach Information Communication Technology (ICT) and uses computers as teaching tools for individual subjects, was implemented. The project motivates the students to learn English as it is through the active use of English with information technology, the language becomes relevant to the students.

In terms of teacher training, Pieronek (2001) described the in-service project in Brunei where teachers kept journals and documented their language teaching strategies. This project created greater awareness among teachers as they teach and was deemed rather effective for language teaching. There is an apparent increase in the use of English by the younger generation in Brunei (Martin and Kamsiah, 2004). However, McLellan and Othman (2000) caution that in Brunei Darussalam, which is mainly a Muslim sultanate, English has to be careful not to become a tool for the propagation of Western ideas. Canagarajah (2002) also notes that language teaching models should take into account the cultural and social factors of a community before they are implemented.

The year 2003 saw a radical change in the language education policy of Malaysia (Pandian, 2004). English remains a second language in Malaysia, but has become a language of instruction for Mathematics and Science from grade 3. Hashim (2003) gives a good historical overview of language policy in Malaysia and surveys the possible problems of this new education policy. Gill (2002) provides a comprehensive discussion on language policy and language change in Malaysia, with a focus on English, from a sociolinguistic perspective.

In Malaysia, the CLT approach in language teaching brought about the self-access learning and Computer Assisted Language Learning (CALL) programs. The English Language Reader Program (ELRP) implemented in 1979 was phased out because it was deemed ineffective. An examinable literature program was introduced in Primary schools starting from the year 2000 in order to continue increasing the competence in the English language for students in Malaysia. An innovation in the Malaysian education system is the introduction of the Smart Schools which emphasize on learning to learn, and critical

and creative thinking (see Pandian, 2004 for an excellent introduction to the situation in Malaysia).

In comparison to other ASEAN countries, the Philippines continue to achieve high English competence due to their positive attitude towards the English language (Castillo, 2003). However, the alarm was raised when the general standard of English among Filipino teachers of English and the younger Filipino generation was deemed to be on the decline (Sunga, 2003). Although English remains the language of instruction in schools in the Philippines, the de facto language of instruction is the Filipino variety of English or Taglish, which includes a fusion of Tagalog (an indigenous language of the Philippines), English, and Spanish. The issues surrounding the use of this Filipino variety of English are often brought into discussion in language education. The focus for improving the teaching and learning of English in the Philippines has been in teacher training (Sunga, 2003). Many teacher training programs have been set up to improve the English of teachers for the teaching of the language, as well as the teaching of individual subjects in the language.

Singapore, like the Philippines, continues to use English as the main language of instruction in schools. In Singapore, English remains the language for acquiring and disseminating information, for social interaction, as well as for literary response and expression. There has been a multitude of changes in language education policy in Singapore since the late 1990s. An especially significant change would be the implementation of a new English curriculum referred to as Syllabus 2001. This new syllabus stresses language use and also the study of grammar. It promotes the “immersion in an English language environment as well as the explicit teaching of grammar items and structures” (Lim, 2003, p. 392). The focus is turned toward students, the process and contextualization of text, and on communication and literary skills. Excellent descriptions of Syllabus 2001 have been given by Cheah (2003) and Lim (2003). Cheah’s chapter is relevant as it explores the limitations and problems that have surfaced with the implementation.

Ho’s (2003) chapter focuses on ELT in Polytechnics and Universities in Singapore. According to Ho, ELT in tertiary education in Singapore has three purposes: (i) for academic purposes, (ii) to meet occupational needs, and (iii) to satisfy English language proficiency requirements in the tertiary institutions. Three innovative ELT computer learning initiatives were introduced, and they are the self-access center (SAC), the self-access interactive language learning laboratory (SAIL), and the computer-assisted training system (C.A.T.S). The aim for ELT in the tertiary level is to encourage learners to make meaning through language, to use language as a thinking tool, and to integrate language and concept learning.

Adam Brown (2000) edited a collection of proceedings from the “English in Southeast Asia” conference held in Singapore in 1999. In that collection, Kirkpatrick (2000) argues from a socio- and psycholinguistic perspective that native and second language (L2) speakers of English have different cultural schemas. The first language schema may very well be transferred to the L2 learning and the different logic in sentence/discourse structures between two cultures may cause misunderstandings. Since English is used as a lingua franca in the region by mainly L2 English speakers, he calls for the use of regional variety of English; although “it would be wrong to claim that all the languages of ASEAN share the same cultural conventions and schemata, there appears to be many similarities and these, when transferred into a regional variety, may make a regional variety the appropriate variety for ASEAN users to learn” (p. 66). The conference continues to report on current work in progress in the area of educational research and applications.

Lindsay and Tan’s (2003) edited book on language trends in Asia is a compilation of papers on the general theme of language, written by scholars from various disciplines for the Asia Research Institute (ARI) at the National University of Singapore in Singapore. Eleven case studies of the consequences of language policy and language-in-education planning in East and Southeast Asia are presented, within the traditional language-in-society paradigm of “who speaks what to whom?” and “when and why?” In the “Asian Babel” the function of English and the connections between nationalism and language are obvious candidates for scrutiny.

#### PROBLEMS AND DIFFICULTIES

Intense concentration on the social contexts of second and foreign language learning has led to innovations in English language teaching in Southeast Asia. However, the diffusion of innovations in second language education can only depend on the change process itself. Implementation difficulties arise, for example, when the resistance to change is not overcome. It is well known that curriculum development does not automatically lead to program implementation. Many countries (e.g., Cambodia, Malaysia, and Singapore) continue to face the problem of implementing new approaches, for instance the CLT approach. Teachers and students encounter difficulties adjusting to new approaches as they are unable to depart from the habitual use of the structural approach. Culture is also a factor for this resistance to change. Language teaching approaches and materials have to take into account the culture, social, and political aspects of this diverse region.

Program implementation in English Language teaching in the ASEAN countries is not uniformly successful. However, as ASEAN countries open up more to economic and political ties to the rest of the world, incentives for the use of English are greater now than ever in this globalizing era. Where the incentives are especially great (for example in Singapore, Brunei, Malaysia, the Philippines) and where there are innovating persons or groups, or institutional support, fewer problems would be envisaged in implementing new targets, objectives, curricula, methodologies, material designs, and in using new technologies. But there are the inevitable clarion calls of falling standards in English, even as—ironically—more and more of the populations are gaining access to English, which by the end of the 1990s was clearly the established global language.

For innovation to spread there must be a framework for analyzing and applying the program for change. These are especially crucial in the other ASEAN nations where second language education lags behind.

#### FUTURE DIRECTIONS

The determination and implementation of language policy is observable in Brunei (*dwibahasa*, promoting Malay and English), Malaysia (the promotion of Bahasa Malaysia and English), Singapore (the promotion of English and one other official language), Indonesia (the promotion of Bahasa Indonesia and English as an additional language), and the Philippines (the promotion of Filipino and English). Because Singapore publicly acknowledges English as the working language of the country, it has invested heavily in the training and development of teachers of English; so has the Philippines, relatively speaking. In the former, theory is given less emphasis than practice. However, the implications for second language teaching and learning are carefully studied.

As increasingly more is known about the second language situation in the countries listed above, so will more light be shed on the situation in the other ASEAN countries. In recent years, conference papers and articles on the second language situation in Cambodia, Laos, Myanmar, Vietnam, Thailand, and Indonesia have been on the increase. However, data on Laos, Cambodia, and Myanmar in terms of second language education are not as easily available as those of Thailand and Indonesia.

ASEAN scholars who have been devoting their research and practice to English as an important second language in the English-associated ASEAN countries may well begin paying some attention to the less researched regions such as Cambodia, Laos, Myanmar, and Vietnam.

## INNOVATIVE SECOND AND FOREIGN LANGUAGE EDUCATION IN THE SOUTH PACIFIC

### INTRODUCTION

The South Pacific is made up of numerous small island territories separated by large stretches of ocean, together with some bigger landmasses (Australia, New Guinea, and New Zealand). It is a very diverse region. Nineteenth century anthropologists saw the island communities in the region as forming two distinct ethno-cultural groups: Polynesia in the east and Melanesia in the west. However, these broad labels are no longer useful. In particular, they fail to recognise the ways in which British, European, Asian and other foreign influences over the past 200 years have had profound political, social, cultural and demographic effects on the region as a whole. In New Zealand, for example, the majority group is British-European in origin and the other main groups are Maori, Pacific Islander and Asian. Further evidence of the diversity that exists in the region is apparent in the number of languages spoken. Apart from English and French, the linguistic legacies of colonial involvement, the South Pacific is home to a third of the world's languages. In Papua New Guinea alone, over 800 languages are spoken and in Vanuatu more than 100. Such diversity makes for an extremely complex situation as far as language in education is concerned.

### EARLY DEVELOPMENTS

In many of the South Pacific island communities, the first schools were established in the nineteenth century by Protestant and Roman Catholic missionaries from England and Europe. Howe (1984) considers that one of the most significant missionary achievements was to turn island societies from a state of nonliteracy to literacy. Alphabets were developed, the Bible was translated into the vernacular and the local people were taught to read in their own language. During the course of the nineteenth century as colonial school systems developed, while vernacular education continued strongly in the more linguistically homogeneous eastern region of the South Pacific, in countries in the western region which had a multiplicity of languages, such as New Guinea and the New Hebrides (present day Vanuatu), the trend was towards providing

education through the medium of the language of the dominant colonial power (Baldauf, 1990).

A mission school for Maori children in New Zealand was established as early as 1816. Emphasis in the mission schools was placed initially on developing literacy in Maori. In the 1860s, government-run "native schools" were established. The use of Maori in these schools was actively discouraged and instruction was given in English. An important contribution to the development of elementary education for Maori students was made by James Pope, the first Inspector of Maori Schools. Pope is notable for introducing English readers based on situations familiar to Maori students. Pope may also be seen as ahead of his time in advocating in the 1880s a modified form of bilingual schooling (Benton, 1981).

The school system that evolved for the increasing number of settler children was modelled on traditional English patterns. For those who received instruction at the secondary school level French, Latin and Greek featured in the curriculum, taught with an emphasis on grammar and translation. George Hogben, the Inspector-General of Schools at the beginning of the twentieth century, attempted to modernise foreign language instruction by introducing more communicative "natural" methods. However, his influence was relatively short-lived and the "grammar grinding" that Hogben opposed was to prevail for more than half a century (Watts, 1974).

The development of language education in Australia has some parallels with the New Zealand experience. In the nineteenth century, vernacular programmes were introduced by missionaries in schools in aboriginal areas (Gale, 1990). In 1838, the Lutheran missionaries Teichelmann and Schuermann began to set up schools in South Australia that taught Aboriginal children reading and writing in their own languages. Much of the teaching in Aboriginal languages declined after the middle of the nineteenth century and the period up to World War II was marked by sporadic attempts to provide western-style education for aboriginal children through the medium of English.

In the secular and religious schools that developed during the course of the nineteenth century for the sons and daughters of the growing white population English was the dominant medium of instruction. However, there were some schools that made use of languages other than English. Clyne (1991) notes that bilingual approaches were followed in a number of Australian schools from the 1850s onwards. Most of these schools were in Victoria and South Australia where there were sizable pockets of immigrants who were not native speakers of English. The languages other than English used in these schools included German, Gaelic, Hebrew and French. Although most of these schools were for children from non-English speaking backgrounds,

some catered for the children of the English-speaking elite who saw value in their sons and daughters developing facility in another language.

### MAJOR CONTRIBUTIONS

A number of innovative developments in foreign and second language education have occurred in the South Pacific region during the past half century. Many of these developments have occurred as part of moves to improve the overall range and quality of educational provision. In the case of many of the smaller South Pacific island nations that gained independence after World War II the priority has been to augment the numbers of students enrolled in classes beyond the basic education level with the aim of promoting social and economic development as well as affirming national identity. For these island states, the development of competence in an international language such as English or French has been an important goal in order to maintain political and economic links with the outside world. However, there has been increasing awareness that competence in languages of international importance should not be at the expense of indigenous languages.

Perhaps the most ambitious attempt to achieve this balance has been the reform of elementary education in Papua New Guinea in the mid-1990s. A developmental bilingual approach was advocated that was aimed at establishing initial literacy in the local language followed by the gradual introduction of English over succeeding years (Wroge, 2001). Due to the wide range of languages spoken in Papua New Guinea, this reform has had very considerable resource implications. (See also Lotherington, *Bilingual Education in the South Pacific*, Volume 5.)

A number of curriculum initiatives have also been put in place in South Pacific territories to enhance the literacy development of learners of English as a second language. Of note is the contribution of Clay (1985) whose work on whole-language reading approaches has had a major influence on educational programmes in Pacific countries as well as further afield. Other significant initiatives include the Book Flood project conducted in Fijian schools in the late 1970s (Elley and Mangubhai, 1983) which was based on the premise that language learners gain benefits from extensive reading in the target language. The success of this project led to the development of reading programmes using shared book methods in other South Pacific countries.

Since the 1970s, indigenous language maintenance has been a key theme in New Zealand education in response to concern that the majority of children of Maori descent were English speakers with little or no access to the Maori language. In 1976, a Maori/English bilingual

school was opened at Ruatoki. An even more significant initiative was the establishment of *kohanga reo* (language nests) by local communities to provide children of pre-school age with immersion experiences in Maori language and culture. The first *kohanga reo* opened in 1982 and the concept rapidly spread to other districts throughout New Zealand. A further development was the formation of *kura kaupapa* (primary and secondary schools based on Maori perspectives) to enable children emerging from *kohanga reo* to continue their Maori-medium education. This immersion model has also been adopted by Pacific Island communities resident in New Zealand leading to the setting up of language nests operating in languages such as Samoan and Tongan.

In Australia, there were moves in the 1970s to develop bilingual programmes for Aboriginal and Torres Islander people. The Northern Territory's bilingual education programme, in which Aboriginal languages and English were used side by side in Aboriginal primary schools, came into being in 1973. However, in 1998, following a government review, the bilingual programme was phased out. Its successor, two-way learning, is seen by Nicholls (2005) as a return to a more English-dominated approach to the education of Aboriginal children.

Whereas in New Zealand attention in bilingual or immersion programmes has mainly focused on Maori and, to a lesser extent, Pacific Island languages, Australian bilingual and immersion programmes have been developed in a wide range of LOTES (Languages other than English) including the languages spoken in immigrant communities, such as Italian and Modern Greek (see also Clyne and Fernandez, 'Community Language Learning in Australia', Volume 4). Australia's first immersion programme started in 1985 at Benowa State High School in Queensland, initially as an enrichment class for motivated students. The success of this experiment led to an extension of the school's programme and its adoption in other localities. Studies of successful immersion and bilingual programmes at different levels have been made, amongst others, by Rado (1991) and Berthold (1995).

The development of immersion and bilingual programmes in Australia was supported by the 1987 National Policy on Languages (Lo Bianco, 1987) and its successor the 1991 Australian Language and Literacy Policy. In response to the strong advocacy of foreign and second language education in these policy documents State governments initiated programmes designed to strengthen language learning. These included efforts to provide an early start to language learning in primary schools. For a study of foreign language developments in Australian primary schools consult Clyne, Jenkins, Chan, Tasokalidon, and Wallner (1995).

A further notable achievement in Australia has been establishment of the Australian Migrant Education Programme (AMEP). To cater

for the post-World War flow of immigrants from Europe the Federal Government initiated in 1948 a large-scale English language scheme that offered free tuition for those who were not native speakers of English. The AMEP developed its own methodology, known as the Australian Situational Method, which was widely employed until its replacement by a more communicative, theme-based approach in the 1980s. Issues surrounding English language support for immigrants in Australia are examined in Burnett (1998).

Part of the search for ways to improve the range and quality of language learning in the South Pacific region has involved investigating different modes of pedagogical delivery. Distance education has been embraced as a means of providing learning opportunities for students in remote areas. The Alice Springs School of the Air, which began broadcasting in 1951, was a pioneer in distance education in Australia as was the Correspondence School in New Zealand. In both of these countries, distance education at the tertiary level is well established through providers such as Massey University (New Zealand) and Deakin University (Australia). In a similar way, the University of Papua New Guinea and the University of the South Pacific have provided distance education programmes since the 1960s. In most of the institutions that offer distance education options a range of languages are taught using a mix of print, video, audio, CD-ROM and online resources. An overview of developments in distance education in the South Pacific is provided in Guy, Kosuge, and Hayakawa (2000).

#### WORK IN PROGRESS

Work is progressing in most of the areas outlined in the preceding section. Initiatives concerning Maori-medium education in New Zealand continue to be advanced though as May and Hill (2005) suggest there are some matters to do with pedagogy, staffing and resourcing that should be addressed as the programmes enter the next stage of development. Progress is also being made in New Zealand to meet the language needs of students from other cultural and linguistic backgrounds. Languages such as Korean, Samoan, Tongan and Chinese have been added to the curriculum. Attempts are also being made to assist the English development of new arrivals from Asia and other countries where English is not the main language, through the provision of extra resources to schools in localities where there is a concentration of immigrant children and the appointment of special English language advisors. With respect to foreign language education the main emphasis has been on strengthening the teaching of languages in primary schools and developing a curriculum framework that encourages a more coherent approach to language learning across the different levels.

In Australia, encouraging results have been reported for immersion and bilingual programmes in the different LOTE areas. De Courcy (2002), for example, notes the favourable test scores of students who participate in foreign language immersion programmes in Queensland. A development of note in Australia as well as in New Zealand is the emphasis on an outcomes-based languages curriculum. In Western Australia, for example, an overarching curriculum framework has been developed that makes explicit the learning outcomes expected of students in the LOTE learning area. Progress maps to monitor student progress towards achieving these outcomes are being refined. Among the tools available to teachers to assess language proficiency are tests such as Ingram and Wylie's International Second Language Proficiency Ratings (ISLPR). The ISLPR is designed to assist teachers to assess in an authentic and naturalistic way the proficiency of learners of different foreign languages or English as a second language (Ingram, 2004). Intercultural language learning is also developing as a key direction in Australian language education. The main goal of this approach is to encourage students to explore and critically reflect on cultural differences. The Asian Languages Professional Learning Project initiated in 2004 by the Australian Department of Education, Science and Training, is intended to update the skills and understanding of teachers of Asian languages, with a particular focus on intercultural language learning (McLaughlin and Liddicoat, 2005).

In South Pacific Island countries, vernacular initiatives continue to be supported. Nako (2004) outlines the progress in implementing a vernacular language strategy as part of an overall transitional bilingual approach in Vanuatu. In 1999, the Vanuatu government approved a policy requiring the usage of vernacular languages in the lower levels of basic education of Ni-Vanuatu children with progressive introduction of English or French at the more advanced stages. Although a number of teething problems have been experienced stemming from lack of adequate planning, lack of resources and deficiencies in teacher training programmes, progress is being made to extend the programme and improve the quality of instruction.

Hand in hand with plans to provide children with early literacy development in their own language has been the move to increase the indigenous content of the curriculum. At the 2001 Re-thinking Pacific Education Colloquium, a number of educators expressed concern that the western-style educational system adopted by most South Pacific countries has not succeeded as expected as the values promulgated were not in tune with the traditions, customs and beliefs of the local people. A strong recommendation of the Colloquium was that educational programmes at all levels should more fully embed Pacific values, beliefs, knowledge systems, skills, attitudes and behaviours (Pene,

Taufe'ulungaki and Benson, 2002). The various ways in which countries such as Fiji, Samoa, Tonga, Cook Islands, Kiribati, Tuvalu and Vanuatu have attempted to increase the amount of local content in school programmes is well described by Siegel (1996) and Thaman (2003)

Further developments are underway in distance education in the foreign and second language-learning domain. White (2003) provides a comprehensive summary of distance education initiatives in Australia such as the SOFNet programme in Victoria. This latter initiative has included satellite transmitted interactive television language programmes as part of the Schools of the Future policy to equip schools with new technology. First developed in the mid 1990s the programme covers a range of foreign languages. Case studies of the use of technology in distance language learning programmes in the New Zealand context are found in Gibbs and Holt (2003). The initiatives that have been trialled include the Telecom Distance Learning Project (TDLP) targeting three languages in demand (Maori, Japanese and Spanish) and involving live weekly programmes via satellite from the New Zealand Correspondence School. The International Language Series (ILS) programme has been developed to help overcome some of the problems that arose in the TDLP programme, particularly the fact that many of the teachers involved were not language specialists. The ILS programme aims to facilitate the professional development of primary and secondary teachers who are responsible for language learning programmes.

A major development in recent years has been the increase in the number of self-access multimedia facilities for language learning in many institutions. These facilities combine computer technology with audiovisual and television facilities. A consequence of the increased use of educational technology has been a blurring of the distinction between students who attend classes in an institution and their peers who study at a distance. Thomas (2003), for example, describes the development of flexible modes of foreign language study at Monash University. These modes of study for on-campus as well as off-campus students combine interactive computer-assisted language learning tasks via CD-ROM as well as a website for tutorial assistance and communication among students and staff.

As far as research into different aspects of language learning is concerned, Kleinsasser (2004) notes a burgeoning literature in the applied linguistics field that informs language teaching by investigating the factors that impact on the success of language programmes. Kleinsasser's review of recent studies in the second and foreign language domain in Australia and New Zealand identifies a number of themes in contemporary research. These include studies of learning environments,

language teaching and learning cultures, teacher beliefs, learner perceptions and learner strategies.

#### PROBLEMS AND DIFFICULTIES

Glynn (2003) points out that in New Zealand the focus on supporting Maori language may have diverted attention away from the language and cultural requirements of other ethnic groups. Although work is in progress to rectify this gap, still more needs to be done in view of the increasing diversity in the population as a result of high immigration flows from Asia and other non-traditional immigrant source regions. There is also a need for more resources to ensure that young immigrants from non-English speaking backgrounds are not disadvantaged in an English-dominant education system (Watts, White and Trlin, 2002). A particular area of need is the development of materials that more adequately reflect the New Zealand cultural and linguistic environment as many of the commercially available materials are designed to cater for short-stay international students rather than immigrants. With respect to foreign language education, the teaching of foreign languages in New Zealand remains handicapped by the fact that in most schools languages are included in the curriculum as optional rather than required subjects. In the national curriculum stocktake conducted amongst language teachers the respondents were sharply critical of the lack of priority accorded to foreign languages compared to other subjects that made it difficult for them to attract and retain students in language classes (McGee, Jones, Cowie, Hill, Miller, Harlow, and Mac Konzie, 2003). According to Kaplan and Baldauf (2003) many of the problems facing foreign language education in New Zealand may be attributed to the lack of overall direction. Unlike Australia New Zealand does not have an official language policy. To a large degree decisions on what languages should be taught and to what level are left to individual schools to decide.

As far as language education in Australia is concerned, while acknowledging the gains that had occurred in the 1990s as a result of the Australian Language and Literacy Policy, Kaplan and Baldauf (2003) consider that the momentum may be slipping and that it is time for Australia to again be policy active. One area of concern is that the expansion of language teaching downwards from secondary schools to primary schools has not been accompanied by the allocation of necessary resources. More attention needs to be paid to professional development programmes that target mainstream teachers and assist them to increase their competence in language instruction. A particular problem that has arisen is that of continuity at the critical juncture point

between primary and secondary education. In the view of Cunningham (2004), increased efforts need to be made to develop curricular structures and strategies that facilitate transition across the primary/secondary threshold.

The supply of competent language teachers is a recurring problem in many of the South Pacific Island territories, which have early childhood and elementary school vernacular education programmes. Countries with a multiplicity of indigenous languages such as Papua New Guinea and Vanuatu face major difficulties in recruiting, training and retaining teachers with the skills required to develop learner materials in the many different languages spoken by local communities. In Fiji, also the multi-ethnic nature of the population poses particular problems for educational provision (Fiji Islands Education Commission Panel, 2000). Although South Pacific countries such as Samoa, Tonga, Tokelau and Kiribati that have relatively homogeneous populations may not be confronted by problems of such magnitude, nevertheless the movement towards a more vernacular-oriented curriculum in the early years of schooling does present for them as well resource issues that are not easily resolved (Pene, Taufe'ulungaki and Benson, 2002).

While distance education has been embraced by many of the South Pacific countries as an important means of bringing educational opportunities to areas outside the main centres, it does have certain limitations. The successful use of distance learning modes of delivery of language instruction is dependent on the social and economic conditions that prevail. Although economically developed countries such as Australia and New Zealand are in a position to take advantage of new advances in distance learning, particularly those that involve the use of the internet, this does not apply to small Pacific nations that lack the basic infrastructure for such developments.

#### FUTURE DIRECTIONS

The future shape of foreign and second language education depends in large measure upon the willingness of the governments of the countries in the region to attempt to address the problems and difficulties that have been outlined in the preceding section. The extent to which different countries are likely to put additional resources into language education does relate closely to their social, cultural, political and economic priorities.

In the case of the smaller island nations of the South Pacific the desire to assert independence and affirm indigenous cultural and linguistic identities is likely to sustain the move towards vernacular education programmes at the early stages of schooling. However, the necessity

to maintain close political and trading links with the international community will ensure that these island territories continue to keep a focus on developing proficiency in languages of wider communication at the post-primary school levels.

Population movements will also have a major bearing on the future direction of language education in the South Pacific region. If the present relatively high migration flows into Australia and New Zealand from countries where English is not the main language are maintained, more attention will have to be given to assisting new arrivals to develop high levels of fluency in English and easing their transition into a different cultural setting. The demands from ethnic communities for further government assistance to help maintain their heritage languages and cultures are also likely to increase.

It must be understood that the successful implementation of curricular innovations in the language education area very much depends on the resources available. Many of the smaller island territories in the South Pacific region are not economically self-sufficient and are reliant on foreign aid for their educational development. Such dependence does pose problems if donor countries channel aid into support for programmes that match their own strategic objectives rather than ones designed to build capacity in the island countries and support local initiatives. Australia and New Zealand are better placed to support educational developments than most other countries in the region. However, proponents of foreign and second language education must be prepared to press for an equitable share of resources. In both Australia and New Zealand foreign language education is handicapped by the fact that English is overwhelmingly the dominant language in society. There is a pressing need in these two countries to promote greater public and political awareness of the benefits of language learning and to gain tangible official support for the implementation of plans and strategies designed to improve the range and quality of language education.

Finally, fruitful exchanges of ideas and experiences are essential to the advancement of foreign and second language education in the region. Such interaction requires effective partnerships between South Pacific foreign and second language professionals and their counterparts in the international community. In a globalising world, there should be greater opportunities for contact with others who work in the foreign and second language education field. One can expect, then, that it will become easier for language educators in the South Pacific to draw on overseas research and best practice. However, this does not mean that real innovation will not be encouraged in the region. There will always be a need to seek ways of teaching foreign and second languages that are in tune with the social, cultural and linguistic situation

of the different South Pacific countries and that match the needs and aspirations of the local students.

# **Section 4**

## **Teacher Preparation and Professional Development**

## THE PROFESSIONAL DEVELOPMENT OF FOREIGN LANGUAGE INSTRUCTORS IN POSTSECONDARY EDUCATION

The teaching of foreign languages in postsecondary education is carried out by a heterogeneous group of instructors: tenure-track professors and graduate teaching assistants whose training is most frequently in literary and cultural studies; and non-tenure-track instructors, often native speakers, with Master's or Ph.D.'s in literature and cultural studies or linguistics. The initial professional development of these instructors takes place within the framework of graduate programs, when these instructors serve as teaching assistants and, in most cases, receive formal preparation in teaching undergraduate language courses. The ongoing professional development of these instructors once they have assumed faculty positions is usually left to the devices and initiative of the individual instructor. In isolated cases, ongoing professional development may be provided by a university-wide language center or through a centralized office of instructional development. Because of the foundational role played by teaching assistant professional development programs in the preparation of foreign language instructors, this review will focus primarily on research on graduate-level programs. Although to a lesser degree, the review will also address research on the professional development of language program directors, faculty who oversee the preparation of teaching assistants, and other faculty, in particular those in adjunct and non-tenure-track lecturer positions.

### EARLY DEVELOPMENTS

As Schulz (2000) and Hagiwara (1976) observe, publications on foreign language teacher education before the 1950s focused primarily on secondary school instructors. With the postwar increase in undergraduate enrollments as a result of the GI bill and the dramatic increase in foreign language enrollments brought on by the National Defense Education Act (NDEA) in 1958, foreign language departments at research universities began to rely almost exclusively on the use of teaching assistants to conduct introductory foreign language courses. This use of teaching assistants, most of whom were fresh out of college and had never taught before, thus served as the catalyst for

research and discussion about the formal preparation of postsecondary foreign language instructors.

Publications from the mid-1950s to the early 1980s on the professional development of postsecondary instructors focus primarily on the need to establish systematic preparation for teaching assistants and provide recommendations for doing so. In this period, a number of articles discussing best practices emerge in journals such as the *Modern Language Journal* (e.g., Dalbor, 1967; Remak, 1957), *Foreign Language Annals* (e.g., Ervin and Muyskens, 1982) the *ADFL Bulletin* (e.g., DiDonato, 1983), and disciplinary journals such as the *French Review* (e.g., Gilbert and McArthur, 1975).

Initial recommendations for providing teaching assistant preparation first appear in the 1955 Modern Language Association (MLA) conference report (PMLA, 1955). The report, based on five meetings of 18 foreign language department chairs, identifies a number of in-service teacher preparation activities already underway at several of the represented institutions, including methods courses, class visitation, general supervision, and collaboration in the preparation and grading of exams, and calls for a formal certification program for foreign language graduate assistants that would consist of courses (e.g., in phonetics, applied linguistics, methods) and the passing of a nationally standardized exam that would be given under the auspices of the MLA.

From the early 1960s to the late 1970s several major surveys of foreign language, doctorate-granting departments were undertaken to assess more systematically the status of graduate teaching assistant preparation and to provide recommendations. MacAllister's 1964 report (MacAllister, 1964), based on a survey of foreign language departments undertaken by the MLA with support from the Carnegie Corporation and two subsequent conferences, revealed that almost 60% of the 52 responding departments (39 universities) provided no training whatsoever for their teaching assistants. Of those that did, preterm orientations, meetings with supervising faculty periodically throughout the semester, and classroom visits were the most common practices. Ten departments (approximately 20%) had semester-long courses on teaching foreign languages in college which were not, however, compulsory for graduate students who did not teach while pursuing their degree. The report compared the lack of systematic training for college-level teachers with the more substantial and methodical clinical preparation for doctors and called on the MLA to exert its influence with the 500 colleges it counted as members to improve the situation. The report identified qualities needed by language instructors and called for proficiency testing before the first assignment, a graduate level course on methods in foreign language teaching and learning, and the establishment

of summer institutes, similar to the NDEA institutes provided for secondary school teachers.

In 1969, another comprehensive survey of graduate programs in foreign languages was conducted by the American Council for the Teaching of Foreign Languages (ACTFL) and the American Departments of Foreign Languages (ADFL). The findings of this report (Hagiwara, 1970) indicated improvements since the 1964 MacAllister report, but much more work was still needed. The most prevalent activities included course-wide departmental final evaluations, class visits by senior faculty, and regular meetings with old and new assistants. Approximately half of the departments provided demonstration classes, and half asked students to evaluate their teaching assistants. Though up from the 1964 MacAllister report, only 28% of the responding departments required a course in applied linguistics or methods. One of the most striking observations made by Hagiwara is the fact that a large majority of the supervisors of teaching assistants were in the rank of assistant professor or below, a sign he interprets as a devaluation of this activity. This topic will be picked up more substantially in publications during the 1980s.

In 1978–1979, two additional surveys were undertaken. Randomly sampling 90 universities, Nerenz, Herron, and Knop (1979) found that a full 91% of departments required a methods course of TAs. Another survey, conducted by Schulz (1980) who surveyed 370 foreign language, comparative literature, and linguistics departments representing 78 universities, showed less progress. (The discrepancy may have been due to the inclusion in Schulz's survey of linguistics and comparative literature departments, where TA preparation was established much later.) Sixty-nine percent of the reporting departments offered pre-service training, up from 38% in 1969; and almost 38% required a methods course, 10% more than the number offering required methods courses in Hagiwara's survey 10 years earlier. Twenty-eight percent of departments offered both pre-service and in-service training as compared to 11% in Hagiwara's research. Schulz notes that student evaluation of TAs had risen substantially, but she also highlights the fact that none of the programs she surveyed required proficiency testing of TAs before the first appointment. Schulz provides a checklist of recommendations for TA development programs. A similar list of recommendations was provided by DiDonato (1983).

One last survey was undertaken by Gibaldi and Mirollo in 1981. While this MLA-funded report did not provide statistical summaries, it gives 17 recommendations for the teaching assistant apprenticeship and presents case studies of current programs. Perhaps most importantly, the report called upon departments to commit themselves to excellence in preparing college-level instructors.

In addition to presenting particular programs that prepare teaching assistants for their instructional roles, publications in the 1980s concentrate on the emerging role of the language program coordinator. As the need to prepare TAs for teaching became more accepted, greater attention was given to the role of the supervisor, his or her status in the department, and the background qualifications that the person brought to the position. Picking up on concerns raised by Hagiwara (1970), Schulz (1980) states: "Relatively few departments seem to recognize the need for specialized training as a prerequisite for the duties of TA trainer and supervisor." Several articles that appear in the 1980s point to this concern, calling for the establishment of standards in hiring language program coordinators. Lee (1987), for example, reports on a 1985 resolution by the Committee on Institutional Cooperation that articulates standards for language program coordinators. The MLA articulates standards for this position in the 1986 volume of *Profession*. Reflecting this increased focus on the professional development of language program coordinators, in 1980 a professional organization is established, the American Association of University Supervisors, Coordinators, and Foreign Language Program Coordinators (AAUSC) whose mission is to "promote, improve, and strengthen foreign language and second language instruction in the US; to strengthen development programs for teaching assistants, teaching fellows, associate instructors, or their equivalents; to promote research in second language acquisition and on the preparation and supervision of teaching assistants; and to establish a forum for exchanging ideas, experiences, and materials among those concerned with language program direction." By the end of the 1980s this focus on the language program coordinator leads to the establishment of a journal devoted to the continued professional development of this group of individuals, *Issues in Language Program Direction*. The attention given to the language program coordinator dovetails with significant directions that begin to develop in the 1980s that have a profound effect both on the teaching of foreign languages and the preparation of instructors: the ACTFL proficiency standards and the reconceptualization of language learning through the fields of second language acquisition and applied linguistics. Articles published in the 1980s in the *ADFL Bulletin* (one entire volume devoted to standards, 1986; Kramsch, 1989) signal these new directions.

#### MAJOR CONTRIBUTIONS

Central publications on the professional development of language instructors appear in the AAUSC series, *Issues in Language Program Direction*. In addition to isolated articles scattered throughout a number of these volumes, the series devotes two issues (Rifkin, 2001; Walz,

1992) to this topic. Of note in the first volume (Magnan, 1991) is an extensive bibliography by Benseler and Cronjaeger (1991) on teaching assistant development signaling that this topic has now become a formal area of research.

Publications that appear in the 1990s in this series and elsewhere reflect major shifts in the professional preparation of teaching assistants. In the late 1980s and early 1990s, the new focus on standards and preparation for the assessment of proficiency is evidenced by articles such as Murphy (1991) and the publication in 1993 of Omaggio's *Teaching Language in Context: Proficiency Oriented Instruction*, a book that would become one of the standard texts in methods courses for teaching assistants at many universities in the 1990s. A second shift evidenced by the research in the 1990s picks up on concerns raised earlier by Hagiwara (1976) that calls on departments to move from the preparation of teaching assistants for the immediate instructional needs of the institution to the education and professional development of graduate students as future faculty (e.g., Azevedo, 1990; Chaput, 2001; Pons, 1993). This trend resonates with and is influenced by similar shifts in the field of TA development in higher education in general in the 1980s and 1990s (e.g., Nyquist, Abbott, Wulff, and Sprague, 1991) and the emergence of Preparing Future Faculty programs at many research universities through funding from the American Association of Universities and Colleges (AAUSC) and the Council of Graduate Schools (CGS) and later by the Pew Charitable Trusts. In addition to emphasizing this longer range view of professional development, research on TA development in the 1990s reveals a shift from a view of teaching as the application of methods to one that is predicated on reflective practice and classroom research (e.g., Kinginger, 1995; Mcdonough, 2006; Wildner-Basset, 1992). These directions are influenced by the work of Schön (1983) on the reflective practitioner, and that of Allright, Crookes, and others on action research. This movement beyond training and methods at all levels of foreign language teacher education is summed up by representative titles from this decade: *Training Foreign Language Teachers: A Reflective Approach* (Wallace, 1991) and *Beyond Training* (Richards, 1998). In the 1990s, the full maturation of the fields of applied linguistics and second language acquisition theory, the shift in foreign language departments from an exclusive focus on literature to one that included cultural studies, and the impact of poststructuralist theory on the humanities lead to publications that begin to challenge current, utilitarian approaches to foreign language study (e.g., Kramsch, 1995) and teaching assistant preparation. Fox (1992) and Rankin (1994) call for a revised model of TA training that will incorporate applied linguistics. Von Hoene (1995) uses feminist, postcolonial, and psychoanalytic theory to rethink the

preparation of graduate students for teaching and makes recommendations to break down the rigid divide (noted by many authors in the AAUSC series and elsewhere) that exists in foreign language departments between the study of language on the one hand and the study of literature on the other. Building on work done by Kramsch and Nolden (1994), Kern (1995) encourages the incorporation of literacy in the preparation of teaching assistants to enable them to guide students in developing critical literacy in a foreign language.

One novel application of a literacy approach to foreign language acquisition (Byrnes, 2001) has been undertaken in the German department at Georgetown University where the undergraduate curriculum has been substantially revised through the lens of narrativity and genre. These changes have led to significant changes in the manner in which teaching assistants are prepared for teaching. By rethinking the divide between language and literature through the concept of literacy, the responsibility for teaching assistant preparation is distributed among all faculty in the department. The language program coordinator in this model becomes less isolated, and the link between language and literature is once again restored.

In the late 1990s, research begins to appear on the professional development of lecturers (Bernhardt, 2001; Robin, 2001; Van Deusen-Scholl, von Hoene, and Moeller-Irving, 1999; von Hoene and Van Deusen-Scholl, 2001). While the increased use of lecturers and adjunct faculty in higher education reflects a structural change in university staffing over the last several decades and is not limited to foreign language departments, the percentage of lecturers at any one university is often concentrated in the teaching of languages. This is particularly true of the so-called less commonly taught languages (LCTLs) and at colleges and universities that do not offer Ph.D. programs. Van Deusen-Scholl, von Hoene, and Moeller-Irving (1999) report on research on the professional development needs of lecturers at a major research university. Following up on this work, von Hoene and Van Deusen-Scholl (2001) call into question models of lecturer "professionalization," which are often steeped in a colonialist, top-down discourse. They describe an alternate model developed at University of California, Berkeley that draws on the input of lecturers and provides support for their ongoing professional development. Bernhardt (2001) points to two generations of lecturers, one trained in second language acquisition theory and applied linguistics and an older generation whose teaching does not benefit from these more recent developments. Robin (2001) describes many of the difficulties involved in providing professional development support to adjuncts who often teach on more than one campus and may lack the time and incentive for ongoing professional development activities.

## PROBLEMS AND DIFFICULTIES

In spite of the strides that have been made in enhancing the professional development of foreign language instructors over the past five decades, significant problems remain.

First, substantial differences exist between the more commonly and less commonly taught languages in the professional development programs available to teaching assistants and lecturers (Rifkin, 1992; Robin, 2001). While a handful of centralized language programs that provide professional development opportunities for lecturers and teaching assistants exist (e.g., the language centers at University of California, Berkeley, the University of Pennsylvania, and Stanford), these are by no means universal. Departmental courses for graduate students teaching the LCTLs often do not have formal syllabi or are not available altogether. Rifkin (1992) makes recommendations for improving professional development for teaching assistants in the less commonly taught languages, but 14 years later, much work still remains to be done.

In addition, the full integration of applied linguistics into the curriculum of foreign language departments and the preparation of teaching assistants has not yet come to fruition. Because departments limit the preparation of teaching assistants to one semester, language program directors are faced with the unfortunate choice of having to prepare teaching assistants simply for their first assignment. This preparation generally focuses on practical strategies such as classroom management, lesson planning, and grading. While extremely important, this approach barely scratches the surface of the deeper field of applied linguistics. Instructors may include a bibliography of literature on applied linguistics on the course syllabus, but they do not have the time that would be needed to integrate that literature into the fabric of the course. Though some of the more commonly taught languages have a two-semester series, the standard practice at most research universities is one methods course. Lalande (1991) and von Hoene (1995) call for advanced or ongoing preparation of teaching assistants.

Given the structural shift in higher education to a more temporary, adjunct workforce, a cohesive approach to the professional development on adjunct faculty has become increasingly important. As Bernhardt (2001) and Robin (2001) note, many lecturers currently teaching languages in higher education have either outmoded training or no training at all in second language acquisition theory and applied linguistics. As a result, language programs vary widely in the degree to which they are informed by the most recent research findings in these fields.

The changing demographics of undergraduates, many of whom are heritage speakers of the language they are studying has led to increased research on the needs of this specific group of learners. Some language

programs have responded to the distinct needs of heritage speakers by creating separate tracks. However, the body of research on teaching heritage students has not been integrated into professional development programs for language instructors.

Departments of foreign languages and literatures have maintained a rigid divide between language teaching on the one hand and the study of literature and culture on the other. A more integrated approach to the notion of the foreign language department and its impact on instructor preparation appears in several works (Byrnes, 2001; von Hoene, 1995), but only limited movement has taken place. Although departments are more frequently hiring specialists in second language acquisition and applied linguistics to run their language programs, the ability of those individuals to impact other areas of the departmental culture are extremely limited.

Many language program coordinators in the United States, either through obligation or choice, adhere to a communicative approach to language learning that is primarily utilitarian in nature (Kramersch, 1995). As a result, applied linguistics and related disciplines such as discourse analysis, stylistics, sociolinguistics, linguistic anthropology, semiotics, among others, have not been included in the preparation of graduate students for teaching. This has helped to maintain the divide between language on the one hand and literature and culture on the other.

#### FUTURE DIRECTIONS

Future directions in research in foreign language instructor development may include the following:

1. Given the increased enrollments in many of the LCTLs which are taught primarily by lecturers, more research is needed on how best to support and enhance the professional development needs of these instructors. This research should survey current models used in the professional development of lecturers and should explore the philosophies and beliefs that guide them. Based on this research, best practices should be identified so that they can be adapted by other colleges and universities. As lecturers at many universities become unionized, research should be conducted on the impact of unionization on contract provisions that support professional development. Where these provisions exist, research should evaluate their effectiveness in fostering professional development. Research in this area should also involve direct input from lecturers so that they may have a voice in their own professional development.
2. As a result of the increase in heritage speakers in college classrooms, research on the needs of heritage learners should include

recommendations for incorporating research findings into classroom practice and into the professional development of language instructors.

3. More research needs to be conducted on the degree to which the preparation graduate students receive in teaching fits the needs of their future careers. Research of this sort would give a basis upon which to make recommendations for courses on the graduate level in areas such as cross-cultural literacy, stylistics, language and identity, language and power, and semiotics.
4. Most colleges and universities have a centralized unit that provides professional development for faculty. Research is needed on how these units currently support the professional development of instructors in foreign languages and how these units can work together to supplement each other's work.
5. The AAUSC, which has had a very low profile up to now, could collaborate with other organizations such as the MLA, AAAL, and discipline-specific organizations such as the German Studies Association to develop an integrated approach to language, literature, and culture on all levels of undergraduate and graduate curriculum. The professional trajectory of Ph.D.'s from alternative programs such as the one based on literacy at Georgetown's German department should be carefully followed to chart the impact that a revised approach to language, literature and culture may have on departments in which these Ph.D.'s are employed.
6. As part of graduate student professional development, research seminars should be offered on a regular basis that bring together language acquisition and theoretical discourses commonly studied in literature and culture programs such as postcolonialism, post-structuralism, transnationalism, psychoanalysis, and feminism. Such seminars would enable graduate students to explore how language reflects and constitutes individual and collective identities and how subjectivity is constructed and revised in the cross-cultural, cross-linguistic encounter with difference (von Hoene, 1995). Such seminars would also enable graduate students to consider the nature and goals of foreign language acquisition in respect to the colonialist insistence on assimilation or the postcolonial attentiveness to difference. Such seminars could be used by departments to consider their contributions to the university as "departments of cross-cultural difference" (von Hoene, 1999).

## NETWORK-BASED LANGUAGE TEACHING

### INTRODUCTION

Over the past 20 years, computer networks have introduced unprecedented opportunities for language learners to access and publish texts and multimedia materials and to communicate in new ways within and beyond the classroom. Whereas computer-assisted language learning (CALL) refers broadly to a wide range of applications (e.g., tutorials, drills, simulations, instructional games, tests, concordancers, etc.), network-based language teaching (NBLT) refers specifically to the pedagogical use of computers connected in either local or global networks, allowing one-to-one, one-to-many, and many-to-many communication. NBLT research explores what happens when learners are brought together with texts, media, and other speakers of the language in computer-mediated contexts of interaction.

NBLT arose at the confluence of both technological and educational change. In the 1980s and 1990s, networking technologies and infrastructure developed with dramatic rapidity in many industrialized countries, making low-cost connections possible. At the same time, educational theory and practice were increasingly influenced by social constructivism, which emphasized the social and cultural construction of knowledge, the importance of collaboration among individuals and groups, and a learner- and problem-based approach to pedagogy.

### EARLY DEVELOPMENTS

Although computer networks have been used for interpersonal communication since the 1960s, it was not until the 1980s that they began to serve language teaching. One of the first pedagogical uses of local area networks was to teach writing to deaf students via synchronous conferencing at Gallaudet University. The University of Texas at Austin was another early adopter institution, where synchronous conferencing was incorporated into English literature and writing courses as well as foreign language teaching (in Portuguese, German, and French). These early studies (for reviews, see Ortega, 1997, and Warschauer, 1997) pointed to a number of potential benefits of synchronous conferencing compared with face-to-face class discussions: (i) increased and more democratically distributed student participation; (ii) more time to

develop and refine comments—possibly leading to greater precision and sophistication of expression; (iii) encouragement of a collaborative spirit among students; (iv) enhanced motivation for language practice and, in particular, greater involvement of students who rarely participated in oral discussions; (v) reduction of anxiety related to oral communication in a foreign language; and (vi) positive effects on students' writing ability and perhaps speaking ability as well.

There soon followed a number of studies that systematically compared the dynamics of synchronous conferencing with face-to-face classroom interaction (reviewed in Ortega, 1997, and Warschauer, 1997). These studies confirmed the expected benefits of synchronous conferencing, with the exception of its effects on general writing and speaking abilities—an area that has been taken up more recently (see Major Contributions later). They also revealed an overall greater level of sophistication of students' language use (in terms of the range of morphosyntactic features and discourse functions). However, synchronous conferencing was also found to introduce a number of unsettling changes. For example, Kern (1995) noted that teacher control over class discussions was compromised, that the rapid pace of written discussion sometimes taxed students' comprehension abilities, and that although participation was more equitably distributed than in normal classroom discussion, the coherence and continuity of discussions often suffered. Kern concluded that effectiveness had to be evaluated in relation to instructional goals. Synchronous conferencing fostered free expression, student responsiveness, and the voicing of multiple perspectives on issues, but it did not improve grammar or reinforce standard discourse norms.

Noticeable in early NBLT studies was a tendency to test the technology to see what effects it might have on language use. In the next section, we see a gradual shift toward testing theories of second language acquisition (SLA) within the context of computer-mediated communication.

### MAJOR CONTRIBUTIONS

Two general trends characterize the bulk of current research on NBLT. The first emphasizes SLA theory and interactionist models of learning. Data analysis typically consists of quantitative counts of the occurrence of morphological, lexical, and syntactical features in online discourse.

The second trend, described by Kern and Warschauer (2000) in the introduction to their key collection of research articles on NBLT, is informed by sociocultural and sociocognitive theories and draws on a mixture of quantitative, qualitative, ethnographic, and discourse analytic methods. At issue here is not only quantifying language development,

but also understanding how learners interpret and construct meaning online across culturally situated contexts.

Although the primary research emphasis of each trend differs, the studies typically share a focus on discourse written by postsecondary foreign language learners in asynchronous and synchronous environments.

### *SLA-Grounded Research*

Most studies grounded in SLA theories of networked classroom instruction are either (i) comparison studies that examine the effectiveness of online vs. face-to-face interaction in promoting negotiation of meaning, noticing, comprehensible output, and form-focused learning (for a review see Kern, Ware, and Warschauer, 2004), or (ii) transfer studies that explore the degree to which language use online transfers to language proficiency more generally, particularly to speaking and listening.

*Promoting negotiation of meaning.* A major benefit for SLA-based research is the ease of collecting interactional data online. In contrast to face-to-face conversation, online negotiation of meaning takes place in writing, which provides a readily usable database of transcripts for classroom and research use. In classrooms, this database of interactions has been used to facilitate the development of students' metacognitive and metalinguistic awareness (Sengupta, 2001). A significant number of studies have examined task type in promoting negotiation of meaning in the network-based classroom. In a synchronous chat study of intermediate level Spanish learners in a university course, Pellettieri (2000) found abundant evidence of form-focused modifications and corrective feedback among ten dyads of English-speaking adult participants, leading her to conclude that online chatting can improve learners' grammatical competence (cf. Kern, 1995). Additionally, she found that closed, goal-oriented tasks promoted greater frequency of meaning negotiation than open-ended tasks. A recent study by Smith (2003) supports Pellettieri's finding, except that he found that decision tasks promoted more negotiation of meaning than jigsaw tasks.

*Transfer studies.* Implicit in this line of research is the expectation that the linguistic and metalinguistic awareness developed online will transfer to other domains of language learning. Students who can converse in spontaneous online chat discussions, for example, should have an easier time contributing to the ongoing flow of a face-to-face conversation. Not surprisingly, a wave of research has put this hypothesis to the test, with differing methods and outcomes. For example, using rigorous quasi-experimental methods to examine the question of transfer into oral proficiency, Payne and Whitney (2002) provide strong

evidence that the intermediate-level Spanish learners in the synchronous chat group outperformed the face-to-face control group on a pre-test/posttest oral proficiency measure. In another quasi-experimental study, Abrams (2003) considers language in a third-semester German course. Although the students in the synchronous group produced higher quantities of output in subsequent face-to-face discussions than their counterparts in either the asynchronous or control groups, she found no statistically significant differences in terms of lexical richness and diversity or syntactic complexity.

To summarize, much of the research grounded in SLA theory and in cross-modality transfer builds off the premise that language itself remains a relatively stable target, and the overarching goals, outcomes, and processes of language learning are generally considered similar whether conducted in physical or virtual space. Research is aimed at determining whether and to what extent technology-mediated interaction can support language acquisition at least as well as face-to-face interaction.

### *Sociocognitive and Sociocultural Approaches*

Researchers who question the assumed stability and neutrality of linguistic forms and functions in virtual discourse have turned their focus to two main areas: genre differentiation and culture learning in networked classrooms.

*Genre differentiation.* Online communication is not a single uniform genre, but rather a range of genres generated situationally for different media (e.g., blogs, e-mail, instant messaging, wikis, online forums, MOOs, chat groups) and according to the particular needs and purposes of participants. For example, synchronous online language is typically characterized by the fragmentary nature of conversation flow, the multiplicity of discussion threads, the difficulty of back channeling to clarify one's message, the lack of paralinguistic and contextual cues, and the tendency to emphasize phatic communication. Asynchronous modes such as threaded discussion, however, tend to be less fragmentary, more informationally dense and complete, and focused on a single discussion topic. Variability in both technology and purpose leads to a range of online language that can resemble hybrid forms of standard and nonstandard language. Herring (2001) maintains that the fragmented, nonstandard language found in some online interactions is not the result of errors, but rather the result of deliberate choices by users to save typing time or to be creative with language. Warner's (2004) work on language play corroborates this view by showing how learners of German created hybrid language forms with code-mixing in their

synchronous chat sessions. From a critical pedagogical perspective, however, such tendencies in online discourse create tensions for teachers intent on assisting their students in developing, if not proficiency in standard forms of language, at least the ability to discern among standard, nonstandard, and hybrid uses.

*Culture in NBLT.* A significant shift in NBLT in the last 5 years is the growing emphasis on cultural aspects of language learning. In part, the result of theoretical trends toward sociocultural and social constructivist frameworks, and in part an outgrowth of the increasing popularity of online collaborative partnerships, many researchers are turning to a broader conception of language learning that insists on its inextricable cultural layering. Often referred to as telecollaboration, these international partnerships link language learners in online discussions to promote language use and intercultural learning. Within the key pedagogical and discourse analytical work on culture and NBLT (for an extended analysis see Kern, Ware, and Warschauer, 2004), the most significant trends have been the move from monolithic to multidimensional presentations of culture (Furstenberg, Levet, English, and Maillet, 2001); the notion of authenticity in online cultural texts (Kramsch, A’Ness, and Lam, 2000); the potential for communication breakdown (Ware, 2005); and the development of intercultural competence (Belz, 2003).

#### WORK IN PROGRESS

New studies investigating the viability of technology-integrated teaching for supporting SLA and intercultural learning continue to appear each month at a rate that shows little sign of slowing. The goals, content, and structure of NBLT are changing rapidly. Traditional definitions of language learning, as measured by demonstrated proficiency and control of the target language, no longer suffice as the primary knowledge base for teachers in online contexts (see discussion in Ware and Kramsch, 2005). In contrast to the primarily task- and product-oriented, classroom-controlled online interactions that characterized early research in NBLT, recent work examines online learning in two new areas: nonclassroom contexts and multimodality.

##### *Nonclassroom Contexts*

Ethnographic work has provided a unique lens on the kinds of language practices that shape linguistic socialization outside of the traditional classroom. Lam’s (2000, 2004) extensive research on Chinese-American adolescents documents how students develop textual

identities and hybrid language forms through their participation in multilingual online communities. Such studies of how learners' identities mediate (and are mediated by) their language practices *outside* educational contexts offer an important perspective for classroom teachers. In Thorne's (2003) study of the "cultures of use" of online learning, for example, he notes the generational shift in college-level students' preference for conversing via instant messaging outside of class and their professors' requirement that they communicate over e-mail for in-class work, resulting in a potentially derailing mismatch of tools and purposes. Research by Black (2005) documents the experiences of adolescent English language learners on *fan fiction* writing sites, and the ways learners on these sites construct their identities as writers solicit and make use of peer feedback. By exploring the affiliations, preferences, and practices of learners in their chosen environments, researchers can provide powerful insights into how we might change the shape of classroom-based teaching.

Unlike the nonclassroom communities Lam documented, which typically form around common interests without an explicit focus on language, tandem partnerships form online for the explicit purpose of improving proficiency in standard forms of the target language. These bilingual partnerships, grounded in two basic principles of learner autonomy and reciprocity, are goal-directed toward improving traditional markers of language proficiency such as syntactic complexity, lexical precision, and morphosyntactic accuracy. Two recent studies have integrated the tandem model of learner autonomy and reciprocity, mostly used in voluntary contexts, into classroom-based MOO environments (Kötter, 2003; Schwienhorst, 2002). Although the focus of both studies was primarily on the development of linguistic and metalinguistic awareness, Schwienhorst also found that students became more autonomous in their regulation of native and nonnative discourse in their chatting.

### *Multimodality*

The environments of technology-mediated teaching and learning are changing to keep pace with innovations in technology tools. A major shift in recent years has been toward the expansion of semiotic modes beyond text. Increasingly, researchers are exploring the flexibility and interactivity of multimodal venues for communication. Thorne and Payne (2005) provide a detailed inventory of cutting-edge research in communication media such as blogs, wikis, podcasting, personal digital assistants, and cell phones. They emphasize the importance of these personalized, portable multimedia tools, not merely for fostering learners' linguistic proficiency in a conventional sense, but also for

challenging them to use the technologies as a springboard for thinking deeply and engaging with content in the ways promoted in classroom language instruction.

Multimodal learning also includes bimodal chat rooms (Blake, 2005) and multimedia authoring tools (Nelson, 2006). Blake (2005) examines a bimodal (oral and written) chat room, in which learners studying Spanish as part of a distance learning course can write and speak to one another and their professor. Although he reports on a case study of only a single learner, his analysis indicates that such bimodal CMC classrooms offer important new venues for student participation and negotiation of meaning. Nelson takes a different approach to multimodality in his examination of postsecondary ESL writing students who, in addition to writing traditional print-based essays, authored multimodal projects. His analysis shifts the focus away from usual concerns of fluency and accuracy in foreign languages and suggests that instructors attend more broadly to students' developing awareness of language as just one aspect of a larger system of semiotics.

#### PROBLEMS AND DIFFICULTIES

As NBLT expands its early focus on linguistic features to include cultural, communicative, and social aspects of online teaching and learning, a number of problematic areas arise. Differences in medium (Thorne, 2003), linguistic style (Belz, 2003), and levels of engagement (Ware, 2005) complicate online language learning.

In order to grapple with these issues, researchers have adopted a number of theoretical perspectives. Reeder, Macfadyen, Roche, and Chase (2004), for example, take an intercultural perspective on online communication and suggest that significant cultural gaps and differences in *cyberculture values* strongly impact the success or failure of online communication. Ess (2005) takes a postcolonial position and argues that because current CMC technologies favor Westernized values and communicative preferences, researchers need to work toward "middle grounds" (p. 162) that better connect global trends with local traditions. Warschauer (2003), drawing on his ethnographic case studies of postsecondary writing instruction (Warschauer, 1999), has pushed for a more integrated, nuanced conception of electronic literacy. He elaborates the plural construct of *electronic literacies*, including computer literacy, information literacy, multimedia literacy, and computer-mediated literacy, to investigate the relationship between the sociocultural contexts of networked classrooms and the particular ways that literacy is valued and practiced by teachers, learners, and members of the larger society.

Another issue has to do with technocentrism, which can draw us toward testing the technology to the point where we risk becoming

stagnated in terms of developing better theories of online language use. Related to technocentrism is the concern that technology-mediated language learning is becoming more and more commercialized, that is, packaged into convenient software programs and marketed to mass audiences. If the technology is attractive, it will tend to woo customers, regardless of the quality of its content or empirical base. In this regard, educators need to become critical consumers, just as their students need to evaluate online sources critically.

Finally, a number of methodological and ethical issues arise as well. Due to the short-term duration of most NBLT studies, a great deal more longitudinal research is needed to examine the effects of NBLT across time. Tracking language learning through year-long or multiyear studies helps mitigate, for example, concerns about how the novelty of technology might affect learner outcomes. Furthermore, longitudinal studies provide a more adequate basis for understanding how language learning might transfer across skill areas, as researchers are better poised to track students across multiple contexts of use.

Ethically, a key methodological issue has to do with subjects' informed consent to participate in research (and the real difficulty of maintaining student privacy in the virtual world.) It is easy to collect data on the Internet without subjects' knowledge or consent, and because boundaries between what is private and public are often unclear, it is essential that researchers follow procedures for obtaining informed consent of subjects. Other ethical issues involve copyright/intellectual property issues, which are especially thorny in multimodality projects in which students download images, sounds, text, and video off the Internet. This is of course also tied to issues of plagiarism that tend to coincide with the easy access of technology-mediated learning.

#### FUTURE DIRECTIONS

As the field of NBLT develops in the coming years, research is needed that continues many of the strands discussed earlier. In addition, we anticipate that research will grow in a number of other areas.

First, more work is needed that explores multimodal learning contexts. Computers have had an impact on the ways we communicate. To date, the research conducted on computer-mediated communication has been mostly text-based, but now image and voice are becoming integral parts of how we interact and represent ourselves online. As digital media become more readily available to wide audiences of users, teachers and students are increasingly able to develop novel ways of integrating multiple modes of learning into the language classroom. In some cases, such integration will certainly take the form

of more conventional approaches, such as the use of audio or video clips to reinforce standard uses of the target language, but we also anticipate innovation in NBLT driven by newer technologies such as podcasting and wikis, as documented by Thorne and Payne (2005).

A second area of future research will likely be directed toward critical explorations of how culture functions in NBLT. Until now, terms such as cross-cultural and intercultural have been used rather interchangeably, and the task of researchers will be to refine the terms and develop viable methodologies and theories for examining issues of (pluri)cultural representation, identification, and contact in online contexts. Work in this area will not only influence how we define language learning in general, but also how we define key concepts such as communicative competence, and how we frame online pragmatics and sociolinguistics.

Third, expanded research will be needed on the relationship between form-focused in-class activities and online collaborations whose primary goals are social interaction and the representation of identity and knowledge. Crucial to this research will be attention to changes in the roles of teachers and students and how the classroom is imagined accordingly.

Fourth, as ethnographic work on language use and learning outside of educational contexts continues to grow, we anticipate that researchers will turn to the issue of curricular integration. As discussed earlier, much of the work on NBLT has taken place in postsecondary contexts. However, K-12 educators are increasingly interested in integrating technology into language classrooms, so researchers will need to explore ways to support such curricular initiatives. With an emphasis in many K-12 educational contexts on high-stakes testing, such work will undoubtedly facilitate the development of assessment tools and feedback loops for learners and teachers.

Finally, as more learning resources of all kinds become available via the Internet rather than as stand-alone applications, the distinctions between CALL and NBLT will increasingly fade. New forms of research will be required to investigate the learning processes and outcomes that occur when traditional CALL activities are carried out in networked environments and combined with computer-mediated communication.

## CONCLUSION

Over the past 20 years, a rich body of research has been conducted on NBLT. The accelerating diffusion of digital media and wireless networks, together with the increased naturalization of computer-mediated communication, promises that NBLT will remain a critical area for teaching and research. We note, for example, that the first

generation of *digital natives* who have grown up using the Internet and view it as an entirely ordinary environment of interaction is now entering higher education. What's more, the Internet itself has changed dramatically in recent years, with the rapid spread of participatory tools and sites facilitating social networking, interactive game playing, collaborative writing and editing, and multimodal production. These tools provide opportunities for students in read, write, communicate, and construct knowledge in a second or foreign language in ways that are both new and unexplored.

Although the potential role of NBLT is thus greater than ever before, research has also shown that sound pedagogy and not computers or networks per se is what really counts in NBLT. Future success will thus require teachers' continued attention to the close integration of project goals, activity/task design, and technology interface within often complex logistical realities. Teachers also need to know how NBLT can constrain as well as enhance their students' language use and know when it is better not to computerize a particular activity. The growing complexity of decisions involved in NBLT highlights the importance of technology integration in both preservice and inservice teacher education.

Finally, given the rapid evolution of technologies and the fluidity of communicative environments, flexibility will be a prime requirement for teachers and researchers as they continue to explore language teaching and learning in new networked contexts. By adopting the same habits of mind that we seek to inspire in our students—autonomous learning; inventive thinking; and critical perspectives on the intersection of language, technology, and culture—teachers and researchers can help ensure that the impressive potential of network-based teaching to transform language learning is achieved.

TEACHER TRAINING IN BILINGUAL  
EDUCATION IN PERU

INTRODUCTION

Peru is a multilingual society in which around 40 different indigenous languages struggle to survive. In an attempt to come to grips with this linguistic diversity and to offer a high quality education to its population, different experiments with bilingual education involving Spanish and indigenous languages have been implemented in the country. Although since the decade of the 1920s some concern was aroused regarding the education of the indigenous population (Vich, 2000) and later on some experiments were implemented in the Amazonian region (Citarella, 1990), it was not until the educational reform of 1972—and the official recognition of Quechua in 1975—that the first National Policy on bilingual education was proposed and this type of education started taking place in primary schools. For a long time, teachers who were involved in the bilingual framework had not been formally trained in this educational approach. In the best cases, the ones who were already working in bilingual schools received a whole week's training twice a year but this was clearly not enough for them to understand the program and to be able to respond to the challenges posed by this type of schooling. In the case of the Andean region specifically, this type of specialization in most institutions of higher education approximately started only five to ten years ago, although in the Amazonian region it had started earlier. Due to the fact that these two regions constitute very different realities in terms of linguistic and cultural dynamics and that this type of education has followed distinct paths in both of them, this review will describe both experiences separately.

EARLY DEVELOPMENTS

Some universities in Peru offer a specialization in Bilingual Education for the indigenous population. Since 1985 the University of Altiplano in Puno and the National University of the Amazonia have offered—respectively—the Masters in Andean Linguistics and Bilingual Education and an undergraduate specialization in Bilingual Education in its Faculty of Education. Both universities could be considered pioneers in teacher training in Intercultural Bilingual Education (hereafter, IBE)

in Peru. Nevertheless, other universities have started to offer specializations in IBE only a few years ago (since 2000) and have not had much sustainability. Some of them have even tried to open a Masters program in IBE but have not reached the amount of students needed.

Training in this kind of education is imparted mostly by what are known as the “Institutos Superiores Pedagógicos” (hereafter, ISP), institutions—with a non-university status—that report directly to the Ministry of Education, in which people study to be teachers during five years. This pre-service teacher training in bilingual education is complemented by an in-service teacher training. The latter is carried out by way of courses for teachers who are already working in bilingual schools and which not only do not satisfy their real demands and needs but also are imparted within a perspective that focuses on repairing or correcting the gaps of the basic training (López, 1996). This review will only consider the pre-service teacher training in bilingual education (from now on, teacher education) that takes place within the ISPs. Teacher education has had a higher achievement during the last decade than its in-service counterpart (Burga, 2004).

In the 1970s, the educational initiative for the indigenous people only addressed the bilingual aspect of the situation. In the 1980s its range was extended to include cultural problems in order to build a more pertinent educational alternative for those groups. Hence, the ISPs train teachers not only in Bilingual Education, but also in IBE with the aim of framing bilingual education in a wider cultural proposal. Nevertheless, educators still hold different notions of what BI and IBE are and, for example, some of them do not conceive an intercultural education that is not at the same time bilingual. This review concentrates on the bilingual aspect of teacher education within IBE.

At the end of the 1980s, there were five institutions of higher education—two in the Andes and three in the Amazonian area—in which primary school teachers specialized in IBE. However, national or international private entities had to finance these institutions, since the initiative from the Peruvian State only started in the 1990s. With the goal of homogenizing basic criteria for the construction of a diversified curriculum, between 1992 and 1993 the Ministry of Education’s entity in charge of IBE organized three participative workshops in order to create a curricular model for teacher education in this type of specialization. The design of this curricular model constituted the first attempt to incorporate linguistic and cultural aspects into the new proposal and allowed teacher educators from the Andes and the Amazonian regions to question the orientation of the curriculum that was used in Peru (Trapnell, Burga, Domínguez and Neira, 2004). Although this curriculum ought to have been experimentally applied in ten educational institutions as from 1994 (in eight ISPs and two universities),

only three of them started to apply it. This was mainly due to the removal of the entity in charge of this type of education within the Ministry. The new curriculum was revised after a few years in order to adapt it to the innovations introduced in the new official curriculum of teacher education in 1996, and from this revision a new diversified curriculum of teacher education in IBE was produced for the Andean region. While the ISPs from this region had felt pressure from the Ministry of Education to *adapt* its curriculum to the official one, one ISP from the Amazonian region (FORMABIAP) had the opportunity to build a more experimental proposal and to *redesign* the official curriculum. It is important to mention that it was in 1997, with the restructuring of some of the departments of the Ministry of Education, when teacher education in IBE officially began.

Currently there are 14 ISPs (eight in the Andes, one on the coast and five in the Amazonian region) that offer specialization in IBE throughout the country (Burga, 2004). If we consider that the total number of public ISPs is 119, the percentage of institutions with this specialization is quite low, in comparison for example to the situation in Bolivia. It is also important to point out that although these 14 institutions are known as ISP IBE, they implement this specialization only on the level of grade school and, in a very few cases, on the first level education. There are no cases of teacher education in secondary education with a specialization in IBE, although it must be pointed out as well that neither is there a proposal for implementing bilingual education at the secondary level.

Another important aspect to consider at this point is the position that teacher education in IBE currently occupies within the structure of the Ministry of Education. There is an entity that administers IBE directly in schools and another that is responsible for teacher education throughout the country—including teacher training in IBE. The latter does not have any experts in IBE and it does not work in coordination with the former. Furthermore, since the ISPs started to implement this kind of specialization, the entity in charge of teacher education transferred advisory functions to the International Cooperation sector, which assumed the responsibility of teacher training in IBE. The lack of coordination between international entities and those of the Ministry of Education in relation to teacher training in IBE has not promoted sustainability of this specialization within the ISPs and has hindered the creation of long term policies for teacher training in this type of education (Zavala, 2007). At the end of 2007, the German Technical Cooperation (GTZ), which has worked for IBE in the Peruvian Andean area since the 1980s and specifically for teacher training in IBE during the last seven years, will withdraw its educational program from the country. This will definitely produce a drawback for teacher training

in IBE in Peru, especially since the Ministry of Education does not offer clear orientations for developing this type of specialization in the ISPs. There are many ISPs that do not receive any support in IBE, neither from the Ministry of Education nor from other entities with experience in this type of education.

#### MAJOR CONTRIBUTIONS: PROBLEMS AND DIFFICULTIES

##### *The Amazonian Region*

In the Amazonian region there are a total of 42 indigenous peoples that speak 38 or 40 languages (Pozzi-Escot, 1998). The largest indigenous group is the Asháninka (with a total of 52,461 speakers), next, the Awajun (with a total of 45,137 speakers) and the Shipibo-konibo (with a total of 20,178 speakers). However, in comparison to Peru's major languages, Quechua and Aimara, the speakers of these Amazonian languages represent less than 1% of the total population (Chirinos, 2001). In this area there are five ISPs that offer pre-service teacher education in IBE. Only the case of FORMABIAP will be reviewed in this section.

The Teacher Training Programme for IBE in the Amazon Basin (FORMABIAP) started in 1988 by way of an agreement between an ISP and the Interethnic Association for the Development of the Peruvian Rainforest (AIDSEP), thanks to the initiatives of indigenous organizations who demanded an education that respected their language and their culture. After 16 years of existence, this program has received prizes from both inside and outside the country, and today it represents a beacon for IBE in Peru and Latin America. According to the agreement, the indigenous organization is responsible for selecting the students to join the program, the teacher educators who will participate in it and the curricular contents, while the ISP guarantees pedagogic quality and is in charge of providing the official title from the Ministry of Education (Gashé, 2002).

Similar to what happened with the National University of the Amazonia, the proposal for training teachers in IBE in FORMABIAP emerged as a response to the work of the Summer Institute of Linguistics, due to the fact that this institution, which had been working in the Amazonian region since 1945, did not really seek to maintain the languages and cultures of indigenous people, but to convert them to the protestant religion (Montoya, 1990). Hence, while the Summer Institute of Linguistics proposed a transitional model of bilingual education, where the indigenous languages served as a medium to acquire certain religious beliefs, FORMABIAP opted for a maintenance model, since the goal was to reconcile students with their origins so that they would be

empowered to accept their identity and their language as indigenous people (Trapnell, 2003). In comparison to the Andean experience, since the beginning this program defined itself more as an intercultural program than as a bilingual one.

In fact, as is the case with Bolivia and Ecuador, in the Peruvian Amazonian region indigenous peoples conceive IBE as an education that goes beyond the classroom and that does not only seek to improve children's academic achievements. In that sense, it constitutes a political project that involves alternative representations of both school and society and challenges hegemonic concepts of development, equity and educational quality. Within the right to determine what type of education, society and development indigenous peoples want for themselves, FORMABIAP has done a lot of work incorporating knowledge, techniques, history and learning strategies from indigenous peoples as curricular content (Burga, 2004).

In 1988, the program started to implement its proposal with seven indigenous peoples (Ashaninka, Aguaruna, Huambisa, Shipibo, Kukama, Huitoto, and Bora) although along the years others have been incorporated (Nomatsiguenga, Achuar, Chayahuita, Candoshi, Tikuna, Quichua, and Shiwilu). The students who were accepted into the program had to speak the indigenous language and needed to be supported by authorities from their original communities who had to guarantee that as soon as they graduated they would return to their communities to work as teachers in the local schools.

Starting with seven languages was a difficult task, mainly because at the time there were no national linguists with expertise in any of them. In the case of some languages the program decided to hire international linguists, who visited the program on a regular basis. Peruvian linguists, most of them from Lima, joined the program but had to learn the indigenous languages from indigenous elders ("sabios"). In order for the program to be sustainable, the ultimate goal was to hire local people as language teachers. Therefore, from the beginning, these linguists worked with indigenous teachers in order to make them aware of how their language worked. Initially, the program design itself did not consider the possibility of courses given in indigenous languages. Hence, during the first years of the program the linguists coming from Lima worked as teacher educators and, although they discussed examples in the indigenous languages, their classes were taught in Spanish. However, today most of the teacher educators in the ISP are indigenous and they are the ones who teach their language to the future teachers belonging to their indigenous groups. Moreover, while at the beginning only the language workshops were taught in the indigenous languages, today some courses from other areas of the curriculum are also taught entirely in these languages (Trapnell, personal communication, 2006).

Spanish constitutes a second language (L2) for the majority of the students, although for Kukama and Shiwilu speakers Spanish is their first language (L1). With the aim of retrieving these indigenous languages, these speakers learn them as L2 in workshops with teachers who use the indigenous languages during the entire class. This constitutes an important achievement of FORMABIAP, considering that the State and the ISPs from the Andean area still deal with a static L1/indigenous language - L2/Spanish language model (see below). Nevertheless, although the students make significant progress in learning their indigenous language, at the end of their training they still do not reach high levels of competence (Domínguez and Monroe, 2005).

For the rest of the students, there are Spanish workshops in which educators apply a second language methodology. Nevertheless, following a content based approach, educators take for granted that the students will process the information as if they were native speakers of Spanish when working in other areas of the curriculum. In other words, although students complain about the difficulty of both technical words and the structure of certain academic texts, educators neither state different goals for them nor do they evaluate them differently according to their competence in the language (Domínguez and Monroe, 2005). Teacher educators have to deal with a great diversity in relation to the Spanish competence of their students and they do not know how to handle this. Students improve their Spanish throughout the five years of their basic teacher training but the competence that they acquire upon graduating is still not satisfactory for being school teachers.

The program has always emphasized two issues: the grammatical analysis of the indigenous languages and the development of indigenous literacy. Today, the emphasis given to grammatical analysis of the indigenous languages has been criticized by the teacher educators themselves, since they now acknowledge that the importance given to it was overvalued in order to demonstrate that indigenous languages and Spanish are on an equal footing regarding their grammatical structure. Not only are there other strategies that could be implemented in order to demonstrate that all languages should be valued (and to value them), but there are some other topics of metalinguistic awareness that are not present in the curriculum and that need to be discussed in a bilingual program, such as the cognitive processes that individuals who learn a second language undergo (Baker, 2001). The emphasis on grammatical analysis has also shown that when students teach in schools they use grammar as a methodological strategy, ignoring that grammatical analysis only contributes indirectly to the teaching of a second language (Domínguez and Monroe, 2005; Vigil, 2005).

In addition, it has been argued that the way the program deals with indigenous literacy is not conducive to the revitalization and maintenance of the indigenous languages involved (Domínguez and Monroe, 2005; Vigil, 2005). One objection is that, based on the implicit belief that languages that are not written are inferior and that all of them have to reach this literate point, orality has been conceived as subordinated to literacy and only as a necessary medium to reach the written mode. A second shortcoming is that indigenous literacy constitutes a topic that is not reflected upon enough. That is, students have developed a kind of inertia, believing that indigenous languages need to be written in order to be revitalized or maintained, but not really knowing how or why. In addition, this association between literacy and revitalization and maintenance impedes a clear perception of language shift processes that are underway in oral and informal domains (Luykx, 2004a). A third criticism is that literacy is not seen as a social practice immersed in power issues, but as a neutral and technical mechanism equivalent to school literacy. This is why most of the issues discussed around indigenous literacy concern the alphabet or the creation of neologisms rather than the need, for example, to augment the number of *real* writers in *real* contexts (Barton, 1994; Street, 1984).

### *The Andean Region*

According to the census of 1993, 16.6% of the population have Quechua as their mother tongue and 2.1% have Aimara as their mother tongue. Although the ISP from Puno imparted teacher preparation in IBE with both Quechua and Aimara from 1986 to 1993 (complementing the master's degree offered by the University of Puno), currently there is no teacher preparation in IBE involving Aimara. In the Andes there are eight ISPs that offer this type of specialization in areas where Quechua is spoken by more of 50% of the population (Apurímac, 76.6%, Ayacucho, 70.6%, Huancavelica, 66.5%, Cuzco, 63.2%, and Puno, 43.2%). Besides the University of Puno, the pioneer in pre-service teacher training in IBE in this area was the Urubamba state teacher training and technical college in Cusco, which was sponsored by the Catholic University of Lima and Canada's McGill University at the end of the 1980's. In this review, I will detail the case of the ISP of "Huancavelica," although this ISP shares its problematic with the other ISPs in the Andean region that also started to impart this type of teacher preparation at the end of the 1990s and that were also technically advised by the GTZ.

In terms of indigenous identity, there are important differences not only between the Amazonian and the Andean region, but also between the Peruvian Andean region and the Ecuadorian and Bolivian ones

(Degregori, 1993, 1998). In Peru, the Amazonian indigenous organization is sizeable and robust, its members define themselves as indigenous and they struggle to be acknowledged as different from the dominant culture. But in the Andes the situation is totally different, since people do not want to define themselves as indigenous and, on the contrary, struggle to be incorporated in the mainstream culture. For instance, in this region teacher educators' main goals are to overcome poverty, learn Spanish and continue on to professional training, and none of them are members of indigenous organizations in the region. Based on this discourse, they sometimes show pejorative attitudes towards indigenous peasants and conceive Quechua as linked to poor and illiterate people and only useful for rural areas. After all, in the Andes there is a strong association between schooling (and being successful in life) and abandoning one's indigenous language and culture. However, due to the pressure felt by the IBE discourse, people simultaneously maintain an argument about valuing and preserving Andean culture and the importance of IBE (Zavala, 2004). Within this framework, in most of the Peruvian Andes IBE does not constitute a political project that goes beyond school, nor does it engage the community in its proposal; it is only seen as a better educational alternative that contributes to improve the students' academic outcomes.

In spite of the fact that in the ISP of Huancavelica almost all of the educators are bilingual, for the majority their dominant tongue is Spanish. The same is true for the students. Since the percentages cited above are much higher in rural areas than in urban ones, it seems that most teacher educators and students from this ISP come from urban backgrounds. In fact, in the urban areas of Huancavelica and in other cities from the southern Andes a process of language shift towards Spanish is underway because most children are no longer learning Quechua from their parents as their mother tongue. As a consequence, some students who do not speak Quechua are admitted to the program, due to the fact that the ISP needs to cover the amount of students required by the Ministry of Education. Nevertheless, this admission policy does not fit in with the policy for language teaching in the ISP, since the ISP do not implement strategies that would help them learn it as a second language. Different cases have shown that students who study in the ISPs without knowing the indigenous language do not learn it during the five years of training in order to be capable of teaching classes in a bilingual school (Luis Enrique López, personal conversation, 2004). Moreover, neither does the ISP of Huancavelica design activities with L2 methodology in order to develop the Quechua of the students who speak it as their L2, since

it is expected that they will make progress only by having contact with their peers (Zúñiga, 2001).

Within recent years, this ISP has started to discuss cultural aspects of the curriculum in order to adapt it to different realities. However, in comparison to the case of FORMABIAP, the intercultural perspective applied in this institution reflects a folkloric conception of culture and the discussion around the topic is far from dealing with epistemological issues (Burga, 2004). Due to specific socio-historical processes developed in the Southern Andes, students and teacher educators from the ISPs in this area have been products of “civilizatory schooling” to a greater extent than in Amazonia. Hence, discussing the curriculum as a social construct framed within schooling as a Western cultural project is sometimes problematic.

Regarding linguistic issues, most of the teacher educators in the ISP of Huancavelica have gained more confidence in using the official alphabet and the orthographic rules for writing Quechua (Córdova, Zariquiey and Zavala, 2005). Furthermore, five of the ISPs in the Andean area have developed technical and academic terminology for linguistic and educational topics. For instance, in 2003 educators from these ISPs (including Huancavelica) developed a bilingual dictionary of mathematical terms, which they use in their classes (Córdova and Zavala, 2004). In comparison to the situation of a decade ago, nowadays in the ISP of Huancavelica there is much more acceptance of Quechua and a better attitude towards this language, and educators and students who speak Quechua fluently have prestige among their peers (Córdova, Zariquiey and Zavala, 2005).

Nevertheless, in this ISP the specialization in IBE has been imparted during many years almost exclusively in Spanish. Paradoxically, after receiving their education in Spanish the new teachers go to work to the bilingual schools and have to use both Quechua and Spanish systematically with the children in class. Today there is more motivation to conduct classes in Quechua within the different curricular areas, but this still reflects the initiative of some educators who make an effort to prepare a class in this language and not a clear institutional policy concerning the use of both languages in the structure of teacher education. Thus, teacher educators do not know what to teach in Quechua and what not, when to do it and with what purpose. This reveals confusion between how to use Quechua and Spanish as instrumental languages in higher education, and a belief that all contents from the curriculum should be developed in both languages. Obviously, educators feel that they are not capable of doing the latter (Córdova, Zariquiey and Zavala, 2005; Zúñiga, 2001).

The area of language is organized along three thematic axes; (i) language teaching pedagogy, (ii) workshops and (iii) linguistic theories.

One of the problems is that, for most curricular topics on these axes, it is mentioned that they should be “in first and second language,” as if all of them had to be developed in both. This produces absurd redundancies and obviates the link between linguistic and cultural aspects, since the discursive styles and the communicative functions developed in each language are not the same (Zavala, 2007). In addition, this also reveals the incorrect assumption that the learning process in the first language is the same as in the second language, and that the methods need not be different (Zúñiga, 2001). For instance—as also occurs with FORMABIAP—Spanish is taught as if it were the mother tongue of the students, in spite of the fact that it constitutes the second language of a significant percentage of them. Educators do not employ strategies to develop the students’ Spanish with second language teaching methodologies.

Since the start of IBE in the schools, Quechua has been equated with the dominant or native tongue (L1) and Spanish with the second language (L2). In the ISP of Huancavelica this model has been replicated, despite the fact that Quechua is neither the dominant tongue of the majority of its educators nor of its students. It is clear that expressions such as *mother tongue* and *second language* are insufficient to encompass the wide spectrum of bilingualism that characterizes the situation of the country and ISP students in particular, who are mostly bilinguals but with different types of oral and written abilities in both languages. In addition, this model does not consider the numerous cases of people who develop two L1 from birth and who shift towards Spanish due to the social pressure that favors using this language, since it is taken for granted that the students’ mother tongue in the ISP is Quechua, and that this language is still the language that they mostly use. It seems that insufficient consideration is given to the difference between IBE in primary schools and in higher education, and that the labels “L1” and “L2” in the curriculum really refer to the indigenous children from bilingual schools (Zúñiga, 2001). Indeed, the use of this static IBE model—still anchored within a paradigm of monolingual communities—only contributes to a false impression in the students’ minds about their sociolinguistic scenario (Trapnell, Burga, Domínguez, and Neira, 2004).

The issues discussed above for FORMABIAP, regarding the lack of a critical perspective for addressing indigenous literacy, also apply to teacher education in the Andean region. In addition, a belief in the importance of speaking a “pure” language, one without interferences from another tongue, has influenced discriminatory practices towards those who speak an Andean Spanish with Quechua interferences, on the one hand, and those who speak Quechua with Spanish interferences, on the other. Thus, the use of Quechua has also turned into a

powerful mechanism that marginalizes some teacher educators and students, and which not only does not allow more presence of the language in the public sphere, but also restricts the initiative of some educators who are willing to use it in the classroom (Zavala, 2007). This ideology of language purism has also led to rejection of neologisms, since many educators believe that it is better to resurrect the “original Quechua” (Niño-Murcia, 1997). It is well-known that in most situations of linguistic revitalization people reject neologisms, and the case of Quechua in Peru is not an exception (King, 2001). Therefore, more discussion on sociolinguistic issues such as variation, language change, language contact, among others, would be worth introducing in the curriculum.

#### WORK IN PROGRESS

Teacher preparation in IBE with Amazonian languages is going through important changes due to the fact that the preparation in some languages has been decentralized. Hence, FORMABIAP is now working with fewer languages since four of them, belonging to big indigenous groups (Ashaninka, Aguaruna, Huambisa, and Shipibo), are being incorporated into proposals from universities in other regions of the country, which are closer to where these groups live. This will definitely contribute to a better training of this population. Although the initial financial aid from international entities has greatly diminished, the program has gained sustainability through out all these years with the support of the indigenous organizations.

Regarding the proposal’s cultural aspect—and given the experimental status of the program—FORMABIAP now acknowledges the scientific bias of its teacher education by arguing that, although indigenous content was systematically taken into account, the break with the western conceptual categories was insufficient; this could be seen, for instance, in the division between “nature” and “society” that was established in the area-based curriculum. After noticing that in the schools a scientific ideology was replicated, and that the indigenous teachers were associating knowledge only with book knowledge, the people involved in the program have been working on a new proposal since 2005. Within a postcolonial framework, they are trying to overcome the process of “colonization of knowledge,” through which hegemonic knowledge is positioned over other types of knowledge within a hierarchical order (Mignolo, 2000; Quijano, 2000; Walsh, 2002; see also von Hoene, *The Professional Development of Foreign Language Instructors in Postsecondary Education*, Volume 4). Nevertheless, tension remains between the concern for academic education and a more alternative agenda. Furthermore, in relation to linguistic training, the

program is considering maintaining grammatical analysis, but is thinking about incorporating more sociolinguistic topics, specifically ones regarding linguistic socialization and literacy within a social perspective (Trapnell, personal communication, 2006).

Regarding the Andean region, since the year 2000 the GTZ has been advising five of the ISPs that impart IBE since the 1990's. During the last two years, it has advised the ISP of Huancavelica in designing and implementing a policy of language use for the institution and in training educators in linguistic topics. However, since the end of 2007, these Andean ISPs will no longer be technically advised by this international entity. Due to the problematic issues mentioned above about the structure within the Ministry of Education, the situation of these ISP—and more so in the case of the new ones that are offering specialization in IBE since the year 2000—will go through a very difficult stage. These ISPs need to be technically advised within long-term policies for teacher education in order to gain sustainability. In addition, these ISPs need to better define the goals of teacher education in IBE since it is not clear enough what is the political, social, and linguistic project sought with this type of training.

#### FUTURE DIRECTIONS

From the above discussion it is clear that teacher preparation in IBE still has a long way to go, and that without the support of the Ministry of Education the changes are both slow and fragile. It is crucial for the Ministry of Education to formulate policies for teacher training in IBE, framed within those stated for IBE in general. In addition, it is fundamental for the different programs to produce more written material about their work, so that they can guide other teacher education processes in IBE in the country. Taking this as a priority, below I suggest some general recommendations—for both research and action—with the aim of improving IBE teacher preparation in both regions.

Research on the aims of IBE should be conducted in different regions since this kind of education is not always conceived as immersed in the same type of social and political expectations. As Aikman (1999) puts it, while some of these programmes' main aim is to strengthen indigenous language and culture (although they vary in the degree of indigenous control and self-determination) others' implicit main goal is to facilitate the integration of these people into the national society. Based on information about the aims of IBE, each region should develop a proposal for teacher education in this type of education according to its own reality. This means redefining the classical IBE model (intended for an indigenous population with very little contact with the hegemonic culture) in relation to how identity issues and cultural contacts are developing in different contexts. In the ISPs

specifically, more reflection on the goals of teacher preparation in IBE, and IBE in general, needs to be developed because both educators and students (especially from the Andean region) repeat definitions of IBE without being clear on where they are heading. Therefore, more reflection is needed around cultural issues and the significance of an intercultural education. Although the national curriculum does not need to be redesigned the same way in every region, it is important to discuss the scientific type of knowledge as a social construction and the power issues involved in its supposed superiority in order to view school education from a more critical approach.

It is also important to conduct research on the demand and supply of teacher training in IBE in different areas, since in some of them there are not enough people interested in studying this type of specialization in the ISPs, mainly because teacher education in IBE constitutes the most devalued specialization within the educational career. In addition, the ones who graduate from these institutions are not trained enough to work in the bilingual schools, especially in relation to their competence in the vernacular language. Hence, it is fundamental to reflect on what type of student population is getting into the ISP for this type of program through the admission process and what type of student population is needed in order to cover teacher positions in bilingual schools. It may be the case that young people from rural areas are not accessing this type of institution. To complement this, research on the processes of language shift in the areas of the ISPs (especially in the Andes) is needed since, although in some of the provinces the majority of people supposedly speak the vernacular language, this is not true for the urban contexts. After establishing the demand and supply issue and the language shift situation, the ISPs should design a systematic but realistic institutional policy for the use of languages in teacher preparation in order to improve the students' competence in both Spanish and the indigenous language.

Research on language ideologies within the ISPs will help to reveal the implicit beliefs about Spanish and the vernacular language that legitimate language use of both teacher educators and students. Based on this it is fundamental for the curriculum to incorporate a perspective of critical language awareness throughout the teacher training (López, 2007) and for teacher educators and students in the ISPs to reflect upon and struggle against linguistic discriminatory practices in the institution. In addition, a social perspective of literacy—within a framework of language policy and planning—is needed in order for the ISPs to deal with the literacy issue in a more critical way. Within this, it is important to address how teacher and students cope with developing an academic literacy/voice required in the ISPs and what clashes teachers and students encounter with respect to epistemological, power, and identity issues in practicing this type of literacy (Ivanic, 1998; Turner,

2003). For instance, clashes between academic/scientific knowledge, personal/experiential knowledge, and indigenous mythic/cosmological knowledge have already been documented in higher education with indigenous populations (Luykx, 2004b). Finally, second language teaching methodologies need to have more presence in the curriculum. However, in order to make teachers autonomous when dealing with diverse teaching situations, it is important to construct the methodologies with the teachers themselves. Some experiences have found that, through a participative research-action technique with both teacher educators and school teachers, better results are achieved. Teachers observe and analyse their own practice in order to detect real problems and then elaborate and implement practical proposals to overcome these (Sainz and Ruiz, 2004). It is in this reflective process that they familiarize themselves with theoretical frameworks from different linguistic areas such as grammar, sociolinguistics and psycholinguistics.

## NONNATIVE SPEAKING TEACHERS OF ENGLISH AS A FOREIGN LANGUAGE

### INTRODUCTION

With the global expansion of English as an international language (see Block, *Language Education and Globalization*, Volume 1), another expansion is taking place, that of teaching and learning English as a foreign language (EFL). In terms of the numbers of both students and teachers, EFL may well be the most widespread form of teaching and learning English because it embraces all those cases where English is taught and learned outside the inner circle countries where it is an ordinary means of communication and taught as a second language (Kachru and Nelson, 1996).

EFL is taught in both outer circle countries such as India where English has a long history of institutionalized functions, and in expanding circle countries such as China where it is widely studied for specific purposes (Kachru and Nelson, 1996).

In both of these latter kinds of contexts, the demand for EFL teaching is ever growing. The expansion of EFL raises two questions: (i) what are the differences between the contexts in which English is taught as a foreign language (EFL) and as a second language (ESL)? and (ii) since the number of native-speaker professional EFL teachers is insufficient to meet the demand the world over, in what ways can nonnative-speaker (NNS) EFL teachers (sharing the L1 of their students) contribute most meaningfully to the profession and be as effective as their native-speaker colleagues? In this chapter, I will compare EFL and ESL contexts and evaluate the strengths and weaknesses of nonnative EFL teachers.

### EARLY DEVELOPMENTS: DEFINING AND DIFFERENTIATING ESL AND EFL CONTEXTS

The answer to the second question in this chapter—how NNS EFL teachers can be most effective—largely depends on the answer to the first question, in which ways ESL and EFL teaching are different. Some people would argue that a qualified NS EFL teacher will always be in a better position than his/her NNS colleague of equal qualification—simply because the language and culture that s/he teaches to his/her students will

always be, or at least “look”, more “authentically native”. However, it is useful to explore the NNS EFL teachers’ strengths and weaknesses.

It should be noted that EFL (or ESL) teaching is not always monolithic and requiring one approach. A lot of “mixed” cases are quite common. For instance, some speakers of Chinese who live and work in a Chinese community in a big US city may not need communication in English on everyday basis. So when such a group of Chinese-speakers start classes of English within their own community, teaching should be closer to EFL than to ESL since it takes place in a single-language subculture. On the contrary, teaching English in Germany to a linguistically diverse classroom including speakers of German, Turkish, Greek, etc. makes it somewhat akin to ESL, but such “mixed” cases are not going to be considered in this chapter. Only clear-cut EFL situations will be analyzed, that is, the “classical” situations of monolingual classes with students learning English in their own country within their own single-language culture where their L1 is spoken and English has no internal communicative function or socio-political status.

It is taking into account just such unambiguous EFL situations that the issue of similarities and differences in EFL/ESL teaching was discussed in the 1980s and 1990s. Those discussions can be considered as early contributions to what is analyzed in this chapter—early not in the chronological sense but in the sense of laying the groundwork for answering the major question, concerning the role of EFL teachers, and especially NNS EFL teachers, in the global expansion of English. Some authors, following Krashen’s ideas (1982, 1985), did not see the need to differentiate between EFL and ESL teaching, asserting that second language acquisition (SLA) data were fully applicable to foreign language learning (Savignon, 1990; VanPatten, 1990). Yet, many other authors supported the idea that the two processes should not be considered as identical or even similar. For instance, Seliger (1988, p. 27) stressed that, despite the universality of manner and order of acquiring an L2, nothing can disprove the possibility of different effects for an L1 transfer in contexts where students have little or no exposure to the L2 outside the classroom, and where all the other students speak the same L1. Wildner-Bassett (1990) drew an important distinction between students’ real communication in second language settings and their artificial communication in foreign language settings. Due to such reasons, Kramsch (1990) considered a separate agenda for a foreign language learning research as distinct from SLA research.

In general, three principal differences between EFL/ESL teaching and learning emerge based on an analysis of the assumptions on this issue made in the professional literature. The first difference is that

EFL learners inevitably lack rich and varied comprehensible input and opportunities for communication in the target language as compared to ESL learners (Tarnopolsky, 2000). This is due to the fact that EFL has reference to the speech community outside the country where it is being learned (Berns, 1990b; Paulston, 1992), and that in that country it is not one of the primary means of communication. The result is that for EFL students, particularly expanding circle countries, unlike their ESL counterparts, the sources of comprehensible or any other input in English are more or less limited and can be found mostly inside the EFL classroom. (In recent years, the situation in this respect has been much improved thanks to the internet, its resources and possibilities, but that does not change the fact that for EFL students live, face-to-face communication in English is limited to the classroom.) Such limitations in comprehensible input and scarcity of live face-to-face communication in English require, as a sort of compensation, greater focus on language form, grammar, and formal instruction (Bley-Vroman, 1990; Doughty, 1991; Herron and Tomasello, 1992; VanPatten and Cadierno, 1993) than the SLA theory and ESL teaching practice advocate (see also Oxford, *Conditions for Second Language (L2) Learning*, Volume 4).

The second difference is the limited use of learners' L1 as a support in EFL learning. If paying greater attention to focus on language form activities is required (see above), students will get much clearer ideas about the target language structures by way of comparing some of them to their mother tongue structures. It was widely recognized in the 1990s that even if such comparisons were not done explicitly, they would inevitably be done by adolescent and adult students themselves because "whether we like it or not, the new language is learned on the basis of a previous language" (Stern, 1992, p. 282). So it is more rational to do the comparisons explicitly when and where they can facilitate understanding of L2 structures. When done explicitly, they enhance students' interlingual awareness, and such awareness, in turn, fosters the use of transfer strategies (Adjemian, 1983; Deignan, Gabrys, and Solska, 1997; Schweers, 1997). Some authors (e.g., Auerbach, 1993) admit that the use of L1 in this function is advisable, even for ESL classrooms. However, in that context its supporting properties cannot readily be utilized in teaching practice since the students in ESL classes are usually speakers of different L1s, while the teachers in such classes are mostly native speakers of English who do not share the L1 of any of their students. As mentioned earlier, EFL classes are mostly monolingual with the NNS EFL teachers sharing the L1 of the learners. That is why, unlike ESL, the supporting properties of learners' L1 can and must be regularly used in EFL situations and become a valuable instrument in presenting meaning (Cook, 1999, p. 201) (see also *Cots, Knowledge*

about Language in the Mother Tongue and Foreign Language Curricula, Volume 6).

The third difference between ESL and EFL teaching is akin to the second one. It can be formulated as a need for much broader use of intercultural (home culture vs. target culture) comparisons in EFL classrooms with the aim of enhancing EFL learners' cross-cultural awareness. This is due to the fact that, unlike ESL students, EFL students are not immersed in the target language cultural and speech community. They may never come across what Hymes (1986, pp. 63–64) called its norms of interaction and norms of interpretation in real communication practice. That is why they will inevitably tend to transfer behavior characteristics of the L1 speech community into interaction with native speakers of their L2 (cf. Chick, 1996), which may result in intercultural miscommunication. It is in constant contacts with native speakers that ESL students mostly acquire the rules of speaking appropriate to the target culture—those rules that define target “language behavior during social interaction” (McGroarty, 1996, p. 11). EFL learners have very few such contacts, if any at all. Therefore, one important way to make them understand and learn the culture of interaction appropriate to the target speech community is to explicitly and systematically make comparisons and emphasize differences. Those differences to be explicitly compared, explained, and emphasized are differences in patterns of sociolinguistic behaviors characteristic of target culture communication in the students' L2 versus home culture communication in their L1 (Tarnopolsky, 2000; Tarnopolsky and Sklyarenko, 2003). Without such explicit intercultural comparisons and explanations, it may be difficult for EFL teaching to achieve what Hornberger (1996) considers to be an integral and fundamental part of L2 teaching—acquiring the target speech community's culture of interaction (see also Hall, *Language Education and Culture*, Volume 1).

#### MAJOR CONTRIBUTIONS

This section addresses the second and major question in this chapter regarding NNS/NS EFL teachers, concerning their relative strengths and weaknesses.

##### *Some Advantages of NNS EFL Teachers over Their NS Colleagues*

The three major differences between ESL and EFL teaching discussed above allowed Tarnopolsky (2000, p. 35) to point out three major advantages of NNS EFL teachers over NS EFL teachers in EFL situations when the group of learners is monolingual and when NNS EFL teachers share the mother tongue of their students:

1. Assuming a learning environment with homogenous groups of learners, it is possible for NNS EFL teachers to use their students' mother tongue whenever and wherever it can facilitate and accelerate the process of learning English.
2. They are much better equipped for developing their students' interlingual awareness by making comparisons and letting them clearly see the similarities and differences in the structures of their L1 and target language. Thus, they are better prepared to foster the learners' acquisition of those transfer strategies (transfer from the L1 into the L2) that are an important prerequisite for target language learning. (It should be noted that in this context transfer is opposed to interference; the former is considered as a positive factor while the latter is definitely negative leading to inclusion of irrelevant structures, forms of expression, etc. from learner's L1 into his or her communication in L2).
3. They are better equipped for developing their students' intercultural awareness by making comparisons of similarities and differences between the L1 and target culture, which is the only way of developing the learners' target culture sociolinguistic behaviors in the conditions where students have no or very little direct contact with target culture communities. Of course, this advantage is manifest when a NNS EFL teacher is well aware of the target speech communities' cultural characteristics. This is not always the case but if they are not aware of such characteristics, it may be due to a lack of training. Understanding cultural and sociolinguistic differences should be among the teachers' professional requirements—just as understanding the linguistic characteristics of the language that they teach.

Two other advantages of NNS EFL teachers were also defined. The first of them is the fact that NNS EFL teachers, who share the mother tongue of their students and who may have worked through similar problems in learning English, are better prepared to cope with those specific learners' problems originating from incompatibilities or differences in the target and native languages (Medgyes, 1983; Tang, 1997). They may better understand the essence of students' difficulties while for a NS EFL teacher these may not be so clear.

A final, purely psychological advantage was pointed out by Cook (1999, p. 200) who wrote that

... students may feel overwhelmed by native-speaker teachers who have achieved a perfection that is out of students' reach ... Students may prefer the fallible nonnative-speaker teacher who presents a more achievable model.

These advantages point to some of the strengths of nonnative speaking EFL teachers compared to native speakers (cf. O'Dwyer, 1996).

Widdowson (1994) strongly objected to the assumption that a native speaker is always better as a teacher of English than a teacher whose mother tongue is not English. This view found support in the current opinion that different kinds of teaching materials are needed in different countries—in Germany they cannot be the same as in Japan, and there cannot be one and the same teaching method for all countries (Berns, 1990a, pp. 104–105). This means that participation of NNS EFL teachers and specialists in organizing and carrying out EFL teaching becomes very important.

The sketch of the NNS EFL teacher above represents an idealized situation, assuming highly qualified teachers meeting all professional requirements. Real teachers of English (both NNS and NS) are never ideal and may be placed along a continuum of expertise (Rampton, 1990), but this chapter will focus its analysis on the somewhat idealized cases of highly qualified teachers to make its general conclusions. However, all the listed advantages of NNS EFL teachers should not lead to adopting a view opposite to the long established perspective that NS EFL teachers should have no say in EFL teaching situations and that only their NNS colleagues can be the absolute authorities on all related issues. Such a view is unacceptable due to a number of challenges that NNS EFL teachers face—even those with the highest qualifications.

### *Challenges for NNS EFL Teachers and Their Positioning in Relation to Their NS EFL Colleagues*

The challenges for NNS EFL teachers are fairly obvious and can be summarized as five principal points:

1. NNS EFL teachers as a rule have a foreign accent and might have other more or less serious imperfections in their English that the best of them often cannot overcome during their career—even if their visits to English-speaking countries are lengthy. The reason is that if an L2 is first learned in adolescence and adulthood (which is very often the case with future NNS EFL teachers), native-like pronunciation is rarely achieved, despite years of practice (Walsh and Diller, 1981). In general, stopping short of native-like success in a number of areas is quite a common occurrence (Towell and Hawkins, 1994, pp. 14–15).
2. For NNS EFL teachers, however competent they are, it is very difficult to be aware of the most recent developments in the English language that, as every other living language, is constantly changing. As a rule, their visits to English-speaking countries are not frequent and lengthy enough to keep track of all such changes.

3. The same can be said about the NNS EFL teachers' cultural awareness—that is, the awareness of the most recent developments in the English-speaking nations' cultures, including the developments in patterns of sociolinguistic behaviors. A significant number of the NNS EFL teachers, who have never been to English-speaking countries, may not even be aware of essential differences in such patterns as compared to their home cultures because they are not sufficiently focused on in EFL teaching and teacher training in many regions of the world.
4. Another challenge is the limited availability of the latest and most advanced teaching materials and methods developed in English-speaking countries—that is, those that are better known to their NS EFL colleagues and are much more accessible to them. Organizations such as the British Council do a lot to disseminate materials and provide updated information about methodology, but their efforts cannot reach all NNS EFL teachers. There are a number of other limitations (for instance, financial) that affect access to these sources as well.
5. The last and perhaps most serious challenge is the fact that in many parts of the world both students and school and university authorities believe that a native speaker is *always* the best teacher of English and thus prefer to be taught or to employ NS EFL instructors to the detriment of their NNS colleagues who, not infrequently, may be better qualified (Kubota, 2004). This is one of the visible manifestations of what is now often termed as *linguistic imperialism* (Canagarajah, 1999; Phillipson, 1992).

Thus, NNS EFL teachers have many strengths but may face some significant challenges as well. This leads to quite an interesting conclusion concerning the mutual positioning of NNS and NS EFL teachers in EFL teaching. Taking into account everything said above, it becomes clear that NNS EFL teachers face limitations where the NS EFL teachers have their greatest advantages: authentic native English, full awareness of its most recent linguistic and cultural developments, and better awareness of the most advanced and recent developments in the ways of teaching the language. On the other hand, NS EFL teachers must face challenges as well: no or little command of their students' L1 and home culture, lack of ability to develop their interlingual and intercultural awareness, lack of understanding the learners' L1 related language problems, and presenting a model that learners may believe unachievable. This means that, in some respects, the positions of NNS and NS EFL teachers in EFL teaching are *complementary*, and this *complementarity* has to be taken into account when discussing the ways of improving such teaching.

## WORK IN PROGRESS

In view of the significance of EFL teaching and learning in the context of the global expansion of English (an absolute majority of students the world over learn English as EFL, not as ESL, that is, in monolingual groups and in their own, not in English-speaking countries), it is quite surprising how little work on EFL is in progress in comparison with ESL. As to the subject matter of this chapter, still less, if any at all, work is in progress concerning the role that NNS EFL teachers play in the global context nor has much research been done on the challenges that they face. Given the complementary positions of both categories of EFL teachers, as discussed above, the time has come to find practical ways to solve their problems to improve the level of EFL teaching.

The Council of Europe, within the framework of the so-called Bologna process, made the most interesting and far-reaching attempt in this respect. The Bologna process is focused on unifying the educational systems in all the European countries so that diplomas and certificates received in one country could become valid for all the others, as well as the relevant levels of education itself that should become easily compatible throughout the European continent. The Council of Europe developed the *Common European Framework of Reference for Languages: Learning, Teaching and Assessment* (2001) that is a part of the set of documents related to the implementation of *the Bologna process* (see Broeder and Martyniuk, *Language Education in Europe: The Common European Framework of Reference, Volume 4*). The *Common European Framework* provides the guidelines for all foreign language teachers and administrators as to: (i) how foreign languages have to be taught and learned in Europe; (ii) what intermediate levels students have to reach in their progress from the beginner level to the highest level of proficiency; (iii) what the characteristics of skills developed by students have to be at each separate level; (iv) what methods and approaches should be used by teachers and learners at each study level and what specific aims have to be set for such levels and the course in general; (v) how assessment should be organized and results evaluated. This sets quite specific requirements to the level of teachers' qualifications making no distinctions between NS and NNS teachers.

Indeed, these distinctions appear to gradually vanish. It gave Canagarajah (citing Howatt, 2004) grounds to point out that “‘non-native’ English teachers are regaining the agency they had in the formative period of the 14th-century Europe” (Canagarajah, 2006, p. 28), that is, a position of equality with NS teachers, if not supremacy in EFL teaching. That is why the last of the five disadvantages of NNS EFL teachers listed above may be regarded as temporary and to perhaps disappear soon.

In the last two sections of this chapter, I will discuss the problems and difficulties in the field of EFL teaching as well as future directions.

### PROBLEMS AND DIFFICULTIES

Both NNS and NS EFL teachers face a number of challenges that cannot be eliminated, or at least not completely. For instance, the number of NS EFL teachers is growing the world over. Their greatest disadvantage is not knowing (or having very little knowledge) of their students' L1 and culture. These difficulties could disappear if they learned both thoroughly. A recent study by Ellis (2006) convincingly proves the greatest professional advantages that NS English teachers can get if they undertake learning an L2. It allows them to understand and cope much better with the problems of their students learning English. But can this be expected of average, even highly qualified, NS EFL teachers who most frequently are free-lancers teaching and living in one and the same country for a couple of years and then moving on to a different country? They would not be able to do some thorough learning and use the acquired proficiency during a comparatively short period of their stay. Most often, they would not even want to spend much time and effort on that, understanding that the acquired skills could be of little use after going to a different country. Even "long timers" in one and the same country not infrequently know very little about its language and culture. Therefore, the difficulties of NS EFL teachers that result from their insufficient command of the local language and culture are probably here to stay in the majority of cases.

The same can be said about the difficulties of NNS EFL teachers. Their disadvantages—the causes of those difficulties—are not all of equal importance. For instance, the practically ineradicable foreign accent is a comparatively minor disadvantage. This is due to the current attitudes towards World Englishes with their enormous varieties of accents (Kachru, 1986; Kachru and Nelson, 1996), as well as to the requirement of teaching *International English* as the language of global communication (McKay, 2002). The norms of pronunciation in this international *lingua franca* are far from being as strict as when one of the inner circle varieties of English is taught (e.g., Jenkins, 2000, 2004). But other challenges listed above theoretically can and should be taken care of. Ideally, NNS EFL teachers should visit English-speaking countries for professional purposes often and for relatively long periods of time, which is practically impossible for a vast majority (great numbers of NNS EFL teachers do not enjoy the opportunity of visiting an English-speaking country even once in their lifetime). This does not mean that no attempts should be made at all to address the specific issues that NNS EFL teachers face, but it is doubtful that a

satisfactory solution can be found easily. There are, however, some ways to address the problems of both NS and NNS EFL teachers and to compensate for the disadvantage that they might encounter. I will outline two suggestions for achieving this in the next section.

#### FUTURE DIRECTIONS

First, one can try to *reduce the disadvantages* by giving opportunities to NS EFL teachers to learn as much as possible about the country where they are going to teach EFL or where they are already teaching (learning the language, culture, traditions of the country, the peculiarities and mentality of its population, etc.). Such learning done prior to the arrival and during their period of stay in the country will not fully eliminate all disadvantages or solve all the problems and difficulties, but it will somewhat reduce these, and NNS EFL teachers can be of great help to their NS EFL colleagues in that respect. That requires broad cooperation between these two categories of EFL teachers.

NNS EFL teachers can also, if not eliminate, at least reduce their disadvantages, problems, and difficulties in a similar way by constantly practicing and improving their command of the language they teach, the cultures of the English-speaking nations, the latest developments in methods and materials for teaching English. There are different ways to accomplish that, including regular work with professional literature, using internet sources, watching movies and listening to the radio in English, contacting native-speakers whenever and wherever possible, visiting English-speaking countries when there is an opportunity, etc. Of even greater value are different forms of pre-service and in-service training. Broad cooperation among all EFL teachers—whether NS or NNS—working in the same country, city, or educational institution is most productive since it can be constant, or at least quite regular. NS EFL teachers, for example, can become more involved in teacher training. Another suggestion would be to build on the complementary strengths of *NNS and NS EFL teachers* by adopting a team teaching approach, which would allow the NS EFL teacher to focus on specific topics, such as conversational English, patterns of sociolinguistic behavior, rhetoric in writing academic essays in English, etc. There is some experience in using such an approach in countries like Ukraine, and the results are very promising.

In view of everything said above, it can be concluded *that the future for the EFL teaching profession in the conditions of global expansion of English lies in building on the strengths of EFL teaching professionals working collaboratively within the same country.*

## **Section 5**

### **The Role of Technology in Second and Foreign Language Education**

## COMPUTER-MEDIATED COMMUNICATION

## INTRODUCTION

This essay provides an overview of computer-mediated communication (CMC), defined here as multimodal, often (but not exclusively) Internet-mediated communication. Globally, the Internet has qualitatively transformed the activities of everyday communication in professional, educational, and interpersonal realms (Castells, 2004). While Internet access remains unequally distributed across social classes and geopolitical regions (see van Dijk, 2005), user populations continue to expand around the world as life becomes increasingly mediated by ubiquitous computing. After a brief description of the development of the Internet and early CMC communication research, attention is given to CMC language educational issues and contexts of use. As research on the use of synchronous CMC tools (real-time chat style communication) forms a significant strand of second language (L2) education research, this literature receives considerable attention. Subsequently, the growing research literature on Internet-mediated intercultural communication is reviewed, followed by a discussion of emerging technologies that includes blogs, wikis, podcasting, and gaming environments.

## EARLY DEVELOPMENTS

*Global Context*

Computer-mediated communication begins with the Internet, but also emerges from a long line of mediated communication technologies such as the printing press, the telegraph, radio, the telephone, and television. The Soviet launch of Sputnik catalyzed the idea of building a global network for information sharing. Under the auspices of the Advanced Research Projects Agency, the first group of networked computers, called ARPANET, was developed and functional by 1969. ARPANET utilized a novel technology infrastructure that separated holistic information into “packets” that could be addressed separately and sent along potentially independent routes. Designed at the height of the cold war, this was a system engineered to function even when component parts were disabled. The initial ARPANET purposes were to share computing power, enable collaborative research projects, and

provide remote access to distant computers. In addition to mediating scientific, military, and professional activity, however, ARPANET rapidly evolved as a social technology that included interpersonal email communication and precipitated large-scale email listservs, the first of which, foreshadowing the evolution of the Internet as a general purpose and educationally relevant communication tool, was devoted to the discussion of science fiction literature.

Through the 1970s into the early 1990s, Internet users were predominantly members of academic, scientific, and computer science communities. The primary communication tool was email, though the synchronous tool Unix *TALK* was also popular. A wave of widespread Internet adoption extended from the early 1990s up through the late 1990s as university-supported email accounts were made available for faculty and students, many K-12 institutions became networked, and private sector Internet Service Providers offered connectivity to general population consumers. It was during this period that North American language educators in particular began using CMC in significant numbers. Globally, Internet access increased rapidly, particularly in northern Europe. Primary communication tools included email and Internet Relay Chat. MUDs and MOOs (text-based virtual environments, often used for role-playing and theme-based socializing), *ICQ*, and a variety of Instant Messaging tools (enabling real-time text and video chat) became popular among more sophisticated users, but email remained the dominant market share tool for everyday social, educational, professional, and commercial purposes. In the current era, and especially for people born after the mid-1980s, email is no longer the primary digital conduit for everyday social, school, and work interaction. Newer tools, particularly instant messaging, have become dominant for social and age-peer interaction. Additionally, text messaging over cell phones, coupled with an escalating reliance on Internet communication tools for social and professional purposes, has resulted in the emergence of ubiquitous computing, the expectation of being able to remain in perpetual contact over a suite of wired and wireless communication devices.

As of December 31st, 2005, there are estimated to be over 1 billion Internet users globally. Among world regions, North America has the greatest percentage of Internet penetration (68.1% of total population), followed by Oceania/Australia (52.9%) and Europe (35.9%). The greatest absolute number of Internet users currently reside in Asia (364,270,713) (from Internet Use Stats, [www.internetworldstats.com/stats.htm](http://www.internetworldstats.com/stats.htm)). Against this backdrop of global Internet growth, to paraphrase Internet pioneer Tim Berners-Lee, the Internet is less a technological fact than a social fact. Noting that the majority of Internet use is linguistic in nature, Crystal is likely correct that “we are on the brink of the biggest language revolution ever” (2001, p. 241).

*Linguistic and Communication Theory CMC Research*

An early pioneer in linguistic analysis of CMC, Herring has authored research and edited volumes examining how CMC affects language use, message structure, and interactional dynamics (e.g. 1996). These issues have been at the forefront of linguistic, communication, and education research focused on CMC. Communication theorists and experimental researchers have analyzed CMC since the early 1980s. An early line of CMC research described the medium as inadequate for many task-related needs (Daft and Lengel, 1984) and ineffective for interpersonal exchanges due to the limited social information available within text-only environments, a framework described as the “reduced cues perspective” (see Parks and Floyd, 1996). This view has been reassessed in current research. Spears and Lea (1994), for example, note that while interpersonal cues are reduced in text-only communication, the cues that remain or are inferred can be highly important. Based on principals of social cognition and interpersonal relationship development, Walther (1996) argues that CMC relationships can be as, and in some cases more deeply relational, than those that occur in face-to-face settings. Walther’s central claim is that in comparison to face-to-face communication, CMC interaction is not different in kind, but typically involves a slower rate of social information exchange. In cases of what Walther terms hyperpersonal interaction, the limited information available in interactive textual communication may precipitate cycles of selective self-presentation and over-attribution of idealized perceptions. This analysis helps to explain the quick intimacy and interpersonal intensity reported by many Internet users. In contrast to the reduced cues perspective, Walther’s research suggests that CMC is a viable medium for educational, interpersonal, and informational functions.

## MAJOR CONTRIBUTIONS

*Synchronous CMC in Intra class Second Language Education*

From the early through mid 1990s, the use of synchronous CMC (SCMC), commonly referred to as *chat*, formed the basis for a number of second language acquisition (SLA) studies. This research produced anecdotal and empirical evidence suggesting a number of pedagogical benefits from CMC use (Kelm, 1992). The research of Kern (1995) and Chun (1994) are widely regarded as some of the most influential from this early period. Kern (1995) quantitatively assessed the impression that foreign language students produce more language output in SCMC environments than they do in large group face-to-face classroom settings. Using a quasi-experimental methodology, Kern analyzed

a 50-minute second-semester French foreign language SCMC session and compared it to an oral discussion by the same language students on the same topic. The SCMC treatment produced between two and three times more turns per student and a higher total number of sentences and words compared to the large-group oral discussion (see also Abrams, 2003). Kern also examined the linguistic quality of the discussions and found that students' SCMC language output was more sophisticated in terms of the range of morphosyntactic features and variety of discourse functions expressed (1995, p. 470). These findings are supported by Chun's (1994) study of fourth-semester German students. Her research suggested that SCMC use promoted increased morphological complexity and a greater ratio of complex sentences in written coursework over the course of one semester. More recent research has also suggested that SCMC language use is more accurate than that of face-to-face interaction (Salaberry, 2000). While Kern and Chun's research on L2 uses of large-group SCMC are seminal studies, Ortega (1997) has noted limitations to comparisons of computer-mediated classroom and whole-class oral discussions. Her critique is that the variables of group size and communicative task were not accounted for in early SCMC research (e.g. Beauvois, 1992; Chun, 1994; Kelm, 1992; Kern, 1995), an observation that has encouraged closer attention to pedagogical and group size variables.

A number of studies have adopted the interactionist SLA model designed for analysis of negotiation of meaning in oral interaction (e.g. Varonis and Gass, 1985) and applied it to CMC learner data and task configurations. Pellettieri's (2000) research on Spanish L2 learners found that dyadic groupings promoted an increase in corrective feedback and negotiation at all levels of discourse, a condition that prompted learners to produce form-focused modifications to their turns. Additionally, task type, specifically goal-oriented closed tasks, was positively correlated to the quantity and type of negotiations produced. In a similar study from the same period, Blake (2000) assessed the SCMC interactions of 50 intermediate learners of Spanish. Participants were arranged in dyads and asked to carry out three task types: decision-making, information gap, and jigsaw. Like Pellettieri, Blake found that jigsaw tasks produced the greatest number of negotiations, but nearly all negotiations were lexical in focus, with very few addressing problems in syntax or larger units of discourse. Building on this earlier research, Smith (2003) confirmed that task type affected the extent to which learners' engaged in negotiation, but also expanded the Varonis and Gass (1985) four-part model of face-to-face negotiated interaction—(i) trigger > (ii) indicator > (iii) response > (iv) optional reaction to response—by explicitly incorporating two additional phases to represent delayed reactions to response turns that are so frequent in

SCMC discourse. Smith terms these *confirmation* and *reconfirmation* phases, elements that explicitly conclude a given negotiation routine and which act as discourse markers suggesting the possibility of resuming nonnegotiation interaction (2003). Smith's expansion of the interactionist model provides a medium specific and more powerful analytic framework for research on computer-mediated negotiated interaction.

Although much of the research from the 1990s focused on comparing SCMC and face-to-face instructional treatments, a growing number of L2 SCMC investigations explore cross-modality transfer between spontaneous SCMC and oral L2 language production (e.g. Abrams, 2003). Payne and Whitney (2002) applied psycholinguistic models of language production and working memory to cross-modality transfer and found a significant difference in the oral proficiency gains between experimental (+SCMC) and control (-SCMC) groups. In a follow-up study, Payne and Ross (2005) augmented this psycholinguistic approach with discourse and corpus analytic techniques to explore how individual differences in working memory capacity may affect language use in SCMC. A principal finding was that learners testing at lower levels of measured phonological working memory were able to use the scrolling on-screen messages from other students as they generated their own contributions. Payne and Ross hypothesize that SCMC creates a "bootstrapping effect" that reduces the cognitive demand of L2 language production and may enable students with measured low-span working memory to produce more complex language than would otherwise be the case. New possibilities in cross-modality research include emerging CMC tools that support bimodal chat (i.e. a combination of both text and voice communication) that may prove promising as an environment that supports a variety of learning styles and cognitive attributes.

### *Internet-Mediated Intercultural L2 Education*

With greater Internet access across more of the world, there has been the suggestion that Internet-mediated intercultural communication constitutes a "second wave" of L2 pedagogy (Kern, Ware, and Warschauer, 2004, p. 243). Internet-mediated intercultural L2 education involves interaction between learners interested in one another's expert language. This approach extends the context of language learning from the local classroom to intercommunity and international interaction and emphasizes the acquisition of discrete linguistic accuracy, but in the service of developing intercultural communicative competence (see Belz and Thorne, 2006).

There exist numerous models of Internet-mediated intercultural L2 education (for a review, see Thorne, 2006). One approach, termed

telecollaboration (Belz, 2003; Warschauer, 1996), describes international class-to-class partnerships within institutionalized settings. Telecollaboration practitioners tend to formally align their courses and often utilize parallel texts (e.g. translations of written material and remakes of films) to structure dialogue, form the basis of cross-cultural analyses, and encourage critical reflection on language-culture relations. Telecollaboration models are administratively intensive to initiate and maintain due the high level of coordination between partner classes (e.g. Belz and Müller-Hartmann, 2003). However, class-to-class partnerships arguably provide the strongest support for developing sophisticated understandings of intercultural communication through careful design of student-initiated investigations and the explicitly designated role of the instructor as critical mediator and resource. A variant of the telecollaboration model involves connecting language students with heritage speakers on the same campus, a format that Blake and Zyzik's (2003) research indicates to hold significant promise. While many institutions and regions include populations possessing heterogeneous linguistic and cultural backgrounds, intracommunity linguistic resources remain largely untapped in instructed L2 education. Tandem learning, used extensively in Europe, involves the pairing of individuals in complementary dyads where each is interested in learning the other's language (Kötter, 2002; O'Rourke, 2005). Tandem learning is most associated with noninstitutional learning configurations and typically requires partners to negotiate discussion topics and the balance between overt pedagogical and conversational activity. A final approach to L2 education that utilizes the Internet to access expert speakers is to encourage learners to participate in established and noneducationally oriented Internet communities, such as discussion fora associated with newspapers such as *Le Monde* (Hanna and de Nooy, 2003).

#### WORK IN PROGRESS

##### *Wikis, Blogs, Podcasting, and Gaming*

Blogs and wikis are considered second-generation web applications and represent relatively modest technological advancements over their static webpage predecessor (for a review of these technologies, see Thorne and Payne, 2005). Wiki (from the Hawai'ian *wiki wiki* meaning "quick") describes a web-based environment that supports collaborative writing. The "WikiWiki concept" was invented by Ward Cunningham in 1995 with a project called the Portland Pattern Repository, a computer programming site. Wikis are intensely collaborative and allow multiple users to edit content and contribute to the writing process. The radical dimension to wiki use is its challenge of the notion

of authorship. In the archetypal wiki, there is no distinction between “author” and “audience” per se since readers of a wiki page can spontaneously opt to become a collaborating author. Individual wiki pages can be password limited to one or a group of users using an access control list, but wiki technology is premised on the idea of universal write access. Within the context of group and educational uses, wikis obviate the need to laboriously merge individual contributions in order to avoid deleting one another’s work. Most wiki engines track each addition, deletion, and modification so that changes can be assessed against earlier versions of the text. Furthermore, determining the amount of individual participation in a group project for assessment purposes need not rely exclusively on self- and peer-assessments by group members or observational hunches by the teacher. Like an archaeological tell, a wiki’s current content is but the top layer of temporally stratified laminations of text that record the history of the writing process (Thorne and Payne, 2005).

Blogs and blogging are terms describing use of a web application that displays serial entries with date and time stamps. Most blogs include a comments feature that allows visitors to post responses. In its short history—the first use of the term blog (from “web log”) is variably reported to have occurred in either 1996 or 1997 and blogging as a populist movement dates only from the turn of the millennium—the rise of blogging as a form of communicative and informational expression has been mercurial. To take one example, LiveJournal (<http://livejournal.com>) reports over 7 million blogs created, approximately 5 million of which have been updated at least once. LiveJournal reports that female-presenting bloggers outnumber users presenting as males by approximately two to one (67.3% vs. 32.7%, respectively). The ages of LiveJournal users span from 13 (35,856 blogs created by this age group) to 55 (1,229). The 15–20-year age group produces the majority of the blogs on this site which suggests that the everyday digital literacy practices of current high school and college students differ significantly from those of earlier generations. Within L2 education contexts, blogging provides an alternative to writing assignments that would normally be presented only to the instructor. The chronological ordering of blog entries creates for each student an archive of their personal work that they can revisit and reflect upon. In addition to its intraclass use as a journaling tool, blogging is also being used to link together study abroad students and those still at their home universities. While still in the exploratory phase, such uses of blogs serve a number of functions, such as providing predeparture cultural exposure for students still at their home university, helping students currently abroad to synthesize and put into narrative form their cultural and linguistic experiences, and for creating predeparture orientation materials that

represent student specific experiences and points of view. It should be noted that in addition to blogs, a large number of additional mediated social networks exist, such as facebook ([www.facebook.com](http://www.facebook.com)), myspace ([www.myspace.com](http://www.myspace.com)), and friendster ([www.friendster.com](http://www.friendster.com)). To date, however, their potential as sites for language learning remains largely unexplored.

One of the principal critiques of textual CMC in language education has been that oral production and aural comprehension are not explicitly exercised. A number of technologies now support the broad distribution of sound, video, and compilations of media that are proving useful for language education. One of the most popular is “podcasting,” the practice of sharing mp3 audio content on the Internet that takes its name from Apple’s popular mp3 player the iPod. Students can (and already do) download podcasts representing a diverse array of current authentic audio texts. Additionally, podcasts and mp3 files are being used distribute more conventional foreign language audio materials. Podcasts can also be included within blog sites, forming what are called audio blogs. Similarly, “vlogs,” describing blogs embedded with video, provide the benefit of visually contextualized audio data. More broadly, the availability of Internet data and technologies in ever smaller footprint devices, such as cell phones and video-capable ipods, will continue to open up possibilities for mobile, anyplace-anytime access to and production of Internet-distributed text, video, and audio resources.

A final genre of digital environment that will likely emerge as the premier L2 educational technology in the immediate future is virtual environment games (Gee, 2003), which provide the opportunity for what might be termed virtual immersion. One variety of gaming involves interaction within preprogrammed (but sometimes customizable) environments, the best selling example of which is *The Sims*. A game that simulates the activities and responsibilities of everyday life, *The Sims* is now produced in a number of languages. In an informal assessment of *The Sims* as a foreign language-learning tool, Purushotma (2005) found that the vocabulary and tasks comprising the game were highly aligned with conventional foreign language course content. The difference between instructed foreign language learning and a game like *The Sims*, suggests Purushotma, is that exposure to the target language is always linked to carrying out tasks and social actions, which concomitantly embeds vocabulary and constructions in rich associative contexts.

A second variety of virtual immersion is massively multiplayer online games (MMOGs). These Internet-mediated environments are immensely popular among young adults and are already “educational” in the sense players must learn to negotiate complex game rules as well as negotiate play in realtime with other online players. Many MMOGs

are multilingual and involve thousands of players from around the world (e.g. Worlds of Warcraft and Second Life). For the growing number of students participating in MMOG cultures, the international, multilingual, and task-based qualities of these social spaces, where language use is literally social action, may one day make them *de rigueur* sites for language learning (or perhaps, somewhat ironically, students will study foreign languages to enhance their gaming skills and interactional capacity in these language-driven action-scapes).

While research on wikis, blogs, podcasting, and gaming environments is nascent in language education, these multimodal technologies show potential to support the performance of a diversity of linguistically mediated social identities—something most instructed language educational contexts are not oriented to provide. Additionally, including use of these technologies in second language education may potentially forge linkages between students' often highly developed everyday digital literacy practices and linguistic expression in additional languages.

#### PROBLEMS AND OUTSTANDING CHALLENGES

This section addresses two challenges to CMC use in education. The first begins with the assertion that the Internet does not exist generically as a neutral medium. Rather, Internet communication tools, like all human creations, are cultural tools that carry interactional and relational associations, preferred uses (and correspondingly, inappropriate uses), and expectations of genre-specific communicative activity. Kramsch and Anderson note that information and communication “has become more mediated than ever, with a mediation that ever more diffuses and conceals its authority. The role of education, and [foreign language] education in particular, is precisely to make this mediation process visible” (1999, p. 39). Cultures-of-use of Internet communication tools develop over time in relationship to use in particular discursive settings and to mediate specific social and informational functions (Thorne, 2003). The suggestion is that Internet technologies, *as culture*, will have variable meanings and uses for different communities, a perspective that makes educational uses of technology a more complex, but ultimately more vibrant, undertaking.

A second challenge precipitated by the Internet is that there now exists an amplification of the conventional generation gap between top-down processes and pedagogies that operate in formal learning environments, and bottom-up life experiences of students in secondary and university environments. This gap has been confirmed by recent research by the Pew Internet and American Life Project (2002) based on focus groups (136 students in gender-balanced and racially diverse

clusters) and voluntary participation data (200 students who submitted online essays describing their use of the Internet for school). The 2002 Pew report revealed that while nearly all students used the Internet as a regular part of their educational activities, little is known about how the Internet is actually used for schoolwork, nor has there been adequate consideration of Internet use as it might substantively inform school policies, practices, and pedagogies. Increases in mediated communication suggest that for many students, performing competent identities in second and additional language(s) may now involve Internet-mediation as frequently as face-to-face and nondigital forms of communication. As Internet users expand numerically and geographically, and as Internet information and communication tools continue to evolve, research and pedagogical innovation in the area of CMC and language education will need to continually adapt in response to new populations, communication tools, and the communicative activities of the present and near future.

#### FUTURE DIRECTIONS

Unlike the CMC L2 research of the 1990s, where the use of the Internet was often treated as a proxy or a heuristic to assist with the development of communicative performance within the primary foci of L2 instruction (i.e. face-to-face communication, aural comprehension, and nondigital epistolary conventions such as letter and essay writing), Internet-mediated communication is now a high-stakes environment in its own right. Business and work activity is conducted via asynchronous and synchronous channels. Interviews occur via instant messaging. Moreover, appropriately, educational activity is now often mediated by email, threaded discussion, and chat, while blogs and wikis, among other technologies, also are increasingly incorporated into general education and L2 course activities. Furthermore, with the proliferation of small footprint technologies, such as cell phones that support text messaging, Internet connectivity, and image, audio, and video display and recording, “computer”-generated and “computer”-mediated communication now include a multiplicity of devices and media that extend far beyond the apparatus conventionally referred to as a computer. This acknowledgement of the seemingly inevitable shift toward mediated forms of communication is not intended to valorize Internet use as universally positive or superior to earlier forms of communication. Rather, the hope is that the availability of new communication and information technologies will provide opportunities to make transformational decisions at the level of classroom practice, curricular innovation, and the larger goals and purposes of language education.

LEARNER CORPORA IN FOREIGN LANGUAGE  
EDUCATION

INTRODUCTION

Analysing learner language is a key component of second and foreign language education research and serves two main purposes: it helps researchers better understand the process of second language acquisition (SLA) and the factors that influence it, and it is a useful source of data for practitioners who are keen to design teaching and learning tools that target learners' attested difficulties.

Learner data types can be ranged along a continuum that reflects the degree of control exerted on language production. According to Ellis and Barkhuizen (2005), the less constrained types of production should be favoured as 'they demonstrate how learners use the L2 when they are primarily engaged in message construction', unlike experimental data, which must be treated with circumspection as they may contain artificial interlanguage forms. Researchers have traditionally shied away from the more natural data types however, opting instead for experimentally elicited samples precisely because they are more constrained. This allows for tighter control of the many variables affecting learner output and thereby facilitates interpretation of the results. In addition, as it is difficult to subject a large number of learners to experimentation, SLA research has tended to be based on a relatively narrow empirical basis, which raises questions about the generalizability of the results. Looking at the situation from a more pedagogical perspective, Mark (1998) deplores the relative lack of focus on the description of learner language, which contrasts sharply with the increased attention devoted to other aspects of mainstream language teaching such as learner variables (motivation, learning styles, etc.) and the description of the target language.

The computer learner corpus (CLC) is a new resource, which is currently bringing learner language back into focus and enjoying growing interest from the language education community at large. It first emerged as a branch of corpus linguistics in the late 1980s but it is only now that it is beginning to attract significant interest from L2 theoreticians and practitioners. This chapter aims to highlight the relevance of learner corpora to the field of language education. Major Contributions gives an overview of the main defining features of this new resource

and some of the dimensions along which they can be classified. *Work in Progress* is devoted to methods of analysis: contrastive interlanguage analysis (CIA) and automated analysis. *Problems and Difficulties: Pedagogical Applications* presents some of the main pedagogical applications of learner corpus research and *Future Directions* outlines some avenues for future research.

#### MAJOR CONTRIBUTIONS

Computer learner corpora are electronic collections of (near-) natural foreign or second language learner texts assembled according to explicit design criteria. Several aspects of this definition require some clarification. The term *near-natural* is used to highlight the ‘need for data that reflects as closely as possible ‘natural’ language use (i.e. language that is situationally and interactionally authentic) while recognizing that the limitations facing the collection of such data often obligate researchers to resort to clinically elicited data for example, by using pedagogic tasks’ (Ellis and Barkhuizen, 2005, p. 7). In principle, learner corpora can contain data from both *foreign language (FL) learners*, who learn a language in a country where they get little exposure outside the classroom (e.g. learning English in Germany or Japan) and *second language (SL) learners*, who acquire a language in a country where the language is the predominant language of communication or has the status of official language (e.g. learning English in USA or India). In practice, however, even if one of the earliest learner corpora, the European Science Foundation European Database (ESF), focused on spontaneous SLA (Perdue, 1993), learner corpus collection has tended to focus more on FL varieties. The term *texts* highlights the fact that learner corpora contain continuous stretches of oral or written discourse rather than decontextualized sentences. This makes it possible to study a much wider range of interlanguage features than in previous SLA studies, which have tended to focus on more local features like grammatical morphemes. The requirement of *explicit design criteria* stems from the necessity to control the wide range of variables that affect learner language. As appears from [Table 1](#), which lists the criteria governing the collection of the *International Corpus of Learner English (ICLE)* (Granger, 2002, 2003a; Granger, Dagneaux and Meunier, 2002), some of these variables pertain to the language situation or task, whereas others pertain to the learner.

It is this requirement that makes learner corpus collection such a laborious undertaking and yet it is a crucial requirement: the usefulness of a learner corpus is directly proportional to the care that has been exerted in designing it and compromising the design stage inevitably leads to less solid results. If the variables are recorded and stored in a

Table 1 *ICLE* design criteria

| Learner Variables                    | Task variables         |
|--------------------------------------|------------------------|
| Age                                  | Medium                 |
| Learning context                     | Field                  |
| Proficiency level                    | Genre                  |
| Gender                               | Length                 |
| Mother tongue background             | Topic                  |
| Region                               | Timing                 |
| Knowledge of other foreign languages | Exam                   |
| Amount of L2 exposure                | Use of reference tools |

database, they can be used to compile homogeneous subcorpora. The interface on the *ICLE* CD-ROM makes it possible, for instance, to study gender differences, topic effects, the influence of timing, even to compare FL learners who have never spent any time in an English-speaking country with those who have done so for extended periods of time.

Learner corpora can be classified on the basis of the following features:

- *Target languages*: while English still has the lion's share, learner corpus collection is now active in a wide range of languages (Dutch, French, German, Italian, Norwegian, Spanish, Swedish, inter alia) (for a survey of major corpora including learner corpora, see Xiao, forthcoming). Most learner corpora cover only one target language, the ESF database being a notable exception in this respect. Bilingual learner corpora like the German–English *Telekorp* corpus (Belz and Vyatkina, 2005) are a promising new development resulting from the growing use of telecollaborative communication in language education.
- *Mother tongue backgrounds*: learner corpora can contain data from learners of one and the same mother tongue background or from several mother tongue backgrounds. The latter are necessary if the purpose of the data collection is to produce generic pedagogical tools such as monolingual learners' dictionaries (see Problems and Difficulties: Pedagogical Applications). Most academic learner corpora contain data from only one language background, for example, Japanese learners of English in the case of the *NICT JLE Corpus* (Izumi, Uchimoto and Isahara, 2004), Chinese learners for the *Chinese Learner English Corpus* (Gui and Yang, 2002) or Swedish learners of French for the *Interfra*

*Corpus* (Bartning and Schlyter, 2004). The *International Corpus of Learner English*, which covers 11 different mother tongue backgrounds, is a notable exception in this respect.

- *Medium*: corpora of learner writing were the first to be collected and are still the dominant type today. The supremacy of written corpora is primarily due to the difficulty of collecting and transcribing learner oral data. In spite of this difficulty, some oral learner corpora have been collected. These include the *College English Learners' Spoken English Corpus*, which contains data from Chinese learners of English (Yang and Wei, 2005) and the *Louvain International Database of Spoken Language Interlanguage*, which contains data from learners from a wide range of mother tongue backgrounds (cf. De Cock, Granger and Petch-Tyson, 2002). A new learner corpus type, the multimedia learner corpus, which contains learners' texts linked to audio–video recordings, is a recent and welcome addition (Reder, Harris and Setzler, 2003).
- *Genre*: while some genres are well represented in current learner corpora, particularly essay writing and informal interviews, many genres are hardly covered at all, which makes it difficult to assess the influence of task on learner production. The 1-million word *NICT JLE Corpus* (Izumi, Uchimoto and Isahara, *ibid*), which comprises three types of task—picture description, role-playing and story telling, is exceptional in this respect. The collection of large multi-task learner corpora is clearly one of the major desiderata for the future.
- *Time of collection*: learner corpora can be collected at a single point in time or at successive points over a period of time. Only the latter, which are much more difficult to collect and are therefore in a minority, allow for longitudinal studies of learner language and are a highly rich resource to describe stages of acquisition (for L2 French, see Bartning and Schlyter, 2004).
- *Pedagogical use*: corpora for delayed pedagogical use sample a given learner population and are used to produce pedagogical tools that will subsequently benefit similar-type learners. The large majority of learner corpora collected so far have been of that type. More recently, however, learner corpus collection has begun to be integrated into normal classroom activities: learner data are collected from a given learner population to inform pedagogical activities which involve in the first instance those same learners, while also allowing for subsequent use with similar-type learners. Learner corpora for immediate pedagogical use thus involve learners as both producers and users of the data.

Learner corpora differ in their degree of accessibility. Many are unfortunately not available outside the arena where they have been

collected. However, a growing number is available for scientific research and/or can be consulted online.

## WORK IN PROGRESS

### *Contrastive Interlanguage Analysis*

A learner corpus is a solid empirical basis from which to uncover the linguistic features that characterize the interlanguage of foreign and second language learners at different stages of proficiency and/or in a range of language situations. The method that has mainly been used for that purpose is CIA (Gilquin, 2000/2001; Granger, 1996). Unlike classic contrastive analysis, which compares different languages, CIA compares varieties of one and the same language and involves the following two types of comparison:

1. comparisons of learner language and one or more native speaker reference corpora (L2 vs. L1) and
2. comparisons of different varieties of learner language (L2 vs. L2).

The first type of comparison plays an important role in uncovering the distinguishing features of learner language, while the second makes it possible to assess the degree of generalizability of interlanguage features across learner populations and language situations. The latter type has never aroused any criticism from SLA specialists unlike the former which has been criticized for being guilty of the ‘comparative fallacy’ (Bley-Vroman, 1983), i.e. for comparing learner language to a native speaker norm and thus failing to analyse interlanguage in its own right. Although it is important to stress the need to view interlanguage on its own terms, there are several arguments that can be invoked in defence of L1–L2 comparisons. First, the native speaker norm that is used in learner corpus research is explicit and corpus-based (Mukherjee, 2005) rather than implicit and intuition-based as has usually been the case in SLA studies. Second, there is not one reference corpus but several reference corpora to choose from. In the case of English, for instance, the analyst can choose between the many geographical varieties of English covered in the *International Corpus of English* (Greenbaum, 1996), several of which are available in electronic format, or may opt for a corpus of expert L2 user data instead (Seidlhofer, 2004). From a pedagogical point of view, the interest of L1–L2 comparisons is even more obvious as they help teachers identify the lexical, grammatical and discourse features that differentiate learners’ production from the targeted norm and may therefore be usefully integrated into the teaching programme.

Learner corpora have already generated a very rich and diversified body of research. The learner corpus bibliography stored on the

Louvain website (<http://cecl.fltr.ucl.ac.be>) is a good starting point for any researcher wishing to embark on learner corpus analysis.

### *Automated Analysis*

One important feature that distinguishes learner corpus data from traditional learner data is the fact that the texts are stored in electronic format. Once computerized, learner data can be examined with a variety of software tools which can radically change the way foreign/second language researchers set about analyzing learner language (for a survey of those tools, see Meunier, 1998). Some degree of automation is arguably essential as several learner corpora contain millions rather than hundreds or thousands of words. Automation contributes to a better analysis of learner language in three major ways: (1) it makes it possible to quantify learner language; (2) it helps uncover interlanguage patterns of use; and (3) it makes it possible to enrich learner data with a wide range of linguistic annotations.

### **Frequency**

One of the major contributions of automation is that it brings forth a wealth of quantitative information on learner language that had hitherto been unavailable. Text retrieval software tools like *WordSmith Tools (WST)* (Scott, 1996) or *MonoConc* (Barlow, 1999) are language-independent programs that enable researchers to count and sort words in text samples automatically. Using these tools, researchers have immediate access to frequency lists of all the single words or sequences of words in their corpora. [Table 2](#), for example, lists the top 20 word forms in the 2.5 million word *ICLE corpus* of writing by intermediate to advanced EFL learners and presents by way of comparison the top 20 words in a comparable native academic corpus (*ACAD*).

One particularly useful tool in *WST* allows researchers to compare lists such as those presented in [Table 2](#), highlight the significant differences between them and draw up lists of words that are significantly over- or underused by learners. This option plays an important role in uncovering cases of over- and under-representation which, as already pointed by Levenston in 1971, characterize learner language just as much as downright errors, especially at the more advanced proficiency levels. As appears from [Table 3](#), an automatic comparison of the top 20 words in *ICLE* and *ACAD* shows that EFL learners tend to significantly overuse some forms of the verb *be* (*is, are, be*) and personal pronouns (*it, they, we, I*) and underuse a range of prepositions and/or particles (*of, in, as, with, by, on*).

[Table 4](#) presents similar results for EAP (English for academic purposes) nouns in the French subcorpus of *ICLE* (cf. Paquot, in press).

Table 2 Top 20 word forms in *ICLE* and *ACAD*

| ICLE |               |      | ACAD |              |      |
|------|---------------|------|------|--------------|------|
| Rank | Word          | %    | Rank | Word         | %    |
| 1    | <i>the</i>    | 5.60 | 1    | <i>The</i>   | 6.76 |
| 2    | <i>of</i>     | 3.30 | 2    | <i>Of</i>    | 4.05 |
| 3    | <i>to</i>     | 3.23 | 3    | <i>To</i>    | 2.69 |
| 4    | <i>and</i>    | 2.82 | 4    | <i>and</i>   | 2.66 |
| 5    | <i>a</i>      | 2.30 | 5    | <i>in</i>    | 2.30 |
| 6    | <i>is</i>     | 2.07 | 6    | <i>a</i>     | 2.28 |
| 7    | <i>in</i>     | 2.03 | 7    | <i>is</i>    | 1.64 |
| 8    | <i>that</i>   | 1.49 | 8    | <i>that</i>  | 1.30 |
| 9    | <i>it</i>     | 1.25 | 9    | <i>it</i>    | 0.90 |
| 10   | <i>are</i>    | 1.03 | 10   | <i>for</i>   | 0.88 |
| 11   | <i>be</i>     | 0.93 | 11   | <i>as</i>    | 0.84 |
| 12   | <i>for</i>    | 0.92 | 12   | <i>be</i>    | 0.82 |
| 13   | <i>not</i>    | 0.91 | 13   | <i>this</i>  | 0.70 |
| 14   | <i>they</i>   | 0.84 | 14   | <i>are</i>   | 0.68 |
| 15   | <i>as</i>     | 0.74 | 15   | <i>with</i>  | 0.68 |
| 16   | <i>have</i>   | 0.73 | 16   | <i>by</i>    | 0.67 |
| 17   | <i>this</i>   | 0.69 | 17   | <i>on</i>    | 0.59 |
| 18   | <i>we</i>     | 0.68 | 18   | <i>was</i>   | 0.59 |
| 19   | <i>people</i> | 0.63 | 19   | <i>not</i>   | 0.56 |
| 20   | <i>I</i>      | 0.61 | 20   | <i>which</i> | 0.52 |

These lists are useful prompts for further research and potential candidates for pedagogical activities.

### Patterns of use

The quantitative benefits of computerized learner data should not obscure the equally impressive qualitative insights afforded by computer-aided methods. Corpus methods, in particular *phrase* (or *chunk*) *extraction* and *concordancing*, are a very powerful heuristic device for uncovering recurrent patterns of use, or put another way, words' preferred lexical and grammatical company. Recurrent sequences of

Table 3 Sample of significantly over- and underused word forms in *ICLE*

| Overuse | Underuse |
|---------|----------|
| to      | the      |
| and     | of       |
| is      | in       |
| that    | as       |
| it      | with     |
| are     | by       |
| be      | on       |
| for     | was      |
| not     | which    |
| they    |          |
| have    |          |
| we      |          |
| people  |          |
| I       |          |
| not     |          |

Table 4 Sample of significantly over- and underused EAP nouns in *ICLE-FR*

| Overuse     | Underuse    |
|-------------|-------------|
| action      | argument    |
| difficulty  | claim       |
| conclusion  | consequence |
| example     | effect      |
| importance  | emphasis    |
| possibility | evidence    |
| problem     | reason      |
| question    | support     |

two or more words can easily be extracted and shed light on the routine aspects of learner writing or speech. Applying this method to a corpus of EFL speech and a comparable native speaker corpus, De Cock

(2004) shows that EFL learners significantly underuse discourse markers like *you know* or *I mean* and vagueness markers like *sort of* or *and things* and therefore prove to be lacking in routinized ways of interacting and building rapport with their interlocutors and weaving the right amount of imprecision and vagueness, both typical features of informal interactions. On the other hand, concordancers make it possible to extract all occurrences of a given lexical item (single word or phrase) in a corpus and sort them in a variety of ways, thereby allowing typical patterns to emerge. Table 5 displays some of the striking differences emerging from the concordance of the word *as* in a corpus of essays written by native American English students (*LOCNESS*) and EFL learners of Spanish, French and German mother tongue backgrounds (*ICLE*).

The striking predilection of the French-speaking learners for the phrase ‘as far as x is concerned’ (modelled on the French phrase *en ce qui concerne*) appears clearly from the concordance excerpt in Figure 1.

### Annotation

A learner corpus can also be annotated. In corpus linguistics terms, the term ‘annotation’ refers to ‘the practice of adding interpretative (especially linguistic) information to an existing corpus of spoken and/or written language by some kind of coding attached to, or interspersed with, the electronic representation of the language material’ (Leech, 1993, p. 275). In learner corpus terms, this means that any information about the learner samples that the researcher wants to code can be inserted in the text. In a learner corpus, it is therefore not only words that are contextualized but also information about the words.

Although there is in principle no limit to the type of annotation that can be used to enrich a learner corpus, there are two which are by far

Table 5 Patterning of the word ‘as’ in native and learner corpora (/100,000 words)

| Patterning of ‘as’          | <i>LOCNESS</i> | <i>ICLE-SP</i> | <i>ICLE-FR</i> | <i>ICLE-GE</i> |
|-----------------------------|----------------|----------------|----------------|----------------|
| As a conclusion             | 0              | 8              | 17             | 0              |
| As far as                   | 5              | 7              | 48             | 17             |

the most commonly used: morpho-syntactic annotation and error annotation. Part-of-speech (POS) taggers automatically attach a tag to each word in a corpus, indicating its word-class membership. These programs are particularly useful as they help disambiguate the many words that belong to more than one part of speech. Only a POS-tagged learner corpus would allow researchers to interpret the overuse of the word *to* highlighted in Table 3 as being solely due to an over-representation of the infinitive particle *to*, the preposition *to* being significantly under-used. It is important to bear in mind, however, that morpho-syntactic annotation programs—whether lemmatizers, POS taggers, or parsers—have been trained on the basis of native speaker corpora and there is no guarantee that they will perform as accurately on learner data. Although the success rate of POS-taggers has been found to be quite good with advanced learner data (Meunier, 1998, p. 21), it has proved to be very sensitive to morpho-syntactic and orthographic errors (Van Rooy and Schäfer, 2003) and success rate will therefore tend to decrease as the number of these errors increases. To counter this weakness, a number of researchers have preferred to use CHILDES (MacWhinney, 1999), a suite of software tools that gives researchers a high degree of flexibility in the annotating process. Initially designed for L1 acquisition research, it has recently been adapted for L2 data analysis (Myles and Mitchell, 2004).

Although error analysis has fallen into disfavour in SLA, it remains a crucial aspect of learner language and one which in fact still lies at the heart of many SLA studies hidden under labels such as negative transfer, fossilization, corrective feedback, measures of linguistic accuracy and developmental sequences. Two methodologies are used in learner corpus research to chart attested learner errors: computer-aided detection and error annotation. In the former case, it is the analyst who chooses the linguistic items to focus on, using his/her intuition, pedagogical experience or previous SLA studies. Once selected, the linguistic forms can be searched automatically in the learner corpus,

counted and sorted as described in Patterns of Use. The study of Cowan, Choi and Kim (2003) of over-passivization errors is a good illustration of this method. The problem is that this method presupposes that one knows what errors to look for, which is far from always being the case.

The only method that can ensure comprehensive error detection is error annotation, which in spite of its difficulty and time-costliness, is enjoying growing popularity and several systems of error annotation have been developed (Dagneaux, Denness and Granger, 1998; Granger, 2003b; Izumi, Uchimoto and Isahara, 2004; Milton and Chowdhury, 1994; Nicholls, 2003). In most systems the error is coded for error type (number, gender, tense, etc.), word category (noun, verb, etc.) and in some cases, error domain (spelling, grammar, lexis, etc.). When applied to a learner corpus that has been carefully compiled on the basis of strict design criteria (mother tongue background, level of proficiency, etc.), error annotation is a valuable resource which makes it possible to tailor-make pedagogical materials for the needs of a given learner population (cf. Granger, 2003b). However, error annotation will always contain an element of subjectivity as the very notion of error is far from clear-cut. As rightly pointed out by Milton and Chowdhury (1994, p. 129), "Tagging a learner corpus allows us, at least and at most, to systematize our intuitions." It is therefore essential that annotators be provided with a comprehensive error-tagging manual and undergo rigorous training. In addition, it is important to bear in mind that error annotation is a very time-consuming, hence costly, process. Limitations in manpower and/or budget may lead researchers to tag only part of their corpus or to limit the tagging to some specific error categories (morphological errors, preposition errors, article errors, etc.).

#### PROBLEMS AND DIFFICULTIES: PEDAGOGICAL APPLICATIONS

Among the many pedagogical applications that could potentially benefit from learner-corpus-informed insights, only a few can boast a number of concrete achievements: pedagogical lexicography, courseware and language assessment.

The field in which advances have been quickest is *pedagogical lexicography*. The latest editions of the *Longman Dictionary of Contemporary English (LDOCE)* (2003) and the *Cambridge Advanced Learner's Dictionary (CALD)* (2003) both contain error notes based on their respective learner corpora, which are intended to help learners to avoid making common mistakes. These notes are a clear added value for dictionary users as they draw their attention to very frequent errors, which in the case of advanced learners have often become fossilized

(*accept* + infinitive, *persons* instead of *people*, *news* + plural, etc.). Although the selection of the errors is not yet optimal (cf. De Cock and Granger, 2005), this is a major first step, which will undoubtedly be followed by others. Although learner corpus data have begun to have a marked impact on EFL dictionaries, they have yet to find their way into EFL grammars. When one considers that even native corpus data were only integrated into grammars as recently as 1999, with the publication of the very first corpus-based grammar of English, *the Longman Grammar of Spoken and Written English* (Biber, Johansson, Leech, Conrad and Finegan, 1999), this fact may seem less surprising. But it seems both inevitable and highly desirable that learner corpus data will become an essential component of grammar design in years to come. Pedagogical grammars would clearly benefit from corpus-attested information on the difficulty of grammatical categories and structures for learners in general or some L1-specific learner population.

While there may still be relatively little CLC-informed courseware on the market, quite a number of teachers have used learner corpora to develop their own in-house teaching materials, which share a number of characteristics: (1) they tend to be based on learner corpora for immediate pedagogical use; (2) they are often L1-specific rather than generic; (3) they are designed with a clear teaching objective in a well-defined teaching context; and (4) they tend to be electronic rather than paper tools. This latter characteristic results from the fact that new technologies—web-based platforms, CALL authoring tools, email—have brought the design of electronic pedagogical material within the reach of any computer-literate teacher/researcher and provide an ideal platform for the production and use of learner corpus data. The web-based writing environment of Wible, Kuo, Chien, Liu and Tsao (2001) is the perfect example of a tool, which allows for the generation, annotation and pedagogical exploitation of learner corpora. The environment contains a learner interface, where learners write their essays, send them to their teacher over the Internet and revise them when they have been corrected by the teacher, as well as a teacher interface, where teachers correct the essays using their favourite comments (comma splice, article use, etc.) stored in a personal Comment Bank. This environment is extremely attractive both for learners, who get immediate feedback on their writing and have access to lists of errors they are prone to produce, and for teachers, who progressively and painlessly build a large database of learner data from which they can draw to develop targeted exercises. Other researchers are using data resulting from computer-mediated written communication (Kung, 2004; Suzuki, Jung, Watanabe, Min and Yoshihara, 2004) or oral tasks (Kindt and Wright, 2001; Perez-Paredes, 2003).

A third field to which “research from learner corpora has much to offer” (Purpura, 2004, p. 272) is language assessment. Carefully analyzed, learner corpora can help practitioners select and rank testing material at a particular proficiency level (Barker, 2004). Combined with Natural Language Processing techniques, they can also be used to draw up automatic profiles of learner proficiency. The *Direkt Profil* analyzer, for example, provides a grammatical profile for L2 French and can be used to assess learners’ grammatical level (Granfeldt, Nugues, Persson, Kostadinov, Agren and Schlyter, 2005).

All these applications show the tremendous potential of learner corpus data to inform pedagogical tools and methods. At this stage, however, CLC-informed materials are still the exception rather than the rule and there is scope for the development of a much wider range of applications in future.

#### FUTURE DIRECTIONS

Although learner corpora are still in their infancy, the buzzing activity in the field and the number of learner-corpus informed reference and teaching tools that have already been produced are a clear indication that they are here to stay. Efforts in the future should go towards collecting data representing a wider range of target languages. At this stage, most learner corpora are corpora of English as a foreign or second language. Other target languages are clearly lagging behind. Future learner corpus compilation should also sample more diversified learner populations in a wider range of language situations and tasks. Over and above data collection, the focus should be on interpreting the data in the light of SLA theory and incorporating the results in innovative pedagogical applications. Prime among these are electronic applications and in particular web-based environments, which allow researchers to collect and exploit learner data within the same environment.

## COMPUTER-ASSISTED LANGUAGE ASSESSMENT

### INTRODUCTION

Computer-based tests with streaming video, feedback mechanisms, and enhanced or enriched input (such as hyperlinked text, answer choices, or objects that, when clicked on or selected, provide glosses, help, or feedback that aid comprehension or test completion) have expanded the testing field and have triggered washback effects that have influenced the second and foreign language classroom. In addition, alternative computer-based assessment formats (see Volume 7), including electronic portfolios (E-portfolios), are used by teachers to develop and implement more qualitative and longitudinal summaries of learning and proficiency as the students' second language (L2) develops over time. Advantages of computerized language assessment include the ease that comes with test delivery and automatic, objective scoring possibilities.

Three circumstances are driving the spur in computer-assisted language assessment. First, advances in technology are making it possible to have more sophisticated computerized testing programs. For example, automatic scoring mechanisms for written essays and oral response items are developing quickly, and commercial software packages for making adaptive tests are readily available. With such advances, the cost benefits in assessing via a computer increase. Second, the generation of language learners typically found in the classroom has grown up with computers. Earlier impediments that centered around computer access and familiarity, albeit not entirely overcome, are breaking down. Third, the development of computer-assisted language learning (CALL) materials has expanded greatly in recent years, and this has had an articulation effect on testing. Teachers are exploring ways to test learners through the same computerized mediums (such as through computer-mediated communication or CMC). Thus, the field of computer-assisted language testing (CALT) continues to expand.

### EARLY AND RECENT DEVELOPMENTS

Early on, computer-based tests of foreign language learning involved item types that were easily scored by a computer. Item types included multiple-choice, multiple-select, drag-and-drop, and short-answer

response and were presented linearly as they were on their paper-and-pencil counterparts. This led to many comparison studies between computerized and paper-and-pencil versions of the same test, and this research still continues today. Eventually, this format changed. Instead of relying solely on discrete item types, test takers were asked to respond to tasks that were more like real-world tasks. In addition, they were asked to produce more open-ended responses. The challenge has been in scoring such items, both in terms of developing the criteria for scoring and in developing programs to help with scoring, and research along this line continues to flourish, especially in the area of computerized tests of writing ability (Goodfellow, Lamy, and Jones, 2002; Li, 2000). In addition, the field quickly incorporated the adaptive functions of computerized testing. These three areas of CALT (research on pencil-and-paper versus computerized tests; CATs (Computer Adaptive Tests); and the development of more open-ended, automatically-scored item types) are discussed later.

### *Comparison Studies*

When computerized tests were first introduced, it was important to establish that they were comparable to, or improvements over, their paper-and-pencil counterparts. Research has focused on whether paper-and computer-administered tests are equivalent in terms of scores (Choi, Kim, and Boo, 2003; Russell and Haney, 1997), test-taker attitude (Hémard and Cushion, 2003; Kenyon and Malabonga, 2001), and motivation (García and Arias, 2000). Investigations along this line have also explored other features of computerized tests, such as the feedback types involved in paper-and-pencil versus computer-administered tests (Delmonte, 2002) and the ways in which raters may differentially assign scores based on the mode of the response item (i.e., typed or handwritten) (Breland, Lee, and Murake, 2005; Lee, 2004; Russell and Haney, 1997). Results have generally found differences, but overall the reports have found that computer-based tests shorten administration time, have high validity, and are in some cases more motivating than paper-and-pencil based tests.

### *Computer Adaptive Tests*

Computer-adaptive tests (CATs) are technologically advanced assessment measures (Dunkel, 1999) that have been used in L2 testing since the 1980s. They use sophisticated algorithms to move examinees from one item to the next based on the examinee's performance on the last item. (Sets or blocks of items used for adaptive purposes are called

testlets, and CATs that use them are called semi-adaptive tests). Brown outlined CAT advantages as such: “(a) the items are selected and fitted to the individual students involved, (b) the test is ended when the student’s ability level is located, and, as a consequence, (c) computer-adaptive tests are usually relatively short in terms of the number of items involved and the time needed” (1997, p. 46). These advantages help with large-scale administrations and keep test takers from being overburdened by items that are too easy or difficult. On the other hand, CATs are time consuming and costly. Even with semiadaptive tests, large databanks of items are needed, and test developers need to (a) understand how to use guidelines and blueprints in designing CATs, (b) use the appropriate IRT model and algorithm for item or testlet selection and for test completion rules, and (c) field test the items to obtain statistical information on each item’s calibration and performance (Dunkel, 1999). Thus, CATs are generally produced and administered by large testing organizations that have resources to support them. However, commercially available test software, such as QuestionMark, or Perception for Web, which can be integrated into classroom management software such as Blackboard and WebCT, offer adaptive functions and templates that are easy to use and do not require sophisticated computer-programming knowledge. Such programs are helping smaller institutions afford the development of CATs for smaller test-taker populations.

### *Open-Ended Item Types*

In contrast to the rapid incorporation of adaptive functions in language tests, the development of authentic, open-ended essay items and extended oral response has been slower. Historically, the problem has been in scoring such items reliably. For example, electronic scoring (E-scoring) is rather controversial, but recently has become a well-developed issue in assessing writing. Kelly (2001) argued that in scoring writing, a computerized tool should mimic the rating processes that expert human raters employ. Other researchers have found that computers can perform as well as, if not better than, human counterparts in scoring writing (Shermis, Koch, Page, Keith, and Sharrington, 2002) and suggest that computer-obtained scores may be more valid since humans often cannot explain why certain essays are “good” or “bad.” One commercially available computerized writing scoring tool is *E-Rater*, produced by Educational Testing Service (ETS, [www.ets.org](http://www.ets.org)), which is based on natural language processing (NLP) ([www.ets.org/criterion](http://www.ets.org/criterion)). Other programs include *IntelliMetric* by Vantage Laboratories ([www.vantage.com](http://www.vantage.com)), *Project Essay Grade* (PEG), introduced in the 1960s by Ellis Page (<http://134.68.49.185/pegdemo>),

*Intelligent Essay Assessor* (IEA), available through Pearson Knowledge Technologies ([www.knowledge-technologies.com](http://www.knowledge-technologies.com)), and RANGE (downloadable from [www.vuw.ac.nz/lals/staff/paul-nation/nation.aspx](http://www.vuw.ac.nz/lals/staff/paul-nation/nation.aspx)), a program that assesses lexical frequency that was developed by Paul Nation. A program based on Nation's work was used in research conducted by Goodfellow, Lamy, and Jones (2002), who found that the writing produced by learners of French could be similarly analyzed by both the computer and human raters when vocabulary use was assessed. However, they observed that the feedback mechanisms from the computerized rating was limited, and thus suggested that the E-scoring approach is best used for self-assessment at this time. However, because studies have shown that ETS's *E-Rater*-generated scores have a high agreement with scores produced on the same essays by expert raters (Burstein, 2003), research into E-scoring will likely continue and become more accurate, and, eventually, be able to provide more meaningful feedback.

There have been advances in the computerized scoring of speaking ability as well. For example, Delmonte (2002) has shown how computerized language tutors, programmed to respond immediately to learners' recordings of short, oral input, can assist L1 and L2 learners with vocabulary acquisition and oral production in non-face threatening, innovative ways. L2 test developers can be encouraged by these successes and can build upon the foundations such studies have developed.

### MAJOR CONTRIBUTIONS

Several books have been published on the specific issues in computerized L2 testing (Chalhoub-Deville, 1999; Chapelle, 2001; Chapelle and Douglas, 2006; Dunkel, 1990); other books have contributed to the development of computerized L2 testing by reporting developments within education and educational measurement that concern online testing and CATs (Howell and Hricko, 2006; Wainer, 2000). Several books in the Cambridge Language Assessment Series have sections which address computerized testing issues, particularly the books on assessing languages for specific purposes (Douglas, 2000), reading (Alderson, 2000), and writing (Weigle, 2002), which discuss the future of computers in the testing of these subfields. Read's (2000) book in the same series on assessing vocabulary also delves into computerized testing but from a different perspective: Read focuses on how computer analyses of vocabulary and lexical units can help testers design appropriate measures of vocabulary size, depth, and use.

Weigle (2002) noted that one of the major contributions to the computerized language testing field is one of the major English as a Second

Language (ESL) university admissions tests, the Test of English as a Foreign Language (TOEFL), which rolled out its first online, integrated speaking test component in the fall of 2005. Weigle stated that the advantages of the computerized TOEFL (there are currently paper-based, computer-based, and Internet-based versions of the test available) include its computer-adaptive format, its timely test score reporting, and, for the written portion of the test, its increased authenticity for those who produce most of their academic writing on computers. Other large-scale, available-by-computer, ESL admissions tests shaping the research agenda of computerized language testing and fostering computerized test development are the International English Language Testing System (IELTS) tests and the University of Cambridge Local Examinations Syndicate (UCLES) tests, which are also used internationally for proficiency testing and university admissions. Taylor wrote that both washback (the effect the test has on classroom curriculum) and impact (the consequences the test may have on test takers, test score recipients, and society) from such high-stakes tests as the IELTS tests must be measured and monitored, and stated that “interest in this area is likely to grow as the range and use of high-stakes tests increase worldwide and the consequences of test use, especially the valid and ethical use of test scores, come under greater scrutiny in the public domain” (2004, p. 143). Taylor noted that computer-based tests promise flexible delivery but also that they raise issues of test security and washback and warns that comparability across CATs needs to be carefully considered, as does the comparability of any test delivered under both paper-and-pencil and computer-based conditions.

Chapelle, Jamieson, and Hegelheimer (2003) addressed the issue of validating low-stakes, Web-based tests. They explained that low-stakes tests, which have minimal effects on decision-making, are often perceived as needing less rigorous validation than high-stakes tests; however, they countered, “when low-stakes assessments are published on the web with the intention that thousands of examinees will spend their time taking them, validation is essential even though the examinees may be the only recipients of the test results” (Chapelle, Jamieson, and Hegelheimer, 2003, p. 410). Many Web-based tests, such as the extremely successful and often studied DIALANG tests (DIALANG is a European project that offers free, Web-based, diagnostic language tests in 14 European languages; see [www.dialang.org](http://www.dialang.org) for more information) are intended to provide feedback to learners and to give them suggestions for strategy use and/or ways in which to improve their L2 ability. Such tests, because they are readily available and up on the Web, are seen by test takers as having high face-validity, yet tests such as these still need to be tested for validity and reliability to assure

quality and to ensure that they are testing what they propose to be testing. Indeed, searching the Web, teachers and researchers can easily find many L2 tests online—teachers and researchers readily use applications such as Hot Potatoes (<http://hotpot.uvic.ca>) or Weinburg's *Alysse7* (for a demo, see <http://aix1.uottawa.ca/~weinberg/alyse7/>) for L2 testing, and many tests created with these tools are available for use on the WWW. However, it must be noted that not all teachers who create and upload such tests for public use are aware of many of the issues in language testing; thus, wholesale adoption of any language test must be pursued with caution, even if the test is being used for low-stakes purposes.

Although many research articles and books on computerized language testing have advanced the field and have discussed what works and what may not, operational, computerized test programs being produced and maintained by educational institutions (such as the Title VI National Language Resource Centers funded by the US Department of Education) and other language testing organizations (such as the Center for Applied Linguistics in Washington, DC, Second Language Testing in Rockville, Maryland, Educational Testing Services in Princeton, NJ, and Lidget Green in Mammoth Lakes, California) have demonstrated what theoretical applications actually work when applied to operational test programs. Test programs currently in development are discussed in the following section.

#### WORK IN PROGRESS

Several CALT projects currently underway demonstrate the field's direction, depth and show how CALT is changing the way in which we test foreign and second languages. For example, Second Language Testing in Rockville, Maryland, is developing a computerized version of the Modern Language Aptitude Test ([www.2lti.com](http://www.2lti.com)). The Center for Applied Linguistics (CAL, [www.cal.org](http://www.cal.org)) is finalizing online listening and reading tests of Arabic and Russian, designed with the software Questionmark, Perception for Web ([www.questionmark.com](http://www.questionmark.com)). These tests, funded by the US Department of Education and based on the American Council on the Teaching of Foreign Languages (ACTFL, [www.actfl.org](http://www.actfl.org)) Proficiency Guidelines, are available for use by both public and private institutions for the testing of learners (for placement testing, proficiency testing, and/or for selection purposes) at the Novice through Superior level. What is interesting about these tests is that they are for less-commonly-taught languages (LCTLs) and are not expected to be taken by more than a few hundred test takers a year; the tests were put online to facilitate remote administration—paper-and-pencil versions were found to be cumbersome and expensive to deliver to the

small clusters of learners at disparate locations, and online administration allows for faster delivery and score turn-around. The semi-adaptive functions of the tests also allow for a single user to take the test more than once throughout his or her foreign language learning process—the items the test taker is presented with when he or she is a Novice learner are different from those at the Intermediate or Advanced level.

Similarly, a Computer-Assisted Screening Tool (CAST), whose framework is the result of a five-institution collaboration (ACTFL, Brigham Young University, CAL, the Defense Language Institute, and San Diego State University), is currently being developed for assessments in Modern Standard Arabic and Spanish. A follow-up grant project, “Diagnostic Testing and Materials Creation” will add CASTs in Persian, Mandarin, and two Arabic dialects, Iraqi and Egyptian. All CASTs are stored on the Language Acquisition Resource Center (LARC) server at San Diego State University (<http://larcnet.sdsu.edu>)—like the online Arabic and Russian listening and readings tests being developed at CAL, the CASTs can be registered for and completed online.

CAL has also had much success with its computerized version of its Basic English Skills Test (BEST), the BEST Plus ([www.cal.org/bestplus](http://www.cal.org/bestplus)). The test assesses basic oral skills in English as a Second Language (ESL) and is administered one-on-one via a CD-ROM. CAL has developed BEST Plus administration training materials and is working on adapting those for Web delivery.

The Center for Applied Second Language Studies (CASLS, <http://casls.uoregon.edu>) at the University of Oregon has developed a CAT called the Standards-based Measurement of Proficiency (STAMP, <http://casls.uoregon.edu/stamp2.php>), which assesses the reading, writing, and speaking of Novice-low to Intermediate-Mid learners (based on the ACTFL scale) of Chinese, French, German, Hebrew, Japanese, Spanish, and Turkish. STAMP is used by institutions for program evaluation and placement, as well as for general proficiency testing. Hindi, Italian, Swahili, and Yoruba versions are currently being developed and will add significantly to the small cadre of criterion-referenced LCTL tests for grades 7 through 12 and at postsecondary levels.

As evidenced by CALT works-in-progress, CALT does not only encompass the direct testing of learners. The field of CALT now extends to other areas of the assessment realm, such as rater-training. Recently, at the University of Auckland, a trial of an online training program for experienced essay raters was conducted as part of the Diagnostic English Language Needs Assessment (DELNA) project, whose purposes are to identify the academic language needs of undergraduate students and to direct them toward appropriate language

support (Elder, Barkhuizen, Knoch, and von Randow, in press). The test battery consists of listening, reading, and academic writing; the writing component is scored by raters. DELNA test developers felt the need to expand the continuing, experienced rater-training program to an online format because the scheduling of regular training sessions to suit all experienced raters was becoming increasingly difficult as the number of raters expanded. The program was developed to reduce the number of recalibration sessions; the program, however, was not intended to replace initial face-to-face training. Results of the pilot program showed slightly higher levels of overall inter-rater agreement and reduced levels of inconsistency and bias in some instances. The researchers also found that the participants responded positively to the program. Other computerized rater training programs currently in existence include CAL's Multimedia Rater Training Programs (MRTP, [www.cal.org/mrtp/index.html](http://www.cal.org/mrtp/index.html)), which are CD-ROM-based rater training programs that train raters how to score the CAL Simulated Oral Proficiency Instruments (SOPIs) and Computerized Oral Proficiency Instruments (COPIs) for Arabic and Spanish.

#### PROBLEMS AND DIFFICULTIES

Many of the problems and difficulties with computer-assisted language assessment are the same as those that plague traditional paper-and-pencil tests: validity, reliability, and washback. That is, do the tests assess what they are intended to, do they consistently and reliably assign scores regardless of the test time or place, and, when the tests influence classroom practice, do they do so in a positive manner? Developers of computer-based tests essentially have the same responsibilities as other test developers; however, the developers of computer-based tests face other challenges relating specifically to the computer or online domain of test security, copy-right issues, and scoring difficulties. Additional burdens placed on the CALT developer relate to significant monetary requirements related to computer equipment, technology turnover, and test maintenance.

Another concern is the construct validity underlying computerized tests and scoring tools. Commercially available server software systems that allow for audio recordings over the Web (such as Wimba) and advanced CAT software (such as Questionmark, Perception for Web) are now available for integration with classroom management systems such as WebCT and Blackboard (see [www.questionmark.com/uk/connectors](http://www.questionmark.com/uk/connectors)), making computerized test technology for language assessment, especially oral assessment, available and ready for use sometimes even before teachers themselves have had time to fully understand how to use the software or even why they should use it.

This is similar to a result found by Hémard and Cushion (2003), who wrote that students and teachers often need to be convinced of the added value of computerizing materials. In addition, it must be noted that articles on CALT still report that some test takers have difficulties in adapting to technology-dependent testing methods, and warn that test developers must consider the test takers' abilities to use computers and the Internet as potential mediating factors influencing test outcomes (Myers, 2002).

Other issues pertaining to CALT concern the specific testing of listening, speaking, and writing. It can be argued that listening comprehension tests can be made infinitely more authentic in a computerized environment where the incorporation of streaming video is possible; however, a common problem is the delivery of high-quality video to a large number of test takers (Buck, 2005). The necessary bandwidth for delivery can be costly, and smaller language testing programs may not have adequate resources to fund projects with the latest technology. Many multimedia players used by basic, computerized L2 listening tests allow for the test takers to play the video or audio files more than once, to rewind, or to fast forward. There has not been much research on how this capability affects scoring or how it may alter the test construct. More sophisticated test environments can track this information; thus much research in this area is expected.

Expense is one of the major setbacks for computer-administered tests of speaking ability. Many universities have developed their own online audio programs that teachers can use to assess their students' speaking abilities. Audioportfolios (<http://www.audioportfolios.com>), developed by Dennie Hoopingarner at Michigan State University, is one such application available to the public that incorporates audio, video, and teacher-feedback mechanisms. Students can use Audioportfolios to record their voices with or without video on a Mac or PC in a computer laboratory or on home computers. Meanwhile, their teachers can listen to the audio files over the Web, provide feedback, and can track their students' speaking development over time. However, many K-12 schools and universities lack computers with audio recording equipment, and this has been a major block to the proliferation of online or computer-based speaking tests.

The major challenge for computerized L2 writing tests is not just how to score them efficiently—Weigle wrote that “while writing in a first language is a challenging, complex task, it is even more so in a second language” (2002, p. 38), thus, part of the challenge is the cognitive aspect of writing itself—Weigle, referring to Bereiter and Scardamalia's (1987) model of writing, described the writing process as *knowledge transformation*, which includes the difficult and labor-intensive processes of “putting one's thoughts to paper as they occur”

along with “using writing to create new knowledge” (Weigle, 2002, pp. 32–33). Without a doubt, writing on the computer is a cognitive process that differs greatly from the cognitive process of writing on paper, and this distinction has been a major concern among CALT researchers for some time. This issue is compounded when considering the different modes of writing (paper-and-pencil versus computer-based) that are involved in writing logographic languages such as Chinese. On paper, Chinese character production is a process that is as much of a memorized motor skill as it is a complex cognitive skill. On the other hand, the process of writing Chinese on a computer is indeed very different and involves a step that uses the Romanized alphabet system to locate and select the appropriate characters. How this changes the writing process cognitively for the learner is not quite known, but that the two systems of writing are vastly different is not debated. Thus, it is up to language testing researchers to discover how different modes of writing during second language testing affects the content validity and construct of the tests themselves.

#### FUTURE DIRECTIONS

It will soon be hard to find a college student who has not taken at least one major standardized test online, and many institutions at the college level have integrated classroom management systems, such as Blackboard or WebCT, that incorporate testing capabilities and make computerized testing a possibility for teachers with access to computer classrooms. The world of CALT will continue to develop, and this is seen “as a natural evolution in assessment practice” (Dunkel, 1999, p. 77). Testing via the computer is a logical step, in that resources are available and because computerized testing can be more motivating, streamlined, and can incorporate automatic scoring. But a system of checks and balances is needed to assure that computerized tests are increasing our ability to efficiently make valid inferences about language learners’ abilities and weaknesses. We must be sure computerized tests contribute overall to L2 programs and L2 learning. Computerized tests should not just increase the efficiency of test administration and scoring, but should also accurately reflect the ways in which L2s are learned and should appropriately take advantage of advances in technology to make for better testing conditions, not just different ones (Chapelle and Douglas, 2006).

The scoring of essays will continue to be an issue in the CALT environment for some time; human raters are still needed for the scoring of extended essays, which adds a considerable expense to the otherwise monetarily efficient scoring process. However, as mentioned earlier, research has shown promise in the use of computers for rating essays,

and in the future we should see computers that are able to score essays not only based on syntactic complexity, lexical complexity, and grammatical accuracy (Li, 2000), but also on discourse coherence, syntactic variety, and on-topic content. Additionally, online systems that directly or indirectly support computerized language testing, such as rater training programs, item development training sessions, and programs for uploading, revising, and finalizing items for item bank completion and maintenance, are becoming more common and should flourish in coming years.

## DISTANCE LEARNING FOR SECOND AND FOREIGN LANGUAGE TEACHING

### INTRODUCTION

Distance learning (DL) or online courses for teaching second and foreign languages (L2) has only recently attracted the field's attention (Blake and Delforge, 2006), primarily in response to student demand for: (i) greater scheduling flexibility unconstrained by time and place, and (ii) increased access to the less commonly taught languages (LCTLs). The profile of today's student increasingly points to someone who has already entered the work force, but still needs continuing education. This type of student is simultaneously juggling school, work, and maybe a family. While work and family needs tend to be relatively inflexible, school schedules constitute the only component that can be readily modified. Likewise, students are becoming increasingly aware of the importance of world languages such as Arabic, Persian, Hindi/Urdu, and Punjabi, to name only a few. Ironically, these languages are infrequently taught on the typical college campus. In the face of scarce resources for LCTL instruction, administrators and students alike have been drawn to the DL format. However, many in the language profession remain skeptical as to whether or not the DL environment can support the same type of linguistic interactions found in the classroom. Research in computer-mediated communication (CMC) has answered this concern by demonstrating that electronic interactions offer benefits much like face-to-face classroom exchanges.

### EARLY DEVELOPMENTS

A DL format for the L2 curriculum typically includes one or more of the following components: multimedia programs delivered by CD or DVD disks, Internet materials and activities, and Chat (Unicode text exchange and often sound interactions, too). Most activities in this format take place asynchronously—usually via a course management system like *Blackboard*, *WebCT*, or an open source system such as *Moodle*—but CMC programs increasingly provide synchronous interactions as well. Teleconferencing courses are commonly treated as a separate type of instructional medium because of the rigid demands for students to be physically present at a specific place and time

(although the instructor may broadcast from a different location) and will not be addressed in this review (but see Belz and Thorne, 2005).

The L2 field has produced relatively little empirical research relating to the effectiveness of online language learning and/or comparisons with performance from traditional classrooms. Early studies have concentrated on evaluating *hybrid* courses, where only part of the curriculum is delivered in class while other tasks occur online. Research on hybrid courses suggests that students who learn language with an online component may develop their literacy skills to higher level than students just working in a classroom environment (Warschauer, 1996).

Adair-Hauck and group (1999) and Green and Earnest Youngs (2001) compared the achievement test scores of students enrolled in standard elementary French and German classes that met 4 days per week with the scores of other learners who attended class 3 days a week and participated in technologically enhanced learning activities in lieu of a fourth hour of in-class contact. Adair-Hauck and group found that students participating in the treatment group did as well as those in the control group on tests of listening, speaking, and cultural knowledge, but performed significantly better than the control group on measures of reading and writing ability. The authors speculated that online students were more motivated to write, which might explain the differences, but they offered no explanation with respect to the reading results. In contrast, Green and Earnest Youngs (2001) found no significant difference between the treatment and control classes' scores on the same type of tests used in the Adair-Hauck and group study but adapted for the Web. It is not immediately clear why the results diverged so much in these two studies and whether or not the authors sufficiently controlled for individual class differences.

Chenoweth and Murday (2003) examined the outcomes of an elementary French course, *French Online*, conducted mostly online that included an hour-long, face-to-face class meeting once per week as well as weekly 20-min individual or small-group meetings with a native speaker tutor. The progress of students in the online group was compared to that of others who attended a traditional class 4 h per week on tests of oral production, listening comprehension, reading comprehension, grammar knowledge, and written production. Scores for the treatment and control groups differed significantly only in the case of the writing samples: essays by students in the online learning group were judged superior to those of the control group on a variety of measures including grammatical accuracy, syntactic complexity, use of transitions, and cohesive devices and organization. It was also found that the online students spent approximately 1 hour per week less studying than did those in the traditional class. Thus, these findings suggest that the online course was more efficient as students achieved results

similar to those attained by learners in the conventional class with less time expenditure.

These studies appear to make the case that online learning can contribute to the student's L2 learning, but much depends on the learning environment, pedagogical materials, Web-based task design, and individual learner differences. However, since these studies combine online instruction with face-to-face class meetings, it is difficult to generalize their results to language courses conducted entirely online.

#### MAJOR CONTRIBUTIONS

To date, only three major studies (Blake and Delforge, 2006; Cahill and Catanzaro, 1997; Soo and Ngeow, 1998) have evaluated entirely online language courses on the basis of empirical data. In all cases, online learners were found to outperform students from conventional courses on the grammar output measures administered.

Cahill and Catanzaro (1997) reported on an introductory online Spanish class that relies on materials from *Dos Mundos*, a popular introductory Spanish text, along with the accompanying audiocassettes and lab manual. Online activities included synchronous chat sessions, open-ended Web assignments, practice tests, and a substantial number of *pen-pal* letter writing assignments. Responses to two essay questions were used to compare the progress of students participating in the experimental group with that of students enrolled in conventional Spanish classes. Based on ratings of global quality and percentage error scores, the writing samples of students in the online course were judged to be significantly better than those from the traditional classes. Although not discussed by the authors, it seems clear that more writing was demanded of the online students, a fact that clouds to some degree the ability to isolate what effect the online format by itself had on performance.

Soo and Ngeow (1998) compared the performance of 77 students enrolled in conventional English classes with 111 students who studied English exclusively through use of a multimedia computer-assisted language-learning (CALL) program. A comparison of pre- and post-Test of English as a Foreign Language (TOEFL) scores revealed that the students in the online group made significantly greater gains with respect to those who took part in conventional classes. In addition, given that the experimental group started studying 5 weeks later than students in the control group due to technical difficulties, it might be said that the online students not only made more progress than learners in the control group but also that their language skills improved more rapidly.

Blake and Delforge (2006) compared 21 continuing students enrolled in *Spanish Without Walls* (SWW) using both quantitative output data

(i.e., grammar tests and compositions) and qualitative measures (i.e., student surveys). SWW is a totally virtual, first-year Spanish course that combines a first-year CD-ROM packet (i.e., *Tesoros*, McGraw-Hill, 2001), Web readings with online content-based activities, and bimodal CMC (i.e., sound and text) in both a synchronous and asynchronous format. The data showed that students enrolled in the SWW course fared statistically better than the undergraduates enrolled in conventional introductory Spanish classes at UC Davis in terms of grammatical accuracy. The authors speculated that the DL format with its primary focus on textual input forced students to pay more attention to their textual output and, therefore, heightened their metalinguistic awareness (Schmidt, 1990) of discrete grammatical contrasts. The results suggest that well-designed distance language instruction can offer a viable option for learners without access to the traditional classroom setting or for those who prefer the online learning environment to the conventional sit-down class format. However, again, the question of whether or not the SWW students developed the same oral proficiency as classroom students has been left unanswered.

As was the case for the hybrid courses reviewed earlier, the outcome data from these three studies lend support for the notion that online language learning can be effective, at least as a means of improving writing, reading, and listening comprehension abilities. Nevertheless, it remains hard to determine which aspects of the online learning environment were responsible for these results. Perhaps the online students had a higher engagement level with the texts themselves. More research is clearly necessary to substantiate these initial observations.

Student attitudes are also of interest in pursuit of an overall evaluation of the DL format. Adair-Hauck and group (1999) used a self-report questionnaire to compare the attitudes and opinions of students in their hybrid French course with those of students taking a conventional class. They found that a greater percentage of students in the hybrid class reported meeting their personal language-learning goals over the course of the semester. A number of students in the technology enhanced class also indicated that the flexibility of the multimedia materials contributed to their progress in the class, noting the advantage of being able to spend more time on activities they found particularly difficult—in short, more student-centered learning.

Blake and Delforge (2006) also found that completely DL students appreciated their ability to work at their own pace and focus on their own learning difficulties. Many students felt that working independently with the CD-ROM materials and the chat program created much less anxiety than the face-to-face format of the conventional language class (Liontas, 2002). Lee (2005) encountered similar findings in another college-level Spanish course that included essay writing assignments and

chat sessions conducted in *Blackboard*. Once again, students appreciated the self-directed nature of the web-based tasks. In oral interviews at the end of the semester, a number of participants in class indicated that they learned to improve their organizational skills and take more responsibility for their own language learning as a result of the *Blackboard* activities. These findings should not be taken to suggest that student-driven materials cannot be incorporated into the regular classroom, but rather that students often perceive that the classroom is primarily teacher-driven in most cases as opposed to the necessarily student-driven environment of the online format.

However, Green and Earnest-Youngs (2001) also found that some Web activities were too difficult or insufficiently organized. Likewise, the mostly online French course evaluated by Chenoweth and Murday (2003) received a lower overall rating on student evaluations than did a conventional class taken by learners in the control group. The authors note that, since students' principal complaints were related to the organization of the online course and to grading standards, this rating may be due to the fact that the course was being offered for the first time rather than to its technological component.

Given the limited amount of research available at this time, student reactions to the experience of L2 learning online the DL format cannot be unconditionally characterized as positive. However, the DL approach appears promising in that many students respond favorably to the flexibility afforded by either CALL or online materials and to their potential for self-directed learning. But this potential can also be a double-edged sword: students learning language online have more freedom to be self-directed, but those students unable to direct their own learning are more liable to do poorly or simply drop out, as evidenced by the relatively low retention rates registered for DL courses in general (Carr, 2000).

#### WORK IN PROGRESS

The major complaint voiced against learning languages through a DL format is that students fail to receive enough oral practice with face-to-face speaking. This claim is indisputably true; such is the nature of learning any subject at a distance. However, the more pertinent question should focus on whether or not the use of chat software can compensate in any meaningful way for the absence of face-to-face interactions. A growing body of research on CMC seeks to address this issue (for further references, see Thorne and Payne, 2005a; see also Thorne, *Computer-mediated Communication*, Volume 4). In order to make the learning experience engaging, successful online language courses make use of an array of technological tools ranging from asynchronous

e-mails, bulletin boards, blogs, and wikis to synchronous keyboard chatting with or without audio conferencing (Thorne and Payne, 2005b).

Recent CMC research tends to be theoretically grounded within an interactionist framework that prominently features notions such as the proximal zone of development, focus-on-form, negotiation of meaning, task-based learning, pair work—all constructs that rely on harnessing the power of human interactions to stimulate the process of second language acquisition (SLA). Although cooperative exchanges among L2 learners or between native speakers and L2 learners cannot be said to directly cause L2 acquisition, they appear to, at least, *prime the pump* (Gass, 1997; Gass, Mackey, and Pica, 1998) by focusing the learner's attention on unfamiliar structures (i.e., *noticing* in Schmidt's (1990) terms) and by providing the necessary scaffolding in the learning environment.

Accordingly, most L2 instructors in today's classroom strive to provide opportunities in the classroom for collaborative interactions. The desire to maintain or replicate this part of the classroom experience, no doubt, accounts for some of the profession's resistance to accept DL language courses as a valid alternative. Nevertheless, non-traditional learning environments such as CMC appear to afford ample opportunities for collaborative work with the concomitant SLA benefits (Blake, 2000, 2005; Blake and Zyzik, 2003; Smith, 2003). At present, only the weight of tradition seems to privilege the classroom over these other learning environments, although each format clearly offers a different set of affordances. The potential benefits of collaborative exchanges, whether set in the classroom or managed online, depend more on sound pedagogical design of the tasks the participants are asked to accomplish rather than on the actual locus of the learning event (Doughty and Long, 2003; Kern, Ware, and Warschauer, 2004; Salaberry, 2000; Van Deusen-Scholl, Frei, and Dixon, 2005). In other words, people working together perform better whether in a face-to-face or CMC environment, provided that the activities have been well thought out so as to stimulate maximum interaction among the participants.

This is not to say that the tools themselves have no effect on successful interactions. Kern (1995) was among the first to look closely at the role CMC tools play in facilitating L2 development. He analyzed large-group textual exchanges among L2 French students using *Daedalus InterChange*. He reported that the chat room reduced the role of the teacher in contrast to classroom where the teacher's role dominated the control of the discourse. His data revealed that students produced more total L2 language, crafted more sophisticated structures, and took more turns in this type of an open chat room than during face-to-face discussions. Chun's (1994) study of fourth semester German students yielded similar results.

Recent examinations of CMC have concentrated more on pair or small-group work rather than the discourse found in large chat rooms. A variety of Instant Messenger tools are currently available that support synchronous text exchange (Lafford and Lafford, 2005). More recently, researchers have turned to tools that have the capacity to support audio conferencing as well as keyboard chat (Blake, 2005; Hampel and Hauck, 2004; Jepson, 2005; Levy and Kennedy, 2004): for example, *Wimba*, *Lyceum*, or *PalTalk*, which are based on *Java* applets; or *Breeze* and other home-grown applications based on *Flash Communication Server*.) All of these tools provide Voice-over Internet Protocol (VoIP) that allows students to use the computer much like a telephone.

These bimodal (i.e., text and sound) CMC tools provide L2 students with multiple communication channels that can be used for different purposes (Jepson, 2005). For instance, if someone in the group begins to monopolize the conversation through the sound channel, the other participants still have recourse to express themselves through keyboard chat. Given this flexibility, it is hard to silence partners and even shy personalities participate actively in the flow of the conversation.

Only a handful of studies have addressed the possible transfer effects that keyboard chatting might exert on oral proficiency (Abrams, 2003; Payne and Ross, 2005; Payne and Whitney, 2002). Payne, Whitney and Ross have found that individual differences come into play as well. L2 students with low-span working memories seem to benefit more from CMC because the reduced cognitive burden introduced by textual chatting allows them to produce more extensive and elaborate constructions, an activity these less verbally gifted students may have found difficult in face-to-face exchanges.

Other researchers are more interested in CMC as a way to link native and nonnative speakers in a growing variety of exchange projects. In this context, CMC takes on new meaning as a medium of socialization. This line of inquiry has been dubbed Internet-mediated intercultural communication in foreign language education (Belz and Thorne, 2005). From this perspective, researchers concentrate on the importance of having online L2 learners develop sensitivity to another's cultural identities and communicative styles. Proponents of this approach want their L2 students to reflect upon the fact that their own identity is culturally contingent on certain patterns of interactions (Kern, Ware, and Warschauer, 2004). Researchers caution the field against viewing CMC as a simple tool-using activity in service of linguistic practice. They argue that participating in online interactions is not a culturally neutral endeavor, but embedded in specific cultural and social norms that may or may not be familiar to all participants, L2 and native speaker alike. Accordingly, this more sociocultural approach seeks to examine the concept of *digital literacy* in a way that goes beyond the

ability to read and write online: How do L2 learners coconstruct their own online roles and identities? The end result is that L2 students are increasingly responsible for diverse representations of knowledge and learning (Van Deusen-Scholl, Frei, and Dixon, 2005) but, in many cases, participants will need training in how to do this if the CMC exchanges are to be successful (Belz and Kinginger, 2002).

Despite the different research interests, the overall tone of the CMC research findings treat CMC—and synchronous bimodal chatting, in particular—as an essential component of a modern L2 curriculum in either the hybrid or DL format. For the DL course, CMC crucially becomes the curricular glue necessary to maintain student interest in lieu of any other form of face-to-face daily contact (Blake, 2005).

### PROBLEMS AND DIFFICULTIES

Implementing and evaluating DL language courses represent two separate issues, each with its respective challenges. To implement a language course in a DL format, L2 teachers cannot simply clone existing print materials for the Web. Careful attention must be paid to making the online activities as stimulating as possible as a function of the strengths of this particular medium. For this reason, the creation of an online curriculum is both expensive (i.e., the Open University spends around two million per course on an 8-year cycle) and time-consuming—two facts largely ignored by administrators and departments. By and large, a content-based approach (i.e., learning language through the study of subject matter) to producing Web activities with the main focus on the exploration of meaning first, and linguistic forms second, will render better results than the more traditional focus-on-forms (i.e., grammatical) methods. Some form of initial pilot testing of DL materials is also highly recommended.

Likewise, administrators tend to see the DL format as a solution to oversubscribed language classes. Large enrollments taught in the DL format are just as difficult to manage, if not more so, as in classroom formats. Teachers of DL language classes need to resist attempts by administrators to accept more students than is the norm for language classroom (i.e., around 25 students).

On the practical side of delivery, extensive user support is key to maintaining student interest and avoiding the frustrations that commonly occur with the use of new technologies (Simpson, 2000). It is wise to remember that roughly half of the enrolled DL students are predicted to give up and drop the course (Carr, 2000). It must be realized that not all students are ready to work independently and take responsibility for the direction their own learning. However, this is the only *modus operandi* within the DL format and should not be blamed when

students are not ready for the challenge. Fortunately, LCTL students tend to already possess solid skills in working independently, a fact which would favor the outcome of using a DL format for LCTL instruction.

The process of evaluating DL courses encounters its own difficulties beginning with the obvious fact that the students have only a virtual presence—they never see their instructor in person. Getting virtual L2 students to take special pre-/posttests or fill out questionnaires not related to the computation of their grade—something that teachers regularly cajole their students into doing through the classroom format—can be a daunting task (Blake and Delforge, 2006).

Perhaps the greatest hurdle to generalizing findings about DL language courses is a characteristic shared with realities of doing SLA research itself: individual differences account for a major portion of the outcome variability and are hard to control for. With technology involved, individual differences are just exacerbated since L2 learners perform from their own respective home environments, which are all different. At the same time, and ironically for research purposes, allowing L2 learners to self-direct their own learning activities constitutes one of the major attractions of this learning environment. Similarly, longitudinal studies—which, again, are relatively rare even in mainstream SLA studies—are almost impossible to carry out in the DL context.

Finally, as mentioned earlier, isolating the effects of the DL format as opposed to those of the learning materials or individual differences is exceedingly hard to operationalize. Not surprisingly, the field has not made much progress on teasing these factors apart.

#### FUTURE DIRECTIONS

Demonstrating to the profession at large that the DL format has a significant contribution to make to the L2 curriculum will persist as a research priority, especially given many teachers' entrenched resistance to technology or even their fears that computers might replace them. Higher education is beginning to reconfigure its delivery mechanisms in the face of growing costs and instructor shortages (as in the case of LCTL offerings) and the L2 curriculum will not be exempt from these trends. The field must experiment and plan for alternate delivery mechanisms if it is to have a significant say in how the L2 curriculum will be organized.

Further research is needed to demonstrate how synchronous CMC can help maintain high levels of conversational interactivity in the DL format. Similarly, more data should be gathered on how best to use new advances in audio conferencing so as to formulate guidelines

of best practices for prospective DL instructors who must learn how and when to alternate text messaging with audio exchanges.

In the same vein, the initial inquiries regarding the effect of keyboarding on the development of oral proficiency show considerable promise for the field and should receive more serious attention (see Abrams, 2003; Payne and Ross, 2005; Payne and Whitney, 2002). In pursuit of this goal, researchers should control for working memory, an important individual variable.

Finally, the field must provide DL instructors and curriculum developers with more insights on how the CMC medium can be used most productively to foster intercultural contexts. Students and instructors alike should not assume that everyone uses chat in the same way and with the same cultural understandings and conventions. This realization opens the door to using CMC to construct and reflect upon one's own identity in a new L2 space.

In technological terms, the DL format for L2 instruction will continue to evolve rapidly. General availability of increased bandwidth will, no doubt, push teachers to high-quality video streaming and video exchanges, as well. Voice recognition and similar technologies are probably not too far off on the horizon for the micro-computing platforms. If the DL language field retains an emphasis on collaborative exchanges and co-construction of learning (i.e., the interactionist perspective), these new or yet-to-be imagined technical advances have the potential of being smoothly absorbed into an educational medium that is here to stay.

# **Section 1**

**21<sup>st</sup> Century Bilingual Education: Advances in Understanding and Emerging Issues**

KEY CONCEPTS IN BILINGUAL EDUCATION:  
IDEOLOGICAL, HISTORICAL, EPISTEMOLOGICAL, AND  
EMPIRICAL FOUNDATIONS

INTRODUCTION: WHY DO WE NEED TO DEFINE  
CONCEPTS?

The concepts we use are almost never neutral. In contested arenas such as bilingual education, words and concepts frame and construct the phenomena under discussion, making some persons and groups visible, others invisible; some the unmarked norm, others marked and negative. Choice of language can minoritise or distort some individuals, groups, phenomena and relations while majoritising and glorifying others. Concepts also can be defined in ways that hide, expose, rationalise or question power relations.

Because concepts and terms develop historically, the same concept may have several definitions. For example, 'language immersion' has historically been associated with French–Canadian immersion for middle-class Anglophones (Cummins and Swain, 1986; Lambert and Tucker, 1971). The term was misleadingly appropriated by US policymakers to describe submersion programmes (called 'structured immersion'), despite protest from the concept's originator (Lambert, 1984, pp. 26–27). Recently the term has taken on new meaning in Indigenous-language immersion programmes to revitalise endangered Indigenous languages (Bear Nicholas, 2005; Hinton and Hale, 2001; Hinton and Vera, Steel, and Advocates for Indigenous California Language Survival, 2002). The ideological, historical, epistemic and empirical bases for these varied uses of 'immersion' are distinct, as are program practices.

A further reason for interrogating concepts is the presence of multiple paradigms. For example, literacy can be defined as the ability to read and write. Yet this definition masks two different paradigms informing literacy research and practice. *Autonomous* views characterise literacy as abstract, neutral and independent from the social context and language users (Ong, 1982). *Ideological* views characterise literacy as 'socially and historically situated, fluid, multiple, and power-linked' (McCarty, 2005, pp. xvii–xviii; Street, 1984, 2001). Educationally, an autonomous view emphasises discrete language skills often taught through direct instruction and scripted phonics programs. An ideological

view binds reading and writing to oracy, emphasising the development of different literacies (and multi-literacies) for different purposes through meaningful social interaction and critical examination of authentic texts.

In this chapter, we define and ‘unpack’ key concepts in bilingual education, focusing on those encountered most frequently in the research and pedagogical literature. We then examine one illustrative case—the term ‘limited English proficient’ (LEP) in US language policy—to illustrate the ideological, historical and empirical underpinnings of such concepts. We conclude by considering the implications of this work for bilingual education practice and linguistic human rights (LHRs).

## KEY CONCEPTS AND TERMS

**Additive language learning.** A new language is learnt *in addition to* the mother tongue, which continues to be developed. The learner’s total linguistic repertoire is extended.

**Assimilation.** Process by which minoritised people are brought into conformity with the dominant language and culture, often through coercive practices to replace heritage languages and cultures with those of the majority.

**Bi-/multilingual education.** Use of two or more languages as media of instruction in subjects other than the languages themselves (Andersson and Boyer, 1978). *Non-forms* of bi-/multilingual education lead to monolingualism, and include: (i) mainstream monolingual programmes with foreign language teaching for dominant language speakers; (ii) monolingual dominant-language medium programmes in which Indigenous/minority children learn the mother tongue/heritage language as a subject, often outside regular school hours; (iii) submersion (‘sink-or-swim’) programmes; and (iv) segregation programmes; *Weak forms* aim for strong dominance in the majority language, and include transitional (i) early-exit and (ii) late-exit programmes. *Strong forms* include: (i) mother-tongue maintenance or language shelter programmes; (ii) two-way bilingual (dual language) programmes; and (iii) plural multi-lingual programmes such as the special European Union schools. Only strong forms lead to high levels of bi-/multilingualism and are associated with greater academic success for language minority students (Thomas and Collier, 2002). These programmes also respect LHRs.

**Bi-/multilingualism.** This includes: (i) *individual bi-/multilingualism*, sometimes called plurilingualism, involving proficiency in and use of

two or more languages by an individual; the term does not always imply an equally high level of proficiency in all the relevant languages; (ii) *societal bi-/multilingualism*, when two or more languages are widely used in a community or state; the term does not always assume official status for the languages; (iii) *bilingualism as an educational goal*, a bilingual speaker who is able to function in two or more languages in monolingual or multilingual communities at the same level as native speakers and in accordance with the socio-cultural demands for communicative and cognitive competence by these communities and the individual, and who identifies positively with both (or all) language groups and cultures, or parts of them (Skutnabb-Kangas, 1984, p. 90).

**Content- and language-integrated learning (CLIL)/Cognitive academic language learning (CALLA).** The teaching of some subjects through the target language; an approach to language learning through content-area study ([www.clilcompendium.com/brief.htm](http://www.clilcompendium.com/brief.htm); Chamot and O'Malley, 1994).

**Ecology of languages.** The study of languages in their ecological and socio-cultural context; a perspective on the relationship between languages guiding language policy strategies, with the goal of achieving a harmonious balance between all languages in a given environment (Fill and Mühlhäusler, 2001; Haugen, 1972; Hornberger, 2003; Mühlhäusler, 2003; Skutnabb-Kangas, Maffi and Harmon, 2003).

**English-as-a-second-language (ESL).** English can be a second language: (i) in terms of the order of learning (as opposed to a first language) and/or (ii) when used in the environment outside the classroom (as opposed to English-as-a-foreign language (EFL), which involves primarily classroom learning). ESL contexts include those in which English is learnt by those for whom it is not the mother tongue (e.g. Indigenous peoples and immigrants in Australia), and post-colonial settings in which English remains the language of power (e.g. Nigeria, Singapore). English is also a second language in European countries in which English proficiency is required for key functions such as in higher education or commerce (e.g. the Netherlands, Sweden), and where there is considerable exposure to English in the wider society (e.g. in the media).

**English-only.** Also called US English and Official English (<http://www.us-english.org/inc>), this US-based political movement seeks to ban instruction and public discourse in languages other than English (Crawford, 1992; González and Melis, 2000, 2001). English-only policies exist in 23 US states.

**Ethnicity/ethnic identity.** Historical, geographical, cultural, linguistic, sociolinguistic and/or national associations that bind individuals together as a distinct, self-identified group. Group-defining characteristics may include common descent ('factual' or 'mythical'), religion and social organisation. Although language is not a defining characteristic of ethnicity for all people, it has been accorded priority by many (Fishman, 1989, 1999; Smolicz, 1979). All people, not only minorities, possess ethnic identities.

**European Union schools.** Special EU schools with sections for various languages in which each language (mostly students' mother tongue) is the primary medium of education. The first foreign language is taught as a subject from grade 1; a few context-embedded subjects (e.g. physical education, arts, etc.) are taught in mixed groups through this language from grade 3, preferably with no mother tongue speakers; a few additional subjects are taught through it in later grades, but decontextualised verbally and intellectually demanding subjects (e.g. history) are taught through the medium of the first foreign language only from grade 8, when students have studied the language as a subject for seven years and have had some less demanding subjects taught in it for five years. There is more teaching through the mother tongue in grades 10–12, especially in demanding subjects. Instruction in a second foreign language (one of the languages of other sections) begins in grade 7. All teachers are minimally bilingual. For each subject, students choose the language in which they take their final exams. Everyone becomes minimally bilingual at a high level, and many become trilingual.

**First language (L1).** Often a synonym for mother tongue, or in contrast to a second language (L2); the language first learnt, best known, and/or most used.

**Foreign language (FL).** A language learnt mainly in the classroom, for reading texts and/or communication with its speakers (e.g. Arabic in Korea, English in Mongolia, French in Russia).

**Immersion programmes for dominant language speakers.** Parents of linguistic majority children with a high-status mother tongue (e.g. Anglophones in Ontario, Canada) choose voluntarily to enrol their children in a programme in which instruction is conducted through the medium of a foreign/minority language. Most of the children in these classes are majority language children with the same mother tongue. Teachers in these programmes are bilingual so that children can initially use their own language and still be understood. These programmes are implemented in additive language learning contexts in which children's mother tongue is not in danger of being replaced by the language

of instruction. Although children enrolled in French immersion programmes in Canada initially represented a largely homogenous Anglophone population, increasingly, children whose mother tongue is neither English nor French are enrolling in these programs.

**Immersion programmes for Indigenous peoples or minorities.**

Dominated-group children who have partially or completely lost their ancestral language choose voluntarily, among existing alternatives, to be instructed through the medium of the Indigenous/minority language, in classes with children with the same goal and target language, in which the teacher is bilingual so that children can initially use their dominant language, and in contexts in which that language is not in danger of being replaced by the Indigenous/minority language; an additive language learning context.

**Indigenous education.** There are at least three senses of this concept: (i) natural systems ('formal' and 'informal') of child socialisation developed by Indigenous peoples in accordance with local norms, to teach Indigenous knowledge and skills through the Indigenous language; (ii) imposed colonial and post-colonial schooling, usually through the dominant language, with assimilation as a goal and (iii) contemporary Indigenous self-determinant schooling, usually based on culturally relevant content and pedagogy, and including instruction in and through the Indigenous language.

**Indigenous peoples.** Communities, peoples and nations, which, having a historical continuity within pre-invasion and pre-colonial societies that developed within their territories, consider themselves distinct from other sectors of the society(ies) now prevailing in those territories. They form non-dominant sectors of society determined to preserve, develop and transmit to future generations their ancestral territories, identity and often, their language as the basis of their continued existence as peoples, in accordance with their cultural practices and social and legal systems (Cobo, 1987, p. 4). The International Labour Organisation's (ILO's) 1989 definition may be the strongest legally: '... peoples in independent countries who are regarded as indigenous on account of their descent from the populations which inhabited the country, or a geographical region to which the country belongs, at the time of conquest or colonisation or the establishment of present state boundaries and who, irrespective of their legal status, retain some or all of their own social, economic, cultural and political institutions.' Self-identification is included within the ILO definition 'as a fundamental criterion for determining the groups to which the provisions of this Convention apply' (<http://www.unhcr.ch/html/menu3/b/62.htm>).

**Language.** The system of sounds, words, signs, grammar and rules for (i) communication in a given speech community for spoken, written, or signed interaction; (ii) storing, acting out and developing cultural knowledge and values and (iii) displaying, analysing, structuring and creating the world and personal and social identity. Theoretically, language also can be seen as existing only in practice, when being used, created and enacted. The existence of discrete languages (rather than continua of mutually intelligible dialects) has also been called a Western myth (e.g. Mühlhäusler, 2003).

**Language endangerment.** Situation in which intergenerational transmission is proceeding negatively, with fewer children in each generation acquiring the language in childhood. Other criteria include low number of speakers, reduced number of communicative domains and low status. About 50%–90% of the world's spoken languages may be extinct or seriously endangered by 2100 (Krauss, 1992; UNESCO Ad Hoc Expert Group on Endangered Languages, 2003; [http://portal.unesco.org/culture/en/file\\_download.php/947ee963052abf0293b22e0bfba319cc-languagevitalityendangerment.pdf](http://portal.unesco.org/culture/en/file_download.php/947ee963052abf0293b22e0bfba319cc-languagevitalityendangerment.pdf); [http://portal.unesco.org/culture/en/ev.php-URL\\_ID=8270&URL\\_DO=DO\\_TOPIC&URL\\_SECTION=201.html](http://portal.unesco.org/culture/en/ev.php-URL_ID=8270&URL_DO=DO_TOPIC&URL_SECTION=201.html)).

**Language maintenance or language shelter programmes.** Linguistic minority children (often with a low-status mother tongue) choose voluntarily, among existing alternatives, to be instructed through the medium of their mother tongue, in classes with minority children with the same mother tongue, in which the teacher is bilingual and there is a pedagogically sound instructional programme in the majority language as a second or foreign language, also provided by a bilingual teacher.

**Language planning.** Socio-cultural process undertaken by an authorising body (e.g. government, schools), communities and/or families to promote language change through (i) *status planning*, decisions and activities specifying how languages will be used, by whom, in what contexts, and for what purposes; (ii) *corpus planning*, including language codification, elaboration, standardisation and development of print materials; and (iii) *acquisition planning*, language programme development (Cooper, 1989; Haugen, 1983; Kaplan and Baldauf, 1997). Language planning may be guided by one or more orientations: (i) *language-as-a-problem*, in which linguistic diversity is viewed as a problem to be overcome; (ii) *language-as-a-right*, the negotiation of language rights, often in contested contexts; and (iii) *language-as-a-resource*, the promotion of linguistic democracy and pluralism (Ruiz, 1984). (See also Grin, 2006 on economic considerations in language planning and policy.)

**Language policy.** Socio-cultural process that includes official acts and documents as well as everyday language practices that express normative claims about legitimate and illegitimate language forms and uses, and have implications for status, rights, roles, functions and access to languages and varieties within a given polity, organisation or institution; the scholarly study of how decisions about language are formulated and implemented, often considered a subset of language planning (see, e.g. Lo Bianco, 1987).

**Language regeneration.** For an endangered language, deliberate language planning and policy activities aimed at (i) *language revival*, restoring oral and/or written functions for a language no longer spoken, and for which little or no literary tradition exists; (ii) *language revitalisation*, giving new vitality to endangered-language domains and functions; and/or (iii) *reversing language shift*, producing new generations of speakers (Amery, 2000; Fishman 1991, 2001; Huss, Camilleri and King, 2003; Paulston, 1993; Romero-Little and McCarty, 2006).

**Language rights.** *Negative language rights* concern the right to non-discrimination in the enjoyment of human rights; *positive language rights* involve the freedom to practice or use distinctive aspects of a group's culture, including language and religion. Positive language rights typically require a state obligation to support minority languages.

Limited English proficient/Non-English proficient (NEP): A definition in US language policy in which minority students are identified negatively, in terms of what they do not yet know fully; revised in 2001 to *English language learner* (ELL), a more positive term but one that nonetheless emphasises what linguistic minority students do not know and invisibilises what they do know (e.g. their own or their parents' language and culture).

**Linguicism.** Beliefs, attitudes and actions whereby differences of language serve to structure inequality between linguistic groups; ideologies, structures and practices used to legitimate, effectuate, regulate and reproduce an unequal division of power and resources between groups defined on the basis of language (Skutnabb-Kangas, 1988, p. 13).

**Linguistic human rights.** Individual and collective language rights that every individual has because of being human, to be able to fulfill her/his basic needs and live a dignified life. In theory, LHRs are so inalienable that no state or person may violate them (Skutnabb-Kangas, 2000; Skutnabb-Kangas and Phillipson, 1994).

**Linguistic imperialism.** A form of linguicism in which one community or collectivity dominates another, as in colonialism, imperialism

and corporate globalisation, and in which the language of the dominant power is privileged structurally in the allocation of resources and ideologically in beliefs and attitudes towards languages (Phillipson, 1992).

**Linguicide/linguistic genocide.** The deliberate elimination of a language, without killing its speakers; forcing speakers to give up a mother tongue through ‘forcibly transferring children of the group to another group’; ‘causing serious bodily or mental harm to members of the group’ (United Nations International Convention on the Prevention and Punishment of the Crime of Genocide 1948, E 793, Articles 2e and 2b); or ‘prohibiting the use of the [mother tongue] in daily intercourse, or in schools, or the printing and circulation of publications in the language of the group’ (from the 1948 Final Draft of the earlier version, not part of the Convention).

**Majority language.** Language of a dominant group, in terms of numbers and/or power.

**Minorities.** Defined similarly to ethnic groups (numbers, dominance, characteristics), and by a desire to maintain distinctive characteristics; there is often no common descent (e.g. women; gay, lesbian, bisexual and transgendered persons; Deaf persons). Ethnic minorities can have national/autochthonous or immigrant origins. Few countries state how long an immigrated minority must reside in a country before becoming a ‘national’ minority (Hungary: 100 years); some countries are unwilling to accept that they have immigrants (‘guest workers’). ‘Being’ a minority in the sense of having less power than some other group(s) (i.e. being minoritised) is a relationship rather than a characteristic; it pre-supposes that (an)other group(s) has/have been majoritised. Human agency can transform these relations in a more equal direction. In international law, the existence of a minority does not depend on a decision by the state but must be established by objective criteria. Minorities have some rights in education that are not accorded in international law to children under other labels (e.g. ‘linguistically diverse students’, ‘ELLs’). In international law, minorities do not have a right to self-determination (e.g. independence), whereas Indigenous peoples do.

**Minority language.** Language that is not the dominant language of a territorial unit such as a state, because the speakers of the language have less power (they have been minoritised), and the language is generally spoken by a smaller number of people. Power relations—not numbers—constitute the defining characteristic of ‘minority’ languages (e.g. Navajo speakers are numerically dominant within the Navajo nation yet their language is minoritised within and outside their lands; many African languages are minority languages from a power point of

view although they have more speakers than those of official languages). In many countries, all groups are minorities.

**Monolingual ideology.** False belief that monolingualism at both the individual and societal levels is normal, desirable, sufficient for most purposes and unavoidable; monolingual fallacy/habitus/reductionism/naivety.

**Monolingualism.** Functioning in a single language (includes dialectal variation; one may be bidialectal but monolingual).

**Mother tongue.** Language(s) one learns first, identifies with, and/or is identified by others as a native speaker of; sometimes also the language that one is most competent in or uses most. There may be a change of mother tongue during a person's lifetime according to all other criteria except the first. A person may have two or more mother tongues (bilingualism/multilingualism as a mother tongue). Indigenous or minority mother tongues are sometimes called *heritage languages* (often when children do not know them well), *home languages* (implying that they are/should not be used for official purposes) or *community languages* (falsely implying that majority populations do not form a community). The last three terms can (but need not) contribute to the minoritisation of the language(s). Even if they do not yet know (much of) a language, Deaf persons and Indigenous peoples have the right to claim a Sign language or an ancestral language as their mother tongue on the basis of identifying with it.

**Native speaker.** Individual whose competence in a language almost always derives from the language being the mother tongue and first language learnt.

**Non-native speaker.** Label that defines a person's language competence negatively, vis-à-vis others for whom the language is a mother tongue, rather than positively as a user of the language as a second or foreign language.

**Oracy.** High levels of spoken language proficiency; to be a competent speaker or storyteller. An *orate* is an individual who communicates through listening and speaking but not reading and writing; orates often have superb memory strategies in comparison with persons considered literate because orates carry their entire 'library' in their heads. *Orature* is oral literature.

**Oralism.** Teaching Deaf people to 'lip-read' and speak only; discouraging or prohibiting them from using a natural Sign language.

**Second language (L2).** Language learnt after acquiring the mother tongue (as opposed to first language), or learnt and used in the environment, often in addition to school (as opposed to foreign language).

**Segregation programme.** Linguistic minority children with a low-status mother tongue are forced to accept instruction through the medium of their mother tongue in classes with minority children with the same mother tongue, where the teacher may be monolingual or bilingual but is often poorly trained, the class/school has poorer facilities and fewer resources than classes/schools for dominant group children, and teaching of the dominant language as a second/foreign language is poor or non-existent. Later integration is not a goal in these programmes.

**Sign languages.** Natural languages that developed in Deaf communities similarly to the way in which spoken languages developed in hearing communities. Examples are AUSLAN (Australian Sign Language), ASL (American Sign Language) and Swedish Sign Language. Sign languages are complex, abstract linguistic systems with their own grammars. They have a small closed set of distinctive features, meaningless in themselves, that combine in ways peculiar to each language to form morphemes, which are then combined into meaningful signs. In analysing a sign, the equivalent of the phoneme is the chereme. Cheremic variation in individual signs plays the same role in differentiating one sign from another as does phonological variation in distinguishing words. There are five parameters within which cheremic variations occur in natural Sign languages: (i) handshape(s), (ii) location of sign, (iii) palm orientation, (iv) movement(s) and (v) non-manual features (e.g. facial expressions, use of shoulders and body). By changing the chereme in any one of these five areas, the meaning of a sign is altered.

**Structured immersion.** An approach in the USA in which linguistic minority students are submersed in the dominant language with little or no support for their mother tongue; combines aspects of ESL and submersion/sink-or-swim, with the goal of replacing the mother tongue with English.

**Submersion/sink-or-swim programme.** Linguistic minority children with a low-status mother tongue are forced to accept instruction through a foreign majority/official/dominant language, in classes in which the teacher does not understand the minoritised mother tongue, and in which the dominant language constitutes a threat to that language, which runs the risk of being replaced; a *subtractive* language learning situation. In another variant, stigmatised majority children (or groups of minority children in a country with no decisive numerical and/or power majorities) are forced to accept instruction through the

medium of a foreign (often former colonial) high-status language (because mother tongue-medium education does not exist). This often occurs in mixed mother tongue classes, mostly without native speakers of the language of instruction, but also in linguistically homogenous classes, sometimes because mother tongue education does not exist or because the school or teachers hesitate to implement a mother tongue-medium programme. The teacher may not understand children's mother tongue(s). The foreign language is not learnt at a high level at the same time as children's mother tongues are displaced and not learnt in formal domains (e.g. mother tongue literacy is not achieved). Often the children are made to feel ashamed of their mother tongues, or to believe in the superiority of the language of instruction.

**Subtractive language learning.** A new, dominant/majority language is learnt at the cost of the mother tongue, which is replaced or displaced, with a resulting diglossic situation. The individual's total linguistic repertoire does not grow.

**Transitional early-exit and late-exit programmes.** Linguistic minority children with a low-status mother tongue are initially instructed through the medium of their mother tongue for a few years; the mother tongue is used as an instrument for acquisition of the dominant language and content. In *early-exit* programmes, children are transferred to a majority-language medium programme as soon as they develop (some) oral communicative competence in the majority language, in most cases after one to three years. In *late-exit* programmes, children may receive some instruction through L1 up to the fifth or sixth grade; sometimes the mother tongue is taught as a subject thereafter. For both programme types, the primary goal is proficiency in the dominant language.

**Two-way bilingual (dual language) programmes (sometimes erroneously called double or dual immersion in the USA).** Approximately 50% majority and 50% minority students (with the same mother tongue) choose voluntarily to be instructed by a bilingual teacher, initially mainly through a minority language (the 90/10 model) or through both languages (the 50/50 model), with the dominant language taught as a subject (at the beginning separately to both groups, e.g. mother tongue English to native English-speakers and ESL to minority language speakers in the USA). The percentage of instruction in the dominant language increases in all 90/10 models, in some to 40% to 60% by grade 6, whereas it stays the same in the 50/50 model. In cases where there is no follow-up through the medium of the minority language after grade 6 when many children move to another school, two-way models can be placed in the transitional model category when considering the child's full educational (K to 12) career. Two-way

models thus combine in one classroom a maintenance model for minorities (especially in the 90/10 model) and an immersion model for the majority, while maximising peer-group contact in the other language for both groups. In some cases two-way immersion may include instruction in two minoritised languages (e.g. Navajo and Spanish in the USA), coupled with ESL instruction for both groups.

AN ILLUSTRATIVE CASE: HISTORICAL,  
IDEOLOGICAL AND EMPIRICAL UNDERPINNINGS  
OF 'LIMITED ENGLISH PROFICIENCY' IN US  
LANGUAGE POLICY

In the USA, a child's identification as LEP has been the primary criterion for participation in state and federal bilingual education programmes. As defined by federal law, LEP refers to (i) persons not born in the USA or whose native language is other than English and who come from an environment in which a language other than English is dominant; (ii) Native Americans or Alaska Natives who come from an environment in which a language other than English has had a significant impact on her or his English proficiency; and (iii) persons classified as 'migratory', with a native language other than English and who come from an environment in which a language other than English is dominant. In all cases, individuals so identified must demonstrate 'sufficient difficulties' speaking, reading, writing or understanding English as to deny them opportunities to learn successfully in English-language classrooms and participate fully in society ([http://www.helpforschools.com/ELLKBase/legal/Definition\\_LEP.shtml](http://www.helpforschools.com/ELLKBase/legal/Definition_LEP.shtml)).

Emphasising what individuals lack rather than the proficiencies they possess, the term LEP reveals the 'language-as-a-problem' orientation in US language policy (Ruiz, 1984). The centrepiece of this policy was historically the Bilingual Education Act of 1968, the purpose of which was, according to its legislative sponsor, not 'to create pockets of different languages throughout the country', nor to 'stamp out the mother tongue', nor to make [minorities'] mother tongue the dominant language', but rather to 'make those children fully literate in English' (cited in Crawford, 2004, p. 107). The compensatory and transitional nature of the policy is underscored by the fact that it gave preference to children from low-income homes and did not require instruction in children's native language (Crawford, 2004, p. 117).

In 1973, the policy was modified to direct schools to use students' native language 'to the extent necessary to allow a child to progress effectively through the education system' (Crawford, 2004, p. 114). Five

years later, a one-word qualifier reaffirmed the policy's transitional approach: LEP students' primary language could be used *only* to the extent necessary to further their English-language development. Subsequent reauthorisations reserved funding for 'special alternative' (English-only) programmes. In 2001, the legislation was re-titled the English Language Acquisition, Language Enhancement and Academic Achievement Act, with the sole purpose of ensuring that LEP children 'attain English proficiency, develop high levels of academic attainment in English, and meet the same challenging State academic content . . . standards as all children' (English Language Acquisition, Language Enhancement and Academic Achievement Act, Part A, Sec. 3102[1]). The term LEP has been replaced by 'ELL', a term that appears benign but is consistent with the dismantling of a 'bilingual education' policy discourse. These changes in terminology have been coterminous with policies to regulate immigration, particularly along the US–Mexico border. As such, the terminology contributes to a larger discourse of containment aimed at regulating diversity deemed threatening to national interests (McCarty, 2005).

#### IMPLICATIONS AND FUTURE DIRECTIONS

In this chapter we have shown how terminological choices shape and are shaped by broader ideological, historical and socio-political forces. These choices have far-reaching consequences for language learners and their communities. In the USA example cited earlier, language choice serves to delegitimise minority students' mother tongues as languages for academic development, while linking those languages and their speakers to poverty and low social status. Other examples (e.g. immersion programmes for Indigenous peoples or minorities) illustrate the ways in which concepts and terms can frame and support democratising educational goals.

As researchers and educators, our first charge is to carefully and critically examine the terms and concepts that constitute the 'toolkit' for our work. How do they describe and frame the characteristics of language learners and their communities? To what extent do they circumscribe or expand learners' opportunities and potentials? What language planning orientations underpin particular terminologies and concepts? Whose interests do they serve? We can then employ these tools strategically towards social justice ends. While changes in terminology alone cannot reverse educational inequities, they are nonetheless essential to the development of a counter-hegemonic discourse that respects and promotes LHRs.

## BILINGUAL/IMMERSION EDUCATION: WHAT THE RESEARCH TELLS US

### INTRODUCTION

This chapter explores key research findings about bilingual/immersion education and the related efficacy of various approaches to teaching bilingual students. When this research is examined, and taken seriously, the picture of what constitutes an effective educational approach for bilingual students can be clearly ascertained. However, this clarity is not yet reflected in wider public and policy debates, where strongly polarised positions both for and against bilingual/immersion education remain commonplace.

A key reason why wider public and policy debates on bilingual/immersion education continue to be so contested rests with the widely different understandings among commentators of what such an education actually constitutes. At one end of the continuum are those who would classify as bilingual *any* educational approach adopted for, or directed at bilingual students, *irrespective* of their educational aims (fostering bilingualism or monolingualism) or the role (if any) of first language (L1) and second language (L2) as languages of instruction. In other words, simply the presence of bilingual students in the classroom is deemed sufficient to classify a program as bilingual (see, e.g. Baker and de Kanter, 1981). At the other end of the continuum are those who distinguish clearly between non-bilingual, weak and strong bilingual programs (e.g. Baker, 2006; Skutnabb-Kangas, 1981, 2000). It is the latter approach that I will adopt in this analysis.

### EARLY DEVELOPMENTS: DEFINING BILINGUAL/IMMERSION EDUCATION

There are a plethora of existing typologies with respect to bilingual/immersion education in the research literature, although, as one might expect, they do not always correspond or overlap, depending on the initial starting point, and position of the researcher. Some of the most accessible and informed can be found in Hornberger (1991), Baker (2006), Cummins (2003), and Skutnabb-Kangas (2000); for a useful overview, see May, Hill and Tiakiwai (2004) and Genesee, Lindholm-Leary, Saunders and Christian (2006).

Before unpacking the characteristics of bilingual/immersion education further in light of these typologies, however, it is useful to begin with a classic definition of bilingual education, first posited by Andersson and Boyer:

Bilingual education is instruction in *two languages* and the use of those two languages as mediums of instruction for any part, or all, of the school curriculum. (1970, p. 12; their emphasis)

Put simply, bilingual education involves instruction *in* two languages (see also Baker and Prys Jones, 1998; Cummins, 2003; Freeman, 1998; Hamers and Blanc, 2000). This immediately excludes programs that include bilingual students but do not involve bilingual instruction, most notably submersion majority language programs, where students are taught only in the majority language, irrespective of their language background. It also excludes programs where an L2 is taught as a subject only. English as a second language (ESL) classes, which include the Sheltered Instruction approach increasingly popular in the USA, are examples of this, as are foreign language classes. Along with submersion programs, they can also clearly be described as non-bilingual programs.

For a program to be deemed to be bilingual, the key is that both languages must be used as media of instruction and thus to deliver curriculum content. As Baker and Prys-Jones (1998, p. 466) conclude: 'If there is a useful demarcation, then bilingual education may be said to start when more than one language is used to teach content (e.g. Science, Mathematics, Social Sciences, or Humanities) rather than just being taught as a subject by itself'. On this basis, immersion models that teach majority language students predominantly through a minority language, such as French-immersion programs in Canada or Maori immersion programs in New Zealand, are also clearly bilingual programs, since some curricular instruction in the majority language (English, in both cases) almost always occurs at some point prior to the end of the program, even in those programs with very high levels of immersion in the minority language.

An additional key point addressed by many commentators in defining bilingual education relates to the *philosophy* and related educational *goals* of any given program. In short, does the program in question aim to achieve, foster and/or maintain longer-term student bilingualism and biliteracy, adding another language to the student's existing language repertoire, which has come to be termed in the research literature as an *additive* approach to bilingualism? Or does it aim eventually to shift students from bilingualism to monolingualism in the dominant language, losing or replacing one language with another, a process that has been described as *subtractive* bilingualism?

First postulated by Lambert in Canada in 1974, the additive–subtractive distinction is also useful for another reason. Research over the last 30 years has consistently demonstrated that those programs which are most likely to achieve bilingualism and biliteracy for their students—that is additive bilingual programs—are also the most likely to see those students succeed educationally. In contrast, subtractive programs not only atrophy their students’ existing bilingualism, but also exhibit far lower levels of educational success for these students, particularly over time (see Baker, 2006; Cummins, 2000; Genesee, Lindholm-Leary, Saunders and Christian, 2006; May, Hill, and Tiakiwai, 2004; Thomas and Collier, 2002; see also later).

With this broad distinction between additive and subtractive bilingualism clearly outlined, the next level of classification of bilingual programs can now be made in terms of the specific linguistic and/or educational aims of particular bilingual education *models*. According to Freeman (1998, p. 3), models are defined in terms of ‘their language-planning goals and ideological orientations towards linguistic and cultural diversity in society’. They can be understood as broad categories that help us to understand on a very general level what bilingual education means, although there is inevitably a degree of arbitrariness in distinguishing among them.

Despite the welter of different classifications of bilingual education in the research literature, there are three broad models of bilingualism that are consistently included in these various typologies. These are *transitional* models, *maintenance* models and *enrichment* models of bilingual education. In addition to these three broad models, there are also what have come to be known as *heritage* models. These are most often associated with indigenous language education initiatives, such as Maori-medium education in New Zealand, Navajo language education in the USA, Quechua language education programs in Peru, and Sámi language education in Norway, among many (see, e.g. Hinton and Hale, 2001).

A *transitional* model of bilingual education uses the L1 of minority language students in the early stages of schooling but aims to shift students away from the use of their L1 as quickly as possible towards the greater use of the dominant language, in order to ‘cope’ academically in ‘mainstream’ or general education (de Mejia, 2002; Freeman, 1998). In other words, the L1 is used only to the extent that it facilitates the transition of the minority language (L1) speaker to the majority language (L2). Accordingly, most transitional programs are also ‘early-exit’ programs, where the L1 is used for only 1–2 years, before being replaced by the L2, and can thus be regarded as both a subtractive and weak bilingual model. In assuming that the (minority) L1 will eventually be replaced by a (majority) L2, bilingualism is not in itself

regarded as necessarily beneficial, either to the individual or to society as a whole. This in turn suggests that the eventual atrophy of minority languages, or the aim of moving eventually *from* bilingualism *to* monolingualism in the majority language, remains a central objective of transitional bilingualism programs. Until their recent demise in a political climate largely antithetical to *any* kind of bilingual program, a transitional bilingual approach was most prominent in the USA, where transitional bilingual programs were developed widely for Spanish (L1) speakers from the 1970s onwards.

A *maintenance* approach to bilingual education, on the other hand, differs fundamentally from a transitional approach because it aims to *maintain* the minority language of the student, *strengthen* the student's sense of cultural and linguistic identity, and *affirm* their individual and collective ethnolinguistic rights. As such, it is clearly an additive and strong bilingual model. There are many types of bilingual program that can be said to fit into this model and these will be discussed more fully below. However, the typical participant in a maintenance bilingual program will be a national minority group member (e.g. Welsh in Britain, Catalan in Spain, French Canadian in Canada, Latinos in the USA) whose L1 is already developed to an age-appropriate level (although they do not need to be literate yet in the language). The language of instruction of the program will either be predominantly in the L1 or, if both L1 and L2 are used as mediums of instruction, at least 50% in the L1. This is because the aim of such programs, as their designation suggests, is to maintain the L1 for a sufficient amount of time so that academic language proficiency in the L1 is achieved. This in turn facilitates the acquisition of literacy in an L2, on the basis of the developmental interdependence principle (see Cummins, 1979, 2000). Consequently, the most common programs in a maintenance bilingual model are late-exit programs—that is the use of L1 as an instructional language continues *for at least* 4 years, often longer.

Closely related to maintenance bilingual programs are *enrichment* programs, a term first coined by Fishman (1976). If the former are geared towards maintaining the L1 of minority language students, the latter are generally (but not exclusively) associated with teaching majority language students (such as L1 English speakers) *through* a minority target language. French immersion in Canada, where many of the students come from middle-class L1 English-speaking homes, is perhaps the most often cited example of an enrichment bilingual program. Welsh-medium schools, which also include many middle-class L1 English speakers, are another example. Elite bilingual programs such as the European Schools movement are also widely regarded as enrichment programs (see Baetens Beardsmore, 1993).

As with maintenance programs, the emphasis in enrichment programs is not just on achieving bilingualism and biliteracy for individual students but also on the ongoing maintenance of the minority language(s) in the wider community. As Hornberger argues, the enrichment model ‘encompasses all those bilingual education program types which aim towards not only maintenance but development and extension of the minority languages, cultural pluralism, and an integrated national society based on autonomy of cultural groups’ (1991, p. 222). Accordingly, Hornberger asserts that this type of program has the greatest potential to educate students successfully, given its strong additive bilingual basis. It is also the program most likely to reduce the educational and wider social and linguistic inequalities experienced by minority language speakers.

This broad L1/L2 distinction between maintenance and enrichment approaches is a useful one, or at least a useful form of shorthand, in the research literature. However, it does not necessarily help us to identify clearly where a *heritage* language model of bilingual education might fit in. As indicated earlier, this model is most commonly associated with indigenous language revitalisation efforts, along with a wide range of other indigenous language education initiatives, although in its wider sense, it can also include other established and immigrant groups (Valdés, Fishman, Chávez and Pérez, 2006; Wiley, 2001). The latter tend to be focused on the reclamation of a heritage language no longer spoken as an L1—that is the students are second language learners of the heritage language. The former include a combination of student language backgrounds. Some indigenous language programs are aimed at students who still speak the indigenous language as an L1 (e.g. Navajo; Hualapai in the USA; Inuit in Nunavut, Canada; Sámi in Finnmark, Norway) and may therefore be regarded as L1 maintenance bilingual programs. But many also cater for students with a mix of L1/L2 speakers of the language (Maori in New Zealand, Hawaiian), and some have only L2 speakers (or, rather, learners) of the language (the Master/Apprentice program developed for the now largely moribund indigenous languages of California) and are therefore closer to the enrichment end of the continuum.

As such, heritage programs can also clearly be regarded as an additive and strong bilingual approach, but tend to be situated somewhere in between maintenance and enrichment models in terms of the L1/L2 status of their students (May and Hill, 2005). That said, increasingly, the majority of students in such programs tend to be second language speakers of the target language, the result in turn of previous patterns of language shift and loss of the heritage language. For example, McCarty (2002) notes that in the Navajo heritage language program at Rough Rock in Arizona—one of the strongest and longest established in the

USA—only 50% of Navajo now speak their own language and their numbers are declining each year. And in Maori-medium education in New Zealand, the overwhelming majority of students are first language English speakers (May and Hill, 2005).

The final level at which bilingual/immersion education can be examined is the *program* level, which is also, necessarily, the most complex and diffuse. According to Hornberger (1991), bilingual programs are more concrete categorisations than models, and can be differentiated from one another by an analysis of specific contextual and structural characteristics. For Hornberger, contextual characteristics include: characteristics of the student population (numbers, stability/mobility in the school, SES, minority status, language background) and characteristics of the teacher population (ethnic background, degree of bilingualism, training, roles). Structural characteristics include: ‘program in school’ (whether school-wide or targeted), ‘languages in curriculum’ (sequencing, oral/literate development, and subject allocation of the languages), and ‘classroom language use’ (patterns and functions).

There is not space here to discuss the complexity of programs involved here (for an exemplary extended analysis, see Baker, 2006), except to highlight—in light of the preceding discussion—the most common types of program. Non-bilingual programs include Submersion, ESL and Sheltered Instruction programs (all subtractive programs). Bilingual programs include weak (and subtractive) bilingual programs, such as Transitional Bilingual Education, where use of the students’ L1 is limited usually only to the first years of schooling. Strong (and additive) bilingual programs include L1 Maintenance Bilingual Programs, Immersion and Heritage programs. These programs, which have also been termed one-way programs (Thomas and Collier, 2002), tend to vary in terms of both their level of immersion in the minority or target language and the related timing and balance of instruction in the majority language. However, most of these programs will use the minority or target language as the medium of instruction for between 50% and 90% of the time. For example, the program may begin as a 90:10 program in the early years (with 90% in the minority or target language) and change gradually to a 50:50 program by year 4 of the student’s schooling.

A variation of this one-way approach, increasingly popular in the USA with respect most often to Spanish-English bilingual instruction, has come to be termed two-way immersion or dual language immersion. The aims of two-way immersion are the same as other strong, additive programs—bilingualism and biliteracy for their students. However, unlike other forms of immersion, two-way programs include native speakers as well as non-native speakers of the target or minority language in the same classroom, wherever possible, in roughly equal

proportion. These programs thus specifically integrate English L1 students and target-language (e.g. Spanish) L1 students with the goals of developing the bilingual and biliterate skills of both groups (Cloud, Genesee, and Hamayan, 2000; Lindholm-Leary, 2001; Pérez, 2003).

The discussion thus far can be summarised, albeit somewhat simplistically, via Figure 1, where the left-hand side can be equated with subtractive approaches and the right-hand side with additive approaches to bilingual students. As we shall see, addressing these various dimensions of bilingual/immersion education is a necessary prerequisite for understanding what research has subsequently found in relation to the relative efficacy of the various approaches just described. It is to this research that I now turn.

MAJOR CONTRIBUTIONS

The complexity of the types of bilingual programs available, along with the widely different understandings of bilingual education adopted in the research literature, have significant implications for how one might proceed to assess fairly and accurately the effectiveness of such

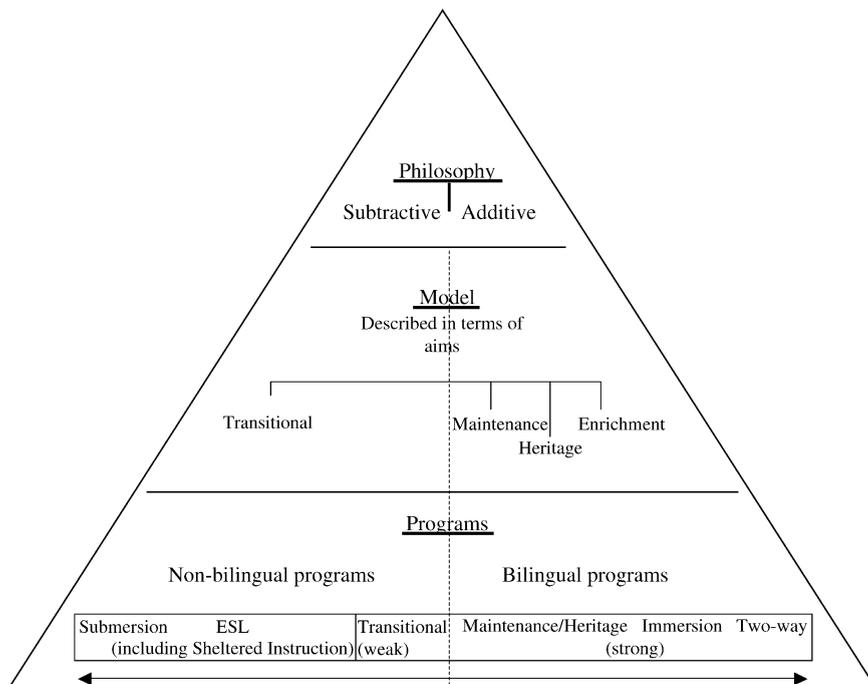

Figure 1 This figure was developed in conjunction with my colleague, Richard Hill, and is loosely based on an earlier figure by Hornberger (1991).

programs. This is crucial because the veracity of the research evidence gathered will, in turn, determine how informed subsequent educational policy and practice is likely to be on bilingual education. Accordingly, even where research is drawn upon as a basis for policy and practice it needs to be carefully examined and evaluated. For example, the recent dismantling of many bilingual education programs in the USA (see Crawford, 2000; Cummins, 2000; Dicker, 2003; May, 2005) has largely been based on a highly effective anti-bilingual education campaign that promoted a combination of popular misunderstandings about bilingualism and highly selective, often directly misleading, 'research evidence' to support its (erroneous) claims. The latter can be most clearly seen in the effective political mobilisation by bilingual education opponents of two deeply flawed US government sponsored research studies which cast (some) doubt on the effectiveness of bilingual education.

The first of these, the American Institutes for Research's (AIR) evaluation of bilingual education programs, was commissioned in the 1970s by the United States Office of Education (Danoff, Coles, McLaughlin, and Reynolds, 1978). It provided an overview of US federally funded bilingual programs operating at the time and found that such programs had no significant impact on educational achievement in English, although they did enhance native-like proficiency. It furthermore suggested that pupils were being kept in bilingual programs longer than necessary, thus contributing to the segregation of such students from 'mainstream' classes.

Despite concerns about its methodology (see later), the conclusions of the AIR study were seemingly replicated by a second piece of US federally commissioned research by Baker and de Kanter (1981, 1983; see also Rossell and Baker, 1996). They reviewed the literature and likewise concluded that bilingual education was not advancing the English language skills and academic achievements of minority language students, predominantly Spanish-speaking L1 students. In short, Baker and de Kanter argued that students in bilingual programs demonstrated no clear educational advantages over those in English-only programs.

Given the increasingly sceptical political climate of the time, this research generated enormous publicity and exerted even more influence on subsequent federal US policy. However, as Crawford (1989) observes, while the Baker and de Kanter (1983) report is easily the most quoted US federal pronouncement on bilingual education, it is probably the most criticised as well. As with its predecessor, much of this criticism had to do with the methodology that was employed. For example, as with the AIR study, Baker and de Kanter specifically rejected the use of data gathered through students' first languages. They also failed to account for the fact that two thirds of the comparison

group in English-only education programs *had previously been in bilingual programs* where, presumably, they had benefited from first language instruction.

Moreover, neither report distinguished between the wide variety of educational approaches to bilingual education, particularly in relation to the degree to which the first language (L1) was used as the medium of instruction, and whether the programs were based on an additive or subtractive bilingual approach. By simply aggregating all results, these reports thus singularly failed to differentiate meaningfully between different bilingual education programs. We can see this, for example, in the related failure of both reports to differentiate between early- and late-exit bilingual programs in their analysis, the former being largely subtractive, the latter largely additive. Consequently, the somewhat lesser educational effectiveness of early-exit bilingual programs, which constituted the majority of the programs under review, inevitably subsumed the better educational results of the late exit programs (Cummins, 1996).

Overall, the inadequacy of Baker and de Kanter's findings has been confirmed by Willig's (1985, 1987) subsequent meta-analyses of their data. Willig controlled for 183 variables that they had failed to take into account. She found, as a result, small to moderate differences in favour of bilingual education, even when these were predominantly early-exit programs. Willig's conclusions are also replicated in two subsequent major longitudinal bilingual education research studies in the USA, those of Ramírez, Yuen and Ramey (1991), and Thomas and Collier (2002; see also 1997). By specifically differentiating among the widely different approaches to bilingual education, and controlling for their variable effectiveness, the findings of each of these major studies (see also Hakuta, Butler and Witt, 2000) clearly and consistently support the efficacy of bilingual education in *additive bilingual* contexts.

Ramírez et al. (1991) compared English-only programs with early-exit (1–2 years) and late-exit (4–6 years) bilingual programs, following 2,352 Spanish-speaking students over 4 years. Their findings clearly demonstrated that the greatest growth in mathematics, English language skills and English reading was among students in late-exit bilingual programs where students had been taught predominantly in Spanish (the students' L1)—equivalent to one-way maintenance bilingual programs. For example, students in two late-exit sites that continued L1 instruction through to grade 6 made significantly better academic progress than those who were transferred early into all-English instruction. Ramírez et al. conclude that:

Students who were provided with a substantial and consistent primary language development program learned mathematics, English language, and English reading skills as fast or faster

than the norming population in this study. As their growth in these academic skills is atypical of disadvantaged youth, it provides support for the efficacy of primary language development facilitating the acquisition of English language skills. (1992, p. 38–43)

In contrast, the Ramírez study also confirmed that minority language students who receive most of their education in English rather than their first language are *more* likely to fall behind and drop out of school. In fact, it is important to note here that the English-only programs used for comparison in the Ramírez study were not typical to the extent that while the teachers taught in English, they nonetheless understood Spanish. This suggests that in the far more common situation where the teacher does not understand the students' L1, the trends described here are likely to be further accentuated.

In the largest and most recent study conducted to date, Thomas and Collier (2002) came to broadly the same conclusions. Thomas and Collier analysed the education services provided for over 210,000 language minority students in US public schools and the resulting long-term academic achievement of these students. They did so by examining in depth five urban and rural sites from throughout the USA over 5 years, from 1996 to 2001. The school bilingual program types examined within these contexts varied widely—they included full immersion programs in a minority language, dual-medium or two-way programs, where both minority and majority languages (usually, Spanish and English) were used as mediums of instruction, transitional bilingual education programs, ESL (English as a second language) programs, and mainstream submersion (English-only) programs.

As with the Ramírez study, one of Thomas and Collier's principal research findings was that the most effective programs—'feature rich' programs as they called them—resulted in achievement gains for bilingual students that were above the level of their monolingual peers in mainstream classes. Another key conclusion was that these gains, in both L1 *and* L2, were most evident in those programs where the child's L1 was a language of instruction for an extended period of time. In other words, Thomas and Collier found that *the strongest predictor of student achievement in L2 was the amount of formal L1 schooling they experienced*. As they state, 'the strongest predictor of L2 student achievement is the amount of formal L1 schooling. The more L1 grade-level schooling, the higher L2 achievement' (2002, p. 7). Only one-way and two-way or dual immersion programs—strong bilingual/immersion programs in effect—achieved these results. As Thomas and Collier conclude:

[These] are the only programs we have found to date that assist students to fully reach the 50th percentile in both L1

and L2 in all subjects and to maintain that level of high achievement, or reach even higher levels through the end of schooling. The fewest dropouts come from these programs. (2002, p. 7)

As with Ramírez et al., Thomas and Collier also found that students in English submersion classes performed far less well than their peers in strong bilingual programs, as well as dropping out of school in greater numbers. Students in transitional bilingual programs demonstrated better academic performance over time, but not to the extent of strong bilingual programs. In both these major large-scale studies, then, length of L1 education turned out to be more influential than *any* other factor in predicting the educational success of bilingual students, *including* socioeconomic status.

I have concentrated on these US-based research findings because they provide us with the most comprehensive analysis to date from the research findings on the effectiveness of bilingual/immersion education. They also include the only major longitudinal studies undertaken thus far with respect to these issues. Of course, there are a wide range of other studies, both from the USA and from other national contexts, that also broadly corroborate these findings. Of the wider, book-length, research-based literature, Baker (2006) and Baker and Prys Jones (1998) provide magisterial overviews of the field of bilingual/immersion education. Cummins (2000), May et al. (2004) and Genesee et al. (2006) provide useful overviews of the key research findings with respect to the academic success of students in bilingual programs. Baetens Beardsmore (1993) discusses various European models of bilingual education, while Barnard and Glynn (2003) explore developments in bilingual/immersion education in New Zealand (see also *International Journal of Bilingual Education and Bilingualism*, 8, 5; 2005). Tollefson and Tsui (2004), Johnson and Swain (1997) and Jones and Ghuman (1995) provide a wide range of international examples of effective bilingual and immersion education programs. All these contributions add to the growing research literature confirming the efficacy of strong forms of bilingual/immersion education.

#### WORK IN PROGRESS

The chapters in this volume clearly demonstrate the breadth of work currently being undertaken internationally in bilingual/immersion education. There are also a number of key journals where research findings on bilingual/immersion education are regularly published. These include, most prominently, the *International Journal of Bilingual Education and*

*Bilingualism, Journal of Multilingual and Multicultural Development, Bilingual Research Journal* (until its untimely demise in 2006), *Journal of Language, Identity and Education*, and the new *International Multilingual Research Journal*.

Key websites that are worth exploring in relation to bilingual/immersion education research include the Center for Research on Education, Diversity and Excellence (CREDE) <http://crede.berkeley.edu/index.html>. Also useful is the first comprehensive web-based resource specifically for teachers working with bilingual students, *Language Enhancing the Achievement of Pasifika* (LEAP). This was developed in New Zealand between 2004–2006 in relation to working with Pasifika bilingual students in mainstream (English-medium) contexts. However, it draws extensively on best practice in bilingual/immersion education and the general principles can be applied to all bilingual students. It can be found at [www.tki.org.nz/e/community/pasifika](http://www.tki.org.nz/e/community/pasifika).

#### PROBLEMS AND DIFFICULTIES

The problems and difficulties associated with this area have already largely been discussed. They include the plethora of, sometimes conflicting, definitions of bilingual/immersion education, along with the often-markedly different positions taken upon the educational effectiveness of bilingual/immersion education. In this chapter, I have tried to untangle this often-bewilderingly complex range of positions—highlighting, first, the clear educational differences among programs for bilingual students and, from that, providing a means by which those programs can be accurately assessed. When this is achieved, the research on the efficacy of bilingual/immersion education becomes much clearer, starkly clear in fact—with strong additive bilingual/immersion programs consistently outperforming other program options.

Conveying these research results to educational policy makers and the wider public—particularly in monolingual (often English-dominant) countries—remains, however, a significant challenge, particularly, given ongoing misperceptions about, and often-vociferous opposition to, bilingual/immersion education. As Ricento observes of the US context, in spite of an impressive amount of both qualitative and quantitative research now available on the merits of bilingual education, ‘the public debate (to the extent that there is one) [still] tends to focus on perceptions and not on facts’ (1996, p.142; see also Ricento and Wright, *Language Policy and Education in the United States*, Volume 1). Or as Fishman despairingly asks of the same context, ‘why are facts so useless in this discussion?’ (1992, p. 167).

This reminds us that in any discussion of bilingual/immersion education, we must always take account of the wider social and political context in which it is situated, along with the positions and wider agendas of the commentators themselves (see Crawford, 2000; May 2001, 2005 for further discussion). It also highlights the responsibility of those well versed in the research literature to articulate clearly and consistently the benefits of bilingual/immersion education in the academic as well as wider public domains. As Mary McGroarty argues: 'it is the job of [those] interested in policies that include attention to bilingualism to keep the value of bilingualism in the public consciousness, to continue to demonstrate that bilingual approaches to education are not only feasible but, in fact, actually exist' (2006, p. 5; see also 2002). In order to achieve this, McGroarty continues: 'advocates for positive language and education policies must constantly articulate the value of bilingualism, and to be able to do so in varied terms that respond to a protean environment of public discussion' (2006, pp. 5–6). A failure to do so will mean that the clearly attested educational effectiveness of bilingual/immersion programs will continue to be (conveniently) overlooked in these wider public debates, to the inevitable cost of bilingual students.

#### FUTURE DIRECTIONS

As well as making the educational efficacy of bilingual/immersion programs clearer to a wider policy and public audience, research on bilingual/immersion education could also expand its base with more ethnographic studies of effective bilingual/immersion education—thus providing a basis of thick description for the more comparative and evaluative studies discussed here.

To date, there have been surprisingly few extended ethnographic accounts along these lines. Hornberger (1988), exploring Quechua language education programs in Peru, was one of the first and still one of the most influential. King (2001) has explored Quichua programs in the Ecuadorian Andes, while McCarty (2002) provides a fascinating ethnographic account of Navajo language education. May (1994) provides an extended ethnographic account of Richmond Road School in Auckland New Zealand, which became internationally renowned for its critical approach to bilingualism and multiculturalism, while Freeman (1998) provides a comparable ethnographic account of Oyster Bilingual School in Washington DC. Both May and Freeman concentrate, in particular, on the program characteristics of these two schools. Heller (1999), in her ethnographic account of a bilingual francophone school in Canada, focuses more on students and their use of language. There have also been a few accounts of bilingual/immersion schooling at the local or regional level,

including de Courcy (2002) in relation to French/Chinese programs in Australia, Pérez (2003) in relation to two-way bilingual programs in San Antonio, Texas, and Freeman (2004) in relation to a range of community based programs in Philadelphia.

These ethnographic accounts provide us with a useful starting point, but there is still much that can be done in unpacking not only the characteristics and efficacy of particular bilingual/immersion education programs, as discussed in this chapter, but also the complex, lived experiences of all those involved in them.

## BILINGUAL EDUCATION AND SOCIO-POLITICAL ISSUES

### INTRODUCTION

The term ‘*socio-political issues*’ is a superordinate category in applied linguistics collecting together discussions of power within the discipline. *Socio* invokes the setting, including culture; *political* introduces considerations of power, interests and conflict, while *issues* casts a wide net of applications and problems.

Recently, theorists of *realpolitik* have introduced the term *soft power* into their descriptions of world affairs and global conflict. In contrast to the more easily recognised *hard power*, which suggests coercion (revealing its origins in economic might or military force), *soft power* operates through persuasion to attract the neutral and neutralise the hostile (Nye, 2004). Because language in society performs multiple functions socio-political issues involve applied linguists in the complex ‘*discourses of power*’ (Hindess, 1996) that have occupied political philosophy from ancient times. Bilingual education involves both soft and hard power consequences.

This paper addresses some intersections among bilingual education, power and politics, discussing both theoretical advances and some actual case studies. Bilingual education arises mostly in multilingual societies in which various languages are ranked sociopolitically and economically. However, immersion education and foreign language teaching, even in essentially monolingual societies, can also be subject to socio-political critique since elite investment in prestigious foreign language competence can entrench asymmetrical social status in society. Monolingual and multilingual societies can also give rise to ‘*socio-political issues*’ not related to different languages at all. In such cases intra-language issues can produce conflict, e.g. over privileging particular dialects in language standardisation (Haugen, 1966) or selections of orthographic conventions (Chen, 2001). However, the present discussion mostly addresses bilingual education in multilingual contexts. The language ecologies in which most bilingual education occurs involve relations between minority and majority groups. The minorities can be speakers of regional, immigrant or indigenous (autochthonous) languages, contrasted with majorities speaking and identifying with socially dominant or officially designated languages.

## EARLY DEVELOPMENTS

Many streams of thought and action have contributed to debates and understandings of bilingual education today. In the decolonising context of the 1950s and 1960s new African and Asian countries were guided by an influential United Nations Educational Scientific and Cultural Organization (UNESCO, 1953) declaration supporting vernacular languages over inherited colonial languages as media of instruction, claiming that it was 'axiomatic' that the best teaching language is a child's mother tongue (MT).

Research findings from evaluations of bilingual education have long been linked with socio-political debates. During the late 1960s controversy erupted concerning the appropriate staging of instructional language for immigrant children in Scandinavia. In a 1976 report to the Finnish National Commission for UNESCO on the educational prospects of Finnish immigrant children in Sweden, Skutnabb-Kangas and Toukoma (1976) pointed out that immigrant children's verbal fluency in their MT was related to their rate of acquisition of Swedish, suggesting that such children's 'semilingualism' denied them educational equality. The writers recommended that the MT should be bolstered in the interests of both the languages of the child, and his or her general academic development.

The issue had arisen from a paper (Hansegard, 1975, cited in Skutnabb-Kangas, 1981), which had described some children from dual-language backgrounds as having deficient competencies in school-appropriate intellectual functioning compared with monolingual counterparts. These 'deficiencies' seemed to hold back bilingual children because they were seen to command a smaller lexical range, to take time translating between their languages and therefore to be slow in giving replies in class, and to possess a limited expressive range. Skutnabb-Kangas (1981) described this as 'double' semilingualism provoking extensive discussion about the importance of MT literacy and language capability beyond domestic domains and settings. For Skutnabb-Kangas '*double semilingualism is one of the ways in which the shortcomings of the school system are projected on to the individual child*' (1981, p. 249).

A commonly recommended response to this problem was for extended schooling in the MT, provoking intense opposition from interests hostile to continuous and long-term use of minority languages in mainstream education, especially prominently in the USA (Crawford, 2002). The Scandinavian reports also provoked criticism of the semilingualism notion from sociolinguists. In a robust critique Martin-Jones and Romaine (1986) described semilingualism as sociolinguistically untenable, arguing that even when a child does not speak

the code and use the norms of a standardised formal school-approved language they are never without a fully fledged language system. Although rebutting the idea of semilingualism in this way the authors supported bilingual education for ethnic minority children, acknowledging that public education systems assume and inculcate formal and standardised language.

The discussion of semilingualism describes only one aspect of what has been a long and sometimes bitterly contested history of debating and researching connections between bilingualism and cognitive functioning characteristic of early developments. Research evidence and reasoning traversed three main stages in considering the relation of thought and bilingualism. In the first, early bilingualism was seen to have predictably negative effects on intellectual functioning. This was followed by a period of doubt, discussing bilingualism mostly as having no distinctive impact on intellectual functioning. Today there appears to be a broad consensus that bilingualism, especially precocious and high-level bilingualism, correlates with high intellectual functioning and makes distinctive positive contributions to intellectual functioning.

Using what would today be judged weak methods of research design and analysis, studies up to the middle of the twentieth century found negative cognitive effects and entrenched in the scholarly literature and among professionals a view of precocious bilingualism as an intellectual handicap. Research by Saer in the 1920s was critical in this respect. In 1923, Saer compared the performance of some 1,400 7–11-year-old bi- and multilingual Welsh children on IQ and other tests, concluding that the bilinguals had significant disadvantages compared with monolinguals, and that the negative differential increased with age. Methodological deficiencies were later found in the sampling and the confounding of variables of class and language used by Saer, such that middle class better-educated monolinguals were compared with working-class bilinguals. There were also inadequate controls for language proficiency levels. However, some research at this time was finding positive benefits of early bilingualism. The apparent contradiction stimulated reflection on research instruments, apparent biases in research design and deficiencies in variable control. As research came to be more tightly controlled for intelligence, differences previously attributed to bilingualism were found to be more readily accounted for by other criteria. The early studies paved the way for more careful and systematic research designs, which, in turn, found positive correlations between bilingualism and intellectual functioning.

A watershed in this change was Peal and Lambert's (1962) French-English Canadian study, notable for strictly controlling the socio-economic status and language backgrounds of its 364 bilingual and monolingual subjects. By matching for economic and social position,

age, sex and language proficiency, Peal and Lambert set new standards for research design in relation to bilingualism and cognition. Peal and Lambert's bilinguals outperformed the monolingual subjects on IQ, but also showed more positive attitudes to French speakers than the English-only subjects. Hakuta and Diaz (1985, p. 322) describe Peal and Lambert as '*the punctuation point in research*' on the relation between bilingualism and intellectual functioning. Their own survey of the first four decades of research on this topic is a prelude for a further watershed. Hakuta and Diaz state that what differentiates Peal and Lambert from much other research was '*the care with which (they) exercised control over sample selection*' (p. 319), distinguishing carefully between 'balanced' and 'pseudo' bilinguals.

However, although Peal and Lambert resolved key issues of methodology it was itself open to criticism that its research design overcompensated past bias *against* bilinguals by bias in their favour, essentially by including among them more intelligent subjects. In effect, this bias left unresolved what distinctive contribution bilingualism itself makes to intellectual functioning. This latter issue was the distinctive contribution of Hakuta and Diaz, who adopted a longitudinal approach to isolate what bilingualism independently contributes to cognitive functioning, in effect exposing a causal relationship between intelligence and bilingualism.

Since these two key pieces of research, study design principles that appropriately control language proficiency and intelligence variables, as well as class and education, repeatedly find positive correlations, and in longitudinal examinations, causal effects, of bilingualism on intellectual performance. Non-verbal tests contain components requiring spatial and perceptual processes and components requiring symbolic manipulation. In Hakuta and Diaz's study bilinguals outperformed monolinguals on symbolic manipulation tasks and were found to be neither better nor worse in relation to spatial and perceptual processes. The researchers called this superior ability 'mental or cognitive flexibility'. As Hakuta and Diaz note their research '*makes more plausible the claim about the positive effects of bilingualism*' (p. 340). In recent decades many studies support the claim that bilinguals outperform matched monolingual counterparts on tests of academic achievement, cognitive flexibility and creativity.

In educational settings a key hypothesis proposed to explain such results is *linguistic interdependence*, most closely associated with Cummins (2000) for which substantial confirmatory evidence is now available. Linguistic interdependence builds on longstanding awareness of differences between mundane and academic language uses and a sense of implausibility that the two languages of a bilingual would be neurologically compartmentalised. The most common practical

assumption encountered about second language learning is maximum exposure, i.e. that the more time spent studying the language the greater will be the level of proficiency attained. By contrast linguistic interdependence posits an '*additive bilingual enrichment principle*' (Cummins, 2001, p. 175), meaning essentially that bilingual children's academic achievements are tied to the cognitive relations between first language skill and second language performance.

Today few question links between precocious bilingualism and cognitive functioning but due to the vast differences of sociolinguistic context current research still leaves unresolved some questions, such as which should be the *initial language* of reading instruction in bilingual programmes; the *amount of time* that should be spent through each language in early grades, except that academic knowledge and skills in each language need to be nurtured; *when to introduce* the dominant language; whether there is a *threshold level* that students need to acquire before formal reading instruction is introduced in the dominant language. However, even these questions, were they satisfactorily answered by research would not deplete bilingual education of its socio-political implications.

### MAJOR CONTRIBUTIONS

In this section, four national experiences of two-language education are discussed to highlight three ways that bilingual education is immersed in socio-political issues:

1. Differential educational outcomes valued differently;
2. Nationalist politicisation of languages or disputed social relationships; and
3. The role of languages in struggles over material opportunity and symbolic capital.

To understand the socio-political implications of bilingual education it is necessary to move away from methodological, programming or pedagogical abstractions and examine how bilingual education is tied to local realities of disputed history and conflicting interests. Language planning for bilingual education should therefore be understood as a situated practice, meaning that what counts as the appropriate balance of educational effectiveness, social justice, opportunity or intellectual commitment often makes sense only in the context of specific circumstances rather than being portable across settings and contexts.

#### *United States*

The Bilingual Education Act is an excellent example of disputation about symbolic and material claims in the socio-political realm. Schneider's

(1976) study of the Congressional debates for the inauguration of the BEA in 1968 reveals its conception as a poverty amelioration measure. Motivated by the unequal educational attainments of Mexican American children the framers of the original legislation rejected overt links to ethnic, linguistic or cultural meanings or consequences for bilingual education.

Intending bilingual education to provide a strictly transitional first language bridge to English, however, did not preclude the BEA from becoming mired in a continuous and often acrimonious debate over the 33 years of its life (it was abolished as part of the *No Child Left Behind Act* of 2001). For Crawford (2002) the dispute about bilingual education was the focal point of a '*war against diversity*' in which the sociocultural loyalties of immigrant Americans were key points of disputation. For example, Bernstein (1994) treats the idea that Cherokee might be taught in public schools to incredulous ridicule (p. 244) as '*multicultural animus against European culture and its derivatives*' (p. 245).

While there is a much longer history of official language activism in the USA, bilingual education as sanctioned by this legislation became the lightning rod of moves to bring about a constitutional amendment declaring English the official language (Crawford, 1989). Anti-bilingual education advocacy, with the goal of banning teaching in languages other than English, coalesced most successfully in a movement called *English for the Children* (Lo Bianco, 2007b). *English for the Children* achieved major electoral successes, such as the June 2 1998 61% to 39% vote in California to approve Proposition 227, an English-only instruction to the State Legislature with the effect of banning much bilingual education in that state (Crawford, 2002).

Importantly, other kinds of two-language education are far less controversial, such as Two-Way Immersion which '*integrates language minority and language majority students in the same classroom with the goal of academic excellence and bilingual proficiency for both*' (Christian, Montone, Lindholm, and Carranza, 1997). Even more revealing, some two-language education that also aims at bilingual competence can actually be constituted as serving national interests, or an economically useful skill. For example, the 1979 President's Commission on Foreign Language and International Studies described US foreign language study as '*nothing short of scandalous*' (Perkins, 1979, p. 5) but it is inconceivable that minority language attrition would be described this way. Today a sense of national need for foreign language competence in the wake of the 9/11 terrorist attacks has made many US government agencies invest heavily in languages (Brecht and Rivers, 2002).

The associations of some languages with national states, proximate or rival states, or key interests and the presumed loyalties that

proficiency in these languages implies can overwhelm scholarly evidence of cognitive benefits from bilingualism. This reflects a long pattern in language education planning captured in the following paraphrase of Kloss's (1971) statement of the symbolic barter that appears to be assumed in requiring immigrant adaptation to new countries:

1. Immigrant minority language rights should be surrendered as a kind of payment to the host society for being admitted into the receiving nation;
2. Immigrants prosper in a new country more than they would have in their country of origin and this constitutes a contract in exchange for which they should waive any language claims;
3. The maintenance intergenerationally of minority languages and cultures is a kind of self-imposed social isolation and therefore it imposes a lag on the ineluctable eventual assimilation. This is undesirable;
4. Languages are potentially divisive and in its self-interest the host nation has a right to require linguistic assimilation.

However, not all minority languages appear subject to this kind of socio-political contracting. By dramatic contrast, in 1990, the US Congress approved possibly the most explicit and bilingualism-promoting language declaration in its history, the *Native American Languages Act* (NALA). Its preamble states: '*It is the policy of the United States to preserve, protect, and promote the rights and freedom of Native Americans . . . to use, practice and develop Native American languages*' (Congr. Rcd, 1990). The apparent conflict between the minority-language affirming ethos of the NALA and relentless opposition to the BEA suggest that socio-political issues such as language vitality, residential settlement patterns, the associations that languages have with states and nations and the relative strength or weakness of intergenerational transmission of languages account for the discrepancy in policy treatment.

### *Australia*

More briefly here a similar history of apparent double standards in bilingual education characterises Australia. Middle class learning of elite or prestigious languages, bilingualism via enrichment, is invariably socially rewarded and recognised, while for immigrant languages, but much more sharply for indigenous languages, there is either little support or opprobrium.

Public sympathy for and political discourse in favour of two-language competence is most ambivalent and sometimes hostile when Indigenous languages are involved, sometimes hostile or at least ambivalent when particular immigrant origin languages are involved

and most favourable when languages associated with trade, foreign relations or prestige cultures are involved (Lo Bianco, 2004a). Children's bilingualism is similarly differently evaluated.

Two-language teaching is sometimes an educational practice associated with progressivist acknowledgement of minority language rights, or with cultural enrichment, (Clyne, 2005) but when indigenous languages are involved different values are sometimes invoked so that bilingualism in English and Australian languages is characterised by criticism that it is a cultural palliative, or a teaching mode whose only serious purpose could be to impart English literacy to indigenous children (Nicholls, 2001).

The effectiveness of bilingual education delivered to indigenous Australian children is mostly assessed in relation to its contribution to English language literacy, whereas the effectiveness of bilingual education in other settings tends to give more value to both of the languages involved.

### *Sri Lanka*

Bilingual education and socio-political issues are in few places as inextricably connected as in Sri Lanka. The reasons for the deep and abiding politicisation of languages in the Sri Lankan context has been the tight association of language (along with religion) with rival claims to statehood, and therefore to making the languages of national groups synonymous with the languages of states. As a result language planning around languages has been deeply implicated in the massive rupture of social relations that has led to an ongoing and bloody civil war (De Silva, 1998).

Before independence from Britain in 1946 'fee levying' schools taught in English while 'vernacular' medium schools were free. In 1943, the Report of the Special Committee on Education recommended universal 'free education' and proposed the adoption of *swabhasha* (Sinhala and Tamil) medium commencing with the primary level (Dharmadasa, 1996).

Only about 12% of the school population at the time were educated in English. This proposal was progressively implemented such that in the 1960s from preschool to university education was in *swabhasha* medium. Education historian J.E. Jayasuriya has written: '*Even after nearly a century and a half of British rule, only about 6 per cent of the population was literate in English but they constituted an elite*'. English was both 'socially disruptive' and 'partly integrative'. The partial acquisition of English divided Sri Lanka (then Ceylon) into two nations (a privileged Anglophone minority and a second class

swabhasha majority) while English facilitated communication between Sinhalese and Tamil elites. This benefit for elites proved a longer-term crisis in majority to majority communication (Jayasuriya, 1981, p. 81). This began with the pursuit of exclusive nationalism via the Official Sinhala Act of 1956 in which Sinhala (and Theravada Buddhism) were constituted as necessary for independent nationality-based statehood provoking a contesting nationalism in which Tamil was seen to be indispensable (De Silva, 1998).

In this context, language education contributed to 'division between ethnic and class groups (rather than a contribution to) national unity' (ICES, 1990, p. 1).

Today, the entire public education and training systems are structured around giving effect to the principle of education in the MT. In the vast majority of cases the principle of MT education results in language-specific schools, Colleges and Universities. Examinations, certification and assessment procedures and school participation and socialisation procedures operate separately in the two languages.

A small number of institutions enrol children from both language communities teaching separate language streams and in some private schools English is the language medium. Moves to teach the two main ethnic groups the other group's language have been sporadic, occurring at three key points: 1953, 1987 and 1997, each responding to crises of relations between the main groups and when nationalism conflicts were elevated. The first was 1953, in the aftermath of independence when idealism about forging a united post-colonial nation was uppermost; the second occasion was in 1987, following the perceived loss of sovereignty that accompanied the Indian Peace Keeping Mission that entered Sri Lanka to curtail the secessionist fighting, and the third, in 1997, followed World Bank investment and other global economic pressures for direct foreign investment which were conditional on a resolution of the inter-ethnic conflict. At every point, but in different ways, bilingual education was irremovably implicated in socio-political strategising.

It is significant that from the early 2000s, the re-institution in many public schools of English medium science and mathematics teaching, in a new bilingual education initiative enrolling children from all ethnic groups, called *Amity Schools*, again foregrounds how bilingual education serves wider agendas of society, politics, power and nation building.

### *South Africa*

Language policy had been a central plank of Apartheid with the aim of '*breaking up the black people into a large number of conflicting and*

*competing so called ethnic groups*' (Alexander, 1989, p. 21). This overt connection between socio-political issues and language education took a more overly educational turn on 16 June 1976 when violently suppressed student protests broke out. Provoked by the policy of using Afrikaans, alongside English, as a medium of instruction for arithmetic and social studies in public schools, hundreds of students condemned this kind of bilingual education as 'gutter education', or as 'domestication', unequal Bantu schooling for oppression. As '*the immediate cause of the . . . Soweto uprising*' (Juckes, 1995, pp. 147–149) compulsory bilingual instruction was the spark that resulted in the deaths of many dozens, by some estimates hundreds, of students. Since 1995 South Africa marks 16 June as Youth Day, a key date in the growth of political consciousness for ultimate change.

Today, in the post-Apartheid reality, a progressive national constitution recognises 11 official languages, including Afrikaans and English, and debates about bilingual education centre more on delivery methods, learning effectiveness or levels of resourcing (Webb, 2002).

These four different instances of language planning around bilingual education highlight the importance of understanding two-language teaching in the concrete historicised settings in which it arises and the purposes it aims to achieve. Languages invoke ancient associations with place, and with identity, and therefore the symbolic realm of ideas and attachments, sentiments and loyalties, but also with actual, material consequences in specific settings. Nationality constituted states demand loyalties, and languages and language behaviours frequently invoke and index such loyalties. Essentially, what distinguishes bilingual from immersion education is the socio-political matrix within which bilingual education arises and which it marks. Since immersion education is intended most often for dominant sections of a society to acquire prestige or utilitarian second languages, implying no threat to the dominant language, immersion education raises few and mostly non-serious dilemmas of a socio-political nature. Bilingual education, on the other hand, may often involve a perceived or actual linguistic concession to minorities. These may be unassimilated indigenous populations, or regional populations, or newly arrived immigrants. This concession is made infrequently and grudgingly, evident in the various ways in which bilingual education's operations are constrained. When the risk of provoking divided loyalties, stoking secessionist fires, or sustaining cultural autonomy is low, bilingual education for minorities garners greater support. The situated and specific historical settings in which bilingual education is implemented are essential to their interpretation from ethical standpoints, but the connection to contested politics is clear.

Multilingualism creates specific kinds of challenges for national states based on assumptions that unilingualism is more efficient and that nationality, itself often defined linguistically, is essential to independent statehood. New nation building in multilingual contexts struggles against a primary forming assumption of nationality-based statehood residing deep in the sense of what constitutes efficiency, overarching state loyalty and ideas of common citizenship (Mansour, 1993; Hailemariam, Kroon, and Walters, 2000). It is relevant in this light to notice the discrepancy in the concessions to minority language rights in the European Union. Despite the overarching context of globalisation, the European Union's supra-national institutional architecture has produced more concessions for regional or sub-national language minorities than for immigrant minority languages. Immigrant language demographics suggest why—these are often larger, urban-based populations with a more recent association with other, sometimes rival, national states than their new host nations.

#### WORK IN PROGRESS

Much of the literature on bilingual education derives from first world settings and refers to three types of target audiences: (i) immigrant populations whose languages differ from the language of public education; (ii) indigenous minorities in New World settings or regional minorities (autochthonous populations) in Old World settings; and (iii) immersion language education for majority populations, usually in prestige foreign languages. Since many of these settings have been Western, or Westernised, the dominant literacy practice that has been researched has concerned reading in shared alphabetic roman orthographies. However, the research literature is presently expanding beyond this paradigm. First, case studies are being described and documented across a broader range of sociolinguistic settings. Second, more documentation of multiple orthographic systems is emerging, so that the reading and general intellectual consequences of literacy gained in different writing systems and their interaction are beginning to be felt.

Hornberger's (2003) continua of biliteracy is a response to the more complex linguistic ecologies that are being researched at present and epitomises the more sophisticated taxonomies that will be required to account for much more diverse settings than have so far prevailed in the literature.

A case in point is Singapore which combines four languages each from a different language family and three orthographic systems. The Chinese languages are Sino-Tibetan, English is Indo-European, Malay is Austronesian and Tamil Dravidian. Expressed in binary pairs,

according to the type of literacy coding-decoding demanded of bilitrates, the most straightforward pairing is Malay><English both of which are alphabetic roman systems, with minor differences between them. The dominant pairing, however, is Mandarin><English which involves two logographic systems (Traditional and Simplified) with alphabetic roman. The Tamil><English pairing involves the syllabic system Brahmi (but with a marked diglossia between spoken and written forms), with the alphabetic non-diglossic roman for English.

In practice no student is expected to be engaged in gaining high literate capability in logographic, alphabetic and syllabic modes; instead most are expected to gain academic-cognitive literacy only in alphabetic roman, large numbers in this plus logographic script and very small numbers in syllabic writing. The content and order of the literacy expectation of schooling is therefore highly stratified. English delivers high and de-contextualised academic demands, Mandarin elevated demands in academic work but not to the level of English, and Tamil and Malay deliver largely ethnicity-affirming or culturally oriented content. Each of these connects directly with a sociopolitical and economic issue, based on the language management practices of an education system devoted to a commitment to human capital principles (Pakir, *Bilingual Education in Singapore*, Volume 5; Lo Bianco, 2007a; Pakir, 2003; Wee, 2004).

A further example of the new perspectives that would result from addressing bilingual education from more diverse perspectives includes the Han pinyin/biliteracy issues in China and the Chinese diaspora. There has been a shift from teaching character writing to use of romanised writing. For some (Chen, 2001), this has been a quiet and remarkable large-scale literacy education development—rarely acknowledged in Western literature. According to Chen, China has achieved high levels of biliteracy—with large segments of the population writing in both characters and pinyin, without ‘*ostensive losses in overall pedagogic or curricular outcomes*’ (p. 77). These approaches are spreading to Hong Kong, Taiwan and Singapore, with large populations of Mandarin speakers.

#### PROBLEMS AND DIFFICULTIES

The essential challenge for research on bilingual education and discussions of the socio-political issues that this raises is accounting for the multiple functions and roles of languages, specifying the situated and therefore often non-transferable historically grounded reality of language education. The relations among the languages involved in bilingual education are a crucial challenge.

The challenge this raises for bilingual education research is that while studies of cognitive attainments, and program delivery modes, are undertaken most effectively by scholars trained in applied linguistics and pedagogy, accounting for socio-political realities requires input from political sciences, policy studies, economics and history.

Although research plays some role in debates and contest around bilingual education, Krashen's (1999) examination of the politicisation, and misuse, of research findings in the US context of bilingual education is instructive. Carefully controlled and systematically defined examinations of two-language teaching in many countries, consistently find evidence of positive educational and linguistic outcomes for learners. But where bilingual education is controversial, it is rarely because of issues that are researched or even researchable.

The disparity between the high academic outcomes often attained by immersion-taught majority language children and the persisting educational disadvantages facing immigrant children and, in New World countries, the indigenous counterparts, has tended to be resolved by recourse to sociocultural context. For immigrant and indigenous children, bilingual education was often instituted as remediation. The intention has classically been to use the first language only as a temporary bridge to more effective mastery of the socially and educationally dominant language in order to facilitate improved educational attainment. Unlike immersion programs for majority children, specific language objectives related to the immigrant or indigenous language were secondary or non-existent.

Immersion is strongly associated with Canada, where it was conceived as contributing to national cohesion between the often mutually uncomprehending English and French components of the society. While the majority children in Canadian immersion education were found to be performing well in standardised achievement tests, and in general learning, despite being taught in the early grades primarily through the medium of a second language, i.e. not their MT, immigrant and indigenous children who were similarly educated in a second language, the socially dominant language, appeared to be consistently under-achieving educationally. Explaining this paradox required consideration of essentially socio-political issues.

Like all educational practice, *bilingual education* is inextricably bound up with the socio-political context in which it arises and the purposes it serves. Specifically here bilingual education and immersion education are distinguished from the many modes of foreign language instruction, essentially language as subject teaching, because immersion, like bilingual methods, uses two languages to impart mainstream subject matter.

However, bilingual education can in turn be distinguished from immersion on principally socio-political grounds; in four main ways, viz:

1. *The existing language and its fate.* This addresses the learner's likelihood of gaining literate intellectualised competency in their primary or first language, usually a minority immigrant or indigenous language;
2. *The target language and its fate.* This addresses the learner's likelihood of gaining literate intellectualised competency in the target language, usually the learners second and the society's dominant, official or national language;
3. *The content and prestige carried by the languages.* This addresses the curriculum components that are delivered in the target and the existing languages; and
4. *Social status, esteem and rewards.* This addresses the material and symbolic rewards and recognition that accrue to learners, the existing language, the target language and for speakers of the two languages. All these in turn reflect the social esteem in which the bilingual program itself is held and the social status of the speaker community.

#### FUTURE DIRECTIONS

Ultimately, at least in ostensibly liberal-democratic states, power involves how we conceive and advance interests, especially how rival interests collide and compatible interests collaborate. In the broad field of language and education, language policy and planning represents the clearest subfield addressing socio-political issues. 'Policy' is the domain of management and the policy sciences which study policy making, are '*a union of political science and economics*' (Nagel, 1994, p. viii). In the formal policy literature 'socio-political issues' tend to be seen in different ways from the perspective of applied linguistics, and especially from the sub-discipline of language planning. The latter carries into its analysis of policy making and language assumptions a descriptivism derived from linguistics, rather than the sciences that theorise power and interests (Lo Bianco, 2004b). Nevertheless, many aspects of applied linguistics, from trying to account for the spread/dispersion of English, to second language teaching, bilingual education or aspects of translation and interpreting are immersed in '*socio-political issues*'.

The continuing disputation caused by Phillipson's (1992) claim that imperialism lies behind the global expansion of English shows that soft, if not hard, power debates are prominent in applied linguistics and a wide range of questions of teaching practice, curriculum development, modes of delivery and policy settings characterise the socio-politics of English teaching today (Kelly Hall and Eggington, 2000).

Ultimately studying the socio-political consequences of bilingual education will require a new kind of language policy and planning theory that adds insight and concepts from economics, political theory and critical studies to its stock of concepts and theories from applied linguistics.

## CONCEPTUALIZING BILITERACY WITHIN BILINGUAL PROGRAMS

### INTRODUCTION

One explicit goal of most bilingual education is for students to become biliterate. For the purposes of this review, biliteracy will be defined as “any and all instances in which communication occurs in two (or more) languages in or around writing” (Hornberger, 1990, p. 213). The development of biliteracy will be conceptualized as occurring in a broad social context. Thus, this review will focus on the development of biliteracy in multilingual educational environments and the conditions of the learning context and interaction that aid the acquisition of literacy in two or more languages. This conceptualization of biliteracy is based on a sociocultural view of literacy, a model that assumes literacies are multiple and situated in a social context. As a result, most of the research cited draws from work in areas such as the ethnography of communication, sociolinguistics, and anthropology that have developed methodologies to study communities and their local practices (Wei, *Research Perspectives on Bilingualism and Bilingual Education*, Volume 10; Toohey, *Ethnography and Language Education*, Volume 10).

### EARLY DEVELOPMENTS

Early research in the development of biliteracy in educational environments focused primarily on the impact of the way that participation is organized within a classroom setting, and the variety of ways in which multiple languages can be acquired and used as a resource for personal expression and instruction within bilingual classrooms. In the early 1980s key research was done in a variety of cultural settings that showed that different communities had varying oral and written participation styles, and instructional effectiveness could be improved by drawing on participation styles that were congruent with minority students’ cultural background. For example, in Hawaii, the staff of the Kamehameha Elementary Education Program showed that reading lessons that were organized in a way that was similar to the traditional Hawaiian “talkstory” discourse structure increased student participation and reading scores (Au, 1980). Research on classroom participation structure on the Warm Springs Indian Reservation showed that

students were more likely to be viewed as competent at tasks when they were able to participate in ways that were congruent with their community ways of interacting such as working cooperatively, learning through completing activities physically and through observation, and minimizing oral corrections (Philips, 1983). These early research studies of the variety of participation patterns among minority communities in English speaking environments influenced similar studies of students acquiring biliteracy in bilingual education programs.

While bilingualism is often viewed by schools as a problem, in the 1980s a number of key studies showed that bilingualism and biliteracy could also be viewed as a resource to aid classroom learning. In one groundbreaking microethnographic study, Moll and Diaz (1985) discovered that students in different level reading groups in Spanish were all placed in the same low-level English reading group. The researchers decided to change the teaching methods that were used in the English reading class to see if the students could understand the fourth grade reading book in English. First, they initially read the story to the students orally rather than having the students read the story independently. They also occasionally discussed the English stories with the students in Spanish or translated key vocabulary words for the students. Their work showed that these students were able to understand the fourth grade reading texts when their native language was used to support their English literacy skills. In another foundational study, Edelsky (1986) conducted research into first through third grade students' writing development in an English/Spanish bilingual program. Her work challenged the myth that bilingual students become confused when developing biliteracy in two languages. Instead, she found that there was considerable transfer of writing skills between languages and the use of two languages increased the students' options for communicating in an expanded range of texts to multiple audiences. Similarly, in a study of bilingual Spanish/Quechua schools in rural Peru, Hornberger (1988) found that the use of the students' indigenous language in schools had several advantages. Students in bilingual schools were able to participate more and write original sentences in class, instead of merely copying from the board as was characteristic of Spanish-only classrooms. In addition, in content area studies such as math, teachers in the bilingual classroom were more likely to explain to students how to do cognitively difficult problems. These early studies of biliteracy in bilingual classrooms were important in dispelling the myth that learning two languages would cause students difficulties in learning to read and write (Graff and Duffy, *Literacy Myths*, Volume 2). These studies were the beginning of what has been an ongoing exploration into the possibilities that are available when two languages are used for classroom instruction.

## MAJOR CONTRIBUTIONS

This section describes several major contributions to our understanding of the conceptualization of biliteracy within bilingual programs. First, some research has focused on adapting major concepts from the social sciences to the analysis and formulation of effective literacy events in bilingual classrooms. Some studies have examined how local funds of knowledge can be used as a basis of literacy learning in schools. Other studies show how the principled use of hybrid linguistic codes, multiple semiotic modalities, and varying participation structures can aid bilingual students' development of biliteracy and content knowledge. A second major contribution to the field is the creation of a general framework for analyzing biliteracy that can be used as a model for analyzing teaching, research, and language planning in multilingual settings. A third contribution has been research that has been conducted on linguistic transfer as a cognitive dimension of biliteracy. A fourth significant contribution has been made by researchers who have written texts that give extensive examples of the types of practical teaching techniques that can be used in a classroom setting to help students develop biliteracy.

*Local Funds of Knowledge*

Traditionally, schooling has primarily drawn upon a restricted body of academic knowledge and literacies, but research has suggested that the knowledge that students gain from participation in families and communities can also be successfully used as a basis of literacy learning in school. Moll, Amanti, Neff, and Gonzalez (1992) call the knowledge that is utilized in order to maintain functioning households and communities "household (local) funds of knowledge". This knowledge includes information about a variety of topics including agriculture, economics, household management, medicine, scientific knowledge, and religion (González et al., 1995). Research suggests that utilizing community knowledge allowed students to participate in activities and produce written products that they would be unable to produce if they were forced to utilize only traditional academic knowledge in completing their assignments. Second, drawing on local funds of knowledge allows parents to participate more fully in their children's education. Third, when the students observe that the local funds of knowledge in their community are drawn upon in a formal setting such as the school classroom, it can help students to develop a more positive self-image and to value the languages and knowledge that are taught to them in their homes and communities.

Funds of knowledge research has now been carried out in a variety of different cultural and linguistic settings, and this type of research has added to our knowledge of the wide variety of vernacular and home literacy practices that can be linked to school learning. One interesting addition to the research in this area is an ethnographic project that was conducted in classes in North West England on how classroom bilingual teaching assistants drew on their knowledge of the students' home languages and cultures to conduct a variety of culturally appropriate literacy events (Martin-Jones and Saxena, 2003). In addition to describing the importance of the use of code-switching, nonverbal and multisemiotic cues, this work also shows how a variety of culturally appropriate activities such as cooking chapattis and telling stories about the Sikh New Year can be used to teach students academic content knowledge and literacy skills (Moje, *Everyday Funds of Knowledge and School Discourses*, Volume 3).

### *Hybridity*

Another major concept in the development of biliteracy is that while it may be considered the norm in most classrooms to draw upon one linguistic code, semiotic modality, or participation structure at a time, it is also possible for these ways of making meaning to be combined and mixed in a single literacy event. This mixing can be referred to as "hybridization" or "hybrid literacy practices." Research suggests that this mixing in bilingual classrooms is typically principled, purposeful, and organized. Gutiérrez, Baquedano-López, Alvarez, and Chiu (1999b) give an example of hybrid literacy practices in their analysis of an after school program. Their research describes how elementary school students describe their activities and learning in daily e-mails to a fictional bilingual character, "El Maga." The undergraduate students who answer these e-mails purposefully use both Spanish and English in a strategic way to help the bilingual students develop their literacy skills in both languages, and develop a strong bond with "El Maga." The analysis of hybridization has also been applied to classroom instructional units (Gutiérrez, Baquedano-López, and Tejada, 1999a).

### *Continua of Biliteracy*

Another major contribution to the conceptualization of biliteracy is the creation of a general framework for analyzing biliteracy that can be used across contexts. The continua of biliteracy is a framework that can be used as a model for analyzing teaching, research, and language planning in multilingual settings. The framework has been described in great detail and applied to many different educational situations in a

recent edited volume (Hornberger, 2003). The framework is composed of four nested set of continua, each of which captures a significant aspect of the learning contexts that are essential for developing biliteracy including the media, context, development, and content of biliteracy. Each continuum consists of weaker and more powerful ends, and the continua thus recognize that all modes of expression and types of knowledge are not viewed as equally powerful by society. However, the model suggests that the more the learning context allows learners to draw from across the whole of every continuum, the greater the chances for the full development of biliteracy (Hornberger, *Continua of Biliteracy*, Volume 9). The framework has been utilized to analyze a number of different learning situations. For example, Schwinge (2003) shows how the continua can be used to analyze how two bilingual elementary school teachers made adaptations to their mandated literacy curriculum to help ensure that their classroom instruction is comprehensible and draws on the many special resources available in a bilingual, bicultural environment.

### *Linguistic Transfer*

Another major contribution to our understanding of biliterate development has been research findings that have focused on how the cognitive effects of biliteracy and linguistic transfer can be utilized to speed the acquisition of literacy skills in bilingual educational environments. A number of recent studies have shown that a wide variety of linguistic skills such as phonemic awareness, reading comprehension, spelling, and an understanding of discourse organization can be transferred. However, these studies also show that there are specific limits on the transfer of literacy skills. For example, in a notable study of four groups of first grade students (English monolinguals, Spanish–English bilinguals, Hebrew–English bilinguals, and Cantonese–English bilinguals) it was shown that while biliteracy in all languages conferred an advantage in acquiring early literacy skills by giving students a greater general understanding of how print worked, there was a greater advantage in literacy acquisition for students whose two languages used a similar writing system, in this case an alphabetic writing system (Bialystok, Luk, and Kwan, 2005). Studies have also shown that there are individual differences in patterns of linguistic transfer (Gort, 2006), and that the extent of transfer of specific skills can relate to linguistic proficiency (Proctor et al. 2006). In addition, since the transfer of specific literacy skills varies depending on the languages that have been acquired, significant contributions have been made by researchers who have focused on languages in which transfer has yet to be studied extensively such as the transfer between Chinese and English (Wang, Perfeti, and

Liu, 2005) and Samoan or Tongan and English (Tagoilelagi-Leota, McNaughton, MacDonald, and Farry, 2005).

### *Classroom Practices*

In addition to the major theoretical contributions that have added to our understanding of biliteracy, contributions have also been made in creating an integrated approach to the teaching of biliteracy in bilingual classrooms. One important addition to the understanding of biliteracy is the introductory text *Learning in Two Worlds: An Integrated Spanish/English Biliteracy Approach* (Pérez and Torres-Guzmán, 1996). This text provides a clear explanation of the most important concepts in biliteracy and also gives extensive examples of the types of practical teaching techniques that can be used to enhance bilingual students' development of emergent biliteracy, advanced proficiency in reading and writing, content area literacy, and assessment of bilingual proficiency. Throughout the text are many examples of student work. While the text focuses primarily on acquisition of literacy in English and Spanish, most of the techniques suggested could be easily adapted for use with students developing biliteracy in other languages.

## WORK IN PROGRESS

The use of children's literature in whole language classrooms and balanced literacy programs has created an increased desire to explore how learning to respond to literature in two languages can be an important part of the development of biliteracy in the classroom context.

The conceptualization of biliteracy in bilingual education has been aided by recent research in new educational contexts. This summary highlights important research in three areas where substantial progress has been made. First, the large number of new two-way immersion programs has led to research in how they can aid students in developing biliteracy. Second, the large growth of early childhood programs has resulted in an additional interest in emergent biliteracy and the impact of bilingual education in preschool. Third, the use of children's literature in the classroom and balanced literacy programs has created an increase in studies that demonstrate how learning to respond to literature in two languages can be an important part of the development of biliteracy in the classroom context.

### *Two-way Immersion Programs*

One area of special interest in recent years is the development of biliteracy in students enrolled in two-way immersion programs. As these programs have expanded in number, there has been a focus on how

these programs assist students in attaining biliteracy and in the policy issues that are related to their implementation. Freeman (1998, 2004) has published two ethnographic discourse analytic studies that examine dual language programs. The first analyzes the established English/Spanish dual language program at Oyster School in Washington DC, and the second text examines the creation and implementation of a number of new dual language programs in Philadelphia. In the texts, discourse studies, ethnographic research, and language policy research helps to give a rich description of the literacy events used to develop biliteracy among the students, and also the challenges that the schools faced when attempting to elevate the status of Spanish and promoting a language policy that embraces bilingualism. Pérez (2004) presents another study of a two-way immersion program in San Antonio that she studied for six years using ethnographic methods. This research presents a detailed view of the ways in which the teachers and the learning environment aided students in becoming bilingual and especially the ways in which code-switching and linguistic transfer were used productively. This account is also notable for its discussions of how the pressure from the Texas state exams, the TAAS, affected the implementation of the dual language program (Brindley, Educational Reform and Language Testing, Volume 7; Menken, High-Stakes Tests as de facto Language Education Policies, Volume 7).

While much of the research on dual language programs describes the positive effects on the children enrolled in successful programs, it is also important to consider the implementation challenges that some programs have encountered. Wiese (2004) has written of her experiences working with the implementation of a dual language program in a second grade classroom in a diverse school environment. Her study focuses on the tensions and conflicts that occurred when trying to assist students in becoming biliterate. These included the difficulties in meeting the needs of English-speaking low-income students who came to school with little background in reading and writing, the time constraints in implementing balanced literacy instruction in two languages, and the ongoing process of deciding what type of language distribution would be best for the students at the school. The type of study adds to our understanding of biliteracy by acknowledging the complexity of meeting the language and literacy needs of diverse students (Genesee and Lindholm-Leary, Dual Language Education in Canada and the USA, Volume 5).

### *Emergent Biliteracy*

Recent studies carried out on emergent biliteracy in early childhood education have also contributed to our theoretical understanding of

the development of biliteracy. For example, research in a preschool class attended by students of Haitian origin (Ballenger, 1999) illustrates how culture influences students' responses to storybook read-alouds and creative play; Schwarzer (2001) has described a first grade student's acquisition of three linguistic codes with different writing systems both at home and in a bilingual program at school, while Reyes (2001) has documented how primary grade students transferred literacy skills from their first to second language and developed spontaneous biliteracy in English and Spanish, despite the fact that they had not received substantial formal literacy instruction in their second language. Some studies contrast the incipient biliteracy of children just starting their education who have not yet mastered the written conventions of their two languages with the instructed biliteracy of students in third grade or higher who engage with reading and writing texts in two languages to obtain information and gain access to the core curriculum (Moll, Saez, and Dworin, 2001). While there are many differences in the activities and the written products in these classes for young bilingual learners, a bilingual classroom environment in early childhood appears to lead students to naturally attempt to read and write in both languages. Research on young learners provides interesting information about biliteracy because early childhood students are often unconstrained with prior ideas about code-switching, and they frequently use both languages in flexible and innovative ways to accomplish literacy tasks.

### *Responding to Literature in Bilingual Classes*

There are also a number of studies that have made major contributions to the understanding of biliterate development within bilingual programs by providing detailed analysis of how children's literature can be incorporated into literacy instruction in two languages. One aspect of developing biliteracy is learning how to respond to literature. Cox and Boyd-Batstone (1997) provide a detailed account of how literature and various types of reading responses are used in an upper elementary bilingual class. Their work is also notable for providing longitudinal case studies of three children's biliterate development between first and fifth grade, and an analysis of how their different home environments and experiences acquiring English and Spanish have influenced the students' literature response styles. Martínez-Roldán and López-Robertson (2000) also discuss how they used literature circles in a bilingual first grade classroom. Their work explains the process of how they initiated Spanish and English literature circles in López-Robertson's classroom and the types of responses that were made by the children such as storytelling and intertextual responses. Ada and Campoy (2003) describe how they have used bilingual children's

literature and a variety of creative writing activities to help students draw on their cultural knowledge and their authentic life experiences to write in the various genres that are required in school. In addition to a theoretical summary of creative writing by bilingual individuals, the text also provides ten thematic units that each focus on a different genre of writing. One of the key features of this text is the engaging examples of creative writing by teachers, parents, and students that are included in the text. Many of these are pictures of homemade books with illustrations that give the reader a positive view of the high quality of writing that can be produced by young biliterate authors. Overall, these three texts provide the reader with a variety of suggestions on how to encourage culturally and linguistically appropriate verbal and written responses to bilingual literature.

### PROBLEMS AND DIFFICULTIES

While recent research provides strong support for the development of bilingual programs that would aid students in acquiring biliteracy, there is still a major difficulty in actually implementing more extensive bilingual education. Some recent work examines how opportunities for the acquisition of biliteracy in the classroom environment are related to patterns in social institutions and power relationships, and how individuals such as school administrators, teacher trainers, teachers, parents, and students can transform specific learning situations to aid in the acquisition of biliteracy.

One major difficulty is that many teachers are not fully biliterate themselves in the languages of their students. Thus, one area in which more research is needed is how teachers who are monolingual can promote biliteracy successfully. Skilton-Sylvester (2003) gives descriptions of the beliefs and teaching practices of four teachers of Khmer students who vary in their encouragement of the use of the students' first language in the classroom and their willingness to include the incorporation of elements of Khmer culture in their instruction. This research shows that the beliefs that the teachers hold about language acquisition and cultural identity strongly influence their teaching practices. Studies such as this one that examine the possibilities for preventing language shift and encouraging biliteracy need to be done in a large number of linguistic environments, especially where there are large numbers of students who speak lesser-known languages that may not be easily incorporated in existing school bilingual programs.

In the context of schooling in the USA, the policies enacted by the federal and state governments are having an increasing influence on the education of bilingual learners, and these policies are often making the continuation and implementation of bilingual programs more

difficult. Federal mandates have changed the context of schooling in bilingual programs by encouraging the use of certain literacy programs in comprehensive school reform and requiring students to take yearly English language exams as part of the mandates of the No Child Left Behind legislation. Some states in the USA such as California, Arizona, and Massachusetts have held referenda where voters approved propositions to mandate English-only instruction for English language learners and these measures have limited access to bilingual education. In addition, some states have high school exit exams that also have an influence on the context in which students are acquiring biliteracy. Clearly, more research needs to be done to document the effects that these federal and state restrictions are having on biliteracy development in bilingual programs (Ricento and Wright, *Language Policy and Education in the United States*, Volume 1; Lo Bianco, *Bilingual Education and Socio-Political Issues*, Volume 5).

While it may be true that the instructional practices of bilingual teachers in the USA are being constrained by these federal and state mandates and programs, bilingual teachers may also be able to work within the constraints to successfully encourage their students' acquisition of biliteracy. Knowledge of the ways in which these programs are actually successfully implementing sustainable bilingual education is crucial to expanding the number of students who are able to attain biliteracy in bilingual education programs in the USA. One area where some research has already been conducted is how teachers implement the Spanish language version of the Success for All literacy program that is being used in thousands of classrooms across the USA as part of the comprehensive school reform demonstration legislation. Ethnographic research has shown that while teachers follow a set of procedures for implementing classroom literacy activities, they also are able to find ways to individualize or personalize the mandated reading program to better fit the students' and the teachers' preferred instructional styles and cultural and linguistic background (Prado-Olmos and Marquez, 2001). Literacy and language policy are intertwined, and it is essential that more research is done to determine the effects of new language policies on teachers' and schools' attempts to aid their students in developing biliteracy.

#### FUTURE DIRECTIONS

While there is a rapidly increasing research literature on the development of biliteracy in bilingual programs, there are still a number of questions that are in need of further research. More research is particularly needed in three areas: (a) the acquisition of biliteracy in lesser-known languages, (b) biliteracy development in home and school

among students in bilingual special education classes, and (c) the impact of new technologies on biliteracy development both with respect to pedagogical applications and opportunities for documenting biliteracy events and practices more precisely.

One area that is in need of additional research is how best to help children's simultaneous acquisition of multiple writing systems. Recent research done in England that asked students who were in Saturday supplemental programs in Chinese, Arabic, and Spanish to teach their classmates additional writing systems showed that five- and six-year-old students understood key differences between the writing systems they were acquiring, and they were able to share this information with other children (Kenner, Kress, Al-Khatib, Kam, and Tsai, 2004). These differences included the ability to distinguish between alphabetic and logographic writing systems and the differing directionality in various writing systems. This research showed that students were able to transfer knowledge between different writing systems, and children who were biliterate tended to show a heightened metalinguistic awareness. More research on this topic could help us to understand how to explain the differing features of writing systems to students who were becoming biliterate and to explain how to maximize transfer of writing skills between languages.

In addition, it would be helpful to have a greater understanding of the development of biliteracy in bilingual special education classes. Overall, there is little research that addresses this topic directly through ethnographic research, especially in a way that would examine how to best use the strengths of students in bilingual special education. One notable addition to the research literature is recent work by Rodríguez (2005) that examines the home biliteracy activities of four bilingual Dominican families in New York City who have a special needs child, and suggests that the diverse language and socialization practices of these households could be used in effective ways in bilingual special education classrooms.

Also, an additional future direction for research in biliteracy in bilingual programs is to make better use of video and digital technology to capture biliterate literacy events more completely. Newer technology holds promise in helping researchers to more easily follow bilingual students longitudinally across learning contexts and time in order to better understand the multitude of factors that aid students in developing biliteracy both inside and outside of the bilingual classroom.

## TEACHING FOR TRANSFER: CHALLENGING THE TWO SOLITUDES ASSUMPTION IN BILINGUAL EDUCATION

### INTRODUCTION

Two related assumptions regarding medium of instruction dominate second language teaching and bilingual education programs. Both of these assumptions reflect what Howatt (1984) terms “the monolingual principle.” In the case of second and foreign language teaching it is assumed that instruction should be carried out, as far as possible, exclusively in the target language without recourse to students’ first language (L1). In the case of bilingual and second language immersion programs, it has become axiomatic that the two languages should be kept rigidly separate. In this paper, I discuss the research and theoretical literature relevant to this “two solitudes” assumption and argue that it has minimal research basis. When we free ourselves from exclusive reliance on monolingual instructional approaches, a wide variety of opportunities arise for teaching bilingual students by means of bilingual instructional strategies that acknowledge the reality of, and strongly promote, cross-language transfer.

Some of these instructional strategies involve encouraging students to use translation as a tool for promoting transfer across languages. The use of bilingual in addition to monolingual (target language) dictionaries is also seen as a legitimate and useful tool within a bilingual pedagogical orientation that focuses on teaching for two-way transfer across languages. Advocacy of translation as a pedagogical tool is unusual in today’s era of communicative language teaching and it is important to emphasize at the outset that I am not suggesting a return to the stultifying world of grammar-translation instruction where the focus was on teaching grammar in isolation from communication and using translation as an end in itself. Rather the argument is that translation has a role to play within a broadly defined communicative approach as a means of enabling students to create multimedia texts that communicate in powerful and authentic ways with multiple audiences in both L1 and L2.

The roots of the two solitudes assumption lie in the *direct method* that became popular in the context of second and foreign language teaching more than 100 years ago and has continued to exert a strong influence on various language-teaching approaches since that time

(Cook, 2001; Howatt, 1984; Yu, 2001). In the next section, I sketch the evolution of the direct method and its mutation into the two solitudes assumption in the context of bilingual/immersion education.

### EARLY DEVELOPMENTS

Yu (2001) points out that the direct method developed in opposition to the grammar-translation method during the late 1880s, mainly in France and Germany. The essence of this approach is that “[t]he direct method imitated the way that children learn their first language, emphasizing the avoidance of translation and the direct use of the foreign language as the medium of instruction in all situations” (p. 176). The primary focus is on the development of listening comprehension and speaking ability (rather than reading and writing skills) and “correct pronunciation and inductively acquired grammatical knowledge are insisted upon” (p. 176).

These principles were reflected in the audiolingual and audiovisual approaches that emerged in the 1960s and 1970s and are also apparent in the implementation of communicative language teaching approaches in many contemporary contexts. Cook (2001) points out that:

Recent methods do not so much forbid the L1 as ignore its existence altogether. Communicative language teaching and task-based learning methods have no necessary relationship with the L1, yet . . . the only times the L1 is mentioned is when advice is given on how to minimize its use. The main theoretical treatments of task-based learning do not, for example, have any locatable mentions of the classroom use of the L1. . . . Most descriptions of methods portray the ideal classroom as having as little of the L1 as possible, essentially by omitting reference to it. (p. 404)

Cook goes on to argue for principled use of the L1 in the second or foreign language classroom based on four criteria:

- *Efficiency*: Can some content or instructional routines be communicated more effectively through L1?
- *Learning*: Will the use of L1 alongside the L2 result in better L2 learning?
- *Naturalness*: Do learners feel more comfortable about using L1 rather than L2 to discuss some functions or topics?
- *External relevance*: Will the use of L1 help learners to acquire some L2 functions or skills that they may need in the world outside the classroom.

The weighting of these four criteria must be set against the potential loss of L2 experience due to the use of L1. Cook concludes that despite the legitimacy of using the L1 under certain conditions, “it is clearly

useful to employ large quantities of the L2, everything else being equal” (p. 413).

Turnbull (2001) responded to Cook by acknowledging that while there is a place for teachers to use students’ L1 in second and foreign language teaching, there are major disadvantages when teachers rely too extensively on the L1. Specifically, when teachers who may not be highly fluent in L2 are given the “green light” to use students’ L1, then L2 use in the classroom may decline significantly on the part of both teachers and students. The differences between Cook and Turnbull are clearly a matter of emphasis but their exchange highlights the importance of establishing the empirical and theoretical basis for choice of medium of instruction in L2 teaching.

### MAJOR CONTRIBUTIONS

The theoretical rationale and empirical basis for teaching for cross-linguistic transfer derive from two sources: (a) the role of pre-existing knowledge as a foundation for learning (Bransford, Brown, and Cocking, 2000); and (b) the interdependence of proficiency across languages (Cummins, 1981, 2001).

#### *Engaging Prior Understandings*

The volume written by Bransford, Brown, and Cocking (2000) entitled *How People Learn* synthesizes research evidence regarding how learning occurs and the optimal conditions to foster learning. A follow-up volume edited by Donovan and Bransford (2005) examines the application of these learning principles to the teaching of History, Mathematics, and Science. The relevance in the present context is that any instructional intervention that claims scientific credibility should reflect these basic principles of learning. Bransford and his colleagues emphasize three major conditions for effective learning: (a) *engaging prior understandings*, (b) *integrating factual knowledge with conceptual frameworks*, and (c) *taking active control over the learning process through metacognitive strategies*. The role of prior knowledge is particularly relevant to the issue of teaching for transfer in the education of bilingual students because if students’ prior knowledge is encoded in their L1, then their L1 is inevitably implicated in the learning of L2.

Donovan and Bransford (2005, p. 4) point out that “*new understandings are constructed on a foundation of existing understandings and experiences*” (emphasis original). Prior knowledge, skills, beliefs, and concepts significantly influence what learners notice about their

environment, and how they organize and interpret their observations. Prior knowledge refers not just to information or skills previously acquired in a transmission-oriented instructional sequence but also to the totality of the experiences that have shaped the learner's identity and cognitive functioning.

This principle implies that when students are being educated through a second language (either in second/foreign language instruction or in bilingual/immersion programs) instruction should explicitly attempt to activate students' prior knowledge and build relevant background knowledge as necessary. However, monolingual instructional approaches appear at variance with this fundamental principle of learning because they regard students' L1 (and, by implication, the knowledge encoded therein) as an impediment to the learning of L2. As a result, these approaches are unlikely to focus on activation of students' prior knowledge. In cases where monolingual approaches do acknowledge the role of prior knowledge, they are likely to limit its expression to what students can express through their L2.

### *Interdependence across Languages*

The interdependence hypothesis was formally expressed as follows (Cummins, 1981):

To the extent that instruction in L<sub>x</sub> is effective in promoting proficiency in L<sub>x</sub>, transfer of this proficiency to L<sub>y</sub> will occur provided there is adequate exposure to L<sub>y</sub> (either in school or environment) and adequate motivation to learn L<sub>y</sub>.

In concrete terms, what this principle means is that in, for example, a dual language Spanish–English bilingual program in the USA, Spanish instruction that develops Spanish reading and writing skills is not just developing *Spanish* skills, it is also developing a deeper conceptual and linguistic proficiency that is strongly related to the development of literacy in the majority language (English). In other words, although the surface aspects (e.g., pronunciation, fluency, etc.) of different languages are clearly separate, there is an underlying cognitive/academic proficiency that is common across languages. This common underlying proficiency makes possible the transfer of cognitive/academic or literacy-related proficiency from one language to another.

There is extensive empirical research that supports the interdependence of literacy-related skills and knowledge across languages (see reviews by Baker, 2001; Cummins, 2001; Genesee, Lindholm-Leary, Saunders, and Christian, 2006). Thomas and Collier (2002), for example, found that immigrant students' L1 proficiency at the time of their arrival in the USA is the strongest predictor of English

academic development. The research trends can also be illustrated by the findings of Verhoeven (1991) in the context of two experimental transitional bilingual programs involving Turkish-background students in the Netherlands. These programs promoted L1 literacy over several elementary school grades. Verhoeven summarized the results as follows:

With respect to linguistic measures, it was found that a strong emphasis on instruction in L1 does lead to better literacy results in L1 with no retardation of literacy results in L2. On the contrary, there was a tendency for L2 literacy results in the transitional classes to be better than in the regular submersion [Dutch-only] classes. Moreover, it was found that the transitional approach tended to develop a more positive orientation toward literacy in both L1 and L2 . . . Finally, there was positive evidence for . . . [the] interdependence hypothesis. From the study on biliteracy development it was found that literacy skills being developed in one language strongly predict corresponding skills in another language acquired later in time (1991a, p. 72).

Depending on the sociolinguistic situation, five types of transfer are possible:

- Transfer of conceptual elements (e.g., understanding the concept of photosynthesis);
- Transfer of metacognitive and metalinguistic strategies (e.g., strategies of visualizing, use of graphic organizers, mnemonic devices, vocabulary acquisition strategies, etc.);
- Transfer of pragmatic aspects of language use (willingness to take risks in communication through L2, ability to use paralinguistic features such as gestures to aid communication, etc.);
- Transfer of specific linguistic elements (knowledge of the meaning of *photo* in *photosynthesis*);
- Transfer of phonological awareness—the knowledge that words are composed of distinct sounds.

The question sometimes arises as to whether we are talking about *transfer* or the existence of *underlying attributes* based on cognitive and personality attributes of the individual. In reality, these dimensions are not separate. The presence of the underlying attribute makes possible transfer across languages. Attributes develop through experience; in other words, they are learned. Once they exist within the individual's cognitive apparatus or operating system (Baker, 2001), they are potentially available for two-way transfer across languages (from L<sub>x</sub> to L<sub>y</sub> or from L<sub>y</sub> to L<sub>x</sub>) if the sociolinguistic and educational context is conducive to, or supports, such transfer.

## WORK IN PROGRESS

An example from a research study conducted in the greater Toronto area (Cummins et al., 2006) illustrates the instructional possibilities that emerge when bilingual students' L1 and prior knowledge are acknowledged as important resources for learning. Several months after her arrival in Canada from Pakistan, grade 7 student, Madiha Bajwa, authored with two of her friends, Kanta Khalid and Sulmana Hanif, a bilingual Urdu–English book entitled *The New Country*. The 20-page book “describes how hard it was to leave our country and come to a new country.” Both Kanta and Sulmana had arrived in Toronto in grade 4 and were reasonably fluent in English but Madiha was in the very early stages of English acquisition.

The three girls collaborated in writing *The New Country* in their “mainstream” grade 7/8 classroom in the context of a unit on the theme of migration that integrated social studies, language, and ESL curriculum expectations. They researched and wrote the story over several weeks, sharing their experiences and language skills. Madiha’s English was minimal but her Urdu was fluent, Sulmana and Kanta were fluent and reasonably literate in both Urdu and English. In composing the story, the three girls discussed their ideas primarily in Urdu but wrote the initial draft in English with feedback and support from their teacher (Lisa Leoni). When the English draft was finalized, they translated it into Urdu.

In a “normal” classroom, Madiha’s ability to participate in a grade 7 social studies unit would have been severely limited by her minimal knowledge of English. She certainly would not have been in a position to write extensively in English about her experiences, ideas, and insights. However, when the social structure of the classroom was changed in very simple ways that permitted her to draw on her L1 concepts and literacy, Madiha was enabled to express *herself* in ways that few second language learners experience. Her home language, in which all her experience prior to immigration was encoded, became once again a tool for learning. She contributed her ideas and experiences to the story, participated in discussions about how to translate vocabulary and expressions from Urdu to English and from English to Urdu, and shared in the affirmation that all three students experienced with the publication of their story as a (hard copy) book and on the world wide web. The fact that instruction was conducted in English and the teacher did not know Urdu or the other home languages of students in her multilingual classroom was not an impediment to the implementation of bilingual instructional strategies.

The fusion of affective, cognitive, and linguistic processes in the creation of dual language texts is reflected in the label *identity texts* that we have used to refer to students' bilingual writing (Cummins et al., 2005). This term describes the products of students' creative work or performances carried out within the pedagogical space orchestrated by the classroom teacher. Students invest their identities in the creation of these texts which can be written, spoken, visual, musical, dramatic, or combinations in multimodal form. The identity text then holds a mirror up to students in which their identities are reflected back in a positive light. When students share identity texts with multiple audiences (peers, teachers, parents, grandparents, sister classes, the media, etc.) they are likely to receive positive feedback and affirmation of self in interaction with these audiences. Although not always an essential component, technology acts as an amplifier to enhance the process of identity investment and affirmation. It facilitates the production of these texts, makes them look more accomplished, and expands the audiences and potential for affirmative feedback.

Translation is an integral part of creating dual language identity texts. Translation also plays an important role in enabling bilingual and newcomer students to participate actively in instruction. Students who engaged in creating dual language identity texts were asked how they felt about using their L1 in the classroom and the extent to which they felt L1 use might help with reading and writing in English (Bismilla, Cummins, Leoni, and Sandhu, 2006). The following written comments reflect newcomer students' insights into both the role of prior knowledge and cross-lingual transfer in L2 learning (spelling and punctuation original):

When I allowed to use Hebrew it helps me understand English I thinking in Hebrew and write in English. If I read in English I think in Hebrew and understand more.

When I am allowed to use my first language in class it helps me with my writing and reading of english because if I translation in english to urdu then urdu give me help for english language. I also think better and write more in english when I use urdu because I can see in urdu what I want to say in english.

When I am allowed to use Urdu in class it helps me because when I write in Urdu and then I look at Urdu words and English comes in my mind. So, its help me a lot. When I write in English, Urdu comes in my mind. When I read in English I say it in Urdu in my mind. When I read in Urdu I feel very comfortable because I can understand it.

Despite their still limited English, these newcomer students insightfully describe what happens inside their heads as they grapple with the learning of English. Their responses accurately reflect the quantitative research on cross-lingual interdependence. They highlight the transfer of concepts and strategies across languages and forcefully call into question the prevalence of monolingual instructional assumptions that essentially deny students access to their L1 as a resource for learning.

#### FUTURE DIRECTIONS

Researchers have observed for many years that many students in bilingual and second language immersion programs spontaneously focus on similarities and differences in their two languages. Lambert and Tucker (1972), for example, noted that students in the French immersion program they evaluated engaged in a form of contrastive linguistics where they compared aspects of French and English despite the fact that in this program (and in virtually all Canadian French immersion programs) the two languages were kept rigidly separate. If students in bilingual/immersion programs spontaneously focus on similarities and differences in their two (or more) languages, and we believe that this increases their language awareness in positive ways, then why not systematically encourage and support them in focusing on language and relating their L1 knowledge to L2?

Teaching for transfer has not been pursued in the vast majority of bilingual/immersion programs, nor in the teaching of the dominant language to newcomer students, because of the uncritical acceptance of monolingual instructional assumptions by many policy-makers, practitioners, and researchers.

Among the bilingual strategies that can be employed to promote literacy engagement in both L1 and L2 are the following:

- *Creation of dual language multimedia books or projects.* Students write creatively in L1 and L2 and amplify these identity texts through technology (see, for example, the Dual Language Showcase <http://thornwood.peelschools.org/Dual/> and the Multiliteracies web site [www.multiliteracies.ca](http://www.multiliteracies.ca)).
- *Sister class exchanges.* Students engage in technology-mediated sister class exchanges using L1 and L2 to create literature and art and/or to explore issues of social relevance to them and their communities (e.g., Social History of Our Community, Voices of our Elders, etc.). Students can also create movies, audio CDs, and/or multilingual web pages in collaboration with their sister classes (Cummins, Brown, and Sayers, 2007).

Many other strategies for enabling bilingual students to use both their languages as tools for learning are outlined in Coelho (2006), DeFazio (1997), Lucas and Katz (1995), and Jessner (Jessner, *Multicompetence Approaches to Language Proficiency in Multilingual Education*, Volume 5). Among the instructional options are the following:

- Focus on cognates in contexts where the languages share common linguistic origins. In Spanish–English and French–English bilingual programs in the USA and Canada, respectively, monolingual instructional assumptions dictate that cognate relationships are only minimally explored despite the fact that the low-frequency academic language of English derives from the same Latin and Greek roots as Spanish and French. Explicit focus on this cross-lingual strategy is required if students are to use it effectively (Nagy, Garcia, Durgunoglu, and Hancin-Bhatt, 1993).
- From kindergarten on, students bring in words (in L1, L2, or L3) to class to explore with peers and teacher and they incorporate these words into technology-supported bilingual/multilingual dictionaries (Cummins, Brown, and Sayers, 2007).
- Provide opportunities for students to develop ideas in their stronger language and then work collaboratively towards expression of these ideas in their less proficient language. For example, English learners could write initially in their L1, discuss and clarify concepts, plan group tasks, write notes and outlines, etc. Coelho (2006) points out that this L1 work “will be a preliminary step toward producing work in English, and it will ensure a better product in the end” (p. 30).
- Students in bilingual or L2 immersion programs can develop critical literacy and language awareness by examining media reports on contemporary issues and comparing the way events and controversies are reported in different languages.

In summary, if bilingual and second language immersion programs are to reach their full potential, it is important that we revisit the monolingual instructional orientation that dominates the implementation of many of these programs and in some cases has assumed the status of dogma. There is simply no research basis for either the direct method or the two solitudes assumption. Similarly, there is no research evidence that translation, used appropriately, is in any way an impediment to effective language learning. On the contrary, research suggests that translation can serve useful pedagogical purposes. Orleana, Reynolds, Dorner, and Meza (2003), for example, highlight the relevance of Latino/a students’ translation practices and abilities for in-school literacy instruction. While extensive use of the target language within foreign/second language and bilingual/immersion programs is clearly a useful and important instructional strategy, it should not be

implemented in a rigid or exclusionary manner. As the examples in this paper illustrate, students' L1 can be a powerful intellectual resource, and bilingual instructional strategies can usefully complement monolingual strategies to promote more cognitively engaged learning.

## IDENTITY, COMMUNITY AND POWER IN BILINGUAL EDUCATION

### INTRODUCTION

Bilingual education is about much more than language. Identity and power relationships figure prominently, although the dynamics of these relationships vary across contexts. Bilingual education planners, policymakers, and practitioners have choices in how they respond to the kinds of language education challenges they face in their school, community, and society contexts. The choices they make about language education policies, programs, and practices reflect ideological assumptions about languages, speakers of languages, and the role of schools in society. These choices can have important implications for students, their families, and the communities and societies in which they live.

Student identities are constantly being negotiated and shaped within all forms of schooling. Within bilingual education this negotiation takes place in two or more languages and reflects the material and symbolic resources of the different social groups. Bilingual education researchers investigate and document how power relations among local and global communities influence the forms of bilingual education that are implemented and the teacher–student interactions that occur within particular bilingual programs. Practitioners use their understanding of power relationships between social identity groups in their communities to develop bilingual education policies, programs, and practices that may elevate the status of minority languages and speakers of those languages, provide more access to opportunities for language minority students, and challenge dominant identity and power relations on the local level.

### EARLY DEVELOPMENTS

Sociolinguistic research conducted in the 1960s, 70s and 80s contributes to our understanding of societal multilingualism, language planning, and the social reproduction of the status of minority language students through schooling. This research provides an important foundation for those concerned with the relationships between identity, community, and power in bilingual education.

Early sociology of language research demonstrates that language use in multilingual societies is never neutral. The historical, social, political, and economic circumstances leading to a particular multilingual situation (e.g., migration, imperialism, federation, border-area phenomena, globalization) influence relations between the different linguistic groups in that context, which in turn influence the ways that languages are used and evaluated by speakers of those languages (see Fasold, 1984 for review of this literature). Haugen (1972) introduced the notion of language ecology to focus attention on the interactions between language and its environment, including how the language interacts with other languages socially as a medium of communication and psychologically in the minds of community members. Power relations structure the functional allocation of languages in multilingual societies, with the prestige language variety (or varieties) used for the higher-status functions of government and education and the less-powerful language varieties used for private or symbolic functions (Ferguson, 1959; Fishman, 1967).

Speakers in multilingual communities manage the complex and at times contradictory pragmatic and symbolic demands for language use in different domains of life (e.g., at home, church, school, work). Sometimes individual minority language speakers or communities make efforts to maintain and develop minority languages, and sometimes majority language speakers or communities assist in these language maintenance efforts. Other times minority language populations experience societal pressure to assimilate to majority language norms, leading to language shift, language loss, or language death (see Fasold, 1984; McKay and Hornberger, 1996 for reviews of this literature).

Fishman (1973) defines language planning as the organized pursuit of solutions to language problems typically on the national level. Much of the early language planning research was problem-oriented (Mühlhäusler, 1996). Ruíz (1984) provides alternatives to the dominant problem orientation in bilingual education language planning, and distinguishes three ideological orientations toward minority languages in society: (1) the language-as-problem orientation underlying transitional bilingual programs for language minority populations; (2) the language-as-right orientation underlying maintenance bilingual programs for language minority populations and (3) the language-as-resource orientation underlying enrichment bilingual programs for language minority and language majority populations. These ideological orientations toward the languages used in the multilingual society reflect power relations between the language planners and the target populations. These ideologies have implications in terms of language use and identity development for students, their families, local communities,

and the larger society. While there are examples of these ideologies in bilingual education programs worldwide, the predominant assumption in research and practice to date has seen linguistic diversity as a problem (Hornberger, 2002; Mühlhäusler, 1996).

The 1980s also yielded an important body of ethnography of communication research illustrating how the microlevel organization of classroom interaction can reflect and reproduce the macrolevel social processes that discriminate against students who speak minority languages (see Heath, 1983; Philips, 1983 for detailed discussion of speakers of vernacular varieties of English in mainstream English speaking schools in the USA). This research identifies cross-cultural differences in the ways that children from different speech communities are socialized through language to use language correctly and appropriately in their everyday lives (see also Schieffelin and Ochs, 1990 for cross-cultural examples). The “mismatch” or cross-cultural miscommunication that can occur between the ways that language minority students use language outside of school and the mainstream teachers’ cultural expectations for appropriate language use in school can negatively position language minority students relative to their language majority peers. Such subordinate positioning can restrict language minority students’ opportunities to demonstrate what they know and/or can do, which can in turn block their access to equal educational opportunities.

Early work in the sociology of language, language planning, and ethnography of communication contributes to our understanding of how the stratification of minority languages relative to majority languages on the macrosocietal level is reflected in the ways that language planners organize bilingual education programs for language minority students, and in the ways that teachers position language minority students in the classroom interaction. These programs and practices can, in turn, contribute to the social reproduction of the subordinate role of minority languages and speakers of those languages. However, as we see in more recent research, social reproduction through schooling is not the only possibility.

#### MAJOR CONTRIBUTIONS

Interdisciplinary research in literacy studies, linguistic anthropology, critical discourse analysis, and language planning in the 1990s contributes to our understanding of the dynamic nature of identity and power relations. This work highlights the social and ideological nature of discourse. Bilingual education researchers can draw theoretically and methodologically on this work in their investigation of how identity and power relations are constructed and contested through bilingual

education in particular community contexts. An interdisciplinary ethnographic and discourse analytic approach allows us to understand how bilingual education policies, programs, and practices can *either* reflect and reproduce dominant identity and power relations, *or* challenge and potentially transform those relations (Freeman, 1998, 2004).

Recent research on language and identity provides evidence of the dynamic, multifaceted, negotiated, and negotiable nature of social identity construction through discourse in particular communities of practice (e.g., Eckert and McConnell-Ginet, 1992; Gee, 1990). This work focuses on language and literacy or discourse practices, which can be understood as the ways of believing, thinking, valuing, speaking, and writing that are shared by community members and that constitute social identities (e.g., gender, racial, ethnic, religious, professional) within those communities. Discourse practices are never neutral; they are always structured by power relations. Power may be understood as symbolic domination, and the strongest form of power may be the ability to define social reality and to impose visions of the world through language (Fairclough, 1992; Foucault, 1979; Gal, 1995).

How do members of a community come to value certain languages and speakers of those languages? Bourdieu (1993) argues that language can be understood as a form of cultural or symbolic capital whose value is negotiated in a metaphorical linguistic marketplace. Speakers use language, like other forms of cultural capital, to pursue their interests. The dominant language in a specific linguistic market is assigned more value than other languages in that market. Proficiency in the dominant or majority language can thus be understood as a form of cultural capital which is unequally distributed throughout society. Proficiency in the minority (immigrant or indigenous) language may not be valued, or it may be valued in different ways by members of the discourse communities within that larger society. Martin-Jones and Heller (1996) apply Bourdieu's economic metaphor to the study of education in multilingual settings in a wide range of contexts to illustrate the fundamental role of education in the production and reproduction of unequal power relations in different multilingual communities.

Recent sociolinguistic research, however, emphasizes the need to develop Bourdieu's concept of symbolic domination through language to allow for the possibility of contestation or resistance to the existing power relationships. Examining resistance tells us about where and how power is exerted, and knowing how institutions of power work tells us where to look for possible signs of resistance (Gal, 1995; Heller, 1994; Martin-Jones and Heller, 1996). Schieffelin, Woolard, and Kroskrity (1998) analyze language ideologies, or "common sense" assumptions about languages and speakers of languages that are reflected in what people say and write, enacted in everyday activities,

and structured by power relations. Norton (2000) focuses on minority language speakers' resistance to assimilation to language majority norms in what she calls identity investment. Her ethnographic research shows that when speakers are invested in a minority identity, they are more likely to make efforts to maintain and develop the minority language and identity.

Recent research in language planning has also taken an ideological turn (Wiley, 1996), and researchers emphasize the need to investigate how language plans are interpreted and implemented in particular sociopolitical contexts. Language planning research is no longer primarily focused on the top-down problem-solving activities of governmental policymakers. Both the notions of who the language planners are and what counts as language planning have expanded. Cooper (1989), for example, defines language planning as deliberate efforts to influence the behavior of others with respect to the acquisition, structure, or functional allocation of their languages. He emphasizes that language planning activities can be undertaken by a wide range of groups including local, regional, and national agencies, community-based organizations, professional organizations, churches, schools, and families. Language planning is now understood as dynamic, ideological processes that can be initiated from the top and/or from the bottom. These processes are shaped by multiple levels of institutional authority (see also Bamgbose, 1989).

Freeman's (1998) two year ethnographic and discourse analytic study of dual language planning and implementation at a successful bilingual school in Washington DC (Oyster Bilingual School) offers an example of this approach, and it provides empirical evidence of the transformative potential of bilingual education on the local school level. Freeman argues that the Oyster educators have constructed an alternative to mainstream US educational discourse for their student population, which is reflected in their dual language policy, multicultural curriculum content, student-centered classroom interaction, and culturally sensitive assessment practices. A primary goal of Oyster's bilingual education policy, program, and practices is to elevate the status of Spanish and Spanish speakers. The result is that Spanish speakers and English speakers are positioned more or less equally at school. Oyster's dual language program challenges the symbolic domination of English and English speakers on the local level.

Hornberger's (2003) continua of biliteracy model is a promising framework for action-oriented ethnographic and discourse analytic research in particular bilingual education contexts and for comparative research and practice across contexts. It is a comprehensive model that is premised on a view of multilingualism as a resource. Hornberger defines biliteracy as any and all instances in which communication

occurs in two or more languages in or around writing, and she describes biliteracy in terms of four nested sets of intersecting continua. Using the continua of biliteracy framework as a guide, bilingual education researchers and practitioners can ask questions about the contexts, media, content, and development of biliteracy to see if there is ideological space in the community, school, classroom, or home for biliteracy development. When they identify policies, programs, and practices that do not promote multilingualism and cultural pluralism, they can devise creative ways to challenge dominant identity and power relations in that context. Hornberger's continua of biliteracy framework has been applied to bilingual education research and practice in a wide range of multilingual communities worldwide (see Hornberger, 2003 for detailed discussion and examples).

### WORK IN PROGRESS

According to Hornberger (2002), the one language-one nation ideology of language policy and national identity is no longer the only available ideology worldwide (if it ever was). She describes language policies in postapartheid South Africa's new Constitution of 1993 and Bolivia's National Education Reform of 1994 as examples of transformative policies, and writes,

multilingual language policies which recognize ethnic and linguistic pluralism as resources for nation-building are increasingly in evidence. These policies, many of which envision implementation through bilingual intercultural education, open up new worlds of possibility for oppressed indigenous and immigrant languages and their speakers, transforming former homogenizing and assimilationist policy discourses into discourses about diversity and emancipation (Hornberger, 2002).

An important aspect of the work in progress is to identify how dominant and alternative language ideologies structure identity and power relations in bilingual education contexts, and to find creative, context-appropriate ways to open ideological and implementation space for policies, programs, and practices that promote multilingualism and cultural pluralism.

Ethnographers often focus on contested terms as an important area of inquiry because they point to power struggles in the community. The term *bilingual education*, for example, technically means using two languages for instructional purposes. Bilingual education researchers have identified different types of bilingual education programs with different target populations, different goals, different program structures, and different outcomes (transitional bilingual programs for

minority language speakers which generally lead to subtractive bilingualism; maintenance or one-way developmental bilingual programs for minority language speakers, two-way or dual immersion programs for majority language and minority language speakers and foreign or second language immersion programs for majority language speakers—which all generally lead to additive bilingualism). However, ethnographers find that in practice the term *bilingual education* often takes on different meanings in different communities. Analysis of these ideological meanings can reveal power and identity relations within those communities.

In New Zealand, for example, Maori immersion education targets Maori (minority) students, many of whom speak more English (the majority language) than Maori (the minority language) in their everyday lives. According to Hornberger (2004), Maori immersion schools ban English from the school premises and provide instruction exclusively through Maori with the goal of additive bilingualism (i.e., the addition of the Maori language) for the Maori students. In the context of Maori revitalization efforts, Maori immersion education is not seen as a type of bilingual education; it is seen as in opposition to bilingual education programs which use English and Maori for instructional purposes. In this context, the term *bilingual education* is negatively evaluated because the use of English, the majority language, is seen as a threat to Maori, the minority language. Efforts to make any changes to language education policies, programs, and practices (e.g., to encourage the use of any English in Maori immersion schools so that Maori students develop the multilingual literacies they need to participate in the global economy) must take seriously insider understandings of the relationships between language, identity, and power relations on the local and national levels in New Zealand.

In the USA *bilingual education* is also a contested term, reflecting power and identity struggles between English speakers and (primarily) Spanish speakers. Bilingual education is often understood in practice as a synonym for transitional bilingual education which exclusively targets English language learners (ELLs), most of whom are low-income Spanish speakers. In the context of increasing English-only and anti-immigrant activity in the USA today, the use of Spanish (a minority language in the USA) is often described as a threat to English (the majority language) and to national unity. Several states (California, Arizona, and Massachusetts) have legislated against bilingual education, despite research that documents the effectiveness of well-implemented bilingual education and the ineffectiveness of English-only approaches. Many more states have passed English-only legislation, and at the time of this writing English-only legislation is under serious consideration on the national level.

At the same time, dual language programs which target English (language majority) speakers are increasingly positively evaluated and funded in the USA.

The most common form of dual language education in the USA is two-way immersion (TWI) which targets English (language majority) speakers and speakers of another (minority) language—most commonly Spanish. We saw strong ideological and financial support for dual language education at the federal level in the mid to late 1990s, including former Secretary of Education Richard W. Riley's March 2000 challenge for the nation to increase the number of dual language programs to 1,000 over the next five years. Top-down ideological and financial support for dual language education was complemented by bottom-up TWI program development across the country, with the number of TWI programs growing to 321 programs in 28 states (Center for Applied Linguistics, 2005). It is interesting to note that the English-only laws that passed in California, Arizona, and Massachusetts allow waivers for dual language programs that target English speakers.

Although dual language programs may have the potential to challenge the symbolic domination of English in the USA by promoting bilingualism and cultural pluralism for English speakers and speakers of other languages, Valdés (1997) makes a strong cautionary note about these programs. Since white middle class students tend to outperform their low-income Spanish speaking counterparts academically in most US schools today, Valdés urges educators to ensure that dual language programs provide Spanish speakers with opportunities to reach equally high standards in both languages in content area classes. Otherwise, Valdés argues, Spanish speakers are exploited for the Spanish language resource that they offer to English speaking students. In this case, instead of challenging dominant power relations that discriminate against low-income Latinos, dual language programs would contribute to the social reproduction of the subordinate status of this population. Clearly, this is not the intention of the language-as-resource ideological orientation advocated by Ruíz (1984) and others.

Competing ideologies about bilingual education in different communities over time begin to illustrate ways that dynamic identity and power relations structure bilingual education policies, programs, and practices at different points in time in those communities. In many contexts, we see conflict and controversy about what bilingual education means and who bilingual education programs are intended to serve. The ideological and implementation spaces change across contexts over time, which requires changing actions by researchers and practitioners.

## PROBLEMS AND DIFFICULTIES

Researchers and practitioners who focus their attention on issues of identity and power in bilingual education agree that multilingual language policies implemented through bilingual intercultural education can enhance children's learning by building on the linguistic and cultural resources those children bring with them to school, and by challenging dominant power relations that contribute to the subordination of minority identities and languages. They also agree that one of the major challenges is ideological. Language ideologies within any bilingual education context are likely to be complex and contradictory, and the contradictions reflect and shape identity and power relations in that context. Although ethnographic and discourse analytic research allows for an understanding of the particular nature of these relations, and although practitioners can devise creative ways to open and spread ideological and implementation spaces, this kind of work takes considerable time and effort.

One of the most challenging decisions facing educators in many multilingual communities concerns what language (or languages) to use for instructional purposes. As Hornberger (2006) emphasizes, the challenge of popular demand for the societal language(s) of power is a very real one in contexts all over the world, one not to be lightly dismissed. Hornberger draws on her continua model of biliteracy development to explain the arguments against Quechua (an indigenous language which was considered not appropriate to be used as the medium of instruction) in favor of Spanish (the majority language) in Peru in 1987–1989 and again against Quechua and Aymara in favor of Spanish in Bolivia twenty years later. Hornberger cites Banda (2000) who identifies a similar set of language ideologies in Black African communities in South Africa, with black and colored parents increasingly demanding English medium instruction even while academics and researchers agree that English medium instruction is largely responsible for the general lack of academic skills and intellectual growth at high school for language minority students in these communities. Freeman (2004) describes contradictory language ideologies in the predominantly Puerto Rican community in North Philadelphia in the USA, leading many parents and educators to think in terms of *either English or Spanish*, or *first English then Spanish*, rather than *both Spanish and English*. The Foundation for Endangered Languages (2006) expresses concern that the multilingual language policy stance endorsed by the Government of India in response to increasing globalization may contribute to imbalances and instability in the language ecology and threaten the viability of less common languages and the communities

in which these languages are spoken. This concern can be extended to other countries whose multilingual language policies support the development of some minority languages at the expense of other less common languages and communities.

The language ideologies of different constituents (e.g., policymakers, members of language majority communities, members of language minority communities) in a particular context are often in conflict with each other. Moreover, the language ideologies held by the different constituents are often in conflict with research that demonstrates the effectiveness of well-implemented bilingual programs that promote the maintenance and development of minority languages for minority language speakers and communities. These language ideologies, however, reflect and shape the types of bilingual education implemented in a particular community context. They also complicate efforts to promote bilingual education policies, programs, and practices that seek to transform dominant identity and power relations on the local level.

A tremendous challenge for practitioners is determining how to address the competing discourses that we identify through ethnographic/discourse analytic research. For example, how should practitioners address conflict and controversy about whether the home language(s) of the language minority students are problems to be overcome or resources to develop? How should they respond to confusion about the role of the child's first or home language(s) in education, or to political questions about the role of language in national unity? Practitioners who are working to challenge dominant social relations through bilingual education need to find creative ways to move from conflict and controversy to a coherent enrichment orientation that sees linguistic and cultural diversity as resources to be developed and not as problems to be overcome. In order for additive bilingual education programs to be effective, the language-as-resource orientation must be reflected in the bilingual education policies, program structure, curriculum content, materials, organization of classroom interaction, and assessment practices. This resource orientation must also be supported by parents and community members outside of school. This kind of educational and social change is neither simple nor straightforward.

The nature of the work in progress in a particular bilingual education context is shaped by the historical and contemporary sociopolitical relations that characterize the multilingual situation, the local language ecology, the ideological and material resources and constraints that one finds in that context, and the role of the person doing the work. Practitioners (policymakers, language educators, parents, community members) can look for creative ways to work the ideological and implementation spaces that they find at a given point in time in their

context. Researchers can describe, interpret, and explain identity and power relations and struggles in particular bilingual education contexts. Researchers and practitioners together contribute to our understanding of symbolic domination and effective resistance through language.

#### FUTURE DIRECTIONS

Although we have developed a theoretical and practical understanding of how identity and power relations influence the ways that bilingual education policies, programs, and practices are interpreted and implemented in particular communities and societies, we need much more research across a wider range of contexts. There is so much variation from one bilingual education context to another, and we need careful ethnographic/discourse analytic studies that document (1) how broader sociopolitical relations among specific local and global communities influence the forms of bilingual education that are planned and implemented, (2) the implications of the different forms of bilingual education for identity construction at school, and (3) the ways that dominant identity and power relations are reflected and reproduced or contested and potentially transformed through bilingual education. Detailed ethnographic and discourse analytic studies of the complex interrelationships between identity and power within and across particular bilingual education contexts will provide considerable insight for practitioners who are working to open and spread ideological spaces that promote multilingualism and cultural pluralism.

Conceptualizing context as made up of three interrelated levels can advance this project. Context can be understood as dynamic relationships among the situational, institutional, and societal levels that relate to each other in important ways (Fairclough, 1989). In most cases, macrolevel identity and power relations are reflected and reproduced in the microlevel situation (e.g., classroom) and/or institution (e.g., school), and in most cases minority languages and speakers of those languages continue to be discriminated against at school and in society. However, we have also seen that the microlevel situation and/or institution can resist, challenge, and potentially transform discriminatory power relations. Bilingual education researchers need to describe, interpret, and explain how bilingual education planning and implementation activities interact with the dynamics of particular multilingual situations within and across the multiple levels of context over time (see Freeman, 1998, 2004 for detailed discussions and examples).

An ideological approach to investigating existing language, identity, and power relations in the community and how the bilingual education policy, program or practice is intended to interact within that context is critical. Grounded longitudinal research can help policymakers and

practitioners understand how the dynamics of the context influence the way that bilingual education is interpreted and implemented on the local level. A critical understanding of context is essential to any discussion about the effectiveness of different types of bilingual education policies, programs, and practices for different target populations.

People have choices in how they define themselves, each other, the languages that they speak, and the educational policies, programs, and practices that they develop. Although the ways that people use and evaluate languages in any given situation may be powerfully influenced by larger historical, sociocultural, political, and economic processes, these processes do not necessarily determine what happens in the face-to-face interaction. Policymakers, community members, and/or educators can choose to open and spread ideological and implementation spaces that promote multilingualism, and to provide opportunities to populations that have been traditionally denied access to those opportunities.

## MULTICOMPETENCE APPROACHES TO LANGUAGE PROFICIENCY DEVELOPMENT IN MULTILINGUAL EDUCATION

### INTRODUCTION

Due to a significant increase in interest in the phenomenon of multilingualism, research on multilingualism and multilingual education has grown over the last two decades. Some influential developments in research on second language acquisition and bilingualism have begun to exert an impact on second language teaching and bi- and multilingual education. These concerns include the symbiosis of the hitherto isolated fields of second language learning and bilingualism, the introduction of the concept of multicompetence, reflecting a *bilingual* view of bilingualism, and the application of dynamic systems theory to second language acquisition and multilingualism.

After an outline of the Chomskyan concept of language competence, these new developments will be described in more detail and the most important areas of research which have provided contributions to the development of multicompetence approaches to language proficiency will be examined. A central theme of the paper is that multilingual education can only be successful if the cognitive potential of multilingualism is explicitly acknowledged on the societal level.

### EARLY DEVELOPMENTS

The concept of language competence was introduced into linguistics by Chomsky (1965), who was one of the first linguists to develop an explicit theory of competence. His theory of competence can be seen as marked by two characteristics, that is, first, the distinction between native-speaker competence and native-speaker performance, and second, the assumption that competence is not immediately accessible to the native speaker. Chomsky (1965, p. 3) stated that ‘[l]inguistic theory is concerned primarily with an ideal speaker-listener, in a completely homogeneous speech-community, who knows its language perfectly and is unaffected by such grammatically irrelevant conditions as memory limitations, distractions, shifts of attention and interest, and errors (random or characteristic) in applying his knowledge of the language in actual performance.’ Furthermore he noted that ‘[l]inguistic

competence is understood as concerned with the tacit knowledge of language structure, that is, knowledge that is commonly not conscious or available for spontaneous report, but necessarily implicit in what the (ideal) native speaker-listener can say.' (Chomsky, 1965, p. 19). Although it was never explicitly stated by Chomsky, it can be assumed '[...] that the native speaker and her/his innate faculties are necessarily monolingual', as pointed out by Herdina and Jessner (2002, p. 31).

Hymes (1972) as one of Chomsky's critics found that Chomsky's theory lacked the aspect of appropriacy and therefore suggested an extension of the theory of competence to include a theory of performance competence or proficiency. Consequently, Hymes introduced the notion of communicative competence, thereby adding a stronger sociolinguistic dimension to the psycholinguistic notion of competence in which verbal repertoire, linguistic routines and domains of language behaviour play crucial roles. This contrasts with the Chomskyan point of view, which posits linguistic competence in isolation from general cognitive conditions or sociolinguistic aspects. Chomsky's approach is complemented by the principle of modularity of mind, which assumes both that the various faculties of the mind are to be thought of separately and that the components of language competence, that is the lexical system, syntactic system, phonetic system, and so on, can also be interpreted as separate modules. Other tenets that Universal Grammar implicitly or explicitly holds are a linear theory of language development, a resetting model of second language acquisition, a critical age hypothesis and invariable competence (for details see Herdina and Jessner, 2002, p. 30–51). In an attempt to define 'competence', Chomsky (1980, p. 59) draws a distinction between knowing the forms of a language, the ability to use the language one knows, and actually using it. In contrast, Bachman (1991) perceived language ability as consisting of language knowledge, which is sometimes referred to as language competence and cognitive processes or procedures implementing this knowledge in language use.

The historical development of the concept of language proficiency is usually described as having two phases. The first phase, lasting from 1920 to 1980, is dominated by Oller's (1976) work who discussed language proficiency as a single, global ability. The second phase is strongly connected to Bachman and Palmer's communicative model of language ability (1982), which views language proficiency as multi-componential, with areas of knowledge that are unique to language use and general metacognitive strategies (see also Canale and Swain, 1980).

Until very recently the concept of language competence was seen as applicable to both first and second language contexts. The reasons for

such an approach have to be seen in relation to the prolonged isolated development of the fields of second language learning and bilingualism. Only when scholars such as Harley and colleagues (1990) started to develop common frameworks for both research fields, a turn—which we might want to call a multilingual turn—in research on how to define the competence of individuals who know more than one language was observed. It should be noted that such a view implies that formal and informal second language acquisition can lead to bilingualism.

### MAJOR CONTRIBUTIONS

Current work on multilingualism and multicompetence, in particular, has mainly been influenced by holistic ideas of bi- and multilingualism. Grosjean's work (1985) on the bilingual as a competent but specific bilingual speaker-hearer strongly influenced both Cook's concept of multicompetence (e.g. 1991) and Herdina and Jessner's (2002) dynamic view of multilingual development and multilingual proficiency, as discussed in the following sections.

#### *Bilingual View of Bilingualism*

Grosjean (1982, 1985) was the first linguist to introduce a bilingual or holistic view of bilingualism. His approach opposes the monolingual norm assumption that interprets bilingualism as a kind of double monolingualism. This viewpoint has dominated most research on bilingualism and has given rise to portraying bilinguals as deficient monolinguals in each of their languages. Such an attitude has also been accepted by a large number of bilinguals who, although they function in both languages on a daily basis, criticize their own language competences and therefore are hesitant about referring to themselves as really bilingual. The strong belief that a person can only be called truly bilingual if s/he is ambilingual, that is, is fully competent and therefore comparable to a monolingual native speaker in both languages, still prevails. Among other reasons, such an approach to bilingualism reflects the focus of researchers on the so-called negative effects of the contact between two languages, be they of either linguistic or social nature. And this attitude is also reflected in language tests used for the assessment of the language skills of bilingual children in minority contexts since traditional tests do not take positive consequences of bi- and multilingualism or characteristic features of bilingual speech, such as codeswitching, into consideration. Grosjean (1985) compared the bilingual speaker to a high hurdler who combines his or her competences, jumping and sprinting, in one person, although

s/he is neither a sprinter nor a high hurdler. In this sense the bilingual speaker is a human communicator who has developed communicative competence in two languages in order to be able to cope with the communicative needs of everyday life.

In his recent work Grosjean (e.g. 2001) concentrated on language mode as a crucial control variable to be taken into account in research on bi- and multilingualism. Language mode which has to be seen on a continuum from monolingual to multilingual mode describes the state of activation of the multilingual person's linguistic repertoire, that is, when and why a speaker uses or activates one, two or three of her/his languages.

### *The Concept of Multicompetence*

Over the past 15 years Cook has developed the notion of multicompetence understood as the knowledge of more than one language in the same mind, or in other words, the knowledge of the first language (L1) in addition to the interlanguage. Cook's concept has been discussed and used in several areas of (applied) linguistics, mainly in second language research and teaching (<http://homepage.ntlworld.com/vivian.c/SLA/Multicompetence/MCrefsList.htm>).

By drawing on Grosjean's ideas of the bilingual as a person in her/his own right, Cook (2001) separated someone who knows more than one language from the native monolingual speaker by emphasizing that the monolingual mind differs from the mind of the second language learner. This also implies that the relationship between the L1 and the interlanguage within one mind is different from that between the interlanguage in one mind and the L2, when the L2 has the status of an L1 in another mind. Additionally, the term *L2 user* became preferred over the L2 (or bilingual) learner by Cook to imply that the user is different from a learner who is always learning and never achieving (e.g. Cook, 2003a).

Cook states that the second language user has a different perspective compared to the monolingual on the L1 and the L2, and also develops a different kind of metalinguistic awareness and engages in different forms of language processing. The research that has derived from this concept has been concerned in particular with the effect of the L2 on the L1 (Cook, 2003) and with the relationships between the language systems in the L2 user's mind, as discussed in Cook et al. (2006). As pointed out by Cook (2006, p. 15) himself, in order to capture the multilingual learner's mind we need a holistic approach such as taken by Herdina and Jessner (2002) who introduced dynamic systems theory as a metaphor for discussing multilingual phenomena.

*Dynamic View of Multilingualism*

As one of the first to apply dynamic systems theory to applied linguistics, Herdina and Jessner (2002) developed a dynamic model of multilingualism (henceforth DMM). They emphasize that dynamic systems theory provides a useful metaphor for discussing multilingual development. A multilingual system is an adaptive complex system which possesses the property of *elasticity*, the ability to adapt to temporary changes in the systems environment, and *plasticity*, the ability to develop new systems properties in response to altered conditions. In DMM, perceived communicative needs, which are psychologically and sociologically determined, are identified as the driving force of language learning and use. Such a holistic view is a necessary presupposition of a dynamic view of multilingualism assuming that the presence of one or more language systems influences the development not only of the second language but also the development of the overall multilingual system. Research on third language acquisition has been able to show the complexity of a multilingual system by focusing in particular on the differences between second and third language acquisition (e.g. Cenoz, Hufeisen and Jessner, 2003).

In DMM, multilingual proficiency is defined as a cumulative measure of psycholinguistic systems in contact. These systems are not identical to language systems as a result of their crosslinguistic interaction, which also integrates synergetic and interferential effects, and the influence that the development of a multilingual system exerts on the learner and the learning process such as greater expertise in learning skills and qualities distinguishing the experienced from the inexperienced learner. As emphasized by Herdina and Jessner (2002), Cummins' interdependence hypothesis (1991), which is based on the assumption of a common underlying proficiency due to the contact between two languages, presents a related concept in a similar way to Kecskes and Papp's (2000) notion of a common underlying conceptual base, they both describe an overlap between L1 and L2 and not a complete metamorphosis of the systems involved as is the case with DMM.

A heightened level of metalinguistic awareness is defined as part of the M(ultilingualism)-factor which also relates to cognitive aspects of multilingual learning such as an enhanced multilingual monitor and/or the catalytic effects of third language learning (see Cenoz, 2003 on the effects of bilingualism on third language learning). Metalinguistic knowledge and awareness of that knowledge play a key role in multilingual learning and use, as discussed in detail in Jessner (2006). Changes of quality between second and third language learning are based on the differences in norms that the language learners relate to, that is, a bilingual norm in third language learning as opposed to a monolingual norm

in second language learning. In addition, in most contexts, third language learning assumes that the learner has already gained experience in learning a first foreign language (Hufeisen, 1997).

#### WORK IN PROGRESS

Although the notion of multicompetence has not yet exerted a major impact on discussions of the multilingual mind in learning and teaching contexts, a tendency to incorporate the main conceptual ideas of multicompetence into new ways of thinking in research studies of bi- and multilingualism can be detected. Many of these new tendencies are associated with efforts in multilingual education contexts to raise metalinguistic awareness or to promote broader cognitive benefits from a heightened level of metalinguistic awareness in experienced learners.

The number of third language studies, mainly focusing on the differences between second and third language learning, has been increasing over the last ten years (e.g. Cenoz, Hufeisen and Jessner, 2001, 2003). Many of these studies, which have been concerned with lexical transfer phenomena in third language learning, evidenced the activation of other languages than the target language in crosslinguistic consultation (for an overview see Jessner, 2006: 74ff.; see also Green, 1998). In other words, these links between the languages in a multilingual's repertoire can be used as a counterargument against the traditional attitudes of both teachers and educationalists to keep the languages in the classroom apart in order to avoid confusion through the activation of prior language knowledge. Recently a number of cross-language approaches to language education have been suggested to foster synergy effects and cross-fertilization through cooperation between the languages and the language subjects in a classroom.

Such an approach also reintroduces L1 to the classroom. Until recently due to the influence of traditional Contrastive Analysis, the intrusion of L1 in the classroom was viewed as interference or negative transfer on second and further language learning. But since transfer has been attested a facilitative role in second language learning (e.g. Lewis, 1990; Schweers, 1993), the L1 or prior linguistic knowledge has been used as a cognitive basis for further language learning. From a holistic perspective this fairly new development is related to the L1 maintenance programs in migration contexts (e.g. Krumm, 2005; see also below).

As part of a cross-linguistic approach to language awareness, James (1996, 145ff) suggested reintroducing contrastive analysis for consciousness-raising purposes, namely to put a special focus on the cognitive dimension of contrastive analysis by gearing it towards the learner. Such an approach also implies that metalinguistic aspects

of in-class contrastive analysis are focused on, as happens in the case of translation. Similarly, Hawkins (1999) referred to language learning as language apprenticeship by emphasizing that the main aspects of language learning concern the process of how to learn to learn a language and to engage in cross-language comparisons with particular reference to the role of L1 in second language learning. Cummins (2001) suggested transformative pedagogy using collaborative critical inquiry to develop critical language awareness. Students should be made aware of language forms and uses, part of which can be done through cross-lingual comparison of European languages deriving from Latin and Greek such as cognates and proverbs. This activity can be complemented by the comparison of similarity across languages in the way abstract nouns are formed from verbs. Wandruszka's pioneering work on how to exploit the common linguistic core, that is the Latin and Greek origins, of the main European languages English, French, Spanish and German as a basis for language learning has to be recalled here (e.g. Wandruszka, 1986).

The development of metalinguistic abilities, i.e. the development of skills distinguishing between form and meaning in order to be able to manipulate languages, and the awareness of this ability formation, constitute part of a language learning strategy training which ideally should be combined with a cross-language approach. The experienced learner who has become aware of the structural similarities and differences between the languages of his/her repertoire has also learnt how to expand the repertoire as well as how to weigh the strategies, as already discussed by McLaughlin (1990). The number of language learning strategies are related to prior linguistic knowledge and the levels of proficiency in the respective languages of the speaker (Mißler, 1999; Ó'Laoire, 2001). Recently Wrembel (2003) has developed a metacompetence-oriented model of phonological acquisition for second language learning and teaching.

Based on the aim of the European Union to have citizens who are able to use their mother tongue plus two other languages, a number of European projects have developed new approaches to language proficiency in multilingual education. For example, the EuroCom (European Comprehension) project ([www.eurocom-frankfurt.de](http://www.eurocom-frankfurt.de)) has concentrated on how to provide European citizens with a solid linguistic basis for understanding each other, at least within their own language family. Such an approach includes optimal inferencing techniques in typologically related languages in order to develop at least receptive skills in the new language and has so far been applied to Romance, German and Slavic language families (Klein and Rutke, 2004). In other projects, funded by the European Centre of Modern Languages, the creation of synergy in language learning by learning

and teaching beyond language borders has been at the centre of interest (e.g. Hufeisen and Neuner, 2003, on learning German as L3). Candelier (2003) coordinated a European project to foster language awareness in school children. The ultimate goal of all these efforts is to arrive at a common curriculum for teaching languages in institutional contexts as discussed in Hufeisen and Lutjeharms (2005). A good example is Innsbruck University (Austria) where a model of teaching language didactics across language departments has been introduced (Hinger, Kofler, Skinner, and Stadler, 2005). An integrated approach to language teaching requires the cooperation of all the language teachers in an institution as well as teacher training that focuses on developing language and language learning awareness among the teachers, students, and teachers as learners since language learning is a life-time process.

### PROBLEMS AND DIFFICULTIES

As discussed above, Cook's concept of multicompetence suggests a holistic view of the L2 user. This fairly new perspective implies the introduction of multilingual norms instead of monolingual or traditional norms in linguistics. Although in a number of studies in second and third language learning, well-trodden paths have already been left, it is clear that a number of problems still need to be solved in order to arrive at a holistic perspective of the multilingual learner or user (see also Jessner and Cenoz, 2007). Some of these will be discussed shortly in the following. They concern the status of the native speaker in language research and teaching, the range and order of languages to be taught in a curriculum, as well as teaching material.

#### *Status of the Native Speaker*

Recently the native speaker has come under strong attack in discussions of norms in multilingual research and teaching. Cook (1999) suggested that multicompetence should replace the native speaker norm as the goal of language teaching (compare Herdina and Jessner, 2002 on multilingual proficiency).

The native versus non-native teacher discussions mainly concern teachers of English. Due to the rapid increase of English as lingua franca, Seidlhofer (2000) called for a redefinition of the ideal non-native teacher of English. She argues that although English nowadays predominantly serves as a medium of communication between speakers with different primary languages, control over the norms of the language still rests with the monolingual minority of its speakers. Recent studies have focused on the dilemmas of non-native teachers of ESL and whether nativeness matters to students who are taught

English by non-native speakers (for an overview see Llurda, 2005). Ellis (2005) points out that the non-native teacher is able to pinpoint linguistic problems and offer metacognitive learning strategies that the native teacher without foreign language experience is unable to detect.

### *Range and Order of Languages to be Taught in a Curriculum*

As already indicated above, research on third language acquisition has shown that learning a second language differs from learning a third one. For the teaching context this has implications with regard to the level of proficiency to be reached in each of the languages in the curriculum, the starting age for each of the languages and the nature of cross-linguistic contact between the languages of the curriculum, with a special focus on prior language knowledge and language learning experience in multilingual learners (Jessner and Cenoz, 2007).

The typology of the languages offered in a curriculum also plays an important role in the order of acquisition, as was shown by Griebler (2001) in her comparative study of level of proficiency in English in three Austrian schools. She found that those pupils who were introduced to French in parallel to English at an early stage outperformed pupils from regular school types where French is taught some years later than English.

Finally it has to be noted that the choice of languages in curriculum planning has to be considered a difficult task since a successful language curriculum should be able to integrate minority and/or heritage languages as well as a number of foreign languages which are of interest to the social community (Krumm, 2005). Besides, problems concerning the choice of languages for heritage language programs might occur as found in an Austrian study by Brizic (2006) who detected a mismatch between the linguistic background that the parents of Turkish migrant children were assumed to have and their actual language background.

Additionally, in reaction to the rapid increase of English as a lingua franca, the role that English should play in a multilingual classroom has received considerable attention in scientific debate. One of the most frequently asked questions is whether English should take a prominent role in education as the first foreign language in those countries where English is not used as a first or second language or whether it would make more sense to focus mainly on other languages than English in instruction since English would be learned anyway due to daily contact with the language outside the classroom (e.g. Vollmer, 2001)? Only very recently it has been suggested to focus on multilingualism with English in order to capitalize on the positive cognitive effects of

multilingual learning which will necessarily show a washback effect on English language learning (Jessner, 2006).

### *Teaching Material*

Comparative grammars and other reference material are necessary requirements for successful instruction. But unfortunately multilingual teaching material is still rather scarce. Glinz's (1994) learner grammar for German-French-English-Latin was followed by Müller (1999) on German-English-French. Apart from a few attempts to develop material used to raise language awareness in children (Candelier, 2003; Feichtinger, Lanzmaier-Ugri, Farnault and Pornon, 2000), textbooks still need to be developed for multilingual education. Ideally, multi-competence approaches to teacher material development have to consider developing common grammatical terminology as one of the prerequisites for multilingual learning.

As pointed out by Oomen-Welke (2006) a great deal of multilingual learning happens through comparisons and promotion of metalinguistic awareness and awareness of language learning strategies can build on the constructive potential of comparing languages. Open material is needed to incorporate new languages, even if they are only known by the pupils who can act as experts, which strengthens the role of the learners, particularly in migration contexts. Ideally, the development of multiliteracies presents an integral part of multilingual education (Cummins, 2006).

## FUTURE DIRECTIONS

As is clear from the previous discussion, much work on how to develop multicompetence approaches to language proficiency development in bi- and multilingual programs needs to be done. One of the main domains which need further development is multilingual testing. If we want to understand the multilingual person as an individual in his/her own right we need to put an emphasis on empirical investigation of constructs of multilingualism in language testing. To understand a multilingual person as somebody who has a different way of using and knowing her or his languages in contrast to the native speakers of the respective languages, means that we acknowledge the cognitive chances that a life with multilingualism can offer and profit from the benefits of the contact with two or more languages. Such a perspective requires that we accredit a less prominent role to the linguistic deficits of second language learners and users in exchange for the cognitive benefits that the life with more than one language can offer so that we will be able to understand that multilingualism is not just additive

monolingualism in several languages. Consequently a reorientation towards the dynamics of multilingualism should replace a conventional monolingual norm. Only by applying multilingual norms to applied linguistics will we be able to understand the requirements of successful multilingual education. Multilingual assessment will have to take holistic constructions of bi- and multilingualism into account, thereby facing tensions between linguistic homogenization imposed by nation states and real-life multilingualism (García, Skuttnab-Kangas and Torres-Guzmán, 2006).

In recent years many attempts have been made to reconcile Universal Grammar with other research concepts of language acquisition (e.g. Plaza-Hurst, 2006). Chomsky's ideas of a speaker-oriented, rather than a system-oriented, theory, certainly helped to provide a theoretical framework needed for language acquisition research in general. Nevertheless his research focus on the ideal, implying monolingual, speaker-hearer has turned out to be a hindrance rather than a support in a world where monolingualism is the exception rather than the rule. If we want to guarantee multilingualism for all, and not elite multilingualism for some (Mejía, 2002), the application of multicompetence perspectives on language proficiency development offers a promising way of how to approach the multifaceted challenges of multilingual education.

MODULARITY IN BILINGUALISM AS AN OPPORTUNITY  
FOR CROSS-DISCIPLINE DISCUSSION

INTRODUCTION

As a first approximation, modular approaches to the study of bilingualism attempt to analyze the relevant cognitive components that make up a person's knowledge of two languages and his or her ability to use them. The objective would be to describe in what way, in fact, these components might be characterized as autonomous domains and how they interact with other components. Far from a unified approach to the problem of modeling linguistic competence and language proficiency, modularity is a concept that has given rise to a great diversity of views. Perhaps, as a blessing in disguise, this divergence could favor the coming together of new lines of discussion, especially in applied linguistics where major theoretical differences can often be temporarily set aside. Why this is true is an interesting question in its own right, I suspect, having something to do with the modularity concept itself. Be that as it may, the study of bilingualism will serve to provide us with some limited common ground to explore the possibilities.

EARLY DEVELOPMENTS AND MAJOR  
CONTRIBUTIONS

The best known early formulation of the basic concept of a modular mental architecture is Fodor (1983). Subsequently, the idea was introduced to the study of bilingualism; Bialystok and Cummins (1991) proposed the discussion of a research program, based on Jackendoff's (1987) Representation-based modularity thesis, for the purpose of orienting work toward a more "differentiated conception" of bilingual development. Since then, researchers have found it useful for working on a wide range of theoretical and applied problems, the ensuing dispersion of modular hypotheses and proposals offering an interesting framework for mutual exchanges that at first might seem unpromising (Carruthers, 2002; Coltheart, 1999; Garfield, Peterson, and Perry, 2001; Marcus, 2004). Specifically within the field of second language learning and bilingualism, a new interest in modular approaches has clearly emerged (Foster-Cohen, 2001; Herschensohn, 2000; Paradis, 2004; Sharwood-Smith, 2004, to mention only a few). Following Jackendoff's

(2002) most recent update of a modular Tripartite Parallel Architecture (TPA), Francis (2004) has proposed a Bilingual TPA, an elaboration, at the same time, of Cummins' (2000) Common Underlying Proficiency model.

For our purposes, the concept of modularity might be most easily understood from the point of view of analyzing a given ability, examining the different aspects of a bilingual ability, for example. If by "aspects" we simply mean the various ways that a single undifferentiated and internally homogenous bundle of behavior patterns can be studied, this approach might be characterized as integrativist or holistic. A similar view would conceive of language ability (as a cognitive entity) as uniformly structured through and through, internally equidimensional in all respects (e.g., in some versions, the distinction between conceptual domains and grammatical knowledge would be questioned). Strong holistic theories, then, almost by definition, would be antimodularist. For instance, in the field of literacy, including bilingual/second language literacy, a strong holistic approach would reject the idea that reading ability should, or even can, be analyzed into interacting component parts (e.g., subskills related to phonological knowledge, processing of phoneme-grapheme correspondence patterns, other aspects of word identification, sentence processing, text comprehension, etc.). If, on the other hand, the "aspects" of an ability correspond to actual cognitive components and networks of mental structure, autonomous in some way one from the other, and interconnected by specialized interfaces, then we are considering a modular-type approach. The idea of component then would imply a degree of autonomy, the constituent, or module in question being domain-specific in some way. What characterizes this kind of componential mental architecture is internal heterogeneity and specialization. An ability, then, could be broken down analytically into dedicated knowledge structures and specialized processing mechanisms. In contrast to total holistic integration, modularity conceives of interactivity within a network of component structures. In a modular system (when it is engaged, in language use), interaction among components is not unconstrained; not all components and structures are open, in the sense of "penetrable," in an unrestricted way to other knowledge domains and processing interfaces. For example, what are commonly known as "top-down" influences on lower level processes (e.g., decoding) are held in check or confined to some degree, depending on the nature of the interaction in question.

A few informal examples might help to make the notion of modularity more concrete. We could compare the abilities of two bilingual high school students in a hypothetical tenth grade dual language immersion class, both of whom arrived from their native country three years ago, but from very different kinds of educational system. Student A demonstrates exceptionally high levels of mastery in tasks related to

academic-type discourse ability. For example, in his second language (L2) he can produce, coherently and skillfully, a complex narrative with multiple characters and embedded story lines; but at the “sentence level” it is evident that his knowledge of the L2 grammar is rudimentary. Comparing this same ability in Student B’s first language (L1), exactly the converse profile is apparent: flawless grammar and rudimentary mastery of narrative ability. University students sometimes comment on this kind of “double dissociation” in comparing their favorite professor, a non-native speaker of the language of instruction, and the native-speaking professor whose lectures are hard to follow (not because of faulty grammar or difficult pronunciation).

Let us compare student A again, but now to a native speaker of his L2. Since he had studied the L2 during the primary and secondary school years, previous to intensive L2 learning in an academic setting in the new country, he has built up a sizeable “vocabulary,” more extensive in fact than what is typical of native speakers of the language. However, while the absolute number of lexical entries is large, at the “word level” he still experiences persistent difficulties with inflectional affixes and other aspects of grammar related to the structure of words. Student C, a native-speaker of A’s L2, commands error-free mastery of L1 inflectional morphology, as we would expect, but for reasons that are also easy to explain has access to a “smaller vocabulary.” But independent of the absolute number of entries, and in contrast to the L2 learner, each entry in the native speaker’s lexicon is more complete and well-formed; see van de Craats (2003) for a discussion of what “lexical knowledge” consists of in L1 and L2.

A general model of bilingual competence and bilingual proficiency should be able to account for the many ways in which its components appear both autonomous each one from the others and closely interconnected, from three points of view: how knowledge of language and how ability are represented, developmentally in language acquisition, and in regard to how language is processed:

1. How do aspects of the strictly linguistic components of proficiency reveal themselves to be independent of general conceptual knowledge, and at the same time how do aspects of language and general cognition appear to be interdependent? A modular perspective on bilingualism could conceive of two dimensions of differentiation/autonomy: one between the linguistic (grammatical) representations of each language system, and the other between a shared conceptual system (which is hypothesized to be non-linguistic in nature) and the linguistic systems.
2. In child development we need to account for why in some circumstances and in regard to some aspects one linguistic system does not appear to affect the other, and why in other circumstances there seems to be a prolific interaction, influences of  $L_a$  on  $L_b$ ,  $L_b$  on  $L_a$ . Why under

similar conditions is there evidence for both balanced development of  $L_a$  and  $L_b$ , and unbalanced development (in reference to both acquisition and erosion)? In child bilingualism especially, it is necessary to distinguish between the kind of relationship between a primary L1 and a nonprimary L2, on the one hand, and the possibility that neither language that the bilingual knows is “first,” “primary,” or “dominant.” Thus,  $L_a$  and  $L_b$  refer to the language systems of the bilingual in situations where “first” or “second” either cannot be determined (e.g., because both are “L1”), or where the distinction between “L1” and “L2” is not relevant to a given analysis (sometimes it is).

3. In processing and normal language use, how are bilinguals able to keep their languages separate, and how are they able to allow for the two systems to combine and interact? How, when combining and mixing, is this accomplished in a grammatically systematic way? And how do general cognitive operations intervene in different ways in language use that sometimes reveals separation and at other times a close interaction? It is important to keep in mind that a number of proposed properties of modular systems are still the subject of ongoing research:
  - The extent to which they are innately specified
  - The degree to which they are informationally encapsulated
  - How they are represented neurologically and subject to selective breakdown, and
  - What accounts for the fast and automatic processing in some domains and controlled processing in others

As was suggested earlier, the fact that there are many empirical questions still to be resolved is a good thing for continued dialog in the language sciences.

#### WORK IN PROGRESS: BILINGUALISM IN EXCEPTIONAL CIRCUMSTANCES

When complex systems suffer breakdowns or respond to external pressures, what before appeared to function as a completely integrated unit reveals itself to be internally structured in a different way, unnoticed when all subsystems operate in relative equilibrium. Compared to monolingual competence and performance, bilingualism affords more opportunities for examining the components of language because aside from simply being a more complex system, during development and use it seems to be more susceptible to different kinds of imbalance and tension. Two remarkable and celebrated cases of exceptional bilingualism give us a glimpse into how language development proceeds under circumstances in which processing must be shifted to another modality, and in which development is abnormal.

Out of a peculiar multilingual environment in Nicaragua, including spoken languages, homesign systems and sign pidgins, a generation of previously isolated deaf children gave birth to a fully-formed creole, Idioma de Signos Nicaragüense (ISN) (Nicaragua Sign Language). Apparently without access to a complete language acquisition model, ISN came forward in a rapid two stage development: (Stage 1) consolidation of a peer-group pidgin, more advanced than the primitive home-sign gestural system that children had attained prior to enrollment in boarding school. (Stage 2) From the system of shared signs and rudimentary grammar, a distinct, fully formed sign language emerged. Significantly, the qualitative leap toward the creole ISN occurred when the peer-group pidgin became the input to young children. Investigators concluded that with a community of homesigners (pre-pidgin stage), favorable conditions are created that give rise to a new system that is sufficiently rich to support the emergence of a full-fledged creole if sufficient exposure is available during the critical period of language acquisition. The most significant finding, however, was that among the boarding school students. Among those who received Stage 1 input, it was the youngest group (immersion before age 7) that was the most successful in surpassing the impoverished model. Older children (8–14 years at exposure) made considerable progress, but consistently attained levels of mastery that were less native-like. Late immersion students (after 15) showed permanent deficits typical of early language deprivation (Kegl, Senghas, and Coppola, 1999).

Consistent with previous findings of strong critical period effects among deaf children, this line of research points to the operation of specialized language acquisition mechanisms. Here we would have an example of domain-specificity: how “structure-seeking” or “structure-sensitive” modules, dedicated to processing input specific to natural language, build linguistic competence under restricted maturational conditions, in a different way than general learning proceeds. Specialized acquisition components are programmed for ensuring acquisition even under severe conditions of “stimulus poverty” (within certain limits) and within a preset developmental window; see Newport, Bavelier, and Neville (2001) and Senghas and Coppola (2001) for more discussion. Mayberry and Lock (2003) make the important connection between the failure to develop grammatical competence within the critical period and subsequent degraded language acquisition capacity, crucially for deaf children who typically must attain mastery of a spoken language system in addition to sign language. Unlike other kinds of knowledge, normal attainment of linguistic knowledge appears to be dependent on domain-specific acquisition processors that both

obey special restrictions (maturationally) and are specially designed to impose complex structure on seemingly incomplete input.

The second case of exceptional bilingualism involves a single individual as opposed to an entire speech community. Smith and Tsimpli (1995) detail an extensive assessment of polyglot savant Christopher's language abilities. Our interest here is to try to account for sharp imbalances and atypical dissociations. But ultimately, as in the case of the atypical development of ISN among Nicaraguan deaf children, findings from these kinds of case study should help us better understand normal language development. After all, every child, monolingual or bilingual, must overcome the Poverty of Stimulus problem (on a different scale perhaps), and all second language learners, polyglots included, reveal interesting performance imbalances. The "savant" side of Christopher's language ability profile included 16 second languages (in a number of which he had attained intermediate to advanced proficiency). In stark contrast, serious deficits were apparent from performance on tasks related to the use of language for elementary problem solving and communicative tasks that involve increased processing demands: resolving contradictions, discourse level comprehension and expression (e.g., simple translation), and Theory of Mind tests typically passed by young children. According to the researchers, how some components of language ability come to be super-endowed, and others either irremediably deficient or spared from impairment is impossible to explain from a holistic perspective. In what sense can we speak of an adolescent who in such a short time has mastered one native language and 16 second languages (at last count) as suffering from defective intellectual capacity? Only from a modular point of view would the question even make sense at all. While we might admit that this case is certainly highly exceptional, the pattern of imbalances is consistent with a number of studies that have described how linguistic knowledge can develop normally even when general cognitive development is radically impaired (Rondal, 1995). Studies of Specific Language Impairment (SLI), on the other hand, provide evidence for completing the double dissociation: normal intelligence and defective grammar.

#### PROBLEMS OF ANALYSIS: TWO DIMENSIONS OF MODULARITY

Returning to an earlier observation about how bilingual competence and bilingual ability might be structured, the presence of two language systems in the mind allows us to portray modularity along two dimensions more clearly. This is one of the main features of the Bilingual Tripartite Parallel Architecture.

*The Cross Linguistic Dimension ( $L_a \leftrightarrow L_b$  or  $L1 \leftrightarrow L2$ )*

Strong evidence from childhood bilingual studies favors a model in which  $L_a$  and  $L_b$  undergo a separation early in development, in response to only partial positive evidence, that is, with exposure to a minimal threshold level from both languages (Genesee, 2002). There is still dispute on some of the details (how early, from which stage of development), but at least one consensus is that autonomy of each linguistic system is achieved spontaneously without the benefit of awareness on the part of the child of structural differences between the languages, and again based only on examples from each language, without the differences being clearly marked in any way in the input. Evidence of interaction between  $L_a$  and  $L_b$  in imbalanced bilingual development—from cases of systematic interference of one system upon the other (Sánchez, 2003), and from studies of early L1 attrition (Francis, 2005)—does not call into question cross-linguistic modularity (i.e., autonomy). Research findings from the field of neurolinguistics (specifically related to the different patterns of deficit and recovery from bilingual aphasia) are consistent with this version, calling attention also to the internal modular differentiation within each linguistic system (Paradis, 2004).

An important application of this aspect of cross-linguistic separation and interaction is to the study of language mixing. Even the mixed utterances of young bilinguals at an early stage of acquisition, and of language attriters in which one language system comes to dominate grammatical patterns, tend to show a strong tendency toward switching and inserting that is systematic and rule-governed. One explanation would emphasize the autonomy of each language representation such that mutual influences operate between systems, not within an undifferentiated network (Meisel, 2001). And a modular approach would perhaps help explain why some aspects of mixing are open to the effects of extra-linguistic factors (metacognition, motivation, general world knowledge), and other aspects are more encapsulated and “sealed off from the outside,” and not subject to awareness and monitoring.

*The Linguistic System-Conceptual Structures Dimension ( $L_{a+b} \leftrightarrow CS$ )*

The proposal that a Common Underlying Proficiency (CUP) (Cummins, 1991) is not “language-bound” introduced the idea of this dimension to the field of bilingual education. Conceptual structures (CS) are nonlinguistic; however it is that semantic relations are computed, and whatever the conceptual formation rules that determine meaning turn out to be, they are likely to be independent of the formation rules of

phonology and morphosyntax (Jackendoff, 2002). How meaning is mapped onto Syntactic Structures (SS), how the parallel structures are correlated and linked up, requires an extensive array of interface mechanisms. The many specific instances of congruence between meaning and phrase and sentence syntax (e.g., all words for concrete objects are nouns), and the prominence and centrality of the CS-SS interface, suggest sometimes that the linguistic domains of phonology, syntax and morphology are really integratively subsumed into a single undifferentiated holistic network along with all aspects of meaning.

But the nature of bilingual ability in particular prompts us to consider seriously the proposal that a central core of conceptual structure is shared between  $L_a$  and  $L_b$  (or L1 and L2). The CUP model, for example, assumes that concepts and non-linguistic skills are stored in such a way that they are accessible to the bilingual when they need to be deployed through the medium of one language or the other. The idea would be that concepts and nonlinguistic skills need only be stored once, not “belonging” to either linguistic system. For example, the entire set of academic proficiencies, including non-language specific literacy skills, mathematical ability, and scientific principles need not be represented redundantly within the domain of each language that a bilingual or multilingual knows (in the manner of “L1 academic proficiencies,” “L2 academic proficiencies,” “L3 academic proficiencies” and so forth). In a similar way, other models of bilingual ability that hypothesize this kind of “three component, two level” architecture (Kroll and Tokowicz, 2001), portray lexical and grammatical links communicating between L1 and L2 systems within a larger inter-linguistic system and linguistic-conceptual interfaces connecting each separate linguistic representation to a shared conceptual level. This idea, formulated differently perhaps, has been one of the basic learning-principle justifications for first language instruction in bilingual education for many years now.

Another important practical application of this kind of componential approach to language ability is to the area of assessment of bilingual children. Specifically, what aspect of “language” is an evaluation meant to measure? This is a question that is typically asked as a part of considering the “validity” of interpretations that can be made from test results. If we think about “abilities” as composed, in each case, of different constellations of knowledge structure and processing mechanism, it should make it easier not to confound one type of performance outcome with another. For example, a common error in school language assessment of bilingual children is to attribute deficient language development to “both languages” (a SLI-type impairment) based on the evaluation of tasks strongly dependent on academic-related

competencies and skills that are non-linguistic. In this case low performance in “both languages” would not necessarily imply (typically, it would not) a language development deficit.

In the domain of informal classroom assessment, a better understanding of the components of language knowledge and language ability should help teachers respond more consistently to second language learners. In fact, the reliability of teacher corrective feedback has been pointed out as a persistent problem for language learners. Students may produce a text or utterance that is syntactically well-formed but may violate a semantic constraint (e.g., the L1 optionally allows for one or two arguments for a verb depending on the intended meaning, while the L2 only allows for one). For sure, syntactic and semantic patterns, together, form what are considered grammatical sentences, but being able to specify the learner’s difficulty helps teachers be more selective and systematic. And depending on the circumstances, no corrective feedback may be the most appropriate response, for example, in the case of syntactic well-formedness, and local semantic acceptability that happens to violate a pragmatic injunction or subtle collocation restriction. In this case, what clearly sounds non-native to the teacher (and in fact is) may require a different kind of observation, or none at all, than an error related to malformed morphology and syntax. All or most of these examples may fall under the broad category of “ungrammatical,” but distinguishing among the components of grammar allows for providing more helpful corrective feedback to learners. Simply indicating incorrect “usage,” for example, sometimes provides confusing and inconsistent information about the target language grammar. Differentiating feedback and being selective in calling attention to errors in this way is also another way to give second language learners credit for what they have mastered.

At this stage, it would be fair to say that the proposal of a  $L_{a+b} \leftrightarrow$  CS modularity dimension is still more of an empirical question, in comparison to the stronger evidence for the  $L_a \leftrightarrow L_b$  dimension. Future research will have to sort out a number of difficult methodological problems and clarify how the different analytical categories should be understood.

#### FUTURE DIRECTIONS

In a broad attempt to make contact with the cognitive sciences and other theoretical models in linguistics, recent proposals from a current within Universal Grammar (Culicover and Jackendoff, 2005; Newmeyer, 2003) have laid out an attractive program of research. From the point of view of the present discussion, this important opening should also

be able to make contact with the growing diversity of perspectives on modularity that also have evolved in some interesting ways. This would include lines of investigation that have, until now, eschewed consideration of standard versions of modularity because of their historical association with mainstream generative grammar and strong innatist positions. The old manner in which debates have lined up (now largely stagnant) might be in for a major realignment in the coming years. One direction around which new lines of cross-discipline sharing of findings might emerge is related to a shift among a number of UG-oriented linguists toward the idea that more of language acquisition can be explained by the concurrence of general learning strategies. According to this view, generative approaches, by and large, have tried to account for too much by positing tightly encapsulated, very specific hardwired constraints that are highly determinate in the way they automatically trigger different components of the child's grammar. The new approach should allow for a broader range of acquisition mechanisms, thus reducing the burden on a single genetically pre-programmed Language Acquisition Device.

This is all related to the  $L_{a+b} <-> CS$  modularity dimension that we proposed for bilingualism. Modularity should also imply that not all cognitive domains are equally encapsulated and autonomous, nor that they carry out computations in the same mandatory way. There is also no reason that they have to interface with other components with the same highly constrained degree of interactivity (Pinker and Ullman, 2002). Another way of considering this possibility is that we should allow for "degrees of modularity." Thus, some aspects of language development might unfold in a highly modular way (closed-ended, bottom-up, and "vertical"), and others to a lesser degree or in a way that is highly interactive (more open-ended), and more dependent on cognitive domains associated with conceptual structure. Inductive learning and hypothesis testing, for example, would fall under the latter category. These domains would be more "central" in the sense (among other senses) that they are in fact more global, "horizontal" and integrated—properties that strong integrativist models apply indistinctly to all aspects of language ability. The proposal for this kind of internal cognitive diversity, different kinds of subsystem for different kinds of computation, should be especially useful for studying the greater degree of diversity that reveals itself in bilingualism, of the many different kinds. It should also lend itself to opening up the discussion, to some degree, hopefully, among researchers working from different theoretical perspectives, because different models of language and cognition might be right about different kinds of knowledge and ability.

## LANGUAGE RIGHTS AND BILINGUAL EDUCATION

## INTRODUCTION

To what extent are indigenous and minority children guaranteed a right to learn both their own languages and at least a/the dominant language in the country where they live, up to a high formal level, through bilingual education of various kinds, most importantly including a right to mother tongue medium (MTM) maintenance education (see Skutnabb-Kangas and McCarty, *Key Concepts in Bilingual Education: Ideological, Historical, Epistemological, and Empirical Foundations*, Volume 5, for definitions)? Do all children have the right to access high quality education, regardless of what their mother tongue is? Do schools support indigenous/minority communities' right to reproduce themselves as indigenous peoples/minorities (hereafter LMs, Linguistic Minorities) through enabling and encouraging intergenerational transfer of their languages? In other words, do indigenous and minority children enjoy linguistic human rights (LHRs) in education?

The chapter attempts to answer the questions by analysing how bilingual education intersects with issues of language rights, by presenting some of the important international and regional legal provisions and discussing their implications. The entry Human Rights and Language Policy in Education in Volume 1 of this Encyclopedia gives a general presentation of educational Language Rights (LRs). The reader is encouraged to read the two articles as complementary—overlaps have been eliminated as much as possible. Neither models of bilingual education nor Deaf education will be discussed here since they are elaborated in other articles in this volume. There is some unfortunate western bias in the instruments and examples presented; however, the comments on indigenous peoples have global coverage.

Research on educational performance indicates that LM children taught through the medium of a dominant language in submersion programmes often perform considerably less well than native dominant language speaking children in the same class, in general and on tests of both (dominant) language and school achievement. They suffer from higher levels of push-out rates, stay in school fewer years, have higher unemployment and, for some groups, drugs use, criminality and suicide figures, and so forth. There would appear to be a strong argument that such children do not benefit from the right to education to the same

extent as children whose mother tongue is the teaching language of the school, and that this distinction is based on language.

Given what we know about the educational benefits of MTM education and, as importantly, the educational harm, with resulting impact on employment prospects, mental and physical health, and life chances generally, of education of LM children mainly through another language, it can be forcefully argued that only MTM education, at least in primary school, is consistent with the provisions of several human rights documents (see Magga, Nicolaisen, Trask, Dunbar and Skutnabb-Kangas, 2005, for an elaboration). No other form of education seems to guarantee the full development of the human personality and the sense of its dignity, nor does it enable children who are subject to non-MTM education to participate as effectively in society. Those research findings are thus taken for granted in this article which state that maintenance-oriented MTM education (with good teaching of a dominant language as a second language, with bilingual teachers) is often the best way to enhance LM children's high-level bilingualism, school achievement, a positive development of identity, and self-confidence.

#### EARLY DEVELOPMENTS

Particularly in the case of higher formal education, instruction has for millennia been in languages other than the students' mother tongues, often in classical languages used for religious purposes (e.g. Sanskrit or Latin), but both the teachers and the students were usually multilingual. The "rules" for the diglossic/multiglossic division of labour between languages were in practice flexible. The learning of both languages and content was often life-long, for instance in monasteries, east and west. The education could be called bi- or multilingual in the sense that several languages were used in instructional situations, at least orally.

In contrast to deciding the religion ("*cuius regio, eius religio*"), feudal landlords globally were in most cases not interested in what languages their underlings spoke, as long as their labour could be exploited ("exchanged for protection"). Whatever education there was, was in most cases informal and through the medium of the various mother tongues. This was also the case with indigenous peoples worldwide before colonisation, even if many learned neighbouring and other languages through peaceful contacts or sometimes conflict.

Colonisation and creation of state borders had a decisive role in formally minorising certain languages and, correspondingly, majorising others. Religion has played a major role in denying LMs educational LRs. Indigenous peoples were to be "civilised" through assimilation into the colonisers' "superior" cultures and languages (see. e.g. Crawford,

1995; Churchill, 1997; Del Valle, 2003; Fesl, 1993; Milloy, 1999; Richardson, 1993, Skutnabb-Kangas, 2000). But some missionary work has ironically also “saved” some forms of indigenous languages (in Africa, Australia, Canada, Latin America, the USA, etc.) because missionaries learned and wrote down (some of) these languages, to be more efficient in capturing the souls of the “pagans”. Initially, indigenous peoples had the land and their own religions; when they woke up, they had the bible but the states that the missionaries came from had the land. Often missionaries not only used distorted and reduced versions of indigenous languages in their “bilingual education”; they created new “languages” and divisions between “languages”, thereby further minorising them. In colonies, several different models of language regimes coexisted in education, with colonial languages and local languages used as languages of instruction. The patterns and motivations varied hugely; they have still not been properly clarified globally (see, e.g. Pennycook, 1998; Phillipson, 1992), and are being vigorously debated.

In general, multilingualism and to a large extent MTM education have been accepted and normalised phenomena among citizens outside the western world; colonisation was mainly responsible for the new negative linguistic inequalities. But even in the west, until the mid-1800s attitudes towards multilingualism and multilingual education were more relaxed or at least more indifferent and even tolerant than during the last 150 years. This was true more for national and sometimes immigrant minorities (who could be majorities in their own regions) than indigenous peoples. Some “national” or “traditional” minorities (see Skutnabb-Kangas and McCarty, *Key Concepts in Bilingual Education: Ideological, Historical, Epistemological, and Empirical Foundations*, Volume 5, for definitions) did and still do have some language rights in Europe (see EBLUL’s publications at [www.eblul.org](http://www.eblul.org)). These rights were also recognised in education already in the late 1800s, in both constitutions and in bi- and multilateral treaties, even if in many cases they were granted because the LMs were religious minorities, i.e. a religion different from the dominant one often coincided with speaking another language. Laws were published in German and English in Ohio and Pennsylvania, in Spanish and English in California and New Mexico, and in French and English in Louisiana, while children had a right to minority language medium or bilingual education as a self-evident part of the system (Del Valle, 2003, pp. 10–17). But even some indigenous peoples controlled their own education, e.g. the Cherokee, Cree, Choctaw, Chickasaw and Seminole between 1830 and 1898 in the USA (*ibid.*, 282).

During the last decades of the 1800s, with the labour and disciplining needs of industrialization, more children started to come into the

realm of formal education, concurrently with the spread of nation-state ideologies (one nation—one state—one language). In the western world, “pernicious” boarding schools for indigenous children arose “whose overt purpose was cultural genocide, including most prominently the eradication of Indian languages use”, writes James Fife about the USA (2005, p. 365, quoting Allison Dussias, 1999). These residential schools have been “arguably, the most damaging of the many elements of Canada’s colonization of this land’s original peoples and, as their consequences still affect the lives of Aboriginal people today, they remain so” (Milloy, 1999, p. xiv).

Indigenous peoples often knew themselves the disastrous consequences of the “white” education from very early on. Handsome Lake, a Seneca born in 1735, a Confederacy Chief of Six Nations, “created a code to strengthen his people against the effects of white society. The code helped to unify the Iroquoian community”. Chief Jacob Thomas’s 1994 book contains *The Code of Handsome Lake* (“The Good Message”). According to Thomas (1994, p. 41–42), Handsome Lake told his people:

We feel that the white race will take away the culture, traditions, and language of the red race. When your people’s children become educated in the way of white people, they will no longer speak their own language and will not understand their own culture. Your people will suffer great misery and not be able to understand their elders anymore. We feel that when they become educated, not a single child will come back and stand at your side because they will no longer speak your language or have any knowledge of their culture.

Chief Thomas noted that the actual results of education imposed by the “white race” were as destructive as Handsome Lake had predicted:

Two children were selected from each tribe to receive the white race’s education. The chiefs at the time believed that this education might benefit the native people. By following the Good Message, the chiefs discovered that the education received from the white race robbed their children of their language and culture. They realized the importance of educating their own children.

States and educational authorities (including churches) in many parts of the world (including the Nordic countries) have also at the latest since the end of the 1800s had the knowledge about the negative results of submersion education and the superior results of even transitional bilingual education. For instance, the USA Board of Indian Commissioners wrote in their 1880 report (quoted in Francis and Reyhner, 2002):

... first teaching the children to read and write in their own language enables them to master English with more ease when they take up that study. [...] A child beginning a four years' course with the study of Dakota would be further advanced in English at the end of the term than one who had not been instructed in Dakota (p. 77). [...] It is true that by beginning in the Indian tongue and then putting the students into English studies our missionaries say that after three or four years their English is better than it would have been if they had begun entirely with English (p. 98).

The earliest formal descriptions of various LRs (or, in many cases, lack of them), even in education, were mainly written by lawyers, often for administrative purposes. The time after the First World War produced, often inspired directly or indirectly by the League of Nations, a large number of language rights documents and research and other accounts about them. The LRs situation in Europe was then on paper better than it is internationally today: in the Minorities Treaties concluded with the Peace Treaties in Paris, many minorities were granted LRs in education. The problem then—as to a large extent today too—was lack of implementation and enforcement.

#### MAJOR CONTRIBUTIONS

During the first three decades after the Second “World” War, various United Nations bodies, Non-Governmental Organisations (NGOs) and academic institutions engaged in lively discussions on the lack of language rights in (monolingual and bilingual) education. A variety of historical descriptions and analyses were written by sociolinguists, educationists and lawyers. New demands started to come forward, and there were many court cases with direct or indirect bearing on language rights in education, especially in the USA (see Del Valle, 2003).

The UN Sub-Commission on the Prevention of Discrimination and Protection of Minorities did suggest some positive measures, especially in a 1967 report (see Gromacki, 1992, p. 544). But it was not until the UN Special Rapporteur on the Rights of Minorities, Francesco Capotorti, published his 1979 report that international and regional (human rights) law in the area of language rights and education started to develop. And despite some early discussions (e.g. Tabor, 1980), it is only during the last 10–15 years that some language rights have started to be accepted as LHRs (see de Varennes, 1996; 2000; Skutnabb-Kangas and Phillipson, 1994). There are many useful overview articles about LRs that include education (see, e.g. Dunbar, 2001; references to Thornberry and de Varennes), also on the web (e.g. Higgins, 2003, or

de Varennes at [www.eumap.org/journal/features/2004/minority\\_education/edminlang/](http://www.eumap.org/journal/features/2004/minority_education/edminlang/)).

Indigenous peoples and minorities are provided with some general protections under various United Nations and regional charters and conventions. The *UN Convention on the Rights of the Child* of 1989 (CRC) has been ratified by more countries than any other United Nations human rights document—the only two countries that have failed to ratify it are Somalia and the USA. But while Art. 17, paragraph 1 of the *African Charter on Human and Peoples' Rights* of 1981 provides that every individual shall have the right to education, the USA Constitution does not grant such a right. Paragraph 1(c) of Art. 29 in CRC provides that the education of the child shall be directed “to the development of respect for the child’s parents, *his or her own cultural identity, language and values*, for the national values of the country in which the child is living, the country from which he or she may originate, and for civilizations different from his or her own.” Art. 13, paragraph 1 of the *International Covenant on Economic, Social and Cultural Rights* (ICESCR) of 1966 (in force 1976) provides that the States Party to the Convention recognise the right of *everyone* to *education*. Similarly, Art. 28, paragraph 1 of the CRC provides that States Parties recognise the right of *the child* to *education* and specifies that States Parties shall “take measures to encourage regular attendance at schools and the reduction of drop-out rates” (subparagraph (e)). Given what we know about the effects of enforced dominant language medium educational policies, which tend to result not only in considerably poorer performance results but also higher levels of non-completion, and so on, the pursuit of such policies could be said to be contrary to subparagraph 1(e) of Art. 28. Combined with the comments made with respect to Art. 13, paragraph 1 of the ICESCR, it would seem clear that an education in a language other than the child’s mother tongue and which contains no recognition of that mother tongue is unlikely to contribute to respect for the child’s own cultural identity, language and values.

Art. 30 of the *Convention on the Rights of the Child* provides that “in those States in which ethnic, religious or linguistic minorities or persons of indigenous origin exist, a child belonging to such a minority or who is indigenous shall not be denied the right, in community with other members of his or her group, to enjoy his or her own culture, to profess and practise his or her own religion, or to use his or her own language.” This provision echoes Art. 27 of the *International Covenant on Civil and Political Rights* of 1966 (in force, 1976). The precise implications of both provisions are, however, far from clear. The Human Rights Committee has noted in its General Comment No. 23 of 1994 on Art. 27 of the ICCPR that, although phrased in the negative,

the Article requires States to take positive measures in support of minorities. Unfortunately, the Human Rights Committee has not spelled out what those measures are, or whether they include measures relating to MTM education.

LMS are also protected by specific language rights regulations in some countries and regions. In contrast, other countries (e.g. Denmark, France) are even contemplating violations of parents' right to speak their own languages to their infants in their own homes.

The provisions which more specifically address minority language education rights—the teaching both of and through the medium of one's mother tongue—are generally most developed in certain minority instruments. Binding treaty commitments have been established in two Council of Europe instruments to which only members of the Council have thus far become party, the *Framework Convention for the Protection of National Minorities*, and the *European Charter for Regional or Minority Languages*. Other very influential non-treaty standards have been set within the Organization for Security and Co-operation in Europe (OSCE), the most significant of which is the 1990 *Document of the Copenhagen Meeting on the Human Dimension*. Influential principles have been developed through the office of the OSCE High Commissioner on National Minorities, the most relevant of which in the context of education is *The Hague Recommendations Regarding the Education Rights of National Minorities* of October, 1996, [www.osce.org/hcnm/documents/recommendations/hague/index.php](http://www.osce.org/hcnm/documents/recommendations/hague/index.php). More particular guidance is provided in minorities-specific instruments. All of these standards apply mainly in Europe (loosely defined; Canada and the USA are also members of the OSCE).

#### WORK IN PROGRESS

There are still relatively few binding *positive* rights to MTM education or bilingual education in present international law, including case law. Today most language-related human rights are *negative* rights, only prohibiting discrimination on the basis of language, as a prerequisite for the promotion of equality. Both various explanations and interpretations of human rights law and many court cases (see, e.g. de Varennes, 1996, Dunbar, 2001, Higgins, 2003, references to Thornberry, Leitch, 2005) have made it clear that treating citizens *de jure* equally, i.e. identically (for instance, using an official language as the only medium of education for *all* children, regardless of their linguistic background and competencies), does not lead to *de facto* equality, and may often constitute discrimination. Identical treatment is not always equal treatment; therefore, “positive discrimination” or “affirmative action” is necessary for substantive *de facto* equality. Substantive equality also includes a positive

obligation on the state to protect conditions, which enable a LM to maintain their special features, including their languages. Still, many court cases and UN Human Rights Committee's General Comments and Communications have been satisfied with formal equality, even if there are also positive exceptions (most of the legal references above detail these), both in relation to LRs in general and also educational LHRs. At this point there are still many contradictions in and confusion about how to handle educational LRs legally and de facto. Today's "free market" approach has also many really negative consequences for these rights (e.g. Devidal, 2004).

UNESCO is mapping today's situation in relation to which LMs do in fact have MTM education. Africa and Europe have been "finished" so far (see Languages of instruction at [http://portal.unesco.org/education/en/ev.php-URL\\_ID=43143&URL\\_DO=DO\\_TOPIC&URL\\_SECTION=201.html](http://portal.unesco.org/education/en/ev.php-URL_ID=43143&URL_DO=DO_TOPIC&URL_SECTION=201.html)). The very real threats to endangered mostly indigenous languages have also alerted many people, NGOs and international organizations like UNESCO (see UNESCO's portal on endangered languages, [http://portal.unesco.org/culture/en/ev.php-URL\\_ID=8270&URL\\_DO=DO\\_TOPIC&URL\\_SECTION=201.html](http://portal.unesco.org/culture/en/ev.php-URL_ID=8270&URL_DO=DO_TOPIC&URL_SECTION=201.html) and their Expert Group Report on these languages [http://portal.unesco.org/culture/en/file\\_download.php/947ee963052abf0293b22e0bfba319cclanguagevitalityendangerment.pdf](http://portal.unesco.org/culture/en/file_download.php/947ee963052abf0293b22e0bfba319cclanguagevitalityendangerment.pdf)). In contrast to earlier, there seems today to be more understanding, on paper, for the demands of indigenous peoples' educational LRs—presumably because most of them are numerically so small that *their* educational LRs (as opposed to those of minorities) do not seem to threaten the states—whereas their land rights demands do.

One example of the language used about indigenous peoples versus "national" linguistic minorities follows. The *Committee on the Rights of the Child* recommended at their 34th Session 2003 (see E/C.19/2004/5/Add.11, Annex, p. 10.) "that States parties ensure access for indigenous children to appropriate and high quality education". Interpreting this access, they ask States parties, "with the active participation of indigenous communities and children", to

- (b) implement indigenous children's right to be taught to read and write in their own indigenous language or in the language most commonly used by the group to which they belong, as well as the national language(s) of the country in which they live;
  - (c) undertake measures to effectively address the comparatively higher drop out rates among indigenous youth and ensure that indigenous children are adequately prepared for higher education, vocational training and their further economic, social and cultural aspirations;
- Recommendation (b) clearly indicates that if the States are to "ensure access for indigenous children to *appropriate* and high quality

education” (emphasis added), bilingual education systems should be created by States.

Aspects of these recommendations bear some similarity to the educational provisions of the United Nations General Assembly *Declaration of the Rights of Persons Belonging to National or Ethnic, Religious and Linguistic Minorities* of 1992 (UNGA Minorities Resolution). Art. 4, paragraph 3 of it provides that “States *should* take *appropriate* measures so that, *wherever possible*, persons belonging to minorities have *adequate* opportunities to learn their mother tongue *or* to have instruction in their mother tongue.” (emphases added).

Despite the positive tone of these recommendations, opt-outs and claw-backs in educational minority provisions are significant, as detailed in the next section.

### PROBLEMS AND DIFFICULTIES

There are many positive recommendations, draft declarations and initiatives of various kinds, by international organizations, NGOs, LM communities and researchers. LMs are themselves, also through web-based information and networking, much more aware of the lack of LRs and their consequences than at any earlier time. But basic problems persist. In order for children to have human rights in education, they must in the first place have a *right to free compulsory education*. This right is far from guaranteed in all countries to all children. Not even primary education is free in 91 countries (Tomaševski, 2004, p. 23; see the list of these countries in *ibid.*, paragraph 23 and at <http://www.right-to-education.org/home/index.html>), and immigrant or refugee children face threats of exclusion from schools in many countries (see the Texas court case, *In Re Alien Children Education Litigation* in Del Valle, 2003, p. 331; see also the list of European countries where children whose residence status is “irregular” may be excluded, in Eurydice, 2004, p. 33–34).

Secondly, however, as Katarina Tomaševski, the former UN Special Rapporteur on the Right to Education, states, “mere access to educational institutions, difficult as it may be to achieve in practice, does not amount to the right to education” (Tomaševski, 2004: paragraph 57). Educational State obligations in international law contain four elements, *availability, accessibility, acceptability and adaptability* (Tomaševski, 2001; also at [www.right-to-education.org/content/primers/\\_rte03.pdf](http://www.right-to-education.org/content/primers/_rte03.pdf)). Her 4-A model has also been adopted by the UN Committee on Economic, Social and Cultural Rights, in General Comment No. 13 (Wilson, 2004, p. 165.). Tomaševski discusses “language of instruction” under “*acceptability*” (2001, pp. 12–15, 29–30), mentioning the *Belgian Linguistic Case*, in which parents’ rights to state-financed education in a language of their

choice was denied. We also discuss language of instruction under “*accessibility*” (see Magga, Nicolaisen, Trask, Dunbar and Skutnabb-Kangas, 2005 for details), where one of the points is Tomaševski’s (2001, p. 12) “identification and elimination of discriminatory denials of access”. Barriers to “access” can be interpreted as *physical* (e.g. distance to school), *financial* (e.g. school fees, already mentioned, or the labour of girls being needed at home), *administrative* (e.g. requirements of birth registration or residence certificate for school enrolment, *ibid.* paragraph 4b; or, e.g. school schedules, 2001, p. 12); or *legal*. If the educational model chosen for a school (legally or administratively) does not mandate or even allow indigenous or minority children to be educated mainly through the medium of a language that the child understands, then the child is effectively being denied access to education. If the teaching language is foreign to the child and the teacher is not properly trained to make input comprehensible in the foreign language, the child does not have access to education. The U.S. Supreme Court acknowledged this in 1974 in the *Lau vs. Nichols* case (414 US 563). Likewise, if the language of instruction is neither the mother tongue/first language or minimally an extremely well known second language of the child and the teaching is planned and directed towards children who have the language of instruction as their mother tongue (i.e. the norm is a child who knows the teaching language), the LM child does not have equal access to education. We see this as a combination of *linguistic, pedagogical and psychological* barriers to “access” to education.

Under the subtitle “Schooling can be deadly”, Katarina Tomaševski claims that translating what rights-based education means from vision to reality “requires the identification and abolition of contrary practices” (Tomaševski, 2004: paragraph 50). This is rendered difficult by two assumptions: “One important reason is the assumption that getting children into schools is the end rather than a means of education, and an even more dangerous assumption that any schooling is good for children”.

The present practices of educating LM children through the medium of dominant national/state languages are completely contrary to solid theories and research results about how best to achieve the goals for good education. In addition, they also violate the parents’ right to inter-generational transmission of their values, including their languages. In Tomaševski’s views (2004, paragraph 5), the impact of a rights-based education should be “assessed by the contribution it makes to the enjoyment of all human rights. International human rights law demands substitution of the previous requirement upon children to adapt themselves to whatever education was available by adapting education to the best interests of each child” (Tomaševski, 2004: paragraph 54; see also Tomaševski, 2006 for a brilliant critical summary of the right

to education). The human right to use one's own language is made impossible if the children lose it during the educational process.

#### FUTURE DIRECTIONS

Comparing the various developments in how human rights instruments, courts, and various regulations have handled educational LHRs during the last many decades, there seems to be a constant tension in how the place, function and future of LMs (seen as Other) has been envisaged. States seem to strive towards some kind of unity, wholeness, integration, but ideas about how this can be achieved vary. Segregation versus integration and bilingual versus monolingual are some of the main polarities here.

The Other has often been feared, despised, marginalised and excluded, and a separate physically segregated development has been seen as necessary and preferable. At the same time the Other has been strictly controlled and disciplined. South African (SA) apartheid Bantu education or USA (especially South) black and white schools are examples. The only positive aspect of this kind of education in SA was that LMs often had MTM education. But the quality and financing of the education in both SA and USA, including buildings, materials, teacher training, and so on, were mostly dismal and the content often racist. Legally mandated (the *Brown v. Board of Education* 1953 case in the USA) or allowed (SA 1990s Constitution and education regulations) desegregation brought the Other into schools which were earlier reserved only for Self, the "whites". Physically it may have meant permission for integration, but housing patterns interacting with class ensure that those of the dominant "race" or "ethnicity" still keep most quality education for children of Self. And medium of education interacts with it; Kathleen Heugh's (2000) countrywide longitudinal statistical study of final exam results for "Black" students in South Africa showed that the percentage of "Black" students who passed their exams went down every time the number of years spent through the medium of their mother tongues decreased.

In the other polarity, a reproduction of minorities through MTM or proper bilingual education has been seen as a threat towards the unity of a state. Linguistic reproduction of minority mother tongues has been seen as a beginning of a conflict where states have feared that the existence of minorities can lead to a disintegration of the state. The Turkish oppression of Kurds is perhaps the worst example of this today but in Europe both France and Greece violate LHRs for similar reasons, and the same reason has been frequently invoked in the USA, pointing at the possibility of Quebec separation from the rest of Canada as a threatening example. Many Asian and African conflicts also have elements

of state elites connecting LMs to disintegration threats and therefore denying them basic language rights. This seems to be one of the main reasons in state resistance against proper bilingual education in many countries. Even if the scientific evidence for bilingual education is compelling, assimilationist mainstreaming mostly wins because MTM maintenance-oriented education can reproduce minorities as minorities. Likewise, content in bilingual education is seen as possibly ideologically threatening because it cannot (for linguistic reasons) be completely controlled by the dominant group.

All this can lead to interesting contradictions—and their solution is a major future challenge. Just two examples:

In San Francisco, USA, Chinese-American students wanted to retain their already existing bilingual programmes. The court noted: “Bilingual classes are not proscribed. They may be provided in any manner which does not create, maintain or foster segregation” (*Guey Heung Lee v. Johnson*, 404 US 1215, 1971; <http://caselaw.lp.findlaw.com/scripts/getcase.pl?court=us&vol=404&invol=4215>). How do you do it?

Each State which has ratified Council of Europe’s *Framework Convention of the Protection of National Minorities* has to report every three years how they have fulfilled their obligations. In several opinions, the Advisory Committee scrutinising the reports urges the state to place the minority in “regular” (meaning dominant-language-medium) classes where they are “integrated” with (i.e. physically integrated with but often psychologically segregated from) dominant group children. But at the same time, the Committee urges the State to “ensure [that] adequate opportunities exist to be taught the [minority] language or to receive instruction in this language” (e.g. opinions on Romania, Croatia and Slovakia); they also see “separate classes” as risky for integration (e.g. in the opinion on Sweden) (see Skutnabb-Kangas, 2004; Wilson, 2004).

But one cannot teach LM children through the medium of a minority language in an “integrated” classroom where children from the linguistic majority are also present—unless these are also to become bilingual (as in two-way programmes), and there is no indication of this in the Committee’s opinions, or in the USA court case.

Majority/dominant group children do not have any right to become high level bi- or multilingual through education either (even if many states are in practice organising programmes for them to achieve this goal, e.g. immersion or CLIL—content and language integrated learning—programmes).

Thus, accepting temporary physical segregation as a means for achieving educational, psychological, societal and political integration of minorities and majorities later on is an absolute necessity for a human-rights-oriented education.

Despite many peace researchers having shown that it is often precisely lack of language rights that leads to conflict, and that LHRs, also in education, may be part of the solution, most states continue the schizophrenic and counterproductive policies of denying indigenous, and national and immigrant minority children basic LHRs, including proper maintenance-oriented bilingual education. States can also expect to have to pay huge reparations if this is continued—the first court cases have already been won by LMs. One example comes from Australia where the Federal Court of Australia ruled in 2005 that the Queensland government discriminated against a 12-year old boy by not providing him with a sign language interpreter at school. The boy was awarded \$64,000 in compensation for future economic losses as a result of his inadequate education. According to Deaf Children Australia, his academic skills were at the level of a six-year old. This decision establishes firmly deaf children's right to an AUSLAN [Australian Sign Language] interpreter in school and has implications beyond the Australian context (see Small, and Mason, *American Sign Language (ASL) Bilingual Bicultural Education*, Volume 5, for discussion of the struggle for deaf children's linguistic rights in Ontario, Canada).

## AMERICAN SIGN LANGUAGE (ASL) BILINGUAL BICULTURAL EDUCATION

### INTRODUCTION

Since the publication of this article in the first edition of the *Encyclopedia of Language and Education*, the title has been intentionally changed from *Deaf Bilingual Bicultural Education* to *ASL Bilingual Bicultural Education* for four compelling reasons.

1. Emphasis ought not to be on being Deaf as it most often solicits a medical/audist view of Deaf children as “audiologically handicapped” regardless of the intentions of the authors. Instead we offer a cultural linguistic perspective of a minority linguistic group deserving of Sign Language as their birthright.
2. We cannot suppose to make recommendations regarding the education of children who use *Langue des Signes de Québec (LSQ)* or other sign languages across Canada or elsewhere as we do not operate in these communities or education systems. Thus, our focus is on ASL bilingual bicultural education in the Ontario context. It is worth noting, however, that both ASL and LSQ are recognized languages in Canada, the country of both authors of this article. The LSQ community and educators will determine their own language planning needs.
3. In *Deaf bilingual education* discussions, emphasis tends to be placed on majority language development, namely, English. We intend to focus on the neglected minority language development of bilingual children, in other words on the development of their ASL proficiency.
4. While both *bilingual* and *bicultural* have been maintained in the title, the authors recognize that culture is inherent in language. As such, it can be argued that culture need not be delineated as a separate entity each time ASL is mentioned in the article as it is inherent in the language (Bahan, 2002).

This article outlines how language planning impacts ASL bilingual bicultural education. To do so we focus on early developments, major contributions and progress in academic institutions and in the community that have positive future educational ramifications. We also examine the constraints that have significantly limited progress. We provide

recommendations for future directions in breaking through the language planning status quo for ASL bilingual bicultural education.

All educators must believe that they “wish only what is best for ASL children.” With that assumption, we are immediately reminded of an African story. It tells about a group of monkeys swinging up in branches overlooking a river in the midst of the jungle. They see a storm brewing and the fish being tossed about in the river below as its current grows swifter and waves grow large. The monkeys, concerned for the welfare of the fish, quickly swoop down and scoop up as many fish as they can and rest them safely on the dry shore at the edge of the river (Rose, 1992). We all know what surely becomes of this unfortunate “school of fish.”

This story must teach us to be humble; to step back and re-examine what we value and what we are doing when we make a decision that affects a child’s life so profoundly. Our roles in the education of ASL bilingual children have an enormous impact on their lives. Many governments and groups engage in conscious language planning in order to control the process of language change and use among different social groups and populations in the interests of maintaining national, societal, and linguistic cohesion. In the name of cohesion, language planning can have devastating effects on minority languages—namely, the death of the language (Skutnabb-Kangas, 2000). In contrast, governments can engage in language planning for language preservation, language maintenance, and language spread. Language planning can serve to enrich their population with the knowledge of a variety of languages and the cultural richness that comes with it. As such, minority languages are viewed as resources to be nurtured (Ruiz, 1984). Language planning touches every aspect of society—business, politics, social life, health, and education. In its elaborate form, language planning is conducted in four arenas, namely, attitude planning, status planning, corpus planning, and acquisition planning. In the following sections we examine each of these dimensions of language planning with specific reference to ASL in Ontario.

### *Attitude Planning*

While this area is the least studied and written about it has the most profound impact on all other areas of language planning. According to *The Cambridge Encyclopedia of Language*, language planning as a field of study dates only to the 1960s (Crystal, 1987). However, language planning has been active for more than two centuries in Deaf education. Nover (1992) has illustrated the evidence of language planning, starting with implementation of manually-coded French by De l’Epee in the 1760s and initiation of several signing systems—SEE 1, LOVE, and SEE 2 that were put in place in North America during the 1970s.

We propose that the development of these systems in the 1970s should be called “method of communication” planning, rather than language planning, since such systems *are not* languages, per se. During that decade, the provincial schools for Deaf students in Ontario experienced the introduction of the Rochester Method (fingerspelling), followed by Total Communication, on the faulty assumption that these methods would enable Deaf students to acquire English skills the way hearing and speaking enable hearing counterparts to acquire English skills. Although there is *no* evidence that emphasis on one or another variation of such methods, including SEE 2, is even a partial factor in contributing to basic language proficiency, the focus of language planning in Ontario continues to be on the acquisition of English rather than the acquisition of a signed language with its own integrity, structure, and knowledge base.

The stranglehold of imposing one or another variation of these “communication methods” on future teachers and their deaf and hard of hearing students interferes with students’ opportunity and ability to become lingually empowered and linguistically adaptable and versatile with one or more languages such as ASL and English. Despite the fact that research carried out during the past decade shows clearly that children who develop strong ASL proficiency develop better English literacy skills than those whose ASL abilities are weaker or nonexistent (Strong and Prinz, 1997), government policies in Ontario continue to provide only minimal support for the development of ASL proficiency in the early years and for the implementation of bilingual bicultural education for Deaf students. For example, government policies discourage children who receive cochlear implants from developing fluency in ASL based on the empirically unsupported assumption that ASL will interfere with the acquisition of oral English.

Attitude planning is carried, consciously or unconsciously, into all other arenas of language planning (refer to [Figure 1](#)). It is therefore powerful and insidious, and exerts the greatest influence over either maintaining the status quo or creating destructive or constructive change in bilingual education.

Figure 1 Attitude planning impacts all other language planning arenas.

Nover (1992) states that Deaf education has been assimilationist and dominating, with the goal of “hearizing” ASL children. Audism is a set of practices that elevates English and other spoken languages and devalues ASL and other sign languages. “It is the corporate and social institution that makes statements about Deaf people, governing where they go to school, teaching about them, authorizing views about them; audism is the hearing way of dominating, restructuring, and exercising authority over the Deaf community (Lane, 1999, p. 43).

Language planning has characterized the history of Deaf education for three centuries although it may not have been explored earnestly from this perspective except by a few scholars such as Nover (1992), Mason (1994), and Lane, Hoffmeister and Bahan (1996). Various attempts have been made to teach ASL bilingual children the language of the speaking majority. Despite the nearly unchallenged recognition that ASL meets the criteria of a language, many educators continue to resist use of ASL in a bilingual bicultural setting. Despite its long and rich history in North America, and the fact that scholarly research on ASL is in its fourth decade, ASL has been slow to gain status in the academic community (Wilcox and Wilcox, 1992). Such resistance to ASL in the academic community more likely has a basis in sectarian dogmatism that English is superior and ASL is inferior even though both are equally sophisticated. The negative attitudes to ASL and other sign languages can be attributed to the incessant audist nature of our society. It is perpetuated by language planning efforts in the areas of acquisition planning, corpus planning, and status planning when those responsible for language planning are unaware of their own audist views or the profound negative impact of those attitudes. In many parts of Europe, language-planning efforts encourage multilingual language use just as hearing children are encouraged to use many spoken languages (Mahshie, 1995). This contrasts with Canada and the USA which tend only to value English above all other languages; this implies that North America is highly sectarian relative to Europe. The majority of Deaf children in Canada and the USA are raised without ASL because of the false assumption that intelligence is not possible without spoken language and that spoken and human communication are one and the same. This attitude impacts all areas of language planning for Deaf children including educational systems, such as Ontario’s, that have accepted ASL bilingual education to some extent. These issues are discussed below in the context of status planning.

### *Status Planning*

An example of status planning is the recognition of two official languages in Canada—English and French. For the educational system in Ontario, English and French are required to be languages used for

purposes of instruction and as subjects of study. In 1993, Bill 4 was passed by the Ontario Parliament to recognize ASL and LSQ as languages of instruction, with the efforts of the Deaf Ontario Community and Gary Malkowski, then a first-ever ASL-Deaf member of Parliament. The passage of Bill 4 has already resulted in changes to Ontario's Education Act. This Act includes "ASL" and "LSQ" in various clauses; however, there are no regulations that dictate how such law applies.

Influential ASL antagonists have interfered with efforts to draft regulations to define how and when ASL is to be used in classrooms. This interference results in exempting future teachers from having to be ASL proficient while allowing them to profess that they are qualified to meet the children's needs. This seriously compromises the integrity of the field. The term used in Bill 4 "may" is interpreted as a suggestion but not an expectation or requirement that ASL or LSQ be used as languages of instruction. For the last 15 years, the Ontario Association of the Deaf (OAD), under the leadership of the OAD Presidents, community leaders, and members have frequently asked the Ministry of Education to include four requirements in the proposed regulation. These requirements address staff ASL competency including evaluation and accompanying training; teacher training programs including in-service training and additional qualifications in the ASL curriculum and Bilingual Education; recognizing ASL as the language of instruction for all subjects; and mandating ASL curriculum as a policy document to implement ASL as a language of study and use fostering high levels of ASL literacy. The clauses in the Education Act remain dormant because of the absence of regulations needed to define how ASL and LSQ are expected to be used in classrooms.

### *Corpus Planning*

Corpus planning is referred to by Cooper (1989) as "the creation of new forms, the modification of old ones, or the selection from alternative forms in a spoken [signed] or written code." In the educational system, English is used as an academic language. To support standardization of this language, ample resources such as dictionaries, curriculum documents, and different forms of technology are provided.

In 1999, the Ontario Provincial Schools ASL Curriculum Team was established to support the bilingual-bicultural educational approach in the Provincial Schools for ASL Students. The curriculum was intended to describe learning benchmarks for students to develop and demonstrate academic ASL skills and academic ASL literacy skills. It has been developed for nursery to grade 12 in the Provincial Schools for ASL Students.

Prior to 1998, Canada had a dearth of its own ASL published resources to draw upon. With the establishment of the Deaf Heritage Project through the Canadian Cultural Society of the Deaf (CCSD), Canada is now beginning to enjoy its own ASL published resources including *deafplanet.com*, an ASL children's TV series, DVD and ASL/LSQ/English/French interactive website, nominated for several Gemini Awards in 2004 and 2005, grand finalist for the prestigious International Japan Prize in 2005, and winner of the UN World Summit Award in 2005 for best e-content and creativity.

CCSD, the only national organization representing the cultural interests of ASL and LSQ Canadians and DawnSignPress an American publisher, as well as a few other publishers have now published a variety of ASL literature on videotape and DVD format. Only a few of these products meet the academic requirements defined by the ASL curriculum. Some are important examples of community-based language providing the rich heritage and critical link for students to their community while others are academically based. Literary analysis must delineate the variety of literature produced so they can be appreciated for the richness they provide.

### *Acquisition Planning*

Acquisition planning involves efforts to influence the number of users and to increase distribution of languages, literatures, and literacies. Its intent is to improve opportunities and incentive to learn a language. Examples are use of English in commerce, revitalization of Gaelic in Scotland, and re-emergence of Hebrew after the founding of Israel. Acquisition planning encourages both language maintenance and language spread.

In respect to the classroom, any language arts curriculum is not sufficient by itself to extend the language and literacy knowledge and skills. The Ontario Curriculum employs strands to integrate learning of language structure and literacy. These strands were not previously addressed in the Ontario public education system.

The ASL Curriculum also uses strands. Its four main strands are American Sign Language, ASL Literature, ASL Texts, and ASL Media Arts and Technologies. ASL teachers in the Provincial Schools for the Deaf use the ASL curriculum to teach ASL Bilingual-Bicultural students. Through the curriculum, ASL-using students gain knowledge of the language's semantics, lexicon, and syntax which enables them to use the language correctly and eloquently. The curriculum also provides exposure to, analysis of, and production experience of ASL literary works. Thus students are exposed to a variety of expressive, creative, and playful aspects of ASL. They learn and acquire the cultural value of ASL literary works and literary works in general.

## EARLY DEVELOPMENTS

The early history of the education of Deaf students begins in France in the 1760s and then travels to North America in the early 1800s when Thomas Hopkin Gallaudet, an English-speaking educator from the USA went to Paris, France to learn from Abbé Sicard, a hearing follower of De l'Eppée. Gallaudet returned to the USA with Laurent Clerc, a Deaf French Sign language (FSL) master teacher and together they founded the first school for Deaf students in the USA in 1817 in Hartford Connecticut, now known as the American School for the Deaf. As French Sign Language merged with sign language used by local Deaf people, ASL evolved. Clerc trained Deaf and hearing individuals, many of whom gained prominence, including Ronald McDonald who opened the first Canadian School for Deaf children in Quebec City in 1831 (Carbin, 1996). Over the next several decades, many Deaf schools were established, many teachers and administrators were Deaf, and ASL and ASL literature flourished in the classrooms and Deaf community. This "Golden Age" presided until oral language was adopted officially in 1880 at the International Congress of Educators of the Deaf in Milan, Italy when sign language went underground and ASL teachers were no longer hired. By 1970, some educators recognized the disastrous effects of monolingual oral education and began to introduce signs to support spoken English (refer to Attitudes section in this chapter). Still the focus was on monolingual oral education. Not until the 1980s in the USA and in western and central Canada, did ASL bilingual bicultural education begin to take hold. The Gallaudet protest in 1988 calling for a Deaf president of the only university for ASL students in the USA and the publication of a working document at Gallaudet University, *Unlocking the Curriculum* in 1989 calling for bilingual bicultural education for Deaf students sparked a shift back to ASL education for Deaf students in the USA and Canada.

The "Deaf Ontario Now" rallies led by the Deaf community resulted in the *Deaf Education Review Report*, commissioned in 1989, a research review of the impact of native sign language on majority language acquisition (Israelite, Ewoldt, and Hoffmeister, 1992) and establishment of the pilot bilingual program in Ontario. By 1993 the three provincial schools in Ontario adopted an ASL bilingual bicultural policy and Bill 4 was accepted in provincial parliament. Resolutions were approved in Alberta and Manitoba recognizing the merits of ASL as a language of instruction but have not been passed into law.

Thus the history begins with promise, displays a backlash against ASL, and then gradual progress towards it once again. This repetitive cycle of growth, oppression, and re-emergence of the language can be seen right up to current educational developments in North America and can be traced to the impact of attitude planning on the status, corpus, and acquisition of the language.

## MAJOR CONTRIBUTIONS

David Mason had a pivotal role in introducing and eventually expanding on Bilingual Bicultural Education as an integral part of the Teacher Preparation Program in the Education of Deaf and Hard-of-Hearing Students at York University in 1991.

In 1996, the first teacher research in Bilingual Deaf Education was published (Small et al., 1996). This monograph was the first in Canada to highlight the insights of educators working in the field and to provide a forum for reflection on bilingual practice. Another monograph highlighting ASL research in classrooms, home, and residence is expected to be published in 2007.

In 1998, the Ontario Provincial ASL Curriculum Development Team with two representatives from each Provincial School for ASL Students, under the direction of Heather Gibson, developed an ASL Curriculum that outlined expectations for ASL-using students' academic and conversational ASL competencies. The curriculum was designed to describe the knowledge and skills required at each grade level, providing administrators, teachers, parents, and students clear expectations and norms for ASL, ASL literacy, and ASL media.

The curriculum continues to be refined, piloted, and field-tested. This process involved ongoing briefings and consultation regarding curriculum issues with the Ontario Ministry of Education Curriculum Branch, Special Education Branch, and the Provincial Schools Curriculum Co-ordinator. The ASL curriculum includes general and specific expectations that outline the knowledge and skills students must complete at each grade level. It is intended to describe learning benchmarks for students to develop and demonstrate ASL skills and literacy skills at an academic level. This will ensure continuity in language development and acquisition.

ASL Literature Week is held by the three provincial schools for ASL bilingual students in Ontario every two years. It hosts a rich variety of ASL poetry, ASL stories, and other ASL literary works presented by well-known Canadian and American ASL professionals. Its purpose is to introduce students to successful ASL masters in the field such as ASL story-tellers and ASL poets. Supported in part by the Ontario Cultural Society of the Deaf, the festival activities create a place for students to take part in expressions of common experiences, history, cultural traditions, politics, and controversial issues in the ASL-Deaf community. The festival enables students to apply the knowledge and skills they have learned in a classroom setting.

A most significant educational contribution is the establishment of a private bilingual school in Toronto, Ontario. Yeshivas Nefesh Dovid is a new model international Yeshiva High School for Deaf male students (<http://www.nefeshdovid.com>). Established in Ontario, with ASL used

as the language of instruction, major emphasis is placed on Hebrew reading and writing skills. All teachers are ASL users. Yeshivas Nefesh Dovid offers a superior state-of-the-art general studies curriculum including an English curriculum as well as Hebrew language and Jewish Studies curriculum. The Nefesh Dovid trilingual curriculum follows all required courses approved by the Ontario Ministry of Education and is a provincially and internationally recognized High School diploma program.

Other significant educational contributions come from within the Deaf community. The Ontario Cultural Society of the Deaf established an ASL Parent-Infant Consultant Program, trained over 100 Deaf ASL Literacy consultants, established an ASL Parent-Child Mother Goose Program, running programs for parents of infants encouraging them to be comfortable, knowledgeable and playful, sharing early ASL literature poetry and stories with their infants and toddlers. They also published *A Parent Guidebook: ASL and Early Literacy* (McLaughlin, Small, Spink-Mitchell and Cripps, 2004), *American Sign Language and Early Literacy* (OCSD, 2004), and *The ASL Parent-Child Mother Goose Program: American Sign Language Rhymes, Rhythms and Stories for Parents and the Children* (OCSD, 2004), videotapes and DVDs used widely across Canada and in Gallaudet University training programs in the USA. They have published *ASL Developmental Milestones* (Small, 2003), finally gathering the research to establish norms for infants using ASL ages 0–24 months. These contributions lay an early foundation for language acquisition planning in the school systems.

A 20-year-project of the Canadian Cultural Society of the Deaf (CCSD) culminated in the publication of the Canadian Dictionary of ASL (Bailey and Dolby, 2002). This seminal work which has received four academic awards, standardizes ASL in this country, documents regional variations across the country, and is a significant contribution to ASL corpus planning. An LSQ dictionary is the next corpus planning contribution being tackled by the CCSD.

#### WORK IN PROGRESS

Development and implementation of the American Sign Language Curriculum in Ontario is one of the most significant works in progress in an educational academic program in North America. Two ASL teachers were hired specifically to teach the ASL curriculum, an accomplishment unprecedented at the Provincial School for the Deaf. Growth strands, instructional strategies, ASL assessment, expectations, student activities, and teaching techniques are taking shape as the curriculum is implemented in the provincial schools. Mini-workshops and training are regularly provided to build a common vision, knowledge,

and understanding of the ASL curriculum among staff. Sample workshops include *Conversational and Academic Languages (BICS and CALP)*; *ASL Poetry Structures*; and *Metaphors and Similes Used in ASL*.

Intensive in-service training must be provided to focus on pedagogical approaches for using ASL as the language of instruction and for the study of language (on conversational and academic levels). Training includes the study and analysis of ASL curriculum design, research perspectives, and language acquisition evaluation.

Data on student learning has been gathered regularly, with ASL Proficiency Assessment used to establish measurable first language progress. The ASL curriculum provides learning benchmarks for students' development, ASL, and ASL literacy skills expectations. To date, results indicate that the ASL curriculum has been on track, as its expectations align well with ASL grade-level learning skills.

The most significant community work in progress is the establishment of the Deaf Culture Centre under the auspices of the Canadian Cultural Society of the Deaf which opened at the historic culture, arts, and entertainment Distillery District in the heart of Old Town Toronto, Ontario in May 2006 ([www.ccsdeaf.com](http://www.ccsdeaf.com)). It features a museum, art gallery, gift shop, research and archives, state-of-the-art visually rich technology highlighting Deaf historical artifacts, sports, ASL/LSQ literature, ASL/LSQ interactive website, television, and multimedia production studio.

The Deaf Culture Centre is an international symbol of the Deaf community celebrating Deaf life. A public forum both historical and forward-looking, it is open to the public and rooted in the Deaf community. It provides education, language, literature, culture, and visual and performing arts. It holds summer and winter institutes, ongoing workshops, school tours, classes, performances, permanent exhibits, special and traveling exhibits. The centre houses treasured historical, literary, and linguistic documents, De'VIA (Deaf View Image Art created by Deaf individuals that incorporates Deaf experience and language), and ASL literary experts who serve as mentors for students and adults learning ASL. The centre promises to play a significant role in attitude planning as it is rooted in the Deaf community, fosters new creative expression in the Deaf community, and is open to different spoken language individuals and to different sign language individuals around the world to be enriched by the beauty, language, and sense of place created by the Deaf community in this country and internationally.

## PROBLEMS AND DIFFICULTIES

Across Canada, the cycle of growth, oppression, and re-emergence is evident. In Ontario, for example, the Ministry of Education has resisted mandating ASL and LSQ skill requirements to obtain certification as a

teacher of the Deaf. Currently, the Teacher Preparation Program for Deaf and Hard of Hearing Students in the Faculty of Education at York University requires only two courses in ASL for entry and “candidates with lesser qualifications may be considered” ([www.yorku.ca](http://www.yorku.ca)).

Lack of strong government commitment to supporting ASL is also evident in other provinces. In Manitoba, the ASL Bilingual Sign Talk Community Centre has closed. In Alberta, the bilingual Alberta School for the Deaf is no longer a government school; it is now under the Edmonton Public School Board that recognizes the merits of the bilingual education model, having been a leader in the implementation of bilingual programs in multiple languages since the 1970s. The Saskatchewan School for the Deaf has closed. Saskatchewan held a court case in 2005 dealing with a 9-year-old boy with a cochlear implant who could not read or write and had virtually no language since ASL ceased to be an option in that province. The judge stated that “in my eighteen years on the bench, I have seldom if ever heard of a situation which engaged my concern more than this one” (ORR, P.C.J., 2005). The judge concluded that it would be of great benefit for those “outside the legal system including educators, civil servants, politicians, and other citizens” to read the judgment in response to the disastrous consequences when a child is denied full access to a strong first language. The court ordered the province to provide a massive commitment to teach the boy, and his single mother, ASL with a qualified instructor, that he be placed in a signing school for Deaf students outside of the province or that he be provided with a full time ASL interpreter at a school within Saskatchewan. At the heart of these dire circumstances is the need for a shift in all areas of language planning that does not tolerate the suppression of language.

#### FUTURE DIRECTIONS

The Education Act in Ontario allows the use of ASL and LSQ as languages of instruction in schools. However, this permissive legislation does not *require* schools serving Deaf students to use ASL nor does it require teachers to have ASL proficiency. In recent years, the Deaf community has been putting pressure on the Ontario Ministry of Education to authorize a process to develop regulations on where, how, and when the use of ASL as a language of instruction will happen. This same authorization should take into consideration an obligation for teachers of ASL students to have higher standards of ASL proficiency.

On the positive side, the Deaf Culture Centre is a community initiative that promises to enhance widespread awareness of the merits of ASL among all people, including those who use it and those who deserve to appreciate ASL better.

We challenge people of all walks of life including ASL antagonists and professionals associated with education to learn about and appreciate the many merits of ASL and how important it is for any ASL user. This means that everyone should examine their own attitudes and appreciate that linguistic minorities are integral to society as a whole. The future depends on how such attitudes change and how these translate into changes in educational policies. We stress that educators should not be audists serving in part as gatekeepers of languages; they should be professionals who support what each child, teenager, and youth has and who nurture them without devaluing their languages, including ASL.

## **Section 2**

### **Illustrative Bilingual Education Programs and Policies**

**Africa**

## BILINGUAL EDUCATION IN AFRICA: AN OVERVIEW

## INTRODUCTION

Bilingual education, the use of two or more languages of instruction at some point in a student's school career, is practised variably in many African countries. In reviewing the issues, therefore, it is only possible to examine some general characteristics and trends. What I propose to do in this review is (i) to give an exposition of some historical background factors that have influenced bilingual education in Africa, (ii) to comment on the policies and practices adopted in selected bilingual programs, where attempts were made to use indigenous languages as the media of instruction, (iii) to give some suggestions for future practices. My focus, unless otherwise specified, is on sub-Saharan Africa.

## EARLY DEVELOPMENTS

The current language policies in education in postcolonial African states provide the best illustration of what Bamgbose (1991), has called *inheritance situation* i.e., how the colonial experience continues to influence and define postcolonial issues and practices. In other words, the attitude of the colonial authorities that ruled the respective countries has shaped postcolonial educational language policies and the current practices in schools (Bokomba, 1995; Obondo, 1997). According to Ansre (1978), we can divide these authorities into two groups: the "pro-users" and "anti-users" depending on whether or not they allowed some use of the indigenous languages or rejected them. Belgium, Germany, and Britain were pro-users, while anti-users were France and Portugal.

The anti-users forbade the teaching of indigenous languages in their colonies because of their colonial policy of assimilation which encouraged their own languages and discouraged African languages. Togo, for example, which had started as a German colony and subsequently was ceded to France, experienced different policies under the two colonial powers. The Germans had earlier promoted the use of Ewe, one of the indigenous languages in the elementary schools, but when the French took over the colony after the Second World War, Ewe

was completely banned from all government schools. Similarly, the Belgians had allowed the use of African languages in their former colony of the Congo but when France took over the colony the indigenous languages were abandoned. French continues to be the medium of instruction in the Congo Republic today (Bamgbose, 1991).

The pro-users led by Britain allowed the use of indigenous languages in the school system at the lower level of primary education. Education in the British colonies was initially left in the hands of the missionaries who were allowed the option of using the indigenous languages in their evangelical work including education. The missionaries were quick to realize that the vernacular languages were the most effective media to lodge the word of God right into the hearts of their speakers. The English language was also taught but it was limited to a small number of schools and to very few Africans. The British did not find it necessary that everyone in the colonies should learn to speak English. The assumption was that a colony's needs could be well served by training a rather small cadre of "natives" in English and allowing these to mediate between the colonial power and the local population. This was in line with the British colonial policy of indirect rule. This system led to creation of a new African class or elites, separating those who could speak the colonial languages from those who could not. These local elites functioning in their European languages and manning privileged positions became the new leaders and took over the affairs of the postcolonial African states.

At independence, when these leaders (read the elites) were faced with the task of formulating the educational language policies for their liberated nations, their colonial linguistic inheritance had significant influence on their decisions (Alexander, 2000). The debate about educational language policy was centered on whether the former colonial languages or one or more indigenous languages could serve as languages of education.

#### MAJOR CONTRIBUTIONS

Fafunwa (1990), in a report on linguistic profile of Africa notes that 22 out of 34 countries use African languages as media of instruction at primary (first) level: of these 22 only 3 countries have extended their use to secondary school. The use of indigenous languages in formal education in most sub-Saharan African countries is usually limited to the first 3 or 4 years of primary education. For example, the policies in Kenya, Ghana, and Malawi stipulate that mother tongue or the language of the school's surrounding community be used as the medium of instruction for the first 3 years of school. In Uganda, Namibia, and Eastern States of Nigeria, mother tongue is to be used for the first four

years of primary school (Obondo, 1996). These language practices have survived more or less unchanged from the colonial period. In fact, the major innovation that has taken place in the postindependence period has been a move to extend the use of indigenous languages as media of instruction beyond the third or fourth year of primary school. Tanzania provides an example of such an extension where Kiswahili is used as medium of instruction for the entire primary education (Rubagumya, 1990). Somalia (before the 1990s civil war) provides another example of innovation in mother tongue education. Having inherited two systems of education (English in the north and Italian in the south) the country was able to break away from the inherited practices and embark on the use of Somali as a medium of instruction. Somali became the medium of instruction not only in primary but also secondary school.

Examples of the other innovations are experimental projects in the use of indigenous languages. One project that has become famous in the literature of bilingual education in Africa is the Six Year Primary Project in Yoruba commonly known as the Ile-Ife Project in Nigeria. The objective of this project was to compare the traditional system of mixed media (mother tongue initially then English) with a new system where Yoruba (one of the three major languages of a total 400 Nigerian languages) was used for the full 6 years of primary education. The experimental classes were taught all subjects in Yoruba and the control group was taught in Yoruba for 3 years and later in English. When the two groups were evaluated, the results showed very clearly the superiority of the experimental groups in all areas: English, Yoruba, science, social studies, and mathematics (Bamgbose, 1991). The project proved that the experimental groups lost nothing cognitively and linguistically by this exposure to 6 years of primary school education through the medium of Yoruba.

The other project which was in effect complimentary to the Ile-Ife project was the Rivers Readers Project based in the River State of Nigeria which is a highly multilingual state having several minority languages. The project was designed to introduce initial literacy in 20 languages and to replace the practice of using only Igbo, a dominant language in parts of the River states. This project demonstrated that the policy of using mother tongue or the language of the immediate community is possible in a multilingual state and that the cost of producing the materials need not be prohibitively expensive.

A similar innovation in mother tongue education is the Operational Research Project for Language Education in Cameroon (with acronym PROPELCA derived from the title in French). Cameroon is a unique country in Africa with two foreign languages-English (south) and French (north)-as official languages. This division follows the split of the country after the Second World War into a British and a French

territory. PROPELCA is designed to experiment with introduction of Cameroon languages into primary education (Tadajeu, 1995) in the context where the use of indigenous languages was prohibited during colonial period (Tadajeu, 1995). Guinea is another francophone country that has attempted to introduce indigenous languages in education. At independence, Guinea named 8 of its 25 indigenous languages as national languages. In the late 1970s up to 1980s, a mother tongue project was instituted. Guinean languages were introduced as media of instruction in the first 4 years of primary school and were taught as subjects from the third year. Substantial progress was made in implementing the project and there was some advance in using the national languages beyond the fourth year (Ridge, 1999). However, the project foundered through lack of funds to provide books and teachers and through growing parent and pupil resistance to the use of indigenous languages. In the late 1980s, the government restored French as the only medium of instruction.

On the surface, these innovative projects give an indication that some effort has been made to use indigenous languages in education. This is particularly significant in the case of countries like Guinea and Cameroon moving from French as an initial primary medium to African languages. However, as the case of Guinea illustrates, any policy that seems to deny the people access to a language which they perceive as important for their advancement is likely to fail. Moreover, the majority of these projects were funded by foreign agencies. For example, the Ile-Ife project was funded by the Ford Foundation after a proposal by the Institute of Education at the University of Ife. Like other foreign funded projects in Africa, the experiment ended when the flow of funds dried up. Hence, despite more than 30 years of independence for most African states, the situation of indigenous languages in education has remained as it was in the colonial period.

#### WORK IN PROGRESS

The disastrous consequences of the use of ex-colonial languages for the education of the majority of African nations has led to a growing demand for an alternative concept for language and education in Africa, based on multilingualism. There is a gradual realization by an increasing number of African scholars that educational language policy based on multilingualism is the key to social and economic development of the African nations (see e.g., Mansour, 1993; Obanya, 2002). One of the attempts to provide a framework for a multilingual policy in Africa is associated with the projects currently being carried out by the African Academy of Languages (ACALAN). The ACALAN was

commissioned by the African Union in the year 2001 to address the issues of language and development in Africa (ACALAN, 2002). One of the main tasks set out for ACALAN is to put into effect the processes of revalorization of indigenous languages so that they can increasingly serve as instruments of value, instruments with which important tasks can be performed such as their use at all levels of education. These ideals echo many of the sentiments expressed by African sociolinguists (e.g., Bamgbose, 1991; Bokomba, 1995; Fardon and Furniss, 1994; Mansour, 1993; Webb, 1998) whose works have generally supported the greater use of indigenous languages (and therefore multilingualism) as a meaningful factor in economic, educational, and political development. These scholars argue in support of a multilingual approach to education on the grounds that meaningful educational development can, in practice, only occur in languages which learners know very well (see also Cummins, 2000; Thomas and Collier, 1997, for perspectives on the education of minority language students). Conversely, pupils perform poorly if a language that is not well known is used as a medium of learning and teaching, as is shown by the cases of Tanzania and Zambia discussed below. ACALAN goals for language policy in education, for example, are to define criteria for member states to formulate language policies in which the mother tongue/s or the language/s of primary socialization of the child is/are used for as long as possible in the child's educational career while the child is acquiring the other languages.

Until now, only a few countries have made practical attempts to formulate a language policy based on multilingualism or "additive multilingualism" as Alexander (2000) refers to it. South Africa and Eritrea are two of the few countries in the subcontinent that have declared multilingualism as the official policy in their national education system. Like South Africa, Eritrea has declared nine indigenous languages as the official languages (Languages and Education in the Mother Tongue. The EFA 2000 Assessment: Country Reports, Eritrea). The Eritrean educational policy is officially understood to call for additive multilingualism so that languages complement one another in the experience of the learners. The most important achievement reported by the Minister of Education, Mr. Osman Saleh Mohammed with respect to the use of indigenous languages as media of instruction is the unshakable psychological confidence and self esteem it has given the learners (Mohammed, 2001). According to the Minister, the opportunity to use the different languages of the learners has brought the users of these languages together and induced them to love, to learn, and tolerate each other. It has also enabled the learners to appreciate each others' languages as equally important to their own.

Consequently, it has fostered unity in diversity through genuine and deep seated cultural tolerance.

These observations by the Minister reflect the qualitative consequences of adopting a multilingual attitude or what Webb (1998) calls “the spirit of multilingualism” characterized by the following sets of values and norms:

- An acceptance of the equal value of all languages and their speakers and a feeling of respect and tolerance toward them
- A positive attitude toward people who know more than two languages
- An acceptance of multilingualism as a national resource rather than as a problem
- A conscious rejection of linguistic and cultural imperialism and an acceptance that political stability is possible in non-European languages
- An understanding of the difficulties people may have in acquiring and using foreign languages and a tolerance (by teachers especially) of people who have an imperfect language knowledge and make mistakes e.g., use interlanguages (thus also an acceptance of the legitimacy of local standards) (Adapted from Webb 1998, p. 143.)

The antithesis of the spirit of multilingualism is the colonial attitude reflected in the bulk of colonial and postcolonial language policies presented in the earlier sections of this review. The belief that some languages are better or more effective than others, an attitude typical of communities and individuals that are dominated by single languages is inappropriate in a multilingual and multicultural Africa. What are the problems and implications of adopting a multilingual language approach to educational development?

#### PROBLEMS AND DIFFICULTIES

As noted above, adopting a multilingual approach to educational development entails expanding the domains in which the indigenous languages are used so that they can become instruments with which important tasks can be performed such as their use at all levels of education. From the examples cited in the previous discussion, it is obvious that there continues to be a strong rejection of the African languages as languages of education by the elites and policy makers in many African countries (see the case of Guinea earlier). One of the arguments used by the opponents of bilingual education in Africa and elsewhere (see Cummins, 1996), is that bilingual programs do not provide children with sufficient exposure to the second language/s. It is important to address this issue because it has been a source of anxiety

for many educational policy-makers throughout the world when issues of bilingual education are raised (see Cummins, 1996 for details). The question of exposure is even more daunting to policy makers in Africa because of the overrating of the foreign languages in these countries where the elite, as the product of colonialism, have really never been enthusiastic about the inclusion of indigenous languages in the education system (Ansre, 1978, p. 291). Granted, exposure is an important prerequisite for language acquisition, but it is not sufficient in itself. The failure of this theory has been adequately proved by the very fact that despite the use of the foreign languages as media of instruction in many countries in Africa, the standard of these languages has consistently gone down.

Take the case of Zambia, for example, which adopted an English-only policy after independence. Researchers (Kashoki, 1990, for example) analyzing the effects of this policy have concluded that it has been unsuccessful in terms of opening up the education system, access to jobs, and participation in either political or social arenas in Zambia. In fact, it has exacerbated the high drop out rate from school and illiteracy in both English and mother tongue. It has also been reported that there is a shrinking minority of people who can speak English competently enough to participate as empowered members of that society. In other words, like in the colonial times, Zambian English-only language policy continues to ensure that only a small elite is empowered. As early as 1973, the Minister of Education of Zambia at the time, commenting on the impact of the English medium on the children's learning, warned that 9 years after the introduction of English as a medium of instruction in Zambian schools, there was still no evidence that learning had been made easier. In fact in the light of surveys published in 1973, it seemed clear that reading and mathematics in grade 3 were poorly developed (Obondo, 1994). The education situation in Zambia has not become any better despite the use of English as a medium of instruction for over three decades. The lack of empirical support for English-only education is further reinforced by Williams' (1996) research which examined the impact of language of instruction on reading ability in L1 and L2 in Malawi and Zambia. In Malawi, Chichewa is the language of instruction for years 1-4 of primary school with English taught as a subject. In Zambia, English is the medium of instruction with one of seven local languages taught as a subject. Williams compared year 5 students in each country on measures of reading ability and reported no significant difference in English reading ability between students in each country, despite the huge difference in amount of English instruction, but large differences in favor of Malawi in local language reading ability.

This scenario is not unique to Zambia. Tanzania which has often been cited as a good example of a country in which an indigenous

language has been promoted is today facing major pedagogical problems (Rubagumya, 2001). Tanzanian children receive 7 years of primary education in Kiswahili, which is not the mother tongue of all, but the second language of most (an estimated 90% in 1971; Abdulaziz, 1971). Children begin learning English in third year, for about 4 hours per week. In the secondary school, there is almost a complete and a sudden switch to teaching entirely in English throughout the tertiary level, except for primary teacher education where there is a switch back to Kiswahili as a medium of instruction. The difficult situation in Tanzania is captured by an observation by one secondary school teacher who is credited with the following statement: "We have 105 pupils in Form 1 this year. Out of this only 12 can count up to 20 in English. Hardly anyone of them can form and understand a sentence in English. And this situation is said to be typical" (Criper and Dodd, 1984). Not only is students' English suffering in this situation but also their Kiswahili. According to Othman-Yahya (1990), the use of English in secondary school has meant that students do not have sufficient time to devote to the development of academic or literacy skills in Kiswahili. Othman-Yahya further notes that the use of no Kiswahili in secondary school and the switch to it later in teacher education, for example, constitutes a leap upward, skipping the immediate stage. Kiswahili medium in teacher education in Tanzania constitutes a grafting of a tertiary level experience on to a primary level literacy (p. 61). The deleterious effects of this practice on Tanzanian education have given rise to many profound questions about the future of the country and its youth (cf. Höjlund, Mtana, and Mhando, 2001).

#### FUTURE DIRECTIONS

What are the future directions for multilingual educational development in Africa?

First, if multilingualism is to play an important role in educational development in Africa, then decision makers must be sensitive to the real needs of the communities. Until now, educational language policy and planning has been almost invariably a top-down political process. The categories of people that have been involved in language policy decisions have been specialists in the colonial languages (e.g., expatriate linguistics). As a consequence there has been very little involvement or input from the people at the grassroots level (e.g., teachers, applied linguistics, researchers etc.). In the absence of such input, teachers and applied linguists are normally put in the awkward position of trying to sort out the mess created by the legislatures or "bodies of well-intentioned men and women acting in a vacuum . . ." as Kaplan refers to them (Kaplan, 2001, p. 9).

Secondly, for a multilingual policy to succeed in Africa, the decisions about educational language policy can no longer be the exclusive concern of big governments or the elite manning the influential positions. It is increasingly being understood that the success of education in Africa is dependent on initiatives from the local communities and institutions (e.g., nongovernmental agencies linguistically heterogeneous groups, small organizations, local departments of education, and other local institutions). In South Africa for example, Heugh (2003) reports several examples where small communities have mobilized themselves to initiate language development activities and pressurize the governments to make provision for the teaching of the languages in school. One example she cites is a school close to the Namibia border that serves two small San and Khoe communities, where as a result of the community lobbying, the local language Khoekhoegowab (Nama) is now taught in the school. Another example Heugh cites is a Northern Ndebele community that has initiated a number of language development activities after they realized that their language was not given the official status in the constitution. The community has commissioned a linguist to write orthography for the language and has lobbied the provincial government to make provision for the teaching of the language in schools. Primary school books are also being developed in the language. According to Heugh, all these activities have been accomplished with a minimal grant cost, demonstrating that language development and materials production do not have to be prohibitively expensive.

Finally, if local initiatives like the ones cited here for South Africa (such initiatives also exist in other countries in Africa) are to succeed, then we must invest in them not only in terms of economic resources but also by researching and documenting the practices. The reason is that since the national governments have failed in correcting the errors of history, initiatives by the civil society, such as those reported above, hold the promise for the future of education of the African nations and the future of African Renaissance (see Alexander, 2003 for views on African Renaissance).

## MULTILINGUAL EDUCATION IN INDIA

## INTRODUCTION

Multilingualism is a social reality in India. Oral and literacy skills in multiple languages are necessary for meaningful participation in the larger democratic sociopolitical and economic system of the country. Starting with the mother tongue (MT) for family and community level communication, people need languages for regional communication, national level communication and wider communication. Thus, promotion of multilingual competence is widely accepted as one of the goals of Indian education. In a very broad sense, reflecting the fundamentally multilingual character of the society, education in India has been multilingual at different points in history continuing into the present times. But, at the same time, the relationships between different languages and their roles in education have continuously evolved both with micro-level socio-historical processes and also with the dynamics of power structures at the macro-level. These processes have continuously affected the positioning and repositioning of languages in the power hierarchy often leading to marginalization and endangerment of languages. One can perhaps use Hornberger's (2002) 'ecology metaphor' to appreciate how different Indian and Indianized languages and their places in society and education have been constantly negotiated through complex socio-historical processes of *language evolution in changing language environments* leading to *endangerment of languages*.

The purpose of this chapter is to show that education in India has actively contributed to perpetuation of social and linguistic inequalities in seeking to accommodate to the dynamics of power relationships between languages and the social groups who speak these languages. At different points in history, it can be shown that language education policy has been implemented without any critical engagement with the social history of languages and education. Current educational policy and practices are examined to show that education in modern and post-independence India has reflected the uncertainties arising out of the underlying tensions and ambiguities in respect of sociopolitical and economic positioning of languages and their role in the larger multilingual mosaic. Such uncertainties and tentativeness, it will be argued, have contributed to the failure of language education policy to move from a language-as-problem to language-as-resource orientation (Ruiz, 1984).

From a historical perspective, it is useful to note a recurrent pattern of relationships in India between the role of languages in the broader society and their position in education. At different points in history, despite its widespread and grassroots level multilingualism, Indian society has been characterized by a double divide between the language of the dominant power structure and elites and the languages of the masses, on one hand, and between the languages of the masses and those of the marginalized, on the other. This has resulted in a recurrent pattern of a three-tiered hierarchy of languages. At the top of this hierarchy, at different points in history, Sanskrit, Persian and English have exerted significant, stable, long-term and enduring impact on the languages of the masses in addition to playing a dominant role in education, which during major periods of history was multilingual in a loose sense since knowledge and scholarship in languages was always considered distinctive. These languages derived their power and dominance from the patronage of the rulers—the Hindu kings, the Persian invaders and Moguls, and the British—whose powers were reflected in the preeminence and influences of Sanskrit, Persian and English languages, respectively. The privileged elites not only actively learned, cultivated and propagated these languages but also derived their power and privileges from them. The languages of the majority of the population were influenced by these dominant and powerful languages through several processes of linguistic convergence, borrowing and change. These languages of the majority existed in the middle rungs of the multilingual hierarchy. Lowest in the three-tiered hierarchy were the minority, low-caste, indigenous or folk varieties or dialects of the disadvantaged groups, which had little or no presence in education and scholarship. With very little access or claims to education, most of these languages did not develop a writing system or orthography.

Before British rule, education in India was loosely multilingual, as has been indicated earlier. Early education of children started in the mother tongues, which were the majority languages of the masses. Higher levels of scholarship usually involved learning the more powerful ruling language such as Sanskrit or Persian, which were also the medium of instruction (MI) in religious texts and philosophical discourses. The distinction between language as a medium of teaching and as a school subject started during the British period with the promotion of English in Indian education along with the need to balance learning of the mother tongues (called vernaculars) as well as classical languages like Sanskrit. Multilingual education in pre-independence India involved use of one language as MI and two to three languages as school subjects. The choice of these languages in education was often influenced by the dominant power structure and the elites. At the same time, the majority languages exercised their regional or local

primacy although the tension between the dominant and the regional languages continues till today. The folk and indigenous languages in the lowest strata of the society were generally kept out of education and other domains of economy and power. They survived through some form of social segregation in earlier periods of history and do so now through marginalization, if not active segregation. Thus, as a common and recurrent pattern, languages in India and their place in education continue to be characterized by the great divides between the elite languages of the dominant, the vernacular languages of the majority and the marginalized languages of the disadvantaged minority groups. The hierarchical relationships between languages and their respective places in Indian education have always been fraught with ambiguities and ambivalence of resistance and accommodation, as has been said of the “English-vernacular divide” (Ramanathan, 2005a, b). In fact, it can be argued that the current uncertainties and confusion in educational policies and practices can be attributed to simultaneous forces of dominance, resistance and accommodation at various levels and dimensions of educational practices in India. It is necessary to briefly look at the nature of multilingualism in India before examining its role in education.

India has 22 constitutionally recognized official languages (*Constitution of India*, VIII schedule, after the 100th constitutional amendment, December 2003). English is an associate official language. Actual mother tongue (MT) returns in the Census surveys are much larger. In the 1991 Census of India more than 10,000 MTs were named by the people. The MT returns were rationalized and categorized into 3372 MTs out of which 1,576 were listed and the remaining 1,796 were categorized under the ‘other’ MT category. These MTs are variously classified into 300–400 languages belonging to five language families. Indian society uses a large number of languages in different domains of activities. For example, 104 languages are used for radio broadcasting as well as adult literacy programmes, 87 for print media and 67 in primary education. Widespread use of two or more languages in different domains of daily life makes it possible for individuals and communities at the grass-root levels to communicate among themselves and with members of different speech communities.

#### MULTILINGUALISM AND EDUCATION IN INDIA: POLICY AND PRACTICE

After independence, the principle of MT education was enshrined in the Indian Constitution (Article 350A), which calls for provision of “adequate facilities for instruction in the mother tongue at the primary stage of education to children belonging to minority groups”. This

constitutional provision still remains to be implemented in practice. Issues relating to the use of languages as MI and as subjects of study in different levels of education continue to be debated.

### THE THREE-LANGUAGE FORMULA

In 1957, the government of India proclaimed an official policy regarding the role of languages in education. This is popularly known as the three-language formula, which recommended use of

1. Regional language or mother tongue as the first teaching language for 5 years
2. Hindi in non-Hindi areas and any other Indian language in Hindi areas as the second language for 3 years (i.e. from the sixth to eighth year in school)
3. English as third language from the third year onwards

This policy envisaged a regional language or mother tongue being used as a medium of instruction in school. Evidently, the distinction between regional languages and mother tongues was not clear. This led to forced imposition of the majority regional languages on the minority and indigenous (tribal) language groups in a subtractive form of bilingual/multilingual education. Further, while the three-language formula is applicable only for the Government sponsored education, the private educational institutions (called Public Schools, as in UK) are free to introduce their own system in respect of languages.

The three-language formula was modified in 1964. This modified formula specified the following three languages to be studied as school subjects (regardless of the MI): (1) mother tongue or regional language, (2) Hindi or English and (3) one Modern Indian language or foreign language not covered under (1) and (2) and not used as medium of instruction. Hindi was no longer compulsory for schools in non-Hindi areas and English could replace Hindi or be taught as a foreign language. Besides, for tribal (indigenous) children, the 1964 modification proposed transitional bilingual/multilingual education—use of tribal language as medium for first 2 years and oral instruction in regional language and use of regional language as medium of instruction from third year onwards.

The three-language formula has evolved through several modifications and interpretations in various states and school systems. Gradually, through divergent applications of the formula, the majority language of each state has become the first language (and the MI) in the state-sponsored schools with English as the most common second language subject followed by either Hindi or Sanskrit as a third language subject. The three language formula was never intended to be

a language-in-education policy and it did not provide any such framework. Different interpretations and applications of this formula in different states and union territories in India were the result of pressure and negotiation between the forces in support of the dominant language of power, English, and the majority regional languages, on the one hand, and between the different regional languages, on the other. While Hindi was acceptable to states with the dominant presence of the fluid Hindi–Urdu–Punjabi languages, the states in the South India rejected Hindi in favour of English. This resulted in strengthening the position of English in India. This process of dominance and resistance resulted in several anomalous situations in respect of the three-language formula and its application. For Hindi states, it meant presence of two languages—Hindi and English—in schools with Sanskrit as a third language subject. In South Indian states, this resulted in relegation of Hindi to a peripheral role and a more prominent place for English. More importantly, for the linguistic minorities, such as the tribal children, the language formula and subsequent emphasis on mother tongue education were rejected or treated with indifference since it meant the use of four languages in education—MT, state majority language, Hindi and English.

In respect of minority languages, the Ministry of Human Resource Development (1990), Government of India, recommended setting up minority language MI primary schools in areas with at least 10% minority language speakers and dual medium instruction in the same schools to avoid segregation of minority children. Further, appointment of minority language teachers was recommended for teaching the minority children in the areas with less than 10% minority language speakers. These recommendations, however, have mostly remained unimplemented.

#### MULTILINGUAL PRACTICES IN INDIAN EDUCATION

The *Sixth All India Educational Survey* (NCERT, 1999) shows that only 41 languages are now used in schools (either as MI or as a school subject) and, out of these, 33 languages are used as MI in primary school (years 1–5) 25 in upper primary (years 6–7), 21 in secondary (years 8–10) and 18 in higher secondary (years 11–12) levels, respectively. The number of languages in school education in India has been declining over the last three decades (Mohanty, 2006).

Most forms of education in India seek to develop multilingual competence by having multiple languages as part of the curriculum but they do not formally use multiple languages for teaching school subjects

other than the languages themselves. However, since most classrooms have pupils from diverse linguistic backgrounds, multiple languages are informally used for interaction. Different patterns of educational use of multiple languages for teaching are described below.

1. *Informal Forms of Multilingual Education*
  - 1a. *Support Bilingual Education*: In some schools, the MI is supplemented or supported by another language. Lessons may be read in the MI and explained in another language particularly when the MI is not the MT of some or all of the students.
  - 1b. *Partial Bilingual Education*: Students use their MT for their classroom responses but interaction between the teacher and the students is conducted in a majority local language MI. Sometimes, when the teacher is not familiar with the students' MT (as when tribal children are taught by a non-tribal teacher who does not know the tribal language), a simplified register may be informally used for classroom communication and the majority language is used as formal MI.
2. *Formal Multilingual Education with a Single MI*
  - 2a. *Majority Language Mother Tongue Programmes*: A majority language MT is the MI and other languages are taught as school subjects. These programmes usually follow the three-language policy. But, their implementation differs particularly across Hindi and non-Hindi states. These programmes can be characterized as forced submersion programmes for minority and indigenous language children whose MT is not the MI.
  - 2b. *Non-MT Medium Programme*: These programmes use a second language as MI with other languages taught as school subjects. All English medium schools (sometimes also Hindi medium schools) teach children whose MT is not English (or Hindi).
3. *Formal Multilingual Education with Multiple Languages as MI*  
In these programmes usually two languages are used as MI either simultaneously or successively.
  - 3a. *Simultaneous Dual Language MI Programmes*: In some Government sponsored schools (e.g. *Kendriya Vidyalaya* or Central Schools) two languages are used simultaneously as MI. In these schools, English is used as MI for mathematics, science and English subjects and Hindi for teaching social studies and Hindi. The *Kendriya Vidyalaya* programmes, however, do not take children's MT into consideration.
  - 3b. *Successive Dual Language MI Programmes*: Up to a certain level of education these programmes use a majority language

MT as the MI and other languages are taught as school subjects (as in *2a* above). At a higher level of education, the students are taught in a second language MI. Sometimes primary and/or secondary level education are in MT medium with English and/or Hindi and other languages taught as subjects. At a higher level, that is, secondary education or university level, the students switch to English (or Hindi) as the MI.

- 3c. *Transitional Programmes for Language Minority Children:* These programmes begin with use of a minority MT (usually a tribal language) as MI in the initial year(s) of schooling along with oral communication in the regional language. Instructional time for the regional language is progressively increased while instructional time for the minority MT is reduced so that by the beginning of the fourth year of schooling, the child is ready for instruction in regional language MI only. Usually, the tribal languages do not have a writing system. In such cases, the script of the regional language is modified and adapted for the tribal language for the special transfer text and for early reading instruction. There are several variations of these programmes, called bilingual transfer models, being implemented on an experimental basis in several tribal areas.

### CONCLUDING OBSERVATIONS

The core of Indian multilingualism lies in the relationship among the different languages and the need to reconcile the interests of the minority and tribal languages, the regional and state level languages, and the languages of wider communication—Hindi and English. Multilingual education is central to language planning for a resourceful and equitable multilingualism. It seems the Indian educational system has not responded adequately to the challenges of its multilingual ethos. The existing educational programmes mentioned above hardly meet the criteria of multilingual education. The simultaneous dual language programmes, such as the *Kendriya Vidyalaya* or the Central Schools, use two languages for teaching of different school subjects and appear to be bilingual at the surface level only. As mentioned earlier, the students in these schools, regardless of their linguistic background, are forced to the two languages—English and Hindi—as instructional media. Further, use of English in teaching school subjects like Mathematics and Science reinforces the popular belief regarding English as the language of science and technology. The transitional programmes of bilingual transfer for tribal children discussed earlier offer weak

forms of bilingual education, which lead to soft assimilation, subtractive language learning and eventual loss of mother tongues (Skutnabb-Kangas, 1984). In the context of Indian society, it is necessary to assess the extent to which the existing educational systems really support multilingualism. Unfortunately, the existing programmes do not support the weaker languages, nor do they promote a high level of multilingual proficiency. They are more focused on languages being used as subjects rather than as media of instruction. More significantly, even when two or more languages are used as media of instruction, the programmes clearly lack any systematic theoretical framework. Use of languages, in most cases, is incidental to the nature of the programmes and, as such, programme outcomes cannot be linked to bilingual or multilingual education.

On the whole, education in India is multilingual only in a surface form. The relationship between societal multilingualism and the communicative objectives of education has not been seriously attended to. The official three-language formula is not only erratic in its various applications but also has failed to address the basic issues of multilingual education. The prevailing policy formulations in India are not well informed by research and theory and, as a result, education has failed to respond coherently to the demands of societal multilingualism and sociopolitical and economic processes underlying use of languages in a multilingual society.

Two issues that are currently getting substantial attention from policy makers and actively debated in public spheres are the questions of medium of instruction and education for the minority linguistic groups. The debate over English is related to its status as a colonial language and its role in pushing other languages like Hindi and regional majority languages out of use. In view of the wider acceptance of English as a language of power and global economy and also, considering that English is also being recognized as an Indian language, it is difficult to refute its claim for a prominent place in Indian multilingualism and multilingual education. As Vaidehi Ramanathan (2005a) shows, Indian English is not only hybridized and nativized; it is also decolonized in many respects—in the way it is transacted, negotiated and transmitted both for English medium (EM) and Vernacular medium (VM) students. Thus, as the place of English is resisted and contested, there are also various processes through which its prominent role is being negotiated and accepted. What is, however, alarming is the manner in which English has played a subtractive or limiting role for other languages in Indian education. In a majority of the states in India, English is now taught as a second language in grade 1 in Government schools where the state majority language is used as the medium of

instruction. This is a result of the fact that English is seen as the language of access to power and dominance. Unfortunately, two basic principles of multilingual education are ignored in this process. The mother tongues are not allowed to develop sufficiently before introducing a second language like English which is quite likely to have a subtractive effect on the first language. Further, such early introduction of English without adequate development of the first language also does not lead to proficient development of English. The basic differences between private English-medium schools for the middle class and upper class children taught in English from grade 1 for the whole of the school day and teaching of English as a language subject from grade 1 to children who mostly come from the lower social strata are ignored. Thus, education in India has not been able to harness the place of English in a true multilingual education framework.

A second issue which is now being taken up with some concern, particularly with the objective of providing education for all, is education of the tribal and linguistic minority children. With the realization that the forced submersion of children of the linguistic minorities in majority language medium schools results in subtractive learning outcomes as well as high 'push out' and failure rates, there are now several efforts to introduce multilingual and multiliteracy education for tribal children. The Multilingual Education (MLE) programmes are now being tried or initiated as experimental programmes in several states with a high percentage of tribal language children such as Andhra Pradesh, Orissa, Chhatisgarh, Jharkhand and several states in the northeast regions of India. These MLE programmes seek to promote and develop the mother tongues for early literacy and classroom education and gradually introduce education in the regional majority language after 2–3 years of instruction in the mother tongue as the medium of instruction. While the goal is to develop oral language proficiency in the second language by grade 2, second language literacy instruction does not begin at least until grade 3. Even after the introduction of literacy instruction in the second language, students' mother tongue continues to be taught and used as the medium of instruction. Gradually, both languages come to be used as the languages of instruction and a third language is introduced by grade 5. Thus, the MLE programmes for the tribal children are designed to promote high levels of multilingual and multiliteracy skills in a strong form of multilingual education focused on mother tongue maintenance. These are, however, early phases of development of MLE programmes for tribal children, which are still in the experimental stage and, in the absence of systematic evaluation of these programmes, it is difficult to make any definite statement on their success. But through these efforts, the system of

education in India has shown positive indications of seriously launching theoretically sound multilingual education with the objective of promoting high levels of multilingual proficiency and multiliteracy skills. These new MLE initiatives, it is hoped, will lead to quality education for the linguistic minorities and, in the process, inform and improve the general system of education with the goal of multilingual education for ALL.

## ENGLISH–CHINESE BILINGUAL EDUCATION IN CHINA

## INTRODUCTION

China<sup>1</sup> has 56 ethnic nationalities, but the overwhelming majority of its 1.3 billion population are Han nationality. The other 55 ethnic minorities have a combined population of slightly more than 100 million, or less than 10% of the total ([http://news.xinhuanet.com/ziliao/2003-01/18/content\\_695284.htm](http://news.xinhuanet.com/ziliao/2003-01/18/content_695284.htm)). There are more than 80 languages and over 30 of them have written forms. The language of Han, which is generally known as “*Chinese*”<sup>2</sup>, is the only official language in China.

English education took roots in China as early as the mid-nineteenth century and in 1902 English was stipulated as a required course in high schools (Fu, 1986). Although China has undergone tremendous political and social changes in the following hundred years and more, having transformed itself from a monarchy into a republic, the status of English as a required course in the Chinese educational system has basically remained unchanged. Technically speaking, however, English is a foreign language in China and is taught as such. But in the wake of China’s accession to the World Trade Organization (WTO) at the turn of the century, the Chinese Ministry of Education called for the use of foreign languages as the medium of instruction in non-language classrooms for the first time since the founding of the People’s Republic of China in 1949 (Ministry of Education, 2001). Since English achieves the same status as Chinese in the school setting, the term “*Shuangyu Jiaoxue*” (two language/bilingual teaching) has gained currency.

## EARLY DEVELOPMENTS

In the latter half of the nineteenth century, the government of Qing Dynasty (1644–1911) initiated the so-called Westernization Movement with a view to bringing in techniques of capitalist production already operating in the west. A feature of this movement was the

---

<sup>1</sup> The English-Chinese bilingual education under review in this chapter applies to all the provinces and regions in China excepting Hong Kong Special Administration Region, Macao, and Taiwan, Hence “China” as used in this chapter refers to Mainland China.

<sup>2</sup> Traditionally, Han language has been translated as Mandarin or Mandarin Chinese.

establishment of western-style modern schools to boost “Western Learning” in feudal China. *Jingshi Tongwen Guan* (Imperial *Tung Wen* College) founded in Beijing in 1862 was the first bilingual type of school in modern China and its founding marked the inception of Chinese-foreign language bilingual education (Li, 1987). The English department was the first department, which was followed by the departments of French, Russian, Mathematics, Chemistry, German, Astronomy and Sciences and Japanese. By 1896, the school started to implement its revised 8-year programme, with a focus on foreign languages in the first three years and science and technology in the remaining 5 years of the programme.

*Jingshi Tongwen Guan* was, however, to all intents and purposes, only a transitional type of university. The first modern university in China was *Jingshi* Imperial University founded in 1898, which was renamed Beijing University in 1912 after the overthrow of the Imperial Qing Dynasty and the founding of the Nationalist Republic (Fu, 1986). *Jingshi Tongwenguan* was incorporated into *Jingshi* Imperial University in 1902 as the Translation College. The college adopted a 5-year schooling system with a curriculum focused on foreign languages and literature. As well as the most important institution of higher learning, Beijing University under the leadership of President Cai Yuan Pei was most influential for its bilingual education (Zhang, 2001). Owing to its influence, other major universities such as Beiyang University (now Tianjin University) and Nankai University became bases for training and fostering bilingual talents in liberal arts and in natural sciences and engineering. All this shows that the emergence and development of modern higher education in China was closely bound up with Chinese-foreign language bilingual education.

Foreigner-run missionary schools operated parallel to this bilingual education type of Chinese-run modern university. The Yali Middle School set up by Yale Foreign Missionary Society in 1910 was one of the best-known English-Chinese bilingual schools (<http://www.sina.com.cn>). At the urging of the home office in New Haven as well as other missionaries in China, the Yale Mission early on assumed more of an educational than evangelical function. The educational compound that began with a medical clinic eventually grew to comprise a preparatory school, the Yali Middle School. Other well-known English-Chinese bilingual education schools included St. John’s University in Shanghai with its affiliated middle school and primary school, and Jingling University (also known as Nanking University or University of Nanking) in Nanjing. Jingling University originated from *Huiwen Shuyuan*, which, founded in 1888, was one of the earliest schools of the US Christian missionaries in China. St. John’s University was originally designed and opened as a secondary school. Gradually, more college

courses were added. In 1905, it gained university status and was allowed to confer Bachelor of Arts degrees. It became the most influential university in China between the 1920s and the 1940s. In the early years, St. John's University gave first priority to teaching English, but later also began teaching courses in Chinese literature.

Therefore English–Chinese bilingual education, with one language which is spoken most widely throughout the world and the other which has the largest number of native speakers, had its roots in modern higher education in China and grew as modern higher education grew. However, at that time bilingual education was practiced basically for the social elite. For example, the students of *Jingshi Tongwenguan* were all from aristocratic families. At its inception, each department enrolled approximately ten students each year, and by the time the school ceased operating the annual enrollment came to no more than 120 students. Likewise, St. John's University started with two colleges with a total number of 39 registered students in 1878 and was attended by students from the wealthiest families.

It must be pointed out that Chinese–foreign language bilingual education in its early years was not approached as a subject of inquiry in its own right. There was no research or academic discussions on the nature or underlying philosophy of bilingual education, nor was there any policy or guidelines for bilingual education.

## MAJOR CONTRIBUTIONS

### *Definition and Goals of English–Chinese Bilingual Education*

An important document issued by the Chinese Ministry of Education in 2001 (Ministry of Education, 2001) ushered in a new area for English–Chinese bilingual education. In this document English–Chinese bilingual education is listed as one of the 12 recommendations for the purpose of improving the overall quality of universities and colleges. Although this document is concerned with higher education, it has also brought about an upsurge of English–Chinese bilingual education in secondary and primary schools.

Bilingual education is defined as teaching subject matter such as math, physics, chemistry, history, geography and so on using English as the medium of instruction (Wang Benhua, 2003). Thus, it is an approach that is based on teaching subject area content through the medium of a foreign language. While “*Shuangyu*” could refer to Chinese and any foreign language, the term “*Shuangyu Jiaoxue*” is generally understood as English–Chinese bilingual education. In Chinese educational discourse a point is made of distinguishing between “education” and “teaching”, and English–Chinese bilingual education

is persistently referred to as “*Shuangyu Jiaoxue* (two language teaching)” which suggests that this type of English–Chinese bilingual education is confined to instructional activities designed to convey subject area content in the classroom, but it is not supposed to address general moral, intellectual and physical development which come within the jurisdiction of “education”. Apparently, English–Chinese bilingual education has set the improvement of students’ English proficiency as its goal. Therefore, this goal is somewhat different from what bilingual education or language immersion in many countries pursues: promotion of social harmony in a multicultural society in addition to promoting language proficiency. In China, bilingual education with these types of cultural or political goals of the above is found only in minority regions such as Inner Mongolia, Tibet, Xinjiang, where promoting harmony between minority and majority peoples tops the educational agenda.

The vigorous expansion of English–Chinese bilingual education is the outcome of the policy of economic reform and opening up to the outside world that the Chinese government has been vigorously pursuing since the late 1970s. In the context of economic globalization, foreign language skills of Chinese citizens are regarded as an integral part of the comprehensive strength of the nation, but the existing model of English education cannot meet the challenge to train professionals who are highly competent both in their own professions and in English communication. Two major causes have been identified: first, English is presently taught as a foreign language. But in the post-WTO era, China needs large numbers of professionals who should be at home with English just as they are with Chinese. As Wang Xudong (<http://www.edu.cn/20020315/3022744.shtml>) claimed, acquisition of English has three distinctive levels: English is acquired as a foreign language, or as a second language, or as one of the languages of a bilingual person. The present model of EFL teaching cannot train English–Chinese bilinguals who can “think in Chinese and English simultaneously and switch between the two languages freely depending on who the addressees are or what the needs of the working environment are” (Wang, Xudong (<http://www.edu.cn/20020315/3022744.shtml>)). Secondly, the present examination-oriented English teaching is time-consuming and of low efficiency, imposing the boredom of rote memorization on students. Former vice-premier Li (1996) complained that what is taught and learned is “dumb English” as it is often the case that a person who has learned English for a dozen years or so cannot communicate in that language. Bilingual teaching is seen as a remedy. Zhang (2002), director of China’s Higher Education Office, pointed out: when language is not taught as an abstract subject, but as the medium of communication, it is much more likely than other methods to create the desire and the necessity to communicate in the target language.

As far as university education is concerned, the ultimate goal of English–Chinese bilingual education is to meet “the challenge of economic globalization and technological revolution” (Ministry of Education, 2001). The 2001 Ministry of Education document points out that the teaching quality and the research level of a university are manifested in, and contingent upon, the use of teaching materials. Hence, with the incorporation of English–Chinese bilingual education, Chinese universities are expected to gain access to teaching materials reflecting the cutting edge of science and technology which are presently used in major universities in the English-speaking countries of the west and, in this way, bring their teaching and research up to the international advanced standard.

In this regard, mention should be made of a special type of English–Chinese bilingual programme: institutes jointly sponsored by major Chinese and English-speaking western universities, which feature the wholesale adoption of the teaching syllabus, textbooks, evaluation systems of the western partner universities. The courses are conducted partly by Chinese university faculty members but largely by the partner university professors. Most of the courses, whether their instructors are Chinese or westerners, are conducted in English.

To sum up, English–Chinese bilingual education in universities is seen as an important and effective measure to integrate Chinese educational institutions into the international community and bridge the gap between the educational level in China and that of developed nations in the world.

### *Initial Achievements*

In line with the goals of English–Chinese bilingual education stated above, the 2001 document of the Ministry of Education required that, within 3 years, at least 5–10% of all the courses on a university curriculum should be taught in English. It has turned out that many universities, especially key universities, have met this demand. For example, 54 courses out of 1440 are taught in English (including assignments and examinations) at Tsinghua University and about 500 kernel courses use textbooks from famous universities abroad as teaching reference materials (China Reading Gazette, 2001). More than 30 courses at Beijing University (Peking University) and 8 at Zhongshan (Sun Yat-Sen) University follow this pattern (Peng, 2003). By the end of 2004, a national seminar on bilingual teaching in higher education was held, where a resolution was announced that every university shall set up 100 undergraduate bilingual courses every year (Cai, 2005).

Bilingual teaching in primary and high schools has also made substantial progress. Take Shanghai for example. As of 2003, 260 secondary

and primary schools started to carry out bilingual teaching. A contingent of bilingual teachers was taking shape, involving 2,100 teachers, or 5% of the total. As many as 45,000 students were involved in bilingual instruction (Huang, 2004). Prof. Wang (2003) described five successful cases of bilingual teaching (three in Shanghai, one in Guangdong Province and one in Qingdao) in his book *Bilingual Education and Bilingual Teaching*. For example, Qingdao Sifang Experimental Primary School administered the English proficiency comparison test to the experimental class students and the grade 3 students of two key junior high schools in Qingdao. The results showed that the scores of the experimental class students in speaking, listening and writing tests were all significantly higher than those of comparison group students. The comparison of scores in all subjects in the final examination between the two experimental classes of grade 6 and the non-experimental classes showed that the achievement rates of the experimental classes in Chinese, maths, natural science and computer science were all higher than those of the non-experimental classes. The questionnaire given to 156 students and parents showed that bilingual teaching increased the interest of most students in English and most students were willing to receive bilingual teaching and hoped to enlarge the range of bilingual teaching; most students made significant gains in English proficiency and their vocabulary, listening and speaking skills, and cross-cultural knowledge improved; the majority of the students felt that bilingual teaching had not affected their subject area learning and most of them thought that bilingual teaching had advanced their subject learning; in sum, according to the survey, the majority of the students and parents in these schools were satisfied with bilingual teaching.

The First National Conference on Bilingual Teaching was held from April 26 to April 29 2003 at East China Normal University in Shanghai. As many as 258 delegates including university professors, school teachers and administrators from 24 provinces attended this conference. The conference received 238 academic papers, reports of empirical experiments, teaching plans and so on. It was decided at the conference that a national conference shall be held every three years to provide leadership for bilingual education (Huang 2003). In line with this decision, the Second National Conference on Bilingual Teaching was held from April 26 to 28 with over 250 delegates participating (The Organizing Committee of the Second National Conference on Bilingual Teaching, 2006). From June 10–11, 2006, the International Forum on Canadian Immersion Education and Bilingual Instruction in China was convened in Shanghai Jiao Tong University. Over 120 scholars, researchers and postgraduate students from Mainland

China, the Hong Kong Special Administration Region, Malaysia and Japan attended the conference (Han, 2006). This conference reflects the efforts and commitment on the part of the Chinese language education community to seek co-operation with and integration into the international bilingual education community in order to further increase the effectiveness of English–Chinese bilingual education.

#### WORK IN PROGRESS

Efforts have been made to improve English–Chinese bilingual education in the following four key areas: exploration of a suitable bilingual teaching model; training of qualified bilingual instructors; control of English proficiency range of the students; and building up of high-quality teaching materials.

##### *Bilingual Teaching Model*

According to Guo, Chen, Ke and Li (2005), there are basically three types of bilingual teaching models in universities, namely, purely-foreign-language type, the mixed type and the semi-foreign-language type. The same is basically true of primary and secondary schools, where the first type is known as the Immersion Model, the second type is called the Transitional Bilingual Model and the third is referred to as the Maintenance Model. In the first type, most of the teaching activities (including assignments and examinations) are conducted through the medium of English to immerse students in the environment of English. In the mixed type, English teaching materials are adopted while the language of instruction is a mixture of English and Chinese. The native language is used to ensure the students' comprehension of the subject matter while efforts are made to improve students' English proficiency. In the third type, the teaching materials are in English but the language of instruction basically is Chinese. The English used in this model is confined to classroom expressions, rules, concepts, definitions or formulae in the text. While many Chinese researchers and educators (Guo, Chen, Ke and Li, 2005; Li, 2004) concede that the first model is the desired one, they also maintain that in light of the actual conditions in China, all the three models are acceptable. Li (2004) found that in most universities the Maintenance Model is used to conduct bilingual teaching as the students lack adequate English communication skills.

##### *Bilingual Instructor Training*

The qualifications of teachers are a key factor in successful English–Chinese bilingual education. They take on double tasks, that is, to deliver

the subject area content of physics, chemistry, music and so on and to improve the students' proficiency in their second language. To encourage faculty to conduct English-medium courses, universities have taken favourable measures such as offering financial compensation for the extra time devoted to bilingual courses (Guo, Chen, Ke and Li, 2005).

However, it is common for language teachers to be unfamiliar with subject area content and subject area teachers to lack competence in language teaching. The approaches to this problem of bilingual teaching in China are: (i) choose subject teachers whose English proficiency is high enough to teach the bilingual courses and let the English teachers participate in the preparation of teaching plans. (ii) Send some teachers abroad to receive bilingual training if possible (Wang Benhua, 2003). According to the statistics provided by Shanghai Teaching Research Institute (Zhu, 2003), in the basic education sector in Shanghai, over 2,500 secondary and primary bilingual teachers have been sent to English-speaking countries for advanced training. At the same time, over 2,000 native-speaking teachers of English have been invited to Shanghai to train Chinese bilingual teachers. In addition, approximately 500 teachers have attended bilingual training at universities.

Yu and Yuan (2005) pointed out that while it is important to improve the English proficiency of subject teachers through training on the job and engaging in advanced studies abroad is also important, the bilingual teachers should also be trained as language teachers, or, at least, given some degree of awareness of language teaching issues and methods. They should know that they are not only subject teachers but also language teachers and should master the corresponding teaching strategies. Teacher training based on this philosophy conducted in Shanghai Jiaotong University was reported as very successful (Yuan and Yu, 2005). From October 2002 to July 2003 Shanghai Jiaotong University organized a number of 6-week-long bilingual instructor training courses. As trainees found the training exciting and useful, even veteran professors, deans and scholars who did their doctoral studies abroad enrolled.

### *Students' English Proficiency*

Students' English proficiency level is an important consideration in the successful implementation of English-medium education. In view of the fact that "mixed" (or "transitional") type and "semi-foreign-language" (or "maintenance") type of teaching models are frequently adopted to cope with the inadequacy of students' English proficiency, the appropriate English proficiency range for bilingual programmes has not

received serious attention. This is especially true in secondary and primary schools. However, over-dependence on students' native language may cause the bilingual classroom to slip into what Swain called the "mixing approach" (Cummins and Swain, 1986) which would negate the potential benefits associated with bilingual education.

At the university level, empirical studies have been undertaken to determine the appropriate English proficiency range for immersion type of teaching model (Han and Yu, 2007; Yu and Han, 2003). Researchers at the University of Ottawa (Burger, 1989; Burger, Wesche and Migneron, 1997; Edwards et al., 1984; Hauptman, Wesche and Ready, 1988; Wesche and Ready, 1985) have shown that francophone students who had attained the required proficiency in English, as measured by the English Proficiency Test (EPT), were able to learn subject content as well as their counterparts in regular (French-medium) classes as well as make progress in attaining second language proficiency and enhancing their self-confidence in using the second language. Yu and Han (2003) assumed that the required proficiency level as identified on Ottawa's EPT should be taken as the language threshold level for Chinese college students attending Immersion Type of bilingual teaching. A concurrent validity study of the EPT of the University of Ottawa and the College English Test (CET), the national standardized test used in China (see Yang and Weir, 1998), was undertaken in which 301 students from three different universities were randomly selected to take the CET and the EPT within one week (Han and Yu, in press). Their scores on the two tests were compared by descriptive analysis and correlational analysis. The findings show that there exists a significant relationship between the EPT and the CET. Han and Yu argued that the EPT could be used to control the students' English proficiency level for successful English-Chinese bilingual education.

### *Teaching Materials*

Universities have adopted the most authoritative textbooks in the original versions as course books. In this respect, priority is given to the use of English textbooks in the fields of biotechnology, information technology, finance, law, and so on (Ministry of Education, 2001). Fudan University in Shanghai has brought in as many as 7,000 textbooks from Harvard University. Besides, university professors and school teachers are encouraged to compile textbooks. For example, Oxford University Press and Shanghai East China Publishing House have joined hands in publishing course books for bilingual courses in physics, chemistry, biology and so on for secondary school teachers.

## PROBLEMS AND DIFFICULTIES

Remarkable achievements notwithstanding, English–Chinese bilingual education as it is unfolding in China is still at an experimental stage. It seems that English–Chinese bilingual education was launched mainly as an administrative response to the new situation of economic globalization rather than an academic recommendation based on extensive research. This means that English–Chinese bilingual education lacks adequate academic preparation. Consequently, both administrators and teachers lack a good understanding of the nature and tasks of bilingual education. In his investigation of bilingual education in secondary and primary schools in Shanghai, Shu (2004) found that government documents have failed to address such vital issues as the theoretical underpinnings of bilingual education, the rationale of bilingual courses, the impact of bilingual courses on the improvement of the quality of English teaching, valid criteria and means for the assessment of bilingual teaching, and so on. The bilingual programmes in secondary and primary schools in Shanghai do not have their own curriculum and teachers engaged in English-medium teaching are left with only the curriculum for the regular programmes. As the goal of bilingual teaching to improve English proficiency is not covered in the regular curriculum, the teachers are at a loss as to how to achieve this goal through their bilingual content classes.

Compared with research on English teaching and learning, empirical studies on English–Chinese bilingual education are far from adequate. Besides, quite a number of studies have methodological weaknesses. For instance, the studies reported in Zhu (2003) which have produced very positive results of English–Chinese bilingual programmes in primary schools in Shanghai are extensively quoted; however, these studies did not provide the background information of the students involved in these bilingual programmes. This is a methodological weakness discussed in Canadian immersion studies as leading to conflicting research findings (Cummins and Swain, 1986).

On the practical side, a significant problem relates to the qualifications of bilingual teachers. Chinese educators are sharply aware that the shortage of bilingual teachers has been a “bottleneck” restricting the implementation of bilingual teaching in China. The various approaches to bilingual teacher training discussed above are not adequate to address the practical needs of bilingual teaching. Therefore, to have a team of high-quality specialized bilingual teachers is both the key and the challenge to carrying out bilingual teaching in China.

A second concern regarding the implementation of bilingual teaching in China is teaching materials. These are the basic materials of bilingual teaching; they embody teaching objectives and they are directly related

to the success of bilingual teaching whether at the university level or in the secondary and primary sectors. Excellent teaching materials are as important as excellent bilingual teachers. At present, bilingual teaching materials in China can be divided into four types: teaching materials from foreign countries, teaching materials published in China, teaching materials compiled by the school and translated teaching materials.

The language of teaching materials from foreign countries is authentic, but its content does not match the domestic curriculum and the requirements of entrance examinations. In addition, some content is not relevant to the social and cultural environment of the students. Teaching materials published in China have the advantages that the language is appropriate, brief and plain and the length of the texts is appropriate. In addition, they are appropriate to the cognition and the psychology of aesthetics of the Chinese students. However, little time is available for planning and publication of these teaching materials. There is the phenomenon of “discontinuity” because the teaching materials are only published for a certain subject or grade. Teaching materials compiled by the school and translated from the Chinese version can satisfy the requirements of entrance examinations. However, it is not feasible in the long run to expect bilingual teachers to prepare all of their own materials. Because the quality of teaching materials directly affects teaching outcomes, it is urgent to develop good bilingual teaching materials to guarantee positive outcomes from bilingual teaching.

Lack of adequate English proficiency on the part of students constitutes another obstacle to the sound development of bilingual teaching. This problem has become especially acute at the university level where the cognitive tasks of the content courses are demanding. As mentioned earlier, Han and Yu (2007) concluded that students who score a cut-off point of 80 or above in CET Level 4, or 60 or above in CET Level 6, are more likely to benefit from bilingual classes in universities. However, according to the 2002 CET results, the average passing rate on CET level 4 was 33.25% and the Excellence rate was 5.38% (Yu and Yuan, 2005). However, as there was no control of the students’ English proficiency, it was likely that many students in bilingual English classes did not reach threshold level. This would negatively affect the results of bilingual instruction.

#### FUTURE DIRECTIONS

English–Chinese bilingual education has experienced dramatic expansion in China in a short span of no more than a decade. The progress of English–Chinese bilingual education, involving as it does one language that has the largest numbers of native speakers in the world and the other language that is the most influential internationally, will

surely have its impact felt not only within the borders of China, but also in all parts of the world. However, the inadequate academic preparation as discussed above requires that priority be given to rigorous research and solid academic work to ensure the sound development of English–Chinese bilingual education. At present, bilingual programmes are in the jurisdiction of teaching administration and consequently bilingual education is treated as a technical or practical teaching matter. However, as an important language and educational policy, bilingual education implicates theory, practice and educational management. Therefore, administrators must closely consult language education experts, seek their advice and collaborate with them to further clarify the goals and tasks for bilingual programmes at different levels of education. It is true that the goal of English–Chinese bilingual education has been clearly defined, but higher education and basic education have their own specific goals and tasks for their English–Chinese bilingual instruction. The English-medium courses at universities have a twofold goal of improving and enhancing English language education and at the same time introducing state-of-the-art science and technology in various disciplines. But the goal of bilingual classes in the basic education sectors is not to upgrade content knowledge. Its sole purpose is to improve English proficiency and should be treated as an “extension” or “supplement” to English language teaching in primary and secondary schools (Shu, 2004).

The issue of teaching models is another focus of research in the Chinese bilingual education community. Here again higher education and basic education should be treated differently. In view of the huge language distance between Chinese and English and the language environment where English is taught as a foreign language, it seems that both transitional and immersion models may exist side by side in secondary and primary school bilingual classrooms to cope with the inadequacy of English proficiency of the young learners. Even in the immersion model, the use of Chinese is unavoidable, but it should be limited as much as possible, that is, only for the purpose of maintaining successful classroom communication. However, in universities, students are already cognitively fully developed and have learned English for about 9 to 12 years by the time they start their university education. Thus, the purely foreign-language teaching model is not only feasible, but also desirable. Hence Yu and Yuan (2005) put forward the criteria by which to judge the success or failure of the bilingual programmes in universities, that is, whether or not students can, without spending extra time, make the same content area achievement as their counterpart in regular programmes but at the same time make long strides in their English. Yu and Yuan (2005) argued that to achieve

such success for bilingual education, the purely foreign-language teaching model must be adopted. Of course, to achieve this goal, the students' English proficiency should be controlled for enrollment into bilingual programmes and course instructors must have an excellent command of English.

Finally, it is important to highlight the cultural components that are inevitably entailed in any good model of English–Chinese bilingual education. Yu and Yeoman (2007) point out that while the current version of bilingual teaching in China refers only to the conveying of subject area content without cultural or values-related objectives, it would be ingenuous to suggest that any curriculum can be value-free, or that a language can be learned without reference to its culture. Even though English has become a language of the world, to the extent that it is now often referred to in the plural as “Englishes” instead of “English”, it cannot be considered culture-free or culture-neutral. This issue should be carefully considered in the development of teaching materials, in curriculum design, and in teacher education.

## BILINGUAL EDUCATION IN SINGAPORE

## INTRODUCTION

This paper examines a bilingual education programme that has thus far challenged Western definitions and assumptions regarding language planning and language education, bilingualism, and second language acquisition (Dixon, 2005; Pakir, 2004). It first traces the social context of the policy, planning and implementation of bilingual education in the country, reviews educational outcomes, and finally comments on the language shifts taking place with their long-term sociocultural and pedagogical implications (Baetens Beardsmore, 1998; Pakir, 2004). The educational outcomes, emerging sociolinguistic profiles, and issues related to the future management of bilingual education in Singapore raise interesting questions for multilingual countries with different bilingual education programme models.

According to the bilingual education categorisation scheme proposed by Cummins (2003), bilingual education in Singapore would be identified as Type II, indicating the use of a national language together with a majority or more dominant language. Cummins notes that ‘these distinctions are motivated by pragmatic considerations to facilitate discussion and are not intended to represent rigid categories’ (2003, p. 6). Indeed, a focus on Singapore’s unique bilingual education system will indicate that it does not fit well into neat typological frames derived from what Holliday (1994) has labelled ‘BANA’—native-English-speaking Britain, Australasia, and North America—whose paradigms have long dominated the research on teaching English to speakers of other languages.

Uniquely shaped and defined by its adoption of English (‘a neutral language’) as the medium of instruction and the ‘first school language’, the bilingual education programme is based on a policy that privileges English (the language of the former colonial power and now a global language) but places important emphasis on the Asian languages (‘ethnic mother tongues’) of its population. English is a ‘major’ language and one of the four official languages of the country although not a ‘majority’ language. Mandarin, Malay and Tamil—the other three official languages of the country are not categorically ‘majority’ or ‘minority’ languages, but more often defined as ‘ethnic mother tongues’, given status as ‘second school languages’ and referred to today as ‘Mother Tongue’ (MTL) languages in the education system.

## GEOPOLITICAL AND HISTORICAL CONTEXTS

The current policy, provision and practice of bilingual education in Singapore can best be understood against the backdrop of some 40 years of nation building for a very small Southeast Asian country that often questioned its very own survival. A former British Crown Colony, the Republic of Singapore is today a first world country with per capita GDP equal to that of the leading nations of Western Europe. This multi-ethnic, multicultural, multi-religious and multilingual city-state is built on 226 square miles (or one-sixth the size of Rhode Island). With no natural resources except its people, it naturally places a high premium on education. A densely populated island nation of 4.3 million people (3.5 million comprising Singapore citizens and permanent residents, and 0.8 million non-residents), it is intent on building a 'dynamic global city' for the twenty-first century. Today, Singaporeans from diverse backgrounds mix, play, and work together as one people, riding on diversity as their strength and welcoming 'foreign talent' as part of their global knowledge creation enterprise.

The country's language and religious profile has been shaped by its socio-historical roots. Singapore's largely immigrant population shows a rich diversity of peoples with three distinct ethnic groups comprising 77% Chinese, 14% Malay and 7% Indian. All major faiths of the world are found with ten of them represented in the local Inter Religious Organisation that was set up to facilitate religious harmony among adherents to different faiths. Singapore's four official languages are from distinctly different linguistic, literary and cultural traditions. Malay (belonging to the Austronesian language family) is the national language, in which the nation's anthem is sung and military commands are obeyed. Although the Chinese form the majority in the country, historically Singapore was seen as a multi-dialectal Chinese-speaking island in a large Malay-speaking archipelago at the time of its full independence in 1965. Viewed as 'neutral', English was selected to become the link language between the ethnic communities and as the language of wider communication for Singapore's global positioning (Afendras and Kuo, 1980). Mandarin, spoken by only 1% of its Chinese population in 1957 is now the primary Chinese language (Sino-Tibetan), and Tamil is an official language used by six in ten of the 7% Indian population, the other South Asian languages being Malayalam and Telugu (Dravidian languages), Hindi, Punjabi, Urdu, Gujarati and Bengali (Indo-European languages).

The evolving population profile of Singapore with an intensified immigration policy of constantly adding to its talent pool has increased the number of highly educated English-knowing bilinguals in the country, and their children's schooling in the official languages (with

English as the cornerstone) is taking place with options for non-southern South Asian languages of Indo-European origins. The emergence of China and India as potentially powerful economies has made pragmatic parents recognise the growing importance of Mandarin as well as other Indian languages (besides Tamil).

### EARLY DEVELOPMENTS

It is essential to recognise that although Singapore is small in size, it is big on language. The official policy in Singapore of giving equal treatment to its ethnic groups has given rise to a bilingual policy with historical, economic, and cultural underpinnings. During 40 years of independence, clear language policy and planning targets have been articulated as they evolved with time. Universal bilingualism as an educational goal was expressed even in pre-independence years. The *All Party Report* in 1956 highlighted the intention to 'produce students equally conversant in two languages' (not necessarily implying that one of the two had to be English). However, by 1959, when Singapore won internal independence, the political leaders realised that

English had to be the language of the workplace and the common language. As an international trading community, we would not make a living if we used Malay, Chinese or Tamil. With English, no race would have an advantage.' (Former Prime Minister and Senior Minister and current Minister Mentor, Lee Kuan Yew, 2000, p. 170).

Education continues to be given a high premium within which there is always a well articulated repetition of the country's bilingual education policy. Current Ministry of Education policy (<http://www.moe.gov.sg>) continues to reflect sentiments expressed more than 20 years ago:

Our policy of bilingualism that each child should learn English and his mother tongue, I regard as a fundamental feature of our education system . . . Children must learn English so that they will have a window to the knowledge, technology and expertise of the modern world. They must know their mother tongues to enable them to know what makes us what we are. (Former Deputy Prime Minister Tony Tan and Education Minister in a Parliamentary Speech, March 1986)

Clearly, language is seen as a resource in Singapore and different functional roles have been allocated to English (an instrumentalist one, as a tool) and the ethnic mother tongues (an integrative one, as a tie to heritage and community). The bilingual education policy gives premier status to English, and has led to an English-knowing bilingualism that is universal in the country today. Kachru's (1986) term 'English-knowing bilingualism' was applied to bilingualism in Singapore by Pakir

(1992) to describe linguistic ability in the first school language, English, and in a second school language that is ethnically defined (Mandarin for Chinese, Malay for Malays, Tamil for Indians).

Bilingual education in Singapore is implemented with English as the medium of instruction across the curriculum, giving it the status of first school language (EL1) with language lessons in Chinese (CL2), Malay (ML2), and Tamil (TL2). English has been the sole medium of instruction since 1987 for Primary, Secondary, and Junior College education and is the main language for higher education. The 'ethnic mother tongues' (Mandarin, Malay and Tamil) are taught as subjects in the school system ('second school language') and entry to higher levels of education is usually determined on the basis of language grades (English and the second school language).

By the late 1970s and early 1980s, English had become a language of importance in Singapore with six main uses identified (Tay, 1982): an official language, a language of education, a working language, a lingua franca, a language for the expression of national identity, and an international language. After more than 40 years of independence, English is now firmly established as (i) the premier co-official language; (ii) the universally accepted working language; (iii) the only medium of instruction (language of education) at primary, secondary and tertiary levels; (iv) the lingua franca for inter-community as well as intra-community relations; (v) as the international lingua franca for global outreach; and (vi) increasingly the language of identity for a nation that has quickly shifted to English.

In the early years of the twenty-first century, English has been established internationally as the global language with no competitors in sight. English has gained ascendancy in Singapore in tandem with its rise as a global language. An 'English-knowing bilingualism' has emerged in Singapore as a result of the country's unique approach to bilingual education where bilingual success is defined as proficiency in English and one's 'ethnic mother tongue'.

Mandarin is actively promoted as the intra-community language for the majority Chinese population with the Speak Mandarin Campaign (SMC) in Singapore that was launched in 1979. It has gained new speakers since 1957 and after nearly three decades, the SMC has contributed to the attrition and loss of use of other Chinese languages, namely Hokkien, Teochew, Cantonese, Hainanese, and Hakka. Malay is used in the home and as the school language for the Malay community, while various Indian languages serve the community that has South Asian origins: Tamil, Telugu, Malayalam, and Hindi; Punjabi, Gujarati, Bengali, and Urdu—the last five being offered as options for 'ethnic mother tongue' study in community-based language programmes outside the formal school hours.

In terms of policy and planning, the bilingual education programme has succeeded in streamlining the apparently unwieldy and complex language situation in Singapore towards the achievement of educational goals and targets. However, owing to these very same complex realities, there have been implementation difficulties as recognised by the policy makers themselves over the past decades: uneven achievements in bilingual attainment, the problems of a community educated only in English, issues related to the status of Chinese, standards for learning the mother tongue languages, and the current focus on even better language delivery and achievements for English and mother tongue languages (see Pakir, 2004 for a recent overview).

## MAJOR CONTRIBUTIONS

### *Educational Attainment*

Studies on bilingualism have traditionally depended on paradigms originating in the West where the interplay between majority and minority languages tends to predominate in discussions of educational processes and outcomes. Language as a problem, language as a right, and language as a resource (Baker, 2006; Ruiz, 1984, p. 383) are often discussed within the power and educational constructs of western societies, and usually contrast English with ‘home languages’ of immigrant children. An examination of the bilingual education policy in Singapore may lead us to other paradigms. Major issues in bilingualism including linguistic, pedagogical, cultural, and sociological considerations are relevant to the country—but are often subsumed by political, economic, and ideological factors.

According to Cummins, the interesting aspect of Type II bilingual programmes is that the outcomes ‘show clearly that minority languages can be used as mediums of instruction in school for a significant proportion of the school day at no cost to students’ proficiency in the majority or educationally dominant language (2003, p. 10). Singapore, although apparently a Type II, has clearly adopted a second language for most of its citizens as a medium of instruction in school. English has become the educationally dominant language in the country, and English-knowing bilinguals in Singapore are now increasingly English-dominant bilinguals, with many shifting to their school language as their language of choice. This phenomenon has raised several interesting educational, pedagogical, and cultural questions.

The educational achievement of Singapore students has been impressive. Dixon (2005) reporting on the bilingual education policy in Singapore and the implications for second language acquisition cites results from several international studies of achievement in science, mathematics, and reading. These include IEA’s Third International

Math and Science Study-Repeat (TIMSS-R) involving grade 8 students in 38 countries and IEA's Progress in International Reading Literacy Study [PIRLS], which tested 10-year-olds in 35 countries. Despite the fact that only 27% of the Singapore TIMSS-R sample (drawn representatively across the schooling population) reported always using the language of the test (i.e. English) at home, results in mathematics and science were among the best in the world. Singapore Secondary 2 students performed highest in the world in mathematics and second in science. In the PIRLS study, involving younger students, Singapore students scored higher in reading literacy than the international average and at a similar level to students in countries such as Scotland and New Zealand. Dixon concludes that 'Despite the status of English as a nonpredominant home language for the majority of Singaporean students, Singapore's scores compare favourably to countries in which the majority of students speak the language of instruction at home' (2005, p. 40). He notes that the Singapore experience shows that a second language (L2) can successfully be used as a medium of instruction for the general population but also points out that 'Singaporean students today may perform better than those in other countries studying a former colonial language due to the codevelopment of literacy in their L1 alongside the development of literacy and concepts through English' (2005, p. 43).

### *Language Planning and Language Shifts*

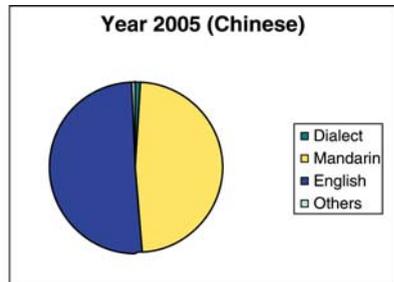

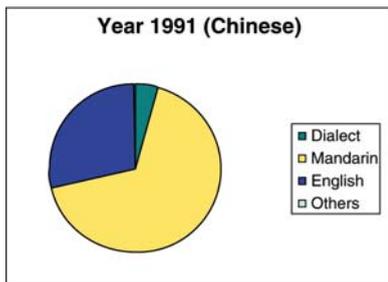

The bilingual education policy, articulated with refinements and modifications along the way for almost half a century has resulted in two major language shifts. Surveys taken by the government (e.g. the General Household Survey [Singapore Department of Statistics, 2006] and the Ministry of Education [2004]) reveal a significant shift to English for the vast majority of Singaporeans of all races, and a secondary shift to Chinese (Mandarin) for the majority ethnic group which customarily spoke a diversity of other Chinese languages (Hokkien, Teochew, Cantonese, Hainanese, Hakka, Shanghainese). The Ministry of Education's language surveys that are taken annually for all 6-year-olds as they begin formal schooling are a valuable source of data as they show the distribution of languages frequently spoken at home by these students.

The tables and pie charts below (1991–2005) for 6-year-olds entering the schooling system show that there has been a substantial increase in the percentage of English speakers across all ethnic groups as well as a noticeable increase in the percentage of Mandarin speakers among the Chinese population over the past 14 years.

The pie charts below showing the two end points (1991 and 2005) clearly indicate that although many of the Chinese pupils have moved to Mandarin, even more have shifted to English over a span of 14 years.

Table1 Distribution of primary one Chinese pupils by first most frequently spoken language at home, 1991–2005

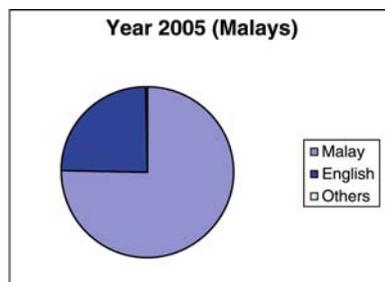

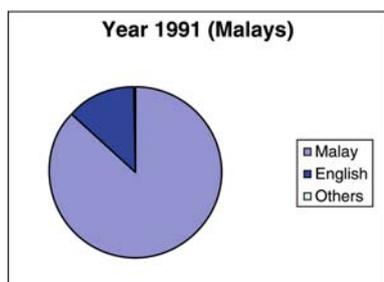

| Chinese pupils |         |          |         |        |
|----------------|---------|----------|---------|--------|
| Year           | Dialect | Mandarin | English | Others |
| 1991           | 4.5     | 66.6     | 28.6    | 0.3    |
| 1992           | 3.6     | 64.6     | 31.5    | 0.3    |
| 1993           | 3.6     | 63.9     | 32.1    | 0.4    |
| 1994           | 2.9     | 61       | 35.8    | 0.3    |
| 1995           | 2.2     | 59.5     | 38.1    | 0.2    |
| 1996           | 2.5     | 59.2     | 38      | 0.3    |
| 1997           | 3.2     | 57       | 39.4    | 0.5    |
| 1998           | 2.7     | 55.9     | 40.9    | 0.4    |
| 1999           | 2.6     | 54.5     | 42.5    | 0.5    |
| 2000           | 2.2     | 54.2     | 43.2    | 0.4    |
| 2001           | 1.8     | 52.8     | 45      | 0.5    |
| 2002           | 1.7     | 51.7     | 46.2    | 0.4    |
| 2003           | 1.6     | 50.3     | 47.6    | 0.4    |
| 2004           | 1.3     | 48.7     | 49.6    | 0.4    |
| 2005           | 1.4     | 47.2     | 51      | 0.5    |

With reference to [Table 1](#), Chinese pupils have made the continuing shift to English and Mandarin, with a distinct shift to English at a faster rate (from 28.6% in 1991 to 51% in 2005). Mandarin rapidly gained several young speakers from the early years of the SMC (1980–1990) from 25.9% to 67.9% (as reported in Pakir, 1993, p. 78) but then slowed down in the next fifteen years with a high of 66.6% in 1991 dwindling to 47.2% in 2005. The years 1991 to 2005 have witnessed

Table 2 Distribution of primary one Malay pupils by first most frequently spoken language at home, 1991–2005

| Malay pupils |       |         |        |
|--------------|-------|---------|--------|
| Year         | Malay | English | Others |
| 1991         | 87.0  | 12.9    | 0.1    |
| 1992         | 85.8  | 14.0    | 0.2    |
| 1993         | 86.2  | 13.6    | 0.2    |
| 1994         | 84.6  | 15.2    | 0.2    |
| 1995         | 83.9  | 16.0    | 0.1    |
| 1996         | 88.1  | 11.7    | 0.2    |
| 1997         | 84.0  | 15.8    | 0.2    |
| 1998         | 83.6  | 16.2    | 0.2    |
| 1999         | 82.1  | 17.8    | 0.1    |
| 2000         | 82.3  | 17.4    | 0.3    |
| 2001         | 81.1  | 18.7    | 0.3    |
| 2002         | 79.6  | 20.2    | 0.2    |
| 2003         | 79.3  | 20.4    | 0.3    |
| 2004         | 77.5  | 22.0    | 0.5    |
| 2005         | 75.3  | 24.3    | 0.4    |

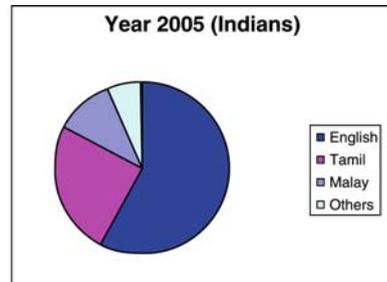

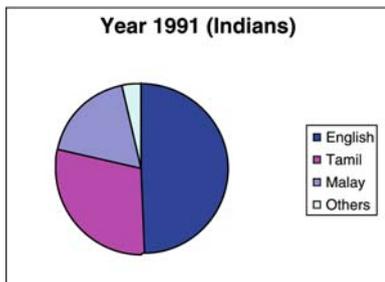

the growth, development and spread of English as a global language and not coincidentally many more young people in Singapore turned to English as the preferred language since it carried greater status and functions.

Even for the Malay pupils (see [Table 2](#) and the pie charts) where the most frequent home language is still Malay, the trend towards English is still discernible.

Table 3 Distribution of primary one Indian pupils by first most frequently spoken language at home, 1991–2005

| Indian pupils |         |       |       |        |
|---------------|---------|-------|-------|--------|
| Year          | English | Tamil | Malay | Others |
| 1991          | 49.5    | 29.1  | 17.7  | 3.6    |
| 1992          | 49.4    | 29.8  | 17.3  | 3.6    |
| 1993          | 49.3    | 29.2  | 17.0  | 4.6    |
| 1994          | 53.6    | 25.5  | 17.7  | 3.2    |
| 1995          | 55.2    | 25.2  | 16.3  | 3.4    |
| 1996          | 54.6    | 26.4  | 15.5  | 3.6    |
| 1997          | 53.5    | 25.7  | 16.4  | 4.4    |
| 1998          | 54.1    | 27.4  | 14.2  | 4.3    |
| 1999          | 55.7    | 27.2  | 12.7  | 4.5    |
| 2000          | 57.1    | 24.8  | 12.8  | 5.3    |
| 2001          | 58.1    | 25.0  | 11.9  | 5.0    |
| 2002          | 59.4    | 23.3  | 11.5  | 5.8    |
| 2003          | 59.4    | 24.4  | 10.3  | 5.9    |
| 2004          | 58.2    | 24.4  | 11    | 6.4    |
| 2005          | 57.7    | 25.2  | 10.8  | 6.3    |

Indian pupils, a heterogeneous group of children with different South Asian ancestries, have always had a larger proportion of English speakers among the 6-year-olds (see Table 3 and the accompanying pie charts). This could be due in part to the perception that the official Tamil language has the least status among the four official languages of Singapore as well as the fact that Singapore’s drive for foreign talent has further increased the diversity of its population with many new

South Asian immigrants coming from the northern parts of that continent. Community commitment to Hindi, Gujarati, Sindhi, Urdu, and Punjabi, is reflected in the increasing trend of Indian pupils speaking languages other than Tamil at home and an increasing number of students taking these languages as subjects in the 'O' and 'A' levels school leaving examinations.

#### PROBLEMS AND DIFFICULTIES

The bilingual education programme in Singapore has been both cause and effect of language shifts, and the sociocultural and pedagogical implications have been amply discussed (Baetens-Beardsmore, 1998; Pakir, 1994, 1995; Saravanan, 1996). The sociocultural management of language shift in Singapore revolves round two issues: that of preserving the Asian identity of an English-knowing and now an increasingly English-dominant population, and that of ensuring a 'standard English' ideology for the small nation state to interact successfully with its global partners. A paradoxical situation obtains in a community that has used English as a working language for decades: it has begun to take ownership of English through a process of nativisation while the leadership of the country discourages this very process. These contradictory trends are illustrated in the following quotations, the first from a young Singaporean and the others from Lee Kuan Yew, Singapore's former Prime Minister (see Lee, 2000):

'Singlish is the spontaneous and delightful way that Singaporeans express themselves in English. In short, street talk. It is a language that is exclusively ours, lah ... Singlish is the common dialect of the people of Singapore.' (a quotation from a teenager as reported in *The New Paper*, Monday, August 15, 1988)

The English we are beginning to see or hear people speak is a very strange Singapore pidgin, a Singapore dialect English which is not ideal but which is the best for the time being, and which we can improve upon if we concentrate our effort and considerable resources. (Lee Kuan Yew, 1978)

I don't have to speak with an English upper-class accent. But I speak in a way which makes it easy for them to understand me and, therefore, they are not distracted by my background ... (Lee Kuan Yew, 29 July 1994, quoted in *The Sunday Times*, July 31 1994).

I think it's important that you know the English language because it is the international language, and you speak it in the standard form. ... Do not speak Singlish! If you do, you are the loser. Only foreign academics like to write about it. You have to live with it. And your interlocutors, when they

hear you, their ears go askew. You detract from the message that you're sending. (Lee Kuan Yew, 1994)

Language campaigns on a greater societal level—the SMC launched in 1979 and the Speak Good English Movement (SGEM) launched in 2000—have undertaken to improve the ‘speaking habits’ of Singaporeans, who went through the bilingual system during Singapore’s phases of survival-driven, efficiency-driven, and ability-driven education. It is left to be seen whether future cohorts, inspired by global opportunities especially in new markets such as India and China, will heed the call to become effective, able and efficient bilingual speakers.

### FUTURE DIRECTIONS

This chapter presents a case study of Singapore and its bilingual education programme that has thus far challenged Western definitions and assumptions regarding language planning and language education, bilingualism, and second language acquisition. The historical, social, and cultural contexts of bilingual education unique to Singapore may not be replicable elsewhere but the bilingual education programme poses interesting questions for multilingual countries with different bilingual education programme models.

The language policy in Singapore of creating ‘English-knowing bilinguals’ allows Singaporeans to communicate among themselves as well as engage with the world using English as their ‘working language’ even though the population is mainly Asian. It can be asserted that the management of success in Singapore is tied to a bilingual education policy that gives premier status to English, but also acknowledges and encourages the development of its other three official languages, Mandarin, Malay, and Tamil. Partly as a result of its bilingual education policy, Singapore has now positioned itself as a global player and a medical, educational, logistics, banking, and financial hub attracting foreign investment and talent. In the current changing geopolitical climate, with India and China as twin engines of growth in the twenty-first century, Singapore, situated between the two and in predominantly Malay-speaking Southeast Asia, has a language advantage in that its citizens learn English as the first school language and either Mandarin, Malay, and an Indian language as the second school language.

Clearly, the language shifts among the young people in Singapore indicate a strong preference for English and among the Chinese, for Mandarin as well as English. The competitive global marketplace and China’s ascendancy as an economic giant might result in changes in the Singapore bilingual education policy. First, the policy of formally allowing only two languages in the education domain, English and MTL—according to ethnic group membership—might change to enable other ethnic

groups (Malay, Indian) to learn Mandarin. Second, the English-knowing bilingual population which is now becoming English-dominant, may reshape itself into one that is English-knowing as well as Mandarin-knowing at comparable levels, rather than the lop-sided bilingualism that is currently observable.

Future educational and social policies within Singapore will have to address questions that are beginning to emerge: Is there an increasing social class differentiation based on linguistic mastery of ‘important’ and ‘big’ languages? Will older Singaporeans with their lower status dialects (Hokkien, Teochew, Cantonese, Hakka, and Hainanese) simply fade away with time? Is the sociolinguistic profile of the country as neat as it looks? Will the development of local and foreign human capital in Singapore allow for the diversity of ‘voices’? Will emergent Singaporean voices question ‘which English’ and ‘whose English’? Will other Indian languages—Malayalam, Telugu, Hindi, Urdu, Bengali, Punjabi, and Gujarati come into their own? Will the education system eventually reintroduce third languages in schools for those who want to have more in their verbal and linguistic repertoires?

In conclusion, bilingual education in Singapore is a response to the dilemma of multilingual countries that are confronted with complex realities in finding the right balance between ethno-linguistic representation and overriding educational goals. The Singapore experience suggests that while the pinnacle of bilingual success (a highly bilingual, bi-literate, and bi-cultural population) may not yet have been reached, the language management and language education initiatives that have been implemented have thus far resulted in extremely encouraging educational achievements.

## BILINGUAL EDUCATION IN CENTRAL ASIA

### INTRODUCTION

Education in contemporary Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan and Uzbekistan occurs in a complex multilingual context amid competing identity discourses.<sup>1</sup> Languages spoken in the region<sup>2</sup> include: the titular languages: Kazakh, Kyrgyz, Tajik, Turkmen and Uzbek,<sup>3</sup> and many others.<sup>4</sup> Initial Soviet encouragement of instruction in *all* languages evolved into sociopolitical dominance of Russian-medium schooling leading to demands for increased status of titular and other languages in schooling in the last decade of Soviet power. [Table 1](#) illustrates Central Asia's ethnic diversity just before the

---

<sup>1</sup> Kazakhstan, Kyrgyz Republic, Tajikistan, Turkmenistan and Uzbekistan were all constituent republics of the USSR before 1991. For more geopolitical and historical background of Central Asia, see E. Allworth (ed.): 1994, *Central Asia: 130 years of Russian dominance*. Durham, NC: Duke University Press.

<sup>2</sup> These include other languages of Central and Inner Asia, such as Balochi, Dungan, Karakalpak, Kurdish, Pamiri languages, Uighur, Volga Tatar, Yaghnobi, languages of relatively recent voluntary immigrants to the region, such as, Armenian, Azerbaijani, Belarusian, Russian, Ukrainian; languages of involuntary immigrants to the region: Crimean Tatar, German, Korean, Meshketian Turkish, making Central Asia arguable the most ethnically and sociolinguistically complex region of the former Soviet Union. Kazakh, Karakalpak, Kyrgyz, Meshketian Turkish, Tatar, Turkmen, Uighur and Uzbek are Turkic languages; Balochi, Kurdish, Pamiri languages, Tajik and Yaghnobi are Iranian languages; Dungan is a dialect of Chinese. Spoken languages often form dialect continua with vernacular dialects showing features of the neighbouring languages. For more, see B. Comrie: 1981, *The languages of the Soviet Union*, Cambridge, Cambridge University Press, and A. Bennigsen and S. E. Wimbush: 1986, *Muslims of the Soviet Empire: A Guide*, Bloomington, Indiana University Press.

<sup>3</sup> So called since in the national delimitation of the 1920s the region was divided into republics that were intended to have one majority nationality for whom the republic was named.

<sup>4</sup> Repeated script reforms have complicated language and literacy development in Central Asia. In the 1920s it was decided for all languages written by Soviet Muslims to shift from Arabic to Latin script. In the 1930s, it was decided to shift from Latin to Cyrillic script. In the 1990s, a return to Arabic script was debated, but taken up nowhere; while Uzbek in Uzbekistan is once again written in Latin script. Thus Uzbek in contemporary Central Asia is written in Latin script in Uzbekistan in primary and secondary school, but in Cyrillic most frequently in higher education and in the press, and in neighboring republics. While arguments have been made in favour of reformed scripts in terms of learnability, every time the script has changed, some are left functionally illiterate by the change. For a thorough review of script changes in the region see Fierman (1991), Landau and Kellner-Heinkele (2001) and Schlyter (2004).

Table 1 Population of Central Asia by Declared Nationality

| Nationality  | Kazakhstan  | Kyrgyzstan  | Tajikistan  | Turkmenistan | Uzbekistan   |
|--------------|-------------|-------------|-------------|--------------|--------------|
| Belarusians  | 182, 601    | 9, 187      | 7, 247      | 9, 200       | 29, 427      |

breakup of the USSR. With independence in 1991, each republic required educational policy to balance multiple aims: raising the titular language's status; providing effective mother-tongue and titular language education to all; and developing proficiency in international languages (Landau and Kellner-Heinkele, 2001; Schlyter, 2004).

A bilingual education framework can play a part in achieving this balance, yet is little studied in the region: scholars and governments have just begun to note experimental bilingual programmes, while debate on bilingual education is so far restricted to international actors (Ekeus, 2005; International Crisis Group, 2003; OSI, 2002; Schulter, 2003). However, the need in our globalized world for sustainable education responsive to individual and state needs indicates that bilingual or multilingual education may become an area of great interest for all stakeholders in Central Asia. This chapter aims to outline the development, current status and future of bilingual education in each republic and in Central Asia overall.

#### EARLY DEVELOPMENTS

Bilingualism traditionally developed in Central Asia through language contact (Schlyter, 2004) and through Islamic education, where classical Arabic, Persian and Central Asian Turkic were studied using rote methods in primary school (*maktab*) supplemented by peer-led discussion approaches in secondary schools (*madrasas*). While there were a few Central Asian madrasa graduates famed throughout the Islamic world for their multilingual skill, reformist critics (*jadids*) ascribed the frequent functional illiteracy of maktab graduates to *classical medium* instruction. The jadids introduced vernacular instruction, with classical languages taught as subjects in preparation for transition to classical-medium instruction. Under Russian imperial rule, nomadic populations received transitional bilingual education: 2 years in the vernacular with Russian as a subject, shifting to Russian-medium instruction in the third year; among settled populations, bilingual Russian-local schools were devised (*Rusko-tuzemnie shkoly*) with half Central Asian curriculum and half Russian curriculum taught in Russian as a means to produce local bilinguals to staff the bureaucracy (Dowler, 2001; Khalid, 1998).

Soviet policy aimed at mass vernacular literacy, developing new standard languages on the basis of select local dialects, abandoning classical Central Asian Persian and Chaghatai Turkic as media of instruction. Each nationality received mother-tongue instruction in its own *national school*<sup>5</sup> and titular language study was compulsory. Mass

---

<sup>5</sup> 22 languages of instruction were used in the Uzbek SSR in the 1930s (Fierman, 1991).

L1 literacy was accomplished, but second language learning by Russian-speakers of titular languages and of Russian by indigenous populations was ineffective. After 1938, Russian study was made compulsory, and the use of many other languages as media of instruction was reduced or abolished. Consequently, many parallel-medium schools developed<sup>6</sup> with several separate language streams housed together, and Russian used as the vehicular language for common school activities. Titular-medium, Russian-medium, parallel-medium and single-medium minority schools co-existed. After 1958, parents were allowed to choose children's language of instruction, and many non-Russian nationalities opted for Russian-medium schooling, leading to increasing local-Russian bilingualism<sup>7</sup> (Fierman, 1991; Landau and Kellner-Heinkele, 2001; Lewis, 1972; Schlyter, 2004; Shorish, 1988).

A multiethnic élite proficient in Russian developed in each republic, some of whom experienced language shift to Russian, whereas the titular ethnicity developed parallel élites: one more proficient in Russian than the titular language and one with more balanced titular-Russian bilingualism. Members of the titular cultural élite had an ambivalent relationship to russification and the titular language's low status, subduing their complaints until *Perestroika*, when each republic passed new language laws making the titular language the *state* language and Russian either an *official language* or *language of interethnic communication*. These new laws aimed to increase titular language status in education, making subtle restrictions on Russian-medium schooling, and no changes in minority language school conditions (Landau and Kellner-Heinkele, 2001; Lewis, 1972; Schlyter, 2004; Shorish, 1988).

<sup>6</sup> These parallel-medium schools are called in Russian "mixed" schools. G. Lewis (1972) uses mixed-medium schools to refer to classes where students who are educated in L2 have bilingual teachers mix L2 instruction with L1 explanation of L2 lessons.

<sup>7</sup> Until 1958, children had to be enrolled in a national school of their ethnicity, if one was available. For ethnicities whose language was no longer used as a medium of instruction and for other ethnicities living outside of the territory of compact settlement, there was a choice of titular-medium or Russian-medium schooling, with Russian-medium instruction the usual preference. After 1958, even where mother-tongue instruction was available in primary school, many parents, concerned that their children would not develop sufficient Russian proficiency for career success, opted to convert their national school to a Russian-medium school. The official justification for a policy that weakened mother-tongue education for minorities was that it was more democratic to offer choice and that it was more equitable in that relieved minority students from the burden of learning one more language than other students did. It is important to note that no proposals for the change of methodology including the introduction of dual-medium education were made. The current system was accepted, and the only solution envisaged was to cut one language of instruction, the weakest one. Of course, parents were offered a *free* choice, but in the sociolinguistic dynamic that existed the choice was not free. See Lewis (1972) for a thorough discussion of the introduction of these laws and their impact. They were resisted more strongly in the Caucasus than in Central Asia.

Post-independence language-in-education policies vary. Turkmenistan guarantees Turkmen-medium instruction only, while the remaining republics provide for other languages of instruction, where numbers warrant. Kyrgyzstan and Kazakhstan, with higher numbers of russophones, retain relatively many Russian-medium programmes. Yet Russian proficiency is potentially beneficial to all, since many Central Asians travel to Russia for employment and higher education. Second-language instruction of the titular language for minorities and of Russian for non-russophones is considered inadequate. Most republics count on improving language learning through investments in curriculum, materials and teacher training (Landau and Kellner-Heinkele, 2001; OSI, 2002; Schlyter, 2004); nevertheless, bilingual education as a means to raise second and foreign language proficiency is little discussed.

### MAJOR CONTRIBUTIONS

#### *Soviet Scholarship*

Soviet scholarship on bilingualism and education generally focused on how non-Russians could develop greater proficiency in Russian. Tajik–Uzbek bilingualism, the monolingualism of many russophones and the preference of non-titular minorities for Russian over titular-medium education were little explored; the primacy of Russian proficiency was not problematized. Conducted largely by sociolinguists and ethnographers using census data and survey results, these studies made some speculations about language(s) of instruction and bilingualism, but limited school-based data mainly to statistics on enrolment by language of instruction. Desheriev (1976) and Guboglo (1984) are examples of this scholarship. However, survey data were unreliable, since many respondents gave the language of their nationality as their native language (*rodnoi iazyk*), regardless of actual language use (Khasanov, 1987), thus underestimating shift to Russian, overestimating bilingualism, and obscuring the role of Russian-medium education in producing subtractive bilingualism and language shift.

Such research examined the results of “ethno-linguistic processes” more than the development of bilingualism itself, neglecting the effect of language of instruction, and school and pedagogy types on pupils’ linguistic development, educational attainment and achievement. Central Asian educators and scholars (Jamshedov, 1991; Khasanov, 1987; Niyozov, 2001; Shorish, 1988) seem to have been aware that educational policy resulted in unbalanced bilingualism, language attrition and learning difficulties for some students, but this knowledge seems to have been largely *anecdotal* and remained unstudied empirically or at least unpublished. During Perestroika, a space for discussion

of the place of languages other than Russian in education opened up briefly. Khasanov (1987) concentrates on Central Asians' problems learning Russian, but also criticizes low levels of Russian–Kazakh bilingualism, and proposes improved instruction of Kazakh as a Second Language, without mentioning bilingual education for non-Kazakhs for this purpose. Multilingual education was, however, raised as a solution in the Tajik SSR (Jamshedov, 1991). Maintenance trilingual education was proposed for pupils speaking minority Pamiri languages, with the mother-tongue used alongside Tajik and Russian as languages of instruction to replace submersion in these languages, which, it was claimed, led to pedagogical difficulties for learners.

### *Western Scholarship*

Much western research on bilingualism and education in Central Asia has been limited by the fact that it has been done from the perspectives of political science, sociology and anthropology for which education is not of central interest except as an indication of shifting identities, and by problems of availability and reliability of data from the USSR. Silver (1976), for example, based on statistical analysis of census data on *native language*, concludes that Central Asians are little prone to language shift to Russian, a conclusion due partly to the unreliability of survey questions on *rodnoi iazyk*. We now know that many urban Central Asians did indeed shift to Russian as their primary language (Korth, 2005; Suleimenova and Smagulova, 2005).

Lewis (1972) provides an in-depth analysis of Soviet language policy over time and the impact of the many policy changes on education, including a wealth of information on Central Asia. Much attention is devoted to the implementation of language policy at the school level, including second language methodology and the various school-types: single-medium national schools (standard model *national schools*), mixed-medium classes (single-medium L2 schools where teachers paraphrase L2 instruction in students' L1), parallel-medium schools (two or more single-medium schools housed together), dual-medium schools (outlawed in the 1920s). Many Russian language works are cited, although no publications in Central Asia languages are included.

Shorish (1988) focuses on Central Asia, supplementing Russian with Tajik-language sources, some representing views of teachers rather than of *experts*. A methodological rift is reported among Russian as a Second Language teachers, with Russian-dominant teachers favouring direct instruction without reference to students' L1, while bilingual teachers favoured contrastive analysis of L1 and L2. This debate continues a century-old controversy between comparative methods *requiring*

Central Asian bilingual teachers, and the *natural* method demanding *monolingual* teaching at all times, favoured by Russophone teachers (Dowler, 2001).

#### RECENT WORK AND WORK IN PROGRESS

Landau and Kellner-Heinkele (2001) is the major resource for students of language policy in Central Asia. The book is divided into sections based on themes, one of which is language and education. Although Landau and Kellner-Heinkele are more interested in the politics of language than the learning process and its effects on learners, and do not deal with bilingual education as a policy option, the book is based on sources in Central Asian languages, Russian and English, and provides a comprehensive survey of policies affecting language of instruction in Central Asia.

#### *Language and Education in Kazakhstan*

Suleimenova and Smagulova (2005) synthesize available information and recent research on the current sociolinguistic and language planning situation applying international literature on sociolinguistics and language planning to Kazakhstan's case.<sup>8</sup> A major theme of research in Kazakhstan is determining whether language policy is successfully increasing the status of the state language, Kazakh, relative to Russian, or whether Russian retains its predominance over Kazakh in high status spheres, including education (Fierman, 2006; Suleimenova and Smagulova, 2005). Survey research on attitudes towards Kazakh and Russian, and towards upbringing and education in these languages is common, while qualitative and experimental studies are relatively rare. A matched guise study confirmed the common perception that Kazakhs and Russians ascribe higher status to both Russians and Kazakhs when speaking Russian (Laitin, 1998). Increasingly positive attitudes have been found towards Kazakh among non-Kazakhs, more of whom are claiming Kazakh proficiency (Masanov; 2002, in Suleimenova and Smagulova, 2005), while numbers of Slavs self-reporting Kazakh proficiency have risen from under 10% in 1995 (Arenov and Kalmykov, 1997) to under 15% in 2000 (Suleimenova and Smagulova, 2005).

Research on schools is just beginning. Statistical surveys of enrolments by language often fail to separate parallel-medium from single-medium

---

<sup>8</sup> For a shortened English version of this work, see Suleimenova, E. and Smagulova, J.: 2006, Kazakhstan: Language situation, in K. Brown (ed.), *Encyclopedia of Language and Linguistics*, Elsevier, London and New York.

schools. Delorme (1999) found that two competing Kazakh- and Russian-medium schools each developed superior proficiency in its medium of instruction and thus recommended that the schools merge, forming one dual-language school. A recent study of changing numbers of school type notably shows a rise in parallel Kazakh-Russian-medium schools from 15% in 1988 to 36% in 1995 of all schools. However, some Kazakhs suggest, separating streams in parallel-medium schools, since Kazakhs generally switch to Russian in the presence of non-Kazakhs, and titular language learning will be inhibited by the presence of Russian-medium streams (Fierman, 2006).

Uzbek, Uighur, Tajik, German, Tatar and Ukrainian are instructional media, with twelve other minority languages offered as subjects (Landau and Kellner-Heinkele, 2001; Suleimenova and Smagulova, 2005). Many members of Turkic minorities exhibit relatively balanced trilingualism: 81, 80 and 64% of Uighurs, Uzbeks and Tatars profess Kazakh proficiency, with stated L1 proficiency of 81, 97 and 37%, and Russian proficiency of 76, 59 and 97% respectively. Nevertheless, pidginized varieties of Kazakh and Russian are reported (Suleimenova and Smagulova, 2005), while many L1-educated Uzbeks are said to have insufficient proficiency in literary Kazakh or Russian to pass university entrance examinations in these languages (Ekeus, 2005).

United Nations recommends greater minority participation in language policy formation (CERD, n.d.), while the Organization for Security and Co-operation in Europe (OSCE) supports Kazakh and Russian as additional instructional media in Uzbek schools<sup>9</sup> (Ekeus, 2005). Intraregional cooperation in bilingual education has begun; Latvian bilingual programme staff have assisted in OSCE programmes, and Kazakhstan teachers have observed multilingual programmes in Kyrgyzstan. OSCE is in negotiations with the government for these “rudimentary” bilingual programmes to be taken over by the government and expanded to all but Russian-medium non-Kazakh schools<sup>9</sup>.

### *Language and Education in Kyrgyzstan*

Statistical and survey studies focus on number of schools by language, and numbers claiming proficiency in various languages of Kyrgyzstan. Only

<sup>9</sup> OSCE support for bilingual education depends on sociopolitical circumstances. As OSCE's primary mandate is conflict prevention, its policy is to promote the provision of bilingual education where submersion in the majority language increases interethnic tensions, particularly when the affected ethnicity is a majority in a neighbouring state (Dmitri Alechkevitch, political advisor to OSCE High Commissioner on National Minorities, Rolf Ekeus, June 2006, Personal communication).

one Kyrgyz-medium school existed in the capital before independence, but from 1989 until 1998, the number of Kyrgyz-medium schools changed by +21%, of Uzbek-medium schools by +15%, and of Russian-medium schools by -38%, while the number of parallel-medium schools increased by 17% to 389 schools. Regional differences in ethnic diversity and Russian language penetration exist, complicating language of instruction policy (Korth, 2005; Landau and Kellner-Heinkele, 2001; UNESCO, 2000; Wright, 1999). Nevertheless, recent statistics show more non-Kyrgyz claiming knowledge of Kyrgyz, possibly indicating successful policies promoting Kyrgyz proficiency among other nationalities.

Korth (2005) has produced a thorough synthesis of current research as part of a qualitative study on attitudes towards language and schooling in Kyrgyzstan. Findings include persistent negative attitudes towards the functionality of Kyrgyz among Russophones and minorities, and towards the current non-communicative teaching of Kyrgyz as a second language, which is seen by many as ineffective and anachronistic, with meaningless assessment that does not actually measure development of Kyrgyz proficiency. Also documented is the role of Russian-medium *boarding* schools as a means of social advancement for rural Kyrgyz children, which generally involved psychological distress and the development of subtractive bilingualism. Korth recommends a change towards more modern and urban curriculum content, towards more communicative methodology.

A recent case study (Shamatov, 2005) illustrates minority schools' challenges. In mixed Uzbek-Kyrgyz districts, shortages of trained Uzbek teachers exist. A Kyrgyz teacher bilingual in conversational Uzbek, where called upon to teach in the Uzbek stream of a parallel-medium school, faced difficulty in teaching in literary Uzbek, thus suggesting the inadequacy of basic interpersonal communicative proficiency (BICS) proficiency for formal instruction.

The United Nations recently commended Kyrgyzstan's efforts in eliminating unequal treatment of ethnic groups (CERD, n.d.). Indeed, experimental Kyrgyz-Uzbek-Russian and Kyrgyz-Russian school programmes have been organized with the support of Ministry of Education, local schools, and international organizations, CIMERA and OSCE, sponsors of a recent conference on multilingual and mother-tongue education for national minorities in Kyrgyzstan (Schulter, 2003).

### *Language and Education in Tajikistan*

Research available in English has focussed more on the question of language of instruction for speakers of minority languages than on the place of Russian-medium schooling. Niyozov (2001) and Elnazarov (2004) noted that teachers report difficulties in instructing non-titular

linguistic minority students in Tajik and frequently resort to the mother-tongue to clarify lessons, to maintain order and discipline children, creating in Lewis' terms (1972), *defacto* mixed-medium bilingual programmes. Summer Institute of Linguistics (SIL) has organized recent sociolinguistic surveys of smaller minority language groups, including several endangered ones, which found generally positive attitudes towards literacy in the vernacular, and mixed attitudes towards L1-Tajik education, with greater interest in bilingual education among communities with less daily exposure to Tajik (Clifton, 2005).

Although around 24% of students attend Uzbek-medium schools, there is little research on schools for titular minorities, such as Uzbek and Kyrgyz, whose schools lack materials and teachers formerly provided by the titular republics, leading to transfer of students to Tajik-medium schools (UNESCO, 2000; Niyozov, 2001). Arguments that bilingual education should be considered to improve educational achievement among linguistic minority children have recently been made (Bahry, 2006). The United Nations commends Tajikistan's minority education policy, but points out that textbook shortages affect minority language programmes disproportionately, and encourages increased dialogue with minority communities on schooling issues (CERD, n.d.).

### *Language and Education in Turkmenistan*

Turkmenistan *only* guarantees education in Turkmen only as language of instruction, and has made the study of English and Russian as *foreign* languages compulsory. In 1997/1998, there were 1,938 Turkmen-medium schools, 250 Russian-medium schools, 90 Uzbek-medium schools and 40 Kazakh-medium schools, whereas from 1997/1998 to 1998/1999 the number of Russian-medium schools dropped to 170 (Landau and Kellner-Heinkele, 2001).

The UN website records communications between Turkmenistan and the UN Committee on the Elimination of Racial Discrimination (CERD) on minority education. Turkmenistan reiterated in 2004 its aim of creating "habits of equality, friendship and comradeship, irrespective of social status, wealth, race or ethnic background" through schooling. The UN's response expressed special concern at the closing of schools with Uzbek, Russian, Kazakh and Armenian languages of instruction, while schooling of smaller minorities such as the Kurds and Balochi was not mentioned (CERD, n.d.). Demidov (2002) provides a critical account of the policy of converting minority-language schooling to Turkmen-medium schooling, focusing mainly on the closing of Russian-medium schools.

*Language and Education in Uzbekistan*

Most research on current language, education and bilingualism in Uzbekistan today centres on language policy, focusing on change in status of Uzbek to *the* official language and the reduced status of Russian. Learning Uzbek is not mandatory for non-ethnic Uzbeks. Yet at independence a strict timetable of full implementation of Uzbek as state language led to high emigration of Russians; in 1995 this deadline was removed reducing emigration rates of russophones (Landau & Kellner-Heinkele, 2001; Schlyter, 2004). Russian is still used as an academic technical language, in which professional articles and dissertations may be written.

Uzbekistan has committed to provide education in six languages, Karakalpak, Kazakh, Russian, Tajik, Turkmen and Uzbek (CERD, n.d.); the number of schools where languages of instruction other than Uzbek are available is: Russian, 917; Kazakh, 595; Tajik, 332; Kyrgyz, 70 and Turkmen, 66 (UNESCO, 2000); in addition there are small numbers of classes using languages such as Crimean Tatar, Kazan Tatar, Bashkir and Greek as languages of instruction (Landau and Kellner-Heinkele, 2001). Some have pointed out with concern that there seem to be more Tajik speakers in Uzbekistan than existing Tajik-medium schools can serve, although Tajik-speakers are generally bilingual in a Tajik-influenced form of Uzbek distinct from the literary language, which may hinder their learning in Uzbek-medium classes (Djumaev, 2001; Schlyter, 2004).

*International Bilingual Programmes*

International schools provide bilingual education where a foreign language is used as an additional medium of instruction. The Aga Khan Lycée in Tajikistan uses English, Tajik and Russian in parallel streams.<sup>10</sup> Bilingual Turkish programmes teach sciences in English, humanities in Turkish, and Turkmen/Kyrgyz and Russian as subjects, while trilingual programmes teach local history and geography in Turkmen/Kyrgyz, other humanities in Turkish, and sciences in English. A study of stakeholders' attitudes concluded that Turkish bilingual schools outperform monolingual state schools (Demir, Balci, and Akkok, 2000), a finding that should be interpreted cautiously due to the differing resources of Turkish and state schools. Nevertheless, this study is a first step in the systematic study of bilingual education in Central Asia.

---

## PROBLEMS AND DIFFICULTIES

*Second Language Learning of Titular Languages*

Government policy in Central Asia and international conventions against discrimination (CERD, n.d.) require equitable opportunity for speakers of other languages to acquire titular languages. The means available by which to achieve this goal are through:

1. Second language education in national schools
2. Immersion/submersion in titular medium schools
3. Parallel-medium schools

The first approach assumes that increased investment is sufficient to improve titular language learning; however, significant changes in curriculum changes providing greater motivation through more meaningful content and assessment of learning improvements may also be required. Despite some positive changes in attitudes towards learning titular languages, research is needed on how and how well they are learned in schools. The second approach should lead to proficiency in the titular language, but lead to subtractive bilingualism, perhaps language shift, with a risk of backlash if minority language communities are threatened with the loss of a sign of their identity. If submersion conditions exist, it may lead to limited acquisition of the formal registers of the titular language and result in poor scholastic achievement. The third approach supports development of BICS and CALP (cognitive academic language proficiency) proficiency in the mother-tongue together with the development of BICS if not CALP proficiency in the titular language *if* L1 is used as the medium of instruction throughout schooling *and* the titular language becomes the vehicular language in the school. Information on whether the vehicular language in parallel-medium schools has shifted to the titular language is not available. Where it remains Russian, these schools will not likely support developing minority-titular bilingualism.

*Learning of Second/Foreign Languages*

The demand for international language proficiency, combined with the perceived ineffectiveness of second language education in state schools leads parents to conclude that *immersion* in a foreign language is the *only* effective way to acquire a foreign language (Korth, 2005). Thus, Russian-medium education has been an affordable means of élite entry since it is available in public schools, while dual-medium schools using Turkish or English as one of the media of instruction are only available at fee-paying schools. Although English, and to some extent Turkish are in great demand, the high levels of migration to Russia for

employment and study, along with the greater availability of Russian teachers and materials, make Russian-medium or parallel titular-Russian-medium bilingual programmes more practical for students and feasible for governments than English or Turkish-medium instruction.

### *Minority Language Maintenance/Revival*

Most republics of Central Asia guarantee mother-tongue education in a limited number of languages. However, although Russia continues to provide textbooks to Russian-medium schools, Central Asian titular ethnicities outside their titular republics have experienced reduced support for their national schools from the titular republics, causing a reduction in quality of education relative to republican language schools and many resulting transfers to schools in the local republican language. Nationalities that lost mother-tongue education under Soviet rule may wish to have it restored, even though among urban inhabitants language shift is almost complete. When mother-tongue education is not state-provided, minorities have the right in most jurisdictions to fund their own mother-tongue “Sunday schools”. However, while all communities have an equal right to open such programmes, they do not have equal ability to do so. Korean community, for example, receives support from South Korea, while Dungans, Central Asian Chinese speakers, receive no support from China (Landau and Kellner-Heinkele, 2001).

### *Educational Research*

Thus far, second language pedagogy has been insufficiently effective in dealing with these problems; hence, thorough research-based debate is required on the possibility of achieving titular and Russian proficiency through dual-medium bilingual education, and maintenance of mother-tongues for other language groups through trilingual education. Most research cited above, when concerned with education, deals with language rights, normative frameworks and surveys of attitudes towards language rather than the relationship between learning, language of schooling and second language pedagogy. Korth’s study (2005) suggests that learners are well aware of inadequacies in second-language classes, while Niyozov’s (2001) study suggests that teachers understand the importance of language as a factor influencing students’ learning. Central Asian governments, supported by UNESCO, have begun research monitoring student achievement (OSI, 2002), yet much more information on achievement, learning and language use inside and outside the classroom needs to be gathered and published so that analysis of their interrelationships may proceed.

At present, multilingual education within Central Asia is mainly supported by external agencies; for example, Open Society Institute (OSI, 2002) and OSCE (Ekeus, 2005) recommend bilingual education in Central Asia with the argument that educating children from different nationalities in their own and their neighbors' languages increases social cohesion, reducing the risk of interethnic violence. International organizations such as the World Bank and UNESCO are proponents of mother-tongue and bilingual education for linguistic minorities in developing countries, but are less actively involved in promotion of bilingual and multilingual education in Central Asia than in other parts of the world.

School-based research on the role of language and education in social cohesion, educational participation and equity, as well as scholastic achievement and attainment is required in order for policy recommendations to be grounded in research. Current approaches to language in education in Central Asia engage in zero-sum thinking; that is, any improvements in learning language X must come at the expense of learning language Y. Thus, dissemination of research on types of bilingual education and conditions that support additive rather than subtractive bilingualism is crucial. However, educational research capacity is limited and can benefit from external support. Heretofore, research on language and education receives greater attention in Ukraine, Latvia, Estonia and Russia, despite the similar linguistic, cultural and ethnic diversity of Central Asia.

#### FUTURE DEVELOPMENTS

The linguistic and social complexity of the region of Central Asia and the disruptions to minority language education caused by the post-independence reductions in inter-republican educational cooperation, suggest a broad ecological approach to language and education in the region that treats each language in relation with all other languages in the context. Governments can profitably share experiences with each other and the international research community to develop effective approaches to language and education, which should include bilingual and multilingual education.

Bilingual education should not, however, be introduced into post-Soviet spaces without sufficient preparation (Silova, 2006). Thus, existing quasi-bilingual programmes, such as parallel-medium schools, require relatively small changes to be converted to experimental dual-medium programmes. Such small-scale experimentation is less wasteful of resources, more sensitive to local conditions and open to learning from experience, and should be encouraged with support from the school system, interested NGOs, and international organizations that will enable critical research and dissemination of results among stakeholders.

The OSCE-sponsored conference “Multilingual Education and Mother Tongue Education for National Minorities in Kyrgyzstan” in Osh, Kyrgyzstan and the British Council- sponsored Sixth International Conference on Language and Development in Tashkent, Uzbekistan have presented such an opportunity. Still, bi- and multilingual education in the region face many challenges in this region: discussion still centres on titular languages *or* Russian, and leaves minority languages largely off the agenda. Voices calling for research and policy debate in this field exist, but depend on support from external agencies, such as OSCE, while the most influential external agencies do not take a leading role in this field in this region. Consequently, political will to engage in research and debate on multilingualism is weak.

Nevertheless, calls for dual-medium bilingual education as an improvement over existing second language programmes have been made for some time. During Perestroika, several Soviet scholar proposed bilingual education as an improvement over current methods. More recently, DeLorme (1998) proposed merging titular- and Russian-medium schools to form dual-medium programmes, paralleling Turkish programmes that teach sciences in an international language and humanities in a local language (Demir, Balci, and Akkok, 2000). However, such proposals retain a hierarchical functional specialization of languages reminiscent of Soviet practice that does not concur with current nation-building goals of language policy which are attempting to broaden the functional uses of the titular language in every republic. To be acceptable, proposals for multilingual education must support the titular language’s status through its use as a medium of instruction in any area of the curriculum and, not limit its use to transmitting *local* knowledge. In the absence of these conditions, bilingual programmes may be perceived as vehicles for russification, turkicization or anglicization.

BILINGUAL EDUCATION IN SPAIN: PRESENT  
REALITIES AND FUTURE CHALLENGES

INTRODUCTION

Baker (2001) states that bilingual education should not be regarded as a modern phenomenon. The fact is that in one way or another it has existed for many centuries and its historical roots have been linked to immigration, political upheavals, the defence of human rights, the fight for equality of educational opportunities, and so on.

This is particularly relevant in Spain. The end of Franco's regime (1939–1975) led to the 1978 Constitution, which, apart from being the basis of a return to democracy, acknowledged all the minority languages spoken in Spain that had traditionally played second fiddle or none at all. However, it has to be remembered that the Magna Carta currently in force embodies a language policy in which Spanish is the only official language for the State as a whole.

With this background in mind, in the following pages we will describe the foundations on which Spanish language policy is based and how they affect the education system. The paper starts by giving an insight into the legal framework and social context before detailing the two most significant examples of bilingual education—the Basque Country and Catalonia—and two less well-known ones—Aragon and Asturias. This will allow us to assess the present situation and, in the conclusions section, outline the challenges on the horizon.

EARLY DEVELOPMENTS: THE LANGUAGE  
POLICY IN CONTEMPORARY SPAIN

Since the approval of the Constitution in 1978, the status of the different languages coexisting in Spain has to be considered from a double legal basis (Siguan, 1992):

1. The acknowledgment of Spain's multilingual and multicultural character.
2. Spain's division into 17 Autonomous Communities with ample legislative powers.

Regarding the first aspect, although Spanish is the only official language, it is established that other languages can also be official in their

respective territories provided that this possibility is included in their statute of autonomy.

As a result, these statutes are the key reference when legislating to guarantee language normalization in areas where Spanish coexists with other languages. The statutes of six Communities (Catalonia, the Valencian Community, the Balearic islands, Galicia, the Basque Country and Navarre) proclaim the existence of a language of their own which, together with Spanish, is the official language in their territory. Moreover, all Spanish Communities have been granted legislative powers in at least some specific areas, education being one of them.

During the 1980s the Parliaments of the aforementioned Communities passed Language Normalization Laws which shared similar structures and contexts: mention was made of the legal basis of the Constitution and the respective statutes, the objectives were justified, the official name of their own languages was established, as well as its co-official status with Spanish, the right to know and use the other language in any context, the principle of no discrimination on linguistic grounds, and so on. All these laws, either explicitly or implicitly, make their respective governments responsible for promoting the learning and use of the minority language so as to compensate for its weaker situation and to safeguard the speakers' right to use it.

Some laws delimit their geographical boundaries. For example, that of the Valencian Community distinguishes the so-called Spanish-speaking zone, where the law is applied only in a limited way; in Navarre the law divides the territory in three parts: the Basque zone, the Spanish zone and the mixed zone, depending on the language most widely spoken. The law is thus applied in different ways in each of these zones. In the case of the Catalan law, it also defines the language policy to be applied in the Aran Valley, where Aranese is spoken, a Gascon dialect of the Occitan language.

Taken as a whole, these laws affect almost 50% of the Spanish population (44 million in total) who live in the territories pointed out in [Figure 1](#) (Turell, 2000).

In [Figure 1](#), in addition to Catalonia, the Valencian Community and the Balearic islands (where Catalan is their own language), the Basque Country and Navarre (where Basque is the minority language) and Galicia (where Galician is spoken), the autonomous communities of Aragon (where both Catalan and Aragonese are spoken) and Asturias (where Asturian is spoken) are also highlighted. In these last two the minority languages have no legal status, as is also the case regarding the part of León bordering Galicia and in the Arabic communities of Ceuta and Melilla.

The level of language competence attained in each of the communities which have a co-official language varies a great deal, as can be observed in [Table 1](#).

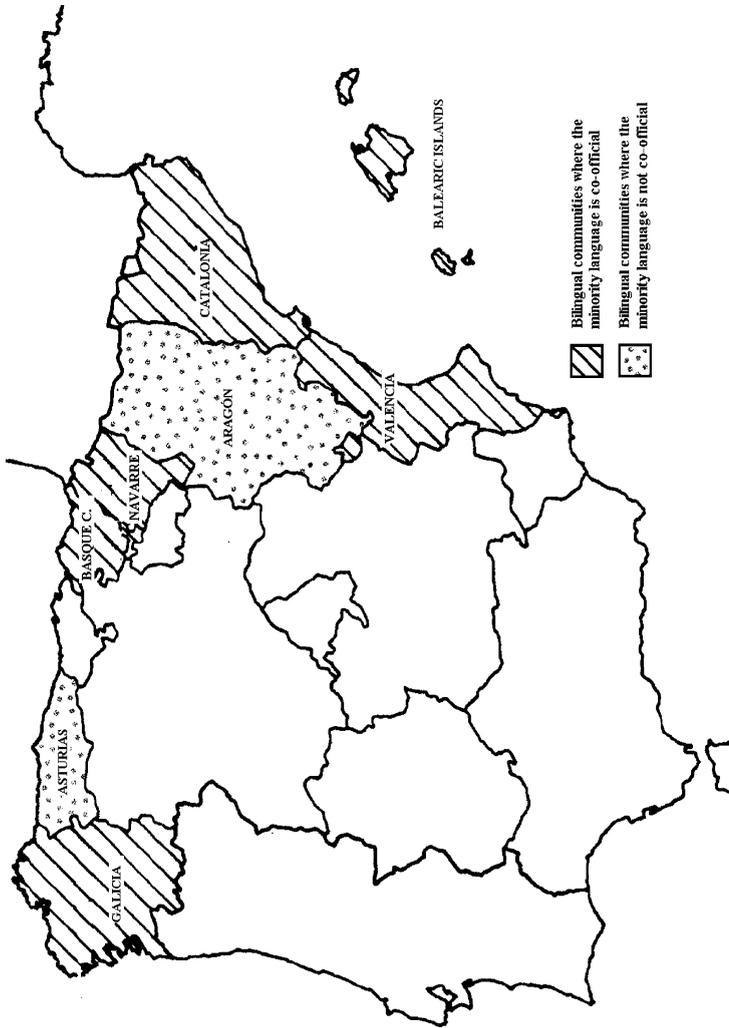

Figure 1. Map of Spanish bilingual communities showing the legal status of the minority language.

Table 1 Percentage of individuals who ‘can understand’ and ‘can speak’ the community language

|                                  | Catalonia | Valencia | Balearic Islands | Galicia | Basque Country | Navarra |
|----------------------------------|-----------|----------|------------------|---------|----------------|---------|
| Individuals who ‘can understand’ | 97        | 89       | 92               | 99      | 44             | 23      |
| Individuals who ‘can speak’      | 79        | 56       | 72               | 89      | 29             | 16      |

Table 1 shows the existence of two groups. The first one is made up of Galicia, Catalonia, the Balearic Islands and the Valencian Community, communities wherein 90% of the population can understand and (to a lesser extent) speak the minority language. The second group consists of the Basque Country and Navarre, where the percentages are much lower, although the efforts made during the last 25 years are significantly improving the situation of the Basque language, especially in the case of the Basque Country.

#### MAJOR CONTRIBUTIONS: BILINGUAL EDUCATION IN SPAIN

The efforts referred to in the previous paragraph are particularly visible in nursery and compulsory education. One aim of the language normalization laws is to ensure that students have a balanced command of Spanish and the other language by the time they reach the minimum school leaving age. This has led the Catalan, Valencian, Balearic, Navarrese, Basque and Galician educational systems to become bilingual, as school is the only context in which many students whose mother tongue is Spanish can develop their language competence in the minority language (Lasagabaster and Huguet, 2007).

As a result, during the last 20 years bilingual education has spread throughout much of Spain. The existence of Autonomous Communities with their own language and law-making powers has generated a considerable number of bilingual programmes. Consequently, Catalonia and the Basque Country have organized their educational systems following bilingual criteria and in other territories such as Aragon and Asturias similar strategies are elbowing through. The following, albeit in a very summarized form, is a description of these four educational systems.

*Bilingual Education in the Basque Country*

The Basque Country is, together with Navarre, one of the two territories where Basque is spoken. From a typological point of view, Basque is very distant from Spanish, being one of the few European languages which does not stem from the Indo-European. This distinguishes Basque from Galician and Catalan, languages much closer to Spanish, and, in fact, over 50% of the Basque population (see [Table 1](#)) do not understand Basque.

Nevertheless, in the last two decades there has been a huge surge in the number of people who consider themselves to be bilingual, a clear effect of the bilingual educational system. In fact, between 1991 and 2001 the percentage of bilinguals in the 16–24 age range has almost doubled, from 25 to 48% (Gobierno Vasco, 2003).

The Basque language first appeared in schools in the 1960s, in the so-called *ikastolak*, that is to say, schools for pupils whose mother tongue was Basque and who were taught through Basque. At that time the Basque Language Academy or *Euskaltzaindia* set out to work on the standardization of Basque. The result was the emergence of a standard Basque or *euskera batua*, which undoubtedly facilitated the use of Basque as a vehicle language at school, although, as happens in any other language, dialects are still spoken and maintained.

After the passing of the statute of autonomy and the reestablishment of the Basque Government, Basque is ever more present in the educational system. The widespread positive attitudes towards Basque have helped develop its presence at school, irrespective of the linguistic model, which is why all Basque students study it at school (Etxeberria, 2004). Research studies demonstrate very positive attitudes towards the minority language, although there are important differences when certain variables are taken into account (Lasagabaster, 2003; Madariaga, 1994).

There are three different bilingual models available, which can be described as follows:

1. *Model A*: All subjects, except for Basque, are taught in Spanish. Basque is only taught as a subject four to five hours per week.
2. *Model B*: Both Spanish and Basque are used to teach content. Although it is a rather heterogeneous model, Spanish is customarily the language for reading, writing and maths, whereas Basque is the means of instruction in the remaining areas of the curriculum. Moreover, both languages are taught as a subject, 4–5 hours being devoted to their teaching per week.

3. *Model D*: Basque is the means of instruction for all subjects except Spanish. From the first year of Primary Education, Spanish is taught only as a subject, usually 4 to 5 hours per week.

During the last few years, the number of students enrolled in Model A has gone steadily down, whereas the figures for Models B and D have steadily increased. To be precise, from 1982/1983 to 2004/2005 the number of pre-university students enrolled in Model A has decreased from 415.465 (79.34%) to 81.603 (26.69%), whereas in Model B it has increased from 44.458 (8.49%) to 69.941 (22.88%), the rise being even sharper in Model D: from 63.699 (12.17%) to 154.164 (50.43%) students. But the data are even more striking when nursery education is considered, as the vast majority of pupils (92%) are enrolled in Models B and D (Instituto Vasco de Estadística, 2006).

### *Bilingual Education in Catalonia*

Catalonia is, together with the Valencian Community and the Balearic islands, one of the three Spanish communities where Catalan is the usual language of communication for part of its inhabitants. Moreover, and although this fact is often overlooked, Catalan is also spoken in an area of Aragon called *La Franja*.

Unlike Basque, Catalan is a Romance language which is typologically very close to Spanish and French. This is one of the reasons why it is widely understood in Catalonia and just 3% of the population claim not to understand it (see [Table 1](#)).

The comparison of census data from 1991 and 1996 (Institut d'Estadística de Catalunya, 1998) reveals a remarkable evolution in the population's language skills in Catalan: understanding has increased from 93.76 to 94.97%, speaking from 68.34 to 75.30%, reading from 67.55 to 72.35% and writing from 39.94 to 45.84%.

Since Catalan was standardized in the early years of the twentieth century, its implementation as a means of instruction on all the different rungs of the educational ladder has been relatively simple. However, its use did not generalize till the re-establishment of the *Generalitat* (autonomous Catalan government). Before, the presence of Catalan at school was limited to the *escola catalana* (schools parallel to the previously mentioned Basque *ikastolak*).

Nowadays it can be affirmed that all students have some contact with the Catalan language as a means of instruction. That is to say, at the turn of this century most of the Catalan educational system is bilingual and comparable to, for example, the educational systems in Luxembourg and in French-speaking Canada.

As far as legislation is concerned, during the early 80s the Department of Education of the Catalan Government published several

decrees which established the presence of Catalan at pre-university levels and the degrees that teaching staff should obtain if they were to teach Catalan or through Catalan. These decrees established that the vehicle language in Nursery and the first two years of Primary Education would be chosen by parents and that all the teaching staff should be competent in both languages. In all cases, whether Catalan or Spanish became the language of instruction, the other language should always be taught as a subject. Moreover, any educational model in which Catalan appeared only as a subject was abolished. Therefore, the teaching would take place in Catalan with Spanish as a subject or in the form of a bilingual programme where, irrespective of the language used to teach how to read and write, both languages would have a progressive and similar presence in the curriculum.

Due to the positive attitude towards teaching in Catalan held by the vast majority of the Spanish-speaking population (Huguet and Llurda, 2001), this context allowed the spread of programmes in which Catalan was the language of instruction and whose students had Spanish as L1; in other words, this favourable attitude facilitated the implementation of immersion programmes.

As for the evolution of the linguistic models, at the time when the Language Normalization Law came into effect bilingual education was uncommon. Nonetheless, the situation changed significantly in a few years and, nowadays, the vast majority of students in Catalonia, irrespective of their mother tongue, attend programmes where Catalan is the predominant language; either language maintenance programmes or immersion programmes. In the former case, the language spoken at home and that of the school is the same, whereas in the latter, there is a home-school language switch (Vila, 1995).

Percentage-wise, when Nursery and Primary Education schools are considered (SEDEC, 2001), 73% of them teach all subjects in Catalan, 25% are in the process of incorporating new subjects taught in Catalan in order to use only this language in class, and the rest (just 2%) offer some school subjects in Catalan and the others in Spanish. As for student percentages, 81% of them study through Catalan and the remaining 19% in both Catalan and Spanish. Thus, the first option is clearly hegemonic.

### *Languages and Education in Aragon and Asturias*

To start with, it has to be remembered that neither Asturian in Asturias nor Catalan and Aragonese in Aragon (all of them Romance languages) have official status in these autonomous communities. As for the number of speakers, although there is no official census, it is estimated that

there are more than 300,000 in the case of Asturian, 50,000 in the case of Catalan and about 10,000 speakers of Aragonese (Turell, 2000).

Although Aragonese was first used at school in the 1997–98 academic year, for a variety of reasons the experience has not been very successful; the main hindrances have had to do with the shortage of teaching materials, the need for a broadly accepted standardized form of Aragonese, and the lack of social consideration for Aragonese as language of culture. Teaching in Asturian and Catalan started as early as 1984, due to an agreement aimed at promoting their use at school signed by the Spanish Ministry of Education and the respective Autonomous Governments. According to these agreements, the minority language could be offered as an optional subject within the school timetable (not as an extra-curricular activity) both in Primary and Secondary education, devoting no more than 3 h to the teaching of Catalan or Asturian.

The students' response to the optional teaching of Asturian has undergone a clear progression, rising from just 1,000 students in 1984–85 to more than 15,000 nowadays. The same applies to the Catalan language in Aragon, where numbers have grown from 800 in 1984–85 to almost 4,000 in the 2004–05 school year.

These trends, together with the positive attitudes towards the minority languages (Huguet, 2006), and the continuing social actions organized in favour of these languages, exert considerable pressure on policy makers and education authorities in these two communities. Such favourable conditions make it more than likely that, in the next few years, Asturian, Catalan and Aragonese may become languages of instruction and, consequently, bilingual programmes may be implemented in Aragon and Asturias.

#### PROBLEMS, DIFFICULTIES AND FUTURE DIRECTIONS: THE ASSESSMENT OF BILINGUAL EDUCATION

In the 1980s and 1990s remarkable efforts were made (especially in the Basque Country and Catalonia) to assess students' academic achievement, particularly concerning the degree of competence attained in the two official languages, and to discover which factors were more influential. The so-called EIFE evaluation (Sierra and Olaziregi, 1990) carried out in the Basque Country and the study completed by Arnau, Bel, Serra and Vila (1994) in Catalonia demonstrate that the variables affecting the learning of Spanish are different from those affecting the other languages. Whereas the level of competence in Spanish is closely linked to the individual capacity to learn and to sociocultural factors, the degree

of competence in the minority languages is influenced by the home language, their presence in the curriculum and the language typology of the classroom. It can be affirmed that, regardless of the aforementioned variables, students enrolled in bilingual programmes always achieve a good command of Spanish when compared to those attending programmes where the minority language is not used as a vehicle language. The truth is that those students whose home language is Spanish and who attend programmes where the minority language is only taught as a subject obtain meagre results in the minority language concerned.

As Vila (2005) points out, these results are in accordance with the developmental interdependence hypothesis proposed by Cummins (1979). This theoretical framework has been confirmed by research studies undertaken in Asturias (Huguet and González, 2002) and Aragon (Huguet, Vila and Llurda, 2000), where students are taught in their L2, but while also learning how to read and write in their L1, which confirms the inherent potential of this hypothesis when it comes to explaining the relationship between the L1 and the L2 in such different contexts.

In any case, the success of these programmes has been borne out both at a national (Instituto Nacional de Calidad y Evaluación, 1998) and an international (Instituto Nacional de Evaluación y Calidad del Sistema Educativo, 2004) level. The national study involved 14 to 16-year-old students and included a Spanish reading comprehension test marked with a maximum possible score of 500. Basque students scored slightly above the national mean (224 *vs.* 220 at the age of 14—there was no 16-year-old Basque sample), whereas Catalan students were very close to the mean (218 *vs.* 220 at the age of 14 and 266 *vs.* 271 at the age of 16). These results clearly indicate that the use of Basque and Catalan as vehicle languages, either in maintenance programmes or in immersion programmes, does not negatively affect the normal development of the majority language, Spanish.

Analysis of the results of an international study, known as PISA 2003 and carried out in 41 countries involving 276,165 students produced similar findings. In this study the academic achievement of students at the age of 15 and about to finish compulsory education was assessed. Spain participated as a whole, but Catalonia and the Basque Country took part with a large sample which allowed more significant comparisons. The results revealed that both communities were above the Spanish mean in reading comprehension (497 for the Basque sample, 483 for the Catalan compared to 481 for the overall Spanish participants) and mathematics (502 for the Basque students, 494 for the Catalan *vs.* 485 for the Spanish participants). Once again these results proved that the bilingual Catalan and Basque educational systems do not hinder the normal development of basic school skills at all.

Last but not least, it has to be said that since the implementation of bilingual programmes in Spain, and especially since 2000, the language background of an ever-increasing number of students is changing. Immigrant students now make up 7.4% of the school population, although their distribution is unequal in the different communities: for example, more than 10% in Madrid and Catalonia, but only between 3% and 4% in Asturias and the Basque Country (Ministerio de Educación y Ciencia, 2006).

This new reality brings about two main consequences. Firstly, these immigrant students in bilingual communities such as Catalonia attend schools which do not meet the immersion programmes' minimum conditions (they have teachers who are not bilingual, for example) and, secondly, they are enrolled in regular programmes in communities where there is no tradition of bilingual education, such as in the Community of Madrid. This is provoking innovation in many schools, whose aim is to develop methodological and organizational proposals which can help to deal with diversity (Lasagabaster and Sierra, 2005). Similarly, the need to foster a better command of the foreign language has also boosted methodological innovations which are usually based on the experience already gathered in bilingual programmes (Vila, 2005).

#### ACKNOWLEDGEMENTS

This study was possible thanks to a grant awarded by the *Dirección General de Investigación* of the Ministry of Education of Spain, through the project number SEJ2005-08944-C02-01/EDUC and number SEJ2005-08944-C02-02/EDUC.

## BILINGUAL EDUCATION BY AND FOR AMERICAN INDIANS, ALASKA NATIVES AND NATIVE HAWAIIANS

### INTRODUCTION

People were shocked when we suggested using Navajo in school. Nobody has ever suggested using Navajo in the school to learn, so how can you do that? School is to learn English. — Agnes Dodge Holm, Navajo bilingual educator and cofounder of the Rock Point Bilingual Education Program (cited in McCarty, 2002, p. 113)

Bilingual education for Native peoples in the USA is no less fraught with controversy today than it was in the 1960s when Indigenous educators such as Agnes Dodge Holm introduced the then-radical notion of schooling in the Native language. The issues today, however, are much different; whereas the goal of early Native American bilingual programs was to develop children's Native language while they acquired English as a second language, the situation today is reversed, as more Native children come to school speaking English as a primary language. The troubling paradox is that even as this shift to English has occurred, Native students often are stigmatized as "limited English proficient" and tracked into remedial programs. Up to 40% of these children will leave school before graduating (National Center for Education Statistics, 1997). Thus, contemporary Native American bilingual education programs have the combined goals of revitalizing Native languages and promoting children's English language learning and school achievement.

The term "Native American" glosses tremendous cultural, linguistic, and educational diversity. More than four million people, or 1.5% of the U.S. population, self-identify as American Indian or Alaska Native; an additional 874,000 people, or 0.03% of the total population, identify as Native Hawaiian or "other Pacific Islander" (U.S. Census Bureau, 2006). Native peoples in the U.S. represent more than 560 federally recognized tribes and 175 languages. Further heightening this diversity are the different historical experiences among tribes in the "lower 48" states, Native Alaskans, and Native Hawaiians, and the fact that education for Native students is conducted in federal, state, parochial, private, and tribal- or community-controlled schools. This diversity notwithstanding,

all Native Americans are recognized as First Peoples and members of internally sovereign Native nations. For more than 400 years, Native American children and the content and medium of their schooling have been at the heart of the struggle between tribal sovereignty and federal control.

#### EARLY DEVELOPMENTS

Bi-/multilingualism was traditionally a natural part of Native children's education. Even as the European colonizing project took root, tribes such as the Choctaws and Cherokees co-opted missionary literacies, establishing bilingual schools and newspapers and developing autochthonous systems such as Sequoya's 1821 Cherokee syllabary. In fact, first-language literacy among the Cherokees in the early 1800s was higher than that of the local White population (Spring, 1996).

Between 1778 and 1871, the federal government signed more than 400 treaties with Indian tribes, of which 120 had education-related stipulations. For tribes, this was understood as educational opportunity in exchange for land, but the federal assimilation agenda was clear: "The first step toward civilization," wrote the Commissioner of Indian Affairs in 1887, "toward teaching the Indians the mischief and folly of . . . their barbarous practices, is to teach them the English language" (Atkins, 1887, cited in Crawford, 1992, p. 51).

By the end of the nineteenth century, the engine for achieving this goal was the federal boarding school system. Boarding schools were established on and off Native lands, often in former military forts that had served as staging areas to annihilate Native peoples just a few years before. These were "arguably the most minutely surveilled and controlled federal institutions ever created to transform the lives of any group of Americans" (Lomawaima and McCarty, 2006, p. 2.). After cleanliness and obedience, "No Indian Talk" was the first rule in many federal Indian schools (Spack, 2002, p. 24), and children were brutally punished for infractions (Medicine, 1982).

By the 1930s, there was general recognition that federal Indian education policy was failing. A seminal report by Lewis Meriam et al. (1928) documented that failure, setting the stage for reforms undertaken from 1933 to 1945 under Commissioner of Indian Affairs John Collier. Those reforms included establishing community day schools, recruiting Native teachers, and initiating some bilingual programs (Medicine, 1982). During Collier's administration the Bureau of Indian Affairs (BIA) also published the first secular literacy materials in Navajo, Lakota, and Hopi, some of which remain in use today (see Lomawaima and McCarty, 2006, pp. 91–113. for a full discussion of the *Indian Readers* series).

These gains atrophied under a subsequent federal policy to terminate the tribal–federal trust relationship. The results for American Indian education were devastating. In 1969, the US Senate released a sweeping condemnation of Indian education, citing dropout rates twice the national average, achievement levels years below those of White students, and the absence of Native people in education positions (Reyhner and Eder, 2004, pp. 254–254.). The contemporaneous National Study of Indian Education reported similar findings, also noting that a majority of Indian students and parents supported instruction in Native languages (Fuchs and Havighurst, 1972, pp. 207, 213.). Along with the Civil Rights Movement of the 1960s and growing activism by Native educators and scholars, a new era of tribal self-determination was born. In 1972, Congress passed the Indian Education Act, followed by the Indian Self-Determination and Educational Assistance Act of 1975. In concert with the 1968 Bilingual Education Act, this legislation established the legal and financial framework for developing new Indigenous bilingual/bicultural programs.

#### MAJOR CONTRIBUTIONS

In 1974, Spolsky reviewed 74 American Indian and Alaska Native bilingual programs—the majority in existence at the time (Spolsky, 1974a). Although differing in their goals and sociolinguistic circumstances, all of these programs sought to enhance Native students’ cultural pride and academic achievement, and included activities for developing Native language teaching materials and preparing Indigenous teachers. Reflecting the reality of reservation economies and the absence of alternative funding, all programs were supported by federal funds; “in virtually no cases,” Spolsky (1974a) writes, “are bilingual programs part of the regularly funded educational system” (p. 56). Research and practice in Indigenous language education over the past three decades must be understood in light of the fact that status, corpus, and acquisition planning all had to be undertaken in the context of short-term, inconsistent federal funding. In all cases, this involved growing bilingual education programs “from scratch,” including the preparation of Native-speaking teachers and the development of practical grammars, orthographies, and other teaching materials.

McCarty (2002) and Dick and McCarty (1996) document the first systematic effort to address these challenges at the Rough Rock Demonstration School, founded in 1966 on the Navajo reservation in Arizona. An outgrowth of federal antipoverty initiatives, the demonstration was two-fold: Rough Rock was the first Native American school to have an all-Indian governing board and the first to teach in the Native language (Roessel, 1977). The school launched the first

publishing center for Navajo curricula, offered initial literacy in Navajo, sponsored numerous economic development projects, and established a training program to prepare traditional healers. Many of these innovations eventually faded due to shifting federal funding, but Rough Rock nonetheless played a profound role in furthering American Indian self-determination. More than 120 Native American communities have subsequently signed grants or contracts to operate their own schools.

More recently, Rough Rock implemented the Rough Rock English-Navajo Language Arts Program (RREN LAP), an elementary school initiative modeled after the Hawai'i-based Kamehameha Early Education Program (Begay et al., 1995). RREN LAP operated from 1988 to 2003, with elementary classrooms organized around learning centers and culturally relevant themes. Classroom instruction was complemented by summer literature camps in which students, teachers, and elders jointly engaged in research, storytelling, drama, and art projects centered on local themes (McCarty, 2002).

Longitudinal studies show that after four years, RREN LAP students' mean scores on local tests of English rose from 58% to 91%. Overall, students who experienced sustained initial literacy instruction in Navajo made the greatest gains on local and national achievement measures. RREN LAP students also were assessed as having stronger oral Navajo and Navajo literacy abilities than their nonbilingual education peers (McCarty, 2002). The key to the program's success was the fact that it was developed by bilingual teachers: "In contrast to programs driven by top-down . . . mandates, RREN LAP involves community educators teaching according to community norms" (Begay et al., 1995, p. 122).

Holm and Holm (1990, 1995) document similar accomplishments for the Navajo bilingual education program at Rock Point, Arizona. On the theory that "learning to read in the language one speaks will . . . result in better reading skills" (Rosier and Farella, 1976, p. 379), Rock Point offered initial literacy in Navajo and a secondary-level applied literacy program involving research, word processing, and publishing in two languages. Rock Point students consistently outperformed their peers in conventional programs, and students' gains were cumulative (Holm and Holm, 1990, p. 184; Rosier and Farella, 1976, p. 38). Moreover, "Most Rock Point graduates came to value their Navajo-ness and see themselves as . . . succeeding because of, not despite, that Navajo-ness" (Holm and Holm, 1990, p. 184).

Watahomigie and Yamamoto (1987) report on a public school program on the Hualapai reservation in Arizona. A Yuman language, Hualapai has approximately 1,500 speakers. Prior to 1976, it had no practical writing system. A bilingual education grant in 1976 enabled local educators, elders, and academic linguists to create a practical orthography and grammar for the language as the foundation for a K-8

bilingual/bicultural curriculum. As a result of the program, Hualapai students significantly increased their oral English abilities as well as school attendance and graduation rates (Watahomigie and McCarty, 1996). The program's founders also established the American Indian Language Development Institute, a university-accredited training program in American Indian linguistics and bilingual/bicultural education that "has prepared over 1,000 parents and . . . educators to work as researchers, curriculum developers, and advocates for the . . . development of Indigenous languages and cultures" (McCarty et al., 2001, p. 372).

Spolsky (1974a) and Crawford (2004) report on Cree, Crow, and Northern Cheyenne bilingual education, which began as a combined project in the 1970s. Cree and Northern Cheyenne are mutually unintelligible Algonquian languages; Crow belongs to the Siouan language family. "One of the fallacies . . . about Indians is that [non-Indians] think we're generic," Northern Cheyenne educational leader Richard Littlebear states, noting that the bundling of three Indigenous language groups into a single program did not work (cited in Crawford, 2004, p. 271). Subsequently, the Crow Tribe established a materials development center that published texts on Crow history as well as bilingual calendars, workbooks, and films. The Crow bilingual/bicultural program taught oral concepts in Crow and offered a Crow language enrichment program through grade 6, along with lessons in Crow history. The program's benefits were both cultural and academic, as more children were reported as "reading close to grade level" (Crawford, 2004, p. 273). An additional benefit was the preparation of a cadre of Native-speaking teachers.

A final contribution is the Yup'ik teacher-leader group or *Ciulistet* in southwestern Alaska. When the program began, a "widespread belief [existed] that Yup'ik 'gets in the way' of English and Western knowledge," program cofounders Jerry Lipka and Esther Ilutsik report (1995, p. 201). Composed of Yup'ik teachers, elders, and non-Native academics, the *Ciulistet* worked over many years to create a bilingual/bicultural math and science curriculum. "Not only do we want the elders to share their knowledge with us," Lipka and Ilutsik (1995) write, "but we want to show the larger community . . . that the elders' knowledge 'counts,' that their language holds wisdom, and that their stories teach values, science and literacy" (p. 201.). This long-term project demonstrates how Yup'ik oral literacy can be a basis for teaching mathematics while simultaneously meeting national standards (Lipka et al., 1998, p. 142).

#### WORK IN PROGRESS

Some of the programs described in [the previous section](#) continue to operate; others have been dissolved or transformed as conditions have changed. A major change in recent years has been the accelerating

decline of heritage-language proficiency among the young. For example, in a 1969 study of Navajo six-year-olds, Spolsky (1974b) found that 73% spoke Navajo as well as or better than English. In contrast, in a 1993 study of 3,300 Navajo kindergartners, only about a third were assessed as having age-appropriate proficiency in Navajo (Holm and Holm, 1995).

The situation is even graver for other Native American languages. “Our Native American languages are in the penultimate moment of their existence in this world,” Littlebear (1996, p. xv) warns. According to the linguist Michael Krauss (1998), of the 175 Indigenous languages still spoken in the USA, only 20 (11%) are still being naturally acquired as a first language by children. The causes of this shift are complex, but federal education policies designed to eradicate Native languages have played a crucial role. “What the boarding schools taught us,” one bilingual teacher remarked, “was that our language is second-best” (cited in McCarty, 2002, p. 182). As Krauss (1998) points out, one does not simply “get over” the federally sanctioned abuse inflicted upon children for speaking their mother tongues in school (p. 16).

Efforts to revitalize endangered Native American languages have been helped by the 1990/1992 Native American Languages Act (NALA), which vows to “preserve, protect, and promote the rights and freedom of Native Americans to use, practice, and develop” Native languages, including their use as media of instruction in Indian schools (NALA, 1990, Sec. 104[1], [5]). Although some have criticized NALA as too little too late, this legislation represents both a resource for and an expression of Indigenous linguistic and educational self-determination. (For a full discussion, see Lomawaima and McCarty, 2006, pp. 134–137). In 2006, NALA was augmented by the Esther Martinez Native American Languages Preservation Act (named after the late Tewa elder and language educator Esther Martinez), which authorizes Native American “language nest” immersion programs for children under age 7, language survival schools, teacher training, and language materials development.

A key strategy for Native-language revitalization is Indigenous-language immersion, instruction that provides all or most content in the Native language. “There can be no doubt that [Indigenous-language immersion] is the best way to jump-start the production of a new generation of speakers,” Hinton (2001) points out (p. 8). The remainder of this section examines a select sample of Indigenous-language immersion efforts under way.

### *Hawaiian Immersion*

After being banned in public schools for 90 years, the Hawaiian language and culture were nearly decimated. Beginning in the 1960s, a

“Hawaiian renaissance” movement took root. “From this renaissance came a new group of Hawaiian speakers who would become Hawaiian language educators,” Sam L. N. Warner, a Native scholar and leader in the movement, states (2001, p. 135).

In 1978, Hawaiian and English were designated co-official languages in Hawai‘i, and a new state constitution mandated the promotion of Hawaiian language, culture, and history. In 1983, Hawaiian-speaking parents and educators established *‘Aha Pūnana Leo* (“language nest gathering”), Hawaiian-medium preschools designed to strengthen the language and culture (Wilson and Kamaná, 2001, p. 149.). As Pūnana Leo students prepared to enter English-dominant public schools, their parents pressed the state for Hawaiian-medium elementary and secondary programs. In 2005, there were 11 full-day immersion preschools and 14 public school sites, and the opportunity for an education in Hawaiian extended from preschool to graduate school (Wilson and Kamaná, 2001). One school provides full immersion to children from birth through grade 12. In other Hawaiian-medium schools, children are educated entirely in Hawaiian until fifth grade, when English language arts is introduced. Children learn a third language in intermediate and high school. In addition, community outreach programs encourage Hawaiian language learning outside of school.

According to Warner (2001), approximately 2,000 children have learned to speak Hawaiian through immersion schooling. Immersion students have performed as well as or better than nonimmersion students on standardized tests, even in English language arts. Equally important is the development of children’s self-esteem and ethnic pride: “I [am] still speaking Hawaiian,” a child educated in Hawaiian-medium schools reports, “and it will be so forever . . . I am very grateful . . . for this blessing” (Maka’ai et al., 1998, p. 121).

### *Navajo Immersion*

The Navajo immersion program at Fort Defiance, Arizona began in 1987. At the time, “only one-third of the kindergarten entrants had even passive knowledge of Navajo” (Arviso and Holm, 2001, p. 204). At the same time, the students did not test well in English: “They were relatively weak in their only language!” program cofounders Marie Arviso and Wayne Holm report (2001, p. 205). In this context, a Navajo immersion program was believed to “be the only . . . program with some chance of success” (Arviso and Holm, 2001, p. 205). The program began with initial reading in Navajo then English, math in both languages, and other subjects introduced as content for speaking or writing (Holm and Holm, 1995, p. 195). In the lower grades, all communication occurred in Navajo, and the program required adult

caretakers to “spend some time talking with the child in Navajo each evening after school” (Arviso and Holm, 2001, p. 21).

After seven years of program implementation, Navajo immersion students performed as well on local tests of English as comparable students in English-only classrooms; immersion students performed better on local assessments of English writing, and were well ahead in mathematics. On standardized tests of English reading, immersion students were slightly behind, but closing the gap (Holm and Holm, 1995). The program has evolved into a full-immersion primary/intermediate school (Tséhootsooí Diné Bi’ólta’, or The Navajo School at the Meadow between the Rocks), and Navajo-immersion students continue to outperform their peers in mainstream English classrooms (Johnson and Legatz, 2006). These students are consistently accomplishing what a large body of research on second-language acquisition predicts: They are acquiring Navajo “without cost” to their English language development or academic achievement, while developing oral proficiency and literacy in a second, heritage language as well.

### *Master-Apprentice Programs*

In California, where 50 Indigenous languages are spoken—none as a mother tongue by children—a radically different approach to language immersion has been developed. As Hinton (2001) points out, unlike the Hawaiians and Navajos, California Native peoples do not have a single language “that can become the symbol of indigenous rights . . . , nor is there one language into which human and financial . . . resources can be poured” (p. 218). The approach there has therefore been the master-apprentice model, in which Native speakers and younger language learners live and work together over months or years, engaging in everyday activities and communicating always in the heritage language, with the emphasis on communication-based, oral language acquisition (Hinton, 2001).

By 1999, 55 master-apprentice teams were in place, representing 16 languages (Hinton, 2001, p. 218). The teams’ work is often complemented by immersion camps involving children, parents, and elders. Sims (1998) examines these efforts for the Karuk, a tribe in northwestern California with 2,300 members but only a few elderly Native speakers. In addition to master-apprentice teams, Karuk language camps involve intergenerational participation in language-learning activities embedded in everyday life. The staff reports the rapid rate at which children learn and use Karuk, language transfer to other contexts, and positive new intergenerational relationships (Sims, 1998). Public school classes also involve teachers and students in collaborative learning of Karuk.

The desired result of these types of programs, Hinton (2001) states, “is that by the end of three years, the apprentices will be at least

conversationally proficient in their language” and ready to teach it to others (p. 223). Other benefits include involving elders in positive ways, thereby “reducing the generation gap felt by so many Native Americans who have struggled with enormous cultural changes in the last century, . . . [and] bringing people back in touch with their roots” (Hinton, 2001, p. 225).

### *Community-Based Language Immersion in the New Mexico Pueblos*

A final example comes from the Keres-speaking Pueblos of Acoma and Cochiti in northern New Mexico. The Pueblos are among the most enduring Native communities in North America, retaining strong theocratic governments and ceremonial systems while participating vigorously in the national economy. At Cochiti and Acoma, language planning surveys in the mid-1990s showed that intergenerational transmission of Keres had virtually stopped, a serious concern because Keres is recognized as the essential “thread that ties together all aspects of traditional . . . life” (Pecos and Blum-Martinez, 2001, p. 76). At the same time, adults and young people expressed strong interest in revitalizing the language (Romero-Little and McCarty, 2006). Both Pueblos launched immersion programs focused on strengthening oral skills. “There is widespread support for keeping [the Native language] in its oral form,” Pecos and Blum-Martinez (2001) explain; “oral tradition . . . has been an important element in maintaining [community] values [and the] leaders know that writing the language could bring about unwanted changes in secular and religious traditions” (p. 76).

Recently, Cochiti extended its efforts to include year-round Keres instruction in the public elementary school (grades 1 through 5). An important factor in these school-based efforts is tribal fiscal and operational control over the program.

Preliminary program data show that on national assessments of English language arts, students who participated in immersion classes performed better than those in English-only classes (Romero-Little and McCarty, 2006). More important to community members are the facts that children have gained conversational ability in Keres and that there is growing evidence of Native language use community-wide. Cochiti and Acoma have been recognized as exemplars of community-based language planning (see discussions in Hinton and Hale, 2001; Romero-Little and McCarty, 2006).

### PROBLEMS AND DIFFICULTIES

Less than a decade after passing NALA, Congress passed Public Law 107–110, the No Child Left Behind (NCLB) Act of 2001. Despite its name, several national studies indicate that NCLB’s

emphasis on high-stakes testing in English, scripted reading programs for children who do not test well in English, and lack of attention to funding inequities for schools with high numbers of minority students, are, in fact, leaving language-minority students “behind.” A 2005 study by the National Indian Education Association (NIEA) found that the law:

1. compromises the rights of tribes, Native communities, and parents to determine the education of their children;
2. negatively impacts the ability of tribes and schools to provide linguistically- and culturally-based instruction “connected to the social, cultural, and linguistic heritage of the children;”
3. has resulted in over-attention to standardized testing at the expense of pedagogically sound instruction; and
4. is inadequately funded for tribes and school districts to meet its legislative mandates and benchmarks (Beaulieu, Sparks and Alonzo, 2005, pp. 5–7).

Further, the report states, “these [legislative] changes . . . have not included the Native voice” (Beaulieu, Sparks, and Alonzo, 2005, p. 4). In combination with state constitutional amendments banning bilingual education in key states with large numbers of Indigenous students (California and Arizona), this federal policy severely restricts the educational options available to Native American students.

#### FUTURE DIRECTIONS

Initiatives in support of Native American bilingual/bicultural education must wedge open windows of opportunity within an increasingly monolingualist and punitive federal and state bureaucracy. New Mexico’s 24 Native nations, for example, have developed memoranda-of-agreement with the state to ensure equitable and quality education for Native American children, including instruction in the Native language where this is desired by the tribe (Romero-Little and McCarty, 2006). In Alaska, the Assembly of Alaska Native Educators (AANE) has developed parallel standards for culturally responsive schools, including guidelines for strengthening Indigenous languages (AANE, 2001). In Arizona and Hawai’i, school leaders have successfully fought to retain heritage-language instruction, pointing to these programs’ salutary academic effects. And in 2005, the Navajo Nation passed the Navajo Sovereignty in Education Act, an unprecedented policy that places supervisory authority over schools on Navajo lands under tribal control. Although the policy is being contested in English-only Arizona, it has been a galvanizing force for tribal sovereignty and educational self-determination.

Equally important is a growing national movement, represented in the annual Stabilizing Indigenous Languages Conference begun in 1994

(see Cantoni, 1996 and McCarty and Zepeda, 2006 for a sample of conference themes); organizations such as the Advocates of Indigenous California Language Survival, the Indigenous Language Institute, and the American Indian Language Development Institute; and policies such as the 2006 Esther Martinez Native American Languages Preservation Act. These initiatives all concern the right to choose the kind of education Native parents and communities want for their children: its content, its teachers, its leadership, and its medium of instruction.

From their inception in the 1960s, Native American bilingual education programs have been at the heart of this language planning and policy movement. These programs have widened the possibilities for Indigenous language and culture maintenance, fostered children's acquisition of academic English, prepared a cadre of Indigenous educators, and improved education services for Native American students. Although programs have varied, their focus increasingly has turned toward the threats to the very language and culture resources responsible for much of these programs' success.

As the programs profiled here demonstrate, there is solid research to show that Indigenous-language immersion is superior to English-only instruction, even for students who enter school with limited proficiency in the Native language. By their very nature these programs involve Native parents, elders, and communities directly in the schooling process – a factor widely associated with enhanced academic achievement. These efforts point the way beyond the standardizing practices of current federal education policy, illuminating what educators, parents, schools, and communities can do to ensure that Native children receive an education that is pedagogically sound, culturally based, and linguistically and academically empowering.

## DUAL LANGUAGE EDUCATION IN CANADA AND THE USA

### INTRODUCTION

Dual language programs in public schools were developed in both Canada and the USA during the 1960s, a period of considerable social change in North America, and indeed worldwide. Dual language education in each country can be said to have been a reflection of more general worldwide concerns for issues of social inequality and institutional response, or lack of response, to inequality in a number of different spheres, including language and culture. At the same time, the specific histories of each country clearly shaped the forms and goals of dual language education that grew out of these very general concerns. For purposes of this review, we define “dual language education” (DLE) as schooling at the elementary and/or secondary levels in which English along with another language is used for at least 50% of academic instruction during at least one school year. This is a minimal definition that captures a wide range of alternatives. The rationale behind DLE is that students can learn a second language effectively if it is used for significant periods of time and for substantive communication in school—much like children learn their native language in the home (see Genesee, 1984, for a detailed description). Most DLE programs (except transitional bilingual programs in the USA) also embrace an additive bilingual conceptualization of language learning; namely, that addition of a second language to a child’s language repertoire is a personal, social, cognitive, and economic advantage that does not need to take place at the expense of the child’s first language competence. Thus, additive dual language programs aim for high levels of oral and written language proficiency in both the students’ home language and a second language.

In Canada, these programs are usually referred to as “*immersion programs*” and in the USA they go by various names (which we explicate shortly), but most generally “*dual language education*” or “immersion education.” We use the term dual language education (DLE) to encompass both additive and nonadditive program types in Canada and the USA in order to provide a comprehensive overview of DLE<sup>1</sup>. In this

---

<sup>1</sup> See the National Dual Language Consortium for a definition which includes only additive bilingual program models; [www.duallanguagenm.org/ndlc.html](http://www.duallanguagenm.org/ndlc.html)

chapter, we briefly review the socio-political history of dual language education in each country. This is followed by descriptions of specific forms of DLE in each country and synopses of research undertaken to evaluate the effectiveness of these programs. Finally, we describe the current status of DLE in each country and identify socio-political, pedagogical, and research issues that future researchers and education professionals face.

#### EARLY DEVELOPMENTS

Immersion programs in English and French were created in the mid-1960s in Quebec in the context of social and linguistic inequities between the French- and English-speaking populations of Canada. French had until the mid-60s been the disadvantaged partner in Canadian confederation despite its historical importance during the early colonization and subsequent development of Canada, despite its contemporary status as an official national language, and despite its demographic significance as the native language of approximately 25% of the Canadian population. Evidence of the inferior status of French has been evident in legislation, which at times prohibited the use of French; patterns of language use, which favored the use of English in most bilingual contexts, even in Quebec; and in language attitudes (see e.g., Genesee and Holobow, 1989). Discontent over these linguistic and cultural inequities had been developing for some time among members of both the French- and English-speaking communities, especially in Quebec. The 1960s were marked by concerted political, social, and in some cases militant action in the French community of Quebec to redress the perceived imbalance in power between the English and French and to recognize the majority status of French in that province. This period in Quebec history is referred to as the "Quiet Revolution." There was, as a result, an emerging awareness in the English-speaking community that French was becoming more important as a language of communication in most spheres of life and, concomitantly, that English alone would no longer assure social and economic success in the province. In response to their dissatisfaction with this state of affairs, a concerned group of English-speaking parents in the suburban community of St. Lambert, outside of Montreal, began to meet informally in the early 1960s to discuss strategies for change (Lambert and Tucker, 1972). These parents attributed the two solitudes that characterized their relationship with francophone Quebecers to their and their children's linguistic incompetence in French. They were determined to improve the quality of second language instruction in English schools and "immersion" was the educational improvement they developed. The first immersion class was opened in September 1965. The primary goals

of immersion programs were to provide the participating students with functional competence in both written and spoken aspects of French, normal levels of English-language development, and achievement in academic subjects commensurate with the students' ability and grade level. They also aimed to ensure an understanding and appreciation of French Canadian people, their language, and culture, without detracting in any way from the students' identity with and appreciation for English Canadian culture. It was also hoped that immersion programs would result in improved relationships between English-speaking and French-speaking Quebecers and, more generally, Canadians who spoke English and French. Many parents across the country came to embrace these goals. Immersion programs in other languages besides French are also available in Canada; for example, Ukrainian, German, Polish, Cree, Hebrew, and Mandarin. Some of these programs include students from minority ethnic group backgrounds who have learned English as a first language and, thus, are learning a heritage language. Some of these programs also include students who are native speakers of the non-English language and, thus, wish to maintain that language and acquire the majority societal language, English. Some programs also include majority group Canadian students who are native-speakers of English and wish to learn the non-English language as a form of linguistic enrichment. All of these programs aim for additive bilingualism.

The socio-political history of DLE in the USA has been complex, with bilingual education tolerated in German, French, and Scandinavian languages in the eighteenth and nineteenth centuries in some states while instruction through any non-English language was outlawed in other states. In the twentieth century, the late 50s and early 60s brought about important changes to language education. With the launching of Sputnik by the Soviet Union, the USA embarked on an effort to improve education in general and to include foreign language competence in particular as an important educational goal. At the same time, the Cuban revolution sent waves of Cuban refugees to the USA, resulting in the first official bilingual program in the USA—at Coral Way School in Miami, Florida. This program was created to allow Spanish-speaking children of Cuban refugees to retain competence in their native language and to acquire competence in English. Subsequent political events pushed bilingual education onto the agenda of the national education community. Instigated by a federal lawsuit (*Brown v. Board of Education* in 1954) on the constitutionality of segregated education, the Civil Rights Act of 1964 declared that no person could be excluded from or discriminated against in any program funded by the US federal government on the basis of race or national origin, thereby raising concerns about the sole use of English to educate minority language students in public schools. Subsequently,

the Elementary and Secondary Education Act of 1969 provided assistance to local educational authorities to establish bilingual programs for Spanish-speaking children across the nation.

The scope of bilingual education was expanded considerably in 1970, when the Office of Civil Rights issued an official memorandum that directed school districts to take affirmative action to ensure that students of “national-origin” (including children who did not speak English) were provided equal educational opportunity, as outlined by Civil Rights Act of 1964. Education through minority language students’ native language along with English became the preferred mode of compliance with the OCR memorandum following the Supreme Court decision in *Lau vs. Nichols* in 1974, a class action suit filed on behalf of the Chinese community in San Francisco who contended that their children were denied “equal education opportunity” in English-only schools since they were compelled to attend schools in which instruction was provided in a language they did not understand. The same year, the reauthorization of the Elementary and Secondary Education Act for the first time provided a definition of bilingual education—“It is instruction given in, and study of, English and (to the extent necessary to allow a child to progress effectively through the education system) the native language of the children of limited English-speaking ability . . .” Thus, federally funded education programs were to include native language instruction (and cultural enrichment); ESL instruction alone was not perceived as sufficient to provide equal educational opportunity to students who came to school with no or limited proficiency in English.

DLE became an option for majority English-speaking students in the USA when, in 1971, a Canadian-style Spanish-English immersion program was instituted in Culver City, California (see Cohen, 1974). In the 1970s and 1980s, Canadian-style immersion and bilingual education were extended to include both minority and majority language students in the same classrooms (see Lindholm-Leary, 2001); these are often referred to as *two-way immersion*, *two-way bilingual*, or *dual language* programs. This has become the most prevalent form of DLE for majority language students in the USA with over 338 programs in 2006 (Center for Applied Linguistics, 2006).

#### PROGRAM MODELS

There are a variety of forms of immersion in Canada (Genesee, 2004). They differ with respect to the grade/age level when the second language is used for intensive academic instruction, the number of years when academic subjects are taught in the second language, and the amount of instructional time during the school year provided through

the second and native languages. One can distinguish *early immersion* (beginning in kindergarten or grade 1) from *middle immersion* (beginning in grade 4 or 5) and *late immersion* (beginning in grade 7, or the initial grades of secondary school). Programs that provide a delayed or late start provide core second language instruction to students in the grades that precede the beginning of immersion; for example, from kindergarten to grade 6 in the case of a grade 7 late immersion program. Programs also differ with respect to the extent of instruction through the second language—in *early partial immersion* programs, 50% of instruction in a given year is presented in the second language and 50% in the native language of the students. In *total immersion programs*, all instruction for one or more years is presented through the medium of the second language. Notwithstanding such programmatic variation, all Canadian immersion programs aim for (a) advanced levels of functional proficiency in written and oral forms of the second language, (b) normal levels of first language competence, and (c) grade-appropriate levels of achievement in academic school subjects. An additional, and sometimes only implicit, goal is to promote awareness, understanding, and tolerance of the culture of the second language group.

There are more varied models of DLE in the U.S. (see Genesee, 1999; Lindholm-Leary, 2001; Lindholm-Leary and Borsato, 2006, for more details). Canadian-style immersion programs, as well as two-way immersion programs (to be described shortly), are available to majority language students in a number of different languages, with Spanish being the most common. US immersion programs for native English speakers, which are included in 7% of public elementary schools, take the form of early immersion and share essentially the same goals as their Canadian counterparts (Rhodes and Branaman, 1999).

There are three basic models of DLE for minority language students in the USA. In *transitional bilingual education (TBE)*, the students' home language is used only during the first two or three grades of primary schooling to teach academic and initial literacy skills while students acquire English as a second language. Students transition to all-English instruction usually in grade 3, or at such time as they are deemed to be capable of benefiting from English-only instruction. In contrast, *developmental bilingual programs* and *two-way immersion programs* aim for full competence in oral and written forms of the students' home language and English, their second language. These goals are accomplished by teaching academic and literacy skills in both languages, although the same subjects are not taught simultaneously in both languages. The portion of the school day that is taught through each language differs—the most common patterns being 90% native

language and 10% English or 50% native language and 50% English—so-called *90/10* and *50/50* models, respectively. In *90/10* programs, students learn to read first in the target language (e.g., Spanish), and then add reading instruction through English in third grade. In *50/50* programs, students learn to read first in their primary language and then add the second language in grade 2 or 3, or they learn to read simultaneously through both languages.

Developmental programs differ from two-way programs in that all students in the former come from language minority backgrounds, usually Hispanic, whereas a third to a half of the students in two-way programs are members of the majority English language group. Both are additive forms of DLE, as are the Canadian immersion programs, since they aim to maintain the students' native language at the same time as they promote competence in the other language along with high standards in academic subjects. There is one critical difference between DLE for minority students in the USA and DLE education for majority language students in the USA and Canada, namely, minority language students in DLE programs are expected to acquire levels of proficiency in both oral and written English that are at grade level or in accordance with district and state expectations for typically developing native English speakers. This obviously arises from the fact that the second language for minority students in the USA is English, the dominant societal language, whereas in DLE programs for majority language students in both countries, the students' second language is considered a minority language relative to the importance of English; this is true even in Quebec, where French is the dominant language. In contrast, DLE programs for majority English-speaking students in Canada and the USA are deemed to be successful if students achieve advanced levels of functional proficiency in their second language even if their proficiency is not on par with native speakers of the target language.

#### MAJOR CONTRIBUTIONS

There has been extensive research on the language and academic development of English-speaking students in Canadian DLE programs, and most notably French immersion (Genesee, 2004). The findings from these evaluations have been replicated, for the most part, in evaluations of DLE programs with different second languages and in other regions of the world, including the USA, where similar programs with majority language students have been implemented (Christian and Genesee, 2001; Johnson and Swain, 1997). In brief, research has consistently shown that English-speaking Canadian students in all forms of French immersion acquire significantly more advanced levels of functional

proficiency in French than students who receive conventional second language instruction—that is, instruction that focuses primarily on language learning and is restricted to separate, limited periods of time. Proficiency has been assessed with respect to speaking, listening, reading, and writing. Many researchers have reported that immersion students' production skills (speaking and writing) in French are less advanced than their comprehension skills (reading and listening) and that immersion students seldom attain native-like grammatical accuracy or idiomatic usage and they often have a limited range of vocabulary and pragmatic competence in French even after 10 to 12 years participation in immersion (see Genesee, 2004, for more details).

At the same time, French immersion students develop the same levels of proficiency in all aspects of English as comparable students in English-only programs. There can be a lag in the development of English literacy skills (reading, writing, and spelling) among students in the initial years of early total immersion when all academic instruction is in French. Parity with control students who have been instructed entirely in English is usually achieved by early total immersion students after one year of English instruction. The English language development of students who begin immersion beyond the primary grades—in the middle elementary or initial secondary school grades, usually shows that these students exhibit age-appropriate English skills at all grade levels. Research has also shown that immersion students generally achieve the same levels of achievement in academic domains (e.g., science and mathematics) as comparable students in English-only programs. Parity with control students is often exhibited even when immersion students receive all academic instruction through French, provided the assessment is conducted in French and modifications are made to take into account that full competence in the second language has not been acquired.

Research has also shown that English-speaking immersion students who are at-risk for academic and language learning difficulties due to socio-economic, cognitive, or first language disadvantages generally achieve the same levels of competence in English and academic domains as comparable at-risk students in English-only programs. At-risk students in immersion generally perform less well than students in the same program who are not at-risk, but their progress is not differentially impeded in comparison to comparable students in English programs. At the same time, at-risk students benefit from DLE by acquiring advanced levels of functional proficiency in the second language. Other research that has examined differences in second language achievement as a function of starting grade level (i.e., early vs. late immersion) and amount of exposure to the second language (total vs. partial) has revealed that early immersion students often achieve

higher levels of proficiency in French than late immersion students, but not always, and that total immersion generally yields higher levels of second language proficiency than partial immersion (Genesee, 2004).

Evaluations of DLE for majority language students in the USA have yielded results that are comparable to those found in Canada with respect to general program goals; that is, with respect to first language development, academic achievement, and second language proficiency (Howard, Sugarman and Christian, 2003; Lindholm-Leary, 2001). Majority language students in immersion and two-way programs often score below comparison students in English language and literacy in the initial two or three grades of elementary school, but are at par with or exceed the performance of comparable students in all-English programs by the end of elementary school. As found in immersion education in Canada, students in two-way programs from a variety of ethnic and socio-economic backgrounds, and even special needs students, achieve at levels commensurate with or higher than their monolingual peers in English-only classes.

Evaluations of DLE for minority language students in the USA have revealed that students in two-way immersion and developmental bilingual programs achieve outcomes in English oral language and literacy and academic domains that are comparable to, or higher in some cases than, comparison students (i.e., Hispanic students) in all-English programs, while also demonstrating higher levels of Spanish language competence (Lindholm-Leary and Borsato, 2006; Thomas and Collier, 2002). Parity in English with comparison students in all-English programs is not always evident during the initial grades of DLE, but is evident by the end of elementary school. Comparisons between the standardized test results of minority language students in DLE programs and district/state or national test norms have found that students in developmental bilingual and two-way immersion programs usually score at norm, or higher. Minority language students in TBE programs generally score better on language, literacy, and academic achievement tests than similar students in all-English programs that provide no special accommodations, but not as high as minority language students in two-way and developmental programs. Long-term studies of the outcomes of minority language students in such programs indicate that there is a positive correlation between length of participation in the program and academic (including literacy) outcomes and between level of bilingual competence and achievement in academic subjects such as mathematics. Lindholm-Leary and Borsato (2006) present a more detailed summary of studies on DLE for minority language students, including results pertaining to other programmatic and instructional issues.

There are significant points of convergence in the findings of evaluations of additive DLE for majority and minority language students, despite the differential status that their first languages and cultures enjoy: (i) achievement levels of students in additive DLE, including levels of proficiency in the target languages, are most evident the longer students are in the program and, usually, after 5 or 6 years; (ii) in a related vein, parity with native speakers of the majority language is often not evidenced in the primary grades but is apparent by the end of elementary school; (iii) there is no consistent relationship between amount of exposure to the majority language and proficiency in that language, at least by the end of elementary school; (iv) in contrast, more exposure to the minority language (Spanish in the U.S. and French in Canada) is usually associated with higher levels of proficiency in that language; (v) instruction through a second language does not impair students' achievement in academic subject matter; and (vi) higher levels of bilingual proficiency are associated with higher levels of academic and cognitive development (see Genesee, Lindholm-Leary, Saunders and Christian, 2006).

#### FUTURE DIRECTIONS

DLE emerged in the 1960s in Canada and the USA as responses to national issues of equity and diversity. Since that time, globalization has become evident in economic, communication, and other spheres of people's lives and the dual language competence as well as familiarity with other cultures that DLE affords are increasingly being viewed as assets in this global context. Immersion programs continue to thrive in Canada, primarily in French, but also in other languages (Genesee, 2004). Similarly, DLE programs for majority language students in the USA continue to grow, particularly in the form of two-way immersion programs. At the same time, there have been constraints imposed on the growth of DLE programs for minority language students in the USA as a result of legislative changes concerning English-only instruction imposed in some states. It remains to be seen how profound and for how long these restrictions will be, especially in light of the increased pressure on US educators and parents to take account of globalization. While there is considerable and reassuring research on alternative forms of DLE in both Canada and the USA, there are a number of outstanding questions of a pedagogical nature that need research attention if program models are to evolve and become more effective. Among these issues are the following:

1. What pedagogical approaches are most effective in promoting language acquisition since, as noted earlier, DLE students often exhibit inadequacies in their language skills even after extended

participation in DLE programs? In particular, are there specific instructional strategies that enhance students' mastery of grammatical features of the L2 while maintaining students' communicative fluency? What forms of corrective feedback produce significant, long-term gains in linguistic competence?

2. Are there students for whom DLE is not effective? In particular, are bilingual programs suitable for students with severe cognitive, perceptuo-motor, or affective disorders? In a related vein, do at-risk students in DLE programs exhibit the same challenges and to the same extent as comparable students in monolingual programs and what intervention strategies are effective for students with such learning challenges? Should services for students with special needs be provided in the native or the second language?
3. Are there specific instructional strategies that are particularly effective for teaching typologically distinct languages? To date, most programs and research have examined linguistically similar languages (i.e., English and French or Spanish). Similarly, how can literacy best be taught in languages with orthographically distinct writing systems? Is simultaneous or successive introduction of literacy instruction in two languages with different typologies and/or orthographies preferable?
4. What kinds of skills and professional development are required of teachers so that they can work effectively in DLE programs.

The reader is referred to the following for extended reviews of research on DLE in Canada and the USA: Genesee (2004), Genesee and Gandara (1999), Howard, Sugarman and Christian (2003), and Lindholm-Leary (2001, Lindholm-Leary and Borsato, 2006).

## **Pacific Region and Australasia**

## BILINGUAL EDUCATION IN THE SOUTH PACIFIC

## INTRODUCTION

The small island states situated in the South Pacific can be visualized as nations within an immense continent of water. Oceania was settled eastward in successive explorations by the world's best navigators, with civilization evident in Fiji some 3,200 years ago (Geraghty, 1994). The peoples of the South Pacific are today a cultural mosaic, speaking hundreds of indigenous languages overlaid by the imported languages of traders, missionaries, colonials, indentured laborers, temporary workers, and immigrants, interspersed with contact languages.

The indigenous languages spoken in the South Pacific belong to two families: Austronesian, the largest and geographically most extended language family in the world, and, in the western Pacific, reflecting a much earlier period of civilization, Papuan (Wurm, 1994). However, it was not until after the European explorations of the 16th, 17th, and 18th centuries that the languages that currently dominate education, trade, and diplomacy arrived in the islands.

The Pacific islands are the most linguistically complex region in the world, home to nearly 1,200 distinct languages, though many are spoken in small, endangered language communities (Lynch, 1998). The islands are characteristically described in three ethnogeographic areas within which language demography varies markedly: Melanesia ("black islands"<sup>1</sup>) has the greatest abundance of languages per capita in the world; Polynesia ("many islands") and Micronesia ("small islands") are demographically far less culturally and linguistically complex. However, Polynesian societies are characterized by rigid social hierarchies, differentiated by privilege, and language register, e.g., in Tonga, different speech registers mark royalty, nobility, and commoners (Lawson, 1996, p. 87), whereas Melanesian social orders are typified by egalitarian, consensual governments in which leadership is achieved rather than ascribed.

The majority of societies in the South Pacific achieved political independence between the 1960s and the 1980s, though a handful of colonies persist, viz., French (French Polynesia, New Caledonia including

---

<sup>1</sup> According to the Oxford English Dictionary, the epithet Melanesian was derived from the ancient Greek word for black: 'melano'.

the Loyalty Islands, Wallis, Futuna, American (American Samoa), New Zealand (Tokelau<sup>2</sup>), British (Pitcairn Islands), Australian (Norfolk Island), and Chilean (Easter Island [Rapanui]). Niue and the Cook Islands are internally self-governing states in free association with New Zealand. Tonga, a unified country under a constitutional monarchy since 1875, was a British protectorate from 1900 till 1970, and is currently a member of the British commonwealth (Tonga, 2006).

One generalization in language education is common to all South Pacific island nations, irrespective of their sovereignty: education is conducted fundamentally in a world language bequeathed as a colonial legacy—English in the majority of islands, French in present and former French colonial territories, and Spanish in Rapanui. This review will focus predominantly on educational language policy and practice in the postcolonial English speaking societies of the South Pacific (including the aforementioned Polynesian countries in sovereignty association with New Zealand), viz., Fiji, Solomon Islands, and Vanuatu (Melanesia); Cook Islands, Niue, Tokelau, Tonga, Tuvalu, and Western Samoa (Polynesia); Kiribati and Nauru (Micronesia), with some reference to programs in Palau, Papua New Guinea, and Aotearoa/New Zealand.

#### EARLY DEVELOPMENTS

Throughout the island societies of the South Pacific, the genesis of formal education is rooted in evangelism. The first members of the London Missionary Society arrived in Tahiti in 1797 (Stanley, 1993). Thus started the wave of evangelism which carried the tide of literacy westward through the Pacific islands, with the London Missionary Society beginning its mission in the Cook Islands in 1821 (Moore, 1990); the Wesleyan Mission beginning the first primary schools in Tonga in 1828 (Fiefa, 1981); the first of the present day network of pastors' schools being set up in Samoa by the London Missionary Society in 1830 (Thomas, 1988); and the Methodists arriving in Fiji in 1835 (Postlethwaite and Thomas, 1988).

The early emphasis on vernacular literacy instituted by Protestant missionaries was to convert the natives of the islands to Christianity and to “civilize” them in accordance with nineteenth century middle class English values (Fiefa, 1981). Education was proselytizing in nature: schools were village-based, materials were religious in nature, the

---

<sup>2</sup> Tokelau is currently in the process of drafting a constitution and developing institutions and patterns of self-government in a planned move toward free association with New Zealand, which would put it on a similar political footing to Niue and the Cook Islands. (<http://www.cia.gov/cia/publications/factbook/geos/tl.html#Govt>)

emphasis was on vernacular literacy, and instruction favored the development of reading as opposed to writing skills (Cokanasiga, 1994; Fiefa, 1981; Thomas, 1988). The aim was for Pacific Islanders to be able to read the Bible in their own languages. Crowley quotes Lynch's 1979 report of an elderly gentleman who had attended missionary school in Vanuatu speaking Bislama, describing it as: "Baibel, Baibel, singsing nomo" [Bible, more Bible, and just singing.] (Crowley, 2005, p. 33.).

Catholics reached Polynesia in 1834 (Stanley, 1993). Marist missionaries arrived in Fiji in 1844 and began the establishment of a few centralized schools in which English took an academic role in contrast to the Protestant missionaries' village-based vernacular schools (Cokanasiga, 1994). These Catholic schools became the preserve of the elite.

Nowhere is the conflict between Protestant and Catholic mission orientations in education more sharply seen than in Vanuatu, which was, prior to independence in 1980, the English–French condominium colony of the New Hebrides. Typically, early education had been left in the hands of the missions who financed and ran their own schools (Thomas, 1990). However, the English–French political divide culturally polarized education with the English affiliating with Protestantism and French with Catholicism. This colonially inherited cultural schism has persisted into present day bringing with it a traditionally dual-lingual as opposed to bilingual system of education that is currently moving into trilingualism with the integration of Bislama, the sole national language (Crowley, 2005; Early, 1999).

Nonsecular schools continue to exert a major force in Pacific education. Due to the variety of structures governing Pacific education, i.e., state, religious, and community councils, education is not compulsory and free for all children, with notable access issues reported in the Solomon Islands, and Vanuatu (Reymer, 1999), and attendance problems in Nauru, which has compulsory education. In Tonga, where education was made compulsory in 1876, 90% of secondary school children attend nonsecular schools (Kavaliku, 1982). The majority of secondary schools in Kiribati, which also provides free and compulsory schooling, are church-run (Mackenzie, n.d.). The literacy rates in Pacific countries correspond to school attendance, reported by Crowl (n.d., electronic version) as: "high in Polynesia—100% in Tokelau, 98.5% in Tonga, 95% in Tuvalu, over 90% in Cook Islands and Niue"; but much lower in the Marshall Islands, Nauru, Papua New Guinea, Solomon Islands, and Vanuatu.

Post World War I, in response to increased public demand for education, governments began to take a hand in the education of their citizenry. The trend was to establish exogenous school curricula, which required importing teachers from such countries as New Zealand and Australia to prepare students for foreign examinations. Since the

late twentieth century, island governments have moved increasingly towards changing the focus of school curricula to a more culturally balanced education which retains the advantages of accessing print in the colonial language/s of wider communication while valuing indigenous cultures.

#### MAJOR CONTRIBUTIONS

Bilingual education does not currently take a strong form in any South Pacific island state. Three paradigms are prevalent: *transitional bilingual education*, where education is conducted in the child's home language until proficiency in the second language, an international language, has reached a threshold sufficient for education to be taught through that medium, normally in primary school; *maintenance bilingual education*, where early education in the home language is maintained through subject teaching after the transfer to the second language for content instruction; and *submersion education*, where instruction is carried out in the colonial language without support to the home language/s, to be contrasted with *immersion education* where content language instruction is linguistically supported. The predominant paradigm is transitional bilingual education, aiming towards functional proficiency in the second (colonial) language within primary school education, though many countries in the Pacific have moved or are moving from a purely transitional model into a more supportive maintenance curriculum. Maintenance bilingual education is provided or attempted in a handful of mainly Polynesian countries. Submersion programs typify education in polyglot Melanesian societies.

Transitional bilingual education, provided in Kiribati (in Micronesia), and in the smaller Polynesian countries, introduces basic literacy and numeracy in the vernacular while teaching English as a second language. The vernacular is sanctioned as the medium of education for the first three years of schooling; by the fourth grade, English becomes the medium. Although English has a strong place in education, international business, and regional government, its use in the community varies. For instance, Niueans and Cook Islanders carry New Zealand passports and may have extended family living in New Zealand with whom they regularly stay. Children in Western Samoa or Tonga would come in contact with less environmental English, mostly from tourists; I-Kiribati children are still further removed from available sources of spoken English.

Fiji, the meeting place of Melanesia and Polynesia with physical and cultural characteristics of both, has predominantly transitional bilingual education, though this model is a poor fit given the linguistic demography of the country. Although Fiji is not as dramatically multilingual as other Melanesian nations, Geraghty (1984) estimates that some

300 communalects of Fijian are spoken across the islands; thus, many Fijian children are learning to read in standard (Bauan) Fijian as a second dialect in their “vernacular” medium classes (Kumar, 2001; Mugler, 1996). Similarly, in the place of Fiji Hindi, the spoken contact language of Indo-Fijians, Standard Hindi is taught in the literate classroom (Kumar, 2001; Mangubhai and Mugler, 2003; Mugler, 1996; Shameem, 2002). There are also limited opportunities for maintenance education in other minority populations: Urdu for Muslims; Tamil, Telugu, and Malayalam for the respective Dravidian communities; Mandarin Chinese for the Chinese population, though they are largely Cantonese speakers; Rotuman, Kiribati, and Tuvaluan, for small communities of other Pacific Islanders (Mangubhai and Mugler, 2003). Nevertheless, given Fiji’s multicultural population as well as manifest differences between the spoken vernaculars and the standard written forms adopted in education, neither maintenance language study nor the transitional literacy period is truly realized in practice. Urban schools with ethnically mixed student bodies often provide English medium education with varying degrees of support for the vernacular languages of the school population, creating a submersion experience, a practice which finds historic roots in Catholic education (Cokanasiga, 1994).

The majority of countries providing maintenance bilingual education, which is a stronger model of bilingual education than a fundamentally assimilationist transitional literacy mode, are Polynesian. In these countries, a single vernacular is often spoken in the community, e.g., Samoan in Western Samoa. Even where more than one vernacular is used within the country, as in the Cook Islands, a single vernacular takes national prominence, e.g., Cook Islands Māori. Other vernaculars tend to be provincially used in outer islands.

In maintenance bilingual education, study of the vernacular language is continued as a subject after the medium of classroom learning has converted to the second language, which is overwhelmingly English, but also includes French in Vanuatu. Most Pacific island states included in this review provide some level of maintenance education, although the degree of support for the vernacular/s range/s from *de facto* use, internally examined at the end of primary school (Tuvalu) (Ielemia, 1996, pp. 103–104), to vernacular medium cultural studies with compulsory examinations at Form Five (Tonga) (Thaman, 1996, p. 129) to the vernaculars being examinable throughout formal schooling to Form Seven (Fiji: Fijian and Hindi only) (Mugler, 1996, p. 278). The republic of Palau in the Northwestern Pacific is the only island country that offers primary education in the vernacular through to grade 8; children then move to a secondary program in which both Palauan and English are used with the proportion of English increasing from grade 9 to grade 12 (PREL, 2005; Spencer, 1992).

In the Micronesian republic of Nauru, and in parts of Melanesia, vernacular education is not practiced, but for different reasons. In Nauru, where the indigenous language, Nauruan, is used in daily spoken communication, there is a long-standing dispute over orthographic conventions (Waq, 2000). Efforts at codification are ongoing, but children are not introduced to their spoken language in its written form in school, though vernacular literacy and cultural maintenance are an acknowledged aim, particularly as the country enters a post-phosphate mining rehabilitation era (Waq, 2000). School is conducted in English; expatriate teachers are needed due to a shortage in local teachers. Intercultural communication in the community is handled with a nameless and officially unrecognized contact language having the features of both Chinese and Pacific Pidgin English (Siegel, 1990).

In multilingual Melanesia, submersion education is the norm, due, in part, to the sheer numbers of indigenous languages spoken: 70 in the Solomon Islands; 109 in Vanuatu, according to the Ethnologue<sup>3</sup>. Though the Solomon Islands is reported to have begun to institute a brief vernacular introduction about a decade ago to what is principally English submersion education (NOOSR, 1995), schooling in the country has been disrupted by severe inter-island ethnic violence over the past decade. Pijin is excluded from official use in the Solomon Islands, in stark contrast to Vanuatu where Bislama, the national language, is being introduced into the complex dual language school system (Crowley, 2005; Early, 1999).

#### WORK IN PROGRESS

##### *Improving Vernacular Literacy in Formal and Nonformal Education*

There are encouraging indications of sustained postcolonial attention to the introduction and maintenance of vernacular literacies in both formal and nonformal educational structures within Pacific Island nations and in the Pacific Island diaspora that reaches extensively into New Zealand, in particular, as well as Australia, and also the United States and Canada. Trail-blazing inter-island initiatives that focused on the acquisition of vernacular literacies and cultural maintenance include the Oceanic Literacy Development Project in the late 1980s and early 1990s, which promoted a story-based approach to literacy acquisition using a combination of New Zealand (English language) texts and locally written and produced vernacular readers for children in the early primary grades, and, in the 1990s, the 11 country Basic Education and Life Skills (BELS) initiative, which provided in-service

---

<sup>3</sup> [http://www.ethnologue.com/country\\_index.asp?place=Pacific](http://www.ethnologue.com/country_index.asp?place=Pacific).

education to primary teachers in literacy education. The current PRIDE Project (Pacific Regional Initiatives for the Delivery of basic Education) is a 15-country initiative funded by both government and nongovernmental organizations dedicated to “quality basic education” (USP, 2006) in the Pacific region. Among the project’s national planning benchmarks are (USP, 2005):

- “Pride in cultural identity” (2005, p. 2) based on “a strong foundation of local cultures and languages . . . enabling students to develop a deep pride in their own values, traditions, and wisdoms, and a clear sense of their own local identity, as well as their identity as citizens of the nation” (2005, p. 2).
- “Skills for life and work locally, regionally, and globally” (2005, p. 2), which includes: “. . . strategies for the systematic teaching of literacy, numeracy, ICT [information and communication technologies], vernacular, and English languages . . .” (2005, p. 2); and “A holistic approach to basic education” (2005, p. 3), which is principled on an “effective articulation between formal and non-formal education” (2005, p. 3).

Reymer (1999) draws parallels in current nonformal education discussions with previous grassroots initiatives in Papua New Guinea and New Zealand to maintain indigenous languages. The *Viles Tok Ples Skuls*<sup>4</sup>, a Summer Institute of Linguistics nonformal education project which began in PNG in 1980 in response to parental fears about the socially alienating effects of English medium schooling on their children had, by the early 1990s, extended to 250 languages (Litteral, 1999, p. 3), despite the decimating effects of the Bougainville civil war, and the central government’s foreign-aid backed push towards English-only education after grade 3 in the formal education sector (Siegel, 1997). The *Kohanga Reo*, or “language nest” program, established as an early total immersion kindergarten program in Aotearoa/New Zealand in the early 80s, has been so successful that it has sparked further levels of Māori education, including the *Taha Māori* (Māori enrichment) and *Kura Kaupapa Māori* (language immersion) programs (Durie, 1997) as well as inspiring similar language nest programs for other Pacific Island communities in Aotearoa/New Zealand.

Manu’atu and Kepa (2001) describe an education project for diasporic Tongans in Aotearoa/New Zealand, based on the Tongan *Pö Ako*, a traditional night school “where primary school children rote learn English, mathematics, science, social studies, and general knowledge to pass the national examination that will permit a child to enter a secondary school” (2001, p. 7). The urban version of *Pö Ako* instituted in Auckland is “a critical communal action that includes the personal

---

<sup>4</sup> Literally: village “talk place” (vernacular) schools

experience of Tongan people and constitutes for them a way to understand how to become decision-making citizens in school and wider society” (2001, p. 7) using the Tongan language and culture as important guidelines for responsible social participation.

These vernacular language initiatives in Pacific Island communities both at home and abroad indicate a groundswell that may prove, as Crowley (2005) has argued, that

Pacific Islanders through their language attitudes and existing patterns of language choice, combined in some cases with proactive responses to sociopolitical pressures against their languages, may well be better positioned to maintain their languages for at least the medium-term future” (2005, p. 46).

### PROBLEMS AND DIFFICULTIES

The difficulties in supporting a bilingual education program in the South Pacific—even a weak program such as transitional vernacular literacy in early primary school—are numerous across the region. Widespread problems include the paucity of materials in vernacular languages; the quality and degree of educational support for the instruction and maintenance of both the vernaculars and international second languages; the disparity between school and community language use; and ambivalent attitudes towards the value of vernacular languages. The heterogeneity of language backgrounds in Melanesian classrooms creates a challenge, as do factors such as the size and status of small speech communities, intermarriage, and migration from smaller to larger islands. Nonetheless, the sheer profusion of distinct languages has been met with creative nonformal education solutions in Papua New Guinea in the *Viles Tok Ples Skuls* (Litteral, 1999; Siegel, 1997). Codification is an issue with some Pacific languages. Lastly, political instability continues to affect countries in the region, with consequences for educational priorities.

Traditionally, little value has been placed on books in Pacific cultures: literacy acquisition has been narrowly defined, taught, and measured, resulting in uncritical literacy practices, which do not equip Pacific Islanders well for the increasing influence of digital media (Lotherington, 1998). Crowl (n.d.) characterizes the general paucity of books in 13 Pacific Island countries as a “book famine.” Limited reading materials are found in most homes: typically, the Bible, local newspapers, and school books. Awareness of and access to quality reading materials in English has clearly improved over time in primary schools; however, access to suitable, quality vernacular resources produced on a commercial scale is still problematic.

Many teachers in Pacific island countries are minimally qualified, though this is being addressed in national development plans in Kiribati, Nauru, and Solomon Islands as well as in supranational educational initiatives, e.g., PRIDE. In countries such as Fiji, teachers in urban schools may have large classes; in rural areas they may have composite classes of two or three different grades. Resources may be scarce, depending on the location and financial support for the school.

Countries implementing vernacular literacy programs have varied linguistic demography. Attempts to teach in the vernacular for the first three years of primary school are complicated in Fiji, where classrooms in urban areas, in particular, are typically heterogeneous. Furthermore, oral—literate use of both Fijian, and Hindi, is, for the most part, diglossic (Kumar, 2001). The hundreds of communalects spoken by Fijian children vary from the standard Bauan Fijian taught as vernacular in the classroom, a situation paralleled in Indo-Fijian communities where children who speak preliterate Fiji Hindi, a koine (Siegel, 1987), are learning standard Hindi as the “vernacular” in school (Kumar, 2001; Shameem, 2002). A further complication to problems of spoken—written language mismatches, which result in second dialect learning instead of vernacular literacy reinforcement, is that the vernacular used in the classroom in heterogeneous contexts may well be that of the teacher rather than that of the students (Shameem, 2002).

Mangubhai (2002) proposes as solution that the country have community-based language-in-education policies. This might help to maintain educational priorities given the continuing political instability of the nation.

Maintaining a classroom milieu of English is also problematic across the Pacific. In essentially monolingual societies, such as Western Samoa and Kiribati, the use of English in the classroom may facilitate access to written materials but it is unnatural as a medium of spoken discourse. For the most part teachers, who are themselves products of submersion education, lack confidence in modeling the second language. Often use of the vernacular is simply continued as the *de facto* medium of the classroom (Ielemia, 1996, p. 104; Thaman, 1996, p. 131). Code-mixing and code-switching are also widely reported (Lo Bianco, 1990; Tamata, 1996), the use of which compromises both language learning and students’ attentiveness to content. Thus, children are expected to acquire literacy skills in English to a threshold level enabling them to do cognitively demanding work in an English print medium in classrooms where there may be insufficient oral support. In this way, immersion education becomes submersion.

The insistence on English (or French) use in the classroom also creates an obstacle for family members not proficient and literate in the second language with respect to actively participating in their

children's academic progress. This linguistic exclusion is characteristic of Melanesia, where the language policy to rely on the colonial language/s in schools is an attempt to unify the linguistically heterogeneous school population with a lingua franca considered to be suitable for academic purposes. However, as Reymer notes, the academic privileging of colonial languages in formal schooling contributes to "a marginalization of indigenous languages and culture, dislocation from traditional land and social structures, and in the longer term, impoverishment for the majority" (1999, p. 22).

In Vanuatu, the use of Bislama in education is being discussed at policy levels, though the situation, as Crowley notes "offers some grounds for worry in that the number of competing agendas operating may prove coherently thought-out policy extremely difficult to implement in a careful and beneficial way" (2005, p. 46). The incorporation of Bislama in education is, however, a mixed blessing. It is a great leap forward to involve a spoken vernacular in formal literacy education; however, as Early (1999) points out, Bislama is, in effect, a killer language in Vanuatu, responsible for eating into indigenous language use, particularly in urban areas. Attention to indigenous literacies is still required.

There exists a further complication with Melanesian Pidgin: Bislama, Pijin, and Tok Pisin do not share a common orthography. Establishing an agreed upon written standard is a problem for two other Pacific countries as well: Nauru and Tokelau.

Attitudes to the languages at stake in education are despairingly ill-informed. On the whole, islanders' attitudes to functional bilingualism being instituted in formal education are dimmed by the bright lights of the economic opportunities that English is expected to bring. Sadly, a degree of language shift in the home is starting to be seen in various contexts across the Pacific with some parents choosing to use English at home in an attempt to give their children what they think will be a head start in school. In so doing, these parents may perpetuate local basilect Englishes that vary from standard English text. Their actions also contribute to language loss on a social scale, limit gateways for cultural transmission and, in the final analysis, reduce rather than augment the scope of their children's opportunities for language and literacy achievement.

Global media have impacted strongly on the Pacific region, as they have elsewhere. Network television, which arrived in Pacific Island nations after the late 1980s, has opened up new spaces for languages, though fledgling TVNZ-installed networks in Niue, Cook Islands, Nauru, Fiji, and Western Samoa air more cheap British and American programming than vernacular medium material, creating a neo-colonizing presence in the home (Lotherington-Woloszyn, 1995; Mangubhai and

Mugler, 2003). Locally produced programs, which are much more expensive to produce and air, tend to be broadcast in English. However, satellite television and pay-TV increase opportunities for accessing programming in languages such as Standard Hindi and Gujarati, benefiting Indo-Fijians (Mangubhai and Mugler, 2003).

#### FUTURE DIRECTIONS

Improvements in the structure and quality of language education are needed across the South Pacific region, but there are indications of positive change. Pacific Island countries are moving towards increased support for vernacular literacy acquisition aided by initiatives such as PRIDE, and before it, BELS, and the Oceanic Literacy Project. Such initiatives are needed to counterbalance the incremental use of English in education and the mass media.

Though Vanuatu is struggling with trilingualism in education, which, as Early (1999) notes, is construed as a balancing act for English, French, and Bislama that “amount[s] to a French rescue package, dedicated to ensuring that French and English should have equal presence in the community” (1999, p. 28), the country is, nonetheless, a participating member of PRIDE, actively working to include Bislama, the national contact lingua franca, in education. This may light the way for the Solomon Islands to improve the status of Pijin, which would help to raise their low literacy levels.

Fijian and Hindi language courses have been taught at the University of the South Pacific since the 1990s, and programs have been designed for teachers of Fijian and Fiji Hindi, signaling increased professional development support for vernacular language teachers, though still limited in scope. However, as Mangubhai and Mugler (2003) note, there is no effort made to teach the living Fijian vernaculars, relying instead on “the code inherited from the accidents of history” (2003, p. 445).

New media offer a mixed potential. Sperlich (2005) informs us that both Niue and Tuvalu have made deals to sell their country domain names: nu and tv respectively, for free national Internet access, resulting in increased participation in culturally focused Web-based discussions. He carefully analyzes the messages posted on the OKA-KAO Niuean cyberforum,<sup>5</sup> finding that though the Internet offers new possibilities for the active use and study of Niuean, it delivers mostly English (2005, p. 74). Mangubhai and Mugler note that Fiji websites are overwhelmingly in English “with only an occasional paragraph in Fijian” (2003, p. 415). So though the Internet provides a new

---

<sup>5</sup> <http://jove.prohosting.com/~okakoa>

channel for vernacular language use, it also floods the region with yet more English.

There are differences of opinion on how endangered many Pacific languages are thought to be. However, regardless of the imminence and scope of threat of extinction and shift, both policy and practice in bilingual language education need sustained and directed attention if the South Pacific is to utilize precious language resources before they become dangerously eroded. It is clear that there are discussions on vernacular language maintenance, both in formal and nonformal educational sectors. What remains is to see these discussions result in sustained positive practices.

## ARABIC-ENGLISH BILINGUALISM IN AUSTRALIA

### INTRODUCTION

Arabic is the main language, after English, spoken in NSW, Australia's largest state and the main language, after English, spoken by 0- to 14-year-olds in Australia. Arabic-speaking groups in Australia have many commonalities with communities in the USA (where they number over 6 million), Canada, France, UK and other western countries. Arabic-speaking migration to Australia began in the 1880s but the main growth occurred in the 1970s and 1980s.

Arabic-speakers are diverse in terms of countries of origin, religious backgrounds, work and educational profiles. Language maintenance is comparatively high and was supported by government policy and programmes in the 1980s. In the past decade, government focus on economic rationalist policies and growing disparities in income and educational outcomes culminated in growing prejudice with youth riots occurring in 2006. On the one hand, growing divisions between Arabic communities and the mainstream on a local level along with, on the other hand, global growth in media, technology, travel and communication with countries of origin may have the effect of slowing down the loss of Arabic and supporting maintenance in second and third generations.

This chapter explores Arabic-English bilingualism and research into language contact in a country of immigration such as Australia. It also examines the impact of language education, political and social change and the effects of global developments in media, technology and travel on Arabic as a diasporic language. The term community languages is used (in the Australian context) as equivalent to terms such as heritage languages or ethnic minority languages.

### ARABIC IN AUSTRALIA—HISTORICAL OVERVIEW

Australia is a country of diversity: a history of more than 40,000 years of indigenous cultures and languages and 200 years of migration from Europe, Asia, the Americas and the Middle East have led to a society in which 206 languages are spoken on a daily basis. Arabic is one of the fastest growing community languages, with 209,371 speakers in 2001, an increase of 17.9% on the previous 1996 census (Clyne and Kipp, 2002). It is the fourth main language spoken, after English, in

Australia. In common with many postwar migrations, Arabic speakers in Australia tend to be concentrated in urban centres (Clyne and Kipp, 1999).

The migration to Australia, as to other western countries, occurred in three waves. The first wave from the 1880s to World War 1 were mainly Christians from present-day Syria and Lebanon escaping from Ottoman rule. Between 1947 and 1975 there were significant migrations from Lebanon and Egypt, due largely to the political situation in Egypt and Lebanon and the Arab–Israeli War of 1967 and Australia’s push for immigrants. Following the outbreak of the civil war in Lebanon in 1975 there was a large influx of mainly Muslim immigrants and the Lebanese-born population doubled in 2 years.

The population is a young one: 69% are under 35. Only 19% of the population has a formal qualification. Employment levels are low, with only 40% of the community between 15 and 65 in the workforce and family incomes are also correspondingly low. Educational outcomes and school retention rates are lower for Arabic-speaking youth than the average in New South Wales. Behind this snapshot lies a complex picture, with there being more differences within and between sub-groups than there are between Arabic-speaking and other groups. Arabic speakers have a range of religious affiliations with over 50% belonging to Christian denominations and 40% to Muslim groups. Backgrounds are diverse with 40% born in Australia, 40% born in Lebanon, 8% in Egypt and the rest in a range of countries across the Middle East and North Africa (Kipp, Clyne, and Pauwels, 1995). Multiple affiliations in terms of language, religion and ethnicity challenge traditional notions of speech or ethnic community. Events following 9/11 have changed the dynamics worldwide around Arabic language, making choices of mainstream and minority language, cultural and religious identities much more charged and politicised.

Maintenance of spoken Arabic in the community is high: there is 6.2% shift to English only in the first generation (Kipp and Clyne, 2003). Arabic is overwhelmingly the language of the home. The reasons for the relatively low attrition rates seem to be the demographic concentration of the community, along with marriage patterns and family and social networks. Several linguistic factors impact on Arabic-English bilingualism in Australia. Arabic is a ‘pluricentric’ language with widely differing spoken dialects in Lebanon and Egypt and across North Africa. It is a diglossic language with Modern Standard Arabic (MSA), based on the classical Arabic of the Qur’an, being used for formal spoken and written communication, and the dialect for everyday communication. The nature of the gap between MSA and dialect is changing with the development of more informal spoken and written genres through the influence of the media, communication and universal

education and hence the diglossic situation has been described more in terms of a spectrum or continuum (Bakalla, 1984; Walters, 1996). The attachment to MSA, however, remains strong because it represents 'shared Arabness' and religious identity. In diasporic communities such as Australia, the gap between standard and colloquial dialect may be greater as many adults may have had limited access to education and MSA. Low (L) functions would be met by colloquial Arabic and English, whilst the High (H) functions would be met by English, since these are mostly in the domain of the host culture, thus leading to possible rapid loss of literacy in Arabic.

The main migration of Arabic speakers in the 1970s coincided with the adoption of multiculturalism as government policy and the development of multicultural initiatives: multilingual television and radio were introduced in the 1980s, interpreting and translation services began, specialist units with Arabic speakers were established in many services, and *The National Policy on Languages* (Lo Bianco, 1987) and consequent state government policies supported the teaching of Arabic and other community and indigenous languages. Although Australia has little history of bilingual education several transitional bilingual programmes in Arabic were established. The teaching of Arabic was supported in community-run language schools; programmes were instituted in primary and secondary schools and in government-run Saturday schools; Arabic became a Year 12 subject accepted for university entry (Clyne, 1991; Djite, 1994; Ozolins, 1993).

Research was slow to reflect the demographic situation in Australia. There were no studies of Arabic recorded in a review of 200 studies involving contact between English and specific migrant languages in 1991, a situation which is now being addressed (Bettoni, 1991; Clyne, 2003; Clyne and Kipp, 1999; Suliman, 2003). With the shift to economic rationalism in the 1990s, short-term economic objectives dominated government education and language policy and Asian 'languages for trade' were fostered. In the past decade community languages such as Arabic have tended to be ignored.

#### ARABIC IN AUSTRALIA—PRESENT SITUATION

##### *Arabic in Key Domains*

Spoken Arabic is very strong in the home domain. Small-scale studies in Melbourne and Sydney found that parents overwhelmingly use Arabic when talking with each other and when talking to pre-school age children (Clyne and Kipp, 1999; Suliman, 2003). Parents use mainly Arabic when speaking to children, but also report a high incidence of mixed Arabic and English. Very little 'English only' is used

by parents to children in the home context. Children use either Arabic or mixed Arabic-English to their parents. Where grandparents are involved, only Arabic is spoken. On the other hand, English tends to be the main language used for communication among siblings. Children and teenagers show that they continuously switch between Arabic, English or English/Arabic depending on their interlocutor. Children and teenagers are also reported to use a mixed code that has developed, *Arabizi*, being a mixture of *Inglizi* (English) and *Arabiya* (Arabic) (Cruikshank, 2006).

There are many differences according to specific factors. Families of Lebanese and Iraqi background report greater use of Arabic in the home than those of Egyptian background; those over 35 prefer to speak Arabic while those under 35 prefer to speak English; females use Arabic more than males. Maintenance rates of Arabic in the home are much lower outside NSW and Victoria in regions where concentrations of Arabic speakers are lower. An exception is the recent groups of arrivals from Iraq in rural cities (Kipp and Clyne, 2003).

There is little use of Arabic reported in the workplace apart from businesses and services where it is used with clients or between Arabic-speaking workmates. The majority of children and teenagers report using Arabic at school, most commonly in class (as part of lessons) or socially during breaks in classes. Teenagers report preferring to use English at school. Arabic tends to be framed in an oppositional way, being used on the sports field against other teams or in the classroom against monolingual teachers (Cruikshank, 2006).

Arabic is widely used in the community. In the suburbs where Arabic speakers are concentrated Arabic is spoken in most shops: there are Arabic food shops, pharmacies, bookshops and other retail outlets along with a range of professionals such as doctors, dentists and accountants. The overwhelming majority of Arabic-speakers of all ages and backgrounds report frequenting Arabic-speaking businesses regularly (Clyne and Kipp, 1999, Cruickshank, 2006).

Although the majority of children and adults report socialising primarily with other Arabic-background speakers, language use in social contexts varies according to age and country of origin. Most socialising is based around the extended family group and membership of Arabic community, church and mosque youth groups is low, especially amongst the young (Clyne and Kipp, 1999).

Religion also figures as a domain in which Arabic is widely used. Most in the community are affiliated to one of the Maronite, Melkite or Orthodox churches or to Sunni or Shi'a mosques. The language of the churches has shifted to English for parts of the service whilst keeping Arabic for rituals, prayers and sermons. Little English is reported in the mosques primarily because Arabic is seen as the language of the

Qur'an. Religious observance, much in Arabic, plays an important role in the home. The Bible, the Qur'an and religious texts have a valued place and more than half of the Muslim students report regular reading of the texts in Arabic or sometimes bilingual versions (Chafic, 1994). It is common for parents to read and discuss texts with their children and tell stories related to the Qur'an. The importance of religious literacy in Arabic and Muslim communities is confirmed by many studies (Sarroub, 2002; Wagner, 1993).

Study figures as a key area of language and literacy practices in Arabic and English in the homes. Along with homework from day schools in English, children and teenagers report spending much time on homework from Arabic language schools. One small-scale study in Sydney found it common for parents to return to study and take advantage of opportunities which may not have been available to them previously (Cruickshank, 2004).

Changes in media have had impacts on bilingualism in the homes. In one study of students in four Sydney schools it was reported that 75% of families had access to 24 hour Arabic channels such as *Al Jazeera* through cable and satellite television and children and most teenagers watched documentaries, news and other programmes in Arabic regularly (Cruickshank, 2006). Watching Arabic language videos rates highest of all media activities, with movies, soap operas and comedies most popular. In the past decade Arabic language FM radio stations have developed in Sydney and Melbourne alongside the government-funded multilingual AM stations and are popular with the older generation. Nearly all Arabic-speaking families have at least one computer in the home. The main uses are games (28%), internet (27%), email (18%) and chat (17%). Although most communication is in English, some 32% of teenagers report accessing Arabic-language sites and using Arabic on the computer such as in word processing or participating in Arabic chat. Arabic language music CD, tapes and videos are also extremely popular (Cruickshank, 2006). Print medium is less popular although there is high reported usage of local libraries which stock Arabic language books (around 80%). The five Arabic language newspapers claim a readership of 100,000. This has fallen in recent years although readership of English language national and local newspapers in the community has remained high. The increased access to and use of Arabic in the media domain is an interesting outcome of globalised media, providing access to the different regional spoken forms and Modern Standard Arabic.

The overwhelming majority of Arabic speakers have friends or family in countries in the Middle East and also in other countries of settlement. Contact is maintained most commonly through land line and mobile telephones, the sending of recorded audio and video cassettes

and of letters in Arabic or English. Most family members visit the country of origin. For children the stay may extend over several months and in this time they find that they shift to relying much more on Arabic. It is also a common experience for families in Australia to have regular contact with friends and relatives visiting from overseas (Cruikshank, 2006).

### *Language Proficiency and Attitudes to Language Use*

Attitudes to the importance of the maintenance of Arabic are overwhelmingly positive across the Arabic-speaking communities (Campbell, Dyson, Karim, and Rabie, 1993; Clyne and Kipp, 1999). Maintenance of spoken and, to a lesser extent, written Arabic is supported for a range of personal, social, educational and religious reasons. Attitudes to English are also positive (Suliman, 2003).

Self-rating of language proficiency is far from ideal because the definition of what constitutes 'good' can depend on how well the language fulfils functions in specific contexts rather than an abstracted notion of proficiency. A study of Arabic-speaking teenagers in Sydney (Suliman, 2003) found that 75% report speaking in Arabic often/very often, compared with only 34% who report reading and 30% who report writing often/very often. 98% claim high-level proficiency in English literacy compared with 45% who report reading in Arabic well/very well and 37% who claim writing in Arabic well/very well. A Melbourne study of all ages had similar findings. Adults over 35 years old claimed to speak Arabic well or very well. Those between 15 and 24 of Lebanese background (95%) were more proficient than those of Egyptian background (67%) (Clyne and Kipp, 1999).

In general literacy rates in Arabic are low: the percentage of readers to speakers is 68% and that of writers to speakers is 67% (Clyne, 2003). Literacy also varies according to age: from 100% of over 45-year-olds who are confident or very confident reading in Arabic to 78% of 15- to 24-year-olds with a Lebanese background. Ability in writing notes or letters in Arabic ranges from 33% to 76%. Those of Muslim background generally report much higher proficiency in literacy in Arabic. Research data on literacy is scarce, however, since census data is based on *home language* use and available studies of literacy draw on small samples.

The question of what counts as literacy in Arabic in self-reporting is important. For some Muslim parents, literacy can mean Qur'anic literacy, being able to recite suras from the Qur'an; for others writing can mean handwriting or being able to read and write the alphabet. The low levels of literacy could be due to both the parents' own lack of knowledge of Modern Standard Arabic (Taft and Cahill, 1989) and

also because Standard Arabic in Australia is seen as having little usefulness as its functions are replaced by English (Campbell, Dyson, Karim, and Rabie, 1993). Low levels of literacy, however, limit access to information in Arabic, lower the status of the language and the speakers' self esteem and contribute to language shift.

#### WORK IN PROGRESS: SCHOOL DOMAINS

All the issues to do with Arabic/English bilingualism have been played out in Arabic language teaching: What are the goals of learning? Is it learning Arabic as an international language? Is it for cultural reasons, to maintain the language of the home? Is it for religious reasons, to develop Qur'anic literacy? What are the respective roles for spoken Arabic and literacy in this teaching?

The teaching of Arabic and other community languages was marked by a dramatic flourishing in the early 1980s, some consolidation and then a period of neglect in the last decade. Arabic is taught in community schools, in primary and secondary schools and in tertiary institutions. Despite these provisions, less than one-third of Arabic-speaking students are involved in any study of Arabic. The system has been likened to a pyramid with many students being involved for short times when younger but gradually dropping out until only 8% of Arabic speakers study Arabic in the final year of school. The status of Arabic in the wider community is low, with negative attitudes that have increased in the last decade. Few non-background speakers study Arabic and there is a lack of support for teaching community languages in schools even amongst teachers (Cahill, 1996; Campbell, Dyson, Karim, and Rabie, 1993;).

#### *Arabic in Community Schools*

Community language schools (ethnic supplementary schools) have been running in Australia since 1839, taught by parents in schools or community places after day school or on weekends. These schools are the main providers of community language teaching in Australia and have some 90,000 students. The schools are run by community organisations with some government funding and regulation. By 1997 there were 12,000 students of Arabic background studying in 56 ethnic schools (not counting students studying Qur'anic literacy in Islamic schools). Most schools offer programmes for primary aged students, although some extend to secondary levels. The main aim of the schools is stated as language maintenance with children attending for several hours in the afternoon or on the weekend each week (Campbell, Dyson, Karim, and Rabie, 1993). More than 50% of the teachers are either unqualified or have qualifications unrecognised in Australia.

Studies indicate that a majority of children at some time attend these schools but then drop out within a year (Taft and Cahill, 1989). The low retention rate of students has been attributed to lack of trained teachers, teaching methods, focus on formal Arabic and organisational difficulties (Campbell, Dyson, Karim, and Rabie, 1993). Improvements have been reported as the schools become more established with greater numbers of trained teachers. Issues relating to Arabic community language schools parallel those reported in studies in the UK and USA (Creese and Martin, forthcoming; Gurnah, 2000).

### *Arabic Programmes in Primary and Secondary Schools*

The introduction of government policies on multiculturalism between 1972 and 1980 combined with pressure from parent and education groups led to the establishment of school-based community language programmes in 1980. Just over 10% of primary aged Arabic background children study the language in day schools. The majority of programmes offer Arabic native speakers some 2 h instruction per week.

In NSW and Victoria there are specialist schools of languages which offer language study up to Year 12 for those who do not have access to it in their day school. By 1992, 2,200 students were studying Arabic this way. Arabic is taught in ten government and non-government secondary schools. Overall, eight per cent of Arabic speakers study their home language at Year 12, compared with 40% for other ethnic groups.

### PROBLEMS AND DIFFICULTIES: ISSUES RELATING TO ARABIC TEACHING

The initial enthusiasm and support for community languages in the 1980s has waned since. The marginalisation of Arabic at the level of language policy planning is confirmed by its exclusion at programme level and the absence of evaluations of the programmes. There is no national syllabus for Arabic, nor any state syllabuses up to Year 10. Materials and curricula for the teaching of Arabic in Australia are problematic with most materials originating from countries of origin. Such textbooks can be too difficult and of questionable relevance to the Australian context. Locally produced materials, which work from the spoken to the written, focusing on similarities between dialect and MSA, are limited because of scant funding.

There are large numbers of teachers with unrecognised qualifications. Many teachers in the primary and community schools and some in the secondary are untrained in language methodology and speak a dialect but not MSA. Small-scale evidence indicates fairly traditional teaching methods are still common (Campbell, Dyson, Karim, and Rabie, 1993).

One study (Kairouz, in Campbell, Dyson, Karim, and Rabie, 1993) found 47% of students discontinued Arabic after Year 10, citing as the main reason difficulty of the subject. Most students in Arabic classes at present are Australian-born and it is unclear how the schools will cope with or survive the influx of second and third generation Arabic background students. There is little doubt that Arabic has a poor image in the non-Arabic speaking population. 'Our impression is that mainstream attitudes to Arabs are negative stereotypes and that these flow on to the Arabic language' (Campbell, Dyson, Karim, and Rabie, 1993, p. 56).

### FUTURE DIRECTIONS

The history of Arabic in Australia has been one of language shift to English, but a shift which is variable and less than that for other languages. Rapid change is occurring at present with local and international issues having a great impact on Arabic in Australia. In particular, the 'war on terror', 9/11 and events in the Middle East will continue to have dramatic effects on school provision, uptake of language study and attitudes towards Arabic and Arabic speakers.

A key factor has been that of segmentation, as schools become increasingly differentiated by socioeconomic status (SES) and the ethnic/language backgrounds of students (Cahill, 1996; Cruickshank, 2006; Schmid, 2001). Some 15 Arabic religious/ethnic-based non-government day schools have been established in the past decade. There have also been marked population shifts within the state system, as schools with Arabic-speaking background students have experienced falling school populations but increases in Arabic-speaking students. This segmentation parallels that in US schools where divisions between white, Latino and African American students are now greater than in 1971 when initiatives were first introduced to bring about more diverse school populations (Schmid, 2001). Educational outcomes for Arabic-speaking students are unsatisfactory, particularly in those schools with high concentrations. Youth unemployment and high school attrition rates are higher than average. Recent events have highlighted and exacerbated community tensions culminating in ethnic-based youth riots in 2006. September 11th, the 'war on terror' and a series of well-publicised rape and terrorism trials in Sydney have fuelled prejudice and divisions.

A second factor is the effect of international migration and developments in technology. Movement between Australia and the families' countries of origin continues to be a growing feature of Arabic-speaking groups as with other ethnic communities leading to complex sets of cultural and linguistic affiliations (Clifford, 1997; Indo and

Rosaldo, 2002). The rapid development in technology: the advent of 24 hour Arabic language television, the growth in Arabic language videos, computers, Internet, email and chat have changed the face of media and communication locally. The new technologies complement existing language and literacy practices (such as the use of mobile phones in contacting relatives overseas) but they also impact on these practices (the increasing influence of Arabic through television). These technologies also generally represent a shift to oral rather than print-mediated communication.

A third factor has been the establishment of organisations and facilities as the Arabic-speaking communities become more established. The Arabic community language schools will continue to grow; they will employ more locally trained teachers; more appropriate materials will be developed. The expansion of Arabic language community radio stations will continue. On the other hand, the shift to English may be accommodated in other domains. Churches, mosques and religious organisations move more to English as the second generation grows. The future of Arabic language teaching in the day schools is also uncertain. The low levels of uptake by Arabic-background students and the lack of commitment by government and departments of education to syllabus and curriculum development and teacher training do not augur well.

Governments, for example, have framed Arabic, other community languages and more prestigious 'modern' languages as one single subject, LOTE (Languages other than English). Generic syllabuses, which draw on models for English, French or Japanese teaching, have been developed. These syllabuses present goals, content and outcomes which assume a homogeneity in language and language teaching. Schools and teachers are then presented with syllabuses and outcomes that have little relevance to the issues of teaching and learning a diasporic and diglossic community language such as Arabic. The gap between the government generic syllabuses and teaching programmes means that responsibility for programme evaluation, curriculum and materials development is devolved to teachers, often leaving them dependent on materials from overseas written for first language learners of Arabic.

Arabic as a diasporic language, in fact, numbers many millions of speakers, but few links have been made beyond local and national curricula with diasporic communities in the UK, Canada and the USA. Appropriate curricula would have as goals the ability to live, work and study across national boundaries in English and Arabic, reflecting the growing reality of Arabic-background families across the globe. Programmes and curriculum would need to reflect the present needs and practices of the communities rather than the marginalised model of the 1970s.

INTERCULTURAL BILINGUAL EDUCATION AMONG  
INDIGENOUS PEOPLES IN LATIN AMERICA

INTRODUCTION

Of the estimated 300 million indigenous persons that survive to date in the world, between 40 and 50 million live in Latin America. There are indigenous people in every country, perhaps with the only exception of Uruguay. In Bolivia and Guatemala they are numerical majorities: 62% of the total population and nearly 50%, respectively (Sichra and López, 2002).

Over 700 different indigenous languages are spoken in the region (Grinevald, 2006), some with a small number of speakers and others with millions, such as Quechua and Aymara. Brazil is the country with the greatest linguistic diversity (approximately 180 indigenous languages) and Nicaragua the country with the least (three indigenous languages and Creole English).

Since the 1970s increasingly powerful indigenous organizations and leaders and the resurgence of ethnicity—recognized as “the return of the Indian” (Albó, 1991)—have pushed governments into reconsidering their positions with respect to indigenous populations. During the 1980s and 1990s most countries underwent constitutional reforms acknowledging the multiethnic, multicultural, and multilingual nature of their societies as well as the right of indigenous peoples to education in their mother tongue or L1 (Moya, 1998), and in certain situations with this right implemented under community management and control (e.g., Colombia) (Bolaños, Ramos, Rappaport, and Miñana, 2004).

Responding to social and economic exclusion, Latin American indigenous national and international movements are highly political. It is difficult to separate education and literacy from the struggle for rights and self-determination. The political mobilization of indigenous organizations leads to educational reforms and intercultural bilingual approaches (e.g., Bolivia, Ecuador). And, in turn, bilingual education has contributed to increased political awareness and organizational processes among indigenous people.

Across Latin America the terms intercultural bilingual education, bilingual intercultural education and ethno-education are used interchangeably.

## EARLY DEVELOPMENTS

Contemporary Latin American indigenous bilingual education (IBE) has a long history (López, 2006b) that dates back to the beginning of the twentieth century with experiments by teachers working in indigenous communities in Mexico (Brice-Heath, 1972), Peru, and Ecuador (Sichtra and López, 2002). Starting in the late 1930s in Mexico, the USA based Summer Institute of Linguistics (SIL) soon became a privileged actor in the region, when various governments signed contracts with this institution whose main mission was and continues to be the translation of the Bible. Additionally, in the Amazonian basin, SIL committed itself to help governments incorporate indigenous communities that were then either isolated or had limited contact with mainstream society. For over 50 years, SIL developed IBE projects emphasizing language development and evangelization, from a perspective of planned cultural change (Larson, Davies, and Ballena, 1979). SIL's work has drawn severe criticism (Hvalkov and Abby, 1981), but it must also be acknowledged that the importance given to the development of literacy in the indigenous language contributed to speakers' self-esteem (Landaburu, 1998) and the valuing of their languages.

Initially IBE was conceived as an instrument of assimilation; hence, most governments implemented early transition strategies (López, 2006b). Nonetheless, large-scale projects carried out in the countries with the highest indigenous presence—Mexico, Peru, Guatemala, Bolivia, and Ecuador—had an impact on indigenous communities and schools, providing important evidence regarding the advantage of initially resorting to the pupils' L1 (López, 1998). Mexico and Peru did more intensive work in the field and produced classical publications on IBE (Aguirre Beltrán, 1973; Arguedas, 1966; Escobar, Matos Mar, and Alberti, 1975; Modiano, 1974). The prominence of IBE in these countries is closely linked to the national policies of state *indigenism* that also had an academic impact. This period witnessed a major impact of linguistics in IBE, both descriptive and applied.

As indigenous demands grew stronger in the late 1970s and early 1980s, a discursive shift took place in most countries away from transitionally oriented programs to adopting the maintenance and development model (Sichtra and López, 2002). A factor influencing this move was the new orientation, which resulted from the meeting held in Barbados in 1977 between Latin American anthropologists, linguists, and indigenous leaders and intellectuals, marking a turn from top-down state *indigenism* to a more grass-roots and critical approach. In some countries, this approach led to the active participation of indigenous organizations in program decision-making.

From its beginnings, IBE drew attention from academic circles; between 1963 and 1992, 380 books and articles about IBE were published in 13 different Latin American countries (Amadio and López, 1993). A recent review on the state of interculturalism and education in Latin America, although with a heavy Mexican emphasis, includes 415 references specifically related to IBE in the decade 1990–2000 (Bertely and González, 2004).

The analysis of IBE has been approached from different and complementary perspectives: as a privileged domain of language policy and planning (Brice-Heath, 1972; *Cultura de Guatemala*, 1995; Escobar, Matos Mar, and Alberti, 1975), as the setting in which the predominantly oral indigenous societies gradually become literate (King and Hornberger, 2004; Larson, Davies, and Ballena, 1979; Sichra, 2006), as a vehicle for combating the long standing history of discrimination and racism (CARE, 2004), as a means to introduce interculturalism in multiethnic societies (Mosonyi and González, 1974), and more recently others have examined IBE within the framework of indigenous peoples' human rights (*Cultura de Guatemala*, 1995; Hamel, 1997).

Books and articles on IBE in Latin America also depict different implementation aspects: curriculum design (Dietschy-Scheiterle, 1987), materials preparation (Chatry-Komarek, 1987), language use and alternation in class (Hornberger, 1988), and pre- and in-service teacher training (Calvo and Donnadieu, 1992). Two additional areas that deserved special attention are the learning and teaching of Spanish as a L2 (Pozzi-Escot, 1990), and the development of a unified writing system in the indigenous languages, an issue that is particularly influential in South-America (Cerrón-Palomino, Landaburu, Mosonyi, and Moya, 1987).

Indigenous organizations have always considered IBE counter-hegemonic, even when governments implemented it. Nonetheless, these projects and programs have been constantly under scrutiny with ongoing tests of validity, efficiency, and efficacy. One of the earliest research projects took place in Chiapas, where indigenous children in a bilingual program obtained better scores than their peers in L2 tests in the second grade (Modiano, 1974). Comparable results were attained in different countries at various levels of primary schooling. In Puno, Peru, at fourth grade level, in relation to proficiency in the L1 and in Spanish as a L2 as well as achievement in other subjects, bilingually educated children obtained comparable or better results than indigenous students in monolingual Spanish schools. In that same region, Hornberger (1988) found that even only after the first 2 years of schooling, bilingually educated Quechua children developed a more complex use of their L1 than their peers in Spanish-only schools. In Mexican indigenous rural schools, Francis and Hamel (1992) determined that

the skills and competencies bilingual children developed in their L1 transferred to Spanish, facilitating reading comprehension and writing skills in their L2. Similarly, in Peru López and Jung (2003) found that Aymara speaking children in IBE fourth and fifth grades produced written texts in Spanish—their L2—of higher grammatical and rhetorical complexity than those they could produce orally in this same language.

Since the late 1980s and early 1990s, the geography of IBE has expanded significantly as countries' educational reforms tried to respond to the needs and expectations of indigenous populations. When in the 1960s and 1970s the implementation of IBE projects was generally restricted to the five countries with more indigenous presence—Mexico, Guatemala, Ecuador, Peru, and Bolivia—by 2006 IBE projects and programs were being implemented in 17 countries. In some cases, like in Bolivia, an analysis of the evolution of IBE and its up-scaling made specialists conclude that governments had changed their perspective towards indigenous pupils' education, moving away from discrete and focalized projects to the inscription of IBE in national policies (Albó and Anaya, 2003; Muñoz, 1997). However, IBE remains generally restricted to the formal primary education of children (Hornberger and López, 1998; López, 2006a,b).

#### MAJOR CONTRIBUTIONS

The studies reviewed and our own involvement in research as well as in the practical implementation of IBE show that the adoption of language maintenance and development ideologies coincided with an emerging understanding of the role of culture in IBE, which led to the relocation of linguistics as the major discipline influencing the field. Anthropologists analyzed the problems indigenous learners faced in schools where their languages were used but within Western-oriented curricula and concluded that much more than bilingual education was needed. Under the *Barbados spirit*, the notions of interculturalism and of intercultural bilingual education were elaborated, when indigenous educational experiments were implemented in Venezuela (Mosonyi and González, 1974). Gradually these notions influenced IBE, initially in South America and later in Mexico, where the concept of bicultural bilingual education predominated (Calvo and Donnadieu, 1992). Although much work remains, for over a decade IBE has been gradually paying more attention to indigenous knowledge and practices, and hence the denomination of *intercultural* bilingual education (EIB in its acronym in Spanish) has become more common in relation to the education of indigenous populations. It must also be acknowledged that most of the educational reforms of the 1990s included the notion of intercultural education for all—influenced by the demands of education

for all and establishing links between education and the strengthening of democracy. This has been precisely one of the most pressing demands from indigenous leaders who claim that society at large should become intercultural since throughout history indigenous people have always had to learn from the non-indigenous but the opposite has never been the case. Most recent indigenous proposals also point in the direction of two-way IBE (CNEM, 2004; CONAMAQ et al., 2004).

Another major outcome of IBE is related to the increasing attention paid to indigenous languages and their present condition (England, 1998; Landaburu, 1998). Taking these languages into schools in most cases meant previously developing writing systems and even elaborating the languages' lexicon, tasks which became even more demanding when IBE moved into the upper levels of basic education. In this context IBE adopted the notion of *normalization* taken from the Catalanian and Basque sociolinguistics and bilingual education traditions (López, 2006a). In various countries, from Guatemala to the south, linguists and teachers, whilst producing educational materials, became involved in language elaboration processes and in the creation of unified writing systems in line with linguistic standardization (Cerrón-Palomino, Landaburu, Mosonyi, and Moya, 1987). Producing written texts for school use in otherwise oral languages also implied training indigenous teachers and educators who spoke these languages but had not written them. In this process, the question of authorship arose and was considered as an instrument of indigenous self-recognition and empowerment (Lindenberg-Monte, 1996).

In line with the emphasis given to language development, initially the preparation of teachers favored training in some aspects of descriptive linguistics, usually to the detriment of a sound understanding of the roles culture and pedagogy played in IBE. This orientation is being revised since attention is now given to a more comprehensive understanding of IBE. The re-conceptualization that is currently in progress is also a by-product of the involvement of indigenous experts and organizations in the field, and particularly in pre- and in in-service teacher training (Carranza, Grandes, and Carrillo, 2004; López, 2006b).

It is now generally accepted that in-service teacher training is insufficient and that greater attention ought to be paid to pre-service education. Thus, there is increasing agreement that ongoing professional development is required. Hence, as of the 1990s, more IBE teacher education programs have been organized, gradually resulting in curriculum re-definition with more consideration paid to indigenous knowledge systems, as in Mato Grosso, Brazil (CEISI, 2005) and Iquitos, Peru (Carranza, Grandes, and Carrillo, 2004). In the Peruvian Amazon, an indigenous bilingual teachers' program—FORMABIAP—prepares professionals to respond to the needs and aspirations of indigenous

peoples and simultaneously stimulates a dialogue amongst indigenous knowledge and value systems vis-à-vis mainstream traditions, in order to structure an intercultural perspective that could contribute to the sustainable development of the Amazonian sub-region. In turn, in Bolivia, indigenous organizations and leaders took it upon themselves to intervene in student and even lecturer selection processes so as to ensure they spoke the indigenous language in question and were sympathetic to the indigenous cause (López, 2006a).

The benefits of L1 development referred to above do not seem to be restricted to greater L2 proficiency. López (1998) summarizes findings from different countries that provide empirical evidence related to indigenous bilingual children's overall academic achievement, active participation in learning and development of positive self-image, self-esteem, and respect. A Bolivian longitudinal study carried out between 1992 and 1995 revealed that in IBE programs girls and boys developed significantly higher levels of self-esteem, a greater capacity for adaptation and a more tolerant attitude in cases of frustration (López, 1998). Research corroborated these findings 10 years later in Guatemala (Rubio, 2006). It is promising to discover that bilingual children take advantage of and apply the linguistic knowledge and experiences previously acquired, in spite of the short span of time devoted to systematic L1 development (3–4 years). With greater investment in L1 development, one could expect even better results.

Two other areas in which the contribution of the inclusion and use of children's L1 in education are in evidence are increased and better quality participation from parent, community, and indigenous organizations (Garcés, 2006; López, 2006a), as well as significant improvement in terms of internal efficiency indicators such as enrollment, attendance, retention, and less grade repetition (López, 2006a).

#### WORK IN PROGRESS

The increasing role indigenous organizations and leaders have assumed has brought about new analysis and research issues. Three of them relate to the recuperation of indigenous views and voices, aspects linked to a shift from top-down language and educational planning to bottom-up approaches, as well as to newer and greater demands on teacher education and on the preparation of qualified human resources in general.

The fact is that the teacher remains a key factor for the construction and implementation of IBE. Opposed to traditional mainstream education that denies the existence of another language and culture in the classroom, IBE is now recognized as part of the indigenous patrimony, rescuing their values, relocating their languages and cultures, assigning

them at least the same status in schools that hegemonic languages and cultures enjoy. This paradigm shift places vast demands on teachers professionally trained under the ideals of monolingualism and monoculturalism and the illusion of an unquestionably homogeneous Nation-state. Thus, teacher education and development is trying to move far beyond just the technicalities of learning and teaching in order to professionally prepare individuals who will assume a personal and collective commitment to struggle against racism and discrimination. This new focus of teacher education is aligned with the indigenous political project of transforming Latin American countries into multinational entities.

In this context, the work regarding indigenous views is being undertaken both within academic spheres as well as by some indigenous organizations themselves. In at least Colombia, Peru, Ecuador, Bolivia, Guatemala, and Mexico, grass-roots organizations are involved in the design and implementation of alternative educational programs in which local knowledge and histories deserve specific attention. In Bolivia and Guatemala this is an outcome of the direct participation of indigenous educational councils (CNEM, 2004; CONAMAQ et al., 2004). In Ecuador, Colombia and Chiapas, Mexico, the concern for the development of alternative curricula is a side-effect of a profound change in the management and administration of education. In Ecuador, in 1988 the nation-wide administration of IBE came under indigenous control, due to an agreement between the government and the most important national indigenous organization (Garcés, 2006). In Colombia, as a result of the constitutional reform of 1991, indigenous peoples have been granted the right to design their own educational models (Bolaños, Ramos, Rappaport, and Miñana, 2004). In Chiapas, a new regime of self-determined autonomous local governments allows indigenous municipalities to organize their own education (Bertely, 2004). In the Peruvian Amazon, since 1988 a regional indigenous organization negotiated with the government a system of shared management of the newly created FORMABIAP. All of these experiences receive support from researchers and committed academicians.

Recuperating indigenous voices and views also receives increasing attention from universities and research centers. Such is the case of PROEIB Andes—the Program of Professional Development in Intercultural Bilingual Education for the Andean Countries—through its MA program in IBE that receives students from six countries (Argentina, Bolivia, Chile, Colombia, Ecuador, and Peru). Research projects are being carried out in order to contribute to alternative curriculum design and implementation in indigenous territories, attending equally to broader social dimensions of the indigenous culture (cf. [www.proeibandes.org](http://www.proeibandes.org)). Some cases are: a ceramics and textile project

for the Awajuns of Peru (Taish, 2001); an art project for the Mapuches of Chile (Cartes, 2001); a project focusing on the social tensions that have arisen amongst the Guambianos of Colombia as a result of the introduction of writing (Almendra, 2005); also a project focused on the incorporation into the curriculum of hunting-related knowledge of the Yuracares of Bolivia (Sánchez, 2005).

The indigenous demand for more curricular-inclusion of their knowledge and value systems has generated an ongoing process of enquiry about the validity of the previously unquestioned official school knowledge (Bolaños, Ramos, Rappaport, and Miñana, 2004; Carranza, Grandes, and Carrillo, 2004; CIESI, 2005; Stobart and Howard, 2002). Indigenous leaders and organizations are now struggling to exercise control over curriculum design, taking advantage of the fissures opened by the ministries of education themselves when they modified their policies and opened up legal provisions for curriculum diversification in order to respond to local needs (Aikmann, 2003; CONAMAQ et al., 2004). The fact is that these new curricula leave little room for diversification and inclusion of local knowledge, due to the content load and the centralized nature of the curriculum determined by governments.

A specific mention needs to be made to the Paraguayan case. Paraguay is a bilingual country par excellence: the majority of the population (87%) speaks Spanish and Guarani and these two languages have been used extensively in education since the early 1990s when a profound educational reform began. In Paraguay a minority (1.6%) is of indigenous ancestry and identifies itself as such. Indigenous Paraguayans speak different Amerindian languages of which only six are genetically related to Paraguayan Guarani (Meliá, 1997). The national reform scheme practically excluded indigenous pupils since it opted for the curricular use of Paraguayan Guarani, a modern urban variety of this Amerindian language widely spoken by the majority of the population of the country that is in fact non-indigenous. It was only at the beginning of the present decade that due to indigenous demands and international pressure, the Ministry of Education of Paraguay started a series of specific IBE projects, thus extending their bilingual reform to the indigenous minorities.

Indigenous demands are in fact challenging historically top-down instituted educational policies and approaches, pushing for bottom-up ones, in view of new political processes, such as decentralization and the control of local governments that indigenous leaders have recently achieved in some countries. In this new setting, the classical leadership in IBE that Mexican and Peruvian institutions once had is being displaced by other countries where this approach is the result of popular demands and indigenous struggle (e.g., Bolivia, Ecuador) and not from

government decisions or academic interests. Bottom-up approaches are also implemented by countries where IBE is a new concern, as in Argentina, where a Ministry of Education team, with technical support from PROEIB Andes, carried out a nation-wide contest to recover local initiatives and learn from school-teachers and grass-roots organizations and leaders (MECyT, 2003). These new ways of educational and language policy design also imply consultations at local and regional levels (Zúñiga, Cano, and Gálvez, 2003) and active involvement of indigenous organizations and leaders.

Together with these new concerns, there is an *old* issue that has steadily attracted the attention of ministries and academic and research centers: learning and teaching Spanish as a L2 (Hamel, 2004; Rockwell and Pellicer, 2003). More work needs to be done in this area, since there is social pressure regarding the children's needs to master Spanish in order to have better chances in life, since historically schools only paid attention to Spanish under a clear assimilationist scheme. Similarly, the L2 methodological issue acquires greater importance when IBE now confronts an emerging and previously unexpected need to teach indigenous languages to speakers of either Spanish or Portuguese.

#### PROBLEMS AND DIFFICULTIES

In Latin America, research cannot be drastically separated from IBE implementation or action. Most generally, researchers are also IBE activists and hence involved in various stages of program implementation. In addition, it must also be taken into account that funds available exclusively for research are practically non-existent, perhaps with the exception of certain Mexican and Brazilian institutions.

When IBE was adopted as the most suitable approach for indigenous children and adults, indigenous monolingualism was relatively high and most of the indigenous population inhabited rural areas that were either isolated or difficult to reach. This scenario has been dramatically modified: roads, migration into cities, telecommunications and political and legal transformations and democratic openness have transformed the historical *invisibility* of indigenous peoples and the physical and mental distance that separated indigenous and non-indigenous people. Notwithstanding, IBE remains trapped in a perspective of indigenous monolingualism, while indigenous sociolinguistic settings become increasingly diverse. A radical conceptual change is thus required since IBE is needed both in rural areas and in cities, with both monolingual and bilingual students.

Linguistic communities that lost active use of the indigenous language are also demanding IBE. This ought to be understood in the context of the ongoing process of "return to the Indian." It has become

common for indigenous leaders to claim that “The school should return to us the language it deprived us of” (López, 2006b). These appeals not only challenge present understandings of IBE but also existing institutional and communal capacities, since indigenous communities and leaders overemphasize the role the school can and should play in linguistic revitalization, while underestimating the importance of other domains of language use (López, 2006b; Sichert and López, 2002).

Another problem is the insufficiency of adequately trained human resources—bilingual teachers and professionals—for the type of education management required. This deficit is even greater if IBE is to be under the responsibility of indigenous educators. For at least a decade, most countries have implemented institutional and pedagogical reforms in teacher-training along the lines of IBE. Nonetheless, results appear to be still minimal: the new teachers do not show the professional and political strength needed to convince parents and communities of the advantages of IBE. Similarly, they do not seem to be able to break away from rote-learning, blackboard copying, and dictation, which are persistent features of pedagogy in many places of Latin America and North America, particularly in connection to indigenous language teaching (King, 2001). This tendency becomes stronger when indigenous languages are taught as a L2 (Sichert, 2006). The usual priority given to “the norm” and to the written word makes the school-language gradually diverge from the language of the home, the elders and the community (King, 2001). This type of pedagogy contradicts the liberating spirit inherent in IBE and the need to encourage and listen to the student’s own voice—in the Bakhtinian sense (Hornberger, 2005).

In turn, decentralized horizontal and participatory educational management of IBE requires from administrators and decision-makers more openness toward the community and to local and regional social organizations and structures. Committed human resources are needed at all levels within ministries of education and indigenous organizations. Since traditionally schools imposed upon indigenous communities their own ways and logic of management, reflecting the perspectives of the dominant group, the active participation of parents and community leaders in decision-making regarding institutional and pedagogical management generates conflicts and feelings of insecurity in both parties. Underlying these problems is the clash between hegemonic and subaltern societal sectors which adhere either to mainstream *criollo* culture or to the indigenous one (Sichert, 2002).

Whether of indigenous origin or not, teachers, unless politically committed and aligned with the interests of the indigenous peoples, most generally represent the interests of the hegemonic sectors, since they are in fact government officers and are regarded as such by everybody. In their role as government officers, teachers gradually experience a

loss of agency and the displacement of their sense of purpose (López, forthcoming).

### FUTURE DIRECTIONS

Indigenous people approach life from a holistic or comprehensive perspective and tend to see different aspects of life as complementary to one another (Bolaños, Ramos, Rappaport, and Miñana, (2004). In the same vein, multilingual communities and bilingual schools ought to approach language education from this integral perspective. Hence, an epistemological move is called for, since we ought to break away from the positivist tradition that has most generally dominated language teaching and also IBE. From an interdisciplinary and ecological approach, language learning should surpass its exclusive linguistic and pedagogical orientation, since it will be necessary to re-establish adequate links between learning and knowledge, learning and identity, and even learning and local histories, voices and expectations. As we have highlighted, recent indigenous demands call into question the ontology of Western knowledge.

In fact, many of the challenges identified here place the discussion regarding the future of IBE in a scenario that is both political and epistemological. Both dimensions seem to intertwine today. For the most part indigenous claims are more concerned with the need to achieve equality with dignity and simply to continue being indigenous and are no longer preoccupied only with issues of school access and coverage.

One of the areas which IBE will have to address is the revitalization of vulnerable languages or even of those on the verge of extinction. Unlike the way this task could have been assumed before—mainly by linguists and anthropologists—nowadays responsibilities such as this one must be approached as a cooperative effort under increasing community control. IBE is then faced with a twofold challenge: (i) its reinvention in order to respond to situations in which the indigenous language needs to be reactivated and therefore very close links need to be established between communities and schools and (ii) the relocation of education within a framework of indigenous sustainable development or of “development with identity,” as the indigenous peoples themselves now put it, since educational projects are to contribute to the community’s life plan and aspirations. In this new context, “good practices” will have to be identified and disseminated in order to promote attitudes of respect towards the interests of indigenous communities and to support projects with real, positive and long-lasting effects (Grinevald, 2006). Therefore, IBE can no longer be approached from a top-down perspective. More than ever, close collaboration

between indigenous communities and their leaders and linguists, anthropologists, and educators is called for.

The recognition of the value of indigenous languages underlying IBE proposals reflects the historical recognition by Nation-states of some of the indigenous patrimony. By regarding indigenous populations as an integral part of the state and promoting their social and political participation, advances have been made against social exclusion thereby triggering an ideological relocation of linguistic and cultural diversity that has an impact on every citizen of a multiethnic society (Samaniego and Garbarini, 2004). This shift implies a tremendous challenge for the non-indigenous sectors, particularly for those in decision-making at ministries of education and other governmental agencies. In this new context it becomes urgent and mandatory to abandon once and for all the compensatory understanding of IBE and to regard it as an approach for better educational quality in general. From this perspective, IBE will have to first come out of its almost universal enclosure in primary education and in rural areas. It will have to be applied in secondary schools, higher education and in the non-formal education of youth and adults. It also ought to be extended to cities and towns and address the non-indigenous sectors of society, providing opportunities for Spanish and Portuguese speaking children to learn—to begin with—the rudiments of the indigenous language most widely spoken in their areas of residence.

In so doing IBE will contribute to a critical revision of the historical linguistic structure of these multilingual societies, challenging the notion that bilingualism is the exclusive realm of the indigenous populations and monolingualism as a characteristic of Spanish speaking citizens. In the same vein, interculturalism needs to transcend indigenous settings and reshape education in cities and towns since they have turned into privileged domains for social interchange between indigenous and non-indigenous persons. Lastly, IBE needs to be regarded as part of a larger process of societal reconstruction in which specific attention is paid to indigenous leadership training. As reflected in current proposals in Bolivia and Ecuador, IBE could accompany the indigenous quest for new and more creative interpretations of citizenship in multiethnic, multicultural, and multilingual societies that have begun to regard themselves as multinational.

BILINGUAL EDUCATION FOR INDIGENOUS  
COMMUNITIES IN MEXICO

INTRODUCTION

In Mexico as in the rest of Latin America, discussion about indigenous bilingual education centres around two central questions. The first relates to the macro-political and anthropological dimension: Will it be possible to build a plurilingual and pluricultural nation state that will be able and willing to reconcile the forging of a national identity and unity with the preservation of linguistic and cultural diversity? The second, of a rather micro nature in the field of psycholinguistics and pedagogy, refers to the modalities of bilingual education, more precisely to the relation between language use and academic achievement in education, in the context of an asymmetric relationship between Spanish as the dominant and the indigenous as the subordinate languages (Hamel, 1988, 2000).

The socio-political dimension emerges in the debates about the policies that the dominant Mestizo society and the state they control design for the nation's autochthonous peoples: Should their members be assimilated and forced to give up their ethnic identity and languages in order to become accepted citizens of the nation? Conversely, could they integrate and acquire full membership while at the same time preserve and foster their own identity and diversity? Ever since the beginning of Colonization through Spain in 1519, and even earlier in the Aztec Empire, the state has assigned a central role to education in this process (Heath, 1972).

The pedagogical and psycholinguistic dimension comes into sight when the question arises how the global socio-political goals could best be achieved through education. How might a given school population of indigenous children who have practically no command of Spanish, the national language, best acquire the knowledge they are supposed to obtain? And, what understandings, orientations and ideologies do those in power cultivate about the role of languages in education: Would those children have to abandon their native language in order to learn the national language properly and become useful citizens? Or, on the contrary, could their first language be a fundamental instrument to acquire literacy, other academic skills, second order discourses

and content matters? Should monolingualism in the state language or enrichment bilingualism be the envisaged aim of indigenous education?

Since colonial times, two basic strategies of ethnic and language policies developed in Mexico, which gained shape after Independence in the early nineteenth century. The first and generally dominant strategy considered the assimilation (i.e. dissolution) of Indian peoples and the suppression of their languages as a prerequisite for the building of a unified nation state. A second strategy favoured the preservation of Indian languages and cultures in this process, without giving up the ultimate goal of uniting nation and state. As a result a gradual process of language loss took place which accelerated during the twentieth century as an outcome of the social dynamics following the Mexican Revolution (1910). Out of approximately 130 indigenous languages (henceforth ILs) spoken at the time of the Conquest, some 62 vernaculars have survived. Although the indigenous population—roughly 10% of the total—is growing in absolute numbers, most indigenous peoples are undergoing a process of assimilation and language shift (Hamel, *Indigenous Language Policy and Education in Mexico*, Volume 1).

The two strategies materialized in education and Spanish teaching—the main pillars of cultural policies for the Indians—through two basic approaches which differed considerably in their cultural and educational philosophy and methods, their view on sociocultural integration, and, above all, in their procedure of using and teaching Spanish as the national language. The first strategy pursued the goal of linguistic and cultural assimilation through direct Hispanicization (*castellanización*), i.e. submersion or fast transitional programmes. Education in Spanish should actively contribute to language shift and cultural change. The national language was to be the only target and medium of instruction; teaching materials, content and methods were the exclusive preserve of the dominant society. Transitional programmes reflected the second strategy; they applied diverse bilingual methods where the Indian language played a subordinate, instrumental role as language of instruction and for initial alphabetization.

No doubt the Mexican governments have always subordinated the questions of psychological appropriateness and the quality of learning to the political questions of control and integration of the indigenous population, from colonial times until our days. Today the two dimensions converge in favour of the stabilization of indigenous peoples as fundamental components for the construction of a new, pluricultural and plurilingual state; and enrichment bilingual education based on instruction and literacy development through the medium of the mother tongue, although still an exceptional model in practice, has shown its

superiority over submersion and transitional syllabuses in terms of quality education and the development of academic proficiency in both languages (Hamel and Francis, 2006).

Given the size of the native population and the significant historical commitment to public services, the Mexican state developed by far the largest public school system for the indigenous population in the Americas.

In this chapter I will briefly refer to education in colonial and early republican times. I will then concentrate on indigenous education, its approaches, problems and results since its consolidation as an educational system of its own in the 1970s and review the main contributions, work in progress and perspectives. The emphasis will be on the role of the languages in bilingual education, the curriculum and the learning processes, where the rare cases where mother tongue education emerges will be highlighted. The macro questions of language policy and linguistic human rights in Mexico are dealt with in another volume (Hamel, *Indigenous Language Policy and Education in Mexico*, Volume 1).

#### EARLY DEVELOPMENTS

Although assimilationist education predominated throughout the colonial regime in Mexico (1519–1810), its early period in the sixteenth century witnessed some of the most exciting experiments of indigenous language based education that have occurred in Mexico until our days. Along with other religious congregations, the Franciscans developed an educational philosophy and practice of their own for the Indians. According to Aguirre Beltrán (1983) and his sources, Franciscan education was based on empathy with indigenous cultures and world views, mother tongue instruction, communication and, above all, Christianization; the Franciscans were the first to practice syncretism in education, a principle that would become relevant during the times when anthropology played a significant role; they adapted many of the native instructional practices. Their strategy also implied the use of young Indians as cultural brokers and assistant teachers. In the renowned Colegio Imperial de Santa Cruz de Tlatelolco, founded in 1536, further education included the development of literacy in Nahuatl, the study of Latin grammar as a path to theology and philosophy, with the ultimate goal to ordain the graduates as priests (Aguirre Beltrán, 1983; Heath, 1972). Given that the Nahuas (Aztecs) had their own pictographic and ideographic writing systems and used paper (*amatl*) and ink (*tlilli*), they could quickly adopt the European alphabetic writing system for their own language (Lockhart, 1992). Similar to the other Vice Kingdom in Peru, a generation of Nahuatl writers

recruited from the Aztec elite burgeoned in the Colegio. Since they had already received formal instruction and acquired second order discourse competence in their own culture (Francis, 2003), they obtained literacy in their language and were able to transfer their knowledge successfully to the literate culture of Spanish and Latin. In the course of the sixteenth century, the alphabetic writing system rapidly displaced pre-conquest pictographic writing, and the development of native language literacy as a social practice spread swiftly through the Spanish colonies. In Mexico, such an early experience of both L1 literacy acquisition and social use was never reached again until our present days.

Throughout the later part of Colony the Spanish Crown tried to enforce Castilianization. Since the feudal order established segregation between Indians and non-Indians, however, massive spread of Spanish proved an impossible task. Here, a well-known principle in education that remains relevant until today emerges for the first time: Formal education will hardly ever reverse general societal tendencies of language use, shift or spread. It was only through radical political and economic change, of devastating community dissolution and loss of territory through violent expulsion, not as a result of education, that in the course of the nineteenth century Spanish became the language of the majority in Mexico (Cifuentes, 2002).

Only in the 1930s would a new turn towards mother tongue education emerge in Mexico. Under the leadership of the US linguist Maurice Swadesh, the well-known *Tarascan Project* was born (Aguirre Beltrán, 1983; Castillo, 1945). In the P'urhepecha (Tarascan) region of Michoacán in central Mexico, a team of Mexican and US anthropologists and linguists developed an integrated programme of bilingual education. They elaborated an appropriate alphabet of P'urhepecha based on linguistic and sociolinguistic studies, they trained indigenous teachers in basic indigenous grammar and the alphabet based on the most advanced literacy approaches of the time. The programme offered a more adequate pedagogical model for the acquisition of literacy and at the same time fostered the indigenous languages and their maintenance by moving them into the prestige domain of literacy. Although the project was quite successful at the beginning, it only lasted two years (1939–1941) as official policy, due to political changes which returned to assimilationist programmes. However, the abundant anthropological and linguistic research surrounding the education project, as well as the proposal of L1 literacy teaching had a long lasting effect on the national and international debate on bilingual education. Thus, the Mexican delegation played a significant role at the 1953 UNESCO conference on vernacular languages education in Paris, and a Mexican contribution (Barrera-Vázquez, 1953) entered the final publication.

For the period from Colony to the 1950s, little specific research on the language question in education exists, although education and indigenous education appears in various studies. For extensive summaries and references see Aguirre Beltrán (1983); a shorter report in English is Hidalgo (1994). The classical text on language policy from colony to the nation, including education, is Heath (1972).

#### MAJOR CONTRIBUTIONS: INDIGENOUS EDUCATION TODAY

After 1950 no clear maintenance programmes materialized in the following decades. Nevertheless, some of the most progressive pilot projects led by pro-Indian anthropologists did contain elements of maintenance programmes, mainly through L1 literacy and a series of contextual ethnic activities. Given their limited pedagogical resources, and—in the long run—political support, however, they eventually turned into transitional programmes.

In 1978 previous modalities of indigenous education found their definite place as a Department in the Federal Ministry of Education under the name of Dirección General de Educación Indígena (DGEI, General Department of Indigenous Education), a subsystem of elementary education.

Since the 1970s the official programme was labelled “bilingual and bicultural”. It consists of two pre-school years plus six grades, the same as the general primary system in the country. In 1992 the administration of elementary education including the indigenous systems was handed over from the federal government to the state governments. Public elementary education in Mexico is based on a common curriculum for all students in the country. Therefore, the indigenous schools are supposed to cover the same curriculum as the ordinary monolingual system. The Federal Department of Education produces common compulsory primers for each grade and subject matter which are distributed freely to all school children, some 28 million copies each year in recent times. These textbooks are oriented towards monolingual Spanish speaking children, mainly in an urban cultural context. Therefore, although they may serve as an appropriate tool for L1 literacy teaching, they are not adequate for bilingual education and the teaching of Spanish as a second language.

In 2005 some 55,000 indigenous teachers instructed over 1.2 million primary school students (50% of the total), speakers of one of the 62 indigenous languages (DGEI, 2005). At the beginning of each school year DGEI distributes over 2.5 million primers written in native languages to the indigenous schools, possibly more than in the rest of the Americas all together. Unfortunately, for reasons outlined below,

most of them are rarely used; and most observers would agree that the indigenous school system does on the whole not contribute to maintain and foster indigenous languages.

Little detailed research exists about indigenous education under the bilingual and bicultural programme. Nancy Modiano's study is the first to demonstrate, in the case of the Tzotzil and Tzeltal Indians in Chiapas, that L1 or even bilingual literacy instruction yields better results for Spanish L2 literacy skills than the common Spanish alphabetization practiced at that time. Her book was first published in English (Modiano, 1972) and two years later in Spanish. More than in Mexico, it had a significant impact in the USA as a study of advocacy for mother tongue instruction within the emerging debate on bilingualism and bilingual education for immigrant children (Francis and Reyhner, 2002).

In an extensive study, Bravo Ahuja (1977) analysed indigenous education focusing on the Castilianization process; from a perspective that fosters transition to Spanish, she developed the first systematic proposal to teach Spanish as a second language (L2), and her team elaborated an official primer for that purpose. Ros Romero (1981) shows that common teaching practice contributes to IL language shift. A new debate arose in view of the overt contradictions between the official programme that should foster bilingual and bicultural maintenance education, and Castilianization practice, a conflict that continues until the present time. Scanlon and Lezama Morfin's (1982) collection of papers discussing these issues becomes a central reference for the 1980s. Citarella (1990) is the most extensive summary of DEGEI's programmes, proposals and activities during the previous period.

Most of the relevant components that relate the general sociolinguistic context to indigenous teachers' orientations, curriculum design, the functions of the languages involved, and classroom interaction are analysed in an extensive study of the Hñähñús (Otomis) in the Mezquital Valley reported in Hamel (1988). In general terms, sociolinguistic analysis identifies for Mexico, as well as the rest of Latin America, that a diglossic language conflict between Spanish as the dominant language and the ILs as the subordinate ones contributes to generalized language shift and loss, in spite of some language maintenance and revitalization processes (Hamel, 1996). The indigenous schools reproduce this general tendency, mainly through the diglossic ideologies of the indigenous school teachers who value Spanish and Spanish literacy as their most precious cultural capital, whereas their own native languages are not considered suitable for academic activities. They share, by and large, the nationalist values of a common nation state that promises upward mobility through a school system of cultural and linguistic

assimilation. Indigenous schoolteachers, who depend—not on their community—but on the state for their appointment and salary, have accumulated considerable power over the past 20 or 30 years. In many communities they replaced traditional community leaders, since the teachers' capacity as cultural and political brokers is considered more useful than the skills of traditional leaders (Sierra, 1992). Even those indigenous teachers' organizations that are critical of the state party and its regime have generally prioritized their status and union interests as tenured state employees over and above community, ethnic, or indigenous language issues. Over the years they have forged a powerful structure, within a powerful national teachers' union, that acts objectively as a language movement in favour of Spanish and linguistic assimilation.

Consequently, they attempt to teach literacy in Spanish from first grade on to pupils who are at best incipient bilinguals, instead of developing cognitively demanding higher order discourses such as literacy in their mother tongue (Hamel, 1988; Hamel and Francis, 2006). Both languages are used orally for instruction, with frequent repetitions and translations that foster neither literacy nor the acquisition of Spanish as L2. Given the lack of communicative contextualization in L2, literacy practices in Spanish become mechanical repetitions, and the reading and writing of isolated phrases with no semantic and pragmatic value. Instead of developing cognitively demanding and context-reduced tasks in the students' native language, the growth of the mother tongue in these areas is cut off and neglected throughout elementary education. Thus the curriculum and teaching practices do not profit from a central and widely acknowledged feature of any bilingual programme: the learners' capacity to transfer cognitively demanding skills from one language to the other, a process which could bring about significant academic growth in both languages (Cummins, 2000). In sum, the observed classroom practices build up a factual curriculum, which implies an ensemble of predominantly negative effects on the development of academic language proficiency. The attempt to teach literacy in a second language without sufficient acquisition of the necessary oral skills leads the teachers to under-exploit the communicative potential of the primers, and to return to traditional practices of synthetic methods and structural pattern drill. The fundamental distinction between conversational and academic uses of language is not acknowledged in either language, as becomes evident in the teachers' attempt to teach oral skills in L2 as a by-product of literacy. And the decision not to develop any academic skills in the L1 fails to take advantage of the cumulative effects of cognitive growth and transfer capacities to Spanish. On the whole, indigenous schools show very poor results in the acquisition of literacy and other content matters. At the same time,

the subordinate role of the mother tongue as a transitional language of instruction reproduces the diglossic conflict between the languages.

Generally speaking, most publications of that period arrive at similar conclusions, namely that the general diglossic orientations shared by the dominant society and most indigenous teachers and parents generate a kind of education that contributes to language shift and does not produce the expected educational skills. Summaries of that period can be found in Berteley Busquets (1998) and Hidalgo (1994).

#### WORK IN PROGRESS

At the present a range of pedagogical practices are in use in the Indigenous Educational System. The most widespread modality teaches literacy in Spanish, uses the official Spanish primer for elementary education as the basic textbooks, and employs the indigenous language as the initial medium of instruction (Hamel, 1988). An increasing number of teaching materials in indigenous languages is being used alongside with Spanish primers. And, since the 1990s a number of pilot projects within the public system develop literacy skills in L1, either as the point of departure of schooling, or as a supplementary activity to L2 literacy teaching. On the whole, given extended poverty in indigenous regions and poor conditions of education along with transitional and submersion programmes, the indigenous educational system exhibits the poorest results in general proficiency among the different subsystems.

Until the last decade of the twentieth century, the federal government sustained through DGEI a bilingual and bicultural model as the target of indigenous education (DGEI, 1990). School children should develop coordinate bilingualism and become fluent in the four basic skills in both languages. Similarly, both cultures should be present through appropriate content matters. During the 1990s, the label “bicultural” was replaced by the new concept of “intercultural bilingual education” on the grounds that the term “bicultural” implied a dichotomous worldview that separated cultures inappropriately. The new intercultural bilingual perspective in turn would propel the recognition, knowledge and integration of both cultures in a pluralistic enrichment perspective (for a critique, see Muñoz Cruz, 2002). Both languages should now be the medium and object of instruction (DGEI, 1999). And, similar to the Law of Education approved in Bolivia in 1994, education should be intercultural for the country as a whole, meaning that all school children ought to be educated in a perspective of pluricultural enrichment producing knowledge, tolerance and positive attitudes towards indigenous cultures and languages. Throughout the following years, ethnicity

and interculturalism in relation to education moved into the centre of academic and educational debate (see Bertely Busquets and González Apodaca, 2003 for extensive summaries of the existing literature). Massive migration of indigenous families to the cities and to the USA motivated new studies about education for indigenous children in urban contexts (*ibid.*).

Educational modernization, quality, productivity and other concepts of a neo-liberal discourse occupied the arena. However, the federal government maintained the dogma of a unified curriculum for all school children. The DGEI even dissolved their department of curriculum development, thus giving up any previous attempts to design an appropriate curriculum of its own for indigenous schools. The centrality of *intercultural* education even relegated the question of *bilingual* education to a secondary place. No advances were achieved during the 2000–2006 conservative administration in terms of L1 literacy and the teaching of Spanish as a second language on a programmatic level. And the administration of the educational system, which in 1992 had been decentralized from the federal to the state level except for the questions of normativity and curriculum, did by no means imply the transfer of control, planning and administration to the indigenous communities and organizations. Implementation, again, did not occur with the expected intensity and speed. By the end of the administration in 2006, practically none of the proposals or even the new debates had reached the teachers and classrooms.

Thus, the central questions of indigenous education remain largely unsolved in Mexico. The global dimension of the construction of a new, pluricultural and pluriethnic nation state advanced significantly on a political, conceptual and legal level (Hamel, *Indigenous Language Policy and Education in Mexico*, Volume 1), but little change has occurred on the grass root level of bilingual education in the classroom. General claims expressed by the growing indigenous movement to achieve greater autonomy have so far not included education, although most experts agree that appropriateness and quality of indigenous education will only improve if indigenous control and curricular diversity advance.

The second dimension mentioned at the beginning, i.e. the pedagogical and psycholinguistic thrust of mother tongue education and literacy have shown little progress and seem to occupy a less central role in the educational policy debates than in previous times. And research findings that document the academic advantages of such an education are still scarce (see however Francis, 1997, 2000) and have so far not been able to convince either policy makers or the indigenous communities themselves on a global level.

## FUTURE DIRECTIONS

On the local and regional level, however, an increasing number of initiatives and experiences try out new ways of improving indigenous education and new relations between academic achievement and bilingual language use. An extremely interesting collective pilot project is reported in Meyer and Maldonado (2004). See Podestá Siri and Martínez Buenabad (2003) for more summaries. Mostly opposed to previous models, the new experimental projects are based on a pluricultural conception of the state and the full respect for Indian peoples and their ethnic rights. They claim as their target the maintenance or revitalization of Indian cultures and languages.

As one example among others, the local initiative of a team of indigenous teachers to develop consequent mother tongue education shall be summarized. In 1995 the P'urhepecha (Tarascan) teachers of two bilingual elementary schools in Michoacán, in the central Highlands of Mexico, introduced radical changes to the previous curriculum which had been based on the fast transition to Spanish and submersion L2 Spanish instruction as described in the earlier case. Academic results had been extremely poor since most children enter primary school as IL monolinguals. Since 1995 they have been teaching all subject matter including literacy and mathematics in P'urhepecha, the children's first language. As a first step they had to convince the community, especially the parents who agreed once the teachers explained that the new curriculum would certainly lead to higher levels of achievement in literacy, Spanish and other subject matters. The teachers had to create their own materials and decide on an appropriate alphabet. The most difficult part was to develop their own writing skills and the necessary academic discourse for all subject matters in their language. Several years later a research team carried out a comparative study between these and another school with the same sociolinguistic characteristics that followed traditional Castilianization. The study was based on extensive classroom observation and a specially designed battery of tests in both languages. The findings showed very clearly that pupils who had acquired literacy in their L1 achieved significantly higher scores in both languages than those who were taught reading and writing in Spanish (see Hamel and Francis, 2006 for a general description of the school project). Furthermore, the study revealed much more intensive classroom interaction and meaningful learning of content matters. Different from most indigenous schools in Mexico, P'urhepecha had become the legitimate, unmarked language of all interaction at school, a sociolinguistic achievement still quite exceptional in indigenous education. In several years of cooperation with the research team the schools developed their own validated curriculum

based on L1 literacy, content teaching of most subject matters in L1, and a specially designed syllabus for Spanish as L2 (Hamel and Francis, 2006). This enrichment curriculum serves now as a model for intercultural bilingual education for other communities and schools. The collaborative work shows very clearly that such a curriculum is feasible and more successful than traditional submersion education; it demonstrates furthermore the validity of the “common underlying proficiency” model (Cummins, 2000 for an updated version), since success in Spanish L2 literacy is best explained through the previous development of core proficiencies and academic discourse abilities in L1, which could then be accessed much more easily in L2.

ENRICHMENT BILINGUAL EDUCATION  
IN SOUTH AMERICA

INTRODUCTION

In Latin America there is a well-established tradition of publication and research relating to the increasing importance that intercultural bilingual education has had in the educational provision offered to indigenous communities, as attested by López (2004, p. 1),

From the 90s onwards, Intercultural Bilingual Education in Latin America has succeeded in moving from a tradition of experimental projects to becoming an integral part of national educational systems, within a framework of programmes of educational reform.<sup>1</sup>

In contrast, studies on bilingual education for majority language speakers in this part of the world are a relatively recent development, even though the phenomenon itself dates from the early years of the nineteenth century, in the case of some of the first bilingual programmes established in Argentina (Banfi and Day, 2005).

Nevertheless, it is important to see enrichment bilingual education<sup>2</sup> in South America as an integrated phenomenon, which encompasses a wide range of programmes aimed at different populations and distinct linguistic and pedagogical goals (King, 2005). For this reason, the present overview of developments should be read in conjunction with two other contributions to this volume, which focus specifically on bilingual education provision for Amerindian communities (see Hamel, *Bilingual Education for Indigenous Communities in Mexico*, Volume 5; and López and Sichra, *Intercultural Bilingual Education Among Indigenous Peoples in Latin America*, Volume 5).

This article focuses on developments in the field of enrichment bilingual education for majority language speakers in six South American nations where most published work has been carried out: two Andean

---

<sup>1</sup> Author's translation of this and subsequent quotations in Spanish in the original.

<sup>2</sup> The term 'enrichment bilingual education' used here refers to Hornberger's (1991) typology, where she distinguishes between enrichment models which promote and extend language development and additive bilingualism, as well as cultural pluralism, in contrast to maintenance or transitional models.

countries (Colombia and Ecuador) and four 'Southern Cone' nations (Argentina, Chile, Paraguay and Uruguay). Most of the studies referenced date from the past 5 years.

### MAIN CONTRIBUTIONS

#### *Programme Development and Evaluation from a Historical Perspective*

One important strand of work relates to descriptive studies aimed at categorising bilingual models and programmes in particular countries. In this section, I refer to three such studies carried out in Argentina, Colombia and Uruguay. These surveys constitute important milestones in the process of charting the development of bilingual education programmes in each of the countries concerned.

Cristina Banfi and Raymond Day (2005a) have tried to come to terms with the diverse nature of what have been termed '*colegios bilingües*' (bilingual schools) in Argentina. After examining more than 150 such schools in the private sector that match the criteria proposed by Johnson and Swain (1997) to distinguish immersion programmes, the authors came to the conclusion that while most broadly adhere to a model of enrichment, there is a great deal of heterogeneity evident, which derives in part from the particular circumstances of their foundation and their attempts to preserve a competitive edge.

The authors trace the development of some of the most prestigious bilingual schools in Buenos Aires from their origins as 'Heritage' or Community Schools catering for the needs of the immigrant communities, passing through a 'Dual Language' stage, in which the majority of the students were native Spanish speakers, learning English, French or Italian as foreign languages at school. Initially, students had to cope with separate 'parallel curricula', which gradually became more integrated and more 'Argentine' (ibid, p. 74) over the years. They see the most recent development among the English-Spanish bilingual schools as that of 'global language schools' reflecting the spread of English as a global language and the increasing internationalisation of education.

My analysis of the situation of enrichment bilingual education for majority language speakers in Colombia (de Mejía, 2005a) shows certain similarities with the above account, although developments are more recent than in Argentina. The longest established institutions were founded in the 1910s and 1920s for the education of sons and daughters of the representatives of multinational companies stationed in Colombia, as well as for children of members of the expatriate communities.

Nowadays, it is possible to divide existing immersion type institutions into two categories: one relating to private schools with a strong connection to a particular foreign country, which often provides

financial support or assistance with staff appointments, and the other which covers national institutions founded by Colombian citizens, usually staffed by Colombian teachers. As in Argentina, there is an urgent need for teacher education programmes specifically designed for those teaching in bilingual programmes, as distinct from Foreign Language teacher training provision.

The situation reported by Brovetto and group (2004) in Uruguay differs from the two previous accounts in that the type of bilingual programme surveyed refers, on the one hand, to English-Spanish immersion programmes started by the Uruguayan Ministry of Education in 2001 for state (public) school children from lower socio-economic groups, and on the other, to Portuguese-Spanish provision for children from similar socio-economic backgrounds who live on the Uruguayan-Brazilian border. In the first case, the modality adopted was partial immersion, while in the second, a type of dual immersion was implemented, to cater for children whose first language was a variety of Portuguese, as well as those who spoke Spanish at home.

Both programmes are in the process of being formally evaluated with respect to levels of achievement in Mathematics, Spanish language and target language proficiency, as well as teacher and school administrator views. According to a preliminary survey carried out in 2003, there was a high level of student satisfaction reported with the English immersion programme, as well as a perception on the part of teachers that students had improved, particularly in reading and writing in both languages. In the dual immersion programme, parents particularly emphasised their satisfaction that students had been able to 'correct' their language errors resulting from language contact phenomena (Brovetto, Brian, Díaz and Geymonat, 2004). There is also a study in progress aimed at evaluating the impact of the bilingual programme on the development of writing in Spanish among children whose first language is Uruguayan Portuguese compared with the productions of a control group of monolingual Spanish speakers (Brovetto, Brian and Geymonat, 2005), (qv Language Testing and Assessment).

### *Development of Literacy and Oracy*

Other studies focusing specifically on aspects of biliteracy<sup>3</sup> in bilingual education have been carried out in Ecuador, Colombia and Paraguay. These are briefly reviewed here (qv Literacy). The first study (Simpson, 2005) looks at the writing of first grade students in both English and

---

<sup>3</sup> For purposes of this discussion, biliteracy may be taken as "any and all instances in which communication occurs in two (or more) languages in or around writing" (Hornberger and Skilton-Sylvester, 2000, pp. 96–98).

Spanish in an enrichment bilingual programme in Quito, Ecuador in an attempt to discover whether there was evidence of an 'elaborate style' of writing characteristic of Spanish written discourse in the samples examined. A second aim was to examine the possibility of reverse transfer of writing style from the foreign language (English), in which initial school literacy processes were carried out, to the children's native language (Spanish).

The author came to the conclusion that there was no evidence of an elaborate writing style in the children's narrative samples analysed, probably because of the extreme youth of the pupils concerned and the intensive literacy instruction in English they had received. She also found that although the students had more practice in writing in English and could use the language items and patterns they had learned without much difficulty, they wrote longer narratives with more confidence in Spanish. Nevertheless, on balance, the analysis revealed that the children exhibited similar syntactic ability in both their languages.

In a recent study in Bogotá, Colombia, Claudia Ordoñez (2004, 2005) examined the bilingual proficiency (in English and Spanish) of a group of Colombian adolescents in oral narratives based on picture book prompts and compared these to the productions of monolingual Colombians (in Spanish) and adolescents from the United States (in English), (qv Second and Foreign Language Education). The researcher found that while the narratives of both the monolingual and the bilingual students showed a similar range of variation in length, evaluation, connection and time representation, the productions of the bilinguals received lower holistic ratings, were shorter and less rich than those of their monolingual counterparts. The author admits that there may be linguistic and cultural reasons which explain these differences, such as different narrative conventions in different languages. However, she calls for more research into what she terms "the possible costs to the first language of acquiring a foreign one early in school" (Ordoñez, 2005, p. 139).

In Paraguay, Susan Spezzini (2002, 2005) has carried out research into language learning variability in an elite immersion-type, bilingual, Spanish-English, programme in Asunción, also among adolescents. In an interesting conclusion, the author maintains that this type of immersion setting provides learners with more opportunities for developing academic language proficiency rather than oral communicative skills in the second language.

She noted that variability existed in students' L2 oral output and comprehensibility and associated this with two main variables: gender and former schooling (qv Second and Foreign Language Education). She concluded that in spite of a long tradition of similarity in school experience, this evidence of variability in oral production 'indicated that

each student's experience with learning and using English was a unique case' (Spezzini, 2005, p. 90). She found that higher comprehensibility was related to frequency of opportunity for L2 use, either because of specific circumstances, such as travel abroad, or because of higher motivation to use English on a day to day basis within Paraguay.

#### WORK IN PROGRESS

##### *Sociocultural Dimensions (Attitudes and Identities)*

In contrast to work on programme characterisation and on the linguistic aspects of the development of literacy and oracy in bilingual settings, there has recently been evidence of a new line of research into the sociocultural and non-linguistic dimensions involved in bilingual education in several South American nations. This shows certain similarities with recent work carried out in immersion programmes at international level (cf. de Mejía, *Researching Developing Discourses and Competences in Immersion Classroom*, Volume 10)

In the study referred to earlier, Spezzini (2002, 2005) shows that some students were conscious that their bilingual code-switched school language use reflected a particular 'unique' social/group identity, as evidenced in the following observation,

The students at the American School of Asunción (ASA) have their own language. When we speak English, we speak ASA English and when we speak Spanish, we speak ASA Spanish. (Spezzini, 2005, p. 87).

The author speculates that this might be evidence of the creation of a non-native language variety based on covert prestige norms.

In Chile, Rowan Iversen (2005) has also been interested in individual learner differences in relation to affective variables. In a study in progress, she has compared non-linguistic outcomes (attitudes, motivation, self-perceived communication apprehension or anxiety and willingness to communicate) in two groups of 11th grade students in schools in Santiago; one, an English immersion programme, and the other, an intensified foreign language programme (qv *Second and Foreign Language Education*). She found that the immersion students scored considerably higher in their willingness to communicate than the non-immersion group; their motivation and attitudes were more positive, and they reported lower levels of anxiety in using the target language. However, the researcher also emphasised that these non-linguistic, affective variables were subject to individual learner differences and that care should be taken in generalising these results to the state or public education sector, where students and their parents do not have such freedom of choice as in the private sector.

In a recent pioneering project in Armenia, Colombia, Silvia Valencia (2005a) has examined the construction of social relations in bilingual programmes at secondary school level, this time in the public sector. The researcher decided to explore how bilingual teaching and learning was carried out in difficult classroom conditions, particularly focusing on the building of social relations through bilingual talk in order to accomplish language lessons. She came to the conclusion that although the working relationship between teachers and students was largely constructive, if asymmetrical, 'very few meaningful episodes of real communication were observed' (Valencia, 2005b, p. 9).

There was also little recognition of students' knowledge and beliefs by teachers in the lessons analysed, and student asides were seen as disruptive of class activities. The researcher noted that teachers' agendas were largely directed at complying with syllabus and policy requirements. The students colluded, at times, with the way the teachers constructed the lessons, either bidding for turns or taking the risk of going to the board. However, there was also evidence that at other times, they contested the teachers' agendas, despite the teachers' privileged position of power (qv Discourse and Education).

In another study in Colombia, this time carried out at primary school level in Cali, Hilda Buitrago (2002) examined how cultural aspects were treated in bilingual (English-Spanish) education programmes. She was particularly interested in studying the congruence between school policy and practice in this respect. After analysing policy documents and carrying out classroom observation and documentation of school celebrations in a private English-Spanish bilingual school, the author noted that the lack of clarity accorded to cultural considerations in the policy documents was reflected in the variety of positions assumed by individual teachers in their classroom practice. There was, furthermore, a generalised belief among teachers in the school that there should be no reference to North American cultural practices in the classes taught in Spanish, and no reference to Colombian culture in classes taught in English, thus evidencing a belief in a complete separation of languages and cultures in the curriculum.

### *Links between Bilingual Education for Minorities and Majorities*

As may be inferred from this discussion, research in the field of enrichment bilingual education for majority language speakers in South America has been characterised by a tendency to focus on micro-level studies carried out in one or two institutions, usually in the private sector. There have been few initiatives aimed at relating tendencies across

bilingual modalities in different cultural contexts, particular educational provision for indigenous communities, Creole speakers and the different Deaf communities established in the area.

Recently, however, there have been moves in this direction. Cristina Banfi and Silvia Rettaroli (2005b) in Argentina, and myself in Colombia (2005a and b) have been working on studies highlighting points of contact between bilingual education provision for both majority and minority language speakers, as part of a larger project involving contributors from France, Ireland, Britain, Spain, Mexico and USA.

Banfi and Rettaroli (*ibid*) have focused on aspects of teacher training and development in different bilingual education contexts in Argentina, such as indigenous language contexts, bilingual programmes for the Deaf, bilingual education provision in contact language situations, as well as in international schools and state bilingual institutions. One of their interests in their study is examining how far teachers who work in these different types of contexts are expected to show competence in areas other than language proficiency; areas such as cultural knowledge, content knowledge, pedagogical expertise and knowledge of the principles of bilingualism and bilingual education.

I have argued that the traditional division between bilingual education programmes offered to speakers of majority languages and those available to minority language speakers in Colombia should be reconsidered within a wider, integrated vision of bilingual provision. I maintain that there are significant areas of convergence between these different traditions in relation to issues such as the maintenance of cultural identity, the status and development of the first language, and the importance of contextual factors in the design and modification of bilingual education programmes. More recently, I have been working on the different ways that bilingual education provision is presented in official documents and decrees in both majority and minority traditions in Colombia, with a view to identifying points of contact and areas of divergence between the two (qv *Discourse and Education*).

#### FUTURE DIRECTIONS

As can be seen, studies of enrichment bilingual education for majority language speakers are very much in their infancy in South America. There are certain similarities that can be noted in relation to the early development of the French Immersion programmes in Canada: a focus on the description of different programme types, comparisons between students in monolingual and bilingual educational contexts, and a concern with the level of foreign language proficiency achieved by students in bilingual programmes.

There is, however, at the same time, evidence of a trend towards researching the socio-cultural and non-linguistic aspects of bilingual education programmes, thus showing a consciousness of the situated nature of these initiatives and recognition of their variability, not only at institutional level but also in the individual experiences of students in the development of their personal bilingual trajectory. A recent novel strand of research is also beginning to focus on interrelationships between bilingual education provision in different educational and cultural contexts.

It would seem, therefore, that work on enrichment bilingual education in South America is gaining momentum, and is moving forward in important ways. There is considerable interest in developments in this area, as can be seen by the creation of a series of international symposia on bilingualism and bilingual education in Latin America in Buenos Aires in 2004. Researchers and academics working in this part of the world are thus beginning to have an impact on developments in the field of bilingual education and a growing consciousness of the importance of their contribution to international debate.

## **Knowledge about Language: Theoretical Perspectives**

## LANGUAGE AWARENESS AND KNOWLEDGE ABOUT LANGUAGE: A HISTORICAL OVERVIEW

### INTRODUCTION

Though Language Awareness (LA) is no longer the buzzword that it was some 10–15 years ago, it has since become a key term in any informed teacher's repertoire. This does not imply though that today everybody in the profession knows what it means. It was in the early 1990s of the previous century that a number of educational linguists from all over Europe got together in London to try and establish what the term stands for. At this mini round-table (I was one of those present) broad agreement was reached on the following working definition of LA: '... a person's sensitivity to and conscious awareness of the nature of language and its role in human life' (James and Garrett, 1992, p. 8). It has been objected that this definition, broad as it is, is open to a host of interpretations. This is indubitably true, but as Van Lier (1996, p. 79) has since pointed out this is not necessarily a disadvantage in the early stages of a new endeavour, even though eventually more precision will be called for. Given the present state of our art, I shall therefore continue to use this broad definition as a point of reference throughout this chapter. On the other hand, this is not to be understood as meaning that I pretend to cover the whole gamut of issues raised at an international conference on LA, for example. No, here the focus will be on the core business of LA, that is language teaching and learning as well as language learners and teachers (cf. Malmqvist and Valfridsson, 2003, p. 155). Also in this chapter, LA and Knowledge about Language (KAL) will be used interchangeably unless otherwise indicated.

So, in the following sections I propose to deal with the evolution and trends in LA. The survey chiefly, though not exclusively, focuses on the evolution of LA in Europe. It emphasises the Germanic language area as this is the author's main area of expertise. As we go along it will become apparent that the adoption of a European perspective is more or less inherent in the development of LA itself, as elsewhere LA studies seem to be of much more recent origin (cf., Candelier, 1992; Van Lier, 1996). In the section Problems and Practical Difficulties, I shall take up some of the current problems and difficulties experienced in the field of LA. In the section Future Directions in Research and

Practice, we shall look at some potential directions in research and educational practice.

#### EARLY HISTORY OF LA

Ever since Wilhelm von Humboldt (1767–1835) apprised the linguistic world of his belief that language is not so much a product (*ergon*) as a process (*energeia*) that manifests itself in the ever repetitive effort of the individual mind to suit the collective medium that language is to the expression of one's thoughts ('[Die Sprache] ist nemlich die sich ewig wiederholende Arbeit des Geistes, den articulirten Laut zum Ausdruck des Gedankens fähig zu machen' [Steinthal, 1884, pp. 262–263]), language pedagogues who derived their inspiration from Humboldt have wondered whether this mental effort could somehow be aided. This is how early modern LA was born. But how to go about it?

In the prevailing pedagogical climate of the nineteenth century, dominated by a deductive methodology of teaching in which the inculcation of grammar rules was rife (Klippel, 1994, pp. 443–444; Wilhelm, 2005) it was by no means easy for the reformers to implement the Humboldtian precepts. For one thing because Humboldt himself had not expressed himself as unequivocally as one would wish. For example, while Humboldt had said that just because native-language acquisition is largely a matter of arousing our language faculties it cannot really be taught or learnt, he had at the same time made allowance for external influences ('[Die Sprache] ist zugleich nicht bloss passiv, Eindrücke empfangend, sondern [...] modificirt durch innere Selbstthätigkeit jede auf sie geübte äussre Einwirkung'. [Steinthal, 1884, pp. 247–248]) such as practice (*Übung*, cf. Steinthal, 1884, p. 285), which might foster the growth of language ability. For another thing there was no appropriate methodology, one that besides enjoyed sufficient scholarly prestige. Phonetics and neogrammmarian research seemed to offer these. Both sciences were primarily concerned with studying the speech of individuals (language was really an abstraction) through the senses, by observation or by self-observation (i.e. introspection). Both favoured an inductive methodology, both resorted to associationist psychology.

By and large, these views were also adopted by the early proponents of LA (cf. Hildebrand, 1867, *passim*; Jespersen, 1904, pp. 125–141; Sweet, 1899, pp. 236–255). Oblivious of Humboldt's ambivalence, they seemed to assume that *conscious* reflection on language form and language use would automatically benefit the workings of the learner's *intuitive* linguistic sense). This is a perennial issue in LA to which we return in the section Problems and Practical Difficulties.

THE TWENTIETH CENTURY: MAJOR  
CONTRIBUTIONS

Not surprisingly, in an age so dominated by the deductive grammar-translation method, LA remained a phenomenon on the periphery of the language-teaching arena. Refinements of the original LA theory were introduced by the German linguist Georg von der Gabelentz (1901), who devoted a chapter of his work *Die Sprachwissenschaft* (General Linguistics) to knowledge of language (*Sprachkenntniss*), and who made a distinction between unconscious acquisition and conscious learning, and one between LA in the teaching of the native and of another language. Von der Gabelentz played down the importance of translating (except as an LA tool) and made out a strong case for what we would now call educational linguistics (Von der Gabelentz, 1901, p. 71).

It is not unlikely that Harold Palmer (1877–1949) was influenced by Von der Gabelentz. In any case, both the works of Palmer in (1917) and (1922), but especially the latter one shows a close affinity with Von der Gabelentz's views on LA. In two separate chapters, Palmer (1922) elaborated on the distinction between our 'spontaneous capacities for acquiring speech' and our 'studial capacities of language studies'. The former operates unconsciously (subconsciously in Palmer, 1917) in the acquisition of one's mother tongue and in the natural acquisition of any subsequently learnt language, the latter is conscious strategies that are mobilised whenever artificial learning tasks like reading and writing are involved. Palmer made much of the latter capacities: '... it would be either unwise or impossible to proceed by the sole aid of nature or by the reconstitution of natural conditions' (Palmer, 1922, p. 22).

Inspired by developments in Germany around 1900 Holland began to evolve its own brand of LA. It formed part of a broader movement for the emancipation of native-language education. Not only because of its relevance to our topic but also because of its intrinsic interest I should like to quote from one of this movement's central publications (van den Bosch, 1903): '[it is our aim] to turn the youngster into a keen observer and a shrewd judge [of language use by] teaching him how to compare and how to distinguish, [by making him] find things out for himself' so that through a process of growing awareness and increasing self-confidence that continues throughout life, he becomes the 'authoritative controller of his own language use'. *What* was to be observed was the immediate, authentic language reality of the learners themselves. It was the teacher's job to provide guidance to his pupils.

These quotations bespeak a close affinity with the current British movement for Critical LA (CLA), especially if one compares them with a recent statement by a prominent protagonist of CLA that if LA

is to affect the pupil's language capacities in a positive way it should incorporate 'the important principle that critical language awareness should be built from the existing language capabilities and experience of the learner. The experience of the learner can, with the help of the teacher, be made explicit and systematic as a body of knowledge which can be used for discussion and reflection, ...' (Fairclough, 1992, p. 16; Fairclough, 1995, pp. 222–227). Like their modern British CLA counterparts, the Dutch reformers also had an ideological axe to grind: they emphasised the social responsibility of teachers as citizens. Teachers should be socially committed and engaged. They should educate their pupils about the ideological and political nature of dubbing particular language varieties appropriate or inappropriate for particular contexts and purposes. They should provide their pupils with the linguistic tools to effectively exercise their citizenship. Language education was primarily seen as a language liberation movement.

There is another parallel between CLA and the early Dutch LA movement: neither want LA work to be conducted as an isolated activity, as a kind of mini-course in linguistics taught across the curriculum, but as an integral part of any regular language class. This is a marked difference with non-critical British LA (cf. Hawkins, 1984).

During the 1930s LA received renewed attention in Germany and Holland from Drach (1937) and Langeveld (1934), both important monographs, continuing and refining the earlier LA work. Special mention must be made here of a fascinating article by Schneiders (1937), a secondary-school teacher of Dutch and writer of coursebooks. In this article Schneiders explored the notion of language understanding (*taalbegrip*), which he contrasted with linguistic feeling (*taalgevoel*), a notion with the general reader was much more familiar at the time. In his acceptance of the primacy of our intuitive linguistic feeling *vis-à-vis* the reflective or cognitive activity of language understanding, Schneiders proved himself way ahead of his time (Van Lier, 1996, p. 79).

The last two works to be reviewed in this section are those of Royen (1947) and Stutterheim (1954). To appreciate the proper significance of the former, it should be compared with a British book on LA that appeared almost 40 years later, Hawkins (1984). Both books aim at an adult readership (primary school teachers or prospective teachers), both books are primarily concerned with the teaching of the national language, either to native speakers or to speakers of other languages. Both books have roughly the same aims, avoid technical terms and theoretical issues as much as possible, and cover roughly the same topics, including language comparison. Even in their definitions of the aims of LA the authors use similar wordings (cf. Hawkins, 1984, pp. 4–5; Royen, 1947, p. 5). Royen was the first to take a much broader view of LA than had up till then been usual. For example, it included a discussion

of language diversity. Where Royen and Hawkins would have parted company is on the question of whether LA should be dealt with in an integrative way or as a separate element in the school curriculum; Royen preferred the former.

Stutterheim (1954) very appropriately bore the title *Taalbeschouwing en Taalbeheersing* (i.e., language awareness and language mastery). It was a well-documented empirical study focusing on the question as to whether in the teaching of reading the explicit attention given to language structure has any positive effect on the pupils' interpretation of what they read and, if so, how this knowledge of grammar can be brought to bear on the pupils' linguistic competence. On the basis of his evidence Stutterheim's answer was a qualified yes. For further discussion, see Van Essen (1995).

We know very little about what went on in the way of LA in the former Soviet Union, simply because of the lack of sufficiently detailed expositions of the work of Russian researchers in English. For decades Vygotsky (1962) and Belyayev (1963) were the only major publications in our field available in English. What we do know—and this has come to us through Dutch and German—is that Galperin, a member of the Vygotskian school of psychology, worked out a theory that capitalises on insightful learning in language teaching. Galperin's theoretical notions, relevant to our topic, are three in number. First grammatical *knowledge* is formed by teaching the learners grammatical acts. These grammatical acts, which are to become *mental* acts (they must be performed in the minds of the learners during active or passive use of the language), are formed by passing through a series of *stages* at which these acts successively assume different forms: material, verbal, mental. Besides, at every stage of the learning process, the learner is provided with a 'full orientating basis', that is all the directions s/he needs to perform a given task. A full orientating basis is said to ensure an errorless performance as well as an adequate insight into the activity and its cues (Van Parreren, 1975, p. 122; Van Parreren and Carpay, 1972, p. 27). Generally speaking, the principles of consciousness and of the learner's conscious grasp of the language structures involved in carrying out a speech act played an important part in the Russian methodology of teaching languages during the Soviet period (Belyayev, 1963, pp. 47–48; Leontiev, 1981, p. 41).

#### CURRENT WORK IN LA

After LA studies had been in abeyance for about three decades there was a resurgence of interest in the 1980s, without any obvious link with the earlier Humboldtian tradition. This renewed interest arose out of a universal disenchantment over the way languages (but especially the

mother tongue) were taught in schools and academic institutions. Calls for reform had been heard from the early 1960s onwards. These demands had been expressed most clearly and consistently in the UK and had resulted in a new and detailed teaching programme called *Language in Use* in which the functional linguist Michael Halliday had also had a hand. The aim of the course was defined as 'to develop in pupils and students awareness of what language is and how it is used and at the same time, to extend their competence in handling the language' (Doughty et al., 1971, pp. 8–9).

Subsequent studies carried out in the UK and elsewhere have demonstrated that there is a close correlation between the home background of the learner and underachievement, with adult time as an important predictor of school failure. These findings pointed to the need for a much greater awareness among teachers as well as parents, of how children's use of language and the school's attitude to language interact to affect learning (Hawkins, 1984, pp. 16–17). It was thought that LA, as a separate subject in the school curriculum and as a course for parents, would cater for just this need.

What would this new element do? It would provide a common ground for discussing language issues in a common vocabulary, thus bridging the gap between English, ethnic-minority mother tongues, foreign languages (including dead languages) and English as a second language. It would offer a forum in which language diversity could be discussed, so that linguistic prejudice and parochialism could be challenged. On top of that it would seek to give learners confidence in grasping the formal patterns in language, especially as such insight had been shown to be a key element in foreign-language learning aptitude. Contrastive procedures could be helpful in bringing out any differences (Hawkins, 1984, p. 4).

Observe that this is rather a statement of what LA does than what it is. (The definition quoted earlier, put forward in 1985 by the British Consortium of Centres for Language Awareness, quite legitimately, states its *nature*.) It is also obvious that Hawkins takes a broad view of LA (not just attending to the language system, but to the socio-cultural function of language), in the way that Royen (1947) did.

The next important landmark in the history of recent LA was the appearance of Ronald Carter's reader *Knowledge about Language and the Curriculum* (Carter, 1990). It is a collection of 16 accessible essays designed to boost teachers' confidence and to provide them with the theoretical basis on which they may organise their classroom practice. An analysis of each of the articles is beyond the scope of the present survey and a brief discussion of the chief aims and the main assumptions underlying this reader must therefore suffice. The book falls into two parts; part one addresses issues of KAL for learners in primary and

secondary schools. Issues addressed are the interface hypothesis, syllabus content, LA methodologies and KAL and its relationship to CLA (for a recent polemical exchange of views on critical language study generally, see Seidlhofer, 2003, pp. 126–168). Part two is predominantly concerned with teachers' KAL and treats such matters as early language development, the four skills, multilingualism, language and social groups and spoken and written language.

It is extremely difficult to extract a definition of KAL from this book; none of the authors seems willing to commit herself/himself. On p. 23 there occurs a kind of paraphrase of KAL: 'Knowing things about language. Being interested in and informed about language'. This statement is modified on p. 27, where it is said that the 'most important kind of knowledge about language is implicit knowledge'. For further discussion, see the section Problems and Practical Difficulties.

Following Halliday, the authors take a functional view of language. This means that there is a preponderant concern with language variation, and the uses and functions of language are stressed *vis-à-vis* the forms of language. Emphasis is placed on the description of language in social contexts rather than on that of isolated decontextualised bits of language. CLA is promoted: being more explicitly informed about the sources of attitudes to language, about its social uses and misuses, about how language is used to manipulate, can empower learners to see through language to the ideologies that particular stylistic choices embody. On top of this, KAL should promote experiential learning, exploratory and reflective encounters with language.

The LINC (i.e., Language in the National Curriculum) project, of which the book under review is the outgrowth, aims at enhancing teachers' understanding and KAL in relation to processes of teaching and learning. KAL provides them with a shared frame of reference in which to discuss language issues, and assist them in discussing such issues with parents (Carter, 1990, pp. 3–4).

Recent American studies dealing with LA are Rutherford (1987) and Van Lier (1995, 1996). Van Lier, perhaps unwittingly, continues the Dutch tradition. His books aim at helping learners and teachers to understand how language is used as a tool, how it relates to life's central activities, from learning to thinking to social relationships. Employing LA activities is in itself a LA-raising exercise (Van Lier, 1995). It deals with a variety of LA and CLA aspects.

In the context of second-language grammar teaching, Rutherford (1987) uses the term 'grammatical consciousness-raising' to denote the processes whereby the learner raises grammatical operations to the level of consciousness. Rutherford convincingly shows that a grammatical syllabus need not rule out a process approach. On the contrary it would nicely dovetail with a discourse-process approach (cf. McCarthy and Carter, 1994).

## PROBLEMS AND PRACTICAL DIFFICULTIES

In this section we shall address the moot question of the relationship between consciously learned and unconsciously used knowledge. Many workers in the field (e.g., Richmond [in Carter, 1990]; Stainton, 1992), but not all (cf. Van Lier, 1996, pp. 69–81) would hold that LA is concerned with explicit or conscious knowledge (and this is how we defined it in the introduction) and KAL rather with implicit or unconscious knowledge. In the latter case it would border on linguistic sense, or Chomsky's knowledge of language, and it would be the teacher's job to help the learner's implicit knowledge of language to develop. But here an important epistemological question arises: what is the difference between conscious and unconscious knowledge if we can help the latter to develop by means of the former? Does one not thus create a learner who can say '*What* I must know I can describe explicitly, but *how* I get to know it I cannot tell. Cannot tell because (a) I cannot analyse what I am doing or (b) I do not care to analyse it'. Does this not mean then that the teacher has to go about the development of implicit knowledge in a haphazard way, leaving it to chance for it to actually develop? Or does he have to create the rich linguistic environment known from the Chomskyan linguistics of the 1960s or the level of comprehensible input known in the literature as 'i+1' (e.g., Krashen, 1982)? Further, is implicit knowledge perhaps the final product of an explicit process? Is it appropriate to call knowledge a process? To make matters even more complex, some researchers (Butzkamm, 1993, pp. 101–104; Green and Hecht, 1993, p. 140; Leontiev, 1981, p. 42) postulate a whole range of (interrelated) levels of consciousness.

Be this as it may, the questions of levels of consciousness or of whether there is any seepage between conscious and unconscious knowledge (known as the Interface Hypothesis) or of whether there is also an *intuitive* awareness that the learner cannot explicitly articulate (Nicholas, 1992), cannot be resolved here and now. But at least one comes in for somewhat closer scrutiny here: the Interface Hypothesis. This hypothesis, launched by Krashen (1982, p. 83) holds that there is no interface between conscious and unconscious knowledge, that conscious knowledge can therefore never become unconscious knowledge, so that learning and acquisition are entirely independent of one another. The non-interface position thereby rejects any useful role for conscious LA activities (see also Sharwood Smith, *Morphological and Syntactic Awareness in Foreign/Second Language Learning*, Volume 6 and Ellis, *Explicit Knowledge and Second Language Learning and Pedagogy*, Volume 6).

Other researchers, basing themselves on empirical evidence (for a review, see Larsen-Freeman and Long, 1991, p. 324), uphold the interface

position, believing that carry-over of some sort does take place; still others defend only a weak interface position (for a discussion, see Ellis, 1997, pp. 114–115). As we noted earlier, this question cannot be settled conclusively until it is made clear what is meant by (un)conscious knowledge.

Another big problem is the diversity of interpretations and implementations of LA in schools. A lesson may be drawn from the apparent failure of LA experiments in three comprehensive schools in the Netherlands (see Diephuis, 1986, pp. 57ff.). As a possible cause of their lack of success I may point to the existence at these schools, alongside each other, of a LA element calling for the explicit comparison of the learner's native language with other languages, and a communication-oriented unilingual language pedagogy, ignoring if not banning, such comparison. In the event it was left to the learners to reconcile the two opposing viewpoints. But any attempt to introduce LA into a school's curriculum without resolving the potential disparity between the two approaches may prove counterproductive. This is far from a peripheral issue. It is a crucial one, which curriculum developers and teachers alike need to monitor carefully.

#### FUTURE DIRECTIONS IN RESEARCH AND PRACTICE

In assessing past developments in LA the reader must bear in mind that much of what today constitutes received educational wisdom or is common practice in the language classroom has never been evaluated for its effectiveness. In the past, many successful educational innovations started as hunches, intuitions or inspirations, or indeed as oracular statements by gurus (cf. James and Garrett, 1992, p. 307). Does this mean we do not have to evaluate LA work? No. What it does mean is first of all that LA is to be firmly implanted in teacher education, and that a workable definition should be agreed on by all concerned. Besides, LA must be seen to *work*. Research and evaluation (preferably in the workaday conditions of the classroom) go hand in hand here. Most (if it had been published in English), but not all (if it had not been published in English), evaluation of LA work done before 1992 was reported in the reader by James and Garrett (1992). Over the last decade and a half most (evaluation of) LA work has appeared in *Language Awareness*, a journal with an international editorial board, founded at the round table referred to in the introduction, and published by Multilingual Matters in the Clevedon.

James and Garrett (1992, p. 307) point to the major benefit that might accrue from a positive evaluation of LA work: the proof with which to convince sceptical colleagues of its value. The establishment of national and regional centres for LA may be an important step in the

dissemination of information about LA, in uniting authorities and teachers on a definition and in helping teachers to overcome any misgivings about LA. But the setting up of such centres requires extra funding. In the 10 years that have elapsed since I first wrote this, the extra money has not been forthcoming.

It has been argued that LA is just the means to an end, never the end itself. And that, whatever it is that is raised to consciousness, is not to be regarded as an artefact or object of study to be memorised by the learner and to be recalled by him/her whenever sentences are to be produced. Rather, what is raised to the level of consciousness is not so much the product (Humboldt's *ergon*) as aspects of the process (Humboldt's *energeia*) (cf. Rutherford, 1987, p. 104). LA activities should aim to be consistent with this principle.

Conscious language learning has, traditionally, been focused on the nuts and bolts of language (i.e., phonology, morphology, syntax, discourse) emphasising formal correctness. But full mastery of a language, any language, can only come as a result of understanding its nature and function in human life, of being aware of what it is and what it does, for us and for others (Van Lier, 1995). On the basis of the empirical evidence available to date (cf. Ellis, 1997, pp. 114–115; Mitchell and Myles, 1998, pp. 138–140) it is unlikely that such understanding will evolve by mere exposure to the language, however rich the linguistic environment may be. For this reason teachers will have to organise the context of learning in such a way that the learner's conscious involvement in language learning is ensured. Thus, learners need to be made aware of the functional differences between different forms by exploring different varieties of the language in different social contexts. They should also be given the opportunity to observe the differences between the language of the classroom and the language of real life, in much the same way that the Dutch reformers did. Over the past decade numerous publications have come to hand, which offer interesting possibilities for such an approach for both the teacher and the student (e.g., Cook, 1989; Legutke and Thomas, 1991; McCarthy, 1991; McCarthy and Carter, 1994; Van Lier, 1995, 1996 and subsequent editions). Such a conscious involvement of the learner does not equate LA with an explicit focus on language forms even though this does not rule out that under certain circumstances some learners may benefit from such a focus (Van Lier, 1996, p. 74).

In the meantime, research carried out under experimental conditions may continue to provide us with interesting sidelights on the differences between conscious learning and unconscious acquisition as well as on those between raw input and internalised intake in second-language learning. At the same time it may awaken us to the potential contributions consciousness-raising, metalinguistic reflection, negative feedback and input enhancement may make to effective classroom

language learning (cf. Ellis, 1997, pp. 110–115; McLaughlin, 1987, p. 22; Mitchell and Myles, 1998).

KNOWLEDGE ABOUT LANGUAGE IN THE MOTHER  
TONGUE AND FOREIGN LANGUAGE CURRICULA

INTRODUCTION

The term ‘knowledge about language’ (KAL, henceforth) is often used to refer to explicit knowledge in the form of pedagogic contents and more or less sophisticated metalanguage, which is aimed at bringing to the conscious attention of the learners particular aspects of how language functions as a system and is used in society (James, 1999). KAL has been considered as an important tool not only for language learners but also in the training of language teachers to assist their understanding of language structure and function (so its use is the same as the use envisaged for pupils), and as a tool for teaching language skills and understanding to their pupils (Andrews, 1999; Carter, 1990). With different connotations, perspectives and emphases, it has been an issue of interest in both mother tongue and foreign language education under several labels: language awareness (James and Garrett, 1992), metalinguistic knowledge (Alderson, Clapham and Steel, 1997), consciousness-raising (Hulstijn and Schmidt, 1994), focus on form (Doughty and Williams, 1998; Long, 1991), and explicit knowledge (Ellis, 1997; 2004 and Ellis, *Explicit Knowledge and Second Language Learning and Pedagogy*, Volume 6). Therefore, in this article I adopt an inclusive view of KAL, which considers it as a supra-label for work on language education that can be characterised with any of the key terms mentioned.

The role of KAL in language education has been and still is at issue (see, for instance, Huot and Schmidt, 1996). On the one hand it has had to confront teaching traditions, like English mother tongue teaching, which placed a great deal of emphasis on literature, aesthetic appreciation and creativity at the expense of systematic language analysis (Mitchell and Brumfit, 2001: pp. 290–291). On the other hand, KAL has also been the object of debate in the field of second/foreign language teaching, with researchers and educators struggling to clarify its role somewhere between two relatively extreme points of view: those who believe that successful performance is based on unconscious knowledge, acquired through being exposed to and participating in natural communication (Krashen, 1982); those who identify KAL exclusively with traditional sentence-level grammar as the basis for the language curriculum. It is important to emphasise that the object

of knowledge to be included within KAL is also highly controversial, between a limited focus on formal rules and a more comprehensive view of verbal communication including forms, uses, socio-cultural meanings and connotations, etc. KAL, as defined in this article, must not be simply associated with a static body of knowledge consisting of “watered-down linguistics” (Hawkins, 1984, p. 6). Rather, the introduction of KAL in the language classroom involves particular sets of classroom materials (e.g. Bain, Fitzgerald and Taylor, 1992), teaching techniques (Ellis, Basturkmen and Loewen, 2002), as well as a particular view of the role of education for the individual and for society (Van Lier, 1996, pp. 90–93).

### EARLY DEVELOPMENTS

The history of the term ‘KAL’ goes back to the Kingman Report, a document resulting from an enquiry by a committee set up by Her Majesty’s Inspectorate of Schools in the UK to make recommendations about the teaching of English (James, 1999). Chapter 2 of this report is entitled ‘The importance of knowledge about language’, and it is basically about the relevance of language competence in essential aspects of everyday life such as participating effectively in democracy, acquiring new concepts, and developing one’s personality (Richmond, 1990). Chapter 3 introduces a model of language including the following aspects of English as requiring attention: the forms of the English language, communication and comprehension, acquisition and development, and historical and geographical variation (Carter, 1990).

The events that led to the Kingman Report in the UK are clearly described by Donmall-Hicks (1997) and James (1999). The first calls for reform are dated back to the 1960s, and they were responded to by the then recently-established Schools Council with the funding of a research programme, directed by Michael Halliday, to connect the work being done in linguistics with English language teaching (Doughty, Pearce and Thornton, 1971). Donmall-Hicks and James concur in mentioning the report of the Bullock Committee as a decisive triggering element that brought together teachers dissatisfied with the low levels of pupils in both English and foreign languages in primary and secondary education. The National Council for Language in Education (NCLE) was set up in 1976, including a series of ‘language awareness’ working parties. The Kingman Report of 1988 and the Cox Report of 1989 seem to have made a convincing case for the importance of learning about language in the mother tongue curriculum, resulting in the *Language in the National Curriculum* (LINC) project. This was funded by the Department of Education and Science to (i) produce materials and (ii) support the implementation of the

recommendations outlined in the Kingman and Cox Reports in connection with the introduction of KAL in the English classroom (Carter, 1990, p. 2).

The area of foreign languages was also affected by the discussions that were taking place in connection with the role of KAL in mother tongue teaching. Hawkins (1984), suggested that the introduction of 'awareness of language' as a new subject in the school curriculum would (i) provide teachers and pupils with the necessary conceptual framework to explore and discuss language issues, integrating English, foreign and ethnic minority languages, (ii) offer a forum for appreciating linguistic diversity and confronting language prejudices, (iii) give pupils confidence in analysing and contrasting formal patterns in language, thereby enhancing their foreign language learning aptitude (Van Essen, 1997, pp. 4–5 and Van Essen, *Language Awareness and Knowledge about Language: A Historical Overview*, Volume 6).

The development of KAL (or language awareness) outside the UK is traced back by Van Essen (1997 and Van Essen, *Language Awareness and Knowledge about Language: A Historical Overview*, Volume 6) mainly for Holland and Germany to the beginning of the twentieth century, as a phenomenon that has been able to remain 'on the periphery of the language teaching arena'. This is the result of the predominance of a teaching ideology equating language with morpho-syntactic knowledge, and which, in spite of the advent of the audio-lingual and communicative approaches, survived in some contexts through the end of the century (see, for instance, Cots, 2000; Mitchell and Hooper, 1992). Finally, in the late 1970s and early 1980s, Roulet (1980), in Switzerland, developed a model to integrate and make more efficient the teaching and learning of mother tongue and foreign languages through a better understanding of language diversity and the functioning of language. The work of Roulet was a direct source of inspiration for the mainly francophone approach known as *Eveil aux Langues* (awakening to languages) elaborated by Candelier (2003, see also Candelier, "Awakening to Languages" and *Educational Language Policy*, Volume 6).

#### MAJOR CONTRIBUTIONS

In dealing with the major contributions to the work inspired by the notion of KAL, it may be possible, at the risk of over-simplifying the panorama, to distinguish between two strands with different emphases: educational and psycholinguistic. The two strands comprise very different understandings of KAL: while the educational strand has clearly moved towards a 'large' view of what knowledge about language is, the psycholinguistic strand is tributary to a view of

language acquisition that is centred around the appropriation of a formal linguistic system.

The educational strand can be considered as the direct inheritor of the grass-roots teacher movement that began in the UK in the late 1970s, and its main objective can be defined as pedagogic improvement in the teaching of mother tongue, second and foreign languages. Hawkins (1984) is generally considered to be the initiator of this first strand, whose adherents can be found in different publications by authors such as Carter (1990), James and Garrett (1992), Van Lier (1996), and Burley and Pomphrey (2003). Within this educational strand, it is possible to distinguish a sub-strand that corresponds to the British movement known as Critical Language Awareness (CLA henceforth). This strand represents an attempt to combine an understanding of the functioning of language as a system with the development of an awareness of the ideological bases underlying language use, and it is represented by the work of authors such as Fairclough (1992), Janks (1993, see also Janks and Locke, *Discourse Awareness in Education: A Critical Perspective*, Volume 6), Goatly (2000), and Wallace (2005).

The second strand of contributions to KAL, although still centred on language pedagogy, is more closely associated with the field known as second language acquisition (SLA) and it has a clear psycholinguistic orientation, focusing on the learning rather than the teaching process. Among the authors/works that qualify for inclusion in this second strand, the following could be mentioned as examples: Doughty and Williams (1998), Ellis (2004), Lightbown and Spada (2000), Long (1988), and Schmidt (1995). In the remaining part of this section I will deal separately at greater length with each of the two strands of KAL.

From the point of view of the 'educational strand' of KAL, in his introduction to the volume entitled *Knowledge about Language*, including supplementary articles to the material developed as part of the LINC project, Carter (1990, pp. 4–5) defines six main methodological principles for KAL work in primary and secondary schools: (i) no return to formalist, decontextualised, sentence-level linguistic analysis; (ii) building upon learners' existing abilities and resources; (iii) a dialectical relationship between learning how to use a language and learning about it; (iv) empowering pupils to uncover ideologies behind language use; (v) gradual introduction of metalanguage in accordance with pupils' needs; (vi) experiential, exploratory approach to language.

As for a rationale for KAL, James and Garrett (1992) propose five possible 'language awareness domains' that summarise the five main directions in which KAL work can be justified, and in terms of which its effectiveness can be evaluated: (i) affective: forming attitudes

and developing motivation and curiosity; (ii) social: fostering social harmony in multilingual/multicultural contexts; (iii) power: emancipating the individual from oppression and manipulation through language use; (iv) cognitive: developing linguistic as well as general intellectual aptitudes, especially in relation to language learning and use; (v) performance: effectively improving language proficiency.

Van Lier (1996, p. 95) postulates the ‘essential interconnection of awareness with autonomy and authenticity’, by which he means that pupils must be able to make choices according to their needs/capacities/learning styles, and that the language material for awareness-raising must come from the real world. Following the same author (Van Lier, 1998), KAL work can be seen as involving different levels of awareness, with different degrees of social interactivity and language development, from a state of being awake (level 1) to a capacity to analyse language use as part of particular social, ideological practices (level 4), through capacities such as focusing attention on and noticing certain objects (level 2), controlling, manipulating and exercising creativity with language (level 3a), and engaging in formal analysis by applying metalinguistic knowledge (level 3b).

The situation of KAL in the actual classroom can be glimpsed from case studies such as those reported in work by Andrews (1999) and Mitchell and Brumfit (2001). The first author shows the extent to which L2 teachers’ metalinguistic knowledge and their beliefs about its pedagogic role can affect their general approach to teaching (see also Andrews, *Teacher Language Awareness*, Volume 6). Mitchell and Brumfit (2001) point to the lack of consistency that pupils experience in connection with KAL work in the mother tongue and in the foreign language classroom, from an emphasis on texts (mainly literary), creativity and subjective appreciation to a focus on sentence-level morpho-syntactic and lexical analysis. These authors also point out the weak influence that debates on KAL have had on the teachers, the ‘patchy’ nature of teachers’ KAL, and the direct relation they establish between KAL and improved performance. Finally, the place of KAL in the mother tongue and foreign language curricula is analysed in works such as those by Labercane, Griffith and Tulasiewicz (1996), for Canada, Cots and Nussbaum (1999), for Spain, and Van Gelderen, Couzijn and Hendrix (2000) for the Netherlands. As was pointed out in the previous section, significant efforts to introduce KAL in the curriculum have also been made by teachers and researchers in the franco-phone world (France, Switzerland and Canada). Between 1998 and 2004, Candelier (2003) coordinated two EU-funded projects aimed at promoting the appreciation of linguistic and cultural diversity in primary schools (see Candelier, “Awakening to Languages” and *Educational Language Policy*, Volume 6).

The main contribution of the CLA movement, which I consider as a sub-strand of the educational strand, in the definition of the role of KAL in the language curriculum is presented by Ivanič (1990): a thorough treatment of language in the classroom must go beyond the level of pattern (accuracy) and purposeful process (appropriacy); it needs to incorporate a third layer of analysis, social context, in which language and its uses are seen as (i) shaped by and capable of shaping social forces, and (ii) as an element for constructing and sustaining social identity. The goal of CLA could be defined as contributing to the education of critical citizens, who can understand, and question if necessary, language use in connection with 'rules' of accuracy and appropriacy (Fairclough, 1992), and who can ultimately critique and react against oppressing situations of language use such as an excessive emphasis on standardization or the manipulative power of politics or advertising. The series of workbooks edited by Janks (1993), for the South African context, is an excellent example of how CLA can be applied to the design of curricular materials, dealing with topics such as identity, the media, or advertising. Other examples of 'critical' curricular activities and materials can be found in Goatly (2000), an introductory textbook addressed to undergraduate students, and Wallace (2005), including a thorough account of a university module on 'critical reading' the author herself taught.

The second main strand of KAL, which I have qualified as 'psycho-linguistic', can be traced in the literature through key terms such as 'explicit knowledge', 'formal instruction' or 'focus on form' (see also Ellis, *Implicit and Explicit Knowledge about Language*; Robinson, *Attention and Awareness*; Sharwood Smith, *Morphological and Syntactic Awareness in Foreign/Second Language Learning*, Volume 6). One of the basic tenets in this strand that endorses the role of KAL is that instruction that directs learners' attention to specific formal properties of a second/foreign language has positive effects on both the rate of acquisition and the ultimate level of attainment (Long, 1988: 135). This position is a reaction to the hypothesis proposed by Krashen (1982) according to which formal, explicit knowledge (i.e., knowledge about language) is of little use for the L2 learner in natural communication, in which the focus is on meaning rather than on form; therefore, according to this view, L2 teaching should be based on implicit knowledge (i.e., knowledge of language) resulting exclusively from meaning-focused communication. The practices of many teachers, however, seem to rely more on a model in which explicit L2 knowledge is considered to be a 'facilitator' of implicit L2 knowledge by helping learners, in the first place, to notice certain formal properties of the

input that may easily pass unnoticed, thereby allowing them to 'notice' (Schmidt, 1995, pp. 1–64) the difference between their performance and that of more proficient speakers. In the second place, L2 explicit knowledge can be used by the learners to monitor their output, either *a priori*, while planning or rehearsing, or *a posteriori*, when revising the output produced (Ellis, 1997; Ellis, *Explicit Knowledge and Second Language Learning and Pedagogy*, Volume 6).

If we accept this second hypothesis, the logical question from a pedagogic point of view is about the best way to impart explicit knowledge. In traditional grammar-centred and cognitive approaches, as well as in some teaching practices following the three-stage 'PPP' model (presentation>practice>performance), the dominant option is the deductive method, whereby a rule is given to learners who are later asked to identify it and apply it in different linguistic or communicative contexts. By contrast, in an inductive method, more characteristic of the audio-lingual or communicative approaches, learners are provided with language data from which they are expected to induce a particular rule.

Long (1991) presents another distinction in connection with the issue of imparting KAL: 'focus on forms' versus 'focus on form'. Long suggests that the former approach involves a pre-selection of linguistic structures in the form of a syllabus, which are isolated, taught and tested discretely; on the other hand, a 'focus on form' approach is characterised by the priority given to meaning-focused communicative activity in a task format, in which form-focused episodes can only arise from specific problems or needs of the learners within a particular communicative activity.

Ellis, Basturkmen and Loewen (2002) make a still further distinction between planned and incidental 'focus on form'. The first type is based on communicative tasks that are designed to make learners aware of the relevance of a particular form and to elicit its use. Incidental 'focus on form' takes place in the course of communicative tasks that are aimed at eliciting communication in general, and it occurs in the form of generally brief episodes whose occurrence depends on whether teacher or learners deem it necessary for the resolution of the task. Doughty and Williams (1998, pp. 197–261) consider planned versus incidental 'focus on form' (in their terminology, proactive vs. reactive) as one of six 'pedagogical choices' in connection with the presence of 'focus on form' in the language classroom: (i) Is it necessary? (ii) Should it be planned in advance or simply remedial? (iii) What linguistic forms should be focused upon? (iv) How much explicit knowledge should it involve? (v) What should be the timing of focus on form in the lesson? (vi) What should be the place of focus on form in the curriculum?

## WORK IN PROGRESS

Two authoritative sources of information for the work that is currently on-going in connection with the place of KAL in the mother tongue and foreign language curricula are the biennial meetings of the Association for Language Awareness and the journal *Language Awareness*. In these sources it is possible to see that one of the topics that seems to attract a great deal of interest is related to teachers' KAL (including metalanguage) and the use they make of it in the language classroom, a tradition that was initiated in the work of Mitchell and Hooper (1992). Relatively recent collections of studies in this line of research can be found in a special issue of *Language Awareness*, edited by Andrews (2003), and a volume edited by Bartels (2004). Work in this orientation tends to be based on the adoption of classroom observation and teacher interviewing as main research techniques. Basturkmen, Loewen and Ellis (2004) constitutes another recent example of this type of research. The authors analysed the beliefs and practices of three teachers in relation to incidental focus on form and found differences in teachers' practices due to personal teaching styles, inconsistencies in the teachers' stated beliefs, and a relative lack of match between the teachers' beliefs, as stated in their interviews, and their practice.

The relationship between multilingualism and KAL (alternatively, metalinguistic awareness), seems to be another focus of interest (see also Jessner, *Language Awareness in Multilinguals: Theoretical Trends*, Volume 6). The study by Herdina and Jessner (2002) constitutes a promising theoretical support for studies dealing with multilingual processing and cognition (see for instance, Jessner, 2005). One of the recommendations Herdina and Jessner make is that in the case of sequential multilingualism, it is important to introduce instruction in metalinguistic awareness to compensate for the increasing instability of the individual's communicative repertoire; this can be interpreted as clear support for the presence of KAL in language teaching, especially with learners whose repertoire already includes more than one language.

From the point of view of research methodology, Ellis (2004 and Ellis, *Explicit Knowledge and Second Language Learning and Pedagogy*, Volume 6) addresses the need for a clarification and empirical validation of the definition of L2 explicit knowledge and of the ways in which it can be assessed. From his definition we can extract the following characteristics (pp. 244–245):

1. It is declarative and often anomalous knowledge of the phonological, lexical, grammatical, pragmatic, and socio-critical features.
2. It incorporates the metalanguage for labelling this knowledge.
3. It is conscious, learnable and verbalisable.

4. It is typically accessed through controlled processing when L2 learners experience some kind of difficulty.

5. It varies in breadth and depth depending on the individual.

In order to measure explicit knowledge, Ellis (p. 265) suggests that a distinction be made between explicit knowledge as ‘analysed (potentially aware) knowledge’ and as ‘metalinguage’, and proposes three types of tests (language aptitude, grammaticality judgments, and meta-language) and verbal reports as assessment tools. In connection with research on teachers’ beliefs and use of KAL in the classroom, Borg (2003, p.106) notes an excessive terminological dispersion in this area (for instance, with concepts such as KAL, metalinguistic awareness, subject-matter knowledge) and suggests that more research is needed into three main aspects: the different ways of understanding KAL by teacher-trainers and teacher-trainees, actual teaching practices, and cognitive and contextual factors shaping pedagogic decisions by teachers.

The design and implementation of KAL materials in the form of modules to be used in the classroom was one of the main objectives of the LINC project between 1989 and 1992 (Bain, Fitzgerald and Taylor, 1992; Carter, 1990). This was also the aim of the *Eveil aux Langues* approach (Candelier, 2003, see also Candelier, “Awakening to Languages” and Educational Language Policy, Volume 6), which inspired the Canadian project *Éveil au Langage et Ouverture à la Diversité Linguistique, ELODIL* (Armand, Maraillet and Beck, 2004) as well as the Swiss project *Éveil au Langage et Ouverture aux Langues, EOLE* (Perregaux, De Goumoëns, Jeannot and de Pietro, 2003). Both projects are being carried out in the context of teacher professional development and one of their main focuses is the preparation of modules for primary school pupils essentially aiming at legitimating the languages of all students, raising awareness about the social role of French as common language, developing general metalinguistic abilities by making reference to different languages, arousing curiosity about languages, and promoting an attitude of enquiry, multilingual socialization and a ‘linguistic culture’.

#### PROBLEMS AND DIFFICULTIES

One of the main problems for the introduction of KAL in the mother tongue and foreign language curricula is mentioned by Carter (1990, p. 4) as the first principle for KAL work in primary and secondary schools: ‘There can be no return to formalist, decontextualised classroom analysis of language’. The problem, in essence, is whether promoting KAL may be perceived by some teachers as a return to the traditional ‘grammar-grind’ approach, focusing on sentence-level

grammar and below, or whether it will be integrated within a clearly communication-oriented approach such as focus on form. The problem is perhaps more evident in the case of foreign language teaching, as has been pointed out by Mitchell and Brumfit (2001). Andrews (1999) and Cots (2000) also show how, despite the apparent dominance of the communicative approach, grammar is still very much at the centre of the materials and teachers' pedagogic practices, whether in Hong Kong or in Spain, with a syllabus and an assessment methodology that rely mostly on the learning of discrete grammatical structures. Guidelines to avoid an excessively formalist curricular orientation have been proposed by Nunan (1991), who recommends that grammatical items should be learnt within a discourse context, with greater attention to form-function relationships, and through inductive activities; the author also suggests that teachers should adopt an 'organic' (as opposed to a 'linear') view of language learning, questioning a direct relation of cause-effect between teaching and learning, allowing for 'backsliding, leaps in competence, interaction between grammatical element, etc.' as natural characteristics of language development (Nunan, 1991, p. 148). McCarthy and Carter (1994) also make a specific proposal to integrate the conscious-unconscious perspectives of language learning through consciousness-raising or language awareness work along three broad parameters (i.e., form, function, and socio-cultural meaning) and five curricular principles (i.e., comparing/contrasting texts, exposure to a continuum of literary and non-literary texts, focus on inferencing procedures, progressing from the familiar to the unfamiliar, and developing critical capacity).

One of the 'pedagogical choices' that Doughty and Williams (1998) point out in connection with the introduction of knowledge about the L2 in the curriculum is whether it should be planned in advance or simply remedial. This choice is connected with 'focus-on-forms' versus 'focus-on-form' debate (see before). The former approach is clearly descendant from the synthetic tradition in language teaching (Wilkins, 1976; cited in Long and Robinson, 1998, p. 15). Focus-on-form instruction is clearly linked to communicative language teaching (Basturkmen, Loewen and Ellis, 2004, p. 243) and it seems to be more in line with recent ecological perspectives on language teaching and learning (see, for instance, Van Lier, 2002). According to Sheen (2003), although the latter approach seems more compatible with currently accepted theories of second language acquisition there is no adequate empirical research proving conclusively that focus on form is a more effective approach than focus on forms. In this same direction, Norris and Ortega (2000, p. 500), after revising 49 studies published between 1980 and 1989 concluded that "although both FonF [focus-on-form] and FonFS [focus-on-forms] instructional approaches result

in large and probabilistically trustworthy gains over the course of an investigation, the magnitude of these gains differs very little between the two instructional categories.”

Another problem that appears in defining the role of KAL in the curriculum is related to the nature of metalanguage and, more specifically, to the level of sophistication required. Gombert (1997) makes a distinction between epilinguistic and metalinguistic processes, with the former referring to unconscious metalinguistic activities and the latter having a reflective, intentional character. For Gombert, the acquisition of metalinguistic awareness follows the acquisition of the first language and of epilinguistic control. This idea is consistent with James' (1999) suggestion that KAL has a different role in the mother tongue and in the foreign language curriculum. In the first case, KAL contribution involves the explication of intuitive knowledge; in the second case, KAL work consists of noticing and understanding the difference between the learners' present knowledge and the target they are aiming at in terms of capacity to manipulate and understand language. Leo Van Lier's (1998) proposal to posit different levels of consciousness is an important contribution towards clarifying the type of work that may be involved in KAL depending on the expectations and the abilities of the learners.

#### FUTURE DIRECTIONS

One of the directions for future work in KAL is related to the need for evaluation of the results of its introduction in particular contexts and teaching programmes. In the concluding chapter to their edited volume, James and Garrett's (1992) argue that evaluation can be made in terms of the effects of KAL on the five domains they propose: affective, social, power, cognitive and performance. The need for evaluation is also pointed out by Ellis (1997), who suggests that the kind of consciousness-raising tasks he advocates need to be investigated by teachers in the context of their classrooms. Van Lier (1998) and Sheen (2003) also advocate the observation, description and analysis of what occurs in the real classroom as a whole; Sheen calls for a return to long-term comparative studies on the effectiveness of different programmes or instructional techniques integrating or excluding KAL, respectively. Evaluation through the experimental method is also seen as necessary by Norris and Ortega (2000), who noticed a lack of studies including delayed post-tests on the durability of focused L2 instruction.

Another direction in which further work will be welcomed is the role of KAL in teacher training, teacher expertise and how teachers transfer their knowledge into particular teaching situations (Andrews, 2003 and Andrews, *Teacher Language Awareness*, Volume 6). In this sense, it is

interesting to bear in mind three of the findings Bartels (2004, pp. 405–424) distills from a review of different studies: (i) the acquisition of KAL during the teacher training process does not guarantee its full and consistent transfer to L2 teaching; (ii) a solid KAL does not seem to be necessary for high teaching quality; (iii) in order to guarantee KAL transfer to teaching situations, teachers cannot be expected to make the link between linguistics and pedagogy by themselves, and they need to be taught in concrete terms how to apply KAL. Teachers' beliefs and training on KAL are also very much connected with the role of metalanguage in their teaching practices and in the learning practices of their students (Berry, 2005). Within the broad area of teacher training, one must also note a recent interest in research that involves developing a greater awareness of non-native language teachers, of their assets and strengths (Llurda, 2005) as well as of the implications of the international role of English worldwide (Gnutzmann and Intemann, 2005).

Finally, it cannot be ignored that the results of research on KAL can only reach the language classroom if they are reflected into specific teaching materials that teachers find useful. In this sense, it is interesting to ponder upon one of the conclusions Nitta and Gardner (2005) reached after their analysis of contemporary ELT materials: in spite of the arguments provided by research against the efficacy of practicing tasks, these still dominate grammar teaching. One of the directions in which the development of KAL materials could proceed is the presentation of language use as negotiation of meanings situated in specific social/institutional contexts. This would require a de-emphasis on rule learning and application (whether it is grammatical rules, as in the SL/FL classroom, or textual rules, as in MT classroom; see Mitchell and Brumfit, 2001) and a greater focus on KAL as naturally emerging from personal communicative experiences, contextualised (situated/negotiated) language use, and personal engagement with some kind of activity which is not necessarily of a linguistic type (Van Lier, 2002). Another future direction for developing KAL materials derives from the fact that, in general (see, for instance, the bibliographic compendium by Aplin, 1997), they focus on either one particular language or on language as a human capacity, and there is a clear noticeable absence of published materials focusing, simultaneously and with greater or lesser degrees of emphasis, on two or more languages, thereby reflecting the multilingual character of our societies with many people's communicative repertoires including at least two languages.

DISCOURSE AWARENESS IN EDUCATION:  
A CRITICAL PERSPECTIVE

INTRODUCTION

*Discourse awareness* does not exist as a concept in the literature.<sup>1</sup> Its invention here resonates firstly with Language Awareness (LA) and secondly Critical Language Awareness (CLA). LA is a classroom pedagogy conceptualised by modern language teachers that was designed to develop student's knowledge about language. CLA is a critique of LA and it is the pedagogical arm of Critical Discourse Analysis (CDA), which is in turn a critique of Discourse Analysis (DA).

The word *critical* which lurks here is a key discriminator amongst this dizzying list of abbreviations. It has a bearing on the two broad meanings of the word *discourse* that we bring to this chapter:

1. An abstract noun denoting language in use as a social practice with particular emphasis on larger units such as paragraphs, utterances, whole texts or genres;
2. A countable noun denoting a 'practice not just of representing the world, but of signifying the world, constituting and constructing the world in meaning' (Fairclough, 1992a, p. 64). Gee (1990) uses 'Discourse' with a capital 'D' for this meaning of the word.<sup>2</sup>

The second signals an approach that focuses on the interface between language and power. This chapter argues that a critical understanding and awareness of discourse is important for education in general and language education in particular. It tracks the history, applicability and problems of what we call discourse awareness in both senses of the word *discourse*, and discusses its significance for both teachers and students.

EARLY DEVELOPMENTS

Hawkins' book, *Awareness of Language: An Introduction*, published in 1984, marks the start of an LA approach to language education (see also Van Essen, *Language Awareness and Knowledge about Language*:

---

<sup>1</sup> However, MacLure's concept of 'discursive literacy' meaning 'an understanding of the rhetorical fabric out of which institutions are built' occupies similar territory (MacLure, 2003, p. 5).

<sup>2</sup> We have not adopted Gee's practice in this chapter. Context generally indicates which meaning of the word applies.

A Historical Overview, Volume 6 and *Cots, Knowledge about Language in the Mother Tongue and Foreign Language Curricula*, Volume 6). LA focuses on the linguistic and pragmatic properties of language per se and was originally defined as 'a person's sensitivity to and conscious awareness of the nature of language and its role in human life' (Donmall, 1985). It was initiated by modern language teachers to address their concern that the increasing number of students in Britain leaving school with English only would create a society of 'complacent mono-lingual adults'. This in turn could produce 'socially divisive' attitudes of 'insularity and cultural superiority' (Donmall, 1985, p. 18).

In 1985, Sinclair proposed that to be linguistically aware pupils needed to understand six properties of language: productivity (language is generative such that from a finite set of rules one can produce an infinite number of sentences); creativity (language rules can be broken and this creates new meanings); stability and change (language is constantly changing but at any moment in time is relatively stable); social variation (social factors cause language to vary); language can do things (language varies in relation to its different functions of use); language is a two-layered code (it is both content and form).

The first series of classroom materials, *Awareness of Language*, edited by Hawkins set out to achieve these aims with activities that invited students to compare and contrast the resources of different languages. In *Spoken and Written Language*, for example, students were introduced to the history of writing, different alphabetic scripts, ideographic languages which use characters, the vagaries of spelling and the differences between speech and writing. Other books in the series introduced students to non-verbal forms of communication, language acquisition theory, language varieties and change and language use. In all, they offered simple introductions to linguistics, socio-linguistics and psycholinguistics.

As an approach, LA has persisted into the new millennium. For example, a European assisted action research programme involving syllabus production and its delivery across several European primary schools made the following assumptions:

- 'LA can empower the language users in all of their first language transactions;
- 'LA extends the instrumental use of language as a vehicle of communication;
- 'It promotes imagination and creativity through the aesthetic and artistic uses of language;
- 'It sensitises language users to the role of language in intercultural education' (Tulasiewicz and Adams, 2003, p. 82).

In a paper entitled 'Critical Language Awareness', Lancaster University colleagues Clark, Fairclough, Ivanic and Martin-Jones (1987),

while applauding LA's focus on knowledge about language and its social concerns, challenged the normative assumptions about schooling, language and language learning that underpin it, arguing that 'Language Awareness programmes present ... linguistic practices as a natural domain, a given and common sense reality whose social origins are out of sight' (p. 13). Evidence to support this view can be seen from the way in which the dominance of English was naturalised, and the way in which language varieties were presented as different but without any discussion of how they are socially stratified in Hawkins' series.

A good example of a critical approach to language variation is Fairclough's discussion of appropriateness (1992b, pp. 33–56). He addresses himself to Hymes's view that 'we have to account for the fact that a normal child acquires knowledge of sentences, not only as grammatical, but also as appropriate. He or she acquires competence as to when to speak, when not, and as to what to talk about, with whom, when and in what manner. . . . There are rules of use without which the rules of grammar would be useless' (Hymes, 1974, p. 15). Fairclough provides an extended argument to show that appropriateness is both a normative and a prescriptive concept. From the perspective of CLA, Hymes's 'rules of use' are inextricably linked to relations of domination and subordination in a society and the notion of communicative competence, in reifying and naturalising these rules, reproduces them and legitimates the social order which they serve. Appropriateness, as determined by the cultural practices of the native speakers of the target language, is based on a unitary view of the target language. It naturalises native speakers' common sense and fails to recognise the fundamentally ideological nature of daily practices.

As an approach to language pedagogy, CLA argues for a more critical perspective on language practices and builds upon the work of critical linguistics and CDA (Fairclough, 1989). Fundamentally, critical linguistics argues for 'strong and pervasive connections between linguistic structure and social structure' (Fowler and Kress, 1979). Fairclough (1989), in his model of CDA has been able to demonstrate how linguistic choices embedded in processes of textual production, reception and dissemination reflect and enhance the power of particular discourses. In *Language and Power*, Fairclough (1989) offers a social theory of discourse based on the second meaning of the term referred to earlier, and which Gee (1990) defines broadly as 'ways of being in the world, or forms of life which integrate words, acts, values, beliefs, attitudes, social identities, as well as gestures, glances, body positions and clothes' (p. 142).

Where Discourse Analysis focuses on classifying speech events in terms of transactions, exchanges, moves and acts, and Conversational Analysis works with the expressive and responsive content of turns in

communicative interaction, CDA is more interested in the ways in which language works to maintain and produce relations of power, in spoken, written and multimodal texts. Marxist and Foucaultian theories of the relationship between language and discourse, on the one hand, and power, knowledge and subjectivity on the other provide the theoretical base for critical approaches to language education such as CLA, critical literacy, critical ESL/EFL. (See also Janks, *Teaching Language and Power*, Volume 1)

#### MAJOR CONTRIBUTIONS

##### *Analysing Classroom Discourse (with a small 'd')*

In 1970, Flanders developed a coding system for student–teacher interaction and concluded that an initiation-response-feedback (IRF) sequence was the basic discourse pattern in classrooms (see also Tsui, *Classroom Discourse: Approaches and Perspectives*, Volume 6). The teacher initiates, the student responds and the teacher reacts to the student's response. As this reaction is often evaluative, the pattern is often referred to as IRE rather than IRF.

The structure of the sequence allows the teacher to maintain the necessary control over the flow of information and the advancement of the academic content. Both the topic of the Initiation move (the teacher's questions) and the content of the Evaluation move allow the teacher to advance the intended topic of discussion or learning. In addition, they allow her to check the status of knowledge, awareness and attention of students by calling on individuals and posing particular questions (O'Connor and Michaels, 1996, quoted in Cazden, 2001, p. 47).

Later work by Sinclair and Coulthard, designed to analyse the underlying structures of talk, provided a sound basis for the quantitative analysis of classroom interaction. It offered the means for assessing the asymmetrical distribution of turn- and activity-types as well as talk-time. In *An Introduction to Discourse Analysis*, Coulthard (1977) combined this work with speech act theory, the ethnography of speaking and conversation analysis as a means of highlighting the discursive properties of classroom interaction, showing, for example, how the control of turn-taking and topics relates to teachers' pedagogical purposes.

The contribution of conversation analysis (Atkinson and Heritage, 1984) to an understanding of classroom discourse is important because it focuses on talk-as-interaction, embracing function and content as well as structure. According to Bakhtin,

The utterance is filled with *dialogic overtones*, and they must be taken into account in order to understand fully the style of the utterance. After all, our thought itself—philosophical, scientific, and artistic—is born and shaped in the process of interaction and struggle with others' thought, and this cannot but be reflected in the forms that verbally express our thought as well (1986, p. 92).

In the classroom context, the analyst needs to understand how the participants engaging in talk take account of what others have said, to anticipate how others might respond, and to give weight to both the expressive and the responsive nature of talk. Such approaches can be thought of as building on the earlier work of Douglas Barnes (1977) which emphasised the relationship between classroom talk and learning, and the importance of pupils using language for making meanings that invite responses rather than for providing answers to be confirmed as correct or incorrect by the teacher.

In order to analyse multi-voiced interactions in collaborative teaching, and by extension collaborative learning, Kilalea (2000) developed a method for analysing discourse that foregrounds co-operative interaction as opposed to the earlier emphasis on asymmetrical interaction. She used Bakhtin's criteria for polyphonic interaction: 'the equality, simultaneity, plurality, independence and divergence of voices' (Kilalea, 2000, p. 165) to explore multi-vocality in classroom interaction. Her polyphonic method of discourse analysis is able to demonstrate how talk across difference can generate understanding and spark new ideas providing evidence for the theory of diversity as a productive resource for innovation and change.

In *Classroom Discourse*, Cazden argued for a shift from IRF/E, teacher-centred, 'traditional' classrooms, to more inquiry-based, student-centred, 'non-traditional' classrooms where interaction patterns were less fixed. Using 1989 and 1991 mathematics curriculum documents in USA as an example, she showed that particular forms of classroom discourse were required to enable students to formulate and solve problems, hypothesise, make connections, reason, convince themselves and others, explore examples and counter-examples, and question one another (Cazden 2001, p. 48). She considered innovations in sharing time; discourse practices that provide scaffolds for learning; interventions in relation to seating arrangements, pace and sequence; strategies for who gets the floor; possibilities for peer talk and collaboration; students' talk in relation to computers. Throughout, her work is sensitive to the play of cultural diversity in the classroom and is concerned to validate the discourses that children bring with them to school and to avoid 'deficit' models of education (Locke, 2004, p. 68).

Like Cazden, Wells has had an enduring interest in ways in which rich and varied conversation can aid children in meaning-making. In a series of Canadian action research projects, Wells showed how different modes of discourse foster learning and teaching in different areas of the curriculum. His emphasis was on the creation of an inquiry-based curriculum, which provided opportunities for collaborative action, knowledge building and reflection (Wells, 2001).

*The Shift to Critical Awareness of Discourse (with a Big 'D')*

While it would be misleading to assert that the approaches thus far discussed share a single, philosophical position on the nature of discourse, how to analyse it and the desirable forms classroom discourse should take, it is arguable that there is broad common ground in an emphasis on the social contextual nature of learning and language practices. It is not surprising, therefore, to find these theorists—Wells is a case in point—calling on the ideas of Vygotsky and Bakhtin, and Halliday's systemic functional linguistics (SFL).

The shift to the critical in discourse awareness was designed to establish a framework for analysing language in its relation to power and ideology. As Fairclough in *Critical Discourse Analysis* (1995) put it:

Power is conceptualised both in terms of asymmetries between participants in discourse events, and in terms of unequal capacity to control how texts are produced, distributed and consumed . . . in particular sociocultural contexts (pp. 1–2).

In terms of such a framework, a range of textual properties—word choice, imagery, syntax, modalities, transitivity and so on—are all potentially ideological.

In relation to discourse awareness, the critical can be thought of in terms of three tendencies: critique as revelation, critical practice as self-reflexive and critical practice as socially transformative.

- *Critique as revelation*: Foucault is the key theorist here, locating the 'critical' in the systematic analytical endeavour to reveal the nature of systems of rules, principles and values as historically situated bases for critique. He called this analysis 'archaeology', the product of this analysis a 'genealogy' and his key term was 'discourse'. His archaeological method aimed at the description of an *archive*, by which he meant 'the set of rules which at a given period for a given society define . . . The limits and forms of the *sayable*' (1991, p. 59). Discourses both constrain and enable human subjects to view the world in particular ways in particular language forms. Such discourses, *naturalised* for individual subjects, incline them to regard their own position as 'common sense' rather than a particular

historical construction of reality. Revelation occurs when these ‘common sense’ positions are exposed as no more than discursive constructions.

- *Critical practice as self-reflexive*: If one’s knowledge frames are socially constructed, then one needs to acknowledge that whenever one makes statements about anything, one does so out of a particular discourse. Knowledge then becomes provisional, with clear implications for teachers and researchers.
- *Critical practice as socially transformative*: The tendency for critical practice to be linked to a socially transformative agenda stems from a view of discourse (and ideology) as involving power relations. Foucault asks pertinently: ‘How is struggle for control of discourses conducted between classes, nations, linguistic, cultural or ethnic collectivities?’ (1991, p. 60). In any socio-cultural context, some discourses are more powerful than others and subscribers of non-powerful discourses are therefore marginalised and relatively disempowered. Both critical literacy and critical language awareness are approaches to discourse awareness in the literacy classroom committed to the project of bringing about change through critical understanding.

Since the late 1980s, Allan Luke has been an influential advocate for a critical approach to discourse awareness in educational contexts as just outlined. Addressing the challenges of a twenty-first century, text-saturated environment, Luke has long argued for and acted to bring about classrooms responsive to a future where ‘a great deal of service and information-based work, consumption, and leisure [will depend on people’s] capacities to construct, control and manipulate texts and symbols’ (1995, p. 6). At the same time he has drawn attention to the rights of cultural and other minorities and indigenous peoples, and ways in which education systems discursively construct ‘successful’ and ‘failing’ students. For Luke then, the aim of fostering discourse awareness in education settings and using tools such as CDA is to identify:

... how educational knowledge, competence, and curriculum contribute to the differential production of power and subjectivity. An approach to critical discourse analysis can tell us a great deal about how schools and classrooms build ‘success’ and ‘failure’ and about how teachers’ and students’ spoken and written texts shape and construct policies and rules, knowledge, and, indeed ‘versions’ of successful and failing students (1995, p. 11).

In a similar way, Corson, in *Language, Diversity and Education*, focuses awareness on ways in which discourse, diversity and human

subjectivity are intertwined such that ‘children, and adults too, are continually renegotiating their subject positions and their identities within multiple and competing discourses’ (2001, p. 14). Because different discourses, different varieties, different languages are not equally valued by society, or equally privileged by education, they produce different amounts of cultural and linguistic capital. In favouring the discourse norms of dominant social groups, schools marginalise students who are different, with serious implications for their sense of self and for their chances of access and success. Teachers need the kind of awareness that enables them to make their discourse practices more inclusive, remembering that discourse (in the Foucaultian sense) is more than just language. It is an embodied practice that relates to different communities’ ways of saying/writing, being, doing and valuing. Situated in more than one discourse, human subjects have fluid and hybrid identities. What education needs to guard against is an imperative for all students to submit to dominant norms and needs to ensure instead that difference is a valued resource for reimagining taken-for-granted norms of thinking and behaving and for envisioning new possibilities.

#### WORK IN PROGRESS

As examples of an approach, Luke and Corson can be thought of as aiming at revealing the discursive shape of a range of educational practices with a view to changing them to produce different outcomes for students. Important work on discourse analysis in classrooms is currently being undertaken by the Centre for Research in Pedagogy and Practice, at the National Institute for Education in Singapore. This large-scale research project includes in its core research programme, six lines of research, two of which, the classroom observation study and the classroom interaction study, focus on classroom discourse analysis. Data for the latter are collected by subject specialists trained to use the Singapore Coding Scheme developed by Luke, Cazden, Lin and Freebody, in 920 classrooms in 56 primary and secondary schools.

This project, which aims to understand pedagogical discourse, looks at how knowledge is framed and classified. Framing looks at ‘how the social interaction of teacher/student discourse and behaviour creates a mediating environment for working with ideas, knowledge and texts, using a range of semiotic artefacts and texts’ (Luke, Freebody, Shun and Gopinathan, 2005, p. 13) and classification focuses on ‘the representation and scaffolding of knowledge using a range of scales to examine epistemological sources of knowledge, disciplinary framing, depth of disciplinary concepts and discourse, knowledge reproduction and construction and levels of critique’ (p. 13). Particularly important

in the Coding Scheme is 'weaving', the movement between levels and kinds of knowledge. This is the most comprehensive coding scheme developed to date and offers an approach to examining discourse in relation to pedagogical content knowledge.<sup>3</sup>

Where educators such as Corson and Luke might be seen as harnessing discourse awareness to develop critical reflective practice in teachers and bring pressure to bear on policy-makers, discourse awareness, as integral to pedagogical approaches such as CLA and critical literacy, alerts students to the power of discourse and its instantiations in oral, written and multimodal texts. Critical literacy as a pedagogy equips readers to identify the various ways texts work to position readers to view the world in particular ways. Discourse awareness can be thought of as fundamentally intertextual, in that it is concerned with the operations of the constructions, versions or representations of reality that are mediated by various sign systems as these operate across texts.

Both CLA and critical literacy are committed to social action that is designed to effect change in the interests of greater equity and social justice (see Comber and Simpson, 2001; Janks, 2000; Luke, Muspratt and Freebody, 1997; Norton and Toohey, 2004 for overviews of the field). Morgan (1998) identifies three broad ways of doing critical literacy in the classroom.

1. A Freirean approach implying 'not merely engagement with printed texts, but the development of a reflective, dialogical, practical mode of social being, grounded in a narrative of hope, an ethic of struggle, and a pedagogy of transformation' (Roberts, 1998, p. 1);
2. An approach associated with Wallace (2003), but really part of a wider critical language awareness movement which asks such questions as:
  - What reading practices are characteristic of particular social groups?
  - How are reading materials produced in a particular society, who produces them, and how do they come to have the salience they do?
  - What influences the process of interpreting texts in particular contexts?

---

<sup>3</sup> The discourse intensive projects described here are only two out of over a 100 related research projects. It is possible to follow the progress of this research at <http://www.cripp.nie.edu.sg>. As it unfolds it is likely to have implications for discourse awareness across the curriculum and beyond the borders of Singapore. It is aimed at taking education to 'the next level' without any 'prototypes of what such a level might be' (Luke Freebody, Shun and Gopinathan, 2005, p. 3).

3. A focus on intertextuality and the juxtaposition of texts to highlight ways in which the same 'reality' is constructed differently in different discourses.

Vasquez' (2004) account of her work as a classroom teacher negotiating critical literacies with her Grade 1/2 children is a fine example of this kind of discursive work. She demonstrates that even very young children can engage in transformative social action that makes a positive difference to their daily lives and to the lives of others. For example, not only do these very young children notice that their school does not cater to their vegetarian peers; they also work out what kinds of action they can engage in to rectify the situation. Their success in this and similar 'small' interventions gives them a sense of their own agency.

#### PROBLEMS AND DIFFICULTIES

Challenges facing advocates of discourse awareness include changes in the nature of textual practice, questions of metalanguage, and theoretical problems in respect of the notions of truth, power, agency and self.

Work of the New London Group and Kress and van Leeuwen (2001) on the modes and media of contemporary communication has been fundamental in extending our understanding of classroom discourse beyond the verbal. They have been able to show that the new digitised technologies used for (particularly multimodal) communication enable a range of semiotic representation that was simply not possible with pen and paper. In addition to sophisticated layout and typography and the touch-of-a-button inclusion of colour images in texts, computer technologies enable the combination of sound, word and moving image, with the simultaneous presentation of multiple texts on split screens. All of this impacts on classrooms and focuses attention on how classroom discourse, in addition to words, embraces gesture, gaze, posture and proxemics.

Two related problems are created by the need for discourse awareness to be served by a metalanguage—a language for describing and analysing textual practice (in the broadest sense of the word 'text'). The first is the need to develop metalanguages or grammars that go beyond the printed word to include a wider range of semiotic resources. Work by Kress and van Leeuwen (2001) has responded to this need. The second problem relates to the desirability of linking discourse awareness to a *particular* metalinguistic system. Although Chouliaraki and Fairclough (1999) have argued a strong case for a formal arrangement between CDA and SFL, others (e.g. Gee, 1990; Locke, 2004) have demonstrated CDA without formally committing to SFL as a system.

A theoretical problem central to discursive awareness is set up by the tension between a Foucaultian view of 'truth' as a product of discourse, rather than the quality of a proposition arising from its being determined in reference to an accessible world outside of discourse. The problematic term (rather glossed over in the last section) *ideology*, used by theorists such as Fairclough and, tends to be used in the context of discussions, coloured by neo-Marxist notions of 'false consciousness', which suggest that oppressive ideologies can be revealed 'scientifically', and assume an ideologically free space from which to speak the 'truth'.

Where neo-Marxist analysis inclines to see power as repressive, and an effect of hegemonic ideologies deliberately fostered by particular individuals and interest groups, Foucault views power as productive, as 'having a capillary form of existence' that 'reaches into the very grain of individuals, touches their bodies and inserts itself into their actions and attitudes, their discourses, learning processes and everyday lives' (Foucault, 1980, p. 30). As MacLure puts it, power for Foucault 'is a productive set of relations from which, for good or ill, subjectivity, agency, knowledge and action issue' (MacLure, 2003, p. 177).

These two orientations (discussed in detail by Pennycook, 2001, pp. 78–100), relate to differing approaches to the question of human agency. A neo-Marxist approach is less problematic in terms of human agency since it can posit a self 'outside' of the ambit of discourse acting *on* the world as shaped (negatively) by ideology. A Foucaultian approach consigns the self to the task of social (transformative) action 'within' the ambit of discourse (as inescapable) and views the self as less unitary than multiply inscribed often by contesting discourses.

### FUTURE DIRECTIONS

What then validates a discursively aware teacher's or student's basis for acting on the world? The answer to this question is firstly a commitment on the part of language educators to a self-reflexivity which would accept as discursively constructed 'common sense' meanings that work to construct versions of reality in the immediate social milieu. The second is a preparedness to accept a radical openness and provisionality that refuses closure and remains open to critical reflection, debate and argument, socio-historical, theoretical and technological changes, as well as differences of politics and place.

A third approach to answering this question is to accept that analyses based in discourse awareness are a 'normative enterprise' (Luke, 1995) which draws attention to the material consequences of particular discursive framings and practices, and which opens up the possibility of alternative social futures. How desirable these futures are compared

to the present depends on one's pragmatically oriented ethical lens. To quote Pennycook again: 'The crucial engagement with ethics and the need for a notion of preferred futures brings us back to Roger Simon's (1992) notion of the situated refusal of the present as definitive of that which is possible (p. 30)' (2001, p. 172).

Certainly, at the beginning of a new century, there is a widespread view that such a 'situated refusal of the present' as it is being enacted in language/literacy classrooms in many educational settings is exactly what is called for. Discourses of narrowly defined teacher effectiveness, pre-determined outcomes and a pervasive audit culture are producing classrooms where critical social enquiry and engagement are not sanctioned and a teacher 'development' environment which discourages critically reflective practice. Yet, we would argue that discourse practices lie at the heart of education, underpinning pedagogy, curriculum, relational practices and assessment. Teacher awareness of discourse, then, is not just a key to the fostering of critically reflective practice. It is the key to educational transformation itself.

BONNY NORTON

## IDENTITY, LANGUAGE LEARNING, AND CRITICAL PEDAGOGIES

### INTRODUCTION

Educators interested in identity, language learning, and critical pedagogies are interested in language as a social practice. In other words, they are interested in the way language constructs and is constructed by a wide variety of social relationships. These relationships might be as varied as those between writer and reader; teacher and student; test maker and test taker; school and state. What makes the educators “critical” is the shared assumption that social relationships are seldom constituted on equal terms, but may reflect and constitute inequitable relations of power in the wider society, on terms that may be defined, among others, by gender, race, class, ethnicity, and sexual orientation. Further, as Norton and Toohey (2004) note, the plural use of “pedagogies” suggests that there are many ways in which pedagogy can be critical; the challenge for critical language educators is to determine how best to pursue a project of possibility for language learners, in a variety of places, at different points in time. Such educators have examined the social, historical, and cultural contexts in which language learning takes place and how learners negotiate and sometimes resist the diverse positions those contexts offer them. It is argued that the extent to which a language learner speaks or is silent, and writes, reads, or resists has much to do with the extent to which the learner is valued in any given institution or community. Language is thus theorized not only as a linguistic system, but also as a social practice in which experiences are organized and identities negotiated.

### EARLY DEVELOPMENTS

While interest in identity and language learning extends to the early 1980’s, those educators who have a particular interest in critical pedagogies are associated with more recent work in the field of second language acquisition (SLA) (see Ricento, 2005) and are discussed more comprehensively in the following section. It is important to note, however, that much of this research is about education in English as a second or international language, indicative of the problematic dominance

of English in the global linguistic marketplace. Further, much of this research is not sufficiently reflective about problems associated with the broader field of critical pedagogy itself, notwithstanding insightful comments from scholars such as Kramsch (1999).

In the 1970s and 1980s, scholars interested in second language identity tended to draw distinctions between social identity and cultural identity. "Social identity" was seen to reference the relationship between the individual language learner and the larger social world, as mediated through institutions such as families, schools, workplaces, social services, and law courts (e.g., Gumperz, 1982). "Cultural identity," on the other hand, referenced the relationship between an individual and members of a particular ethnic group (such as Mexican and Japanese) who share a common history, a common language, and similar ways of understanding the world (e.g., Valdes, 1986). As Atkinson (1999) has noted, past theories of cultural identity tended to essentialize and reify identities in problematic ways.

In more recent years, the difference between social and cultural identity is seen to be theoretically more fluid, and the intersections between social and cultural identities are considered more significant than their differences. In this research, identity is seen as socioculturally constructed, and educators draw on both institutional and community practices to understand the conditions under which language learners speak, read, and write the target language. Such research is generally associated with a shift in the field from a predominantly psycholinguistic approach to second language learning to include a greater focus on sociological and anthropological dimensions of language learning, particularly with reference to sociocultural, poststructural, and critical theory.

Critical language educators have tended to draw, in particular, on the work of scholars such as Bakhtin, Bourdieu, Foucault, Freire, Lave and Wenger, and Weedon. This more recent research suggests that second language learners frequently struggle to appropriate the voices of others (Bakhtin, 1986); command the attention of their listeners (Bourdieu, 1977); negotiate multiple identities (Weedon, 1987); and understand the practices of the target language community (Lave and Wenger, 1991). The research does not suggest, however, that the language learner should bear the primary responsibility for expanding the range of identities available to the learner; of central interest is the investment of the native speaker as well. Drawing on such theory, becoming a "good" language learner is seen to be a much more complicated process than earlier, more positivistic research had suggested. Indeed, in the latter half of the 1990's, three special issues on identity were published in diverse language education journals, all of which made problematic existing notions of "the good language learner" and

anticipated the wide range of research on identity and language learning characteristic of the early years of the 21st century. These included special issues of *Linguistics and Education*, edited by Martin-Jones and Heller in 1996, *Language and Education*, edited by Sarangi and Baynham in 1996, and *TESOL Quarterly* edited by Norton in 1997.

#### MAJOR CONTRIBUTIONS AND WORK IN PROGRESS

Current research on identity, language learning, and critical pedagogies grapples with questions of power and access, and conceives of identity as dynamic, contradictory, and constantly changing across time and place. Further, much of this research adopts a critical pedagogical lens when considering implications of the research for classroom practice. This growing body of research, common themes of which are discussed later, has been published in a wide variety of journals, the most notable of which is the award-winning *Journal of Language, Identity, and Education*, edited by Ricento and Wiley. In addition, a number of monographs on the topic have appeared in catalogs and libraries, all of which are making their mark in the wider community (Benesch, 2001; Block and Cameron, 2002; Canagarajah, 2002; Cummins, 2000; Goldstein, 2003; Kanno, 2003; Kumaravaduvelu, 2003; Miller, 2003; Norton, 2000; Pennycook, 2001; Ramanathan, 2002; Toohey, 2000). The three common themes in this area of scholarship that I address are those on (i) identity, investment, and imagined communities; (ii) identity categories and educational change; and (iii) identity and literacy. This scholarship represents both major contributions and work in progress.

#### *Identity, Investment and Imagined Communities*

In a recent review of research on identity and language learning, Ricento (2005) makes the case that Norton's work on language, identity, and investment represents a new and important direction in the field of SLA. In research with immigrant women in Canada, Norton (Norton, 2000; Norton Peirce, 1995) observed that existing theories of motivation in the field of SLA were not consistent with the findings from her research and did not do justice to the identities and experiences of language learners. Drawing on the work of Bourdieu (1977), she developed the notion of "investment" to signal the socially and historically constructed relationship of learners to the target language and their often ambivalent desire to learn and practice it. If learners "invest" in the target language, they do so with the understanding that they will acquire a wider range of symbolic and material resources, which will in turn increase the value of their cultural capital. Unlike notions of instrumental motivation, which conceive of the language learner as having a

unitary, fixed, and ahistorical “personality,” the notion of investment conceives of the language learner as having a complex, nonunitary identity, changing across time and space, and reproduced in social interaction. Norton makes the case that an investment in the target language is also an investment in the learner’s own identity.

The notion of investment has sparked considerable interest in the field of language and education (see Pittaway, 2004). McKay and Wong (1996), for example, have drawn on this concept to explain the English language development of four Mandarin-speaking students in a California school; Angelil-Carter (1997) found the concept useful in understanding the language development of an English language learner in South Africa; and Skilton-Sylvester (2002) drew on her research to argue that the interaction between a woman’s domestic and professional identities is necessary to explain her investment in particular adult ESL programs. Most recently, Potowski (2004) has used the notion of investment to explain students’ use of Spanish in a dual Spanish/English immersion program in the USA, and in 2008, a special issue of the *Journal of Asian–Pacific Communication*, edited by Davison and Arkoudis will focus on the theme of investment in the Asia–Pacific context.

An extension of interest in identity and investment concerns the imagined communities that language learners aspire to when they learn a new language. Norton (2001) drew on her research with two adult immigrant language learners to argue that while the learners were initially actively engaged in classroom practices, the realm of their desired or “imagined” community extended beyond the four walls of the classroom. This imagined community was not accessible to their respective teachers, who, unwittingly, alienated the two language learners, who then withdrew from the language classroom. Drawing on the work of Lave and Wenger (1991) and Wenger (1998), Norton makes the case that, for many language learners, the community is one of the imagination—a desired community that offers possibilities for an enhanced range of identity options in the future. The community may also be, to some extent, a reconstruction of past communities and historically constituted relationships. In essence, an imagined community assumes an imagined identity, and a learner’s investment in the target language must be understood within this context.

Of particular interest to the language educator is the extent to which such investments are productive for learner engagement in both the classroom and the wider target language community. Such questions have been taken up more extensively in a coedited special issue of the *Journal of Language, Identity, and Education* on “Imagined Communities and Educational Possibilities” edited in 2003 by Kanno and Norton, in which Blackledge, Dagenais, Kamal, Kanno, Norton,

Pavlenko, and Silberstein explore the imagined communities of specific groups of learners in Canada, Japan, Pakistan, the UK, and the USA.

*Identity Categories and Educational Change*

Critical language educators with an interest in identity have sought to investigate the ways in which particular relations of race, gender, class, and sexual orientation may impact on the language learning process. Innovative research that addresses these issues does not regard such identity categories as “variables,” but rather as sets of relationships that are socially and historically constructed within particular relations of power. With regard to questions of race, Ibrahim’s (1999) research with a group of French-speaking continental African students in a Franco-Ontarian High School in Canada explores the impact on language learning of “becoming black.” He argues that the students’ linguistic styles, and in particular their use of Black Stylized English, was a direct outcome of being imagined and constructed as Black by hegemonic discourses and groups. From a slightly different perspective, Taylor’s (2004) research in an antidiscrimination camp in Toronto, Canada, argues for the need to understand language learning through the lens of what she calls “racialized gender.” The stories of Hue, a Vietnamese girl, and Khatra, a Somali girl, are particularly powerful in this regard, supporting the view held by Kubota (2004) that a color-blind conception of multiculturalism does not do justice to the challenges faced by language learners of diverse races and ethnicities. Lee (in press) makes the case that race is in fact a “third voice” in the native and nonnative speaker debate while a special issue of *TESOL Quarterly* on “Race and TESOL,” edited by Angel Lin and Ryuko Kubota in 2006, has put race squarely on the agenda of language education.

With regard to issues of gender and language learning, the work of scholars such as Ehrlich (1997) and Pavlenko (2004) is particularly insightful. Their conception of gender, which extends beyond female–male divides, is understood to be a system of social relationships and discursive practices that may lead to systemic inequality among particular groups of learners, including women, minorities, elderly, and disabled. Pavlenko, for example, argues for the need to understand the intersections between gender and other forms of oppression, noting that both girls and boys who are silenced in the language classroom are more likely to be those from the working class. In a similar spirit, Nelson (2004) explores the extent to which sexual orientation might be an important identity category in the second language classroom. Of central interest is the way in which a teacher can create a supportive

environment for learners who might be gay, lesbian, or transgendered. A special issue of the *TESOL Quarterly* on “Gender and Language Education,” edited by Kathy Davis and Ellen Skilton-Sylvester in 2004, brings much current research on gender to the attention of a wider audience, while an edited volume on *Gender and English Language Learners*, edited by Norton and Pavlenko, (2004), highlights gender research in different regions of the world, including Uganda, Malaysia, and Australia.

### *Identity and Literacy*

Critical researchers of identity and language learning have become interested not only in the conditions under which language learners speak, but in the extent to which identities and investments structure their engagement with *texts*. There is growing recognition that when a language learner reads or writes a text, both the comprehension and construction of the text is mediated by the learner’s investment in the activity and the learner’s sociocultural identity. Scholars such as Luke (2004), Kress (1993), and Ivanič (1997) have influenced much research on the relationship between literacy and second language identity. Although Luke’s work has focused on the contribution of critical literacy to second language education and Kress’s on the conception of text as a socially and historically constituted “genre,” Ivanič has explored the notion of writer identity, making the case that writers’ identities are constructed in the possibilities for self-hood available in the sociocultural contexts of writing.

In exploring what he calls the “subversive identities” of language learners, Canagarajah (2004) addresses the intriguing question of how language learners can maintain membership of their vernacular communities and cultures while still learning a second language or dialect. He draws on his research with two very different groups, one in the USA and the other in Sri Lanka, to argue that language learners are sometimes ambivalent about the learning of a second language or dialect, and that they may resort to clandestine literacy practices to create what he calls “pedagogical safe houses” in the language classroom. In both contexts, the clandestine literacy activities of the students are seen to be forms of resistance to unfavorable identities imposed on the learners. At the same time, however, these safe houses served as sites of identity construction, allowing students to negotiate the often contradictory tensions they encountered as members of diverse communities.

In a very different region of the world, Stein (2004) invites us into a language and literacy classroom in post-apartheid South Africa, drawing on the innovative and increasingly influential work on

multiliteracies associated with a variety of scholars, including those in the New London Group (1996). With reference to multiliteracies research, as well as feminist theories of the body, Stein reflects on her classroom teaching with English language learners, and develops a comprehensive blueprint for what she calls “multimodal pedagogies.” Such a blueprint, she argues, arises from the need to acknowledge the tensions between local forms of communication and the literacy demands of schooling, recognizing that representation occurs through a variety of modes, including the visual, the gestural, speech, writing, and sound.

Starfield (2004), like Stein, seeks innovative and empowering pedagogies that can expand the range of identities available to language learners, focusing in particular on the power of concordancing in academic writing at an Australian university. Drawing on her teaching experience in an academic writing workshop, Starfield describes how she and her students used concordancing to examine the structure of academic writing and the ways in which authors use language to establish credibility and authority. Over time, Starfield noted a marked improvement in the academic writing of her students. Her work provides a window into the possibilities that technology holds for helping students develop identities not only as accomplished writers but also as contributors to the larger academic community.

The use of technology is also the subject of research that addresses the impact of literacy practices on relationships beyond the classroom. Lam (2000) for example, who studied the internet correspondence of a Chinese immigrant teenager in the USA who entered into transnational communication with a group of peers, demonstrates how this experience in what she calls “textual identity” related to the student’s developing identity in the use of English. In another study of synchronous and asynchronous communication between American learners of French in the USA and French learners of English in France, Kramsch and Thorne (2002) found that some students had little desire to adopt the textual identity of the other. Ramanathan and Atkinson (1999), indeed, make the case that there is much need for cross-cultural writing research to better inform both teachers and students of the sociocultural knowledge of student writers from diverse regions of the world.

#### PROBLEMS AND DIFFICULTIES

Two problems that face scholarship in the area of identity, language learning, and critical pedagogies concern the challenges of classroom practice, on the one hand, and the complexities of qualitative research, on the other. Although critical language educators have great interest in

rapidly evolving theories of language and identity, this is not always shared by an equally passionate commitment to practice. Students' voices are sometimes little more than a backdrop to discussions on the development of theory and teachers sometimes feel disempowered by abstract notions that appear unrelated to the challenges they face on a daily basis. Lin (2004), for example, provides a comprehensive and rigorous account of her attempts to introduce a critical pedagogical curriculum in an MA TESL program at the City University of Hong Kong. The challenges she experienced include student teacher frustration with the academic language of critical pedagogical texts, as well as feelings of pessimism and powerlessness. She makes the case that school-teachers, unlike academics, are situated in contexts in which cultural capital is determined not by mastery over academic language, but by the ability to make learning meaningful for students. In this context, the inaccessibility of some critical texts serves simply to alienate the very teachers who seek insight from these texts. Such frustration is exacerbated by pessimism arising from a teaching context in which labor relations are unfavorable to teachers.

Two publications that have sought to address this problem in this area of scholarship are those by Sharkey and Johnson (2003) and Auerbach and Wallerstein (2004). In "The TESOL Quarterly dialogues," Sharkey and Johnson initiate a productive and engaging dialogue between researchers and teachers, with the express aim of demystifying research and theory in critical language education. Equally effective, though with a different audience in mind, Auerbach and Wallerstein's classroom text "Problem-posing in the workplace: English for action" takes seriously the need for critical pedagogies to be accessible and relevant to language learners.

The very complexity of undertaking research on identity, language learning, and critical pedagogies is another problem facing scholars, given that much of this research tends to be qualitative and ethnographic. This problem is the subject of recent work by Leung, Harris, and Rampton (2004) and Toohey and Waterstone (2004). Drawing on their research on task-based language learning in urban settings in the United Kingdom, Leung, Harris, and Rampton (2004) examine the inelegance of qualitative research, arguing that the "epistemic turbulence" in SLA qualitative research centers on the question of what constitutes or represents reality. In their study, naturally occurring data were collected with the use of video and audio recordings, supplemented by field notes. An ongoing challenge was how to represent and account for data that did not fit neatly into the theoretical construct of task-based language use. Leung, Harris, and Rampton make that case that researchers need a conceptual framework that acknowledges rather than obscures the messiness of data.

In a very different context, Toohey and Waterstone (2004) describe a research collaboration between teachers and researchers in Vancouver, Canada, with the mutual goal of investigating what practices in classrooms would make a difference to the learning opportunities of minority-language children. Although teachers were comfortable discussing and critiquing their educational practices, they expressed ambivalence about translating their practice into publishable academic papers. Like the student teachers in Lin's (2004) study, the teachers in the research group felt little ownership over the academic language characteristic of many published journals. Toohey and Waterstone draw on this experience to suggest that writing which respects both teacher and researcher ways of knowing might artfully blend narrative with analysis, telling dramatic stories of classroom incidents, enriched by a consideration of theoretical insights.

### FUTURE DIRECTIONS

Although this chapter has focused primarily on the identity of the language learner, there are broader developments in the area of critical language education that suggest important directions for the future. If we take seriously the argument that the identity of the language learner is not just a "personality variable" but a socially and historically constructed relationship to both institutional and community practices, then it follows that teachers, researchers, administrators, testers, and policy-makers are all implicated in the range of identities available to the language learner.

One area that is receiving increasing attention is that of the language teacher educator (see also Andrews, *Teacher Language Awareness*, Volume 6). In recent research, Pennycook (2004) reflects on his observations of a TESOL practicum in Sydney, Australia. He reminds us that a great deal of language teaching does not take place in well-funded institutes of education, but in community programs, places of worship, and immigrant centers, where funds are limited and time at a premium. Of central interest in this work is a consideration of the way in which teacher educators can intervene in the process of practicum observation to bring about educational and social change. To this end, Pennycook argues that "critical moments" in the practicum can be used to raise larger questions of power and authority in the wider society, and provide an opportunity for critical discussion and reflection. Other perspectives on this issue can be found in the edited collection by Hawkins (2004) in which a wide variety of scholars make the case that language teacher education is a practice that engages identities of teachers in complex and intriguing ways.

Another direction for the future concerns the broader area of critical language testing. Shohamy (2001) provides a comprehensive analysis of the way in which democratic principles can be applied to assessment practices in multicultural societies in which minority groups struggle for recognition and respect. Although dominant groups may pay lip service to principles of equality, the *de facto* situation, in many societies, is that minority groups are expected to assimilate into the majority society. Evidence to this effect is frequently demonstrated in the form of assessments that are used in education, where competing conceptions of “knowledge” vie for prominence. The ongoing and future challenge for language educators in general, and language testers in particular, is to develop language assessment practices that take seriously the identities and investments of language learners, and challenge rather than perpetuate inequity in the wider society.

A third area that has much potential for future research on identity, language learning, and critical pedagogies concerns growing interest in globalization and language learning (Block and Cameron, 2002). Morgan and Ramanathan (2005) argue persuasively that the field of language education needs to consider ways in which English language teaching can be decolonized, arguing that there is a need to decenter the authority that Western interests have in the language teaching industry. In particular, we need to find ways to restore agency to professionals in periphery communities (Kumaravaduvelu, 2003) and give due recognition to local vernacular modes of learning and teaching (Canagarajah, 2002). In this regard, special issues of a number of journals are significant, including: a special issue of the *TESOL Quarterly* on Language in Development, edited by Numa Markee in 2002; two recent issues of the *AILA Review of the International Association of Applied Linguistics* on “Africa and Applied Linguistics” (Makoni and Meinhof, 2003) and “World Applied Linguistics,” (Gass and Makoni, 2004); and a 2006 special issue of *English Studies in Africa*, edited by Pippa Stein and Denise Newfield. It is clear that research on identity, language learning, and critical pedagogies has struck a chord in the field of language and education, opening up multiple avenues for research on every aspect of the field. The future holds much promise.

DISCOURSE AND SOCIALLY SHARED COGNITION

INTRODUCTION

Consistent with prevalent views in psychology, neuroscience, computer science, linguistics, and indeed the intellectual history of Western thought, “knowledge” in second language learning and education is predominantly conceptualized as mental, internal representations and processes located in individual minds. Whether theorized as propositional, symbolic, and rule-based or in connectionist, emergentist, and associationist terms, knowledge is treated as the content and organization of memory, perception, attention, and consciousness. Indeed the overall project of cognitive science, the interdisciplinary study of mind, is to elucidate the cognitive architecture(s) that enable knowledge representations and learning. Among the objects of knowledge studied in these frameworks, language figures with particular prominence (e.g., Eysenck, 1990). As knowledge of and about language is overwhelmingly understood as subject to the same cognitive structures and processes as other knowledge and skill domains, I will henceforth refer to “cognition” (rather than “knowledge”) as the more encompassing construct.

Traditionally the individual mind is conceived as the site of cognition also in such branches of social psychology that identify “social cognition” as their object of inquiry. In the prevalent mentalist understanding, social cognition refers to the processing, representation, and evaluation of information about the social world and its inhabitants. “Social” thus attaches to the object of cognition rather than the persons doing the cognizing or the properties of cognitive processes (Condor and Antaki, 1997). Although the individual mind predominates as the object of theory and research in the cognitive sciences, alternative conceptualizations originating in philosophy, psychology, anthropology, and education emphasize the social nature of cognition and the origin of individual cognition in socially situated interaction and the wider sociohistorical context (Rogoff, 1990; Tomasello, 2003; Vygotsky, 1978; Wertsch, 1991). Sociocultural theory (Lantolf and Thorne, 2006), theories of situated learning (Lave and Wenger, 1991) and language socialization (Duff, 2008) in particular have been seminal in expanding, and indeed redefining, the research agenda on second

language learning and education from its focus on cognition as private and hidden from sight to cognition as socially shared and embedded in social practices. These efforts have been complemented by research traditions originating in sociology, notably ethnomethodology and conversation analysis (CA). A related research strand with its home base in psychology is discursive psychology (DP), which draws on both of its sociological predecessors among other sources. Different versions coexist within each of these approaches, and they differ from each other in several theoretical and empirical matters as well as in their analytical preoccupations (cf. Condor and Antaki, 1997, for contrasting perspectives on social cognition; Potter and te Molder, 2005, for a concise historical overview). Acknowledged diversity notwithstanding, the three perspectives are indebted to some of the same precursors, in particular the practical language philosophies of Austin and Wittgenstein, and they converge in their view of cognition as inextricably interrelated with social actors' engagements in socio-interactive, and especially discursive, practices. It is therefore with some justification that Potter and te Molder (2005) categorize the three approaches collectively as "interaction studies." Recognizing language-mediated interaction as the foundation of sociality and cognition also changes the view of language from an object separable from interaction to a resource in interaction. On this view, language figures as a semiotic store for formatting sequentially organized actions, indexing affective and epistemic stance, constructing social identities, and coordinating participants' orientation in and toward time, space, and the ongoing activity. The interactional (pragmatic, discursive) meaning(s) that linguistic resources take on at any given interactional moment is a joint product of their placement within the turn structure and interactional sequence, and of the hearer's understanding of the action-thus-formatted. Furthermore, although language is critical to social interaction, it is but one of several classes of semiotic resources.

Drawing on interaction studies, this chapter will profile a line of inquiry that examines how cognition may be interactionally manifest as social actors go about their practical activities. In this enterprise, cognition is analyzed as embedded in social interaction and locally and contingently occasioned by current interactional events. After outlining how cognition is addressed in (some versions of) ethnomethodology, conversation analysis, and discursive psychology, I review how the social constitution of cognition has been examined in the research literature on language education and assessment. In conclusion, I suggest how discursive perspectives on cognition in interaction might be pursued in future studies.

THREE PERSPECTIVES ON SOCIALLY SHARED  
COGNITION*Ethnomethodology*

Ethnomethodology is concerned with the practical methods (procedures, practices) by which social members make their actions and understandings mutually intelligible and in so doing accomplish social order (Garfinkel, 1967, 2001; Heritage, 1984). By extending a phenomenological perspective to the study of everyday life, Garfinkel's seminal work *Studies in Ethnomethodology* (1967) conceptualized the linkage between cognition and social organization as observable and reportable ("accountable") local activities. As noted in Maynard and Clayman's (1991) extensive review, the original version of the ethnomethodological program spawned a diversity of strands that differ from each other, *inter alia*, in their emphasis on and conceptualization of cognition in social activities. Cicourel's cognitive sociology (1973) stands out as a key example of an early ethnomethodological proposal with a mentalist orientation. Central to Cicourel's theory is the concept of "interpretive procedures," a set of generic properties that articulate cognitive structures, interaction and macro-social organization and thereby enable social actors to mutually understand and coordinate their activities. While the phenomenology of Alfred Schutz and Chomsky's notion of a dual linguistic structure were influential sources for Cicourel, Coulter's (1979) "epistemic sociology," drawing on the later Wittgenstein's pragmatic philosophy of language, firmly turned cognition on its social feet. Contemporary strands in ethnomethodology, while retaining and further developing the intellectual diversity of its early days, operate from a shared understanding of cognition as a socially constituted activity. By emphasizing that the knowledge that people draw on in the concerted management of their situated activities is always embedded in and arises from practical exigencies, ethnomethodologists respecify the relationship between cognition and social action as theorized in the cognitive sciences in two fundamental ways.

1. On a cognitivist account, the traditional objects of psychology — memory, perception, problem solving, learning—are considered individual, internal, abstract, and not directly observable mechanisms for information processing, storage, and retrieval. Instead, ethnomethodologists treat such activities as socially constituted, concerted, occasioned, and deployed for practical purposes.
2. In cognitivist perspective, cognitive and affective states are understood to preexist their "expression" in linguistic and other socially intelligible forms. Instead, the ethnomethodological project is to

explain “how mental concepts (like other everyday concepts) are grounded in communicative actions produced by competent members of a linguistic community” (Lynch and Bogen, 2005, p. 226). As Coulter notes,

“a distinctively ethnomethodological focus upon topics in the study of cognitive phenomena (...) treats all cognitive properties of persons as embedded within, and thereby available from, their situated communicative and other forms of activities. The central issue becomes: how can members tell, and how do they make tellable, *inter alia*, their beliefs, memories, forgettings, dreams, understandings, thoughts, ‘states of mind’, the rules they are following, and the knowledge they possess?” (Coulter, 1991, p. 189).

A prime example of how social members invoke “states of mind” for practical purposes is Lynch and Bogen’s (2005) analysis of the testimony given by witnesses in the Iran-contra hearings (1987). In these high-stake events, witnesses recurrently appealed to “memory failure” in response to interrogators’ questions. Notably, key witness Oliver North responded on several occasions with such expressions as “I don’t recall,” “I don’t have a specific recall of that at this time point,” and the notorious “My memory has been shredded.” Such claims of nonrecall, Lynch and Bogen argue, enable “plausible deniability” as an evasive strategy (complementing and in fact partially made possible by the prior shredding of documentary evidence). Memory, then, serves as a flexible interactional resource, rhetorically malleable to the occasion at hand. What witnesses claim to remember or not to remember is responsive to a social and institutional logic associated with membership in social categories, the rights and obligations tied to such categories, moral judgments and normative expectations. Moreover, in witnesses’ accounts of past events, grammar has a pivotal role in constructing the witness as a morally responsible person who would have engaged in an appropriate course of action if the situation had demanded or enabled that line of conduct (but it did not). Such claims to moral character through hypothetical past actions may be formatted as counterfactual conditionals, for instance “if I had not known at the time that the deal was authorized I would have asked more questions about it” (Norton, July 7, 1987, paraphrased by Lynch and Bogen, 2005, p. 237). Memory and the talk about it are thus inextricably bound up with specific social actions and the activities they are embedded in. Analogous observations have been made in ethnomethodological studies about a wide range of practices by which members talk up cognitive phenomena.

From ethnomethodology’s beginnings, a vibrant research strand has been the study of education. As Hester and Francis’ (2000) edited

collection documents, current ethnomethodological studies on education simultaneously share their fundamental understanding of teaching and learning as socially ordered and accomplished activities while also displaying rich diversity in their objects of investigation and, reflexively, their research methods. Macbeth (2000), for instance, conceptualizes classrooms as “installations,” asking how classrooms afford learning or “install” knowledge and competence through students’ and teachers’ ordinary local and practical achievements in the setting. By analyzing several interactional scenes from a range of classrooms, including kindergarten Spanish immersion and science and English lessons at different grade levels, Macbeth documents through detailed sequential analysis of electronic records and transcripts how students orient to such interactional practices as choral recitation, known-answer questions and demonstrations as recognizable ordered activities through which curricular objects (as well as the recurrent enabling classroom activities themselves) are learned. The study exemplifies the most prevalent line of ethnomethodological research on education, the analysis of recorded interaction in educational activities.

Ethnomethodology’s project to respecify cognitive phenomena as social and public achievements also extends to studies of literacy. Sharrock and Ikeya (2000) interrogate reading as an occasioned social practice through the analysis of an undergraduate matrix algebra text, showing how the text is designed as a site of instruction that associates the organization of subject matter knowledge with the professional organization of the academic community. By describing their own understanding of the text as mathematically untrained readers, Sharrock and Ikeya employ a line of investigation that contrasts markedly with the analysis of recorded interaction. Heap (2000) engages with Flower and Hayes’s (1981) influential information-processing theory of writing, taking issue with its implicit assumption that the event of writing is recognizably and unproblematically bounded. By confronting Flower and Hayes’s model and its elaboration by Pea and Kurland (1987) with a transcript of a single interactional episode in a writing center, Heap demonstrates that the borders between writing and nonwriting, between the task and the task environment, and indeed between writers and nonwriters, are not specifiable by reference to an abstract model but rather are locally occasioned in concerted, publicly available, recognizable social activities.

### **Conversation Analysis**

Conversation analysis, founded by Harvey Sacks (1992), is the most prominent and prolific offshoot of ethnomethodology and exerts an expanding influence throughout the social sciences. CA’s project is to elucidate the “interaction order” (Goffman, 1983) as the fundamental

form of social organization, and one that is accorded autonomous status vis-à-vis other systems that sustain human life. However, CA is also interested in exploring how the organization of social interaction intersects with other systems, notably with language and cognition. Tracing CA's stance toward cognition to its ethnomethodological roots, Schegloff (1991) notes that CA's analytical interest in *socially shared cognition* centers on the procedures by which participants establish, maintain, and revise shared understanding—intersubjectivity—of a common social world through practical interactional processes. Such procedures compose the “architecture of intersubjectivity” (Heritage, 1984b, p. 254) whose detailed investigation is CA's specific and unique project. These practices are generic in the sense that they are constitutive or regulatory operations in any talk-in-interaction irrespective of the specific activity, language, or other aspects that may distinguish the ways in which particular types of talk are organized. In addition to interactional practices, cognitive states and processes are also indexed by several classes of linguistic resources. Finally, on occasion, participants may display “cognitive moments” through their interactional conduct. Each of these intersections of interaction and cognition will be described later.

**Interactional Practices.** Participants make their local and contingent understandings mutually recognizable throughout their talk exchanges, as evident in turn-taking, recipient design, responses to prior turns, repair, and such interactional practices as joint utterance construction and formulations. Some practices of repair organization can serve as examples.

When difficulties arise in speaking, hearing, or understanding, participants can redress such problems through a generic interactional apparatus, the organization of repair (Schegloff, Jefferson, and Sacks, 1977). Repair is tied to the organization of turn-taking. For the most part, repair of troublesome conduct is initiated in the same turn (by same speaker, “self”) or in the immediately following turn (by next speaker, “other”). Excerpts 1 and 2 illustrate two methods of other-initiated repair.

(1) [Kasper and Ross, in press]

1 A: Mm.↑Can you tell me about- what- you did over

2 Golden Week?

3 C: Pardon?

4 A: >Tell me what you did< for Golden Week, >over

5 Golden Week.<

6 C: °Yah°, I (.) worked as a (.) >assistant< of ca-,

7 >cameraman<, anduh one day I (.) met, =I've

8 Mmet my (.) parents.=

In line 3, C displays a problem in hearing or understanding what A said in his preceding turn. Further, by initiating repair with the open-class repair initiator “pardon” (Drew, 1997), C indicates difficulties with the entire previous turn rather than a specific component of it. Through the design of the repair turn, A orients to C’s unspecified receipt problem by issuing the question in a somewhat modified form (4/5). This time around, C demonstrates through her relevant answer (6–8) that she understood A’s question.

In Excerpt (2), the recipient of a prior turn also shows problems in understanding that turn, but the scope of the problem and the methods by which it is addressed differ from those in Excerpt 1.

(2) [Ross 1995, modified]

- 1 A: ah:: you said that (.) the Tokyo people are
- 2 (.)kinda international do you consider yourself
- 3 an international person Mr Kondo?
- 4 K: myself?
- 5 A: yeah
- 6 K: yeah I think so

Here Mr Kondo checks his understanding of a specific component of the prior turn (4), which A confirms (5). Mr Kondo then relevantly answers A’s question.

The two excerpts illustrate two practices of other-initiated repair, each of which defines the repair initiators’ reception problem differently. The repair speakers, in turn, display in the format of the repair what they understood the trouble to be. Irrespective of the scope of the problem, in either case, intersubjectivity is reestablished after only two turns of intervening repair activity. While parties overwhelmingly manage to realign their talk through the minimal and most expedient form of other-initiated repair seen here, on occasion longer repair sequences are needed, and understanding is not always achieved (Egbert, Niebecker, and Rezzara, 2004, for a very long but ultimately successful repair sequence in L2 multiparty talk).

By initiating repair on another speaker’s immediately prior turn, the repair initiator displays some problem in the receipt of that turn. However, the speaker of a prior turn can also indicate problems in the understanding displayed by the recipient of that turn, as in Excerpt 3.

(3) [Ross, 1995]

- 1 A: ahhm (0.3) do you ah (0.3) could you tell me a
- 2 little bit about your ahh university life
- 3 B: university life.
- 4 A: what you did in university
- 5 B: ahh
- 6 A: in general

- 7 B: yeah in general ahh in Japan the stu- students  
 8 of university eh  
 9 ^A: no your university life not in general  
 10 but yours

At the arrowed turn, A shows that she heard B's immediately prior turn as one that did not relevantly answer A's question about B's "university life." Through several sequential and linguistic resources, she marks what in B's understanding of A's question was amiss and how the question should be understood instead: by interrupting B's turn-in-progress with the disagreement marker "no," by contrasting the qualifier "your" and "yours" with "in general," and by deploying lexical indices ("not" . . . "but") and prosodic markers of contrast (emphasis on your and yours). The form of repair deployed by A illustrates a "third position repair" (Schegloff, 1991, 1992), an interactional resource that speakers can draw on to repair what is commonly called a "misunderstanding." This is possible because a second position in a turn structure displays how the speaker B of that position understands speaker A's action in first position. In the third position, A then has the opportunity to either accept B's understanding of A's action in first position or not to accept it. Nonacceptances are done as claims to a discrepancy between what A meant and how B understood it, often with a claim as to what A "really" meant or means.

**Markers of Cognitive Stance and State.** A considerable body of CA research also exists on the interactional work of specific linguistic and other semiotic resources through which participants display, or make claims to, cognitive states and processes. While markers of epistemic stance have been examined from diverse theoretical perspectives, CA focuses on their sequential deployment and production formats within turn organization. Cognitive claims and displays are thus seen as interactionally occasioned and intertwined with the action(s) that participants are accomplishing at particular moments in the talk. Epistemic stance markers draw on different types of grammatical classes. In a corpus on conversations in American English, Kärkäinen (2003) observes, in descending frequency, epistemic phrases, adverbs, modals and semimodals, adjectives, nouns, and participial forms. Other languages also furnish discourse particles as epistemic stance markers, such as modal particles in German and pragmatic particles in Chinese (Wu, 2004) and Japanese (Cook, 2001, for review). The specific discursive meanings of these markers critically depend on their sequential placement. For instance, the Japanese particle *ne* (Tanaka, 2000) and the epistemic marker *I think* (Kärkäinen, 2003) accomplish different turn-managing operations, social actions, and stances depending on whether they are positioned turn-initially, turn-internally, turn-finally, or occupying a turn of

their own. A further class of vocal devices figures as response tokens, including (in English) “continuers (most typically *Mm hm* and *Uh huh*), acknowledgement tokens (typically *Yeah* and the weaker acknowledgement token *Mm*), the newsmarker group (‘change-of-state’ token *Oh*, the ‘idea’ connector’ *Right*), and the ‘change of activity’ tokens (*Okay* and *Alright*)” (Gardner, 2001, p. 25). Insofar as these markers embody their producers’ stance toward the current turn distribution or their hearing and understanding of the speech activity toward which they are directed, they participate jointly in cognitive displays and interactional organization.

A lexical resource specialized as a particular sort of epistemic stance marker in English is the particle *oh*. Heritage (1984a) described *oh* as a “change-of-state” token that figures critically in information transfer (e.g., from the state of a not-knowing questioner to that of a knower upon receipt of an answer) and embodies interactionally occasioned cognitive processes such as recollecting, remembering, receiving news, referential ambiguity resolution, and claims to epistemic supremacy (Heritage, 2005). An *oh*-embodied shift in cognitive state is seen in Extract 4.

(4) [Ross, 1995]

- 1 A: Hm. And do you live in a house?
- 2 T: Uh (.) called, uh (.) in Japanese
- 3 called *manshon*.
- 4 A: Oh, it’s a kind of apartment.
- 5 T: Yes.

In line 4, “oh” embodies an act of recognition, viz. A’s association of the Japanese word *manshon* with the English reference term *apartment*. However, beyond this most proximal function of *oh* in A’s response to T’s immediately prior turn, A’s change of state can also be heard to extend to a recategorization of the class of objects that he refers to as “house” in his question. To competent listeners, the polysemy of “house” as a superordinate term in the sense of “dwelling” and as a subcategory referring to a freestanding building for a single family is resolved in the question. However T’s answer turn orients to the superordinate meaning of “house,” of which *manshon* is a subcategory. On this reading, the *oh*-prefaced turn claims A’s recognition of how T understood A’s question (third-turn repair<sup>1</sup>, Schegloff, 1997).

---

<sup>1</sup> In third-turn repairs, the trouble-source speaker self-initiates and completes a repair in third turn as a display of understanding of how the recipient of the first turn understood that turn. The speaker of the second turn shows no indication of trouble in understanding the first turn. Third-turn repair is thus different from third position repair, in which the trouble source speaker repairs after the recipient shows an understanding problem (Schegloff, 1992).

**Cognitive Moments.** A third area of intersection between interaction and cognition will only be touched upon here. It comprises “cognitive moments” (Drew, 2005b), viz. occasions on which a cognitive state becomes interactionally manifest. Examples are “touched-off” remembrances (Frazier, in press; Jefferson, 1978), displays of memory and recall (C. Goodwin, 1987), or of confusion (Drew, 2005b). Although the psychological terms are suggestive of individual experiences of inner states and processes, the studies show how in each case, the cognitive moments are interactionally generated and socially organized. Echoing Schegloff (1991), Drew reverses the dominating Cartesian view of how cognition and interaction interrelate:

Instead of regarding cognition as determining action, we can view interaction as a source of cognition. It is in the course of interactional sequences, and speakers’ moves and actions within those sequences, that cognition may be shaped—and in this way interaction becomes a context for cognition (Drew, 2005b, p. 181).

### *Discursive Psychology*

Discursive psychology is a more recent development than ethnomethodology and CA, both of which DP incorporates among its theoretical stances and analytical resources. Initiated by British psychologists in the 1980s, DP questions the epistemological basis of institutional psychology by reconsidering its unproblematized assumptions and research practices from a variety of discourse perspectives. Among the early texts that set the scene for the development of different research strands were social constructionist perspectives on self and personhood (Gergen and Davis, 1985; Shotter, 1984), Billig’s (1987) rhetorical approach to social psychology, and Potter and Wetherell’s (1987) discourse-analytical outlook on the study of “psychological” phenomena. In addition to practical language philosophy, semiology, ethnomethodology, and conversation analysis, an important further precursor to Potter and Wetherell’s project was the sociology of scientific knowledge (Gilbert and Mulkay, 1984), whose continued influence on DP’s epistemology is evident in more recent statements (Edwards, 1997; Potter, 1996). Consistent with its disciplinary origin in psychology, DP is interested in standard (cognitive and social) psychological topics such as memory, cognitive and affective states and processes, attribution, attitudes, self and identity. However, DP’s exploration of these themes represents a radical alternative to the traditions of academic psychology. Instead of theorizing them as intrapsychological phenomena that find their expression through language and other forms

of behavior, and which, by implication, preexist such expression, DP examines how people enlist cognitive notions for practical purposes. Specifically, DP (in the vein of Edwards, Potter, and Wetherell) wants to see how people construct versions and describe events (putatively “internal” as well as external) in their pursuit of actions in ordinary activities. DP focuses particularly on how versions are produced, contested, and undermined through rhetorical organization. Two aspects of rhetorical arrangement have come under special scrutiny. One is the “psychological thesaurus,” the indexical (local, situated) use of ordinary psychological terms (stressed, angry, know, feel) for practical purposes. For instance, Potter (1996) shows how the routine “I don’t know” (in various prosodic versions) is used as “stake inoculation,” a practice by which a speaker avows a stance of disinterestedness and thereby makes their version more difficult to subvert. The other focal concern is to show how through event descriptions, speakers rhetorically enable inferences to various psychological states (intentions, motives and motivation, attitudes) without necessarily using psychological category labels (Edwards and Potter, 2005). These interrelated analytical foci implement DP’s project of scrutinizing “how psychological avowals, attributions and implications work in conjunction with factual descriptions and normative accountability” (Potter, 2004, p. 255). In pursuing these goals, DP, like ethnomethodology, does not limit its data to talk-in-interaction but also examines written texts. Like CA, DP analyses of talk take sequence organization and turn design into account, but DP’s topical interest places greater emphasis on rhetorical resources and structuring.

DP’s epistemological position has been the object of some confusion. As its leading proponents clarify in several places (e.g., Edwards, 1997; Edwards and Potter, 2005; Potter, 1996), their version of DP is constructionist in some senses of the term and not in others. Unlike constructivist theories in developmental psychology, DP does not propose that “real minds” are constructed through language-mediated interaction. This stance distinguishes DP from Vygotskian and related sociocultural theories and from such notions as “internalization.” DP is also not constructionist in the ways that semiotic and linguistic structuralisms are, that is by positing abstract constructions of concepts and stances through the grammatical resources of a language and their system-internal interrelationships. The missing dimension in the various semiotic and linguistic versions of constructionism is performativity, i.e., the ways in which participants in situated activities assemble linguistic “constructions” to produce descriptions and facts. It is these latter two senses in which DP, not only programmatically but through its research practices, defines itself as constructionist: accounts, descriptions, and in fact a whole range of other actions construct versions of

the world, and these actions themselves are assembled through sequential and rhetorical organization (Potter, 1996). DP's constructionism in this dual sense enables its analytical stance of "methodological relativism" (Potter and Edwards, 2003, p. 173), a policy that allows researchers to analyze how people produce facts, descriptions, and common-sense theories of mind and cognition without assessing their validity. Methodological relativism emphasizes DP's epistemic rather than ontological orientation and represents perhaps its strongest link with the sociology of scientific knowledge.

To illustrate how versions of facts and events can be assembled and contrasted, consider Extract 5, a sequence from an interview study on the construction of the professional identities of EFL teachers (Simon-Maeda, 2004). Celine is an EFL teacher in Japan who suffers from a severe visual impairment.

(5) [Simon-Maeda, 2004, p. 411f]

Andrea: So, you told me before that you wanted to continue on to the doctoral program.

Celine: Right now it's a completely greedy situation. I want the most money possible, so give me my Ph.D.; yeah, I would like to be called doctor, but I mostly want to go back to Montana and show all those people that said I would not graduate from university. People flat out told my folks, "Your daughter will not graduate from university, she won't be able to get a bachelor's," because I couldn't read. Because in elementary school they told me I would fail, even teachers, halfway through elementary school they said, "Your daughter's not going to finish," or the percentage of students that went to that elementary school didn't graduate, and I was going to be one of them, kind of thing. So I kind of want my Ph.D. to go back and say, "Excuse me, [*chuckle*] I did it [*said in a sarcastic voice*]." Yeah, I just want to show off and punch them in the nose, but even my mother's aunt and uncle said I would never graduate, our own family said I wouldn't.

On a necessarily abbreviated analysis, a first observation to be registered is that Celine's account of her plan to go for a doctorate is replete with mental state avowals ("greedy," "want") of varying strength ("completely greedy," "would like," "mostly want," "kind of want," "just want"), enlisted in the construction of several motives for pursuing a PhD. "Money" and "be(ing) called doctor" invoke common sense assumptions about the kinds of material and social benefits accruing from holding a doctoral degree. These two motives are set off from a third, framed as Celine's ultimate objective by the prefatory phrase

“but I mostly want”: her desire to return to her home state with academic honors and thereby prove wrong “all those people” who predicted that she would not succeed academically because of her visual impairment. Celine’s account for obtaining a PhD thus follows the classical rhetorical schema of a revenge story. Through skillful assemblage of rhetorical devices (e.g., invoking the social obligations for the educational welfare of the young through the category terms ‘teacher’ and ‘family’; enabling inferences to the authenticity of the narrative through direct quotes), Celine produces a version of past events that discredits her opponents and legitimizes her own plans for future action within a normative framework of moral order.

#### RECENT ADVANCEMENTS AND FUTURE DIRECTIONS: APPLICATIONS TO LANGUAGE EDUCATION

The three types of interaction studies reviewed above have had differential impact on language education research. Farthest along are CA applications to the study of discourse and cognition in several educational settings, such as

- teacher-fronted language classrooms (He, 2004; Lee, 2006; Markee, 2000; Mondada and Pekarek-Doehler, 2004; Richards, 2006; Seedhouse, 2004)
- different classroom activities (Frazier, 2007; Hellermann, 2006; Markee, 2000, 2004; Mori, 2002)
- writing tutorials (Koshik, 2005; Waring, 2005; Young and Miller, 2004)
- small-group conversations arranged for language practice (Carroll, 2004; Hauser, 2005; Jung, 2004; Kasper, 2004; Mori and Hayashi, 2006)
- assessments of oral language proficiency (Brown, 2003; Kasper and Ross, 2007; Kim and Suh, 1998; Lazaraton, 2002)

Not all of these studies have explicitly examined cognition in its various roles in interaction as outlined earlier in the chapter. However, as they are fundamentally interested, by default, in participants’ joint accomplishment of intersubjectivity, analytical treatments of cognition as a participant concern are implicit in all CA studies of language education. An explicit discussion of socially shared cognition in CA research on L2 classroom interaction is offered by Seedhouse (2004). The intersection of interactional practices with various aspects of cognition is brought to the fore in studies of “touched-off” remembrances in undergraduate student group work in writing classes (Frazier, 2007), tutor utterances whose incomplete design elicits knowledge displays

from the student (Koshik, 2005), tutor's reversed polarity questions that critique students' work or hint at grammatical errors (Koshik, 2005), other-corrections ("recasts," Hauser, 2005; Seedhouse, 2004), repairs prompted by word-searches (Jung, 2004; Rylander, 2004), or multiple question sequences by which interviewers in oral language tests address candidates' difficulties in producing relevant answers (Kasper and Ross, 2007). This incipient literature demonstrates how the theoretical and methodological resources developed in interaction studies can profitably be applied to investigate the roles of cognition in language education. It also allows us to map out several interrelated trajectories for the study of cognition as a socially shared, discursively constituted phenomenon in second language education and assessment.

1. One task for interaction researchers is to critically examine how existing theory and research holds up against studies of cognition as embedded in social practice. Two examples of such critical investigations are Carroll's (2004) study of "dysfluency" and Hauser's (2005) examination of the theory of meaning underlying the practice of coding in second language research. Under speaker-based models of speech production, "dysfluent" L2 speakers' utterances are standardly taken as evidence of limited L2 knowledge and processing facility. However, by analyzing "dysfluently" produced turns in their sequential environments, Carroll (2004) shows how repetitions and delays prove to be skillful methods that enable the speaker to recover her turn from overlap and secure reciprocity. The broader implication of this study is to warn against the mentalization of fundamentally interactional practices. Taking as an example the case of "recasts," Hauser (2005) problematizes the implicit theory of meaning underlying this concept and more generally the research practice of coding interactional material. Coding is predicated on the stability of meaning, a critical assumption in all dominant traditions of social science and pervasive in second language studies. Hauser confronts the standard theory of meaning with the ethnomethodological view of meaning as indexical and locally contingent, showing that the practice of coding prevents researchers from examining how the participants themselves understand the ongoing activity. These studies implement Markee's call to respecify second language acquisition research from an ethnomethodological perspective (Markee, 2000).
2. A second type of contribution results from studies that put into practice the conversation-analytic principle of "unmotivated looking." By bracketing preexisting theories from the analysis, researchers can enable discoveries of interactional practices and objects that are not available to metadiscursive and metalingual

commonsense understanding and had eluded professional investigation. Examples are the “zones of interactional transition” between classroom activities (Markee, 2004) and instructors’ “designedly incomplete utterances” (Koshik, 2005).

3. A third kind of advancement is made by studies that subject known objects to new scrutiny and thereby bring to light grammatical forms and interactional functions that went unnoticed so far. For example, Koshik (2005) reveals how tutors in writing conferences accomplish specific instructional actions through reversed polarity questions and alternative questions, and Kasper and Ross (2007) show how language testers enlist various formats of multiple questions to enable candidate answers at difficult moments in language assessment interviews.

Importantly, the discursive perspective on cognition in educational contexts reveals that interaction is not only constitutive for oral language use and learning but also for literacy development (Frazier, 2007; Hellermann, 2006; Koshik, 2005; Waring, 2005; Young and Miller, 2004). Future research in this domain can build on a small but rapidly growing literature.

4. A final application of interaction studies that has remained unexplored thus far is the domain traditionally known as “individual differences.” Here discursive psychology holds promise for the exploration of received social-psychological topics such as attitudes, motivation, anxiety, risk-taking, and cognitive and affective learning styles and strategies. In DP perspective, the study of these psychological constructs would have to be respecified from learner-internal traits and processes to descriptions and accounts. Rather than theorizing cognitive and affective concepts as independent variables that explain behavior and “learning outcomes,” DP studies would ask how students and teachers deploy psychological category terms and manage cognitive and affective implications as they pursue their practical activities.

Discursive psychology also recommends itself as an analytical perspective for research on the lives of multilingual speakers, writers, and language teaching professionals. Often inspired by a poststructuralist sensibility for the tension between individual agency and sociohistorical, political, and institutional macrostructures, such work strives to represent research participants’ voices by giving preference to a range of autobiographical genres as data, such as interviews, focus groups, diaries, and journals. Unfortunately, the theoretical sophistication of this research often does not translate into commensurate analytical practices (Pavlenko, 2007), resulting in underanalysis and few insights beyond common sense knowledge. Discursive psychology offers an

analytic alternative that enables researchers to focus on the rhetorical practices through which research participants make their accounts intelligible and construct—in interactional activities such as interviews, coconstruct in collaboration with the interviewer—versions of their lives and identities as agents in a multilingual and multicultural world.

## COGNITIVE LINGUISTICS AND ITS APPLICATIONS TO SECOND LANGUAGE TEACHING

### INTRODUCTION

Traditionally language has been viewed as an autonomous system, separate from other cognitive and social abilities. In this view, the language system operates under a set of arbitrary and unmotivated rules and properties and the various subcomponents of the language system such as syntax, morphology, and lexis are independent of each other. The approach to language learning that accompanies this view of language emphasizes the need for the learner to learn vocabulary items separately, master the grammar rules and memorize their exceptions.

A radically different view of the language system is found in a cognitive linguistic approach. Cognitive Linguistics (CL) is based on the assumption that meaning is embodied and attempts to explain facts about language in terms of other properties and mechanisms of the human mind and body. Meaning is therefore often motivated through metaphor, metonymy, and image schemas, not only at the lexical level, but also in syntax and morphology (see also Nation, *Lexical Awareness in Second Language Learning*, Volume 6; Sharwood Smith, *Morphological and Syntactic Awareness in Foreign/Second Language Learning*, Volume 6).

Even though studies that apply CL theoretical insights to L2 learning and teaching are still relatively sparse, applied linguists such as Nick Ellis (cf. 1998 and 1999) have explicitly stated that CL has a lot to offer to SLA because it provides for meaningful learning, giving insight into the conceptual principles that may give rise to different forms. This chapter first gives a brief overview of how CL has developed and then after explaining CL in more detail, it shows what a CL view entails for second language development and how it may be used in raising language awareness in second language teaching.

### EARLY DEVELOPMENTS

CL developed in the 1970s from the work of a number of different researchers and has been influenced by many influential linguists, but it would be safe to say that its “founding fathers” are Leonard Talmy (1981), George Lakoff (1987), and Ronald Langacker (1987).

Cognitive linguists hold that language is part of, dependent on, and influenced by human cognition, including human perception and categorization and that language develops and changes through human interaction and experiences in the world. In other words, language is part of and influenced by psychological, sociological, and cultural factors. CL does not make any claims about psychological reality, but it does strive to create analyses that are at least psychologically, biologically, and neurologically plausible. Langacker even goes so far as to say that “despite its mental focus, cognitive linguistics can also be described as social, cultural, and contextual linguistics” (1997, p. 240).

In addition, during the 1970s, several other streams of linguistics developed that were quite compatible to CL in that they hold that language is best studied and described with reference to its cognitive, experiential, and social contexts. Functional linguists such as Joan Bybee, Bernard Comrie, John Haiman, Paul Hopper, Sandra Thompson, and Tom Givon focused especially on explanatory principles that derive from language as a communicative system, and historical functional linguists such as Elizabeth Traugott and Bernd Heine showed how meaningful lexical units such as adverbs may become grammatical morphemes over time. Influenced by Piaget and by the cognitive revolution in psychology, Dan Slobin, Eve Clark, Elizabeth Bates, and Melissa Bowerman laid the groundwork for a strong functional/cognitive strand in the field of first language acquisition. Other compatible approaches developed in the 1980s. Connectionist models of language processing, such as those developed by Jeff Elman and Brian MacWhinney, which model language acquisition using connectionist networks, also hold the notion that language learning is basically a bottom-up process, approaches also compatible with Herb Clark’s approach to language in interaction and Michael Tomasello’s approach to first language acquisition. CL is interdisciplinary and strives to be sensitive to findings in the brain sciences, social sciences, psychology, or philosophy (cf. Ruiz de Mendoza and Peña, 2005).

Over the last decade, cognitive linguistic theory has developed further with work by Gilles Fauconnier and Mark Turner (2002) on mental spaces and conceptual blending, which “blends” in interesting ways with both Langacker’s cognitive grammar and Lakoff’s theory of metaphor. In addition, construction grammars that focus on the meanings of constructions as proposed by Goldberg (2006) or Croft (2001) are considered part of the cognitive linguistic paradigm.

As this brief overview has shown, CL is a complex, dynamic theory. For introductions into CL the following readings are recommended: Croft and Cruse (2004), Dirven and Verspoor (1998), Evans and Green (2006), Taylor (1995), and Ungerer and Schmid (1996). In addition, *Handbook of Cognitive Linguistics*, edited by Geeraerts and Cuyckens has recently appeared (2006). The remainder of this chapter focuses only

on those aspects and notions of CL that have found their application in second language teaching. What these applications have in common is that a CL approach shows that form–meaning connections are often not arbitrary but motivated. The advantage of a CL approach to teaching language is that it helps raise awareness of these form–meaning connections, and that once an L2 learner recognizes these connections, he or she may be better able to remember them.

#### MAJOR CONTRIBUTIONS

The two most important works in CL are Lakoff's influential book *Women, Fire and Dangerous Things* and Langacker's *Foundations of Cognitive Grammar*, both of which appeared in 1987. Lakoff is especially well-known for his work on metaphor and metonymy and Langacker has developed an explicit theory of usage-based grammar. There is a great deal of overlap between the two approaches to language and CL does not make a clear distinction between lexis and grammar, but because CL holds that syntax and morphology are governed by the same cognitive principles as lexis, the first few sections deal with motivated meaning at the lexical level and the later ones with motivated meaning at the grammatical level. Where appropriate, applications to SLA will be shown.

#### *Prototypes and Radial Categories*

One of the major ideas in Lakoff's work is that human categorization is fundamental to language use and that by looking at language we can often indirectly infer the ways that humans conceive of their world. Human categories are not clear-cut. Basing himself on work by Rosch, Lakoff argues that human categories are clusters of entities that may be more or less central to a category. The best example within a category is considered the prototype. For example, the category "fruit" has many members, such as apples, pears, pineapples, watermelons, strawberries, mangos, and so on. If you asked a group of informants in Western Europe to write down three types of fruit, they would be most likely to include apples, oranges, pears, and bananas. These would be considered the "best examples" or "prototypes," not only because they are most frequently seen but also because they have the most typical sizes and flavors (not too big, not too sour, and so on). Lemons are less central members, probably because they are atypically sour and watermelons and berries are less central because of their atypical sizes. A tomato may be considered a fruit by some if its genetic make-up is taken into consideration, but most people consider it a vegetable because of how it is used. The point of all this is that there are no objective categories out in the world, but that humans impose categories upon the world, which are subject to change depending on

time, place, and context. For example, a person may name a strawberry as a central member of fruit if he or she has just eaten some strawberries or has seen a great deal of strawberries in the last few weeks.

### *Core Senses and Meaning Extensions*

Just as categories have different members, which may be more or less prototypical, words may have different senses, some of which may be more or less central. Almost any word in a language has more than one sense, but there is usually one sense, called the “core meaning,” which typically gives rise to the other senses. The *New Oxford Dictionary of English* definition of “core meaning,” which we use, is very much in line with general cognitive thought:

The core meaning is the one that represents the most literal sense that the word has in modern usage. This is not necessarily the same as the oldest meaning, because word meanings change over time. Nor is it necessarily the most frequent meaning, because figurative senses are sometimes the most frequent. It is the meaning accepted by native speakers as the one that is most established as literal and central. (*New Oxford Dictionary of English*, 1998, foreword)

In CL theory it is held that just as in categories the different members are related to each other in different ways, the different senses of a word will have some things in common and these meaning relations become clear when we start with the core meaning.

The relation between the core and the peripheral senses of a word is one of meaning extension, which can take place diachronically or synchronically. Diachronically, new senses of linguistic expressions have found their way in the language because speakers saw a conceptual link between an original sense and a newer sense; then the older sense may come into disuse or be forgotten altogether. For example, historically *launch* was metonymically related to *wielding a lance*, which over time has generalized to mean “throw [any object] forward with force.”<sup>1</sup> For most speakers the more central sense is now probably associated with rockets or ships rather than lances. Synchronically, this newer sense would be considered a core sense as it pertains more to our everyday experience of the world than a lance and can easily explain related metaphoric senses as in *The magazine was launched last week*.

Two basic semantic extension principles are *metaphor* and *metonymy*. In the case of *metaphor*, conceived associations are among different

---

<sup>1</sup> In Late Latin the verb *lanco* occurred, related to the noun *lancea*. The English verb *launch* and noun *lance* are derived from two different French dialects. In its earliest attestation, *launch* is used with the sense of *wielding a lance*.

domains of experience: the logic of one domain is mapped on to another one. For example, in the sentence *The houses had been gutted by grenades*, the verb *gut*, which literally refers to removing the bowels and entrails of an animate being, is used metaphorically to refer to destroying the inside of a building.

Metaphorical meaning extensions can also be based on image-schema transformations (e.g., Lakoff, 1987, p. 440). Consider the sentence *there was a bulge in the birthrate*. Through an image-schema transformation, the multiple births are conceived as a “mass” object, and then through metaphor, the collection of births is spread over a timescale resulting in the conception of a graph with a bulge, literally a bump, representing an uneven spread.

In the case of *metonymy*, the association is within one domain of experience. An example of a metonymic meaning extension is “taut,” which literally refers to “having no give or slack.” When applied to a person’s facial expression, it points to emotional tension as in *Eyes blinking, showing no signs of being emotionally taut, President Clinton looked like an ordinary man defending the ordinary lies he had concocted to hide an ordinary affair.*<sup>2</sup>

Two other types of meaning extension are *specialization* and *generalization*. Meanings of words may become specialized or generalized, both in diachronic and synchronic use. A diachronic example of specialization is “queen,” which originally meant “woman,” and now refers to a particular type of woman: the king’s wife. A synchronic example of specialization is “forge” (make or fabricate), which may also be used to refer to a specific kind action, “to shape or make by heating in a forge.” An example of generalization is “grid,” which literally refers to a “perforated or ridged metal plate,” but may also be used in a much broader sense of “a network of uniformly spaced horizontal and perpendicular lines” as in *The skeletal grid of paved streets quickly gave way to sandy roads*.

The conceptual links between senses of a linguistic expression mentioned earlier are not limited to the ones that occur between a core and a noncore sense, but the senses are all interrelated, as one peripheral sense may form the base for an even more peripheral sense. Cognitive linguists have demonstrated in numerous cases that the multiple senses and uses of a polysemous word are systematic. For example, seemingly unrelated uses of prepositions are actually connected in explainable ways (e.g., Brugman, 1981; Boers, 1996).

---

<sup>2</sup> Because there is also a degree of metaphor involved (tension projected on face) in addition to the fact that the tautness points to the person’s emotion, Goossens (1990) would label this example “metaphonymy.”

In second language teaching, Lindstromberg (1998) and Tyler and Evans (2004) have applied a core meaning approach to understanding English prepositions and Dirven (2001) and Rudzka-Ostyn (2003) to teaching English phrasal verbs. Empirical evidence for a core meaning approach to vocabulary learning has been provided by Verspoor and Lowie (2003).

### *Conceptual Metaphor and Fixed Expressions*

The meaning extensions that pertain to individual words also apply to concepts, which in turn may give rise to fixed expressions and idioms. Cognitive linguists have shown that idioms, often thought to be “dead” figures of speech with unpredictable meanings, are usually motivated by conceptual metaphor or metonymy.

For example, as Kövecses (1986) has shown, English has a lot of expressions to describe anger that are motivated by overarching conceptual metaphors, each of which may give rise to a variety of expressions. The overarching conceptual metaphor ANGER AS A HOT FLUID IN A CONTAINER may give rise to expressions such as *anger welled up inside me, I was boiling with anger, she was all steamed up, she erupted, simmer down, he flipped his lid, I was fuming, and he blew up at me*. The ANGER AS FIRE conceptual metaphor gives rise to expressions such as an *inflammatory remark, adding fuel to the fire, he kept smouldering for days, she was breathing fire, she exploded, and he's hot under the collar*. And the ANGRY PEOPLE AS DANGEROUS ANIMALS conceptual metaphor gives rise to expressions such as *he has a ferocious temper, don't snap at me, she unleashed her anger, and don't bite my head off*.

In an experiment, Boers (2000) offered these expressions to Flemish-speaking learners of English, to one group organized according to their common conceptual metaphors and to another group organized randomly. This experiment and several others showed that helping language learners to retrace idioms to their conceptual metaphors or original source domains helps them appreciate the motivated nature of such expressions and thus encourage insightful learning. In addition, other controlled experiments have shown that CL approaches to teaching idiomatic expressions can be effective in terms of in-depth comprehension, retention, and even appreciation of usage restrictions (e.g., Boers, 2000; Boers and Demecheleer, 1998; Boers, Demecheleer, and Eyckmans, 2004; Kövecses and Szabo, 1996; MacLennan, 1994). Kövecses also reported on a classroom experiment that provided evidence that teaching the strategy of metaphorical thinking, as opposed to teaching particular conceptual metaphors, fostered a higher rate of learning of idioms. He suggested that “people need to be made aware of the metaphor approach before they can put it to use” (2001, p. 109).

Different cultures may use different conceptual metaphors reflecting varying degrees of preoccupation with certain “source domains,” motivated by their different historical or cultural factors (Boers, 2003). A contrastive analysis of metaphors as provided by Barcelona (2001), who compared English and Spanish conceptual metaphors for emotional domains such as “sadness”/“happiness,” “anger,” and “romantic love,” shows that discovering a target language’s conceptual metaphor may help not only to learn the language but also to make students aware of the differences between L1 and L2 cultural concepts. In addition, Sharifian (2001) and Sharifian and Palmer (forthcoming) show that discovering underlying metaphors may help the learner better understand the L2 culture.

#### RADIAL CATEGORIES, CONSTRUAL, AND GRAMMAR

CL theory holds that grammatical categories, albeit more abstract, are just as meaningful as lexical categories (Langacker, 1987, 1991). In fact, grammatical and lexical meanings are not two discrete types of meaning but exist along the same continuum at opposite ends of a spectrum. Just as with lexical entities, the different senses of grammatical morphemes such as case endings or classifiers, grammatical constructions such as tenses, or syntactic constructions such as SVO can be more or less central, with a central sense, the more salient prototype, giving rise to the more peripheral ones. In other words, as Taylor (1995, p. 197) explains, “[linguistic] constructions . . . need . . . to be regarded as prototype categories, with some instantiations counting as better examples of the construction than others.” It is these “better examples” that are represented in the intuitions of speakers, not only about their own first language, but also about the language to be learned. A principled approach to the description of textbook grammar could, therefore, start out by teaching prototypical grammar items, and gradually introduce less prototypical examples. In this way, the teaching of grammar would tap into learners’ intuitions.

Another key concept in cognitive grammar is the notion of construal. According to Langacker (1991), an expression’s meaning does not only call to mind some conceptual content but also how the speaker construes it. For example, looking at a group of stars, a speaker can refer to them as *a constellation*, *a cluster of stars*, *specks of light in the sky*, and so on, expressions that are semantically distinct. In other words, speakers can construe the same objective content in alternate ways. The notion of “construal” certainly has an impact on the teaching of grammar. For example, if one wants to explain to L2 learners of English the use of the definite versus indefinite article as in “I will have

*the* tuna fish sandwich” versus “I will have *a* tuna fish sandwich,” one could point out that the definite article, which implies that both speaker and hearer have mental access to the entity referred to, is more likely to be used in a more individually catered restaurant, where the sandwich is construed as unique to that restaurant.

One of the first to discuss in detail the cognitive-didactic approach to grammar is Dirven (1989), who investigated where CL can make a contribution to the general process of facilitating language learning. He argues that discovering the conceptualizations laid down in linguistic expressions in the L2, especially where they differ from the L1, facilitates the learning process. Taylor (1993) also makes the claim that a cognitive approach to grammar is inherently contrastive, albeit focused on semantic content and conceptualization rather than on formal properties. He argues that target language structures that are difficult to acquire are usually those that symbolize conceptual categories that are not in the learner’s L1. Some clear examples of conceptual categories that are difficult to acquire for learners of English as an L2 are the use of the present versus the present progressive tense, the use of the *to* infinitive versus plain infinitive and *-ing* form as complements of verbs, and the use of articles in English.

Two volumes edited by Pütz, Niemeier, and Dirven (2001a, b) show how pedagogic cognitive linguistic approaches to different topics may be worked out. In one of the papers, for example, Tyler and Evan (2001) offer a systematic, motivated account of how English tense usage works, and they show that a number of distinct and fundamentally nontemporal meanings associated with tense can be distinguished, such as intimacy (between speakers), salience (foregrounding vs. backgrounding), actuality (realis vs. irrealis), and attenuation (linguistic politeness), which are all shown to be related to each other in a systematic principled way. In addition, for Slavic languages some cognitively based textbooks are available written by Janda and Clancy (2002).

To show how a cognitive approach to grammar could be implemented in a classroom, the teaching of the notoriously difficult English article system will be used as an extended example. Huong (2005) addresses Vietnamese learners, whose L1 has a classifier system that does not mark for definiteness. He suggests that rather than giving incorrect “rules of thumb,” lots of isolated rules, long lists of uses, and loads of exceptions to the rules, as given in many standard textbooks, a cognitive approach gives a coherent account of the whole article system, showing how the core meaning associated with each form may also be used in nonprototypical senses.

The approach would first address the fact that in English, one must always mark whether an entity (the person or thing the noun refers to)

is definite or not. An entity is considered definite when in a given context a speaker and hearer can both make mental contact with it. In other words, both know which particular entity is referred to. This is the case with most proper nouns, such as *Tom* and *Vietnam*, but also with names of sports, meals, days of the week, and months of the year such as *tennis*, *lunch*, *Monday*, and *November*. These proper nouns and names have the ultimate sign of definiteness: the “null” article. The fact that “null” is very definite can be inferred by contrasting (a) “Father helped me” versus (b) “My father helped me” where in (a) the speaker probably assumes the hearer also knows the father.

Whereas the “null” article marks definiteness in proper nouns and names, the definite article *the* must be used with a common noun used in a definite sense, no matter whether it is a count noun, singular or plural, or a mass noun as in *I saw the bike/the cars/the water*. The prototypical examples of definite entities are unique ones in the world, in the larger context, or in the immediate context such as *the sun*, *the president*, or *the door*. Other definite entities are those that are unique to the speaker and hearer’s discourse, either explicitly or implicitly as in *I rode a taxi home; the taxi was yellow*, or *I rode a taxi home; the driver was friendly*. More peripheral members of definiteness would be entities that are not necessarily identifiable to both the speaker and hearer, but the hearer can infer that the speaker refers to a unique one in his or her mind as in *Be aware of the dog*, *I went to the park*, or *I took the bus*. An even more peripheral example of definiteness is one where the noun does not refer to a particular unique entity, but to a whole class of entities in a so-called type hierarchy. For example, in *the dog is a domestic animal*, the dog refers to a type (rather than a token) within the hierarchy of animal–domestic animal–dog. (A similar account is possible for nonprototypical use of generic *a* or generic plurals.)

If the L2 learner wants to determine which article to use, it is best to first determine whether the common noun is definite or not because there is only one form: *the*. If the noun is used in nondefinite sense, some further choices have to be made. Singular count nouns must have *a*, but plural count nouns and noncount nouns do not. Now it is important to know whether the noun is count or noncount. As Taylor (1993, p. 211) points out, the prototypes of “count noun” can be seen as a three-dimensional, concrete “thing” and of “mass noun” as an internally homogenous, divisible “substance” (i.e., “bottle” vs. “beer”). Prototypical count nouns refer to entities that are “bounded” such as bikes, tables, or pens and prototypical noncount nouns are entities that are “unbounded” such as water and gold. One way to distinguish a bounded entity from a nonbounded one is as follows: If you take a piece of the table, such as a leg, you do not have a table, but if you take some water, you have some water in your hand and in the

container. In other words, an unbounded entity is more diffuse than a bounded one. What seems most difficult for L2 learners is to understand why some nouns may be count in one case and noncount in the other as in (a) *I had a good sleep* versus (b) *I need sleep*. The notion of construal is important in understanding why: in (a) the noun refers to an instance of a bounded event with a clear beginning and end, but in (b) to any instantiation of a more diffuse event. In addition, a noun like education may be confusing: (a) *He needs an education* versus (b) *Children need access to education*. In (a) *education* is construed as a rather linear training with a beginning and end, but in (b) *education* is a rather diffuse, abstract concept that includes any activity of learning and instruction and those that impart knowledge or skill.

This brief treatise of the English article is of course not complete, but shows that with a cognitive approach, it may be possible to explain in a systematic and coherent manner the conceptualizations that give rise to forms, starting from more prototypical examples to more peripheral ones. The assumption is that such an approach would raise awareness, constitute insightful learning, aid retention, and finally aid correct application.

#### WORK IN PROGRESS

Within the field of CL, an enormous amount of research has addressed the motivation of linguistic constructions in a host of different languages, and a few of the findings have found their way into published articles about and textbooks for second language teaching and acquisition. Boers and Lindstromberg are currently working on a book for teachers dealing with cognitive linguistic approaches to vocabulary teaching, and Tyler and Evans are currently working on a cognitive pedagogical grammar for teachers. In addition, several of Tyler's students are currently testing the effectiveness of a CL approach to grammar.

#### PROBLEMS AND CHALLENGES: FUTURE DIRECTIONS

There is sound evidence that making learners aware of core meanings of words or of conceptual metaphors that give rise to figurative expressions helps learners to retain these noncentral and figurative senses. There is no doubt that CL can also aid learners in becoming aware of cross-cultural differences in conceptualization. But as far as a CL approach to teaching grammar, there is no conclusive evidence yet. Even though it has been claimed that a cognitive approach provides a qualitative better approach to teaching grammar than more traditional

ones, there is very little empirical evidence that it indeed does. There are several reasons. For one thing, in the light of the popularity of communicative approaches to language teaching, grammar teaching has received very little attention and secondly effect studies are notoriously difficult to conduct. The only systematic study into the effect of a cognitive approach that I am aware of so far is by Huong (2005), who compared the cognitive approach with teaching articles described earlier with a commercially available functional approach. The short-term results were very favorable, but the long-term effects showed no significant differences. He attributed the disappointing results to the fact that his learners, who were quite advanced, may have reverted back to old habits and applied their old “rules of thumb.” However, several current classroom-based intervention studies by Tyler and her students show promising results.

But even though the role of explicit grammar teaching might be debatable, the fact is that there are many grammar books for both teachers and students, which are often consulted by second language learners. As Corder (1967) already pointed out, “It is a defining concern of second language research that there are certain aspects of language to which second language learners commonly prove impervious, where input fails to become intake” and in such cases a qualitatively sound and meaningful explanations are needed. CL can offer these.

## KNOWLEDGE ABOUT LANGUAGE AND EMOTION

### INTRODUCTION

There can be no gainsaying the fact that emotions constitute an important and perhaps indispensable part of human experience. “Our passions,” writes one influential scholar, “constitute our lives.” (Solomon, 1993: xiv). Even a new-born babe is capable of expressing feelings of joy and pain, widely held to be the visible and physical manifestations of emotions. Indeed, one might even argue that emotions are of the very essence as far as human nature is concerned. Emotions affect us all and often in ways that no one else, but ourselves can grasp or fathom. When the Friar in Shakespeare’s *Romeo and Juliet* (Act 3. Scene iii) tries to console the protagonist, who is faced with the prospect of impending banishment, by offering him “adversity’s sweet milk, philosophy”, he is told somewhat brusquely:

Hang up philosophy!

Unless philosophy can make a Juliet

Philosophy or systematic reasoning is of no use to a pair of star-crossed lovers. Philosophy can at best rationalize things and help us see through our conceptual entanglements. “But,” as the Bard himself put it on another occasion, “love is blind, and lovers cannot see/The pretty follies that themselves commit” (*The Merchant of Venice*, Act 2. Scene vi).

Theorists of emotion, or passion as it is sometimes called (Gaukroger, 1998), typically contrast it with reason. However, as is often the case with the dichotomies we postulate, the opposition between reason and emotion turns out, on closer inspection, to be actually hierarchical, with the former invariably occupying the privileged position.

### MAJOR CONTRIBUTIONS

#### *In Philosophy*

The relation between reason and passion is one of the oldest and most enduring questions in philosophy (Elster, 1999). Aristotle wrote in his *Rhetoric*: “We shall define an emotion,” “as that which leads one’s condition to become so transformed that his judgment is affected, and which is accompanied by pleasure and pain.” (cf. Calhoun and Solomon, 1984, p. 44). In so viewing emotion, Aristotle inaugurated a trend in philosophy that has survived through the 2500 years since

it was put forward and still shows tremendous vitality. Aristotle's view contrasts with a view advanced centuries later by the American psychologist-cum-philosopher William James (1884), according to whom the emotions were essentially physical reactions and as such simply another way of referring to their sensory counterparts, the so-called "feelings."

What makes Aristotle's view so refreshingly "novel" and indeed "modern" is that it puts emotion on an equal footing with reason, "as a more or less intelligent way of conceiving of a certain situation, dominated by a desire (e.g., in anger, the desire for revenge)" (Calhoun and Solomon, 1984, p. 3).

But the fact remains that, by and large, philosophers have been of the opinion that, in the tussle between Reason and Emotion, it is the former that gets (or rather, should get) the upper hand. A notable exception is David Hume who challenged the Platonic precept by proclaiming: "Reason is, and ought only to be the slave of the passions, and can never pretend to any other office than to serve and obey them." (*A Treatise of Human Nature*, 2.3.3.4). Hume was directly reacting to Descartes' famous metaphysical distinction between the mind (thinking substance) and the body (extended substance) and the problems it engendered for an understanding of emotions. In particular, he was critiquing the Cartesian quest for certainty and his use of "I think, therefore I am" as the Archimedean point for erecting an entire epistemological edifice. In Hume's view, the stable entity called "I" postulated by Descartes simply cannot exist, given that our passions succeed one another, creating a state of utmost volatility inhospitable for any durable "self."

Another major philosopher who reacted negatively to the Cartesian theory of emotions was Spinoza who reinvigorated an ancient Stoic theory, according to which emotions are essentially judgments gone astray and hence are deleterious and in need of being reined in by robust reason.

Perhaps the most vigorous contestation of the Cartesian dogma was mounted by Giambattista Vico (1688–1744), an Italian humanistic philosopher, who insisted on the importance of self-knowledge over and above objective, scientific knowledge. In the words of Maynard (2002, p. 12), "Vico's hermeneutics is a reminder against the sheer arrogance of the Cartesian mind-set."

### *In Psychology*

William James' 1884 essay—referred to in the previous section—may be considered a landmark in the psychological approaches to the study of emotions. Since then, scholars have conducted their research to

either confirm or refute James' idea that emotions are essentially bodily experiences. Walter Cannon (1939) was among James' early critics. On the other hand, Sigmund Freud, the founder of psychoanalysis, endorsed James' view, reformulating it to accommodate his own trademark notion of the "unconscious." Freud maintained that emotional disorders resulted from traumatic experiences so intense that they affected the smooth functioning of the reasoning mind. This in turn harks back to the long tradition—ultimately dating back to ancient Stoics and, as we have seen, reworked by Spinoza—of regarding emotions as generally deleterious and in need of being brought under the control of robust reason. Freud was only continuing a tradition whose roots may be traced back to Petrarch's *De Remedis*, a compendium of Stoic techniques for "healing the passions." Incidentally, this tradition is still kept alive in contemporary practices of cognitive therapy for emotional disorders.

### *In Anthropology*

Charles Darwin, the founder of evolutionary biology, may be seen as having inaugurated an approach to the emotions that seems to underlie a number of studies undertaken in the field anthropology. In his book *The Expression of the Emotions in Man and Animals* (Darwin, 1872), the English biologist, while conceding that some emotional expressions may have a survival value, went to the extent of claiming that emotional expressions are behavioral equivalents of vestigial anatomical organs such as the appendix: the implication being that they are, strictly speaking redundant and perfectly dispensable as such at best, or an irksome impediment at worst, being left-overs from an earlier, bestial stage of evolution. When the eighteenth century English poet Alexander Pope wrote (Pope, 1930, p. 180)

Unlearn'd, he knew no schoolman's subtle art,  
No language, but the language of the heart.

he was simply expressing what has over the centuries been an unargued assumption underlying our cultural practices namely that emotions betray a lack of culture and sophistication and hence need to be brought under the control of cool, dispassionate reason.

### *In Sociology*

Although the emotions may strike someone as relating directly to the personal and intimate side of a person (more on this later), it has increasingly become clear over the past few decades that there is also a collective or social/cultural dimension to them (Niemeier and Dirven, 1997). In fact, the idea itself that emotions may help explain social

behavior—in terms of not only social causes, but also social effects—is nothing new. It plays an important role in Max Weber’s discussion in *The Protestant Ethic and the Spirit of Capitalism* (Weber 1905 [1991]). Weber argued that, with the increasing rationalization of the way the world is run, the emotions would tend to get relegated to the margins in human affairs and conduct. From the 1970s on, sociologists have moved away from the excessive and almost exclusive emphasis on the cognitive bases of social action and increasingly begun to pay attention to the role of emotions (Barbalet, 1998).

### *In Linguistics*

In the Western world, the study of language and the study of logic share a common history. For the most part, the two are viewed as intertwined and inseparable from each other. Language is generally thought to be an attribute of the reasoning mind. In other words, man is *Homo loquens* because he is *Homo sapiens*. Indeed, a common thread that runs through the otherwise disparate attempts to understand the workings of grammar over the centuries is that it must somehow embody the rules of logic.

In the seventeenth century, Antoine Arnauld and Claude Lancelot (1968) published in France a monumental work of grammar, referred to in the literature as the Port-Royal Grammar. The exact title of this work was *Grammaire générale et raisonnée* “the aim of which was to demonstrate that the structure of language is a product of reason, and that the different languages of men are but varieties of a more general logical and rational system” (Lyons, 1968, p. 17). Indeed, so powerful has the temptation been to locate and identify a rational hard core in human languages that Leibniz, impressed by the beauty and perfection of the language of mathematics, is believed to have exclaimed that, if God Almighty were to descend from Heaven and address ordinary mortals (all made after His own image, as the Bible tells us), he would speak to them in that language—it was simply inconceivable from the German philosopher’s point of view that an all-perfect God would resort to any language other than the all-perfect language of mathematics.

Traditional grammarians typically equated ungrammaticality with illogicality. The use of double negation to express a negative proposition just cannot be grammatical, they said, because binary logic, incorporating as it does the law of the excluded middle, would automatically assign positive polarity to a sentence containing two negatives. A good deal of traditional grammar was an effort to put natural languages and their grammars on the procrustean bed of classical logic. In many ways,

modern linguists, who initially established their scientific credentials in stiff opposition to the claims of traditional grammarians, rarely, if ever, questioned the guiding principle of their adversaries. It is significant in this respect that when Labov (1972) undertook his pioneering work on Black English, his immediate concern was to show that the so-called nonstandard English did obey its own logic, albeit a logic different from that which underwrote Standard English. In his own words, his primary target was the then prevalent mainstream view—so-called “deficit theory”—among educational psychologists who held that “the children’s speech forms are nothing more than a series of emotional cries” (Labov, 1972, p. 205) and that children ought to be removed from their family environment where they “maintain primary emotional relationships” to “hopefully prevent the deceleration in rate of development which seems to occur in many deprived children around the age of two to three years.” (Caldwell, 1967, p. 17, cited in Labov, 1972, p. 233). The very title of his classic paper ‘The logic of non-standard English’ is itself very suggestive indeed in this regard.

The truth of the matter is that, as heir to mainstream Western philosophical tradition, linguistics has systematically sought to downplay the role of emotions in language (Rajagopalan, 2004). Emotional aspects of language use are typically considered secondary or marginal to its rational, fact-stating role. In the words of Sapir (1921, p. 38):

On the whole, it must be admitted that ideation reigns supreme in language, that volition and emotion come in as distinctly secondary factors.

#### WORK IN PROGRESS

In the history of human thought, it is only relatively recently that the study of emotions began to be pursued in different ways under the rubric of different and separate academic disciplines, because the rise of distinct disciplines is itself of relatively recent origin. This is attested to by the fact that in most Anglophone universities the highest degree awarded to a research student is still called PhD or Doctor of Philosophy, irrespective of the specific area where the candidate submitted his/her dissertation. But, what is truly amazing is that the overall picture that emerges from work done on the topic of emotions is that, barring occasional discordant voices here and there, they all add up to a broader picture or a world-view which posits Reason as the beacon light which alone can save man from straying into the dangerous minefield of emotions. Also, this overall picture helps sustain a number of other binary oppositions, which in turn help prop it up.

*Public Versus Private*

A case in point is the opposition between the public and the private spheres. The opposition “Reason versus Emotion” is often conflated with “the public versus the private” opposition. This ties in neatly with the dominant attitude in the West of keeping one’s emotions to oneself and withholding it, as far as possible, from the public gaze. It also ties in with the allegation made by the neopragmatist philosopher Richard Rorty (1980) that it has been philosophy’s mission, from Plato on, to pry into and control the private lives of citizens. In other words, it is the task of reason to curtail the play of emotions and make sure they do not spill over the bounds of their allocated ken.

*Mind Versus Body*

As we have already seen, the opposition between reason and emotion is bound up with the opposition between mind and body. Reason is thought of as disembodied. For instance, philosophy does not deal with words, sentences etc., which are linguistic objects. Rather, it is concerned with concepts, propositions, and so on which are extralinguistic and universal (i.e., do not belong to any one language in particular). Language itself is seen as the embodiment of thought. Poets, whose raw material is language, can keep themselves busy doing such “superficial” things as rhyming and alliteration; not so the philosophers, whose work is more cerebral and celestial and who are intent on unlocking the mysteries of thought itself.

It is not difficult to see that the distrust of language that has been a mainstay of Western philosophy is directly related to the widely held view that to invest in the salvation of one’s soul one must sacrifice all bodily pleasures, resigning to the life of an ascetic. Oddly enough, the subtext that emerges from a number of elaborate treatises on human languages is one of profound lamentation to the effect that the human-kind is not endowed with the ability to communicate telepathically (i.e., without any recourse to the use of language) (Harris, 1981).

*Masculine Versus Feminine*

The “reason–emotion” dichotomy is often conflated with the “masculine–feminine” dualism, so that the exaltation of reason is invested with an androcentric agenda. The macho man must keep his feelings to himself and not display them in public. With this, the distrust of emotions takes on a new twist, thanks to the association with the Biblical theme of the woman’s seductive charm swerving the reasoning power

of man from the path of righteousness. The control of one's emotions through reason thus becomes a metaphor for man's dominance over woman.

### PROBLEMS AND DIFFICULTIES

In view of what we saw in the foregoing sections, it is hardly surprising that linguists and philosophers of language have tended to accord primacy to fact-stating sentences, since it is in the declarative mood that propositions—the bearers of truth values—find their true expression. Scholars like Ogden and Richards (1923) and Stevenson (1944) distinguished emotive (or affective) meaning from cognitive (or purely referential) meaning, invariably giving primacy to the latter. Likewise, in the early models of transformational-generative grammar, there were transformational rules generating interrogatives and imperatives from an underlying base structure, but no rule for generating declarative sentences, since the declarative itself was assumed to be the basic, default pattern, from which all the rest were to be derived. J.L. Austin (1962), it is true, did make a great effort to turn the tables, when he argued that the constative (fact-stating) utterances were but performative ones in disguise. But, interestingly enough, the idea of the primacy of propositional meaning was restored by his best-known interpreter and intellectual legatee John Searle (1969) when the latter reintroduced into the framework the notion of “propositional content” and thus positing within the content of a speech act a hard core of truth-value-bearing form.

#### *Impact on Educational Practices*

**The “Reason Versus Emotion” Opposition and Its Role in the Hierarchization of Academic Disciplines.** Given the traditional stand-off between reason and emotion, it is not surprising at all that the so-called human and social sciences are considered “soft” in contrast with the “hard” sciences such as physics, chemistry, biology, and so forth. As a matter of fact, the roots of this prejudice can be traced back to the Platonic gesture of expelling the poets from his ideal city. The “hard” sciences in this sense as well as mathematics are all covered by the term “philosophy”. The ancient and mediaeval practice of dividing the liberal arts into the trivium (grammar, rhetoric, and logic) and the quadrivium (arithmetic, geometry, music, and astronomy) is a reflection of this hierarchical organization of academy. Notice, incidentally, that the four subjects that compose the quadrivium bear

testimony to the Pythagorean concept of mathematics as “the study of patterns in space and time”—arithmetic is the study of number in itself, geometry that of number in space, music number in time and astronomy number in space and time.

**The Opposition “Reason Versus Emotion” and Its Impact on the Relations Between Academia and the Society at Large.** In his 1987 classic entitled *The Last Intellectuals: American Culture in the Age of Academe*, Russell Jacoby lamented the slow extinction of public intellectuals in academia and their replacement by professional academics who wrote primarily if not exclusively for their own peers. Since then Jacoby’s point has been taken up by a number of concerned scholars. The stand-off between academics and public opinion on matters such as euthanasia, abortion, GM food, and so forth are widely publicized. As far as issues related to language policies and language planning are concerned, it has of late become embarrassingly clear to many professional linguists that their scientifically backed opinions seldom or never find welcome resonance in the public opinion. Their interests, as it has been shown time and time again in such cases as the Ebonics controversy in the USA (a heated debate over a decision by the Oakland, California School Board on December 18, 1996, declaring that the official language of 28,000 African American school children enrolled in Oakland’s public schools was not English, but “Ebonics”), are frequently seen to be at loggerheads with those of the laypersons.

What is important to point out in relation to the frequent clashes between science and public opinion is that the tussle between expert and lay opinions on a given subject of common interest tends to be viewed as one between reason and emotion. The principled neglect of public opinion has been one of the founding axioms of modern linguistics. This is clearly evident in a classic paper by Bloomfield (1944) entitled “Secondary and tertiary responses to language” where the founding father of American linguistics disparages in no uncertain terms lay opinions about language.

Several peculiarities of these secondary responses deserve further study. The speaker, when making the secondary responses, shows alertness. His eyes are bright, and he seems to be enjoying himself. . . . The whole process is, as we say, pleasurable. (Bloomfield, 1944, p. 49).

Bloomfield claims that science is a rational enterprise, cold and methodical. There should no room for warmth or mirth in it. As a matter of fact, Bloomfield writes as if there was sufficient justification in the very fact that the natives appeared to be having a great

time talking about their language for arriving at the conclusion that what they say could not be considered scientifically admissible.

#### PROSPECTS FOR THE FUTURE

Recent research in the field of education has unveiled the centrality of the emotions to learning and the way our thoughts are formed (Frijda, Manstead, and Bem, 2000) and the way bilinguals react to emotional language (Dewaele and Pavlenko, 2002, Pavlenko, 2002, 2006, Wierzbicka, 1992). More and more scholars are of the opinion today that the emotions play an important role in the development of language (Bloom, 1997; Ellis, 1994). On his part, Krashen (1987) put forward his famous “affective filter hypothesis,” according to which a number of “affective variables”—such as motivation, self-confidence, and anxiety—play a facilitative, albeit noncausal, role in second language acquisition.

Not only language, say some educators, but the very personality and character of young children depend a great deal on how the school attends to their emotional needs (Weare, 2004). In defiance of the time-honored tradition of pitting emotion against reason, researchers are also beginning to discover that there is “a strong link between emotion and reason, feelings and thoughts—thereby disproving the adage that emotion is the enemy of reason” (Weiss, 2000, p. 45). Worth special mention here is the emergence of the new field of research called “emotional intelligence” (Mayer, Salovey, and Caruso, 2000).

#### ACKNOWLEDGEMENTS

I am grateful to the CNPq (National Council for Research and Development), a funding agency under Brazil’s Ministry of Science and Technology, for financing my research (Process no. 300158/2003-3).

## **Section 2**

### **Knowledge about Language and Language Learning**

## LANGUAGE AWARENESS IN FIRST LANGUAGE ACQUISITION

### INTRODUCTION

The human capability to acquire language so early and so efficiently has been attracting people's interest for thousands of years. In Ancient Egypt, during the 7th century BC, it was believed that the language capacity was inborn and that even isolated children, deprived of any linguistic input, would develop language. Much later, this belief was tested in the form of a "natural" experiment, in which children were withdrawn from their linguistic environment, and their language development was observed. Those first studies were preoccupied with the phylogenetic aspect of language development and only later has the focus been shifted to the ontogenetic aspect of first language acquisition. Conditionally speaking, in more recent history, that is, for the last 250 years, researchers and practitioners have expressed their interests in the way that children learn to understand and produce language. A milestone in a child language development research that enabled more sophisticated and systematic studies was the invention of the tape recorder. This invention was soon followed by other technological improvements, as well as the elaboration of methodology.

Today, language acquisition is a rapidly emerging field with numerous scholars coming from a variety of disciplines such as linguistics, psychology, speech and language pathology, neuroscience, and computer science. The aims of the field are to determine what in human language is inborn and what is learned through experience; how language development can be facilitated; how the acquisition process can be decomposed; and how to map the stages of language development. The key to success is the ability of the researchers to develop satisfactory methods and research designs. One of the topics that have lately gained considerable scientific attention is *language awareness*. In this chapter, the focus is on the development of language awareness in first language acquisition from infancy to early school age; it is in terms of language components, i.e., phonology, lexicon, morphology, and syntax. Language awareness is related to the topic of communicative

competence; in addition, the importance of first language awareness in second language acquisition is briefly touched on.

#### LANGUAGE AWARENESS: DEFINITION AND EARLY DEVELOPMENT

##### *Definition*

First, it is necessary to define the term language awareness, which appears frequently in texts dealing with applied linguistics, often in the company of two other terms—*metalinguistic (knowledge/ability)* and *metalanguage*. For two reasons, these terms are problematic: (i) different authors use the same term to mean different things and (ii) in some texts the two terms refer to the same concept, while in others they refer to different ideas. In this chapter, language awareness is considered as a common denominator of the two other concepts. Metalanguage has the broader meaning of language about language and can be understood as a tool for explaining linguistic phenomena in applied linguistics; on the other hand, metalinguistic knowledge or ability is the linguistic ability of any native speaker to make a decision about an utterance in terms of its acceptability. Metalinguistic ability enables the communicator to be attentive to language and to follow what is conveyed and how. In other words, metalinguistic ability makes it possible for the speaker to reflect on language regardless of his receptive and expressive abilities (e.g., Flavel, 1988; Perner 1991).

Language awareness can be viewed, as summarized by Garvie (1990), as consisting of several types: *linguistic awareness*—that is, knowledge of the basic components of language, such as phonemes, morphemes, and lexical units; *psycholinguistic awareness*, meaning that the competent language user knows not only the components of the language, but the rules for assembling them; *discourse awareness*, which points to the necessity of being aware not only of the rules of assembling the components of language on the sentence level, but also at the higher level of discourse; *communicative awareness*, enabling a language user to be aware of how words, strings of words, and entire discourses can change according to topic, purpose, situation, and audience; *sociolinguistic awareness*, which helps the user to identify the influence of social context on language use; and finally, *strategic awareness*, which helps the language user to be aware of a set of strategies that can be applied when problems are encountered in the communication process. When one takes all these types of language awareness into consideration, it becomes clear that language awareness has to start developing very early in the process of first language acquisition.

*Early Developments*

Although the study of language development dates far back in history, the fact is that there was no identified discipline devoted to the topic of first language acquisition, as David Ingram claims in one of his earlier works (1989). One of the first major journals that focused on this topic was *The Journal of Child Language*, which has been published since 1974, and which for a long time was the only one of its kind. Until recently there were no university departments of language acquisition. Due to the field's marginal status a large body of literature was published, but with unbalanced coverage of the different relevant issues, and occasionally, it was hard to make sense of all the existing findings coming from very different perspectives.

The developing role of language awareness in first language acquisition began to emerge in the last few decades of the twentieth century, first in the area of metalanguage development, which focused primarily on early school age. Both the linguistic and the social role of bilingual development gave an additional impetus to study of language awareness. Linguistic diversity gave rise to the recognized importance of the role of language awareness. First language acquisition gradually became a discipline with sharper contours, and language awareness became more relevant as a topic of more profound exploration. Researchers have begun to study language awareness from the very beginning of language acquisition, in relation to all the components of language.

## MAJOR CONTRIBUTIONS

Language awareness starts developing at age 1½ to 2 (or even earlier, at the first word stage), when a child starts to monitor his first utterances. At that age, the child produces sounds, first words and later sentences. He is able to produce spontaneous repairs and to adjust to different partners in communication. Language awareness gradually develops throughout the preschool period, when the child acquires the ability to follow the feedback to what he has produced, elaborates on his own language, use and intentionally learns the language. In that period the child frequently checks whether others understand what he has produced and tries to repair his productions when the feedback is negative. He also tends to correct the speech of others, comments overtly on his own language as well as that of others, enjoys practicing different speech styles, and assumes the roles of different speakers (e.g., Bloom, 1975; Clark, 1978; Hakes, 1980; Palermo, Molfese, 1972). In the process of early language acquisition, the child is not initially aware of the complexity of the language system and its rules, but gradually, through language play and by means of cognitive development,

his understanding of the linguistic system expands (Berko, 1958; Karmiloff-Smith, 1987). As the child matures linguistically and cognitively, some aspects of the language system become opaque (Cazden, 1972). At school age, the child can anticipate the impact of his language productions, can make adjustments on his productions in order to fit his utterances to a particular listener or to make judgments about the correctness of produced language, and can differentiate between form and function (Brown 1978; Cazden, 1974; Clark, 1978a; Papandropoulou, Sinclair, 1974).

*The State of the Art of First Language Acquisition and Language Awareness*

First language acquisition can be decomposed into two distinctive processes: the understanding of the language and speech of others, and the production of one's own language. The relationship between these two processes that the child needs to master is not simple and unidirectional. Comprehension frequently precedes understanding, but not always. They can also develop as two parallel processes, or the child can produce language without fully understanding the produced constructions. One of the relevant questions for language researchers is how to define the development of those facets of language as well as the discrepancies between them. A significant portion of our language knowledge is implicit and not easily reachable for self-explanation. Bearing in mind that language use is a fast developing skill, it is even more intriguing to learn how and when we develop language awareness skills. Normally, we are not aware of the processes that underlie language production and comprehension. This is especially true for children who cannot grasp the arbitrariness of language (Pan and Gleason, 1996).

*Early Language Acquisition and Language Awareness*

The first language component that the child starts to acquire is phonology. Generally, maturation and experience have an impact on early phonological development. Since the auditory system is already prenatally ready to function, the infant hearing system is adequate from the moment child is born (Kuhl, 1987), and numerous studies have proved that the infant is capable very early of discriminating among speech sounds (e.g., Goodman and Nusbaum, 1994). Actually, the child is capable of recognizing some types of phonological (e.g., phonotactic) regularities before he produces his first word, as early as 9 months of age (Jusczyk, Luce and Charles-Luce, 1994). Very soon after the child enters the so-called word spurt (until this point, his vocabulary has been about 50 words), he develops a representational phonology, i.e., the

phonological system of his mother tongue. This has been supported by evidence of an increase in cognitive capacity, particularly memory storage, which enables the child to establish the sound system of the target language, though not the same as in adults (Vihman, Velleman, and McCune, 1994). At age 6 ½ or 7 the child has at his disposal the entire repertoire of sound of his mother tongue, and his language production sounds like the production of an adult. However, as much as it may be important to sound like an adult, proper phonological development is crucial for the development of adequate sound representations, which will enable phonological segmentation, which is highly relevant for other language skills.

Another important aspect of early language development is the acquisition of lexis, which is interdependent with phonological development and in a way prerequisite to grammatical development. At the beginning, the child's lexical development is slow, but it soon becomes accelerated. Children vary significantly in the number of words they produce and understand, as well as in the content of their vocabulary. A child's early lexicon is also influenced by cross-linguistic and cross-cultural differences. It has also been proven (De Houwer, 1997; Snow, 1977; Tomasello and Todd, 1983) that the type and quantity of input are relevant factors in lexical acquisition. There are different theories explaining the clues and sources for the child to learn new words, their meanings and concepts. Very soon after a child starts producing his first words, he becomes very efficient in relating some meaning to each newly acquired word. Rapid form-to-meaning mapping is one of the prominent features of early acquisition. As much as the capability of phonological segmentation is an important skill for further language development, speech segmentation is generally an important ability for acquiring new words. This becomes even more articulated when the child receives as input longer strings of words and has to find the word boundaries. Making a child aware of these boundaries can be facilitated, for example, through rhyme play. Research has shown that children are inclined to be attentive to the rhythmic properties of language, and that they learn them with ease.

Although the child acquires some new words using morphosyntactic cues, as is the case in the acquisition of verbs, the beginning of the productive use of grammatical morphemes and/or syntactic rules is a clear sign that the child is becoming aware of structural rules. In the beginning, the first level of awareness is the child's ability to manipulate with the smallest elements of meaning that are parts of words. Later, children develop knowledge of rules. Children prefer pattern regularity in their speech productions, and so they start to produce overgeneralizations, indicating that they overapply the rules that they have learned. Finally, in experimental situations with elicited tasks,

they have proved to know how to use novel words in grammatical constructions. As the language system develops, it becomes more evident that the child has at his disposal grammatical, morphosyntactic knowledge, which consists of productive rules. However, it is not necessarily the case that there is a complete overlap between the productivity of adult-like language and child language. Evidence that has showed us a discrepancy between understanding and production in children suggests that a child might know much more about the language's grammar than can be identified in his speech (Johnson and Gilbert, 1996). Various researchers have recently stressed the role of intake in the output language. They have found that child-directed speech is reflected in the child's own language. These findings so strongly indicate the importance of the input language that they should redirect theoretical claims in the field (Tomasello and Merriman, 1995).

In particular, an interesting aspect of language awareness is the simultaneous acquisition of more than one language by one person. The topic of simultaneous acquisition of two first languages has been attracting more and more attention for the last few decades, and recently, it is has become especially prominent. With geographical migration and increased human mobility, the number of children acquiring two languages is growing daily. The topic itself is marked by social, cultural, and political significance, but it is also a linguistically relevant issue that is being explored by many language development experts (e.g., Cenoz and Genesee, 2001; Deuchar and Quay, 2000; Lanza, 1997, 2004).

Within the context of language awareness, one of the most intriguing questions is the question of language separation: when and how does the child differentiate between two languages (e.g., Vihman, 1985). The ability to separate languages undoubtedly includes all aspects of language knowledge. This ability develops gradually, over a period of time, and does not affect all aspects of language evenly at different time points. In order to use two languages properly—like an adult—the child needs to learn the grammatical systems of both languages and their proper pragmatics. Mastering those two aspects of the languages, with increased language awareness, enables a child to reduce their mixing and to differentiate them as two separate systems. Lanza (2001) emphasizes the need to observe bilingual first language acquisition within a framework of language socialization, i.e., identifying the child's language input as one of the key points in bilingual first language development.

In the study of bilingualism, one of the first cited advantages of bilingual development versus monolingual development was better metalinguistic awareness (Bialystok, 2001; Clark, 1978b). Although,

as Meisel (2001) states, there is still a need for further developments in theoretical and methodological research, particularly related to the issue of language differentiation, it has been proved over time that bilingual acquisition results in better metalinguistic abilities. A child's being able to master two separate language systems and to develop a balanced knowledge of those two systems supports the notion that humans are predisposed to be the speakers of more than one language. This predisposition also speaks in a favor of advanced language awareness, which would make a child's experience of the surrounding world unique (see also Baker, *Knowledge about Bilingualism and Multilingualism*, Volume 6; Jessner, *Language Awareness in Multilinguals: Theoretical Trends*, Volume 6).

### *First Language Acquisition at School Age and Language Awareness*

In less recent literature, the tendency was to claim that first language acquisition is more or less accomplished at early school age. Today, data prove that children continuously acquire language through the whole school period. They expand their vocabulary, but they also develop their semantic system as well as syntax. At first, they are focused, unconsciously, on linguistic elements and on assembling them into linguistic structures. Later, they master more complex constructions, start to develop discourse skills, and become more aware of communicative demands. The school period is marked by language development in all linguistic and communication domains. They become aware of language rules and their role in producing more and more complex language structures. As language users, they become more aware of the rules, and of how to combine the elements of language at a higher, discourse level. Schoolchildren are constantly moving toward new social settings in which they have to adjust their speech. Besides developing their linguistic and psycholinguistic awareness, they are also becoming more aware of their communicative needs. Entering school, young speakers are also for the first time exposed to direct language instruction and are introduced formally to language about language.

The child is becoming capable of making judgments on the correctness of produced utterances, and he can correct grammatically incorrect constructions. He is also developing his ability to identify individual linguistic elements, to explain words by using metalanguage, to play with language, to produce neologisms intentionally, and to understand humor. As much as language awareness improves with age and language knowledge, it is also correlated with cognitive maturation and the accumulation of experience.

## WORK IN PROGRESS

*Do We Know Enough about Language Awareness in First Language Acquisition?*

At first, some aspects of language awareness help the young language learner to better acquire the language system. Soon he will become sensitive to primitive, but available, forms of language use. Language use and/or communication is the starting and ending point of the language learning continuum—a fact that has been forgotten many times. Often, linguists refer to the use of language as pragmatics, while referring to developed skills as communicative skills. Better communicative skills will facilitate language development and will assure more competent language use. There is a tendency to forget that even first language users (even those who use only one language) can have poorly developed language skills due to their weak communicative competencies. Regardless of which language the child acquires, grammar is acquired through observation, attempts, and errors—and it is accelerated through adequate communication. To develop language awareness, the child needs to be engaged more frequently in the communication process. In this way, he will have an opportunity to practice, to test his language constructions, and to receive feedback, both directly via correction or indirectly, through misunderstanding, for example. If the child learns the first language, but it is a member of a plurilingual environment, defined with dialectal diversities, this might raise the level of language awareness—both on the linguistic/psycholinguistic level and on the discourse/communication level (Kovacevic and Pavlicevic-Franic, 2002).

In the beginning, the child does not need to have any conscious awareness of the complexity of language, but as his cognitive system matures, the child requires better tools for understanding language (Doherty, 2000; Taylor, 2000). The development of cognitive skills occurs as the child grows older, enters the school system, and starts learning to read. All this helps him better manipulate the language system (Purcell-Gates, 2001; Tabots, Snow, and Dickinson, 2001). Gradually, as he begins to participate in the process of formal schooling, the child is also developing language awareness skills related to the development of syntax, which continues to be crucial at that age and afterwards. Explicit syntactic awareness does not develop before the child enters the school system and starts acquiring reading skills. Another very important aspect of mastering literacy skills is the development of phonological awareness, that is, the ability to recognize and manipulate sound units smaller than the syllable. Reviewing the literature, the reader can find various definitions that are not always compatible with one another. What is evident is that phonological awareness—like other

types and subtypes of language awareness in first language acquisition—has been identified as an important factor in language and reading development. For instance, it has also been proved that morphological awareness improves vocabulary and spelling (Nunes, Bryant, and Olsson, 2003). All these studies point to the importance of language awareness and call for further similar studies in depth, which will enable a more well-grounded understanding of the phenomenon of first language acquisition.

## PROBLEMS AND DIFFICULTIES

### *Unanswered Questions*

The field of first language acquisition has fascinated many researchers whose primary intention was to describe and to understand the phenomenon of early language development, during which the child acquires such a complex system. Two central questions were central to the work of many child language researchers: *What* do they master and *how*? All children learn language, and they acquire similar skills regardless of what their target language is. In depth, research has been conducted for several decades, but there are still many questions that have gone unanswered.

Along with the studies that have been conducted, there has been an overt effort to develop adequate methodologies which will suit the researchers' needs and the aims of study. Today, we have access to much descriptive data and large collections of spontaneous speech data, such as the CHILDES database and computer programs (MacWhinney, 1995). In addition, various experimental techniques and research paradigms have been developed. All this has helped us to gain knowledge of what children acquire, to learn about the provisional timetable, and to define the stages of language development. Only 10 or 15 years ago, we still lacked more extensive language acquisition research in languages used in small language communities and in typologically different languages. A noticeable change in this situation was initiated with Slobin's work (Slobin, 1985) and has continued intensively over the last two decades. However, the question of how children acquire language, how they really grasp the grammatical rules, and/or how they produce what they have never heard before is something that motivates further research, as well as the many discussions and controversies going on among scientists and advocates of opposing theoretical claims (e.g., Clark, 2002; Gentner, 1982; Pinker, 1984; Rice, 1990; Verlinden and Gillis, 1988).

Among all of the other relevant questions waiting to be explored and answered is a question more closely connected to the issue of language awareness and first language acquisition. The fact is that the every

language system consists of a vocabulary and a complex grammar system, which the child needs to decode and internalize. We still do not know what actually helps a child in the process of acquiring language structure. Can the process be facilitated or speeded up? We know today that the language process is quite orderly, and based on data that we have, we can predict it in a child with typical language development capabilities. We also know that language awareness could serve as some kind of compensating mechanism for children who experience language problems and that it plays an important role in second language acquisition. However, certain questions still remain to be answered: can language awareness at an early age be stimulated and/or facilitated; what kind of language exposure and input could help the child to master language skills; and could any intentional intervention at an early age and at the beginning of language acquisition be counterproductive? Finally, we should also ask how the language awareness issue should be approached at school age: does it gain enough attention, that is, as much in its implementation in formal education as it does in research?

#### FUTURE DIRECTIONS

There is no doubt that the whole area of first language acquisition will continuously attract researchers' attention and that language development will maintain its status as an important topic not only for both linguists and psychologists, but also for experts such as speech/language pathologists, biologists, and cognitive scientists. The establishment of a new society that emphasizes the need to acquire more than one language, and preferably three, will actually put more emphasis on language research and attempt to understand the phenomenon more adequately. A better understanding of first language acquisition will be beneficial for the learning of other languages as well. Language awareness as an ability to employ intentional, conscious mechanisms needs to be further studied. At the moment, among the countries of Europe this topic has not gained the same attention, neither in research nor in its application. Pragmatic awareness has been recognized as a very important element in second language acquisition (Garcia, 2004; see also Alcón and Safont Jordà, *Pragmatic Awareness in Second Language Acquisition*, Volume 6), but it calls for more attention to the first language as well. Research has shown that in second language learning, metalinguistic awareness is beneficial (Lindberg, 2003). Similar studies should be done in relation to first language acquisition in order to explore how language awareness could be increased and with what consequences. For more than twenty years, for example, language awareness has been an important element in the British school curriculum.

It has been perceived by school policy makers and those involved in curriculum development as one of the core solutions to the problems encountered in schools. A similar emphasis, both in research and in practice, should be placed on language awareness in other language communities. Further research should focus more on exploring discourse and communicative awareness in the primary school system and on defining the correlation between language awareness and other language development variables, in particular at early school age, when the child is introduced to more formal instruction, to reading, and to other subjects in which success is known to be highly correlated with acquired language skills.

## IMPLICIT AND EXPLICIT KNOWLEDGE ABOUT LANGUAGE

### INTRODUCTION

Children acquire their first language (L1) by engaging with their caretakers in natural meaningful communication. From this “evidence” they automatically acquire complex knowledge of the structure of their language. Yet paradoxically they cannot describe this knowledge, the discovery of which forms the object of the disciplines of theoretical linguistics, psycholinguistics, and child language acquisition. This is a difference between explicit and implicit knowledge—ask a young child how to form a plural and she says she does not know; ask her “here is a wug, here is another wug, what have you got?” and she is able to reply, “two wugs.” The acquisition of L1 grammar is implicit and is extracted from experience of usage rather than from explicit rules—simple exposure to normal linguistic input suffices and no explicit instruction is needed. Adult acquisition of second language (L2) is a different matter in that what can be acquired implicitly from communicative contexts is typically quite limited in comparison to native speaker norms, and adult attainment of L2 accuracy usually requires additional resources of explicit learning. The various roles of consciousness in second language acquisition (SLA) include: the learner noticing negative evidence; their attending to language form, their perception focused by social scaffolding or explicit instruction; their voluntary use of pedagogical grammatical descriptions and analogical reasoning; their reflective induction of metalinguistic insights about language; and their consciously guided practice which results, eventually, in unconscious, automatized skill. From various divisions of cognitive neuroscience, we know that implicit and explicit learning are distinct processes, that humans have separate implicit and explicit memory systems, that there are different types of knowledge of and about language, that these are stored in different areas of the brain, and that different educational experiences generate different types of knowledge.

### EARLY DEVELOPMENTS

Theoretical dissociations between implicit and explicit knowledge of language evolved relatively independently in language education, applied linguistics, psychology, and cognitive neuroscience.

In language education, differing assumptions about the nature of language representation and its promotion motivated different teaching traditions (Kelly, 1969). Traditional grammar translation foreign language (FL) instruction and the cognitive code method popular in the 1960s and 1970s capitalized on the formal operational abilities of older children and adults to think and act in a rule-governed way. This allowed their instruction, through the medium of language, in pedagogical grammar rules, with lessons focusing on language forms such as, for example, particular tenses and inflectional patterns. These explicit methods were motivated by the belief that perception and awareness of L2 rules necessarily precedes their use. In contrast, FL and L2 teaching methods like “audiolingualism” which held sway during the Second World War, and more recent “natural” and “communicative” approaches, maintained that adult language learning is, like L1 acquisition, implicit. Since language skill is very different from knowledge about language, they consequently renounced explicit grammar-based instruction.

In applied linguistics, the defining distinction between implicit acquisition and explicit learning of L2 was made by Krashen (1982, see also Ellis, *Explicit Knowledge and Second Language Learning and Pedagogy*, Volume 6 and Sharwood Smith, *Morphological and Syntactic Awareness in Foreign/Second Language Learning*, Volume 6). He argued that adult L2 students of grammar-translation methods, who can tell more about a language than a native speaker, yet whose technical knowledge of grammar leaves them totally in the lurch in conversation, testify that conscious learning about language and subconscious acquisition of language are different things, and that any notion of a “strong-interface” between the two must be rejected. Krashen’s input hypothesis, an extreme “noninterface” position, thus countered that (i) subconscious acquisition dominates in second language performance; (ii) learning cannot be converted into acquisition; and (iii) conscious learning can be used only as a Monitor, i.e., an editor to correct output after it has been initiated by the acquired system. In Krashen’s theory, SLA, just like first language acquisition, comes naturally as a result of implicit processes occurring while the learner is receiving comprehensible L2 input. The input hypothesis was the theoretical motivation behind natural and communicative approaches to instruction.

In psychology, two important foundations were the dissociations of implicit and explicit memory, and of implicit and explicit learning. The dissociation between explicit and implicit memory was evidenced in anterograde amnesic patients who, as a result of brain damage, lost the ability to consolidate new explicit memories (those where recall involves a conscious process of remembering a prior episodic experience) to update their autobiographical record with their daily activities,

to learn new concepts, or to learn to recognize new people or places. Nevertheless, amnesiacs maintained implicit memories (those evidenced by the facilitation of the processing of a stimulus as a function of a recent encounter with an identical or related stimulus but where the person at no point has to consciously recall the prior event) and were able to learn new perceptual skills like mirror reading and new motor skills (Schacter, 1987; Squire and Kandel, 1999). They also showed normal classical conditioning, thus the famous anecdote of the amnesic patient who, having once been pricked by a pin hidden in the hand of her consultant, refused thereafter to shake him by his hand while at the same time denying ever having met him before.

The dissociation between explicit and implicit learning was made by Reber (1976) who had people learn complex letter strings (e.g., MXRMXT, VMTRRR) generated by an artificial grammar. In the course of studying these for later recognition, they unconsciously abstracted knowledge of the underlying regularities, so to be able to later distinguish between novel strings which either accorded or broke the rules of the underlying grammar. However, like young children who can pass "wug tests" in their native language, these adult participants too were unable to explain their reasoning. Such research illustrated quite different styles of learning, varying in the degree to which acquisition is driven by conscious beliefs, as well as in the extent to which they give rise to explicit verbalizable knowledge: Implicit learning is acquisition of knowledge about the underlying structure of a complex stimulus environment by a process which takes place naturally, simply, and without conscious operations. Explicit learning is a more conscious operation where the individual attends to particular aspects of the stimulus array and volunteers and tests hypotheses in a search for structure.

In Brain Science, neuropsychological investigations of the results of brain damage demonstrated that different areas of the brain are specialized in their function and that there are clear separations between areas involved in explicit learning and memory and those involved in implicit learning and memory (A.W. Ellis and Young, 1988). Explicit learning is supported by neural systems in the prefrontal cortex involved in attention, the conscious apperception of stimuli, and working memory; the consolidation of explicit memories involves neural systems in the hippocampus and related limbic structures. In contrast, implicit learning and memory are localized, among other places, in various areas of perceptual and motor cortex.

#### MAJOR CONTRIBUTIONS

These foundations demonstrated that human learning can take place implicitly, explicitly, or, because we can communicate using language,

it can be influenced by declarative statements of pedagogical rules (explicit instruction). These modes of learning apply to differing extents in all learning situations. There are at least some mutual influences in their development too. Consider, for example, that from implicit to explicit knowledge: although in native language acquisition implicit learning is primary, the development of self-awareness allows reflective examination, analysis and re-organization of the products of implicit learning, resulting in redescription at a higher level and the formation of new independent and explicit representations. Thus an older child can make a good stab at explaining how to form a plural in English because they have realized the relevant metalinguistic insight of “add –s” from observing themselves forming plurals in this way (Bialystok, 1982). The central issue of the interface question is just how much influence there is in the reverse direction, how much do explicit learning and explicit instruction influence implicit learning, and how can their symbiosis be optimized? Subsequent research took up this theme, though now as a better-informed interdisciplinary collaboration (N.C. Ellis, 1994).

In language education, analyses of learners in “grammar-free” immersion L2 and FL programmes demonstrated significant shortcomings in the accuracy of their language (Lightbown, Spada, and White, 1993). This prompted renewed calls for explicit instruction, but the pendulum did not swing back all the way, this time instruction was to be integrated into the meaningful communication afforded by more naturalistic approaches: learner errors should be picked up by a conversation partner and corrected in the course of meaningful, often task-based, communication by means of negative evidence which offers some type of explicit focus on linguistic form (Doughty and Williams, 1998, see also Robinson, *Attention and Awareness*, Volume 6; Sharwood Smith, *Morphological and Syntactic Awareness in Foreign/Second Language Learning* Volume 6). Long (1991) argued that this type of feedback, which he called Focus on Form, was a necessary element of successful L2 instruction. Prototypical Focus on Form instruction involves an interlocutor recasting a learner’s error in a way that illustrates its more appropriate expression. Recasts can present learners with psycholinguistic data optimized for acquisition because—in the contrast between their own erroneous utterance and the recast—they highlight the relevant element of form at the same time as the desired meaning-to-be-expressed is still active, enabling the learner to attend the relevant part of the form and engage in conscious input analysis. Long contrasted this with the decontextualized and often meaningless grammar drills of traditional Grammar Translation instruction, which he termed Focus on Forms. The period from 1980 to 2000 was a time of concerted research to assess the effectiveness of different types of explicit and implicit L2

instruction. Norris and Ortega (2000) reported a meta-analysis of 49 of the more empirically rigorous of these studies which in sum demonstrated that focused L2 instruction resulted in substantial target-oriented gains, that explicit types of instruction were more effective than implicit types, and that the effectiveness of L2 instruction was durable.

In applied linguistics, critical theoretical reactions to Krashen's input hypothesis (e.g., McLaughlin, 1987), together with empirical investigations demonstrating that it is those language forms that are attended that are subsequently learned, prompted Schmidt (1990) to propose that conscious cognitive effort involving the subjective experience of noticing is a necessary and sufficient condition for the conversion of input to intake in SLA. Schmidt's noticing hypothesis was the theoretical motivation for subsequent research efforts, both in laboratory experiments (Hulstijn and DeKeyser, 1997) and in the classroom, into the role of consciousness in SLA. The shortcomings in uptake and the consequently limited endstate of naturalistic learners, together with the demonstrable role of noticing in SLA, obliged in turn the rejection of the extreme "no-interface" position. Applied linguistics was thus left with something in-between, some form of a "weak-interface" position (R. Ellis, 1994; Ellis, *Explicit Knowledge and Second Language Learning and Pedagogy*, Volume 6; Long, 1991) whereby explicit knowledge plays a role in the perception of, and selective attending to, L2 form by facilitating the processes of "noticing" (i.e., paying attention to specific linguistic features of the input) and by "noticing the gap" (i.e., comparing the noticed features with those the learner typically produces in output). Some weak-interface variants also saw a role of consciousness in output, with explicit knowledge coaching practice, particularly in initial stages, and this controlled use of declarative knowledge guiding the proceduralization and eventual automatized implicit processing of language as it does in the acquisition of other cognitive skills.

In psychology, subsequent research in implicit and explicit learning of artificial languages, finite-state systems, and complex control systems showed: (i) When the material to be learned is simple, or where it is relatively complex but there is only a limited number of variables and the critical features are salient, then learners gain from being told to adopt an explicit mode of learning where hypotheses are to be explicitly generated and tested and the model of the system updated accordingly. As a result they are also able to verbalize this knowledge and transfer to novel situations. (ii) When the material to be learned is more randomly structured with a large number of variables and when the important relationships are not obvious, then explicit instructions only interfere and an implicit mode of learning is more effective. This learning is instance-based but, with sufficient exemplars, an implicit understanding of the structure will be achieved. Although this knowledge

may not be explicitly available, the learner may nonetheless be able to transfer to conceptually or perceptually similar tasks and to provide default cases on generalization (“wug”) tasks. (iii) Whatever the domain, learning the patterns, regularities or underlying concepts of a complex problem space or stimulus environment with explicit instruction, direction, and advances clues, heuristics, or organizers is always better than learning without any cues at all (MacWhinney, 1997; Reber, Kassin, Lewis, and Cantor, 1980). (iv) Although Reber had emphasized that the results of implicit learning were abstract, unconscious, and rule-like representations, subsequent research showed that there was a very large contribution of concrete memorized knowledge of chunks and sequences of perceptual input and motor output that unconscious processes tally and identify to be frequent across the exemplars experienced in the learning set (Stadler and Frensch, 1998).

On the broader stage of cognitive science, the period from 1980 to 2000 showed a parallel shift away from an almost exclusively symbolic view of human cognition to one which emphasized the overwhelming importance of implicit inductive processes in the statistical reasoning which sums prior experience and results in our generalizations of this knowledge as schema, prototypes, and conceptual categories. Everything is connected, resonating to a lesser or greater degree, in the spreading activation of the cognitive unconscious, and categories emerge as attractor states in the conspiracy of related exemplars in implicit memory. These are the aspects of cognition that are readily simulated in connectionist models (Elman et al., 1996) and which subsequently have had considerable influence on our understanding of implicit knowledge of language and its acquisition (Christiansen and Chater, 2001).

In cognitive neuroscience, technological advances in functional brain imaging using electro-encephalographic (EEG) and functional magnetic resonance imaging (fMRI) triangulated the findings of earlier cognitive neuropsychological studies of brain areas involved in implicit and explicit memory. Subsequent improvements in the temporal and spatial resolution of these techniques afforded much more detailed descriptions of the dynamics of brain activity, promoting a shift of emphasis from knowledge as static representation stored in particular locations to knowledge as processing involving the dynamic mutual influence of interrelated types of information as they activate and inhibit each other over time—as Charles Sherrington had put it 60 years previously, “an enchanted loom, where millions of flashing shuttles weave a dissolving pattern, always a meaningful pattern though never an abiding one; a shifting harmony of subpatterns”(Eichenbaum, 2002; Frackowiak et al., 2004).

## WORK IN PROGRESS

Thus, in the latter part of the twentieth century, research in these various disciplines converged on the conclusion that explicit and implicit knowledge of language are distinct and dissociated, they involve different types of representation, they are substantiated in separate parts of the brain, and yet they can come into mutual influence in processing.

With regard to language pedagogy, there is now greater consensus in the acknowledgment of the separable contributions of explicit and implicit language learning, and it is more usual to hear of the necessity of a balanced learning curriculum that provides opportunities for meaning focused input, meaning-focused output, form-focused learning, and fluency development (McGroarty, 2004). Nevertheless, there is still considerable work involving the particular details of how different tasks encourage the use of different aspects of language, how this processing encourages different learning outcomes, and how they should be structured, sequenced and co-ordinated. The pursuit of these goals involves improved operationalizations of implicit and explicit knowledge in educational testing, the investigation of individual differences in implicit and explicit learning, and the determination of interactions between different learner aptitudes and different educational treatments (Hulstijn and Ellis, 2005; Robinson, 2002).

With regard to language learning, investigation has turned to much more detailed investigations of the processes and outcomes of implicit and explicit SLA:

What is the nature of the implicit knowledge which allows fluency in phonology, reading, spelling, lexis, morphosyntax, formulaic language, language comprehension, grammaticality, sentence production, syntax, and pragmatics? How are these representations formed? How are their strengths updated so as to statistically represent the nature of language, and how do linguistic prototypes and rule-like processing emerge from usage? The vast majority of our linguistic processing is unconscious and is underpinned by our history of implicit learning which has supplied a distributional analysis of the linguistic problem space. Frequency of usage determines availability of representation and tallies the likelihoods of occurrence of constructions and the relative probabilities of their mappings between aspects of form and interpretations. Generalizations arise from conspiracies of memorized utterances collaborating in productive schematic linguistic constructions. It is now possible, using fMRI and ERP techniques, to image the implicit processing of words which, despite being presented below the threshold for conscious noticing, nevertheless result in subsequent implicit memory effects, and to identify the very local regions of sensory cortex where

this processing takes place (N.C. Ellis, 2005). Such implicit learning, operating throughout primary and secondary neocortical sensory and motor areas, collates the evidence of language, and the results of this tallying provide an optimal solution to the problem space of form-function mappings and their contextualized use, with representational systems modularizing over thousands of hours on task (Frequency effects, 2002). There is broad agreement on these generalities, and considerable uncertainty of the details.

If these implicit learning processes are sufficient for first language acquisition, why not for second? One part of the answer must be transfer. In contrast to the newborn infant, the L2 learner's neocortex has already been tuned to the L1, incremental learning has slowly committed it to a particular configuration, and it has reached a point of entrenchment where the L2 is perceived through mechanisms optimized for the L1. The L1 implicit representations conspire in a "learned attention" to language and automatized processing of the L2 in non-optimal L1-tuned ways. Current research is focused on psychodynamic tensions in the unconscious mind of the second language speaker, not the psychodynamics of Freudian psychology, but of a more psycholinguistic kind: how associative and connectionist learning principles explain the shortcomings of SLA, the fragile features which, however available as a result of frequency, recency, or context, fall short of intake because of one of the factors of contingency, cue competition, salience, interference, overshadowing, blocking, or perceptual learning, all shaped by the L1 (N.C. Ellis, 2006).

Transfer, learned attention and automatization provide some reasons why implicit learning does not work for L2 as it does for L1. The pedagogical reactions to these shortcomings involve explicit instruction, recruiting consciousness to overcome the implicit routines that are nonoptimal for L2. What then are the detailed mechanisms of interface? What are the various psychological and neurobiological processes by which explicit knowledge of form-meaning associations impacts upon implicit language learning? This is a question not just about language learning, but involving human cognition and human neuroscience as a whole, an enterprise as fascinating as it is audacious. However naïve our current understanding, we have at least moved on from static conceptualizations of language, of representation and of physical interface. The interface, like consciousness, is dynamic: It happens transiently during conscious processing, but the influence upon implicit cognition endures thereafter.

The primary conscious involvement in SLA is the explicit learning involved in the initial registration of pattern recognizers for constructions that are then tuned and integrated into the system by implicit learning during subsequent input processing. Neural systems in the

prefrontal cortex involved in working memory provide attentional selection, perceptual integration, and the unification of consciousness. Neural systems in the hippocampus then bind these disparate cortical representations into unitary episodic representations. ERP and fMRI imaging confirm these neural correlates of consciousness, a surge of widespread activity in a coalition of forebrain and parietal areas interconnected via widespread cortico-cortico and cortico-thalamic feedback loops with sets of neurons in sensory and motor regions that code for particular features, and the subsequent hippocampal activity involved in the consolidation of novel explicit memories. These are the mechanisms by which Schmidt's noticing helps solve Quine's problem of referential indeterminacy. Explicit memories can also guide the conscious building of novel linguistic utterances through processes of analogy. Formulas, slot-and-frame patterns, drills, and declarative pedagogical grammar rules all contribute to the conscious creation of utterances whose subsequent usage promotes implicit learning and proceduralization. Flawed output can prompt focused feedback by way of recasts that present learners with psycholinguistic data ready for explicit analysis. We know of these processes, but we too are like those children doing "wug" tests: at present we can say little about their details. It is the results of thinking that come to consciousness, not the thinking itself, but consciousness then broadcasts these results throughout the brain to the vast array of our unconscious sources of knowledge, and by these means, consciousness is the interface (N.C. Ellis, 2005).

#### PROBLEMS AND DIFFICULTIES

The problems and difficulties are abundantly apparent. The understanding of human consciousness is the toughest intellectual problem with which we are set. How do the contents of consciousness, what philosophers call "qualia"—the lilt of Welsh pronunciation, the pleasure of a good pun, the pedant's irritation with bad grammar, the loss and frustration that go with comprehension break-down, the bitterness of lies—how do these arise from the concerted action of nerve cells? Compared with the vast number of unconscious neural processes happening in any given moment, the stream of consciousness evidences a very narrow bottleneck. How is it that a single percept is elected as the current focus of consciousness from the massively parallel activity of the unconscious mind? And what are the functions of these conscious thoughts? Despite our preoccupation with many of these questions throughout our philosophy, until quite recently their scientific study was stifled. Consciousness reacts to investigation. The unreliability of the introspective methods of early structuralist approaches to psychology led

to the denial of any discussion of these ideas within behaviorism. The Association for the Scientific Study of Consciousness was established only as recently as 1996. The extreme limits to the scope of introspection are why we need research in the Cognitive Neurosciences. But despite these developments, we are still only at the relative beginnings of our research.

Our uncertainties about the nature of consciousness are well matched by those relating to the fundamentals of linguistic knowledge. The last 60 years of linguistic theorizing have seen an impressively contradictory line-up of theories about the nature of linguistic representations, including Structuralism, Universal Grammar (Government and Binding theory), Minimalism, Lexico-Functional Grammar, Cognitive Grammar, Construction Grammar, Emergent Grammar and many more. Equally contrary are the Linguistic positions concerning whether second language has access to the same Universal Grammar learning mechanisms as does first language: The complete range is still on the table, including “Full Access/No Transfer,” “Full Access/Full Transfer,” and “No-Access” positions whereby SLA is fundamentally different from first language acquisition. Such uncertainty about the proper nature of the representations of first and second language do not help in the proper characterization of the learning processes.

Because both consciousness and linguistic knowledge are difficult to conceptualize and operationalize, much existing research has taken a pragmatic approach and, like the drunk who looked for his car keys under a lamppost a block away from where he dropped them, “because the light is better there,” used easy to administer grammaticality judgments, or metalinguistic judgments, or multiple choice or other limited response format measures of language proficiency. Such tests have questionable validity as measures of language proficiency and in their very nature they are more likely to tap explicit conscious learning than are measures involving free constructed responses (Norris and Ortega, 2000). This is a research area plagued with measurement problems (Hulstijn and Ellis, 2005).

It is also an area beset by the Experimenter’s Dilemma: should research strive for the research validity afforded by laboratory control and experimentation, or the ecological validity given by observing language learning in its natural environment (Hulstijn and DeKeyser, 1997)? Every study falls down in one of these respects: consciousness is hard enough to pin down in the laboratory, never mind the classroom. Connectionist models learn language that is a very small sample compared with yours or mine. It is hard to be natural in a loud and claustrophobic fMRI scanner. Real language learning takes tens

of thousands of hours, not the minutes of the typical psychology experiment. And so on and so forth, abundantly so.

#### FUTURE DIRECTIONS

For future research to properly address these issues, the studies of implicit and explicit language knowledge, SLA, applied linguistics, cognition, consciousness, learning, education, and brain must proceed in consort within the broader inquiries of cognitive science and cognitive neuroscience (Doughty and Long, 2003). Sophistication in one of these areas is not enough if naivety in others flaws the whole. Interdisciplinary collaboration is essential in the development of both theory and empirical methods (Hulstijn and Ellis, 2005). Particular priorities include:

1. Measurement: improved operationalizations of implicit and explicit learning, knowledge, and instruction in the classroom, psycholinguistics lab, and brain imaging scanner.
2. Triangulation: predictive and concurrent validity assessment of the interrelations of these measures.
3. Psychometrics: investigations of the core dimensions and latent structure of these variables.
4. Meta-analysis: research synthesis allowing the determination of moderator variables in research outcome.
5. Content-validity: the different types of implicit and explicit knowledge of language must be properly represented in batteries of outcome measures in studies of different learning or instructional regimes.
6. Individual differences: the assessment of individual differences in implicit and explicit learning aptitude.
7. Factorial research: The assessment of aptitude/instruction/outcome interactions.
8. Brain imaging: electrical and hemodynamic imaging of the results of learning in cross-sectional comparisons of first language learners and multilinguals, and also of the processes of language learning.
9. Computational modeling: there are so many variables involved that proper understanding can only come from simulation research.
10. Mindfulness of complexity: awareness of the dynamic processes, reactivity, and emergent properties of the complex system that relates language, culture, brains, learners, and their conscious and unconscious knowledge representations.

## ATTENTION AND AWARENESS

### INTRODUCTION

Attention and awareness are closely related concepts, and can function in the environment for language learning at different levels. To begin with the concept of attention, a distinction needs to be made between two levels of attention, and the mechanisms regulating them, which will be important to the issues of language learning raised later. This distinction is between (1) *perceptual attention* to the numerous phenomena which we attend to automatically and involuntarily (during, for example, a conversation with a colleague), such as the room temperature or noises from the room next door, and (2) *focal attention* which is under some degree of voluntary executive control, such as the attention we pay to our colleague's words and facial expressions while they are speaking and while we are trying to understand what they intend to communicate. Issues of how much, and also what quality of, attention to input is necessary for subsequent retention and learning are major topics of research in the broad field of cognitive psychology, and in the content-specific domain of second language acquisition (SLA). Although there have been claims in both these broad and narrower domains that non-attentional learning is possible, this almost always means learning without focal attention to the input stimuli, which *selects* them for further processing and encoding in memory. In such cases, simple *detection* of input, at a stage of perceptual processing before selection is argued to contribute to learning. If this is so, then learning could be said take place without *awareness*, since focal attention is widely argued to be a precondition for awareness (see Logan, 2005; Robinson, 2003; Schmidt, 2001, for review).

The necessity of awareness of input for SLA (or for other learning domains) is therefore more disputed than the claim that attention to input is necessary. Like attention, awareness can also be at a number of different levels, varying from what Schmidt (1990) called 'noticing' of elements of the surface structure of utterances in the input to those higher levels of awareness implicated in 'understanding' metalinguistic rules and regularities which the surface structure elements conform to. The possibility, and extent, of learning without awareness (implicit learning) became a topic of major interest in cognitive psychology in

the 1960s and 1970s. Claims about the contribution of implicit learning to SLA also led to developments in SLA theory, most notably Krashen's Monitor Model (Krashen, 1981), which argued that there are two distinct consciously and unconsciously regulated systems involved in language learning (see also Sharwood Smith, *Morphological and Syntactic Awareness in Foreign/Second Language Learning*, Volume 6). These developments prompted fine-grained information-processing accounts of the roles of attention and awareness in SLA in the late 1980s and early 1990s. Subsequently, experimental and quasi-experimental studies, in laboratory, and classroom contexts were performed to test the claims of these accounts.

This chapter describes some of the earlier research, its historical antecedents in SLA theory, and current research which is examining the same issues with a steadily increasing range of methodologies. It also describes two more recent developments this research has led to—reconceptualizations of the role of aptitude in learning under different conditions of instructional exposure and competing claims about the structure of, and capacity limits on, the attentional resources drawn on during task-based language learning and performance.

#### EARLY DEVELOPMENTS

Throughout the 1960s and 1970s, research and theory in cognitive psychology increasingly addressed the role of the 'cognitive unconscious' in learning. This included research and theorizing about: implicit, unaware 'learning' of complex stimulus domains (Reber, 1967, 1993); the contribution of 'tacit knowledge', which could not be verbalized, to problem-solving and performance in everyday life (Polanyi, 1958); and the relationship of conscious, 'explicit' memory for events to 'implicit' memory, which (in contrast to explicit memory) involves no deliberate conscious attempt at recall (Schacter, 1987). Research showed that implicit and explicit learning, and memory, could be dissociated from each other, suggesting functionally independent learning and memory systems. Reber (1993) further argued that implicit learning and memory processes are earlier evolved in childhood, are drawn on during child first language (L1) acquisition, and that complex information can only be learned implicitly.

In SLA theory, a very similar proposal to that of Reber was developed by Krashen (1982). He argued that there are two separate conscious and unconscious learning systems and associated processes, termed 'acquisition' and 'learning', respectively. Acquisition processes resulted in a 'natural' order of L2 development—so-called because it closely resembled the order in which the first language is acquired by children. Krashen also argued that the acquired system was uninfluenced by, or 'non-interfaced' with, the conscious learning system.

Knowledge that had been consciously learned could only be used to 'edit' production initiated by the acquired system. Successful SLA was therefore largely the result of unconscious acquisition, Krashen claimed, and conscious learning contributed very little to the process.

Three lines of dissent were taken, following Krashen's proposals, which continue to the present day to stimulate research into the roles of: (1) *attention*, (2) *skill acquisition* and (3) *awareness* during instructed SLA. Firstly, Sharwood Smith (1981) argued that 'consciousness raising' activities could be potentially helpful for instructed L2 learners, and he distinguished four types of intervention that could be used to direct learners' *attention* to language form. These ranged from provision of pedagogic rules (highly demanding of focal attention) to 'brief indirect clues' to the L2 structure (much less attention demanding), such as visually enhancing, or otherwise making perceptually salient, a particular structure in the input to language learning activities. Similarly, Long (1991) argued that a 'focus on form', or brief *attention* to language as object during meaningful language exposure, could be beneficial to language learners. These two proposals formed the early rationale for subsequent research into the effects of different pedagogic techniques for directing learner attention to form in communicative and task-based classrooms. Research in this area has flourished in recent years (Doughty and Williams, 1998) as will be described in the following section (see also Ellis, *Implicit and Explicit Knowledge about Language*, Volume 6; Sharwood Smith, *Morphological and Syntactic Awareness in Foreign/Second Language Learning*, Volume 6).

A different response to Krashen's proposal was to argue that SLA was essentially a process of *skill acquisition* (McLaughlin, 1987), and that—following then the current cognitive models of automatization processes—the early phase of instructed language learning involved exclusively effortful, conscious, controlled processing. With practice, explicitly learned knowledge becomes restructured, and access becomes less effortful, and eventually automatic. Versions of this approach are also currently being explored (see DeKeyser, 1997; Segalowitz, 2003). A third response to Krashen was to argue that consciousness was insufficiently defined in Krashen's theory. Schmidt (1990) pointed out that 'unconscious' (the defining feature of Krashen's 'acquisition' process) can be used in three distinct senses; to describe learning without 'intention', learning without metalinguistic 'understanding', and learning without 'awareness'. While L2 learning without intention, and without metalinguistic understanding are clearly possible, Schmidt argued that there can be no learning without attention, accompanied by the subjective experience of 'noticing', or being *aware* of aspects of the 'surface structure' of input. All L2 learning is conscious in this sense. Schmidt assumed that focal attention and the

contents of awareness are essentially isomorphic. Robinson (1996) further argued that focal attention together with rehearsal processes in short term and working memory jointly give rise to awareness. Consequently, differences in attentionally regulated rehearsal processes shape the contents of awareness and the extent of learning and retention it results in. However, Tomlin and Villa (1994) argued that while attention was necessary for L2 learning, awareness was not, and that detection outside of focal attention was the initial, prerequisite level of processing needed for SLA. Much contemporary research continues to examine evidence for and against these three lines of reaction to Krashen's claims.

### MAJOR CONTRIBUTIONS

SLA researchers in the 1980s and 1990s were dissatisfied not only with the theoretical position taken by Krashen, described earlier, but also with the methodology used in studies reported to support the claims of the acquisition/learning distinction. These were overwhelmingly method comparison studies of the effects of learning (over a semester or longer) in instructed settings which focussed on meaning (leading, Krashen claimed, to superior 'acquisition') such as content-based, or immersion classrooms, versus those which focussed on grammar instruction (and which emphasized explicit 'learning'). However, it is clearly impossible to know with any certainty that learners in focus on meaning classrooms, over the course of a semester, are not also—outside of, or inside classrooms—also focussing their attention on grammar, with a full intention to learn it. Consequently, in attempts to relate the cognitive phenomena of interest (attention and awareness) to specific learning processes and outcomes, researchers adopted a range of methodologies for addressing the issue in the fine-grained detail needed to have certainty about causal relationships. Three such methodologies were: (1) the use of case studies of the role of awareness; (2) experimental laboratory studies of implicit, incidental and explicit learning; and (3) quasi-experimental classroom studies of the effects of focus on form.

In one of the first of these fine-grained detail studies of the effects of attention and awareness on language learning, Schmidt (1990; Schmidt and Frota, 1986) found some evidence for his 'noticing' hypothesis in a case study of his own learning of Portuguese over a 6-month period in Brazil. Schmidt kept a diary of his experiences in using and learning Portuguese, noting a variety of aspects of the language (sounds, phrases, inflections, etc.) as he became aware of them, or 'noticed' them in the input. He also had periodic conversations in Portuguese, with a native speaker, which were recorded and later transcribed. Looking at the diary entries and the transcriptions, Schmidt noted a strong

tendency for those things he had noticed in the input to subsequently appear in his own production. Such learning, then, was not unconscious or implicit, Schmidt claimed, it was conscious though incidental (i.e. unintentional).

Laboratory studies of the role of attention and awareness in learning have the advantage of allowing tighter control over the amount and nature of the input to learning than is possible in case studies of naturalistic learning, taking place over lengthy periods of time. In the 1990s, a number of experimental laboratory studies made use of computerized delivery of different learning conditions to examine the relative effectiveness of implicit versus explicit learning, and the synergistic effects of combining both. DeKeyser (1995) and Robinson (1996) both addressed the issue of what kinds of L2 phenomena can be learned under implicit and explicit conditions. DeKeyser found superior explicit learning of categorical rules, whose condition statements can be stated clearly, but equivalent, and poor, implicit and explicit learning of rules which are gradient, and fuzzy. Related to this, Robinson found learners in an explicit condition that received instruction on rules and applied them to examples in the input outperformed those in conditions that searched for the rules in the input, or processed input for meaning alone, or simply memorized it. This was most clearly so in the case of a rule of English judged to be easy, and largely so also for a rule of English judged to be hard. Ellis (1993) in a study of the acquisition of rules of Welsh found that a condition that combined implicit (memorize examples or instances) and explicit (understand a structured rule presentation) conditions outperformed those in implicit, or explicit only conditions, who had the same amount of exposure.

Understanding the relationship of attention and awareness to basic learning and other psychological and psycholinguistic processes is essential to understanding the cognitive underpinnings of SLA (see the edited collections by Ellis, 1994; Hulstijn and DeKeyser, 1997, 2005). However, experimental laboratory studies are open to the charge of limited ecological validity when comparing the settings in which their findings are arrived at with those of classroom instructional contexts. A third kind of study—classroom studies of the effects of briefly drawing learners' attention to language form during meaningful language exposure—has therefore been conducted to examine the generalizability of findings about basic processes, as revealed in laboratory settings, to classroom instruction. An edited collection by Doughty and Williams (1998) illustrates both the research questions guiding, and the methodologies adopted in pursuing, this research agenda. Three basic issues that have guided much subsequent research are: (i) which kind of focus on form technique shows the most consistently successful results; (ii) which kind of forms are most susceptible to

learning via various focus on form techniques that have been proposed and (iii) should the delivery of the technique be decided and contrived before sessions of instructional exposure to meaningful activities (i.e. planned off-line), or only be improvised as an on-line reaction to learner errors and production problems in situ, as they occur during communication. In line with the laboratory findings briefly described earlier, techniques for focus on form which are more attention demanding, such as processing instruction, which involves brief rule explanations, have been found to be quite consistently successful. Less attention demanding, and less communicatively intrusive techniques, such as delivering a recast of a problematic form in the speech of an L2 learner during conversational interaction, have shown more variable effects on uptake and learning of the corrected form. Recent overviews of the—now extensive—findings for the effects of attention and awareness on learning induced by both the recasting and the processing-instruction techniques for focus on form can be found in Long (2007) and VanPatten (2004), respectively.

#### WORK IN PROGRESS

The issues described earlier all concern the role of attention and awareness in processing input, and the extent to which levels of attention and awareness are necessary for retention of input and further learning. Experimental laboratory, and classroom research, continues to address these issues. Recently, however, two additional areas of research have attracted an increasing amount of theoretical discussion, and empirical studies of these issues are increasing. The first of these areas concerns not simply attention to and awareness of *input* occurring during communicative activities, but also attention to and awareness of the form of language production, or *output*. The theoretical question of interest here is the notion of attention as ‘capacity’. Clearly, the human information processing system is limited in its ability to process and respond to information in the environment, but are breakdowns in performance that occur caused by limits on attentional resources? Skehan (1998) argues for this position, claiming capacity limits on a single pool of attentional resources leads to decrements in the fluency, accuracy and complexity of L2 speech when tasks are high in their attentional, memory and other cognitive demands. Consequently, Skehan has shown, when planning time is allowed, which reduces task demands, then there is greater fluency and accuracy of L2 speech than when the learner has no planning time before performing a task in the L2. A contrasting position has been proposed by Robinson (2003) who argues that some dimensions of tasks are separately resourced, and do not draw on a single undifferentiated pool of attention. Increasing complexity along

these dimensions of tasks, such as increasing the amount of reasoning the task requires, can lead to greater accuracy, and also complexity of L2 production compared to performance on simpler task versions, requiring no, or little reasoning. Further, along these resource-directing dimensions, greater complexity of the task leads to greater noticing and uptake of task relevant input. This multiple resources view is motivated in part by arguments from functional linguistics that greater effort at conceptualization leads to greater complexity and grammaticization of speech.

A second area of recent research concerns the contribution of individual differences in cognitive abilities to successful learning from the focus on form techniques described earlier. Do different techniques for focus on form draw on different sets of learner cognitive abilities: for example, delivering a recast of a problematic learner utterance in the hope that the learner will notice and use the recast form in their own production, versus giving a brief metalinguistic explanation of the error, or rule that has been broken? Research has shown that working memory capacity is related to the ability to notice and use the negative feedback provided in recasts (Mackey, Philp, Egi, Fujii and Tatsumi, 2002)—those with higher working memory capacity profit more from this technique, and are also better able to notice and learn aspects of grammar while processing input for meaning (Robinson, 2002, 2005). Findings such as these are prompting new proposals for comprehensive aptitude batteries that sample the abilities drawn on under a range of input processing conditions, and in response to a range of focus on form techniques.

## PROBLEMS AND DIFFICULTIES

Two issues which are problematic in the empirical study of the role of attention and awareness in learning are: (1) the problem of task construal and (2) the sensitivity of measures of awareness. Firstly, in studying the role of attention and awareness on learning, research in cognitive psychology, and increasingly SLA, has presented stimuli under different (experimental, or classroom) task conditions. In Reber's (1993) research into implicit versus explicit learning, learners in two training conditions are presented with the same stimuli—for example, strings of letters that follow complex rules for which combinations of letters are permissible. Implicit learners are instructed only to memorize the display whereas explicit learners are instructed to search the stimulus display to identify rules. On post-training transfer tests, learners in the implicit condition are often found to be sensitive to the rules, i.e. they correctly classify as grammatical those letters strings that follow the same rules as the training task stimuli, and correctly reject

as ungrammatical those that do not. However, learners in these conditions are argued to be unaware of these rules, as revealed by their inability to *verbally report* them. They just 'felt' some letter strings were more acceptable, or similar to the training set stimuli, than others. The Ellis (1993), DeKeyser (1995) and Robinson (1996) studies reported earlier adopt very similar procedures, but use either an artificial language (DeKeyser) or a natural language (Ellis and Robinson) as the stimulus to be learned.

The first problem this procedure raises is that of *task construal*: are learners in fact following the instruction to memorize only in the implicit condition, or are they adopting a more analytic approach, and in fact doing what learners in the explicit condition are instructed to do, i.e. search for rules explicitly? That is, are they construing the demands of the task in the way the researcher intends them? There is, of course, no guarantee that they will, and this raises difficulties in interpreting results of learning under one condition versus another as evidence of supposedly causal and categorical differences in the way input is processed. This caveat also applies to inferences about the causal effects of different degrees of attention to and awareness of form in classroom studies. For example, learners presented with one technique for focus on form (such as textual input enhancement, in which various elements, such as regular past-tense inflections in English, have been made perceptually salient via underlining) may be processing it in many different ways. This leads to the second problem for research in this area: the need for *sensitive measures of awareness* to examine what learners are actually doing and aware of during experimental task and classroom exposure. Verbal reports requiring rule explanation, as in Reber's experiments, may not have been sensitive to what implicit learners actually did attend to, and were aware of, such as noticing of co-occurring 'chunks' of letters in the input. If such noticing did guide judgements of grammaticality following exposure, then implicit learning can not be called 'unaware' or nonconscious in Schmidt's (1990) terms, since learners were basing their decision making on what they 'noticed' in the input. Consequently, research in SLA is exploring a range of methods for assessing learner awareness, both during and following treatments, which aim to manipulate it. Gass and Mackey (2000) have examined the effectiveness of a method called 'stimulated recall', in which learners are videotaped during classroom activities which adopt one focus on form technique or another, and then following the treatment learners are shown the video and prompted to recall what they were thinking, and aware of at certain points in the activity. This is an off-line, post-experiential means of assessing awareness, but it has the advantage of greater sensitivity to the causes and contents of awareness than post-treatment verbal responses to decontextualized

questions, such as ‘Were you looking for rules?’, or ‘Can you describe the rules?’, etc. An on-line technique for assessing awareness *while* treatments are being delivered is the use of protocols, in which learners verbalize what they are thinking, attending to and aware of as they perform a task (see Leow and Morgan-Short, 2004). This is a potentially sensitive measure of awareness, but there is the important issue of whether performing the protocol interferes in a substantial way with the nature of the processing the experimental task or classroom activity aims to induce.

### FUTURE DIRECTIONS

Future research will likely adopt increasingly sensitive measures of the contents of awareness, and explore new methodologies for operationalizing these. Neurophysiological measures of physical changes in brain states will also be used increasingly to complement the behavioural and introspective methods for studying the relationship of attention and awareness to learning. Finally, content issues that are likely to be addressed with increasing frequency include *what* aspects of a language can be learned with less versus more attention to and awareness of form, not simply with regard to syntax, phonology, lexis and morphology, but also with respect to pragmatics and advanced levels of L2 discourse ability.

## EXPLICIT KNOWLEDGE AND SECOND LANGUAGE LEARNING AND PEDAGOGY

### INTRODUCTION

The role of explicit knowledge in the learning of a second language (L2) is highly controversial (see also Sharwood Smith, *Morphological and Syntactic Awareness in Foreign/Second Language Learning*, Volume 6). Three different positions can be identified:

1. The non-interface position: Krashen (1981) has argued that implicit and explicit knowledge are entirely distinct, involving separate mental processes and storage. He also claims that explicit knowledge does not convert into implicit knowledge.
2. The strong interface position: DeKeyser (1998) claims that L2 knowledge commences in declarative form and is then changed into procedural form through communicative practice. According to this position, then, explicit knowledge can convert into implicit knowledge.
3. The weak-interface position: R. Ellis (1993) proposes that explicit knowledge functions primarily as a facilitator of the processes involved in the acquisition of implicit knowledge.

Not surprisingly, proponents of these positions offer very different pedagogical recommendations. Krashen argues that instruction should be directed primarily at implicit knowledge by ensuring learners have access to 'comprehensible input'. DeKeyser proposes that declarative rules of grammar are taught and then practised under real-operating conditions (i.e. in communicative tasks). R. Ellis suggests that the teaching of explicit and implicit knowledge be kept separate, with explicit knowledge taught through consciousness-raising tasks and implicit knowledge catered for by means of task-based teaching.

In the next section, the two types of knowledge will be defined. The major contributors to work on implicit/explicit knowledge in the field of L2 studies are then identified. Following this are reviews of a number of studies that have investigated L2 learners' implicit and explicit knowledge. Pedagogical directions are then briefly discussed. Finally, problems in investigating and teaching explicit knowledge and future directions are considered.

EARLY DEVELOPMENTS: DEFINING IMPLICIT  
AND EXPLICIT KNOWLEDGE

The terms implicit and explicit knowledge refer respectively to 'knowledge of language' and 'knowledge about language'. It is important to distinguish implicit/explicit learning and implicit/explicit knowledge (Schmidt, 1994); the former refers to a product—the knowledge that exists in the mind of the learner—whereas the latter refers to a process—how L2 knowledge is internalized. The focus of this article is second language (L2) knowledge.

According to Bialystok (1990), implicit L2 knowledge is typically manifest in some form of naturally occurring language behavior (e.g. conversation) and cannot easily be accessed separately from this behavior. It is 'unanalysed'. Similarly, Mathews et al. (1989) argue that implicit knowledge takes the form of compilations of memories of past experiences rather than of an integrated model that reflects analytical cognition (i.e. it is 'memory-based' rather than 'rule-based'). Both Bialystok and Mathews et al. also characterize implicit knowledge as easily accessible. However, Reber (1989) claims that implicit knowledge is, in part, abstract and structured. That is, it can deal with 'different symbol sets' (i.e. different input) to those from which it was derived. According to this view, then, implicit knowledge can be rule-like. Evidence for this comes from studies such as Berko's (1958) which demonstrate language learners' ability to apply 'rules' they have internalized to new language contexts.

Explicit knowledge, broadly defined as 'knowledge about the L2', can be broken down into (i) analysed knowledge and (ii) metalanguage. Analysed knowledge refers to that knowledge about L2 items and structures of which the learner is aware but not necessarily conscious. In the case of L1 acquisition, knowledge starts off as implicit and then becomes increasingly more analysed (see Bialystok, 1994). However, this is less likely to be the case in L2 acquisition, especially in foreign language learners. Metalanguage, 'the language used to analyze or describe a language' (Richards, Platt and Weber, 1985) must be learnt through instruction or observation. Analysed knowledge can exist quite independently of whether the learner has acquired the technical language with which to articulate it, although, fairly obviously, it is likely to be more precise, clearer and better-structured if the learner has access to metalingual terms to talk about it. Explicit knowledge often constitutes an inaccurate or incomplete representation of implicit knowledge. Because explicit knowledge is amenable to study through conscious, intentional reflection, it can easily be re-analysed. Learners are constantly refining their analysed knowledge. Metalanguage can consist of technical terminology (e.g. 'the most typical semantic role of a

subject is agentive'—Quirk and Greenbaum, 1973) or semi-technical terminology (e.g. the subject typically tells us who does an action). Research has shown that L2 learners vary enormously in the amount of metalanguage they learn (Green and Hecht, 1992). Ellis (2004, pp. 244–245) offers the following definition of explicit knowledge:

Explicit L2 knowledge is the declarative and often anomalous knowledge of the phonological, lexical, grammatical, pragmatic and sociocritical features of the L2 together with the metalanguage for labelling this knowledge. It is held consciously and is learnable and verbalizable. It is typically processed through controlled processing when L2 learners experience some kind of linguistic difficulty in the use of the L2. Learners vary in the breadth and depth of their L2 explicit knowledge.

#### MAJOR CONTRIBUTIONS

Major contributions to the study of L2 explicit knowledge have been made by Bialystok, R. Ellis, DeKeyser and N. Ellis.

Bialystok's view of explicit knowledge and its role in language learning has shifted somewhat over time. In her *Model of Second Language Learning* (Bialystok, 1978) she allowed for a two-way interface between explicit and implicit knowledge. Formal practicing was the means by which explicit knowledge became implicit while inferencing allowed explicit knowledge to be derived from implicit. In her later work, (Bialystok, 1990 and 1991), she reconceptualized L2 knowledge in terms of two intersecting continua reflecting the extent to which rules and items are 'controlled' and 'analysed'. In addition, her definition of control has changed. Initially (see Bialystok, 1982) it concerned the ease and rapidity with which knowledge can be accessed, while in later formulations (e.g. Bialystok and Ryan, 1985) it refers to three different functions: the selection of items of knowledge, their co-ordination and the extent to which these can be carried out automatically. Analysis refers to the extent to which a learner has abstracted an account of some linguistic phenomena (e.g. by analysing the components of a formulaic chunk). It is this dimension of the later theory that addresses explicit/implicit knowledge. However, this later view sees analysed (explicit knowledge) deriving from unanalysed (implicit knowledge), as described by Karmiloff-Smith's (1979) account of L1 acquisition. As such, it has limited applicability to L2 acquisition, where for many learners acquisition begins with explicit knowledge.

In an attempt to relate the work on implicit and explicit knowledge to language pedagogy, R. Ellis (1993, 1994) developed a weak-interface model of L2 acquisition. This position is grounded in research which

indicates that learners do not bypass developmental sequences, which are assumed to involve implicit knowledge, even when they are able to practice using their explicit knowledge of target structures (Pienemann, 1984). The model allows for explicit knowledge to convert into implicit knowledge under certain stringent conditions (e.g., when a learner is developmentally ready to acquire implicit knowledge of a specific feature) and also for implicit L2 knowledge to convert into explicit L2 knowledge (cf. Bialystok's 1978 Model of L2 Learning). The process by which this occurs is self-reflection. Like linguists, L2 learners reflect on their implicit knowledge, thereby 'analysing' it. The main thrust of Ellis' model, however, rests in the claim that explicit L2 knowledge functions as a facilitator of implicit L2 knowledge. This occurs in three possible ways. First, it helps learners to notice linguistic properties of the input that otherwise might not be noticed. That is, it can assist in the process of input-enhancement (Sharwood-Smith, 1993). Second, intake is also enhanced when learners are able to compare what they have noticed in the input with what they currently produce (or might produce) in their own output. This kind of cognitive comparison is hypothesized to help learners identify what it is that they still need to learn. It can serve two functions; it can help learners notice the gap (Schmidt and Frota, 1986) between the input and their own output and it can provide them with evidence that an existing hypothesis regarding a target language structure is the correct one. Third, as Krashen (1982) has argued, explicit knowledge can be used to monitor output from implicit knowledge, either before the output is uttered or after. Monitoring can also assist acquisition. For example, it can help the conversion of implicit knowledge into explicit knowledge. Monitored output also constitutes 'auto-input' which can be used for acquisition.

DeKeyser (1998, 2003) promotes a strong interface position. Drawing on Anderson's (1993, 1995) skill acquisition theory, DeKeyser argues that, for adults at least, learning typically commences with declarative knowledge which is subsequently proceduralized through practice. He defines declarative knowledge as 'factual knowledge' and procedural knowledge as behaviour involving 'condition-action pairs that state what is to be done under certain conditions' (1998, p. 48). Declarative knowledge serves as a 'crutch' that enables learners to engage in target behaviour. Repeated behaviours allow the declarative knowledge to be slowly restructured as procedural knowledge. A key point in DeKeyser's position is that learners need to engage in communicative language use for this transformation to take place—mechanical drills of the kind found in audiolingual language teaching suffice only to sharpen learners' declarative knowledge. Is the declarative/procedural distinction that DeKeyser draws on a mirror of the implicit/explicit distinction? Declarative knowledge is clearly the same

as explicit knowledge. However, it is less clear that proceduralized declarative knowledge is the same as implicit knowledge. DeKeyser (2003) argues that it is 'functionally equivalent' whereas Hulstijn (2002) considers it is distinct on the grounds that rapid access to explicit rules cannot involve the same processes as those involved in utilizing a highly connected network of implicit knowledge.

N. Ellis (2002, 2005, see also Ellis, *Implicit and Explicit Knowledge about Language*, Volume 6) draws on a connectionist view of language learning and language representation. Explicit knowledge involves conscious learning requiring focussed attention on the part of the learner. Implicit knowledge is acquired through the largely unconscious process of identifying sequences of form in the input and subsequently abstracting regular patterns from these. He sees a clear distinction between explicit and implicit knowledge, viewing the former as facilitating the process of acquiring the latter. He outlines a learning sequence that incorporates the two types of knowledge as follows:

Externally scaffolded attention → internally motivated attention → explicit learning → explicit memory → implicit learning → while explicit learning knowledge can help to accelerate the process of implicit learning it is distinct from it and not essential. In this respect, N. Ellis' position differs from DeKeyser's and resembles R. Ellis' weak-interface position.

A number of studies have investigated L2 knowledge. The main findings are as follows:

1. Explicit knowledge has been typically operationalized as learners' oral or written explanations of grammatical rules while implicit knowledge has been operationalized as the use of grammatical features in some kind of performance involving either judging the grammaticality of sentences or actual language use.
2. Learners' metalinguistic knowledge is often fuzzy and anomalous. 'The ability to make rules explicit is a relatively late achievement' (Sorace, 1985, p. 245). The quality, depth and consistency of learners' explicit knowledge varies considerably (Clapham, 2001).
3. However, contrary to Krashen's (1982) claim that learners are only capable of learning relatively simple rules as explicit knowledge, at least some adult learners seem able to learn quite complex rules (Butler, 2002).
4. Learners are better at learning and making use of explicit rules for prototypical uses of grammatical features than rules for peripheral uses (Hu, 2002).
5. Judging the grammaticality of correct sentences draws on implicit knowledge. Explicit knowledge is utilized when learners analyse incorrect sentences (Bialystok, 1979; R. Ellis, 2005).

6. In the case of advanced L2 learners, implicit knowledge exceeds explicit knowledge. That is, learners are able to correct more errors than they can explain (Seliger, 1979; Green and Hecht, 1992).
7. Explicit knowledge is available for use in spontaneous production but there are constraints on its availability (e.g. whether there is time available for linguistic processing and attention to form) (Hu, 2002).
8. Learners' explicit knowledge has been found to be related to performance on proficiency tests that encourage the use of explicit knowledge (Han and Ellis, 1998).

No study to date has investigated the different interface positions. This is because of the difficulty of obtaining separate measures of implicit and explicit knowledge (see later).

Fotos (1993) provided evidence to suggest that learners who had been equipped with explicit L2 knowledge of a specific grammatical feature noticed it in subsequent input to a greater extent than those who had not. This finding lends support to the weak-interface hypothesis. However, Fotos' study did not examine whether noticing contributed to subsequent implicit knowledge.

#### DIRECTIONS FOR LANGUAGE PEDAGOGY

Some of the key questions for language pedagogy are:

1. Are there any grounds for teaching learners explicit knowledge of L2 items and structures?
2. Assuming explicit knowledge is useful, is it necessary to teach metalingual knowledge or is it sufficient to raise learners' awareness of linguistic properties?
3. How should explicit knowledge be taught?
4. What can teachers do to help learners make effective use of their explicit knowledge in processing L2 input and output?

While doubts exist regarding the efficacy of teaching implicit knowledge, based on the difficulty of ensuring that learners are developmentally ready to acquire the target structure (Lightbown, 1985), the teaching of explicit knowledge would seem to be less problematic. This type of knowledge is 'teachable', as it is not subject to the developmental constraints that govern implicit L2 knowledge, although it may well prove subject to constraints of a non-developmental kind (e.g. the complexity of information required to formulate an explicit rule). Norris and Ortega (2000), in a meta-analysis of 39 form-focussed instruction studies, reported a clear effect as measured by the kinds of tests likely to elicit explicit knowledge. In contrast, the effect was much weaker on the kinds of tests likely to tap implicit knowledge.

Research by Alderson, Clapham and Steel (1995) and Elder, Warren, Hajek, Manwaring and Davies (1999) indicates that metalingual knowledge is not related to general language proficiency. It may be, therefore, that it is more important to teach explicit knowledge as awareness and to limit the teaching of metalanguage to semi-technical terms.

One obvious way of teaching explicit knowledge is by direct explanation—of the kind used in the grammar-translation method, for example. Fotos and Ellis (1991) found that in the case of Japanese college students, who had considerable experience of this kind of formal instruction, direct explanation was very effective. There are, however, sound educational reasons for not pursuing such an approach. It is based on a transmission-model of education and, as such, does not actively engage the learners in taking responsibility for their own learning. An alternative to direct explanation is to devise a consciousness-raising (CR) task to help learners develop explicit L2 knowledge for themselves. Fotos and Ellis found that this, too, was quite successful, even though their learners had little prior experience of it. One major advantage of this discovery approach is that it provides opportunities for learners to interact in the target language while learning about it. Grammar becomes both the object of learning and a topic for talking about.

Two broad types of CR task can be identified—inductive and deductive. This distinction is common in language pedagogy, where it is traditionally used to distinguish the pattern-practice associated with audiolingualism from the rule-giving approach associated with the grammar-translation or cognitive-code methods. In terms of CR tasks, it has a rather different denotation. In an inductive CR task, learners are supplied with L2 data and are required to induce an explicit representation of a target language structure. In a deductive CR task, learners are supplied with a description of a target language structure and are required to utilize this description by applying it to L2 data. Irrespective of whether a CR task is inductive or deductive, it will consist of (i) data of some kind and (ii) some required operation to be performed on the data. Ellis (1991) lists the different types of data (e.g. authentic vs. contrived) and the various operations (e.g. sorting and rule provision) that can be performed on them.

Interpretation tasks (R. Ellis, 1995) serve to draw learners' attention to linguistic features in the input. A text is 'seeded' with the target structure. Learners listen to a text and indicate their comprehension of the key sentences containing the structure by means of a non-verbal or minimally verbal response. One way of inducing attention to the target structure is by first ensuring that learners' have explicit knowledge of it. Dictogloss (Wajnryb, 1990) serves as a tool for encouraging learners to make use of their explicit knowledge in processing output. This consists of a short text which has been seeded with the target

structure. Students listen to the text and take notes. They then work in groups to reconstruct the text. The collaborative group work results in 'language related episodes' (Kowal and Swain, 1994) where the learners jointly attempt to produce the target structure.

### PROBLEMS AND DIFFICULTIES

There are problems and difficulties in both researching and teaching L2 explicit knowledge.

As Bialystok (1979) pointed out many years ago:

The problem for the researcher is to identify those language tasks which could be accommodated by an intuitive or an implicit knowledge of the language and those which require the intervention of a set of formalized articulated rules.

This constitutes the measurement problem—how to devise reliable and valid measures of implicit and explicit knowledge, bearing in mind that it will be impossible to develop 'pure' measures of the two types of knowledge. Until this problem is solved it will be impossible to investigate the different interface positions or indeed to be sure about the nature of the effects of any kind of form-focussed instruction. R. Ellis (2005) reports a study showing that an oral elicited imitation task served as a good measure of implicit knowledge while learners responses to the ungrammatical sentences in a grammaticality judgment test provided a measure of explicit (analysed) knowledge (as in Bialystok's own 1979 study).

An approach to grammar teaching based on helping learners develop explicit knowledge may not be appropriate for all learners. It may not be a priority for beginner learners, who need to develop some basic implicit knowledge (e.g. formulaic chunks) first. Younger L2 learners may find the conscious study of language unattractive, although it may be possible to devise tasks in the format of games that are more appealing. Learners of the 'data-gathering' kind (Hatch, 1974) may also resist tasks that are essentially 'rule-forming' in nature. Also, as a study by Reber, Walkenfield and Hernstadt (1991) indicates, learners may differ in their ability to engage in explicit learning tasks according to their general intelligence. In contrast, Reber, Walkenfield and Hernstadt suggest that implicit learning 'operates largely independently of intelligence' (p. 894). It may be, therefore, that teaching explicit knowledge is not for every learner.

### FUTURE DIRECTIONS

Future research is likely to continue to probe to what extent and in what ways explicit knowledge is involved in the performance of different

kinds of tasks. One important line of enquiry will be to investigate what factors make specific linguistic features easy or difficult to learn as explicit knowledge. We currently know very little about how learning difficulty is to be defined where explicit knowledge is concerned. Another obviously important line of enquiry is to investigate whether teaching learners explicit knowledge aids the development of implicit knowledge. In particular, as researchers develop better ways of measuring the two types of knowledge, it ought to be possible to test the competing interface claims. Such research will be of importance for both theory development in second language research and language pedagogy.

PHONETIC AWARENESS, PHONETIC SENSITIVITY  
AND THE SECOND LANGUAGE LEARNER

INTRODUCTION

A very large number of studies have shown that our speech perception abilities are shaped by the particular linguistic environment or input we are exposed to. According to many authors, learning to read and write, that is, exposure to written input, for example, helps us to become more attentive to individual sound segments. In the literature, the ability to focus attention on sound segments is often discussed by using terms like phonetic or phonological awareness. These two terms, whose scope is discussed in the first part of this chapter, appear to be used to refer to rather attentive or conscious processing of speech. As the second part of this chapter shows, it seems reasonable to distinguish terms like phonetic or phonological *awareness* from phonetic or phonological *sensitivity*. This is because the results of speech perception research indicate that long before children learn to read and write and begin to show a greater awareness of speech as a sequence of sound segments, they develop a high degree of sensitivity to those speech contrasts that are used for distinctive purposes in their first or native language (L1). At the same time, their ability to perceive non-native or second language (L2) speech contrasts is attenuated. The third part of this chapter exclusively focuses on second language learners and variables that have been found to have a strong influence on their *production* of L2 sounds. The chapter is concluded by relating the findings of L1 and L2 research to the foreign language classroom.

EARLY DEVELOPMENTS: PHONETIC AWARENESS

The literature on language awareness does not clearly distinguish between *phonetic* awareness and *phonological* awareness. Often the two terms appear to be used almost synonymously. On the basis of a literature review, García Lecumberri (2001, p. 238), for example, concludes that “(Meta-)phonetic awareness can be described as the ability to reflect on and manipulate the sounds and sound system of a language independently of function and meaning [. . .].” Nicholson (1997, p. 53) provides a similar definition of phonological awareness, which he describes as a metalinguistic skill involving “the ability to reflect on

and manipulate the sound components of spoken words". As pointed out by García Lecumberri (2001), it would of course be possible to more clearly differentiate phonological from phonetic awareness. She suggests that the term phonological awareness could be used to refer to awareness of the contrastive units of a sound system including consonants and vowels as well as suprasegmentals such as syllables, stress and intonation. The term phonetic awareness, on the other hand, could be used to refer to awareness of more specific properties of sounds including awareness of their articulatory, acoustic and perceptual characteristics as well as awareness of the different realizations of phonological units in speech. However, most authors appear not to draw such a distinction between the two terms, and the term phonetic awareness is, in fact, often used in a broader sense to refer to awareness of both phonological and phonetic characteristics of sounds and sound systems. A third term occurring in the literature is *phonemic* awareness. Although this term is not used in a consistent way either, it appears to be preferred by some authors when the emphasis clearly is on awareness of individual sounds or phonemes (e.g. Goldsworthy, 1998; Nicholson, 1997).

The phenomenon of phonetic awareness has most often been examined in studies exploring the relationship between the ability to divide words up into individual sound segments and the acquisition of alphabetic orthography. In these studies, the first of which were conducted in the 1960s, literate, illiterate and preliterate individuals have usually been asked to analyze the phonological structure of words by, for example, deleting initial sound segments or adding sound segments to the beginnings of words by substituting sound segments or by simply counting the number of individual sounds occurring in a word (e.g. Bruce, 1964; Elkonin, 1971; Liberman, Shankweiler, Fischer and Carter, 1974; Morais, Cluytens and Alegria, 1984; Tyler and Burnham, 2000). A finding obtained in most of these studies is that it is relatively easy for literate individuals to deal with tasks involving the addition, deletion or substitution of individual sound segments. Illiterate or preliterate individuals, on the other hand, have proved much weaker at these tasks and appear to manipulate syllables easier than individual sounds. Results like these have usually been interpreted as support for the hypothesis that there is a close relationship between learning to read and write in the alphabetic system and awareness of speech as a chain of individual sound segments. However, as pointed out by several authors, the ability to reflect on and manipulate individual sound segments should not simply be viewed as a product of literacy. There rather appears to be a reciprocal relationship. Some degree of phonetic awareness seems to be necessary to be able to learn to read and write, and at the same time reading and writing appears

to help individuals to become more attentive to individual sound segments (e.g. Stanovich, 1986).

Studies exploring the relationship between exposure to written alphabetic input and the ability to manipulate individual sound segments have mainly examined how literate, preliterate and illiterate individuals perform in tasks requiring rather conscious processing of speech. However, it has to be noted that even preliterate children who prove weak at tasks involving an analysis of speech into sound segments usually show no greater difficulties in discriminating the sounds of the language(s) they are regularly exposed to. This means that the development of sensitivity to sound contrasts is not dependent on the ability to consciously analyse speech into individual sounds. The next part of this chapter describes how people develop sensitivity to particular phonetic and phonological characteristics of the speech stream depending on the linguistic environment they happen to be exposed to.

#### WORK IN PROGRESS: THE DEVELOPMENT OF SPEECH PERCEPTION ABILITIES

In a very large number of studies carried out since the early 1970s young infants have been found to perceive just about any speech contrast occurring in the world's languages and even those speech contrasts that are not present in their native language environment (for reviews, see Burnham, Tyler and Horlyck, 2002; Wode, 1994). It has, for example, been shown that under experimental conditions, one-to-six-month-old infants discriminate voiced from voiceless initial stops in syllables such as /ba/ versus /pa/ (Eimas, Siqueland, Jusczyk and Vigorito, 1971), various Zulu click contrasts (Best, McRoberts and Sithole, 1988) and vowel contrasts such as /ɤ/ versus /ʊ/ and /y/ versus /u/ (Polka and Werker, 1994). As pointed out by Wode (1994), the finding that during the first months after birth children are able to perceive just about any speech contrast occurring in the world's languages makes a lot of sense from the point of view of learnability. Any child can learn any language, and therefore children have to be born with the ability to perceive any of the sound contrasts used in the world's languages.

Numerous studies, in particular by Werker and colleagues, have shown that the infant's original ability to perceive just about any speech contrast is subsequently modified in the direction of the sound contrasts of the input language, i.e. an individual's L1. At the same time, the ability to perceive speech contrasts which do not occur in the input language is usually attenuated. According to the results of some studies (e.g. Polka and Werker, 1994), perceptual attenuation for non-native vowels appears to begin between 4 and 6 months after birth. A decline in the ability to perceive non-native consonant contrasts has been

observed with infants between 7 and 11 months. It has, for example, been shown that until the age of about 7 months, infants growing up in an English-speaking environment are able to perceive the contrast between retroflex /ʈ/ and dental /ʈʰ/, which is used for phonological purposes in Hindi, but not in English (Werker, Gilbert, Humphrey and Tees, 1981). By about 11 months, on the other hand, infants from English-speaking backgrounds show great difficulties in perceiving the Hindi contrast between /ʈ/ and /ʈʰ/. During this period, which is characterized by a noticeable change in infants' perceptual behaviour and which seems to end around 12 months after birth, children apparently become particularly sensitive to speech contrasts that are phonologically relevant in their native language. At the same time, their ability to perceive speech contrasts that are phonologically irrelevant in their native language is dampened so that older children and adults fail to discriminate non-native speech contrasts which infants regularly perceive.

These findings concerning the development of speech perception abilities appear not to be encouraging for foreign language teachers, because they seem to suggest that the difficulties adolescent and adult second language learners show when *pronouncing* non-native speech sounds could be due, at least in part, to irreversible changes in speech perception abilities involving the loss of sensitivity to non-native speech contrasts. It is important to note, however, that in adulthood the early ability to also perceive non-native speech contrasts is only obscured but not obliterated (Burnham, Tyler and Horlyck, 2002). This is supported by different types of empirical evidence. For example, second language research has shown that Japanese adults, who usually prove weak at distinguishing the English /r/ versus /l/ contrast, can improve their perception and production of this contrast with experience and training (e.g. Flege, Takagi and Mann, 1995; Iverson, Hazan and Bannister, 2005). Moreover, some studies examining the production of L2 stop consonants such as /p, t, k/ or /b, d, g/ have provided evidence that as a result of extensive and prolonged exposure to a second language, L2 learners can learn to approximate voice onset time (VOT) norms for L2 stop consonants although they may not achieve the norms that are typically produced by native speakers of the L2 (e.g. MacKay, Flege, Piske and Schirru, 2001). Such findings clearly show that it is not impossible for adolescent and adult learners to improve their sensitivity to the particular phonetic characteristics of non-native speech sounds and that the early ability to also perceive speech contrasts which do not occur in an individual's L1 can in principle always be reactivated.

Finally, in this context, it has to be noted that the way a second language is processed by learners may also be influenced by their L1

writing systems. As has already been discussed in the previous part of this chapter, exposure to written alphabetic input appears to contribute to phonetic or phonological awareness, i.e. awareness that the speech stream can be divided up into individual sound segments. Several studies have shown that second language learners who have acquired increased awareness of certain linguistic units such as phonemes or words through exposure to their L1 writing system can apply this awareness to other languages (e.g. Bassetti, 2005; Loizou and Stuart, 2003). For example, the results obtained in a study examining English learners of Chinese as well as Chinese natives, led Bassetti (2005) to conclude that due to their experience with the word-spaced writing system of English, English learners of Chinese have different concepts of the Chinese word than Chinese natives who have learnt a writing system that represents morphemes rather than words as discrete units. Moreover, it has often been observed that an individual's pronunciation of L2 consonants and vowels may be influenced by the grapheme-sound relationship that exists in his/her L1. The results of several studies (e.g. Piske, Flege, MacKay and Meador, 2002) suggest that even learners who are highly experienced in their L2 may produce certain types of pronunciation errors because they pronounce graphemes occurring in L2 words as they are pronounced in their L1.

On the whole, then, the findings reported here indicate that sensitivity to and awareness of both native and non-native speech sounds develop on the basis of the linguistic environment or input an individual is exposed to. The results of studies examining the development of speech perception abilities during the first years of life as well as the results of several studies examining bilinguals' perception and production of L2 sounds suggest that the development of sensitivity to native or non-native speech contrasts is not dependent on any more conscious processing of speech. At the same time, the results of studies examining the effects of training on the perception and production of L2 sounds as well as the results of studies examining the relationship between learning to read and write and the ability to manipulate sound segments indicate that the development of sensitivity to and awareness of native and non-native speech contrasts may well be enhanced by tasks requiring rather conscious processing of speech.

Teachers, especially language teachers, should be aware of the important role different types of input play in a student's acquisition of a native or a non-native sound system. The importance of input for second language learners' success in pronouncing an L2 well has been confirmed by a number of studies examining subject variables that have been claimed to affect the accuracy with which second language learners speak an L2. These variables and their relevance for L2 pronunciation is discussed in the third part of this chapter.

PROBLEMS AND DIFFICULTIES: FACTORS  
CLAIMED TO AFFECT L2 PRONUNCIATION  
ACCURACY

In the L2 literature, several subject variables have been claimed to affect second language learners' pronunciation of an L2. As pointed out by Piske, MacKay and Flege (2001), researchers have drawn different conclusions about the role each of these variables plays in L2 speech production. This, however, is probably not surprising because the studies so far conducted differ greatly in terms of design and methodology. The variables that have received the most attention in the L2 literature are age of first intensive exposure to a second language (hereafter referred to as age of L2 learning or AOL), language use, length of residence in a predominantly L2-speaking environment (LOR), quantity and quality of L2 input, training in the perception and production of segmental and suprasegmental aspects of L2 speech, gender, language learning aptitude and L1 background. In the following paragraphs previous findings regarding the relative contribution of each of these variables to L2 pronunciation accuracy is briefly discussed (for more comprehensive reviews, see Moyer, 2004; Piske, MacKay and Flege, 2001).

On the basis of a literature review, Long (1990) inferred that a second language is usually spoken accent-free if it is learned by the age of six years. Individuals who begin learning an L2 after the age of 12 years, on the other hand, would most probably speak it with a detectable foreign accent. The results of almost all studies examining the importance of AOL for ultimate attainment in L2 acquisition do, in fact, support the view that the earlier in life a second language is learnt, the more native-like its production and perception will be (e.g. Asher and García, 1969; Piske, MacKay and Flege, 2001). However, some studies have also shown that an L2 will not automatically be spoken without a foreign accent if it is learnt before the age of 6 years. Flege, Frieda and Nozawa (1997), for example, identified a group of bilinguals who spoke their L2 English with a slight foreign accent even though they had begun learning English at an average age of 3.2 years and had already been living in an English-speaking environment for at least 18 years when they were tested. Other studies have shown that individuals who begin learning an L2 after the age of 12 years may still learn to speak it without a foreign accent. Highly successful late learners have, for example, been identified by Bongaerts, van Summeren, Planken and Schils (1997) and Moyer (2004). Findings like the ones reported here indicate that ultimate attainment in L2 pronunciation is also dependent on variables other than AOL. According to the results

of more recent research, these variables include language use and quantity and quality of L2 input.

Language use was, for example, identified as an important determinant of L2 pronunciation accuracy by Flege, Frieda and Nozawa (1997) and Piske, MacKay and Flege (2001). Piske, MacKay and Flege (2001) found that both child L2 learners and adult L2 learners who were living in an L2-speaking environment, but continued to use their L1 frequently spoke their L2 with significantly stronger foreign accents than child and adult learners who only seldom used their L1. The findings of some studies indicate that such language use effects on L2 pronunciation accuracy could, among other things, be due to differences in the L2 input received by individuals who continue to use their L1 frequently and people who only seldom use their L1. The results of a study by Flege and Liu (2001) examining native Chinese learners of English who differed in terms of LOR in the US and in terms of their occupation (students versus nonstudents), for example, suggest that even adults' performance in an L2 will improve measurably over time if they receive a substantial amount of native speaker input. Individuals, on the other hand, who—due to their occupation and their social environment—spend a long time in an L2-speaking environment without receiving a large amount of L2 input from native speakers are much less likely to show progress in learning an L2.

Another factor that has been found to have a positive influence on the pronunciation of an L2 is training in the perception and production of L2 sounds. As mentioned earlier, some studies have shown that training may help Japanese adults to improve their production of the English /l/ versus /r/ contrast (e.g. Flege, Takagi and Mann, 1995). Similarly, Missaglia (1999) reported that prosody-centred phonetic training had an ameliorative effect on both prosodic and segmental aspects of native Italian learners' pronunciation of German, and results obtained by Bongaerts, van Summeren, Planken and Schils (1997) suggested a positive influence of training on native Dutch learners' pronunciation of English.

It seems reasonable to assume that the accuracy with which non-native speakers pronounce an L2 is, at least to some extent, also dependent on their L1. Surprisingly, only relatively few studies have examined to what extent L2 learners' performance in L2 pronunciation tasks is dependent on their particular L1 backgrounds. Those studies that have examined this issue have identified L1 background as an important determinant of L2 pronunciation accuracy (e.g. McAllister, Flege and Piske, 2002; Purcell and Suter, 1980). In a study comparing native Arabic and native Persian learners of English, Purcell and Suter

(1980), in fact, identified L1 background as the most important determinant of degree of L2 foreign accent.

On the whole, then, previous research has provided convincing evidence that the accuracy with which a second language is pronounced is influenced by AOL, quantity and quality of L2 input, training in the perception and production of L2 sounds and L1 background. As far as the importance of other variables for L2 pronunciation accuracy is concerned, the results obtained so far do not allow one to draw any stronger conclusions. For example, whereas some studies (e.g. Asher and García, 1969) have reported an influence of gender on degree of L2 foreign accent, most studies have not identified gender as an important determinant of L2 pronunciation accuracy (e.g. Piske, MacKay and Flege, 2001; Purcell and Suter, 1980). Moreover, some people appear to have a special talent or aptitude for pronouncing non-native sounds and sound sequences, but no study has, as yet, been able to show how this aptitude develops. Finally, motivation has often been found to play an important role in L2 learning. However, as far as the pronunciation of a second language is concerned, the empirical evidence collected so far suggests that factors like professional motivation, integrative motivation or strength of concern for L2 pronunciation are rarely so strong that late learners will still be able to attain a native-like pronunciation of the L2 (see the review by Piske, MacKay and Flege, 2001).

#### FUTURE DIRECTIONS: IMPLICATIONS FOR THE FOREIGN LANGUAGE CLASSROOM

In most foreign language classrooms, language learning proceeds under conditions that are likely to make it particularly difficult for learners to develop an accurate L2 pronunciation. From the start foreign language students will hear their classmates' and, in many cases, probably also their teachers' incorrect pronunciations and they will therefore probably develop L2 norms that are rather different from the norms of native speakers (Winitz and Yanes, 2002). As has been described earlier, even if students begin learning the foreign language in primary school, their perceptual abilities have already been modified in the direction of the sound contrasts used for distinctive purposes in their native language. Their ability to perceive non-native speech contrasts, on the other hand, is attenuated and has to be reactivated through exposure and training. If foreign language students have already learnt to read and write in their L1, they may be expected to pronounce graphemes occurring in L2 words as they are pronounced in their L1. Moreover, in many foreign language classrooms training in the

perception and production of segmental and suprasegmental aspects of L2 speech appears to play a minor role compared to instruction concerning grammatical, lexical and communicative aspects of an L2 (García Lecumberri, 2001; Piske, MacKay and Flege, 2001). If phonetic symbols are used to raise students' awareness of similarities and differences between their L1 and L2 sounds systems, this may in several cases also be rather misleading. A study by Steinlen (2005), for example, showed that L1 and L2 vowels are sometimes transcribed with the same phonetic symbol in dictionaries and textbooks although these vowels have different acoustic qualities, and L1 and L2 vowels that have the same acoustic quality are sometimes transcribed with different symbols. This means that students may not pronounce L2 sounds in a target-like way, because the similarities and differences between L1 and L2 sounds are insufficiently represented by the phonetic symbols used in dictionaries and textbooks. Finally, it appears that in many foreign language classrooms students still only rarely have an opportunity to practice pronouncing the foreign language, because teachers hardly encourage them to actually speak it.

It is important to note, however, that based on the findings reported in the previous parts of this chapter, it is possible to draw several conclusions regarding learning conditions that should help students in a foreign language classroom develop an accurate L2 pronunciation. In general, it appears to be reasonable to introduce foreign languages as early as possible, but teachers should be aware of the fact that a student's success in learning to pronounce an L2 well is not only dependent on an early starting age. Students will not be able to develop an accurate L2 pronunciation unless they receive a substantial amount of native-speaker input. In the foreign language classroom, the teacher is the students' major source of L2 input. This means that non-native teachers themselves are required to learn to pronounce the L2 in a native-like or at least almost native-like manner. As emphasized by García Lecumberri (2001), it is important for teachers to become aware of their own L2 pronunciation and to analyze their own problems in producing and perceiving specific phonetic and phonological characteristics of the L2. This self-awareness will help them to better understand the difficulties their students might have in L2 production and perception (see Andrews, *Teacher Language Awareness*, Volume 6). In order to maximize their students' native L2 input, teachers can of course also use audio and video recordings as well as computer-mediated language programs (Winitz and Yanes, 2002). Results obtained by Piske, MacKay and Flege (2001) suggest that exposure to native-like input appears to be particularly important in the early phases of L2 learning. This means that especially those teachers who teach beginners should

try to make sure that their students are provided with a substantial amount of native-like L2 input.

In order to avoid pronunciations influenced by the writing code of a student's L1, it seems reasonable to first introduce new words, phrases, etc. auditorily and to encourage students to practice the pronunciation of these items before they are introduced in their written form. Moreover, students may not always learn to pronounce the sounds of an L2 by simply imitating a native-like model. Teachers should therefore also have a profound knowledge of articulatory phonetics so that they will be able to make their students aware of the articulatory mechanisms underlying the production of those L2 sounds non-native learners find particularly difficult to pronounce (García Lecumberri, 2001).

As mentioned earlier, extensive and prolonged exposure to an L2 has been found to have a positive effect on learners' perception and production of non-native speech sounds. In addition, it has been found that the successful acquisition of a non-native sound system is also dependent on how much the L2 is actually used. Unfortunately, however, students often only spend two to three lessons per week in a foreign language classroom so that they are exposed to the foreign language for only a very limited amount of time and only rarely have an opportunity to speak it. It is in such situations that teachers will particularly have to rely on training in the perception and production of both segmental and suprasegmental aspects of the L2 to help their students learn to pronounce it well. Suggestions as to how foreign language students can be trained to improve their perception and production of L2 sounds and sound sequences are discussed in a very large number of books, scientific journals and didactic journals. However, it has to be noted that not all training techniques are equally useful (e.g. Iverson, Hazan and Bannister, 2005; Missaglia, 1999; Steinlen, 2005) and that training always has to be age appropriate and adjusted to the level of L2 competence learners have already achieved. Moreover, it appears that in most foreign language classrooms, all the students usually receive the same training in the perception and production of L2 sounds irrespective of their L1 backgrounds. The finding reported earlier that ultimate attainment in L2 pronunciation is also dependent on a learner's L1 background suggests that such an approach is highly problematic and that students from different L1 backgrounds should rather receive different types of training, which are specifically based on the differences and similarities between their particular L1 and the L2. This also means that teachers should not only have a profound knowledge of the L2 sound system. If they want to be able to understand their students' difficulties in learning to pronounce a foreign language, they also have to acquaint themselves with the students' native phonetic systems.

## LEXICAL AWARENESS IN SECOND LANGUAGE LEARNING

### INTRODUCTION

Developing lexical awareness involves developing an interest and focus on consciously considering aspects of language, language learning, and language use. Lexical awareness can have a range of goals including helping learners gain a positive attitude toward vocabulary learning, improving their learning skills, developing an enduring interest in the analysis of the vocabulary of different languages and of vocabulary use, and increasing their understanding of the ways in which vocabulary is used for a whole variety of purposes. There has been very little written about lexical awareness in second or foreign language learning within the tradition of language awareness, although there has been a long history of giving deliberate attention to vocabulary learning and explicit analysis of semantic relationships and etymology. The major focus of this chapter is to look at the teaching of lexical awareness.

### EARLY CONTRIBUTIONS

The whole language approach to learning, at first sight, would not seem to encourage the idea of lexical awareness because it might be seen as looking at bits instead of the whole:

“language is a whole . . . any attempt to fragment it into parts—whether these be grammatical patterns, vocabulary lists, or phonics “families” destroys it. If language isn’t kept whole, it isn’t language any more.” (Rigg, 1991, p. 522).

However, it is clear from pioneers like Ashton-Warner (1963) that there is a role for looking at the parts, if these parts arise from a whole language focus. Young Maori learners in Ashton-Warner’s class worked on their word cards, reading the words and tracing the letters, which contained keywords that carried immense power and significance for them.

There has been a long history of giving deliberate attention to vocabulary and encouraging the growth of strategies such as word part analysis and using word cards.

Nation (2001) sees the major vocabulary learning strategies as being (1) guessing from context, (2) deliberate learning using bilingual word cards, (3) using word part analysis to help remember words, and

(4) dictionary use. Although the eventual application of the guessing from context strategy is seen as being below the threshold of conscious awareness, development and training in the strategy involve raising learners' awareness of the various clues available and their combined application to make an inference that takes the learners forward in their knowledge of the word. Fukkink and de Glopper (1998) have carried out a meta-analysis of studies involving training in deriving word meaning from context. Their analysis supports the value of raising learners' awareness of this very important strategy and the value of deliberate training. The classic study on guessing is Nagy, Herman, and Anderson's (1985) study with first language learners, which was the first to provide a workable methodology for measuring learning from guessing. Clarke and Nation (1980) describe a deliberate bottom-up strategy for training in guessing, but see this as a step toward fluent, nonconscious guessing while reading or listening.

The strategy of deliberate learning from word cards requires awareness of the principles that should guide such learning. Many of these are described in Baddeley (1990) and include spaced retrieval, deep processing in accordance with the levels of processing hypothesis, the avoidance of serial learning, the use of mnemonic techniques like the keyword technique (see Ellis and Beaton, 1993; Pressley, Levin, and Delaney, 1982, for reviews), and the avoidance of interference (Nation, 2000).

Learning from word cards is seen by some as an ineffective way of learning because they believe that words learned in isolation are not remembered, and such learning does not help with the use of the word. Research shows otherwise (Nation, 2001, pp. 296–303).

The strategy of using word parts has had a very long history. The pervasive influence of French, Latin, and Greek on English vocabulary has meant that there are many English words that consist of prefixes, stems, and suffixes that have clear connections to the meanings of the words. If a relatively small number of the most frequent and regular prefixes and suffixes are known, these can be used to help remember new words that contain them (see Bauer and Nation, 1993, for a graded list of prefixes and suffixes).

The strategy of using word parts requires the following kinds of awareness: (1) learners need to be able to recognize word parts in a word, (2) they need to be able to attach a relevant meaning to the most useful of those parts, and (3) they need to be able to see how the meanings of the parts relate to the meaning of the whole word. A more general goal of lexical awareness may also be the awareness that words have a history, that is, an etymology. Surprisingly, learners' dictionaries do not point out this interesting and helpful information. Knowing that *arrange* and *rank* have the same stem is not only interesting but also

helps the learning of *rank* by relating it to the known word *arrange*, which has a related meaning.

The fourth strategy, dictionary use, not only provides a way of accessing the meanings of words but also supports the other three major strategies. The strategy of dictionary use has the goal of making dictionaries a means of learning. This involves finding what is common in the various senses listed for a word, looking at words with the same stem that are listed near the target word, and looking at the examples of use in the dictionary to see what patterns the word fits into. Using a dictionary in this way involves awareness of what is involved in knowing a word (Nation, 2001, p. 27). This includes knowing the spoken and written forms of the word and whether it contains word parts. It includes knowing the meaning of the word and its range of senses. It also includes knowing the various associations the word has. It includes knowing how the word is used and its common collocates, and finally the various constraints on the use of the word such as whether it is formal or colloquial, a rare word, a word used only with children, a swear word, a word used mainly in the USA, and so on.

Awareness and control of the strategies for vocabulary learning need to be accompanied by an awareness of what vocabulary to learn. Unfortunately, as Moir has shown (Moir and Nation, 2002), awareness of what vocabulary to learn and how to learn it is not often translated into practice. Moir conducted in-depth interviews with ten students in a pre-university English proficiency program. All the students were working hard on improving their English and saw the relevance of the course to their immediate goal of studying in an English-speaking university. However, of the ten students, only one had truly taken responsibility for his own learning. This learner had well-thought out approaches for deciding what words to learn:

“Mostly I just choose the words that I already know but I have to improve them or make them clear to me. Or I choose the one that are difficult to me—about how to use them in different situations.”

“I learn words from talking to people, from TV and from radio. If that word is interesting I write on a small book. I always have a pen and notebook. Later I can put them in this list (vocabulary notebook).”

He also had well-thought out procedures for making sure that words were learned:

“I try to speak to the native person as much as I can every day. I talk to them and try to use new vocabulary . . . if I use in different situations I can remember that word. I just talk every day. Sometimes even I talk to myself.”

The other learners were much more dependent on teacher behavior for their learning. They noted words that appeared on the blackboard as a source of learning rather than considering what vocabulary would be useful for their own needs. They studied vocabulary for the weekly test but did not revise it afterward to make sure that it stayed in their memory. Although they were aware of a range of vocabulary learning strategies like using word cards, the keyword technique, and dictionary use, they did not incorporate them into their own learning.

### MAJOR CONTRIBUTIONS

Lexical awareness can help learners realize what is involved in vocabulary learning and affect their attitudes to learning, and can provide a means for improving skill in learning.

#### *Lexical Awareness and Attitudes to Vocabulary Learning*

Positive attitudes to vocabulary learning can be developed by giving learners some initial very successful experiences in vocabulary learning and by helping them become aware of a clear way forward in their vocabulary learning. A very effective way of providing successful experience is to get learners to do a small amount of deliberate vocabulary learning from word cards and to keep a record of their progress in learning, including how many words they learned by just making the cards with the foreign language word on one side and the first language translation on the other, how many they learned after the first run through the cards, and so on. Older learners especially are typically amazed by the number of words that they can learn in this way in a very short time. Successful experiences like this and reflection on and discussion of such experiences can lead to a positive view of vocabulary learning. Reviews of research on such learning (Nation, 2001, pp. 296–316) show the effectiveness of the use of word cards and other forms of deliberate learning. Similar experiences could involve the use of graded readers at the right vocabulary level for the learners, and listening to stories from graded readers well below the learners' level. There is virtually no research on the effects of such awareness raising on attitudes to vocabulary learning.

Gaining a basic awareness of the high-frequency/low-frequency words distinction can help learners see that there are manageable short-term goals for vocabulary learning. These make the task of vocabulary learning seem more achievable. An effective way to do this is to get learners to use vocabulary analysis programs like RANGE, FREQUENCY, WordSmith Tools, and MonoPro to turn texts into frequency lists. These frequency lists show (1) that a relatively small number of words can account for a very large proportion of the running

words in the text, and (2) that high frequency words give a much greater return for learning than low-frequency words. This is usually a surprising revelation to most learners. If this text analysis is accompanied by an understanding of the word frequency markings in learners' dictionaries like the *Longman Dictionary of Contemporary English* and the *COBUILD English for Advanced Learners Dictionary*, then learners can see that there is a reasonably straightforward way to proceed with learning the vocabulary of English.

A third way of helping learners become aware of the likelihood of success in learning another language is to help them see that parts of that language are already known to them or have a low learning burden because of parallels with their first language. For example, Daulton's (2002) research on Japanese and English shows that about half of the most frequent 3,000 word families of English are represented in some form or other as loan words in Japanese, for example *raitō* for *light*, *anaunsa* for *announcer*, and *terō* for *terrorism*. Showing these connections between the first language and the language to be learned can help learners realize that the task of vocabulary learning may not be as overwhelming as they thought.

### *Lexical Awareness and Skill in Vocabulary Learning*

A lot of vocabulary learning can be done through the deliberate application of strategies and the conscious application of principles of learning. Lexical awareness can also help learners in deciding what vocabulary to learn and in reflecting on their learning to monitor its effectiveness. Boers (2000a, b) presents experimental evidence that drawing deliberate attention to the metaphors that native speakers use can help reading comprehension and retention of metaphoric expressions. These included expressions relating to sailing and gardening as metaphors in economics—*keep on course*, *the firm is in the doldrums again*, *rock the boat*; *flourishing companies*, *rooting out fraud*. The source of such a focus goes back to Lakoff and Johnson's (1980) text *Metaphors We Live By*. Boers (2000b) sees the goals of raising metaphor awareness as (i) recognition of metaphor as a common ingredient of everyday language, (ii) recognition of metaphoric themes behind many figurative expressions, (iii) recognition of the nonarbitrary nature of many figurative expressions, (iv) recognition of possible cross-cultural differences in metaphoric themes, (v) recognition of cross-linguistic variety in figurative expressions.

He suggests that a good start to such awareness raising is reflection on the first language, and proposes an activity that gets the learners to define the difference between love and friendship using their first language. This inevitably involves the use of metaphor which is then discussed. From here it is an easy step to look at metaphor in the

second language. Raising awareness of metaphor should draw attention to metaphoric themes such as up is good, down is bad, as well as showing the mnemonic value of such analysis for learning individual items.

There have been several major studies of learners' awareness of vocabulary strategies and their application of these strategies (Gu and Johnson, 1996; Lawson and Hogben, 1996; Schmitt, 1997). These strategies cover a variety of aspects of vocabulary learning (choosing what to focus on, finding information, and establishing knowledge). The research shows that learners are able to describe their strategies and make strategic decisions on their use. There may be a gap between awareness of strategies and using strategies effectively, but there is evidence that links various kinds of strategy use to proficiency development.

#### WORK IN PROGRESS

Perhaps the mainstream of lexical awareness research and theory lies in ways of developing learners' interest in looking at language analytically. This can involve giving deliberate attention to the patterns and systems that can be seen in the relationships between words belonging to the same lexical set. This leads naturally to examining the relationships between words from different languages. The most researched areas are family relationships and colors, because it is in these areas that different languages can have obviously different classification systems. In the Thai language, for example, family relationships follow a very different system from that of English. English has distinctions based on gender and descent—grandmother, grandfather, mother, father, uncle, aunt, brother, sister, son, daughter, niece, nephew, cousin. Thai however makes distinctions based on relative age and gender which are not made in English. For example, your mother's sister who is older than your mother has a different form of address from your mother's sister who is younger than your mother. Similarly, your brother who is older than you is referred to in different way from your brother who is younger than you.

Byram (1997) argues for a closer connection between cultural awareness and vocabulary learning (see also Fenner, *Cultural Awareness in the Foreign Language Classroom*, Volume 6). Adopting a moderate version of the relativist hypothesis (Whorf, 1956) that each language expresses a different view of the world, Byram suggests that learning new vocabulary in new areas of cultural and linguistic experience is a very important part of developing cultural awareness, and can be approached in several ways. One way is to look at the meaning of a word in the dictionary and then contrast it with the related word in another language. For younger learners a way of making this contrast

is to list the associates of a word and compare them with lists made by native speakers of other languages for the roughly equivalent word. Another way, which Byram calls the ethnographic method, is for learners to interview native speakers about particular words and support this with observations of the use of culturally important words. A third possibility is to use literary texts as sources for examples. The availability of a very large number of literary texts for computer-based searching at the Project Gutenberg Web site (<http://promo.net/pg/>) makes this a very feasible option. The most noticeable culturally important words are likely to be those which refer to emotions, family relationships, and food. Looking, for example, at the meanings of words like *clean*, *naughty*, *shy*, *homesick*, *family* in the first language and in the second language can be very revealing of cultural values and can provide a truly educational dimension to language learning. However, the culturally important differences are likely to be even more widely spread. Williams (1983) provides fascinating descriptions of how English words like *career*, *city*, *democracy*, *romantic*, *sex*, and *work* have changed their meanings through time. These historical comparisons are likely to be a rich source for cross-cultural comparison.

Making learners aware of these differences between languages has the educational benefits of seeing that there is more than one way of viewing the world, and that words are labels that can shape the way we view things. One way of doing this is to start with understanding the constituents of meaning of first or second language words. This is recommended by several writers about second language learning (Channell, 1981; Julian, 2000), usually in the form of semantic feature analysis. Rudzka, Channell, Putseys, and Ostyn (1981) produced sets of activities for second language learners looking at the distinctions between members of a lexical set like *glimmer*, *twinkle*, *sparkle*, *flash*, *shine* in terms of their meaning constituents. Such activities are useful if learners are already familiar to some degree with most of the words in a set, but there is the danger of interference between previously unknown synonyms of widely differing frequency levels (Nation, 2000). This interference could result in confusion rather than clarity and may have more negative than positive effects on learning.

#### PROBLEMS AND DIFFICULTIES

An area of importance in lexical awareness is that of collocation, the company words keep. This area of research still struggles with poorly defined categories. There are some relationships between meaning distinctions and collocations—I may have a sparkling personality, but not a flashing one. Looking at collocation introduces learners to the ideas that in language production we often operate with units larger than

words, and that words that seem to be similar in meaning can behave in quite different ways. An effective way of introducing learners to these ideas is to get them using concordancing programs like MonoPro, or WordSmith Tools on texts or corpora along with the sorting function (Cobb, 1997; Thurstun and Candlin, 1998). Concordances are also useful ways of looking at the grammatical patterns of words and becoming aware of principles that can be used to describe the kinds of patterns words take. Zipf (1949) pointed out the relationship between the length of a word and its frequency, with short words generally occurring more frequently than long words. This same rule applies to the grammatical patterns that a word occurs in with simple patterns usually being much more frequent than more complex, longer patterns. Looking at concordances of words can make learners aware that some words or some uses of words follow fairly set patterns. Stubbs (1995), for example, points out that *provide* typically goes with words like *care, food, help, money* and the accompanying adjectives are usually positive. This fits with Sinclair's (1987) observation that some uses of words follow the open-choice principle where a wide range of choices are possible. *I like . . .* for example can take a range of patterns and a range of words. Other uses follow the idiom principle where the choice of one word limits what can go with it. Work in this area will be enhanced when there are clear and robust definitions of the various types of collocations, and when these definitions are more widely accepted and carefully applied.

We have already looked at giving attention to parts as a strategy for improving vocabulary learning. A deliberate focus on the etymology of words can encourage an enduring interest in vocabulary and language and help learners see how languages are interrelated and see the causes of these interrelationships. An awareness of how languages are influenced by other languages is a useful first step to the important idea that languages are in a continual process of change. A major obstacle to the use of etymology for second language learners is the failure of learners' dictionaries to provide etymological information. There are signs that this may be changing.

The growth of sociolinguistic research and gender studies has provided a wealth of information on constraints on lexical use. A small part of the lexicon is strongly marked for use within limited areas. Some words are marked geographically. *Faucet, wrench, cookie* are largely used by speakers of English from North America. Others like *hikoi* (march), *batch* (holiday cottage), and *pakeha* (white New Zealander) are largely limited to speakers of New Zealand English. The increasing availability of electronic corpora and tools for searching the World Wide Web have made lexicographical research into the unique features of regional vocabularies much more feasible. There are numerous other

constraints on vocabulary use. These include words that are used only with children (*moo-cow, doggie, poo-poo*), words that are old-fashioned, and words that are very infrequent. Developing an awareness of these constraints on use helps learners see language as a social phenomenon where the use of words involves more than what they refer to. At present this work is hindered by the availability of megacorpora like the British National Corpus, although work is progressing on a similarly sized American corpus.

### FUTURE DIRECTIONS

There still remains a lot of work to be done on the role of lexical awareness in developing sensitivity to language use. Vocabulary can convey messages beyond the referential meaning of words. An important example of this is what Corson (1997) has called “the Lexical Bar.” Corson argues that the Graeco–Latin vocabulary of English acts as a barrier or bar to educational success. To be able to cope well in academic study through the medium of English, learners need to cross this barrier and become comfortable and fluent in both receptive and productive use of the prestigious Graeco–Latin vocabulary of English. Use of this vocabulary indicates that a user has become a member of the academic community.

Critical language awareness differs from language awareness in that “critical language study . . . highlights how language conventions and language practices are invested with power relations and ideological processes which people are often unaware of” (Fairclough, 1992, p. 7; see also Janks and Locke, *Discourse Awareness in Education: A Critical Perspective*, Volume 6). Vocabulary of course plays a major role in this. In this respect, the ideas behind critical language awareness are related to the ideas of Whorf mentioned earlier—“language use has effects upon society as well as being shaped by it” (Fairclough, 1992, p. 8). Critical lexical awareness involves the study of metaphor, euphemism, formality, and “appropriate language”, to see the ideology hidden behind such lexical features.

An interest in lexical awareness is very much in line with recent research in second language acquisition, which sees giving deliberate attention to language as an important component of a well-balanced learning program. So far, this attention has been largely directed toward improving the learning of language features. A wider focus covering the areas described in this chapter would be the next useful step.

MORPHOLOGICAL AND SYNTACTIC AWARENESS  
IN FOREIGN/SECOND LANGUAGE LEARNING

INTRODUCTION

We often use language with minimal or no awareness of the structural patterns we are employing: our minds are focussed on the meaning of the message we are trying to convey or understand. Becoming aware of linguistic patterns, i.e., being ‘metalinguistically’ aware is nevertheless something that happens to us very early on when, as children, we play games with words. It is an awareness that, at the time, is not informed by much, if any technical appreciation of language structure, and it appears to be enhanced amongst bilingual or multilingual children who have everyday involvement with different language systems (Bialystok, 2001; see also Baker, *Knowledge about Bilingualism and Multilingualism*, Volume 6). As older children become literate, formal schooling provides some of that technical knowledge, that is to say, from the time we learn to count syllables and, for example, identify nouns and verbs. This experience is often capitalised on later, in the foreign language classroom. Talented individuals go on to become writers and public speakers. It is not only for the sake of our general education that, apart from enlarging and refining our stock of words and expressions, we are also made aware of grammar: it is a necessary step, many people believe, toward fully mastering any language. The discussion that follows will focus on metalinguistic awareness in this context, especially with regard to acquiring a second or other language.

Simply being immersed in language is clearly not enough for development to take place. Common sense would prompt the question: without being aware of what has to be learned, how can one possibly learn it? Establishing exactly what language learners actually notice when listening or reading a language, for whatever reason, and whether or not they are really aware of what they notice is fraught with tricky theoretical questions. It is important to appreciate this fact because common sense answers do not necessarily get us very far when we try and assess the value of directing learners’ attention to some aspect of the second language (L2) system. One issue concerns the very nature of ‘noticing’ and ‘attention’. The second, obviously related issue is that

of awareness itself: for instance, how aware are we, in a given situation, of what we notice? Are there indeed degrees of awareness and what has most impact on what we remember later? These are topics, which constitute an enormous challenge for researchers in cognitive science. Everything said about morphological and syntactic awareness in the ensuing discussion should be considered with this in mind.

It is not necessary to spend much time on the theoretical status of morphology and syntax. It will be assumed here that morphology has mostly to do with inflectional and derivational parts of words and with what are commonly known as functional (or 'grammatical') words, like auxiliaries, article, prepositions and the like. Syntax is about how words may occur and combine in phrases, clauses and sentences. How to form the plural of German *Kind* or English *child* is a morphological issue. What orders are possible when combining the words *children*, *were*, *there* and *the* in English is a syntactic issue, and making the plural morphology of *child* agree with the plural form of *be*, as in *the children were there*, is a morphosyntactic issue, since it appeals to both morphological facts (the shape of individual words *children* and *were*) and the way words behave together in a sentence (subjects agreeing with verbs). In a similar fashion, phonological facts can be combined with morphological facts as, for example, when the plural morpheme in, respectively, *cat* + <Plural> and *dog* + <Plural> receives a particular phonological shape according to whether the preceding stop consonant is voiced or voiceless: the preceding context determines whether <Plural> is realised as /s/ or /z/. In the ensuing discussion, morphology and syntax will also be referred to together as 'grammar'.

Let us now focus on the grammatical features of a second (or other) language or 'L2'. The learner, to reproduce the correct L2 patterns, must logically first notice them. This means that noticing, in some sense of noticing, is certainly a necessary condition albeit not a sufficient condition for the patterns to appear later in the learner's own linguistic performance. Without noticing these language forms, it is logically impossible to make them part of the developing grammar of the L2. For example, you really do need to notice definite articles in the L2, if the L2 *has* definite articles, that is, notice their shape (sound and orthography) and where and when they occur before you can hope to involve them in the way in which you, the learner, interpret L2 utterances and ultimately produce them yourself. This is true whether or not your performance is native-like. A learner with an L1 (native language) like Polish, for example, one that simply does not have articles, may use the wrong English article in the wrong context; we can nevertheless be sure at least that the unfamiliar forms, i.e., articles of various types, which appear in the speech and writing of native speakers of the L2 (target language) have really been noticed by that Polish learner.

Somehow the learner's mind has, at some point and probably on a number of occasions thereafter, become oriented toward some aspect of the L2 grammar with the result that that it has been registered and retained and has subsequently brought about changes in that learner's performance (see Tomlin and Villa's analysis of the notion of attention: Tomlin and Villa, 1994). Thus, we can all agree that noticing is a logical necessity for any learning to take place and that, in particular, the existence of some novel, unfamiliar form or construction in the learners' L2, like the English definite article for the Polish learner, will be convincing evidence of this because it cannot have been copied over from the L1.

The extent to which noticing implicates some degree of awareness is a crucial part of this discussion. Schmidt's noticing hypothesis, for example, presents the act of noticing as noticing surface elements, but without any degree of analysis or understanding, and in his terms as something separate from metalinguistic awareness (Schmidt, 2001, see also Robinson, *Attention and Awareness*, Volume 6). It is generally accepted, that we or rather our minds can notice objects and events without our necessarily being very aware of them. Indeed, most people would accept that awareness is a relative concept ranging from either no awareness at all, or very transitory awareness, to a heightened, intense awareness, the latter state being associated with introspection, a 'conscious' mental activity that is characterised as 'metalinguistic' and which requires a heightened and sustained degree of awareness to allow the learner to reflect on the patterns they have noticed. In other words, the act of noticing a linguistic form or pattern may be associated with more or less awareness. This in turn prompts the question as to which, 'more' or 'less', is particularly conducive to boosting the learner's grammatical development. It also helps to see that awareness is distinct from knowledge. The ability to reflect in an analytic fashion on what we are aware of requires a structured understanding of grammatical patterns, something we can call metalinguistic knowledge (Sharwood Smith, 1994, p. 11). Note also, in passing, that both noticing and becoming aware should also involve registering elements that are not on the surface, that are actually absent, a very simple example being an English learner of Polish faced with the complete absence of definite and indefinite articles.

Traditional, formal language teaching and the more or less diluted forms in which it is still available today is known for its metalinguistic bias: learners are required to actively reflect on the formal properties of the language with a view to memorising grammatical patterns, rules and exceptions. Teaching therefore involves make learners aware of grammatical properties and explaining rules. Armed with the accumulated knowledge acquired as a result of such teaching, the learner is then able to notice and analyse examples of rules and violations of rules

in their own or other people's utterances. In principle, they should then be able to correct any errors. By way of contrast, we might be faced with learners who are able to 'feel' that a given utterance was ungrammatical without being able to analyse or explain why this should be so. They would have a minimal amount of metalinguistic awareness but without any metalinguistic knowledge: error correction by such learners is also possible but without any understanding of the nature of their errors. A third possibility suggests itself here, namely that these learners once quite consciously grasped the nature of the formal grammatical principle or rule involved, but are now no longer in possession of that analytic understanding. This prompts various questions such as whether forgetting, that is, the loss of their original state of conscious, analytic understanding was simply due to the fact that it was no longer needed or whether it was discarded because it would actually get in the way of smooth fluent language use. Can we conclude from error-free performance that learners must at some time or other have been consciously aware of the grammatical rules and principles that underlie their performance? In addition, was the original state of understanding a prerequisite for their current ability to detect errors and produce error-free utterances or was it just a luxury extra?

What practical conclusions can we draw from the association of various forms of noticing and the process of acquiring a language? It might seem obvious to some that learners and teachers should simply make ceaseless attempts to focus on anything that is judged to be missing or incorrect in learner performance so that whatever has been regularly drawn to the learners' attention will eventually by dint of practice become part of that learner's regular L2 repertoire. For people who readily accept this conclusion as self-evident, it may come as a shock that, already at the close of the 1960s, some researchers began to be convinced that nothing can be further from the truth. Forms that seemed to stare a learner in the face by virtue of their frequency and simplicity or because a teacher or textbook had deliberately tried to make them especially noticeable would mysteriously refuse to appear in the learner's own spontaneous performance: the early appearance of other native-like L2 forms not so frequent or not so salient in other respects was by the same token also a mystery.

#### EARLY DEVELOPMENTS

In the early days, that is to say in the 1950s and 1960s, for those in North America and elsewhere who wished to put the study of second language acquisition on a rigorously scientific footing, there was no need to talk about awareness and noticing because of the currently dominant approach to the psychology of learning. Adopting a behaviourist view

meant excluding such 'private' mental activities from the realm of science and leaving all speculation about abstractions that were not directly observable and measurable to the realm of metaphysics. Once behaviourism was discredited in linguistic circles, it became permissible, in a scientific context, to talk once more about mental events and mental capacities such as noticing and awareness, phenomena that were at least indirectly observable and indirectly measurable.

When Selinker first outlined his interlanguage theory in the early 1970s (Selinker, 1972), he made only sporadic and indirect references to awareness since interlanguage was the non-native system that was seen to underlie performance in communicative contexts where presumably the focus was on getting a message across. He therefore discounted patterns emerging in formal classroom activities, which were simply mimicking the teacher or the textbook. There is not much discussion of this, but if a teacher asks you to do an exercise which then results in your producing a grammatical pattern in response to instructions, your performance would not necessarily be a good candidate for showing what was driving your current learner system: you might be, for example repeating patterns parrot-fashion or performing artificial manipulations such as deliberately switching the subject and verb around simply following the teachers' model. Some of Selinker's discussion of learner strategies does imply a role for conscious awareness: learning strategies are or may be deliberate, for example, rote memorisation of words and phrases. You may also choose to take short cuts for the sake of quick and easy communication (backsliding to an early stage of your development when you produced no article in front of English nouns), but the general topic of noticing and awareness is not elaborated.

It is not clear, then, to what extent grammatical awareness plays a serious role in Selinker's interlanguage framework and it was not until Tarone formulated her own version of interlanguage theory that noticing and awareness started to play a more salient part in theoretical discussions about the nature of grammatical patterns in learner performance (Tarone, 1979). Tarone, in fact, gave attention to form a pivotal role in her account of interlanguage variation. Her investigations convinced her that L2 speakers or rather interlanguage speakers, rather than speak a single monolithic interlanguage, typically gave evidence of systematic variation according to context as would be expected of speakers of mature, 'native' languages. This variation, in her scheme, ranged from a spontaneous interlanguage 'vernacular' to very careful performance which, perhaps surprisingly, since learners would be attempting consciously to speak 'correctly, showed more signs of L1 influence and less overall consistency than in the informal variety. In attempting to push their performance as far as they can, learners, in

careful mode, may resort to various strategies, which could include borrowing from their L1. This would not happen when they were communicating in a relaxed, informal style and, by implication, were not particularly aware of the morphological and syntactic patterns they were using (Tarone, 1979).

In Tarone's approach, then, learners could not only pay more attention to their own L2 performance: when they did, it altered it in systematic ways such that one could talk of a consistent 'variety' of IL. She confines herself to the effects of increased attention to speech and writing in interlanguage variation. She does not focus on the role of awareness in acquisition, that is, helping to move the learner on to a new stage in their interlanguage development. It was the proponent of a rival position that for a time at least pushed the effect of heightened awareness of the formal properties of the L2, into the spotlight in theorising about language development. Although Stephen Krashen's main contribution in this area could be described as part of the early history of the subject, the impact of his controversial ideas are still tangible in modern theorising about SLA.

#### MAJOR CONTRIBUTIONS

Following on from Burt and Dulay's pioneering work on L2 developmental sequences, Krashen was interested in comparing immigrants who were only picking up English in the street and those who were also undergoing formal instruction as well. Were the natural sequences in the acquisition of various morphemes as had been evidenced in L1 acquirers, also in evidence with L2 acquirers but only with those who were acquiring their L2 in natural, i.e. untutored learning environment? Did formal instruction bring any advantage? He found that on spontaneous tasks like picture description, learners from both groups produced the same kind of results already seen in the Burt and Dulay studies (see Dulay, Burt and Krashen, 1982 for a general account of this research). L1 influence did not seem to affect the difficulty orders in the data. Learners who were operating in spontaneous mode, with minimal awareness of the structural options they were employing, and focussing on conveying and understanding messages, appeared to be relying on intuitively acquired knowledge and not on what (a) their particular experience of formal instruction had been or (b) their particular mother tongue might prompt them to do. The formally instructed learners only produced different and better results on the tasks that gave them time to reflect and self-correct and, it was claimed, showed the influence of their formally gained grammatical knowledge. This finding laid the basis for Krashen's now famous distinction between the process he called acquisition (subconscious learning) and the process he called (conscious)

'learning' (Krashen, 1976, 1985). In Krashen's view, each process produced an entirely different kind of product, i.e. a different kind of grammatical knowledge. Krashen's 'acquisition' was a natural process that caused grammars to grow beneath the level of conscious awareness in the same way as they were supposed to grow in the minds of children acquiring their mother tongue. Krashen's 'learning' resulted in a more artificial, technical kind of learning (here called metalinguistic knowledge), which could only be used in limited ways and which had absolutely no effect on the natural course of development. Subject P, for example, was consistently able to correct her own errors when confronted with them, produced virtually no errors in writing but consistently made errors in her spontaneous speech thus demonstrating, in Krashen's view, the ineffectiveness of learned knowledge to transform itself into acquired knowledge (Krashen and Pon, 1977).

#### PROBLEMS AND DIFFICULTIES

Criticism of Krashen's ideas was not long in coming: one oft repeated charge was that the main concepts were too vague to be operationalised. McLaughlin also voiced the standard view in cognitive psychology that learning with awareness came first and that the resulting explicit knowledge gained about a given aspect of grammar (his example was learning final verb position in German subordinate clauses) could become implicit later via a process of automatisisation. Translated into Krashen's terms, 'learning' directly influenced 'acquisition', a position to which Krashen himself was strenuously opposed (McLaughlin, 1978). Sharwood Smith also put forward a number of objections, which Krashen later addressed in his book on the 'input hypothesis' (Krashen, 1985, Sharwood Smith, 1981). One was that, rather than use the rigid conscious-versus-subconscious dichotomy for further research, it would be better to adopt a more fine-grained model of what he then termed grammatical 'consciousness-raising'. The overtly metalinguistic approach adopted by traditionalists would be only one of many options. These options could be ranged along an axis of 'explicitness' and 'elaboration'. Hence, investigations could include sporadic and subtle ways of making the learner aware of a morphological or syntactic pattern as well as, say, brief but very explicit discussions about grammatical rules and exceptions, and anything between these two extremes. The treatment could also be more or less elaborated; in other words, it could range from the brief and sporadic to something that lasted a longer period of time. Learners could be exposed (without any prior explanation) to long texts that had tense markers in boldface or a speech where certain crucial words (verbs, say and time adverbs) were spoken more slowly and emphatically.

Alternatively, in a much more overt, explicit style, learners could be subjected to a lengthy explanation of tense usage accompanied by exercises. The point was that research should be based on a more differentiated view than permitted by the simple conscious/non-conscious dichotomy. Furthermore, Sharwood Smith suggested that even if one allowed for no direct 'interface' between learned and acquired knowledge, learners, in trying to use their L2, might even be able to use their 'learned' knowledge to create their own utterances and, by using them, create their own self-generated input that would feed back into their acquisition mechanisms. Krashen did not dismiss this 'backdoor' possibility completely but regarded it as just speculative. However, he did use the idea of an interface to characterise the debate as to whether or not learning with heightened awareness of grammatical structure could seep through and be converted into intuitive knowledge and this was later adopted in numerous discussions on the subject in the literature. Krashen's original two-way opposition became a three-way one; Ellis (see Ellis, *Explicit Knowledge and Second Language Learning and Pedagogy*, Volume 6), in particular, defined the options as follows:

1. The no-interface position: learned knowledge can never affect the development of intuitively acquired grammar (Krashen's own position).
2. The strong interface position: learning becomes acquisition, explicitly learned grammar can be converted into intuitive knowledge. (Bialystok, 1978; DeKeyser, 1990; McLaughlin, 1978).
3. The weak interface position: there is no direct effect of learning and acquisition, but formal instruction can indirectly affect development (Ellis, 1991, 1993; Sharwood Smith, 1981).

The debate continued in a rather attenuated fashion until people began to take seriously the idea of investigating different ways of manipulating the linguistic input to the learner. Researchers looking at the questions of L2 learners' access to the constraints of universal grammar by implication seemed neither to totally endorse Krashen's view of conscious learning nor indeed to deny it (but see Gregg for a robust rejection of Krashen's model: Gregg, 1984). Sharwood Smith replaced his term 'consciousness-raising' with 'input-enhancement to signal the need to focus first on what we know we can do (manipulate the exposure to L2) and not what actually happens in the learners' mind. He also suggested that research should look carefully at the possibility that certain areas of L2 may be characteristically immune or alternatively characteristically responsive to some form of input enhancement. In other words, success in one area should not be generalised to all areas without proper testing and vice-versa (Sharwood Smith, 1991, 1993, 1994, pp. 178 ff.).

Where there is opposition to the no-interface position, the role of grammatical awareness naturally goes hand in hand with discussions about how to exploit it. Taking the view that noticing with awareness was a necessary prerequisite to learning, VanPatten places the emphasis in instruction less on getting learners to produce and much more on getting them to process the L2 input more effectively, with awareness, than they would otherwise do (see, e.g. VanPatten and Cadierno, 1993). For example, at a given stage, they may be exposed to native L2 utterances, but actually processing only the most meaningful items (lexical and some, but not all grammatical forms). It is only what learners actually notice that can have any impact on acquisition: hence, unnoticed items will fall by the wayside and only noticed items have a chance of affecting subsequent development. Although VanPatten advocates the use of explicit grammatical instruction, the crucial role goes not to getting the learners to actually produce utterances containing given target constructions but rather to process the input more efficiently during comprehension. A classic example of processing-based instruction, in his framework, would be the structuring of L2 input so as to make a given grammatical form absolutely necessary for the solving of a meaning-based task. English-speaking learners of Spanish at some stage will regularly misinterpret sentences like *A María la llama Juan* (Juan calls María) as *María calls Juan* assuming that *María*, the first mentioned noun, is the subject of the sentence in accordance with a processing principle that leads them to assume the first-named noun is the agent (VanPatten and Cadierno, 1993). This means that they have not made the necessary connection between the grammatical form *a* and the object status of *María*. Perhaps they have been vaguely and sporadically 'aware' of the presence or absence of the relevant morphological material (*a, la*), but obviously not to the extent that has allowed them to make connections between the grammatical forms and the subject/object status of noun phrases. Learners are presented with two pictures, one depicting María as the caller and the other depicting Juan as the caller and asked to match one of the two pictures with, say, *A María la llama Juan*. In this way, although the task is meaning-based: they will need to notice the relevant grammatical forms that have previously been ignored. Explicit instruction is also provided, before and after, to alert them to the nature of the task but the crucial part of the whole undertaking is not explanation but solving the problem. This shows that making learners aware of grammatical forms is best done, in VanPatten's view, using communicative activities although this is supported by consciousness-raising of the more explicit type to guide their noticing. Making people explicitly aware of a given grammatical phenomena in the L2 and then following this directly with production

practice will be much less effective (VanPatten and Oikkenon but see DeKeyser and Sokalski, 1996 for a dissenting view).

Despite Krashen's early insistence on the minor role played by explicit instruction in stimulating learning, it is, then, still being considered as a serious option by quite a few researchers, although not necessarily in the extreme form associated with traditional teaching. Focus on Form (FoF) and Focus on Forms (FoFs), a distinction proposed by Long (see, e.g. Long and Robinson, 1998) has become a common way of discussing the difference between two basic forms of explicit input enhancement. In 1998, a collection of studies came out which marks the first collective response in the research literature to the calls for a rigorous investigation of these issues (Doughty and Williams, 1998a; see also Ellis, *Implicit and Explicit Knowledge about Language*, Volume 6). FoF is a 'reactive' strategy, raising awareness of grammatical form when and if the need arises but in the context of otherwise meaning-focused classroom activities (Long, 1991, Doughty and Williams 1998b: 197ff). FoFs is the most explicit and elaborated end of the consciousness-raising spectrum whereby grammar is of necessity focussed on and practiced separately and is not embedded in communicative activities. VanPatten's use of explicit instruction before and/or after meaning-based tasks could be seen as a variant of FoF although it is not always reactive and in some cases takes on some of the characteristics of FoFs. Trying to trace the role that increased awareness of grammatical form plays in various types of instruction is extraordinarily difficult. In 2000, Norris and Ortega made a noteworthy attempt to analyse the results of a large number of studies bearing on this issue but their findings, though suggesting that L2 instruction making learners aware of grammatical form was beneficial, leave many questions unanswered (for a thorough and informative discussion of the problems involved see Doughty, 2003).

#### FUTURE DIRECTIONS

As it is clear from the preceding discussion, understanding the nature and implications of what we have called morphological and syntactic awareness is dependent upon advances in a number of related domains of inquiry. Within the area of second language research, there are signs that a stronger theoretical basis has become a priority if empirical investigations are to produce less ambiguous results than has hitherto been the case. Without a strong, coherent conceptual framework where 'awareness' can occupy an important place, even the most refined experimental techniques will be of no use. One current trend is built on the well-established view that language ability is just one aspect of general cognitive ability. This accords with the strong interface position

(see, e.g., DeKeyser, 2003; Hulstijn, 2002). Another trend is one which takes a domain-specific view of linguistic ability and which would seem to favour one or other of the other two interface positions (e.g., Carroll, 2001; Truscott and Sharwood Smith, 2004). In either case, a strong interdisciplinary bias is clearly the way forward whether the main practical interest is the facilitation of multilingual language development, in any age group, or refining the way we make young native speakers literate in their mother tongue. Experimental research needs to continue with more than just a general hypothesis, that is, with a more rigorously theoretical underpinning: this will allow very precise areas of the grammar to be investigated to confirm which, if any, is amenable to intervention by the teacher and which must necessarily rely on exposure alone.

As far as day-to-day teaching practice is concerned it seems important neither to completely write off all attempts to make learners notice some formal linguistic property nor to take the opposite approach and simply assume that making learners' aware of some form or some regularity is going to have a direct impact on their linguistic development. Rather, teachers should keep in mind the idea that a selective use of 'focus on form' or 'input enhancement' may well pay off, and this can include correction, and while research has not yet properly identified the principles for selection, there is certainly room for a little informal experimentation by the practitioner albeit without any firm guarantee of success. The teacher will also have to take into account the expectations of the learners themselves. If learners assume that correction and other forms of awareness-raising are vital for their progress, they may find that being deprived of all such techniques perverse, frustrating and demotivating. They may also remain unconvinced that research does not fully support their beliefs. In addition, older learners, especially, want to understand what it is they are learning and the resulting metalinguistic knowledge can be a comforting and sometimes useful substitute for any morphosyntactic deficiencies that persist in their spontaneous performance.

## PRAGMATIC AWARENESS IN SECOND LANGUAGE ACQUISITION

### INTRODUCTION

Pragmatic awareness is the conscious, reflective, explicit knowledge about pragmatics. It thus involves knowledge of those rules and conventions underlying appropriate language use in particular communicative situations and on the part of members of specific speech communities. Following an educational perspective, we deal with pragmatic awareness in relation to the construct of communicative competence, and we consider research on the role of awareness in pragmatic learning. First, pragmatic competence is introduced as part of the overall framework of communication. Second, we raise the need to focus on pragmatics including pragmlinguistic and sociopragmatic awareness. Third, a review on research dealing with learners' pragmatic awareness is provided. Finally, some future directions deriving from the previous subsections are briefly mentioned.

### EARLY DEVELOPMENTS

The notion of communicative competence originated from those criticisms raised by the Chomskyan notion of linguistic competence (1965). Scholars of different fields, namely those of linguistics, psychology, sociology and anthropology, argued against the absence of aspects related to language use in the concept of linguistic competence, as it merely accounted for an ideal grammatical knowledge shared by native speakers of a given language. Hymes (1972) first suggested the substitution of Chomsky's linguistic competence into a wider concept, that of communicative competence, which would also include social and referential aspects of the language. Nevertheless, the term communicative competence may involve much more than the mere extension of linguistic competence. According to Cenoz (1996), it also implies a qualitative change and a distinct approach to the study of language use, since communicative competence is a dynamic concept that depends on the interlocutors' negotiation of meaning.

The construct of communicative competence has been particularly influential in the field of language learning as it bears a direct relationship with the communicative approach to language teaching. For this

reason, different scholars in the field of applied linguistics have attempted to describe that construct by identifying various components that would constitute a whole model for the study of learners' communicative competence. One of the most representative and significant models that have arisen within the field of applied linguistics is that of Bachman (1990) as it was the first explicitly identified pragmatics as one of the two major components of communicative competence. Bachman (1990) distinguishes between organisational and pragmatic competence. On the one hand, organisational competence refers to those abilities taking part in the production and identification of grammatical and ungrammatical sentences, and also in understanding their meaning and in ordering them to form texts. These abilities are sub-divided into grammatical and textual competence. On the other hand, pragmatic competence is understood as dealing with the relationship between utterances and the acts performed through these utterances as well as with the features of the context that promote appropriate language use. The relationship between utterances and acts concerns the illocutionary force, whereas the context involves those sociolinguistic conventions taking part in using the language. The illocutionary competence is defined in terms of Searle's speech acts (1969) and Halliday's language functions (1973), since it involves the relationship between the utterances and speakers' intentions specified in them. In addition, the sociolinguistic competence refers to sensitivity to differences in variety, register and to the ability of interpreting cultural references.

Bachman's model (1990) points out the idea that communicative competence can not only be achieved by improving learners' grammatical knowledge, but it also concerns the development of other competencies such as the textual and pragmatic ones. From this point of view, pragmatics has become a common target in the language classroom, as illustrated by current proposals (Bardovi-Harlig and Mahan-Taylor, 2003). In those proposals, most suggestions and lessons for pragmatic instruction focus on routines as part of the pragmlinguistic component that constitutes pragmatic competence. Hence, we find lesson plans for teaching how to make requests (Mach and Ridder, 2003; Yuan, 2003), others dealing with refusals (Kondo, 2003), apologies (Bardovi-Harlig and Mahan-Taylor, 2003) or complaints (Reynolds, 2003). Yet few proposals consider a sociopragmatic perspective in foreign/second language teaching, thus presenting a partial view of the pragmatic component.

However, the literature on inter language pragmatics (ILP), by referring to pragmatic awareness as learners' conscious and explicit knowledge about pragmatics, has pointed out that both pragmlinguistic and sociopragmatic aspects should be included. For instance, Safont (2005) suggests that unless students are provided with socio-cultural and sociolinguistic information, their difficulty to understand

politeness issues affecting the use of the target language will increase. This has raised the need for focusing on pragmatic awareness and production in the language classroom. Pragmatic awareness might be achieved by fostering learners' connections between their previous pragmalinguistic knowledge (both in their L1 and the TL) and new pragmatic information they may be provided with. In addition, pragmatic production should focus on appropriateness, thus paying attention to both propositional content, on the one hand, and cultural effects on the other.

### MAJOR CONTRIBUTIONS

Analysing language use in context has provided language teachers and learners with a research-based understanding of the language forms and functions that are appropriate to the many contexts in which a language may be used. From this perspective, research in cross-cultural and ILP has provided information on the interactive norms in different languages and cultures. Cross-cultural studies with a focus on speakers' pragmatic performance aim to determine whether the same speech act can be found in different cultures, and if so, to what extent it is performed. Likewise, explanations that account for those differences are provided. Among them, pragmatic transfer at the level of formal, semantic and speakers' perception of contextual factors seems to explain some of the differences between L1 and L2 speakers' use of the language. In addition to transfer, learning effects, which may be of a formal or informal nature have been reported to cause a deviation from the target language norm. Examples of types of learning effects include overgeneralization, hypercorrection, or responses that do not reflect reality.

Research from an inter language perspective takes into account acquisitional rather than contrastive issues, as is the case of cross-cultural perspectives stated earlier. Barron's (2003) study follows this acquisitional perspective in inter language development. Barron's (2003, p. 10) definition of pragmatic competence states that it involves 'knowledge of the linguistic resources available in a given language for realising particular illocutions, knowledge of the sequential aspects of speech acts and knowledge of the appropriate contextual use of the particular languages linguistic resources'. In the same line, Bachman (1990) and Thomas (1983) account for the realisation of speech acts in which they distinguish between pragmalinguistic and socio-pragmatic components. Hence, while dealing with pragmatics they suggest that not only routines and forms specific to particular pragmatic realisations should be considered, but also the context of use.

Most studies to date (see contributions to Rose and Kasper's volume, 2001 and Kasper and Rose, 1999) have focussed on the former

component, that is, routines and pragmalinguistic realisations. A wide amount of studies now exist with a focus on request realisations (Hassall, 1997; Li, 2000; Rose, 2000, among many others). Other speech acts that have received some attention on the part of scholars may be refusals (Félix-Brasdefer, 2004), compliments (Rose and Ng, 2001) and apologies (Trosborg, 1995). We may also find exceptional studies in which sociopragmatic factors have been dealt with, but they usually refer to descriptions of situations presented to learners so that they acknowledge the most appropriate routine (Lorenzo-Dus, 2001). However, it seems as argued by Kasper (2000), that the sociopragmatic component has received less attention in ILP.

The relevance of the sociopragmatic view in L2 pragmatic development is also put forward by Jung (2002). The author states that L2 pragmatic acquisition should be studied from both the psycholinguistic perspective of the learner that has traditionally paid attention to variables such as proficiency level, or the type of task (among others), and the socio cultural perspective, which emphasises the need to analyse sociopragmatic development just as pragmalinguistic development has been investigated (Barron, 2003; Kasper and Rose, 2002). Bou-Franch and Garcés-Conejos (2003) acknowledge such need in their proposal for teaching linguistic politeness. The authors particularly focus on avoiding sociopragmatic failure in the language classroom. Sociopragmatics is here understood as related to 'our knowledge, beliefs and perceptions of socially adequate linguistic behaviour' (see Bou-Franch and Garcés-Conejos, 2003, p. 2). On that account, these authors' proposal is based on Brown and Levinson's (1987) politeness variables—namely those of power, distance and ranking of imposition—and Scollon and Scollon's (1995) suggested politeness systems. Scollon and Scollon (1995) identify three main politeness frameworks on the basis of face relationships. The former one, also named deference politeness system, relates to those relations where there are no power differences, but there is social distance (e.g. colleagues at work). The second system refers to solidarity politeness, where there are no power differences or social distance (e.g. family members). Finally, the third system relates to hierarchical politeness, where there are power differences and social distance (e.g. boss and employee). Although Scollon and Scollon's (1995) proposed politeness systems have been criticised for including a simplistic view of human communication (see Bou-Franch and Garcés-Conejos, 2003), it may serve as a point of departure for research in sociopragmatic development. In fact, these politeness systems may be employed to test the effect of instruction in sociopragmatic development, just as speech act routines and linguistic realisations have been used in testing the acquisition of pragmalinguistic aspects.

Second language pragmatics learning is also L2 culture learning (see also Fenner, *Cultural Awareness in the Foreign Language Classroom*, Volume 6). This may imply learners' modification of their own world view, thus including attitudes and ethnolinguistic variation while acquiring foreign/second language pragmatics. In fact, as suggested by Thomas (1995) and Jung (2002), one's own linguistic and cultural identity is usually best acknowledged when being confronted with a different reality. From this perspective, awareness is probably the first step to the earlier quoted shift as it would involve knowledge of these politeness systems. Research on learners' pragmatic awareness may in turn provide us with suitable information on those needs and difficulties, which also relate to their language learning process.

As stated by various scholars, learners' pragmatic awareness manifested in their ability to recognise and identify speech act types is limited. For instance, Kasper's (1984) investigation of the pragmatic comprehension of German-speaking English learners, suggested that failure to comprehend the illocutionary force of speech acts could be explained by learners' inability to produce those illocutionary devices in non-conventional indirect speech acts. In addition, the effect of proficiency on language learners' pragmatic awareness has been examined by Koike (1996), Cook and Liddicoat (2002) and García (2004). Koike (1996) found that the more proficient participant could recognise speech act type and understand the illocutionary force of the utterance better than less proficient participants. Similarly, Cook and Liddicoat's (2002) study reveals that there is a proficiency effect for interpreting request speech acts at different levels of directness. In the same line, García (2004) shows that there are proficiency-related differences in the identification of speech acts. However, the author suggests that contextual knowledge and linguistic ability should be viewed as complementing variables that interact with each other in the comprehension of indirect speech acts. In addition, it is suggested that by examining L2 learners' pragmatic awareness we can infer learners' pragmatic comprehension, and we might also discover linguistic factors that contribute to comprehension as well as to enhance the provision of those conditions for understanding pragmatic meanings. This is particularly relevant in second language learning, since in contrast to native speakers, who may not need to recognise speech act type consciously, second language learners' attention to pragmatic issues seems to play a role in developing pragmatic competence. The fact that second language learners need to recognise speech act conventions in a conscious way may determine the importance of pragmatic comprehension in the language classroom. Yet, awareness understood as conscious pragmatic knowledge would not only refer to comprehension but also to production as long as both involve some degree of consciousness.

## WORK IN PROGRESS

Current research has been motivated by an attempt to establish a more direct link between the fields of ILP research and SLA studies, which address learners' development of pragmatics (Kasper and Rose, 2002). From this perspective, studies have been conducted to address whether the instructional contexts provides opportunities for pragmatic learning. Furthermore, the teachability hypothesis in the pragmatic realm has been tested in several studies. In relation to the conditions offered in second and foreign language learning contexts to develop pragmatic competence, Bardovi-Harlig and Hartford (1996) illustrate how the input offered to learners in academic contexts may not result in pragmatic learning. The authors point out that in an ESL context the suggestions made were status-bound, and as a consequence they could not serve as direct models for the learner. In this line, Nikula's (2002) study also focuses on how pragmatic awareness is reflected in the use of modifying elements of talk by two non-native speakers (NNSs) in EFL and content-based classrooms. Findings of this study reveal a tendency towards directness in teachers' performance, which is explained in terms of the constraints of the classroom and the teacher's status compared to that of students. In addition, Rose (1999) claims that large classes, limited contact hours and little opportunity for intercultural communication are some of the features of the EFL context that hinder pragmatic learning. Apart from the analysis of the input, other studies have examined if textbooks present pragmatically accurate models for learners (Bardovi-Harlig, 1996; Crandall and Basturkmen, 2004; Vellenga, 2004). Results of these studies have showed that the way speech acts or conversational functions are considered in textbooks is not adequate. Bardovi-Harlig (1996) showed that textbooks do not often present a particular speech act or language function at all, and very often when they do, it may not reflect authentic language use. Finally, according to Vellenga (2004), textbooks do not include sufficient metapragmatic explanations to facilitate learners' awareness of pragmatic issues.

As a consequence of the difficulties mentioned earlier to develop pragmatic competence in language learning contexts, several investigations draw on Schmidt's (1993, 2001) noticing hypothesis to address awareness-raising as an approach to the teaching of pragmatics (see also Robinson, *Attention and Awareness*, Volume 6). First, the use of authentic audiovisual input has received special attention as a way to foster learners' pragmatic knowledge; being that knowledge conscious it would then refer to pragmatic awareness. Audiovisual input (the use of video, films and TV) has been stated to be useful to address knowledge of a pragmatic system, and knowledge of its appropriate use.

The studies conducted by Rose (2000), Grant and Starks (2001), Washburn (2001) and Alcón (2005) were motivated by the assumption that both pragmatolinguistic and sociopragmatic awareness are particularly difficult for those studying in an EFL context. From this perspective, the authors claim that authentic audiovisual input provides ample opportunities to address all aspects of language use in a variety of contexts. Besides, as quoted by Rose (2000), audiovisual material first offers language teachers the possibility of choosing the richest and most suitable segments, analyse them in full, and design software to allow learners to access pragmatic aspects as needed. Secondly, it may be useful to expose learners to the pragmatic aspects of the target language. Thirdly, pragmatic judgment tasks can be based on audiovisual discourse analysis and prepare learners for communication in new cultural settings. This last aspect takes into account the issue of task design and task implementation, which in turn is related to research focussing on the effect of instruction on learners' noticing of pragmatic target features.

As pointed out in various studies on pragmatic instructional intervention (House and Kasper, 1981; House, 1996; Rose and Ng, 2001, Takahashi, 2001), explicit metapragmatic instruction seems to be more effective than implicit teaching. However, more recently, research has focussed on the effect of implicit instruction for pragmatic learning following a focus on form approach. Taking into account that a higher level of awareness can be achieved by manipulating input, the studies conducted by Fukuya, Reeve, Gisi and Christianson (1998), Fukuya and Clark (2001), Martínez-Flor (2004) and Alcón (2005) aim to prove whether learners' intake of pragmatic target forms can be enhanced even in implicit conditions. Fukuya, Reeve, Gisi and Christianson (1998) implemented recasts as implicit feedback on learners' production of requests. Results of the study did not support the hypothesis that this implicit feedback would result efficient in comparison to the group that received explicit instruction on the sociopragmatic factors that affected appropriateness of requests in different situations. In a similar vein, the studies conducted by Fukuya and Clark (2001) and Martínez-Flor (2004) used input enhancement techniques to draw learners' attention to the target features. In Fukuya and Clark's (2001) study, findings from the three groups' performance (i.e. focus on forms, focus on form and control group) did not reveal significant differences on learners' pragmatic ability. The authors claimed that a different operationalisation of the input enhancement may have involved differences as far as potential of saliency is concerned. To their explanation, it could be added Izumi's (2002) suggestion of using a combination of implicit techniques to help learners notice the target features. In line with Izumi (2002), Martínez-Flor (2004) used a combination

of implicit techniques to analyse the effect of explicit and implicit teaching on the speech act of suggestion. Results of her study demonstrated that both implicit and explicit instructional treatment groups outperformed the control group in awareness and production of the speech act of suggesting. Alcon's (2005) study also showed an advantage of explicit and implicit instructed learners over uninstructed ones in their awareness and production of requests. However, the author indicates the need to consider the delayed effect of explicit and implicit teaching on pragmatic learning in future research.

#### PROBLEMS AND DIFFICULTIES: FUTURE DIRECTIONS

The research mentioned earlier is based on the assumption that awareness is related to acquisition of pragmatic competence. From a cognitive perspective, research on pragmatic awareness and language learning is based on one of the tenets of SLA theory that claims that attention to input determines intake. Thus, drawing on Schmidt's theoretical framework (1993) which points out the need to implement pedagogical intervention on pragmatic issues, most of the studies on pragmatic awareness and language learning address learners' noticing of L2 features as a requirement for further second language development. However, although it is possible that Doughty's (2001) micro-processes, which potentially contribute to learning-selective attention and cognitive comparison, may be activated through direct and indirect pragmatic consciousness raising instruction, it is not clear the extent to which awareness is sufficient to gain absolute proficiency at the pragmatic level. According to Schmidt (1993), the noticing hypothesis postulates two levels of awareness: at the level of noticing (referring to the targets without mentioning any rules) and awareness at the level of understanding (referring to the explicit formulation of rules). However, since it is hypothesised that even awareness at the level of understanding may be insufficient to gain absolute proficiency (Gass, Svetics and Lemelin, 2003; Rosa and Leow, 2004), the noticing hypothesis may be further examined in empirical studies at the pragmatic realm. To do that, first it should be tested empirically. For instance, it needs to be tested whether Tomlin and Vila's (1994) functions of attention (alertness, orientation and detection) are separable, or, as suggested by Simard and Wong (2001), they are activated at the same time in processing pragmatic information. In addition, and related to research conducted in cognitive psychology, a different operationalisation of awareness may be needed in ILP research. While in cognitive psychology awareness is usually linked to the ability to verbally report a

subjective experience (Schmidt, 2001; Tomlin and Vila, 1994), most SLA studies dealing with the role of instructional techniques to draw learners' attention to formal aspects of the input, assess what is attended to by means of post-exposure tasks (Fotos, 1993). Following this procedure to measure awareness, most studies point to an indirect evidence on the role played by attention and awareness on pragmatic language learning, but more direct assessment of attention and awareness, for instance by using think-aloud protocols, should be included in further research. Secondly, considering Izumi's (2002) suggestion of using a combination of implicit techniques to help learners notice the target features, input enhancement of pragmalinguistic and socio-pragmatic factors, together with other techniques such as positive feedback, need to be examined to shed light on how they help implicit instructed learners to pay attention to pragmatic features of the language. Thirdly, since the effect of instructional treatments has been proved effective for pragmatic awareness, the delayed effect that pragmatic awareness (both at the level of noticing and understanding) may have on learners' pragmatic learning should be addressed in the future. Likewise, in line with Takahashi (2005) and Safont (2005), further studies that examine to what extent pragmatic awareness is related to learners' individual variables are desirable.

In relation to the pedagogical insights which are likely to be drawn from research on pragmatic awareness, it should be pointed out that, in line with second language acquisition research, the focus is not to transform results into pedagogical ideas. Nevertheless, some implications can be drawn. First, due to the limitations involved in classroom discourse and in textbooks presentation of pragmatic issues, more valid data can be obtained from authentic audiovisual input, and awareness and comprehension of different pragmatic meanings can be achieved by drawing attention to the linguistic forms and the sociopragmatic variables of selected speech events. Thus, a possibility would be designing material that combines the different speech acts taxonomies of linguistic formulations, and the actual face relations described in terms of different politeness systems.

## METALINGUISTIC KNOWLEDGE AND ORAL PRODUCTION

### INTRODUCTION

It is widely believed by second language acquisition (SLA) experts that the ability to explain a grammatical rule and the ability to use that rule while speaking reflect two qualitatively different kinds of knowledge (Lightbown, 2000). Explaining rules involves what is referred to as *explicit* or *metalinguistic* or *declarative* knowledge whereas oral production involves *implicit* or *linguistic* or *procedural* knowledge (see list of other labels in White and Ranta, 2002, p. 260). Although the terms implicit/explicit are preferred by some influential scholars (Ellis, 2004) and declarative/procedural by others (DeKeyser, 1998), there is an advantage in using the term “metalinguistic” because it links knowledge *about* language to other metacognitive abilities. Thus, “metalinguistic knowledge” is used here to refer to the mental representations that underlie the ability to perform metalinguistic tasks; such tasks require a shift of attention away from meaning to the formal aspects of language. Explaining grammatical rules, probably the most demanding of metalinguistic tasks, requires what Berry (2005) calls “metalingual” knowledge, that is, technical terminology like *noun* and *verb*. Metalinguistic knowledge is characterized by its explicitness, which makes it more readily available for verbalization (Bialystok, 2001; Ellis, 2004). In contrast, the ability to use grammatical forms accurately in fluent speech relies upon implicit knowledge, which is highly accessible for use, but typically unanalyzed, formulaic, and unavailable for verbal report (Ellis, 2004) (see Ellis, *Implicit and Explicit Knowledge about Language*, Volume 6).

The body of theory and research dealing with the relationship between metalinguistic knowledge and the linguistic knowledge underlying oral production has two clear strands, one of which relates primarily to first language (L1) acquisition and childhood bilingualism, the other to second language (L2) acquisition. In this review, I briefly discuss the L1 acquisition context as a backdrop to the L2 acquisition issues, which is the main focus. Furthermore, although the term metalinguistic can be applied to phonological, lexical, and pragmatic knowledge, the discussion focusses exclusively on the relationship between

metalinguistic knowledge of *grammar* and the use of grammatical structures in oral production, an emphasis that reflects the predominant trends in the literature.

## EARLY DEVELOPMENTS

### *L1 Acquisition*

All normal children develop the ability to formulate grammatical utterances in their mother tongue and to produce them fluently according to a more or less universal schedule. Although the pattern of development of metalinguistic abilities is subject to much greater variation, there is a clear pattern in how children's metalinguistic abilities progress from being able to monitor their own speech to being able to explain why certain sentences are possible and how they should be interpreted (Clark, 1978). Metalinguistic skills emerge as a function of age such that a seven year old is generally able to do what a five year old cannot. It is also the case, however, that considerable variation is evident in metalinguistic performance among children of the same age (Gleitman and Gleitman, 1979). One factor that has consistently been found to have an influence on metalinguistic development is early childhood bilingualism (see review in Bialystok, 2001). For most children, however, the acquisition of literacy skills is the most important driver of metalinguistic awareness since it is the written script that provides the child with a model for thinking about language (Olson, 1994). Finally, explicit instruction is particularly important for the development of metalingual knowledge (i.e., technical concepts for grammar analysis). For example, native speaker teachers of English often lack confidence teaching grammar in L2 classes because they have not had adequate metalingual instruction during their own schooling (Andrews, 1999).

Differences in the ability to perform metalinguistic tasks are also found among otherwise normal adults. Gleitman and Gleitman (1979) asked two groups of adults, who differed in their level of education, to paraphrase novel compound nouns in English. They found that the more educated adults were significantly better able to comment on syntactic novelty although there were no differences between the groups with respect to semantic novelty. They concluded that not everyone can focus attention on a syntactic feature, even when a speaker is in productive control of the construction in question.

### *Second Language Acquisition*

Based on their studies of metalinguistic judgments in both children and adults, Gleitman and Gleitman (1979) concluded that the ability to use

language communicatively is independent of the ability to reflect on language usage. The independence of metalinguistic skill is also a prominent notion in second language acquisition. Krashen (1985) posits that unconscious “acquired” knowledge gained from input processing underlies spontaneous oral production whereas consciously “learned” knowledge gained from metalinguistic instruction can only be accessed when there is sufficient time and a focus on form. Such conditions apply during metalinguistic task performance and in written production. According to Krashen, even production practice in the target language is not *necessary* for oral production abilities to develop; only comprehensible input is required. Krashen cites as support for the dissociation of “acquisition” and “learning” a case study of a learner (referred to as “P”) who displayed but low levels of accuracy in oral production was able to self-correct almost all of her errors when asked. Research findings consistent with Krashen’s theoretical framework come from a study of the effect of comprehension-based ESL instruction on L2 acquisition of francophone children in New Brunswick by Lightbown (1992). She found an early emergence of lexical and grammatical features in the L2 oral production of those learners who had only listened to and read along with audiotaped materials as compared to those who had experienced a modified audiolingual program including oral practice.

In contrast to findings in support of Krashen’s model, studies of the oral production of French immersion students revealed that years of comprehensible input did not guarantee native-like grammatical accuracy in oral production (Swain, 1985). The immersion research findings suggested that in addition to comprehensible input learners needed guidance (i.e., metalinguistic instruction) to figure out how the target language works. Furthermore, Swain hypothesized that the relatively passive nature of content-based classroom learning did not push learners to be more accurate in their oral production, and therefore a greater amount of output was called for. The early findings from French immersion pointing to the limits of comprehensible input led to classroom investigations that have shed further light on the relationship between metalinguistic instruction and L2 oral production (see Interfaces section later).

### MAJOR CONTRIBUTIONS

Three topics stand out as having contributed to our present understanding of the relationship between metalinguistic knowledge and oral production. These are the Analysis/Control framework, the interface hypotheses, and the body of research on form-focussed instruction (FFI).

*Analysis and Control Framework*

The Analysis/Control framework developed by Bialystok (e.g., 1991) consists of two independent processing dimensions: analysis of linguistic knowledge and control of linguistic processing. The first component refers to “the progressive analysis or restructuring of mental representations of language” (Bialystok, 1991, p. 117). The function of the control component is to direct attention toward knowledge representations for a particular purpose. Different tasks make different demands on the learner’s level of analyzed knowledge and degrees of cognitive control. Metalinguistic tasks typically make the greatest demands on both analysis and control. The most demanding metalinguistic tasks are those, which require the individual to direct attention away from meaning and toward the formal features of language. Over time, the learner’s mental representations of language structures become increasingly explicit. In their initial unanalyzed state, language representations are organized around function and meaning; as the process of analysis takes place, they become organized around formal structures. This increasing analysis of mental representations leads to greater accessibility to knowledge and greater flexibility in its use. Development in control, on the other hand, is associated with the learner’s increasing ability to execute intentions and direct their performance in real time. When problems can be solved with less attention, they appear to be performed with fluency or automaticity.

The value of Bialystok’s model is that it accounts for both L1 and L2 acquisition in the same theoretical framework. What is different for the child acquiring his or her L1 and the older L2 learner is the starting point: the L2 learner begins with the analyzed representations of language gained from the L1, and with developed procedures for directing attention. According to Bialystok, the processing components in L2 learners also develop differentially depending on instructional emphases; for example, fluency-oriented programs promote the development of processing control, while grammar-oriented programs develop analysis.

*Interfaces Between Implicit and Explicit Knowledge*

An important contribution in SLA has been the conceptualization of the relationship between implicit and explicit knowledge in terms of the metaphor of an *interface* (Ellis, 1994; Krashen, 1985; White and Ranta, 2002) (see Ellis, *Explicit Knowledge and Second Language Learning and Pedagogy*, Volume 6). A noninterface model, such as Krashen’s, views implicit and explicit knowledge as the products of separate processes. For Krashen, there is no point of contact between

“acquisition” and “learning.” At the other extreme is the strong interface model (or “full interface” in White and Ranta, 2002) in which implicit and explicit knowledge are in a bidirectional relationship; this allows practice to make explicit knowledge implicit and awareness-raising activities to make implicit knowledge explicit (Bialystok, 1978).

A third position, the “weak interface,” has been advanced by Ellis (1994). Here the degree to which explicit knowledge influences interlanguage development depends on learner readiness and whether the new rule is a developmental feature or not. Explicit instruction about developmental rules such as question forms in English will only become implicit if the learner is at the right level of development to be able to accommodate the new rule. If not, the learner’s existing knowledge acts as a filter, allowing through only that which the learner is able to internalize. In addition, Ellis proposes that some target language rules (i.e., nondevelopmental grammatical rules) will be readily converted to implicit knowledge. Thus, the weak interface model views explicit knowledge as having a facilitative role, helping learners notice features in the input, and equipping them with the tools for analyzing their own production. Although the weak interface view seems to be the one that best accounts for the delayed effects of FFI found in some research, it is a difficult hypothesis to test formally (White and Ranta, 2002).

### *Studies of Form-Focussed Instruction*

FFI refers to different approaches to drawing learners’ attention to grammatical form within L2 teaching that is primarily oriented toward the development of communicative competence. Over a decade’s worth of research investigating how FFI influences L2 learning has led to widespread agreement that learners benefit from FFI. Norris and Ortega (2001) surveyed 49 studies involving a wide range of learner populations, learning contexts, and target language structures. They concluded from their meta-analysis that explicit (i.e., metalinguistic) instruction has a positive effect on L2 grammar development when compared to communicative input alone. Doughty (2003) argues, however, that the sample of studies was biased toward explicit instruction and toward outcome measures that require explicit knowledge. Only 5 of the 49 studies reviewed by Norris and Ortega included free oral production measures; most used measures involving “constrained, constructed-responses” (p. 486). In another review, Ellis (2002) examined the results of 11 studies in which a measure of free production was used (including the 5 from Norris and Ortega). He concludes that FFI *can* contribute to the development of implicit knowledge, especially in cases where the intervention is extensive and focusses on “simple”

rather than complex structures. Less extensive instruction targeting complex structures may also succeed if the targeted form is readily available in the input inside and outside of the classroom.

### WORK IN PROGRESS

The techniques used in FFI research have greatly enriched the range of metalinguistic activities available to teachers. Some of these techniques have been extensively researched with respect to their impact on L2 learning, others to a lesser extent, while still others are largely untested. In this section, I draw attention to the following FFI techniques: consciousness-raising tasks, structured output practice, structured input practice, and corrective feedback.

#### *Consciousness-Raising Tasks*

Traditional L2 grammar instruction typically begins with the presentation of a grammatical rule. One new technique, the consciousness-raising task, incorporates a task-based approach to the presentation or review of grammar rules. Consciousness-raising tasks are collaborative tasks that focus explicitly on a particular grammatical feature. Thus, instead of spotting the difference between two diagrams, or discussing whether or not the death penalty should be abolished, learners negotiate meaning *about* language (Fotos, 1994). In an early study of the effectiveness of this technique, Fotos found that Japanese students in college level EFL classes learned as much about the target grammar rules as those who were exposed to traditional deductive grammar lessons, and engaged in as much negotiation during group work as those who participated in a regular communicative task. Evidence for the impact of consciousness-raising tasks on learners' oral production is offered by White and Ranta (2002). They conducted a quasi-experimental study in a grade 6 intensive ESL program in Quebec. The target form was the possessive determiners *his/her*. They found that the group of learners who participated in consciousness-raising tasks outperformed a comparison group in terms of their accuracy using *his/her* during an oral picture description task and their ability to correct possessive determiner errors on a passage correction task.

Consciousness-raising tasks can be inductive, that is, the learners figure out the rules underlying a set of data. For example, in Fotos (1994), learners in groups were given example English sentences with adverbs in different positions and were asked to figure out which position in a sentence adverbs cannot occur. In White and Ranta (2002), the consciousness-raising task was deductive in nature. The students were first

given a rule of thumb for determining whether *his/her* is used in a sentence and then were given cloze passages to complete as a group. White and Ranta argue that doing these tasks regularly over a period of five weeks helped anchor the metalinguistic rule in the minds of the learners. According to the weak interface model, learners' improvement in their oral production of possessive determiners could be due to the forms becoming more noticeable in the input as a result of the cloze passage discussions, and then integrated into learners' implicit knowledge.

### *Structured Output Practice*

A traditional approach to grammar instruction usually consists of presentation of a rule, followed by controlled exercises and ending with an open-ended production task (i.e., the so-called Presentation-Practice-Production). Skehan (1998) contends that PPP remains the commonest teaching approach for practical reasons despite being discredited by proponents of communicative language teaching. Recently, however, the role of output practice is once again being taken seriously. As noted above, in the context of French immersion, Swain (1985) called for a greater focus on output. But merely giving learners the opportunity to talk more is not necessarily the solution. Indeed, Skehan (1996) warns against "undesirable fluency" that can result when learners practice getting their meaning across using compensatory communication strategies. How is undesirable fluency to be prevented? A useful concept in this regard is *transfer-appropriate processing* which has been borrowed from cognitive psychology to account for L2 fluency development (Segalowitz and Lightbown, 1999). This is defined as "a person's success in retrieving previously learned information is . . . facilitated to the extent that the mental operations engaged in at the time of recollection (i.e., at the time of test) match those previously engaged in at the time of encoding or learning" (Segalowitz and Lightbown, 1999, p. 50). Pattern practice drills of the type that students in audiolingual classes experienced in the past did not lead to knowledge that was readily transferable to more open-ended production tasks because the processing mechanisms involved in drills are not the same as those used in communicative interactions (Lightbown, 1983). Rather than drilling, Gatbonton and Segalowitz (2005) propose a task-based teaching approach called *Automatization in Communicative Contexts of Essential Speech Segments (ACCESS)* that focusses on fluency development through repetition of formulaic utterances in communicative tasks. In the ACCESS framework, an instructional unit consists of three phases: (i) the creative automatization phase in which functionally

useful utterances are used repeatedly; (ii) the language consolidation phase where a focus on form (i.e., metalinguistic instruction) occurs; and (iii) the free communication phase. This revised view of production practice has not yet been tested empirically but it offers a starting point for exploring the role of production practice.

### *Structured Input Practice*

Rather more empirical evidence exists about the value of focussed practice that requires learners not to produce utterances, but to comprehend them. VanPatten (2002) reviews the arguments in support of what he terms “input processing instruction.” This type of instruction consists of three stages: (i) learners are given information about the target metalinguistic rule; (ii) learners are given information about input processing strategies that interfere with acquisition of the target form (e.g., processing the first noun in a sentence as the agent/subject makes it difficult to acquire sentence initial object pronouns in Spanish); (iii) learners engage in activities that push them to process the target form in written or oral input. Along the same lines as Krashen (1985), VanPatten argues that input processing instruction leads to restructuring in learners’ interlanguage systems, which then makes this knowledge available for oral production. Production practice, on the other hand, does not feed directly into the learners’ interlanguage system and therefore cannot transform L2 learners’ abilities to communicate orally. Despite the strong theoretical arguments and the growing research base to support the use of structured input practice activities, they are still not commonly found in commercial L2 grammar textbooks.

### *Corrective Feedback*

Traditional L2 grammar instruction was characterized by constant error correction. Communicative language teaching, on the other hand, emphasizes teacher feedback on the comprehensibility rather than formal accuracy of learners’ output during interaction. Many teachers have been taught to respond to students’ errors by providing a corrected version of what the student has said (i.e., a recast). The problem with this technique, according to Lyster and Ranta (1997), is that learners may not interpret the recast as a correction. In their analysis of classroom interaction data in Canadian French immersion classes, prompting (i.e., clarification request, repetition, metalinguistic clue, and elicitation) was more likely to lead to learner self-correction. There is currently some debate about the effectiveness of recasts versus more explicit types of feedback. The issue may not be the surface characteristics

of the teacher's feedback (i.e., recasts vs. prompts) but rather the degree to which the learner recognizes that the purpose of the feedback relates to the grammatical correctness of the previous utterance rather than offering encouragement or praise. In an experiment dealing with grammatical gender in French, Lyster (2004) examined the impact of FFI combined with different types of feedback. He found that the prompting group outperformed the recast group on two written post-tests. On the oral production tasks, however, all of the groups who had received FFI outperformed the comparison group. Lyster accounts for this with reference to the testing procedure in which randomly selected learners from each treatment group were tested individually, thereby providing all participants with individualized practice opportunities. This interpretation of the results highlights the difficulty of designing studies that permit the contribution of feedback to be teased apart from that of the other components of FFI.

## PROBLEMS AND DIFFICULTIES

### *Fluency and Accuracy in Oral Production*

It is beyond doubt that over the past three decades, applied linguists have made great strides in broadening general understanding of L2 learning in classroom settings. Less progress has been made, however, in our understanding of how to ensure that L2 learners develop high levels of accuracy and fluency. Studies of the long term outcomes of French immersion, one of the most successful approaches to L2 teaching, point to the stabilization of interlanguage development at a non-native-like level, and the attainment in many cases of what Skehan (1996) would call "undesirable fluency." According to Ellis (1994), the problem seems to be that fluency favors processes that are inimical to the development of accuracy. Paradoxically, while output practice is recognized as having an important role to play for both accuracy and fluency development (Swain, 1995), it remains somewhat disconnected from SLA theoretical models. Part of the problem is that the concept of practice is still tainted by its association with the behavioristic drilling of audiolingualism (Lightbown, 2000). In reaction to behaviorism, SLA researchers have emphasized the emergence of grammatical forms in learners' interlanguage rather the correctness of their production.

In contrast to the vague attitude toward practice in input-oriented SLA theories, cognitive theory views extensive practice as the means by which explicit knowledge becomes accessible for use in fluent, spontaneous oral production (Segalowitz and Lightbown, 1999). But cognitive theory's emphasis on production means that the role of input

processing is ignored. So what is urgently needed is a theoretical model that specifies the relationship between input, output and metalinguistic knowledge. The models proposed by Bialystok (1978) and Skehan (1998) each offer a potential starting point but further refinement is needed in order to provide testable hypotheses for research (see Verspoor, *Cognitive Linguistics and its Applications to Second Language Teaching*, Volume 6).

#### FUTURE DIRECTIONS

Studies addressing the issues discussed above should include a range of research approaches (DeKeyser, 2003). First of all, carefully controlled experiments of how different types of FFI impact learning outcomes should be carried out on a variety of grammatical structures from different target languages. Wider use of free oral production tasks as outcome measures is essential. It is also important that such research should take into account learner differences in L2 aptitude, a trait that constitutes strengths in language learning ability (Robinson, 2005). This ability has been conceptualized as being made up of components of subskills. Robinson proposes that some learners have a particular aptitude for specific learning conditions such as via explicit rule learning or via recasts. Being able to identify such strengths would make it possible to match learners to optimal types of L2 instruction. In this way, research could support decision-making in the expensive enterprise of L2 training to advanced levels of proficiency.

In addition to laboratory studies, more classroom-based research is needed to investigate the effects of different models of instruction (i.e., PPP, ACCESS) that have been proposed. Theoretical arguments can be made for and against each of these approaches but empirical evidence is needed to guide pedagogical decision-making.

Finally, it is likely that new approaches to the teaching of L2 grammar such as consciousness-raising tasks and structured input practice will be slow to appear in teacher education programs, or may not be taught in such a way as to make them readily applicable. Studies of how preservice and inservice teachers integrate new ideas about teaching grammar into their praxis is yet another piece of the puzzle essential to our understanding of how metalinguistic instruction can influence the development of L2 learners' oral production skills.

and the Teacher**

## “AWAKENING TO LANGUAGES” AND EDUCATIONAL LANGUAGE POLICY

### INTRODUCTION

When using the terms “Awakening to languages” I refer to an approach that has been defined as follows in the European Evlang program (see Candelier, 2003b, pp. 18–19; Evlang is an acronym for “Eveil aux langues à l’école primaire”):

“An awakening to languages is when part of the activities concerns languages that the school does not intend to teach (which may or may not be the mother tongues of some pupils). This does not mean that only that part of the work that focuses on these languages deserves to be called an awakening to languages. Such a differentiation would not make sense as normally it has to be a global enterprise, usually comparative in nature, that concerns both those languages, the language or languages of the school and any foreign (or other) language learnt.”

As such, it appears to be a direct heir of the “Language Awareness” approach that emerged in the UK during the 1980s, thanks to the theoretical and practical work of Eric Hawkins (Hawkins, 1984) and of other researchers and teachers (see also Van Essen, *Language Awareness and Knowledge about Language: A Historical Overview*, Volume 6; Cots, *Knowledge about Language in the Mother Tongue and Foreign Language Curricula*, Volume 6).

The aim of the present contribution is to outline theoretical and practical research about the possibilities of using this approach for educational language policy aims, in the context of societies where openness to others and plurilingual competences are urgently needed (see Helot, *Awareness Raising and Multilingualism in Primary Education*, Volume 6).

The underlying conception of language policy is that of an action, according to the definition proposed by the *Guide for the Development of Language Education Policies in Europe*, which states that “language policy is a conscious official or militant action that seeks to intervene in languages of whatever type [...] with respect to their forms [...]”,

social functions [. . .] or their place in education” (Council of Europe, 2003, p. 15).

The research work described later has to be understood as belonging to “Critical language policy research,” mainly in that it “aims at social change” and at “developing policies that reduce various forms of inequality,” but also because it is strongly influenced by “critical theory” dealing with social issues, elaborated by such thinkers as Bourdieu (1982) (Toffelson, 2006, pp. 42–43).

### EARLY DEVELOPMENTS

Educators and researchers promoting the awakening to languages approach believe in its capacity to contribute to the acquisition of attitudes, aptitudes, and knowledge required for individual development and life in common within the multilingual and multicultural context resulting from migratory phenomena and increasing globalization of economy, information, exchanges, and culture.

This relates to favorable perceptions of and attitudes toward not just the languages and their diversity but also the speakers of the languages and their cultures. Naturally, this applies also to the languages and cultures of allophone pupils (pupils having another language at home, immigrant, or native), whose abilities and identities are thus recognized by school.

Developing curiosity, interest, and openness for and toward that which is different should also contribute to diversifying the languages pupils choose to learn.

While improving better aptitudes for listening to, observing, and analyzing languages awakening to languages enhances the ability to learn them. It is also a matter of developing a “language culture,” a knowledge specific to languages, particularly of a sociolinguistic nature. This knowledge represents a set of references that help to understand the world in which pupils live today and will live in the future. Unlike Schiffman’s “linguistic culture” (see Schiffman, 2006) the use of “culture” made here does not include attitudes (values, prejudices. . .), following the approach of competences adopted by the *Common European Framework of Reference for Languages*, which distinguishes “knowledge,” “skills,” and “existential competences”—Council of Europe, 2000, chapter 2.1.1.

Although in a slightly different context—also characterized by a massive presence of migrants but still at a lower stage of globalization—the “language awareness” approach developed in the UK during the 1980s already featured most of the goals listed earlier for the awakening to languages, whether cognitive or affective, including the aim of encouraging better relations between ethnic groups (Donmall,

1985, pp. 7–8). Among the many motivations stated, the predominant one originally was the determination to fight failure in languages at school (in both English and foreign languages) (James, 1995, p. 27; James and Garrett, 1992, p. 3; Moore, 1995, pp. 45–46). (Therefore, the decision taken by the promoters of the Evlang project not to keep the expression “awareness of language” for their own “awaking to languages” work has nothing to do with discontinuity in aims, but with the wish to delimit a specific area within the broader domain of language awareness research.)

The movement was not subsequently recognized by any institutions in the UK. In 2000, however, the Nuffield Language Inquiry suggested that the “national action programme for early education” should introduce language awareness modules to “establish a bridge between teaching in English and teaching in foreign languages” and to promote the “acceptance of diversity” (for recent developments, see Hawkins, 2005).

A large number of studies influenced by the British forerunner movement was carried out in the 1990s in several European countries, for instance in Grenoble (France) under the direction of Louise Dabène (see Dabène, 1995), at the Landesinstitut für Schule und Weiterbildung at Soest, Germany (Haenisch and Thürmann, 1994), and at the Zentrum für Schulentwicklung at Graz, Austria (Huber and Huber-Kriegler, 1994). In Italy, the language awareness approach influenced the work carried out under the heading of *Educazione linguistica* (see Costanzo, 2003).

French-speaking Switzerland had been interested from the early 1990s in the awakening to languages approach which it called EOLE (*éveil au langage/ouverture aux langues*—awakening to language/openness to languages) to specify that it was a matter of both developing pupils’ metalinguistic skills and their plurilingual and pluricultural socialization (Perregaux, 1995). The promoters were particularly motivated by the need both to reach a better acceptance of the learning of other national languages of the country (mainly German in its francophone part) and to recognize within classroom practice the often fully ignored resources of pupils from immigrant families. The second motivation was also a very important one for the work carried out at Freiburg (Germany) around Ingelore Oomen-Welke, focused essentially on taking into account the languages of immigrants at school (Oomen-Welke, 1998).

#### MAJOR CONTRIBUTIONS

At that stage in the development of innovations in the awakening to languages approach it was felt necessary to set up a more substantial project capable of verifying whether or not the expectations raised by the approach were justified.

This was the task ascribed to the Eulang program (1997–2001) backed by the European Union as part of the Socrates/Lingua programs (see Candelier, 2003a). It combined the efforts of some 30 researchers involved in language teaching in 5 countries (Austria, France, Italy, Spain, and Switzerland). The aim was to show that the approach could be applied on a broader scale, that it was realistic with regard to the means to be implemented, and that it would lead to the anticipated results—at least those that were perceptible within the framework of a project lasting 3 years, a duration specified by the Socrates programs.

Some 30 teaching materials for a course of 1 year to 18 months at the end of primary school were produced (see the chapter by de Goumoëns, Noguerol, Perregaux, and Zurbriggen in Candelier, 2003a) and experimented in their usual classes by generally nonspecialist and not “preselected” teachers. A specific tuition had been provided to them as part of in-service teacher training sessions lasting generally not more than 2–3 days. A quantitative evaluation was carried out on some 2,000 pupils (compared with about half that number of pupils for the control group), based on prior and final tests and a very stringent scientific protocol. The qualitative evaluation focused essentially on some 20 classes, with interviews (of teachers and pupils) and a detailed observation of the approach (video recordings and specific observation grids). These were complemented by various questionnaires addressed to a larger number of teachers and parents (see the chapter by Genelot and Tupin in Candelier, 2003a).

As for the effect on attitudes, the tests looked firstly at the pupils’ interest in diversity and secondly at their receptiveness to the unfamiliar. For the development of language-related aptitudes, the study looked at the ability to discriminate and memorize by listening, and at syntax skills using the method of text deconstruction–reconstruction in an unknown language.

In both cases—attitudes and aptitudes—the impact of the awakening to languages on the first of the two components mentioned (interest and listening skills) has been confirmed in a large majority of samples. The effect was also shown for the second component (receptiveness and syntax skills) although in only a few cases. These differences can be explained: receptiveness obviously demands more than simple interest, and the deconstruction–reconstruction exercises were carried out much less frequently than the listening exercises in the teaching materials (see the chapter by Bernaus, Genelot, Hensinger, and Matthey as well as the chapter by Matthey, Genelot, Noguerl, and Têcher in Candelier, 2003a).

The only relative disappointment concerns the effects on skills in the language(s) of the school, which have not been stated, although

teachers tended to consider that they do exist when expressing their experience in the interviews and questionnaires. The majority of the Evlang initiators themselves had expressed certain doubts in this respect concerning activities scheduled at the end of primary education.

It should also be retained that these results apply to a course that generally lasted 35 hours. Yet the study of the links between the number of teaching hours (which varied from 7 hours to 95 hours) and the intensity of the effects clearly shows that a longer course has every chance of leading to more generalized effects with a broader scope.

It should also be noted that the Evlang's contribution to the development of attitudes essentially concerned the weakest pupils at school, and thus may be seen as compensatory. Furthermore, the awakening to languages significantly promoted the desire to learn languages. In several cases, it boosted interest in learning minority languages, including the languages of immigrants.

The practice of this approach usually led teachers to be more "sensitive" to the presence of allophone pupils in their class, and to call upon their resources. For most of the teachers, referring to several languages simultaneously was seen as natural. Intellectual approval of the awakening to languages approach predominated. A majority of pupils found Evlang useful or even very useful, even if the reasons for its usefulness were not always perceived or clearly expressed. They generally appreciated the way they were asked to work (through socioconstructivist activities—see the chapter by Aeby and de Pietro in Candelier, 2003a).

As a whole, the Evlang research can be seen as having produced the awaited evidence for the capability of the awakening to languages approach to develop attitudes toward otherness and abilities for language learning corresponding to language policy educational aims, which have to be pursued in the context of multilingual and multicultural societies.

Many researchers involved in the Evlang program collaborated again from 2000 till 2004 in the next program, called *Janua Linguarum* (The gateway to languages—in reference to the title of an important book by the great pedagogue Comenius, *Janua linguarum reserata*, published in 1631), which has been supported financially by both the Council of Europe (European Centre for Modern Languages in Graz, Austria) and the European Union. *Janua Linguarum* activities were developed in 16 European countries: Austria, Czech Republic, Finland, France, Germany, Greece, Hungary, Latvia, Poland, Portugal, Romania, Russian Federation, Slovakia, Slovenia, Spain, and Switzerland (Candelier, 2003b).

This time the focus was laid on dissemination work, which was felt as inseparable from studying the conditions of the incorporation of the

approach into the curricula of various education systems. At the same time, it was decided to target also younger learners (Kindergarten) and some older ones (lower secondary).

The most important result of the *Janua Linguarum* program was to show the capacity of the awakening to languages to adapt to fairly different sociolinguistic contexts and teaching traditions and that there were no subsequent “counter indications” to the use of this approach.

The facilitating role of multilingual national or regional contexts as regards motivation of teachers and educational authorities for the approach was also shown.

It was interesting to note that the difficulties felt by the national coordinators during the program’s implementation were more material in nature than representational. One of the questions that recurred constantly is that of the approach’s place in the school timetables. The solution already formulated within the *Evlang* program remains the best: as an interdisciplinary approach the awakening to languages has to be incorporated simultaneously into several subjects.

At the same time, links were established between awakening to languages and the education to “Democratic Citizenship,” as developed within the Council of Europe (Audigier, 2000). Although such links also used to take into account the linguistic empowerment that can result from an increased capacity to learn languages aimed by awakening programs, they mainly stressed aspects dealing with the positive acceptance of differences and diversity, belonging to the domain of attitudes (Candelier, 2003b, p. 23).

As such, awakening to languages indubitably converges with the so-called “intercultural” (or “cross-cultural”) approaches. An attempt to clarify the relationship between awakening to languages and those approaches was made, which highlighted some important specificities (Candelier, 2003b, pp. 21–22). Its access to culture phenomena is intrinsically a linguistic one, thus reiterating the statement common in the didactics of languages (and cultures) according to which language is both a means of expression of a culture and a privileged access to that culture. It thoroughly follows the principle that positive attitudes toward diversity are not to be built by a “persuasive” moralizing discourse but by a highly involving cognitive activity of the learner.

During the *Janua Linguarum* program, it was noted that—as emerged already in the *Evlang* evaluation—teachers are more convinced of the potential effects of the approach on the attitudes of pupils toward the diversity of languages and cultures than of its effects on their metalinguistic aptitudes. This is also the aspect of the approach that parents commented on most. On the whole, it is definitely as an approach aimed at ensuring a positive acceptance of diversity that awakening to languages achieves spontaneous approval, rather than

as an approach likely to develop language observation and analysis skills facilitating language learning. The partial lack of understanding of the approach revealed by this finding partly inspired further developments.

#### WORK IN PROGRESS

The influence of research work done by experts of the Council of Europe on language teaching orientations and methodology in Europe has been continually growing since the 1970s, with the development of important reference documents like the “Threshold levels” (notional-functional approach, in the mid-1970s) or, more recently, the *Common European Framework of Reference* (Council of Europe, 2000) and the Language Portfolios. (For more information, see <http://www.coe.int/>, Language Policy Division.)

Therefore, establishing precise links with the concept of “education for plurilingualism” promoted at the present by the Council of Europe was an appropriate way to better anchor the awakening approach into language didactics on the whole and to stress its potential role for plurilingual language learning.

In that perspective, it was useful to establish it as one “pluralistic approach” to languages and cultures, among others like the integrated teaching and learning of languages taught (building for instance on the learner’s own language to facilitate access to a first foreign language, or on a first foreign language to facilitate access to a second one—see Hufeisen and Neuner (eds.), 2004), the intercomprehension between related languages (for an overview see Doyé, 2005), and, of course, the inter- (or cross-) cultural approach (e.g., Byram, 2003).

While “singular” approaches address one particular language or culture taken in isolation, pluralistic approaches are teaching approaches in which the learner works on several languages or cultures simultaneously.

According to the *Guide for the Development of Language Education Policies in Europe* (Council of Europe, 2003, p. 16), “education for plurilingualism [...] involves enhancing and developing speakers’ individual linguistic repertoires from the earliest schooldays and throughout life.” These repertoires constitute the “plurilingual and pluricultural competence” of individuals, which is seen as the “actual ability to use several languages to different degrees of proficiency and for different purposes” (ibid., p. 71). For the *Common European Framework of Reference for Languages*, the “plurilingual and pluricultural competence” should not be seen as “a collection of distinct and separate competences to communicate depending on the languages [the individual] knows, but rather a plurilingual competence encompassing the full range of the languages available to him [...]” (Council of Europe, 2000, p. 168).

Sensibly, the *Guide* sets that “managing the repertoire means that the varieties of which it is composed are not dealt with in isolation; instead, although distinct from each other, they are treated as a single competence [. . .]” (Council of Europe, 2003, p. 71).

In other words, to help learners to build up this general plurilingual competence and to develop it continuously in a process of lifelong learning, there is a need to make use of approaches able to foster competences (knowledge, skills, attitudes), which can be considered either as “overall” competences (concerning languages and cultures in general) or as competences through which the learner can base his/her acquisition of a new language or culture (or certain aspects of it) on the aptitudes acquired in the previous learning of a particular language or culture (or certain aspects of it). Obviously, only “pluralistic approaches” in the sense developed before can account for this, as they include activities putting at stake different linguistic and cultural varieties at the same time.

“Education for plurilingualism” is just one of two aims proposed by the Council of Europe as constituents of what it calls “plurilingual education,” the other one being “education for plurilingual awareness,” the purpose of which is “to educate for linguistic tolerance, raise awareness of linguistic diversity and educate for democratic citizenship” (Council of Europe, 2003, p. 16). The fact that awakening to languages also works at this second aim has been amply shown earlier.

Despite of the grounding role it has played in developing and disseminating the key notion of “plurilingual and pluricultural competence,” the *Common European Framework of Reference* does not include any detailed and systematic inventory of competences of the kind that has just been outlined. To fill this gap, some researchers having been involved in the previous awakening to languages innovative work decided to start a common project with colleagues working in the field of the other pluralistic approaches (see earlier) aiming at establishing a specific framework of reference. The project is part of the 2<sup>nd</sup> medium-term program (2004–2007) of the European Centre for Modern Languages (ECML, Graz, Council of Europe) under the name “Across Languages and Cultures” (ALC).

Such a framework should provide an overview of the competences concerned and show how each approach can contribute to their development. This facilitates the elaboration of curricula setting out a genuine progression in the acquisition of these competences and allows the necessary coordination between the different pluralistic approaches and between these approaches and the learning of a particular language.

Simultaneously it was felt that elaborating more systematic strategies and materials for teacher education was necessary to ensure a better

dissemination of the approach and its overall efficiency. Therefore, another group from the previous *Evlang* and *Janua Linguarum* researchers decided to start another ECML 2<sup>nd</sup> medium-term program called “Language Educator Awareness,” which is also intended to end in 2007. The activities produced aim at raising among language teachers awareness of diversity as a key element of society and providing them with the wish and the ability to exploit linguistic and cultural variety both at individual and social levels in their classes (for both ALC and LEA programs, see <http://www.ecml.at>) (see Andrews, *Teacher Language Awareness*, Volume 6).

The dissemination work initiated by *Janua Linguarum* is continuing at national or regional level in almost all countries that were already involved (see earlier), through the elaboration and publication of new teaching aids (as for instance in Slovenia and Switzerland—see Perregaux, de Goumoëns, Jeannot, and de Pietro, 2003), through educating teachers (for instance in Portugal and Poland), and informing the general public and gaining the interest of education authorities (as in the Czech Republic and Catalonia—Spain). In Japan, some classroom activities are conducted by students of the Keio University under the direction of Atsuko Koishi (see Sekiji and Yasui, 2005). In Belgium, Foyer, a Brussels integration centre, is the promotor of awakening to languages in Flemish education, developing educational materials on the topic, and creating a regional network with different teacher training institutes, involving also the Flemish Department of Education (see Top and De Smedt, 2005).

Stimulated by the results of *Evlang* and *Janua Linguarum*, field research has been started in Canada and the francophone part of Belgium. During awakening to languages classes in a migration or immersion context at late primary level in Montreal and Vancouver, Armand and Dagenais (2005) collected qualitative data documenting critical discussions about the value attributed to different languages and to their speakers as well as the way in which allophone children acquire a new status as language experts in classroom interaction. Again, the stimulating effect of such activities on the ability to reflect about languages could be shown (the teaching aids developed have been made available on the ELODIL website—see later). Research work in progress involving other colleagues of the same Universities (P. Lamarre, D. Moore, and C. Sabatier) aims to deepen the gained insight through a longitudinal approach.

In 2002, the Minister in charge of primary schools within the Belgian “*Communauté française*” ordered a feasibility study concerning awakening to languages, followed by an experimental implementation in five schools (with pupils aged from 5 to 12). The activities were generally appreciated positively by the teachers and

the children, who fast unanimously expressed their feeling to have learnt “interesting things” (Blondin and Mattar, 2004). In 2005, the Government of the Communauté française de Belgique asked the same researchers to deepen the analysis of the relationship between existing curricula and awakening to languages and to develop new teaching aids adapted to the context of francophone Belgium.

For research work in the same area conducted in France parallel to the European projects mentioned earlier, see Young and Helot, 2003, and Helot, *Awareness Raising and Multilingualism in Primary Education*, Volume 6.

## PROBLEMS AND DIFFICULTIES

We concentrate on some obstacles or grounds for resistance belonging to the domain of educational language policy (see Candelier, 2003a, pp. 338–339).

At primary school level, the great majority of parents are asking for the teaching of one foreign language—mostly English in non-English-speaking countries. Although there is no contradiction between this demand and the introduction of an approach aiming at the development of the ability to learn languages, material constraints due to the school time available tend to let both options appear as competing. In that case, decision-makers seldom hesitate and generally favor the one language option.

Concurrently, many educators and decision-makers are till now—due to the dominant educative culture—unable to imagine that languages could be used at school for anything else than learning them (or, according to more recent perceptions, learning other subjects through them). In some cases, this incapacity leads to a wrong understanding of awakening to languages, which is seen as an attempt to learn many languages at the same time—this being with good ground considered as too demanding or only possible with “gifted” students.

The same incomprehension can also lead to seeing awakening to languages as a mere “sensitization” to languages, without any actual learning objective (for such objectives, see the chapter by M. Kervran and M. Candelier in Candelier, 2003a, pp. 74–81, as well as the ALC project mentioned earlier).

Finally, it occurred that decision-makers declared that the approach was “too cheap” (in terms of financial means required) and that adopting it would expose them to the critic of not doing enough for languages in education! (This was in France, just before an important presidential election.)

## FUTURE DIRECTIONS

At this stage, researchers and educators wishing to promote the awakening to languages approach have to pursue two aims: a quantitative one, linked with the dissemination of the approach—which includes convincing authorities—and a qualitative one, consisting in ensuring broader and more regular effects of the approach on the competences of learners. Both require new efforts in two main directions:

1. complementing and diversifying reflection and research on the implementation of the approach in different settings;
2. investigating accurately the ways by which competences acquired during awakening to languages activities can be reinvested by pupils in different dimensions of language learning.

The disastrous influence of inadequate language education on school achievement in all continents and that of lacking recognition of linguistic identities on life in so many societies has already led to introducing a worldwide perspective in reflections about contextual variations of objectives, contents, and methods of awakening to languages. The decisive step—nourished in particular by the confrontation with the situation in French overseas Départements (French Guyana, see Légise and Migge, 2006; Réunion Isle) and the discovery of already existing practice in Cameroon (see Mba and Messina, 2003)—was taken when working out a contribution for UNESCO (Candelier, 2006). One of the most promising directions lies in the ability of the awakening to languages approach to offer some of the advantages that are currently awaited from the use of the language of the family in first school grades, in settings where bilingual education is not possible/desirable, due to financial reasons, the wish to avoid school ghettos (when several languages are present on the same territory), and/or negative perceptions. In such situations, the approach can at least ensure some educational recognition of the language of the child, value her/his preexisting linguistic abilities and provide some explicit awareness of differences and similarities between the idiom already known and the one to be acquired at school (see Ó Riagáin, *Language Attitudes and Minority Languages*, Volume 6).

As for the second direction, a doctoral thesis (by Martine Kervran) has just started at the Université du Maine (Le Mans, France) to explore the ways in which primary school pupils use abilities acquired in awakening to languages activities when confronted with foreign language learning tasks (see Ellis, *Explicit Knowledge and Second Language Learning and Pedagogy*, Volume 6). A parallel study is about to start in the near future about tasks in French as a language of instruction. In Canada, a new project under the direction of

Françoise Armand is expected, which aims at investigating the combined effect of awakening to languages and metaphonological activities on the acquisition of reading and writing proficiency in multi-ethnic and underprivileged settings. This broadens first insights gained during a previous investigation (Armand, 2004) (see Piske, *Phonetic Awareness, Phonetic Sensitivity and the Second Language Learner*, Volume 6).

Another task for the future is to ensure the development of the international association EDiLiC (Education et Diversité Linguistique et Culturelle) launched in 2001 in the wake of the Evlang project to coordinate dissemination and research activities worldwide. Elaborating a database of teaching materials was felt as one of the most urgent tasks. After the first Congress, held in July 2006 in Le Mans in connexion with the eighth ALA Conference (Association for Language Awareness), the association will develop its own Web site.

## LANGUAGE AWARENESS AND CLIL

### INTRODUCTION

The term Language Awareness (LA) covers a broad range of issues relating to learning, teaching and using languages. These include knowledge about a language itself; how people best learn languages and how they communicate in real-life situations. Correspondingly, it involves achieving deeper understanding of how language is used to achieve specific goals in communication. These may be largely positive, as in building synergy through relationships, and effective transfer of ideas; or largely negative, as when language is used to influence people through manipulation and discrimination.

Content and Language Integrated Learning (CLIL) is a generic term that refers to the teaching of subjects in a different language from the mainstream language of instruction. It is an educational approach in which diverse methodologies are used which lead to dual-focussed education where attention is given to both topic and language of instruction. ‘... achieving this twofold aim calls for the development of a special approach to teaching in that the non-language subject is not taught *in* a foreign language but *with* and *through* a foreign language (Eurydice 2006, p. 8).

Applications of CLIL are multifarious depending on educational level, environment and the specific approach adopted. The learning outcomes tend to focus on achieving higher levels of awareness and skill in using language in real-life situations, alongside the learning of subject matter. This approach can be viewed as being neither language learning, nor subject learning, but rather an amalgam of both. Successful application involves utilizing and developing a broad range of language awareness capacities.

### EARLY DEVELOPMENTS

The development of foreign language learning has clearly been influenced by various trends over the past 50 years. While these trends shifted from predominant focus on ‘form’ to ‘meaning’, and corresponding methodological approaches were applied, three major operational issues have remained of key importance. The first involves ensuring a high degree of learner motivation when teaching groups of

individuals who have diverse preferred learning styles. The second involves the distinction and overlap between language acquisition and language learning as relating to optimal learning environments. The third concerns the amount of time, which can be allocated to language learning within the educational curriculum.

The language awareness movement developed in relation to both first and second language learning during the 1980s (Donmall, 1985; Hawkins, 1984; see also Van Essen, *Language Awareness and Knowledge about Language: A Historical Overview*, Volume 6 and *Cots, Knowledge about Language in the Mother Tongue and Foreign Language Curricula*, Volume 6). Originally focussing on explicit knowledge of grammar and function, it attempted to seek commonality of interest between those involved with first and second language teaching, and promote the curricular concept of 'languages across the curriculum' (Barnes, Britton and Rosen, 1969). Much of this work was carried out in the United Kingdom in relation to social inequalities and low standards of literacy in the first language (Davie, Butler and Goldstein, 1972). Recent international statistics (PISA, 2003) exemplify the ongoing scale of the problem by showing that some 20% of European 15-year olds have serious difficulty with reading literacy in the first language.

Because the field is so wide, language awareness can be found as an issue of interest in both first and second language learning which crosses many academic boundaries. A driving force since the 1980s has been on the learning of a second language, and critical language awareness. This has resulted in primary focus on the learner, the user of language, being actively involved in understanding the process of learning as an individual, and the use of language in communication.

There is an international association that describes the area as focussing on 'explicit knowledge about language, and conscious perception and sensitivity in language learning, language teaching and language use' (ALA, 2006).

Turning to one aspect of the language awareness movement, namely how people effectively learn languages, leads us to the educational approach known as CLIL. The CLIL movement developed in Europe through the 1990s with active investment support from the European Commission (Marsh, 2002).

The term was launched in 1996 to denote a dual-focussed educational approach in which an additional language is used for the learning and teaching of both content and language.

Proponents wanted to bring good practice from differing types of bilingual learning environments into mainstream education so as to enhance language learning, usually in the second language. This includes forms of immersion, content-based language teaching, language across the curriculum, among others. The major objective was to determine how

language-supportive methodologies worked, and what outcomes might be expected. What happened, over time, was that forms of CLIL focused more on the content, rather than on the language. This would be the single most distinctive difference between such forms of CLIL and immersion.

CLIL is inspired by 'important methodological principles established by research on foreign language teaching, such as the need for learners to be exposed to a situation calling for genuine communication' (Eurydice, 2006, p. 9). These principles are often geared towards drawing on types of higher language learning capacities, which are a major focus of those working on language awareness. CLIL usually goes beyond aiming for development of types of lower-order thinking skills (Bloom 1984) towards higher-order skills. This is what often differentiates CLIL from types of language learning approaches which are also content-oriented.

In those educational environments where language learning is considered particularly important, there is inevitably curricular pressure that reduces the amount of time available. This restriction of time allocated requires decisions to be made about what should be taught, and for what purpose. Even if the methodologies used to teach languages are broadly effective in developing a learner's sensitivity to the role that language plays in human interaction, and other features of language awareness, it is reasonable to assume that lack of time plays a decisive role in what can be reasonably achieved within the classroom. 'CLIL enables languages to be taught on a relatively intensive basis without claiming an excessive share of the school timetable' (Eurydice, 2006, p. 9).

Curricular pressure also influences learner motivation. In order to cater for groups of learners, and fulfil curricular requirements, it is inevitable that homogenization of methods and materials will work against accommodating diverse individual language learning styles. 'Among the factors that recent studies have emphasized (within second language acquisition), three are of motivational importance for the CLIL teacher. The first one, an integrative orientation towards the target language group, that is a desire to learn a language to communicate with people of another culture who speak it. Second, pedagogical factors, such as the effects of classroom environment, instructional techniques, and attitudes towards the language teacher and course. And third, the students' linguistic confidence, that is their belief to have the ability to produce results, accomplish goals or perform tasks completely, and in the case of an L2 to do all this with low levels of anxiety as well' (Munoz, 2002, p. 36).

These fall within the remit of (critical) language awareness, whereby language itself becomes meaningful for the student both in terms

of its structure, and how it is used in real-life contexts. Thurlow (2001, p. 214) introduces the notion of ‘communication awareness’ to describe how communication becomes ‘meaningful, to young people themselves; . . . how they articulate their own understanding and experience of communication’. CLIL methodologies often serve to enact this experience both in terms of the second language, and the first language in some ways.

As a generic term, CLIL describes a wide range of educational practice. This type of methodology has taken root in various parts of the world, for possibly quite different reasons. Some of these may not actually be specific to language learning, but rather other inter-linked goals that can be broadly considered as developing language awareness through experiential forms of learning (Coyle, 2005). Across Europe, these have been identified as serving cultural, environmental, language, content and learning-oriented knowledge and skills (Marsh, Maljers and Hartiala, 2001). Globally, attention is now being paid to a synthesis of these, focussing on content, culture, communication and community. A major interest is in how appropriate use of these methodologies serves to enhance cognitive development.

#### MAJOR CONTRIBUTIONS

Language learning, and within this language awareness, is an area of growing interest because of the pace of global, social and technological change. Cultural diversity, and the use of the new technologies for new or adapted forms of communication, results in an ever greater need to explore how the role of language impacts on individuals in their interaction with the wider world. Put simply, globalization and the ‘knowledge societies’ in which we increasingly live are leading to a re-thinking about maximizing literacy levels in first and second languages, and in specific language domains. This has resulted in the development of integrated educational approaches, which develop the knowledge and skills required for an increasingly inter-connected world.

Since the 1990s, Europe among other continents, has witnessed a knowledge revolution in education resulting mainly from increasingly widespread access to the Internet and the new technologies. CLIL can be seen as a practical application of the ‘Knowledge Triangle’, which integrates education, innovation and research. ‘Some would argue that one effect of this on young people concerns the purposiveness of education and an increasing reluctance to postpone gratification. Teachers and others argue that some students are no longer willing to *learn now for use later*, which is a form of deferred purpose,

but prefer *to learn as you use and use as you learn* which suits the immediacy of purpose common to the times' (Marsh, 2002, p. 66).

The field of language awareness has been heavily influenced by the need to go beyond achieving only utilitarian skills when learning languages. Bruner (1983) argued the need for a Language Acquisition Support System (LASS) by which to utilize Chomsky's (1972) Language Acquisition Device (LAD). This was influential in discussion of a natural approach to language learning as described by Krashen and Terrell (1983). It was argued that learning a foreign language under school conditions requires the use of some form of LASS. Hawkins (1999) describes this as leading to more than the development of utilitarian skill in using the language for specific purposes. He considers a range of language awareness features including reflection on the first language, and development of Halliday's (1978) 'mathetic' function, which concerns a holistic approach combining the development of language-for-learning with language-for-action.

These are summarized by van Lier (1995, p. xi) in his definition of language awareness: 'Language awareness can be defined as an understanding of the human faculty of language and its role in thinking, learning and social life. It includes an awareness of power and control through language, and of the intricate relationships between language and culture'.

Providing opportunities for learners to be immersed in a form of holistic learning environment can be provided by forms of 'language across the curriculum' such as CLIL. Clearly this can be achieved through various forms of language teaching approaches. However, language teaching, separated from other subject learning, often faces constraints which prevent this type of holistic goal from being achieved. The main reasons for this are usually to do with context, methodologies and time.

Put simply, a language learning classroom is usually an artificial environment because regardless of what is done within the lesson, language learning is the main aim. This can have a negative impact on certain types of learners, especially over time, because of issues relating to relevance and authenticity. In a CLIL context, the focus shifts from language to achieving, or otherwise learning about, some other goal, so the language learning falls into the background, and learning becomes more incidental.

The situation common in the early development of CLIL as a means for developing language awareness was characterized by the need to search for a complementary extra platform for developing language learning. This 'extra space' would then enable specific forms of methodology to be used to achieve goals not attainable within a time and resource-restricted language-learning slot within a curriculum. These

methodologies evolved into a form of education, which surpasses 'language learning', taking place in forms of 'integrated language acquisition-rich' learning environment.

This has resulted in moving beyond linguistic goals that are predominantly utilitarian, towards those that are pragmatic. These pragmatic goals involve the student learning how words are used to elucidate action and link to the seminal work of Austin (1962). Working in rich communicative environments that require performative action engages the individual, and helps develop holistic language awareness. This is difficult to achieve in a language lesson where the main focus is on 'doing things with words' and not 'using words to achieve things'. In CLIL the target language needs to go beyond being a 'vehicular language' towards a 'mediation language'.

Wolff (2006) observes '(CLIL) is based on the well-known assumption that foreign languages are best learnt by focussing in the classroom not so much on language—its form and structure—but on the content which is transmitted through language. Compared to other content-based approaches the specific novelty of this approach is that classroom content is not so much taken from everyday life, or general content of the target language culture, but rather drawn from content subjects or academic viz. scientific disciplines'. This has led to reports of high learner motivation (Huibregtse, 2001), with the CLIL approach viewed as appealing to a range of preferred language learning styles, and satisfying the language-learning goals outlined by those working within language awareness.

Citing Fishman (1989, p. 447), Baetens Beardsmore (2002, p. 24) observes 'the propagation of CLIL responds to the growing need for efficient linguistic skills, bearing in mind that the major concern is about education, not about becoming bi- or multilingual, and that multiple language proficiency is the added value which can be obtained at no cost to other skills and knowledge, if properly designed'. Research by Coyle (2000), Mäscher (1993), and Gajo (2002) provides insight into how CLIL achieves this objective within the curriculum.

Coyle (2002, p. 28) observes that 'language is learned through using it in authentic and unrehearsed yet scaffolded situations to complement the more structured approaches common in foreign language lessons'. De Bot (2002, p. 32) notes that the success of CLIL in the Netherlands has '... encouraged other schools to follow suit and they have done so with remarkable success, now delivering students with above average scores not only for (the foreign language), but also for other languages and subjects'. Munoz (2002, p. 36) observes that CLIL stretches the learners' language and language learning potential through, for example, pushing learners to produce meaningful and complex language'.

Takala (2002, p. 40) cites Mackay (1970), Stern (1983), Strevens (1977), and Spolsky (1978), as examples of foundation work which supports CLIL through seeking 'to define what disciplines contribute to language education; what the tasks of theoreticians, applied linguists and practitioners are in language education; and what factors/major variables interact to place language learning into its sociopolitical context'. This relates directly to the broad basis of defining and operationalizing language awareness in the curriculum. In order to achieve the types of cognition and language use required for CALP (Cummins 1979), a procedural approach to developing language awareness and language learning is required. It could be argued that it is the cognitive demands of the content learning, supported by structured language input and use of interactive methodologies, and the time allocated within the curriculum, which allow a procedural approach to the development of language awareness to take place.

The European CLIL movement has various origins because it developed for diverse reasons in equally diverse contexts. What unites these developments is the pursuit of goals which fall largely within the framework of language awareness. There is also a historical dimension which plays a key role. The term CLIL, though introduced in 1996, was adopted to draw together a range of 'bilingual education' models and experiences, some of which had been practised for 20 or more years in Europe.

Outside of Europe, the major contributions originally came from the work on immersion in Canada, where more than 1000 key studies have been published (Genesee, 1987; Swain and Lapkin, 1982, see also Baker, *Knowledge about Bilingualism and Multilingualism*, Volume 6). However, those CLIL models which gave particular interest to how content is negotiated and learnt, and how thinking skills are applied, meant that predominant interest in language became diminished. This would inevitably lead to a process of divergence from immersion.

In Europe, the methodological experimentation has generally occurred before the application of research procedures, but the work on immersion in Canada has been a major catalyst as noted in Eurydice (2006, p. 8), 'While it has gradually become clear that the Canadian experience is not directly transferable to Europe, it has nevertheless been valuable in stimulating research in this area and encouraging the development of a very wide range of experimental activity'.

#### WORK IN PROGRESS

In 2001, a pan-European survey was conducted on why CLIL was being introduced across Europe (Marsh, Maljers and Hartiala, 2001). Five dimensions were identified, each of which included a number

of focus points. Each dimension was seen to be realized differently according to three major factors: age-range of learners, socio-linguistic environment, and degree of exposure to CLIL. This survey report is complemented by more extensive follow-up research on a comparative overview of CLIL provision in Europe which reports similar aims (Eurydice, 2006). The diverse aims of CLIL, as found in these differing dimensions, are an important influence that affects how researchers and practitioners describe this educational approach.

The dimensions are idealized and rarely standing alone, because they are usually heavily inter-related in CLIL practice. This means that in real-life implementation of CLIL, it is likely that a school will wish to achieve successful outcomes in relation to more than one dimension at any given time. These dimensions, particularly those under culture (Cultix) and language (Lantix) directly relate to the types of interests found within language awareness; knowledge about language, sensitivity to aspects of language learning, insight into language use, especially in terms of critical thinking skills, and interpersonal communication.

Distinguishing the dimensions allows us to identify the separate, yet inter-locking reasons why CLIL is implemented in diverse European contexts. The 2001 survey report was a first step towards describing CLIL types because the core characteristic of any type depends on the major and predominant reason for teaching through CLIL. It follows the work on situational and operational variables in bilingual education reported by Mackay (1970) and developed further by Spolsky, Green and Read (1974).

The dimensions reported do not denote specific types of CLIL. They concern the goals underpinning CLIL models. It was often found that as many as three or four goals, drawn from different dimensions, might be given as fundamental reasons for implementing CLIL. One issue that was considered significant was that the language dimension was the least commonly reported overall. Thus, the predominant reason for implementing CLIL was not language per se, but aims included within the culture, content, learning or environmental dimensions.

The dimensions are as follows:

1. The Culture Dimension—Cultix
  - A. Building intercultural knowledge and understanding
  - B. Developing intercultural communication skills
  - C. Learning about specific neighbouring countries/regions and/or minority groups
  - D. Introducing the wider cultural context
2. The Environment Dimension—Entix
  - A. Preparing for internationalization
  - B. Accessing international certification
  - C. Enhancing school profile

3. The Language Dimension—Lantix
    - A. Improving overall target language competence
    - B. Developing oral communication skills
    - C. Deepening awareness of knowledge of language, and language use
    - D. Developing plurilingual interests and attitudes
    - E. Introducing a target language
  4. The Content Dimension—Contix
    - A. Providing opportunities to study content through different perspectives
    - B. Accessing subject-specific target language terminology
    - C. Preparing for future studies and/or working life
  5. The Learning Dimension—Learntix
    - A. Complementing individual learning strategies
    - B. Diversifying methods and forms of classroom practice
    - C. Increasing learner motivation
- (Marsh, Maljers and Hartiala, 2001, p. 16)

Research in progress tends to focus on one or more of these dimensions. In terms of Canada, it is clear that a variety of different programmatic models and pedagogical strategies have been adopted and implemented. The same applies to any description of applications of CLIL in other environments.

Research interests tend to be on situational, operational and outcome parameters. These focus on the theoretical principles underpinning CLIL; the methodologies by which it is implemented; the learning environments; and means by which to assess impact. Like CLIL itself, findings are not easily generalized. However, there is an emerging theoretical basis for CLIL reported in Coyle (2005, p. 6), which provides insight into how this approach can:

- raise learner linguistic competence and confidence
- raise teacher and learner expectations
- develop risk-taking and problem-solving skills in the learners
- increase vocabulary learning skills and grammatical awareness
- motivate and encourage student independence
- take students beyond ‘reductive’ foreign language topics
- improve L1 literacy
- encourage linguistic spontaneity (talk) if students are enabled to learn through the language rather than in the language
- develop study skills, concentration—learning how to learn through the foreign language is fundamental to CLIL
- generate positive attitudes and address gender issues in motivation

Following the work of Mohan and van Naerssen (1977) and Mohan (1986), Coyle (1999) introduced a framework by which to describe the inter-relationship between language and subject teaching common

to successful forms of CLIL. Using a framework which incorporates attention being given to cultural, communicative, content and cognitive attributes—the 4Cs Framework, Coyle (2005, p. 8) emphasizes that the operating principles and outcomes of CLIL will not be found in the traditional spheres of either language or subject teachers. It is clear that the teaching and learning approaches differ to those generally found in both language and content teaching.

The 4Cs Framework is noted as building on these principles:

- Content matter is not only about acquiring knowledge and skills. It is about the learner constructing their own knowledge and developing skills;
- Content is related to learning and thinking (cognition). To enable the learner to construct the content, it must be analysed for its linguistic demands;
- Thinking processes (cognition) need to be analysed for their linguistic demands;
- Language needs to be learned which is related to the learning context, learning through that language, reconstructing the content and its related cognitive processes. This language needs to be transparent and accessible;
- Interaction in the learning context is fundamental to learning. This has implications when the learning context operates through the medium of a foreign language;
- The relationship between cultures and languages is complex. Intercultural awareness is fundamental to CLIL. Its rightful place is at the core of CLIL.

Work on CLIL now increasingly focusses on how the methodology achieves outcomes that fall within the domain of language awareness. Because CLIL involves inter-disciplinary cooperation, and integration, it builds bridges between different academic disciplines and the language sciences. Moreover, compared with such areas as sociolinguistics, psycholinguistics or pragmatics, these bridges can be quite profound. This is why CLIL is viewed as being neither ‘language learning’ nor ‘subject learning’, but a fusion of both.

Researchers in Language Awareness have described the need for conceptual shift, whereby the individual develops in a performative, or otherwise procedural way, from less aware to more aware about ‘explicit knowledge about language and conscious perception and sensitivity ... in language use’ (Garret and James 2000). Drawing on the cognitive, cultural, communicative, and content input of methodologies, CLIL provides a procedural platform by which the student can undergo such conceptual shift, both experientially and intellectually.

## PROBLEMS AND DIFFICULTIES

The term CLIL was originally introduced to bind together diverse dual-focussed educational practices where explicit attention is given to both content and language. The diversity involved makes it difficult to generalize research findings. The fact that CLIL has often preceded theoretical description, and the relatively short period in which it has been widely introduced and practiced in different educational contexts, means that there will be an inevitable time lag between description and evidence of outcomes.

In addition, CLIL transcends traditional boundaries in education. This results in academic disciplines, publishers, and other facets of any educational infrastructure, needing to establish where it should be located in terms of practice, research and theory. This also means that it may challenge the status quo, the 'way things are', in a given environment. 'The organization of CLIL type provision in foreign languages makes demands that go well beyond those associated with traditional language teaching. It requires the use of human resources (specialist teachers) and suitable teaching materials to a significantly greater extent than conventional language teaching. Given that CLIL is a relatively recent practice in Europe, it is not surprising to note that over half of the countries concerned confront problems when the time comes to extend this kind of provision—or in some cases introduce it—on a general basis to the entire school population (Eurydice 2006, p. 52).

An educational innovation on the scale of CLIL (Eurydice 2006, p. 14) would be expected to go through a period of some turbulence in the early implementation and experimentation stages. Within countries, studies are clearly being undertaken, to a greater or lesser extent, but there has been no co-ordination of research to date. In addition, because there is often no standardized CLIL blueprint suitable for export from one environment to another, so there is often a problem with drawing conclusions on impact in relation to aspects of language awareness.

## FUTURE DIRECTIONS

The new global linguistic order is particularly marked with respect to the spread of English as medium of instruction. In Europe, CLIL has emerged in response to the need to raise levels of plurilingualism so that more citizens have greater competence in different languages. However, globally, we are increasingly witnessing a rapid adoption of English as a medium of instruction in environments where it may be considered a second or foreign language.

Changing the medium of instruction from one language to another in an educational context does not automatically qualify as an example of CLIL. This approach requires use of *dual-focussed language-sensitive* methodologies alongside change of medium of instruction from one language to another. What we are witnessing, worldwide, is a rapid adoption of English as medium of learning, from kindergarten in East Asia, through to higher education in Europe. Much of this is being done without adaptation of teaching and learning approaches, and it is likely that there will be negative consequences, especially in lower-resourced developing contexts. CLIL is an educational approach that is essentially methodological. It goes beyond change of the medium of instruction. Communicating this to stakeholders will be an ongoing key process worldwide, even if the reasons for medium of instruction problems, and opportunities, differ widely.

The CLIL 'generic umbrella' includes many variants. Some of these may be considered as primarily language teaching. Some can be seen as mainly content teaching. The essence of CLIL leads to it having status as an innovative educational approach, which transcends traditional approaches to *both* subject and language teaching. It is likely that other forms of educational integration will surface which also lead towards similar methodological adaptation and change.

When CLIL is incorporated into the curriculum, language takes its position at the centre of the whole educational enterprise. Teachers consider themselves to be responsible for language development to a greater or lesser extent, even if the language focus takes a secondary role to content. Students are empowered to learn how language is used to achieve goals. The design and implementation of initial and in-service teacher education which ensures that optimal goals are reached is likely to continue to be a key issue requiring research-based expertise.

The language focus within CLIL is invariably on facets of language awareness. This may involve learners having greater understanding of the types of language needed to learn content, the types of thinking skills required for achieving different learning outcomes, and the types of preferred learning styles and strategies that individuals possess. Van Lier (1995) introduces the notions of subsidiary/peripheral and focal awareness. Focal awareness on how we use language to achieve goals through integrated education is now a key interdisciplinary research issue.

As socio-political pressures support wider implementation of adopting a second/foreign language as medium of learning, it is likely that greater emphasis will be placed on examining how CLIL methodologies can enable successful outcomes to be achieved. This will open doors on research that examines language awareness outcomes in relation to specific types of CLIL application.

## KNOWLEDGE ABOUT LANGUAGE AND LEARNER AUTONOMY

### INTRODUCTION

We are autonomous in relation to a particular task when we can perform it (i) independently, without assistance from others, (ii) beyond the immediate context in which we acquired the knowledge and skills on which successful task performance depends, and (iii) flexibly, taking account of new and unexpected factors. Autonomy in this behavioural sense is a criterion of success in developmental learning, including first language acquisition; it is also a goal of educational systems to the extent that they seek to equip learners with knowledge and skills they can deploy spontaneously in their life beyond the classroom. The extent to which metacognition and conscious awareness of self-management are implicated in the autonomy that is integral to developmental learning is infinitely variable, depending on the complex interaction of inherited traits with domestic, social and cultural factors. The same is true of the autonomy that is a coincidental mark of success in formal learning. However, when learner autonomy is a declared pedagogical goal, learner self-management and the learner's reflective capacities play a central and necessarily explicit role. This chapter is concerned with knowledge about language in L2 learning contexts shaped by such a pedagogy. It focuses mainly on classroom learning, but the issues it raises are equally relevant to other contexts of formal language learning, for example, self-access, e-learning and distance learning.

### EARLY DEVELOPMENTS

The concept of learner autonomy was first introduced into the ongoing debate about L2 learning and teaching by Henri Holec in a report published by the Council of Europe in 1979 (Holec, 1981). According to Holec autonomous learners are capable of setting their own learning objectives, defining the 'contents and progressions' of learning, 'selecting methods and techniques to be used', monitoring the learning process, and evaluating learning outcomes (1981, p. 3). The ability to take charge of one's learning in this way is 'not inborn but must be acquired either by "natural" means or (as most often happens) by formal learning, i.e. in a systematic, deliberate way' (ibid.). Thus the educational

challenge is to introduce ‘learning systems which will allow both for the acquisition of autonomy and for self-directed learning’ (ibid., p. 8).

Work on learner autonomy that has focused on the psychological processes of learning (e.g. Little, 1991) has mostly adopted a broadly constructivist perspective, drawing in particular on work in developmental psychology, notably by Piaget (1926), Vygotsky (1978, 1986) and Bruner (1983). For them autonomy is a basic human capacity and characteristic: we *become* autonomous because we *are* autonomous. At the same time, such work has emphasized both the metacognitive (Ridley, 1997) and the affective/motivational dimensions of learning (Ushioda, 1996), thus forging links with research on learning and communication strategies on the one hand (e.g. Oxford, 1990; Wenden, 1991) and motivation on the other (Deci and Ryan, 1985; Dörnyei, 2001). Work in this domain raises two questions relative to knowledge about language: What kinds of knowledge about language are necessary to the growth of autonomy in language learning and language use? and How can learners simultaneously acquire and deploy such knowledge?

Attempts to answer these questions necessarily bring us into contact with two areas of research that have developed more or less contemporaneously with research on learner autonomy. The first is concerned with the internalized linguistic knowledge on which spontaneous language use depends and the pedagogical measures most likely to promote its development (e.g. Bygate, Skehan and Swain, 2001; Doughty and Williams, 1998; Robinson, 2001). The second has to do with ‘sensitivity to and conscious awareness of the nature of language and its role in human life’ (Donmall, 1985, p. 7). This latter kind of knowledge is the concern of proponents of Language Awareness and underlies curricular initiatives designed to interest learners in language acquisition, language use, language variation and language change (Hawkins, 1981, 1984). Although Language Awareness as an educational movement originated in the United Kingdom, similar developments have arisen in other European countries—for example, in France via the concept of ‘*éveil aux langues*’ (Candelier, 1992; see also “Awakening to Languages” and Educational Language Policy, Volume 6), and in Germany via the concepts of ‘*Sprachbetrachtung*’ (contemplation of language), ‘*Reflexion über Sprache*’ (reflection on language), ‘*Sprachbewusstsein*’ (consciousness of language), and ‘*Sprachbewusstheit*’ (language awareness) (for an overview see Gnutzmann, 1997, see also Van Essen, Language Awareness and Knowledge about Language: A Historical Overview, Volume 6). Key questions for these research areas are: What is the relation between explicit and implicit knowledge about language? In particular, does an explicit focus on linguistic form support the internalization of target language grammar? Alternatively, how far

is it possible to be non-interventionist with regard to target language grammar, depending on language use gradually to develop the target language system? These are also, of course, key questions for language pedagogy. However, when that pedagogy is explicitly oriented to learner autonomy, they are apt to be posed and answered in a particular way.

#### MAJOR CONTRIBUTIONS

When Holec identified the challenge posed by learner autonomy as the introduction of ‘learning systems which will allow both for the acquisition of autonomy and for self-directed learning’ (1981, p. 8), he was evidently thinking of large-scale educational structures. Perhaps the most sustained attempt to develop, monitor and refine such a system at classroom level is the one reported in the literature by Leni Dam. For the past 30 years, she has taught English classes in a Danish middle school according to precepts that coincide closely with Holec’s definition of the autonomous learner. Six features define the essence of her approach (derived from Dam, 1995):

1. From the beginning, she uses the target language as the preferred medium of classroom communication and requires the same of her learners. Inevitably, in the early stages their interlanguage bears powerful, sometimes overwhelming, traces of Danish.
2. She involves her learners in a non-stop quest for ‘good learning activities’, which are shared, discussed, analysed and evaluated with the whole class—in the target language, to begin with in very simple terms.
3. She requires her learners to set their own goals and choose their own learning activities, and these too are subjected to discussion, analysis and evaluation—again, in the target language. Especially in the early stages, learners are encouraged to develop their own learning materials. For example, by creating word games they not only learn vocabulary but also (by playing the games) become fluent in the performance of simple interactive routines in the target language.
4. Although learners are required to identify individual goals, they mostly pursue them via collaborative project work in small groups. In this way reflection—whether on learning goals, appropriate activities, features of the target language, or learning outcomes—usually begins as an interactive, dialogic process that (according to Vygotskian principles) can gradually develop inwards.
5. All learners are obliged to keep a written record of their learning: plans of lessons and projects, lists of useful vocabulary, whatever

texts they themselves produce. This written record is kept in a logbook or journal, so that all their learning is in one place.

6. Dam engages her learners in regular evaluation of their progress as individual learners and as a class—in the target language.

The remarkable success that Dam has achieved (e.g. see Dam, 1995; Dam and Gabrielsen, 1988) seems to be attributable to three causes. First, by involving her learners from the very beginning in the choice of learning activities and materials she requires them to engage personally with the learning process; passivity is not an option. This confronts head-on the problem of learner motivation, which was Dam's starting point in the mid 1970s (1995, p. 2):

I was up against the tired-of-school attitude that this age group often displays, as well as a general lack of interest in English as a school subject. In order to survive I felt I had to change my usual teacher role. I tried to involve the pupils—or rather I forced them to be involved—in the decisions concerning, for example, the choice of classroom activities and learning materials.

Second, Dam's insistence on use of the target language not just to perform learning tasks but to discuss and analyse possible learning activities, organize and monitor group projects, and evaluate learning outcomes, ensures that from the beginning learners must use the target language to express personal meanings. It also ensures that they gradually develop metacognitive as well as communicative proficiency in English. Dam's learners proceed by using their target language to perform a variety of learning tasks; that much they have in common with classes organized according to the precepts of task-based learning (e.g. Bygate, Skehan and Swain, 2001). However, the decisive difference is that in Dam's classroom the tasks are devised and task outcomes are evaluated by the learners themselves.

Third, the fact that Dam requires her learners to capture their learning in a journal provides them with two kinds of learning support. On the one hand, the written record is a resource they can use for further learning. For instance, if they have chosen to write a short text for homework—perhaps a description of themselves and their hobbies—they can subsequently use the text as a prompt for classroom communication and discussion. This function of writing is further exploited in the use of posters to summarize and maintain awareness of information that is important to the class as a whole: possible homework activities, useful words and expressions, plans of project work, and so on. On the other hand, the fact that Dam's learners make such extensive use of the technology of literacy means that they cannot help but focus on linguistic form. As Olson (1991) has pointed out, writing

objectifies language, turning it into something we can analyse and discuss. Thus when language pedagogy assigns a central role to writing, it positively invites reflection on linguistic form, especially when learners undertake collaborative writing tasks.

Insisting from the outset that her learners take decisions and make choices, Dam gradually expands the range within which they do so. To begin with, preponderantly whole-class learning is punctuated by pair and group work in which the initiative passes to the learners; but gradually more time is devoted to group work, which means there is gradually more scope for the exercise of learner autonomy and more space in which it can develop further (see Dam, 1995). Because the target language is both the object and the medium of learning, the growth of learners' capacity for autonomous learning depends on the growth of their proficiency in English and vice versa. Again, in the earliest stages Dam herself must initiate and scaffold communication in English and provide her learners with the words and phrases that they need. However, they are expected also to find their own words and phrases, and they quickly learn to scaffold one another's utterances as they develop control of the dynamics of group interaction (see Thomsen, 2003).

As Legenhausen (2003) has pointed out, for Leni Dam language learning is a process of 'creative construction' that is driven by authentic communicative interaction. Essentially, the teacher has four responsibilities: to devise and maintain a rigorous work cycle; to suggest possible learning activities and materials; to challenge learner decisions and choices that are lazy or ill-conceived; and to raise learners' awareness of linguistic form, the mechanics of communication, and the process of language learning—but always within the limits of their achieved proficiency. Dam's approach assumes that linguistic competence (internalized knowledge of the target language) cannot be taught directly: its growth must be stimulated by involving learners in purposeful target language use. To this extent classroom language learning of this kind is closely comparable to 'naturalistic' language acquisition, whether of first or second languages. However, the central role assigned to writing encourages the development of metalinguistic awareness and a focus on linguistic form. In other words, within the framework of interactive language use there are manifold opportunities to engage in explicit linguistic analysis. When the pedagogical process is driven by authentic communicative interaction and captured in a learning journal, explicit focus on linguistic form can only bring added benefit (see Thomsen, 2003, for examples of explicit vocabulary learning and the use of video recording to introduce learners to the idea of scaffolding and encourage them consciously to develop techniques for scaffolding one another).

## WORK IN PROGRESS

If the Council of Europe was responsible for bringing the concept of learner autonomy to the attention of the language teaching world at the end of the 1970s, it was also responsible a quarter of a century later for introducing the European Language Portfolio (ELP), one of whose declared purposes is to support the development of learner autonomy. Not only is the ELP one of the most significant pedagogical innovations of recent years; it is also beginning to establish itself as an important focus for language learning research.

The ELP is designed to foster the development of learner autonomy by providing language learners with tools to plan, monitor and evaluate their learning. Its chief means of stimulating these reflective processes is self-assessment carried out in relation to the common reference levels of the *Common European Framework of Reference for Languages* (CEF; Council of Europe, 2001). The CEF defines L2 proficiency (i) in the form of 'can do' statements; (ii) at six levels arranged in three bands: *basic user* (A1, A2), *independent user* (B1, B2), *proficient user* (C1, C2); and (iii) in relation to five communicative activities: listening, reading, spoken interaction, spoken production, writing. The six proficiency levels are summarized in the so-called self-assessment grid (Council of Europe, 2001, 26f.) and elaborated in 34 illustrative scales. There is no single version of the ELP. Instead, *Principles and Guidelines* (Council of Europe, 2000) constrain the design of ELPs for particular kinds of learner in particular learning contexts and provide the criteria for their accreditation by a Validation Committee that meets twice a year in Strasbourg.

The ELP has three obligatory components: a language passport, a language biography, and a dossier. The language passport summarizes the owner's linguistic identity and his or her experience of learning and using L2s; it also provides space for the owner periodically to record his or her self-assessment of overall L2 proficiency, usually against the CEF's self-assessment grid. The language biography accompanies the ongoing processes of learning and using L2s and engaging with the cultures associated with them. Checklists of communicative tasks in the form of 'I can' statements, scaled according to the proficiency levels of the CEF and arranged by communicative activity, are used to set learning goals and assess learning outcomes. The language biography also encourages reflection on learning styles, strategies and intercultural experience. Sometimes this reflection is a matter of filling in a form or recording one's thoughts under a series of headings; sometimes it is entirely open. The dossier is where the owner collects evidence of his or her L2 proficiency and intercultural experience; it may also be used to store work in progress.

In keeping with the behavioural definition of communicative proficiency elaborated in the CEF, use of the ELP requires the learner to have and to develop knowledge about language that is action-oriented. In the first instance self-assessment is a matter of knowing what one can *do* in the language(s) in question. For example, in the self-assessment grid spoken interaction at A1 level is summarized thus:

I can interact in a simple way provided the other person is prepared to repeat or rephrase things at a slower rate of speech and help me formulate what I'm trying to say. I can ask and answer simple questions in areas of immediate need or on very familiar topics.

And in the ELP designed for use in Irish secondary schools (Authentik, 2001) the A1 checklist for spoken interaction (developed by drawing on the illustrative scales in the CEF to restate the communicative goals of the official curriculum in the form of 'I can' statements) is as follows:

- I can say basic greetings and phrases (e.g. please, thank you), ask how someone is and say how I am
- I can say who I am, ask someone's name and introduce someone
- I can say I don't understand, ask people to repeat what they say or speak more slowly, attract attention and ask for help
- I can ask how to say something in the language or what a word means
- I can ask and answer simple direct questions on very familiar topics (e.g. family, school) with help from the person I am talking to
- I can ask people for things and give people things
- I can handle numbers, quantities, cost and time
- I can make simple purchases, using pointing and gestures to support what I say

The CEF complements its behavioural definition of L2 communicative proficiency with a focus on the user/learner's competences, which yields scales of general linguistic range, vocabulary range, vocabulary control, grammatical accuracy, phonological control, orthographic control, sociolinguistic appropriateness, flexibility, turntaking, thematic development, coherence/cohesion, spoken fluency and propositional precision. These scales make it possible to draw up detailed descriptions of the many kinds of linguistic knowledge required to perform communicative tasks at different proficiency levels and in a wide range of situations and contexts. The CEF has nothing to say about the ways in which such knowledge should be developed in learners, though the official guide to the ELP for teachers and teacher trainers (Little and Perclová, 2001) advocates a pedagogical approach closely related to the one described above. If an ELP is to be used in this way, however,

it must fulfil at least one non-obligatory condition: goal setting and self-assessment checklists and the process pages of the language biography must be presented not in the learner's mother tongue but in the language(s) he or she is learning. For only thus can the ELP support language learning through language use; and only thus is it possible to ensure that the development of autonomy in language learning depends on the development of autonomy in language use and vice versa.

#### PROBLEMS AND DIFFICULTIES

The pedagogical approach described here is not easy to replicate, for at least three reasons. First, it makes great demands on the teacher, requiring high levels of target language proficiency, pedagogical skill, and perseverance. Although its governing principles are clear enough, they cannot simply be imposed on learners but must be explored, negotiated and implemented afresh with each new class; and the development of learner autonomy is a slow process, always subject to frustrating delays and backsliding. Secondly, if the approach is to be effective within the school as a whole, it must be adopted by all teachers, who must work together on curriculum, classroom methods, and assessment. This requires that all teachers have the same commitment to learner involvement, learner reflection, and the development of target language proficiency through target language use. Thirdly, at the level of the national or regional educational system, the approach requires not only a curriculum that allows teachers and learners a high degree of freedom, but forms of assessment that are harmonious with the varieties of self-assessment that help to drive the development of learner autonomy. Evidence is beginning to emerge that the ELP can help individual teachers rise to the challenge of learner autonomy (e.g. Sisamakris, 2006; Ushioda and Ridley, 2002). However, while the ELP could provide a focus for developing a whole-school approach to language teaching for learner autonomy, we so far lack fully documented examples of its use to this end; and work has still to begin on the development of large-scale assessment systems that accommodate self-assessment.

The pedagogical approach described here also poses a challenge to empirical research, not least because it demands to be explored at once longitudinally and holistically, following learners' L2 development over a number of years. Leni Dam and Lienhard Legenhausen have explored the linguistic development of Dam's learners in various dimensions—for instance, the acquisition of vocabulary in the early stages of learning (Dam and Legenhausen, 1996); the acquisition of English grammar without formal instruction (Legenhausen, 1999); and the development of conversational interaction and the impact on learning of 'pushed output' (Legenhausen, 2003). In some cases their

exploration has involved control groups—Danish and German classes that have been following the more usual route of learning English with a ‘communicative’ textbook (e.g. Dam and Legenhausen, 1996). Their findings clearly support the view that it is possible to achieve a high level of proficiency in English without a strong explicit focus on English grammar, and yet doubts and difficulties remain. As long as the data are drawn from a single classroom, it may be objected that the learners’ undoubted achievements are attributable to the teacher’s unique qualities. What is more, although Dam and Legenhausen have focused on issues that are central to classroom-based SLA in general, their work is clearly constrained by key features of Dam’s pedagogical approach, which exclude certain kinds of empirical exploration as being interventionist in the wrong way. Research into the effects of task-based learning on mastery of target language grammar, for instance, cannot easily be replicated because the learners select their own tasks. Finally, there is the question of generalizability from the learning of English to the learning of other languages. When compared with (say) French, German, Spanish or Italian, English has a greatly reduced inflectional morphology. This means that early fossilization in learners of English may not prevent them from achieving relatively high levels of communicative proficiency, especially if they develop a good phonological system; whereas early fossilization in (say) English-speaking learners of German may well be a serious impediment to effective communication. The only way of settling this question is by replicating Dam’s long years of experimentation and commitment in a number of different countries in different classrooms teaching different languages.

#### FUTURE DIRECTIONS

Much of the literature on learner autonomy, especially when it is concerned with self-access language learning or the politics of language education, assumes that the pedagogical task is to lead learners from dependence to independence. In this article, by contrast, autonomy in language learning has been understood as a particular instance of a general human capacity, tendency and need. According to such an understanding, the pedagogical task is to exploit and develop further the autonomy that learners already possess, making it explicit to them as they gradually achieve communicative and metacognitive proficiency in their target language. Holec argued that self-directed learning implies ‘a change in the *definition of the knowledge* to be acquired and a change in the *learner/knowledge* relationship’, so that ‘objective, universal knowledge is [...] replaced by subjective, individual knowledge’ (Holec, 1981, p. 21; italics in original). In terms of the conception of

learner autonomy presented here, this is more than a routine obeisance to learner-centredness: it is an epistemological challenge. One of the urgent tasks facing theorists of learner autonomy is to respond to this challenge, making full use of research in child development (e.g. Trevarthen, 1998) and social psychology (e.g. Deci and Ryan, 1985) that treats autonomy respectively as an inborn characteristic of the human organism and one of our deepest needs. When our focus shifts from conceptualization to operationalization, we are confronted by the truth that we necessarily learn any L2 on the basis of the language(s) we already know. Classrooms that are organized according to the principles explored in this article invite a new wave of research on language transfer and interlanguage, as phenomena not only of individual learners but of micro-communities of language users. The same classrooms also raise an important question about the cultural dimension of language learning that needs to be explored in depth: at least to begin with, autonomous language learners are necessarily concerned not with the otherness of their target language culture, but with the need to find ways of encoding their own culture in the target language.

Our capacity for autonomous behaviour in any sphere develops not in isolation, but in interaction with others. Thus in language classrooms the exercise and growth of learner autonomy is stimulated above all by interaction—between teacher and class, teacher and individual learners, teacher and groups of learners, learners working in pairs, and learners working in groups. Vygotsky's sociocultural theory has greatly enhanced our understanding of this dimension of autonomy, and there is much to be learnt from the sociocultural turn in SLA studies. At the same time, work within the neo-Vygotskian paradigm has generally not concerned itself with learner autonomy as such, which may seem slightly odd, given that Vygotsky's 'zone of proximal development' is defined as the distance between '*independent* problem solving [...] and problem solving under adult guidance or in collaboration with more capable peers' (Vygotsky, 1978, p. 86; my italics).

It is one thing to insist that learner autonomy is a product of social interaction, quite another to do full justice, in theory and practice, to the role played in its development by the diversity of interacting phenomena and factors to be found in any context of learning. The ecological perspective on language and language education (Kramsch, 2002; van Lier, 2004) at once a response to and an extension of sociocultural theory, offers theorists of learner autonomy a rich resource for conceptualizing context; it also offers an approach to research that is more obviously in sympathy with the holistic character of learner autonomy than the approaches of mainstream SLA (van Lier, 2004). In the immediate future the most important developments in theory and

research may well be inspired by the multiple dimensions and holistic tendency of the ecological perspective.

Of course, theory and research are useful only to the extent that they help to illuminate the challenges and solve the problems that we encounter in practice. We may arrive at a fuller understanding of autonomy as an essential human characteristic and need, of the role played by interactive, linguistically mediated dynamics in its development, and of the almost infinite ways in which the many different features of context shape and constrain language learning and language use. However, none of this will get us far if it does not arise from and feed back into projects that seek to achieve more widespread success in L2 learning by following the principles explored in this article. If the ecological perspective points the way forward for theory and research, the ELP opens up new possibilities for pedagogy. For it is a tool that supports language learning through language use, yet encourages the reflective development of explicit knowledge about language, from the learner's sense of what she can do in her L2(s), through analytic knowledge of linguistic form and the structures of linguistic communication, to awareness of the language-embeddedness of culture.

## CLASSROOM DISCOURSE: APPROACHES AND PERSPECTIVES

### INTRODUCTION

The term “classroom discourse,” as used in this review, refers to all forms of discourse that take place in the classroom. It encompasses the linguistic as well as the nonlinguistic elements of discourse. The former includes the language used by the teacher and the learners, as well as teacher–learner and learner–learner interactions. The latter includes paralinguistic gestures, prosody, and silence—all of which are integral parts of the discourse. The linguistic and nonlinguistic elements constitute the observable dimension of classroom discourse. Studies of classroom discourse have explored factors that play a critical role in shaping classroom discourse. These factors pertain to the sociocultural contexts in which the discourse is generated, including the physical environment, the socioeconomic and cultural backgrounds of participants, as well as the psychological dimensions such as their perceptions, emotions, beliefs, and orientations. They constitute the unobservable dimension of classroom discourse. Because of the limit of space, this review focuses on SL/FL classrooms, and makes reference to L1 classroom discourse research only when it impacts on SL/FL classroom research.

### EARLY DEVELOPMENTS

Research on classroom interaction and classroom events originated in the field of general education in the 1950s for teacher education purposes. It was motivated by the search for “objective” assessments of student–teachers’ performance in the classroom and the identification of “effective teaching”. The first major attempt was made by Flanders who proposed a systematic analysis of classroom interaction with an instruction referred to as Flander’s Interaction Analysis Categories (FIAC) (Flanders, 1960, see also Janks and Locke, *Discourse Awareness in Education: A Critical Perspective*, Volume 6). Studies of interaction in SL (second language) and FL (foreign language) classrooms began in the 1960s and were largely influenced by Flanders’ work. There is a plethora of classroom discourse instruments based on FIAC for language teacher training (see Allwright 1988 for a review of ESL/EFL classroom observation instruments). Early studies of SL/FL classroom

interaction were also driven by the need to evaluate the effectiveness of the various FL teaching methodologies in the hope that the “best” method would be identified. The inconclusive findings, however, pointed to the problematic nature of the basic tenets of these studies. It was generally agreed that classroom processes were extremely complex and little understood. The aim of classroom-centered research, it was argued, should be descriptive rather than prescriptive. There was also a consensus that research should focus on not only the teacher’s language and behavior, but also the learners’ behavior.

Parallel to the development of research on SL/FL classroom discourse was the research on L1 (first language) classrooms. The impetus for research in this area came from the “language across the curriculum” movement in Britain, which drew attention to the important role of language in education. A number of studies were conducted on L1 content classrooms. Some studies focused on specific dimensions of the language used by teachers and learners, for example, the types of teacher questions and the learner responses elicited, the types of learner-talk (“exploratory” vs. “final draft”) and the mental processes reflected (Barnes, 1969). Some studies aimed at providing a comprehensive description of classroom events and discourse. For example, Sinclair and Coulthard (1975) adopted the notion of “move” to analyze all elements of classroom discourse to construct a grammar of spoken discourse. Although Sinclair and Coulthard’s work was motivated by linguistic rather than educational concerns, their descriptive framework has been highly influential in classroom discourse research, particularly their analysis of the hierarchical structure of discourse units, namely “acts,” “moves,” “exchange” and “transaction,” and the structure of the “exchange” as consisting of “initiating,” “responding” and “follow-up” moves (IRF).

#### MAJOR CONTRIBUTIONS

Until the mid-1990s, research on classroom discourse was dominated by an information-processing approach to learning based on an input–output model. Learning was understood as a process that took place inside the head of the individual and was separable from the sociocultural contexts of learning. The majority of studies focused on the analysis of language input, interaction, and language output. Much of the research conducted in the 1970s and 1980s was “etic” (nonparticipant’s perspective) rather than “emic” (participant’s perspective), and a minimalist approach was adopted to the role of context (for reviews of classroom discourse research, see Allwright and Bailey, 1991; Chaudron, 1988; van Lier, 1988). More recent studies have begun to examine classroom discourse more holistically, and sociocultural perspectives of learning have become increasingly influential.

*The Observables: Input, Interaction, and Output*

Studies of language input have examined teachers' speech and how it affects learners' language output. Linguistic modifications made by teachers were found to be similar to those used by native speakers (NS) of the target language when talking to nonnative speakers (NNS); these have been referred to as "foreigner talk." Early studies focused on the linguistic features of teachers' modified speech with the assumption that such modifications would facilitate comprehension. Subsequent studies, however, have pointed out that interactional modifications resulting from the negotiation of comprehensible input are more important to facilitate language learning. The research focus has shifted to interactional structure and modification devices used by NS in NS–NNS conversations, such as confirmation checks and comprehension checks, which have been used in a number of studies to determine the amount of comprehensible input made available to the learners (Long, 1983; Varonis and Gass, 1985). The lack of evidence that comprehensible input produces higher quality learner output has led to the "Out Hypothesis" (Swain, 1985) which states that pushing learners to produce comprehensible as well as grammatically accurate output is important for language acquisition because it forces learners to process language at a deeper level and to notice the "holes" in their interlanguage. Subsequent research has further argued for the centrality of output in language acquisition on the basis that it provides opportunities for negotiation of meaning. Negotiation of meaning, which happens when communication failure occurs or when learners are required to complete structured tasks involving information gaps, has been considered particularly effective for language acquisition because it connects input, and enhances attention to linguistic form and output (see Interaction Hypothesis proposed by Long, 1996; see also papers collected in Doughty and Williams, 1998). The findings of studies on the relationship between negotiation of meaning and language acquisition have been somewhat inconclusive, however.

Another strand of research on language input is the study of teachers' questions and their corrective feedback. Studies of teachers' questions in SL/FL classrooms have adopted Barnes' (1969) classification of teacher questions in L1 classrooms, mainly "open" versus "closed" and "pseudo" versus "genuine" questions. They have made similar distinctions between "display questions" (i.e., pseudoquestions) and "referential" questions (i.e., genuine questions). Referential questions have been found to elicit linguistically more complex responses from learners than display questions (Long and Sato, 1983). Modifications of questions by teachers (comprehension-oriented and response-oriented) and their impact on students' responses have also been investigated. The function of teachers' feedback has been conceived as providing information for

learners to confirm or disconfirm their hypotheses about the target language, and the notion of “error” has been reconceptualized from a developmental perspective (Allwright and Bailey, 1991). More recent research has emphasized the importance of form-focused corrective feedback and “recasts,” or reformulations, which rephrase the learners’ utterances and correct the errors without changing the meaning of these utterances are considered to facilitate learning, particularly “focused recasts” (see papers collected in Doughty and Williams, 1998), though research findings have been inconclusive (Lightbown, 2000).

Earlier studies of learner output include learners’ turn-taking behavior and oral participation in different classroom settings. Seliger (1983) found that “high-input generators” (HIGs) who generated more input by taking more turns were more effective learners compared with “low-input generators” (LIGs) who took fewer turns. Seliger’s position has been questioned on the grounds that important factors such as the cultural backgrounds of the learners which could affect learners’ interactional behavior were ignored. Investigations of learners’ oral participation have examined the effects of learning arrangements and task types on learner participation. Pair and group interactions were found to generate more negotiation of meaning and a larger variety of speech acts than teacher-fronted settings (Doughty and Pica, 1986). Tasks which required obligatory information exchange yielded more modified interactions and learner output in pair and group work than those where the information exchange was optional (Plough and Gass, 1993).

### *The Unobservables*

The studies reviewed so far pertain mainly to the observable in the classroom. By the late 1980s and early 1990s, it had become clear that studies of the observable needed to be illuminated by the unobservable in the classroom. Researchers suggested that learners’ participation in the classroom could be affected by their learning styles, psychological states, cultural backgrounds, and beliefs about classroom behavior (Allwright and Bailey, 1991; Tsui, 1996). Studies of Asian learners’ participation in the classroom have noted that they are less willing to volunteer answers and they take fewer turns than their non-Asian counterparts (Johnson, 1995), and that their observable behaviors are partly shaped by the cultural values, identity and differences of the learners (Duff, 2002). Similarly, the way teachers pose questions and provide feedback, and the kind of interaction they engage with learners are shaped by their conceptions of teaching and learning, and their lived experiences of classroom events. Subsequently, classroom research have adopted an ethnographic approach and have analyzed classroom

discourse data in its sociocultural contexts from an emic perspective (Bailey and Nunan, 1996; Johnson, 1995; van Lier, 1988). Instead of simply focusing on classroom discourse data, a variety of qualitative data, such as lesson plans, teachers' and learners' journals, interviews and stimulated recall protocols have been used to make sense of the discourse data. The wider educational and sociopolitical contexts, such as educational policy, school curriculum, socioeconomic background of learners and school culture, have also been taken into consideration.

### *Sociocultural Perspectives*

In the 1990s, the shift in research paradigm in general education from information processing to sociocultural perspectives of learning, influenced by the work of the Soviet sociohistorical school (Vygotsky, 1978), began to make an impact on SL research (see Lantolf, 1994). This shift has led to a reconceptualization of language, context, and learning in profound ways. A sociocultural theory (SCT) of learning conceptualizes the relationship between the learner and the social world as dialectical rather than dichotomous and as mediated by cultural artifacts, of which language is primary. Learners are not just passive recipients of language input and teachers are not just providers of input. Rather, the learners, the teacher, and the sociocultural context in which the discourse takes place are constitutive of what is being learned. Classroom discourse studies based on the input–output model have been criticized for presenting an impoverished and reductionist view of SL/FL learning (see papers collected in Lantolf and Appel, 1994 and in Lantolf, 2000).

A number of recent classroom-centered studies have adopted SCT, and classroom discourse has been reconceptualized as a major semiotic resource that mediates learning in the classroom. Similarly, curriculum materials, pedagogical activities, and tasks have been conceptualized as semiotic resources rather than ways of packaging target language input (see papers collected in Lantolf, 2000). Key concepts in SCT have been used as interpretive frameworks for analyzing classroom discourse data, including the Vygotskian concepts of zone of proximal development (zpd), mediated learning and scaffolding (Bruner, 1983). Several studies have adopted the notion of scaffolded instruction in the learners' zpd and noted that scaffolding facilitates learning only if the teacher is sensitive to the learners' level of linguistic competence and their specific interlanguage features. They have also pointed out that scaffolding can be mutual rather than unidirectional (i.e., from expert to novice), and can be provided by peers, even among very young FL learners (Lantolf and Appel, 1994). Adopting the notion of mediated learning, Swain (2000) has extended the notion of "output" as external

speech. She has argued that external speech in collaborative dialogues is a powerful mediational tool for language learning because it encourages learners to reflect on “what is said” in language-related episodes while still being oriented to making meaning, and helps learners to monitor their own language use, to notice the gaps in their interlanguage and to set goals for themselves.

#### WORK IN PROGRESS

Current research on classroom discourse appears to cluster around two concerns. One concern is to address issues where research findings have been inconclusive. For example, the conflicting findings of the effect of form-focused corrective feedback such as focused recasts on learners’ output have led researchers to investigate other effective strategies. For example, Ellis, Basturkmen and Loewen (2001) have proposed that preemptive rather than corrective focus on form by the learner was more likely to result in learner uptake. Similarly, the inconclusive relationship between negotiation of meaning and language acquisition has led to more recent studies on the relationship between the two. For example, Nakaham, Tyler, and van Lier (2001) have found that compared to structured activities such as information gap tasks, unstructured conversations provided more opportunities for language use at a higher level of linguistic complexity even though they triggered fewer negotiation repairs. Foster and Ohta (2005) have found that learners engaged in output modification and form-focused negotiation with supportive peer assistance even when they were not required to fill information gaps or repair communication breakdowns. In addressing these issues, a number of studies have drawn on various theoretical perspectives and have yielded interesting insights.

The second concern is to advance the field by adopting conceptual frameworks in a variety of disciplines, most of which are sociocultural in orientation. A number of classroom discourse studies have drawn on insights from Activity Theory (Lantolf and Appel, 1994) which conceptualizes goal-oriented human action as part of a larger activity that is driven by motive and shaped by the broader sociocultural system in which the activity is situated. The individual’s participation in these socially meaningful activities is mediated by the cultural tools, which he or she appropriates. In the course of the interaction, the cultural tools, the nature of the activity and the modes of participation are transformed; the same activity may be realized by different actions mediated by different tools. Conversely, the same action may be driven by different motives, hence realizing different activities. According to this perspective of learning, the same task may be operationalized as different activities with different goal-oriented actions by different learners and by the same

learner in different contexts. The dialogic interaction that emerges in task completion plays an important part in shaping the way learners orient themselves to the task and to each other. It is the orientation of learners as agency, not the task per se, that determines the way the task will be performed and the learning that will take place (Lantolf and Appel, 1994). Hence, tasks should be understood as emergent interactions and not as the packaging of language input.

Also working within the sociocultural paradigm, a number of researchers have adopted an ecological perspective of language learning. For example, van Lier (2000) has emphasized the totality of the relationships between the learner and all other elements or participants of the context with which he or she interacts. He has proposed “affordance” as an alternative conception of “input”. He has pointed out that the environment makes available opportunities for learners to engage in meaning-making activities with others (a “semiotic budget”), and what is perceived as relevant and acted on by the learner becomes an “affordance”. In other words, “input” has been reconceptualized as the linguistic affordances perceived and used by the learner for linguistic action. Input is therefore not something standing outside the learner waiting to be acquired, but rather the interaction between the learner and the environment.

Classroom discourse research has also begun to draw on the conceptual framework of learning as social participation (Lave and Wenger, 1991; Wenger, 1998), which is also sociocultural in orientation. For example, Donato (2004) has distinguished “interaction” in the second language acquisition (SLA) literature from the notion of “collaboration” in a social theory of learning which entails mutual engagement in a joint enterprise that is socially meaningful to members of a community of practice. He has noted that the relational dimension of collaboration has been largely ignored in SL/FL classroom research. He has argued that the analysis of discourse generated by isolated task completion in short time frames by group members who are new to group work does not capture the reality of how learning is co-constructed in collaborative work because it takes time to establish relationships. Drawing on the notions of “community of practice” and “legitimate peripheral participation,” Donato has further maintained that the value of collaboration is not to enable learners to acquire more language knowledge, but rather to move from peripheral to full participation as competent members in their communities of practice.

#### PROBLEMS AND DIFFICULTIES

From the above review of major contributions to the field, including work in progress, it is apparent that classroom discourse research has

made significant progress in addressing issues germane to understanding the complex interplay between factors that impinge on what appear to be simple classroom interchanges. Research on classroom discourse in the last decade has begun to move away from being “data-heavy but theory-light” (Donato, 2004, p. 299). The appropriation of research methods and theoretical frameworks in other disciplines has enriched our understanding of classroom discourse. However, the field is faced with a number of challenges of which only a few obvious ones have been outlined here. One challenge is whether there is a propensity to adopt methodologies without understanding their origins and theory-method relationships, and to use the same terminology with different theoretical assumptions in the discussions. For example, the terms “social” and “context” have been widely used with assumptions which are not shared. Similarly, the term “community” has been used by different researchers in different ways, and the term “community of practice” has been adopted without regard to the way it has been defined in Wenger’s theoretical framework (see papers collected in Duff, 2002). There is also a potential danger of appropriating uncritically some of the key notions in other disciplines. For example, the notion of scaffolding might be taken uncritically as assistance which necessarily leads to more effective learning. As the preceding discussion has shown, scaffolded instruction does not necessarily facilitate learning and overscaffolding might inhibit learning. Another example is the notion of “collaboration” which seems to have been taken as implicated by “interaction”. As Donato (2004) has pointed out in his review of current studies of collaborative work, not all forms of classroom interaction are collaborative and conducive to the development of discourse competence.

Another challenge is that the analysis of classroom discourse as situated in its sociohistorical context typically involves an eclectic approach in research methodology and a triangulation of qualitative and quantitative data collected from different sources over a period of time. A rigorous analysis of data requires an iterative process of data interpretation and theory generation which is extremely time-consuming. It is sometimes difficult to present a full account of the research processes within the word limit of a journal article (see, e.g., the exemplars of research methodologies presented in Duff, 2002). This is probably one of the reasons why, as Donato (2004) has pointed out, research studies from a sociocultural perspective are rich in theoretical concepts but thin on data.

Yet another challenge is the substantiation of claims made about the relationship between language learning and the classroom discourse data analyzed. For example, claims have been made about the effect of input on learners’ output, and the effect of pushed output on language

acquisition. However, in many cases, there is a lack of substantial evidence to support such claims. In some cases, the evidence is confined to the learners' language output in the adjacent discourse units. There is little evidence of the long-term effect of input on language learning. Similarly, claims made about collaborative learning or co-construction of knowledge have been based on the analysis of the co-construction of discourse between the teacher and learners and among learners. Although one can argue that the discourse is evidence for co-construction of knowledge, it is not always clear that such co-construction facilitates SL/FL learning.

#### FUTURE DIRECTIONS

Since the 1990s, research on classroom discourse has advanced the field in several aspects. First, as Kramsch (2002) has observed, there has been a revival of the emphasis on context, an aspect which was minimalized in the 1970s and 1980s. Moreover, instead of focusing on specific aspects of classroom interaction, there is emergent research which takes a more holistic view of classroom interaction, integrates micro- and macroanalyses, and attends to the multiple dimensions of context and the multiple levels of discourse in the classroom. Issues such as power, identity, culture, and gender are beginning to appear on the research agenda. For example, Duff (2002) has investigated the co-construction of cultural identity and difference in the classroom where learners are linguistically and socioculturally heterogeneous. The question of the (mis)representation of self in classroom situations through the discourse in which ESL learners are typically engaged is an area which has begun to draw greater attention.

Second, the theoretical frameworks drawn on from neighboring disciplines to illuminate the complexity of classroom data continues to widen. For example, the collection of papers in Lantolf (2000) has advocated a pluralistic approach to SLA and has brought together the work of Vygotsky and Bakhtin, social philosophers such as Bourdieu and Habermas, cognitive psychologists such as Rommeveit, and psychologists such as Gibson, Bateson and Bronfenbrenner. Van Lier (2000) has proposed in that volume that the input-output model should be replaced by an ecological perspective. This has been echoed by Kramsch (2002) who considers an ecological approach to language learning as a powerful way of capturing the symbiotic relationship between the language user and the environment. This approach not only reconciles the tension between language acquisition and language socialization, but also offers a new way of bringing together theoretical frames from other disciplines to enhance our understanding of the

complexities of classroom discourse. In the collection of chapters in Kramsch (2002), concepts in the sociology of language such as Goffman's frame analysis and participatory structures have been adopted to analyze the multiple discourse units and levels that are recursively embedded in classroom discourse and the variety of speaker and addressee roles. Papers in the volume point out the need to unravel the cultural, institutional, and interactional dimensions of the contexts in which classroom discourses are embedded.

Finally, there are an increasing number of studies which have adopted an eclectic approach to research methodologies in which qualitative and quantitative data are collected from a variety of sources for triangulation, and have provided both etic and emic perspectives in their data analysis.

While classroom discourse research is likely to continue along the trends outlined earlier, there appear to be three areas that need strengthening. First, as mentioned before, as the field draws on theoretical concepts and research methodologies from a variety of disciplines, it becomes all the more important that the methodologies and terminologies adopted are explicitly and rigorously defined, with full awareness of their theoretical assumptions, irrespective of whether they have been adopted wholesale, extended or redefined.

Second, there has been relatively little in the classroom discourse literature that examines critically the methodological assumptions made in the analysis of data. The issue of *Applied Linguistics* (Volume 23 (3), 2002), which is devoted to methodological issues in the microanalysis of classroom discourse, is necessary and timely. It presents a collection of papers containing exemplars and critiques of three influential and well-defined methodologies within which classroom discourse analysis have been conducted: ethnography of communication, conversational analysis, and systemic functional linguistics, which have emerged respectively from anthropology, sociology, and functional linguistics. The discussions do not advocate a particular methodological approach, but rather raise researchers' awareness of methodological issues. More discussion of this kind is necessary to move the field forward.

Third, the teachers' and the learners' voices in the analysis of classroom data continue to be a very important aspect of future research. This is necessary not only because it is crucial for both teachers and learners to be aware of the implications of the classroom discourse that they are involved in co-constructing, but also because they provide an emic perspective on the data, an aspect which still needs strengthening. In particular, as Cazden points out, classroom discourse should be the object of focal attention for students as well, because "all students' public words become part of the curriculum for their peers" (Cazden,

2001, p. 169). How learners' engagement in the discourse contributes to the ESL/EFL curriculum constructed in the classroom and how their awareness can be raised are still underexplored.

## CULTURAL AWARENESS IN THE FOREIGN LANGUAGE CLASSROOM

### INTRODUCTION

This article discusses the development of the role that culture plays in foreign language teaching and learning, mainly in Europe. Over the past 15–20 years, the emphasis on cultural competence and awareness has increased. This heightened focus is largely the result of work instigated by the Council of Europe and the influence on foreign language teaching of the *Common European Framework of Reference for Languages* (2001).

Despite the vast influence of the *Framework*, different traditions related to cultural awareness in European language teaching can still be seen: on the one hand, the originally German concept of *Bildung* as an overall aim of education, on the other, a tradition that focuses more on skills and competences. The former reflects a philosophical view of cultural relationships in which the roles of Self and Other take centre stage. The latter is based on a more instrumental and utilitarian view of foreign language learning with an emphasis on skills. In most European countries, national curricula reflect both these traditions, often with the former as a general aim for all subjects. Recently also a third direction can be distinguished: the development of cross-cultural didactics (Krumm and Müller-Jacquier, 2002).

Culture is a complex concept and different approaches to studying culture have influenced language teaching. Risager (2003, p. 84) distinguishes between three main categories of the concept: the individual, the collective and the aesthetic, all of them relevant to foreign language teaching. Recent research on culture in this context has concentrated on anthropological approaches because these are primarily concerned with the collective and because of their focus on ‘the Other’ (p. 89). In foreign language teaching it is, however, important to include the individual aspect. According to the phenomenologist Peter Berger, culture ‘is at base an all-embracing socially constructed world of subjectively and inter-subjectively experienced meanings. Culture must be constructed and reconstructed as a continuous process’ (Berger in Wuthnow, Hunter, Bergesen and Kurzweil, 1984, p. 25). Here culture

is defined as both dynamic and dialectic, in other words, learners are influenced by a culture, but they also influence that culture.

This article discusses the transition from regarding cultural awareness in the classroom as an addition to foreign language teaching to seeing it as an integral part of language learning. It is a matter of learning *through* culture as well as learning *about* it. Only by gaining insight into the Other can learners gain an outside view of themselves.

As with any culture teaching and learning, this article is influenced by the writer's own background. One's own culture shapes the way one experiences the outside world, it is the glasses through which one sees things. Thus it also shapes the arguments in an article.

#### EARLY DEVELOPMENTS: FROM BACKGROUND KNOWLEDGE TO SOCIO-CULTURAL COMPETENCE

Culture has always played an important part in foreign language teaching, especially at higher levels of education. Historically, the focus was mainly on knowledge of the target culture: society, history, geography, institutions and literature. At lower school levels, cultural knowledge included knowledge of everyday life, focusing on home, school and spare time. At university level, the subject area is still aptly referred to as *background*, *civilisation* or *Landeskunde*. It provides a backdrop to language learning and is not regarded as an integral part of it. This view of culture and language is largely based on the eighteenth-century German New Humanist ideal of *Bildung*: the broadly and well-educated citizen who could read and write foreign languages. The methods for teaching modern foreign languages were similar to the philosophy behind the teaching of Latin and Classical Greek. The view of culture in foreign language learning was primarily elitist, focusing on the individual and regarding culture as a static entity.

During the first half of the twentieth century, new methods of foreign language teaching were introduced, primarily at early stages of language learning. The Direct Method was prevalent in textbooks for beginners and the view of culture in language learning changed. With the widespread introduction of the audio-lingual method after the second World War, foreign language learning became accessible to large numbers of learners and it was no longer just the 'culture of the elite' which was interesting, but also the 'culture of the people'. These are loaded words, but the distinction has to be made when discussing cultural awareness in the classroom. Gradually travelling became one reason for learning languages and there was a gradual shift from emphasising only knowledge of the target culture to also including cultural competence: being able to act in the foreign language culture.

In the 1970s, a paradigmatic change in foreign language teaching occurred, from behaviourist, audio-lingual teaching to communicative language teaching. Chomsky's theories of language and meaning and his distinction between linguistic competence and performance were important contributions to this change. Hymes opposed Chomsky's narrow definition of linguistic competence as it 'left a major gap in not dealing with the issue of appropriacy' (Spolsky, 1989, p. 139) and introduced the term *communicative competence* to allow for socio-cultural factors (Hymes, 1972, 1985; see also Alcón and Safont Jordà, *Pragmatic Awareness in Second Language Acquisition*, Volume 6). Although Halliday rejected the term competence, his linking of the meaning of language to the social and situational contexts also strongly influenced communicative language teaching (Halliday, 1979). In his book *Scope*, van Ek defined what he calls *communicative ability* as consisting of the following components:

- linguistic competence
- socio-linguistic competence
- discourse competence
- strategic competence
- socio-cultural competence
- social competence

In addition to these, he stated another aim for language learning: *optimal development of personality*, which consists of two components, cognitive and affective development (van Ek, 1986).

Foreign language curricula in Europe changed radically within a fairly short period of time to include van Ek's definition of communicative competence. Knowledge of the target language culture was no longer the sole cultural focus in the foreign language classroom. Through communication gap exercises, role-plays and other simulated activities, students were in addition required to develop socio-cultural competence.

Misinterpretations of the communicative approach made teachers in many countries focus on oral activities, believing that communication was largely to be understood as oral communication. Up to this period, the main focus in the classroom had been on reading and writing, not on speaking. Gradually the focus on cultural knowledge, including the role of literature, decreased and foreign language classrooms became the playground for oral activities centred around acting out every-day situations and dialogues. Students acted out visits to shops, restaurants, simulated phone calls, arguments with parents, etc., situations they could identify with and which they might need when travelling.

Textbooks during the 1970s, 1980s and early 1990s reflected this view of foreign language learning. At lower school levels, they had

previously contained constructed texts written by source culture authors, reflecting specific language problems. With the increased focus on communication, they were now full of constructed dialogues as examples of what people might say in specific situations.

Another aspect of the communicative approach, which took longer to appear in textbooks, was the focus on authentic texts. Definitions of authentic texts and their use in foreign language learning were debated widely (Little, Devitt and Singleton, 1989; Widdowson, 1979). Teachers and textbook authors treated these texts mainly with the aim to teach language and not as representations of culture, but gradually the view that authentic texts represent the voice of a culture gained ground in the classroom. As far as literary texts are concerned, however, the view which Kramsch presents in the quotation ‘language teachers seem constrained to teach these texts for their information value only’ (1993, p. 8), is still predominant.

The introduction of socio-cultural competence as an aspect of communicative ability was the start of regarding culture, not only as ‘information conveyed by the language’ but ‘as a feature of language itself’ (Kramsch, 1993, p. 8). Changing foreign language classroom practice, however, takes a long time.

#### MAJOR CONTRIBUTIONS: FROM SOCIO-CULTURAL TO INTERCULTURAL COMPETENCE

In an attempt to define and clarify the concept of socio-cultural competence in education, Byram, in cooperation with Zarate, presents the following categories:

- savoir: knowledge of self and other; of interaction: individual and societal
- savoir comprendre: skills—interpret and relate
- savoir être: attitudes—relativising self, valuing other
- savoir apprendre/faire: skills—discover and/or interact
- savoir s’engager: education—political education, critical cultural awareness (Byram, 1997a, p. 34)

These five categories show a shift of focus from teaching to learning and from declarative to procedural knowledge (Neuner, 2003). It is no longer just a matter of aims, but also how the learner is going to achieve these aims.

The focus on *savoir être* has greatly increased during the 1990s. Until this relatively late emphasis on awareness, many foreign language teachers, curricula and textbooks seem to believe that cultural awareness is an automatic result of foreign language learning; that positive attitudes and tolerance develop alongside knowledge and

competence. Those language teachers who have taken students on school trips abroad can vouch for the opposite when students return to the classroom with more prejudiced views than before they left. According to Allport prejudice is ‘an antipathy based upon a faulty and inflexible generalization’ (1954, p. 9). Developing intercultural awareness means to fight the human tendency to simplify by overgeneralising (p. 13). It requires encountering ‘the Other’ not only at the group level, but also as individuals (Eagly and Diekmann, 2005, p. 19). Stereotyped attitudes and beliefs have to be expressed and consciously worked on in the foreign language classroom; they do not automatically occur as a result of language learning and knowledge about the foreign culture (Fenner, 2003).

Byram and Zarate’s categories have been further developed and form part of the classification used in the *Common European Framework of Reference* (CEF). Unfortunately, the 2001 edition of the *Framework* presents the ‘savoirs’ under the heading of ‘general competences’ and not as an integral part of language learning, as follows:

- savoir—declarative knowledge, which includes: knowledge of the world, socio-cultural knowledge, intercultural awareness
- savoir faire—skills and know-how, which includes practical skills and know-how and intercultural skills and know-how
- savoir être—‘existential competence’
- savoir apprendre—ability to learn (CEF, 2001, pp. 101ff.)

In this edition of the *Framework*, the concept *cultural* has been replaced by *intercultural*, both relating to skills and awareness. Based on a constructivist view of learning and the realisation that the foreign language learner encounters the target culture from a stance founded on his or her habitus and cultural capital (Bourdieu, 1994, pp. 12–14), the term *intercultural* has gradually replaced the term *cultural* in foreign language learning and teaching. The learners encounter the foreign culture as members of their own cultural community, and the encounter thus implies two cultures.

The development from *cultural* to *intercultural* shows a development of the view of culture in foreign language learning away from a focus solely on the target culture towards regarding it as an interrelationship between two cultures: one’s own and the other. In order for learners to step back and reflect on a culture different from their own, they have to be consciously aware of the culture of which they are an integral part. Awareness of differences as well as of similarities between the native culture and the target culture is essential for the development of intercultural awareness. While learning a foreign language, the learner brings his own culture into the communication process with the foreign culture. Intercultural awareness can consequently

'be seen as an interdependent relationship between cultures which constitutes a dynamic enrichment for self as well as the other' (Fenner, 2000, p. 149). Communication is an open-ended process dependent on the context and the situation in which the communication takes place. Without knowledge and understanding of both native and target cultures, intercultural communication is hardly possible.

Communicating with the other means entering into a dialogue where one has to be willing to adjust one's own attitudes and perspectives to understand the other, even if a complete understanding can never be achieved (Fenner, 2000; Rommetveit, 1992). Bakhtin defines dialogue as follows: 'To live means to participate in dialogue: to ask questions, to heed, to respond, to agree, and so forth' (Bakhtin, 1984, p. 293). It is this type of dialogue that is required in the classroom if intercultural awareness is to develop.

Intercultural encounters can be seen as negotiating meaning in a process, where meaning 'is constructed between [the two participants] as a kind of ideological bridge, is built in the process of their interaction' (Bakhtin and Medvedev, 1985, p. 152). In order for the participants to understand each other, or at least establish what they do not understand, openness towards the other is necessary. Discussing ideological bridges, Kramsch argues that '[w]hat we should seek in cross-cultural education are less bridges than a deep understanding of the boundaries' (1993, p. 228). Building ideological bridges in the Bakhtinian sense, however, does not mean blurring differences, but attempting a temporary, contextual understanding of both self and other. Both cultures in the encounter must also be regarded as dynamic and polyphonic; any culture is 'a living mix of varied and opposing voices' (Bakhtin, 1984), and learners have to acknowledge this also when it comes to their own culture.

According to Ricoeur, it is through interaction with others that we experience our own identity, not through introspection (Kvalsvik, 1985). The aim of *savoir être* can only be achieved through a learning process based on reflection on and understanding of the other as well as of self. It is an on-going process where students develop not only as language learners but as human beings, or in Ricoeur's words, they 'extend [their] existence' on the basis of 'le mode de cet être qui existe en comprenant' (Ricoeur, 1969, p. 11).

Byram and Zarate (1997) introduce the concept 'intercultural speaker' or 'locuteur culturelle' to describe foreign language learners as 'interlocutors involved in intercultural communication and action' (Byram, 1997b, p. 4), stating the importance of developing critical thinking 'about one's own and other cultures and their taken-for-granted

values and practices' (Byram, 1997b, p. 10). Developing critical thinking is dependent on reflection, that is, a meta-level of language learning, which is often sadly lacking in many foreign language classrooms where the focus of teaching is solely on language skills.

Learning a foreign language is not merely a matter of becoming proficient in the language, but also of developing personality. In a study related to the development of the CEF, the authors challenge the assumption that the ultimate aim of language learners is to become indistinguishable from native users:

... language learners should not be trained as ersatz, native speakers, but should develop as intercultural personalities, bringing the two cultures into relation and becoming more mature and complex people as a result. (Byram, Zarate and Neuner, 1997)

Seeing intercultural awareness as an integral part of foreign language learning indicates that one of many aims is the development and enrichment of the student's identity. This is a dynamic process. When learning a foreign language, the learner brings his own culture into the communication process with the foreign culture, whether it is in reading a foreign text or in speaking to a representative of that particular language community. It is not only a matter of negotiating meaning, but of interpretation in the hermeneutic sense. Interpreting the meaning of texts or personal encounters also means interpreting oneself: '... in the hermeneutical reflection—or in the reflexive hermeneutic—the building of the self and the meaning (*sens*) are simultaneous' (Ricoeur, 1992b, p. 55).

It is a dialectic and dialogic process where the learner is influenced by the foreign culture at the same time as he or she is influencing that culture (Foucault, 1983). This cannot be done passively or by the teacher presenting learners with knowledge about the foreign culture. Foucault states that

The idea that the other can simply reveal or disclose itself to us, without any work whatsoever on our part, is ultimately unintelligible. There can be no access to the other without our actively organising the other in terms of our categories. (Foucault in Falzon, 1998, p. 37)

Reorganisation of categories entails change and developing identity in the learning process. Developing intercultural awareness means being confronted with one's own as well as the foreign culture, and in Kramersch's words the goal of developing such awareness 'is not a balance of opposites, or a moderate pluralism of opinions but a paradoxical, irreducible confrontation that may change one in the process' (Kramersch, 1993, p. 231).

PROBLEMS AND DIFFICULTIES/WORKS  
IN PROGRESS: CULTURAL AWARENESS  
IN A TEST CULTURE

Interestingly, the 2001 edition of the *Framework* includes intercultural awareness in the first category, *savoir* or knowledge, and lists *savoir être* or existential competence as a separate concept. One can always hope that this will lead to an increased focus on intercultural awareness, although it is more difficult to implement in teaching programmes than the other components, as it is not something that can be taught and as it is difficult to assess. That it now appears in a category with components that can be taught, might cause a problem, though, because teachers as well as learners might revert to the old misconception that developing intercultural awareness will be an automatic result of gaining cultural knowledge rather than a learning process that requires conscious reflection upon such knowledge, that is a meta-level of knowledge. Developing awareness is an aspect of foreign language learning which the learners have to take charge of themselves. But teachers are of vital importance when it comes to organising learning situations and mediating the individual's learning processes in order for the learner to develop intercultural awareness.

There is, however, another possible reason for intercultural awareness having been placed in the *savoir* category. In recent years, there has been an increasing focus on assessment and testing in foreign language learning; one can almost talk about an assessment and test culture developing with a large number researchers involved. It is, consequently, important to ask what it is possible to test in the foreign language classroom. Although it is relatively easy to teach and test knowledge and skills, it is far more difficult, if not impossible, to test awareness. Do we want attitudes to be tested?

As stated before, developing accepting attitudes towards the other culture is a vital part of language learning. Working in the classroom on stereotyped views, getting learners to express these to work on them and to challenge them, is one of the foreign language teacher's tasks. This involves encounters with 'the Other' as an individual, not only as a group, for instance through literature. But teachers have no guarantee that stereotyped views will disappear. In many classrooms, teachers never offer scope for learning processes that include reflection and discussion. If the focus is merely on teaching knowledge and skills and not on the learner's awareness, learning processes that challenge the students' views of their own and the target culture will not take place.

The difference between learning foreign languages in the classroom and acquiring language outside school lies in the fact that in the

classroom the teacher can mediate the learning processes, including the development of attitudes. Outside the classroom attitudes develop accidentally, based on personal experience, inside the classroom attitudes can be challenged through a number of cognitive processes like comparing, contrasting, problem-solving, etc. (Camilleri, 2000). Through a qualified choice of texts and tasks, discussions and reflection the teacher can mediate dialogues between the source and the target culture as well as between learners (Fenner, 2001, 2005). Through such classroom dialogues the learners' attitudes can develop and change, but it requires that the teacher becomes acquainted with the individual learner's zone of proximal development (Vygotsky, 1978) and it requires training in intercultural mediation (Zarate, Gohard-Radenkovic, Lussier and Penz, 2004). It also requires time, as attitudes are not changed overnight.

Over the last few years, work within the Council of Europe has focused on how to assess intercultural awareness and this assessment has caused debate. Various forms of self-assessment have been discussed. At the Moscow meeting on the European Language Portfolio a mode of self-assessment was proposed in preliminary form: an *Autobiography of key intercultural experiences*. So far, no solutions have been decided upon and maybe one should hope that none is. Placing intercultural awareness as a subcategory of knowledge is no solution, it can only serve the purpose of confusing it with cultural knowledge. Defining *savoir être* as existential competence and not as attitudes might blur the whole concept, especially in learning cultures where views on language learning are mainly instrumental and where the development of self is not explicitly expressed as an overall aim of foreign language learning.

#### FUTURE DIRECTIONS: QUO VADIS?

The two educational traditions, on the one hand a tradition where personal development is an overall aim of learning, especially of language learning, on the other hand a tradition where skills and testing are more heavily emphasised, will influence the views on cultural or intercultural awareness and its place in foreign language teaching in the coming years. These are matters for policy makers and are, to a certain extent, dependent on educational policies. A shift in political direction will influence the emphasis between utilitarian and instrumental aims of language teaching and long-term general educational aims. Short-term aims for the business community will also influence the focus in the foreign language classroom. International trade needs competent foreign language speakers who know how to behave in a foreign culture.

Although it is not easy to predict how intercultural awareness will develop in the foreign language classroom, some major trends can be pointed out. The first of these is the role played by literature. This article has not discussed the cultural content of foreign language teaching and learning, except by briefly mentioning 'high' culture versus 'low culture'. With the demand of authentic texts, non-fictional texts fairly quickly appeared in textbooks. In recent years, literature seems to have edged its way back into foreign language classrooms, not only at higher-school levels, but also at lower levels.

Along with a shift of focus from teaching to learning, came a shift in literary theory towards receptionist theory and the learner's text (Fish, 1980). This has resulted in an altered attitude to teaching literature in the classroom. From methods largely based on New Criticism and structuralism, the focus in many classrooms has shifted to approaches based on hermeneutics and the individual's interpretation of the literary text as a basis for classroom reflection and discussion. With the view that the aim of reading literature is not only to discover the author's intention or the accepted meaning of a literary artefact or even the teacher's interpretation of it, the literary text has again become important in foreign language teaching and learning. Teachers cannot compete with the cultural influences learners are exposed to outside the classroom, like music, television and other forms of entertainment. For the development of cultural awareness, it is important that teachers do not feel they have to compete, but can use and add something to the outside influence. Many young people do not read extensively outside the classroom, and hence foreign language education can assist the enhancement of the learners' cultural capital by spending more time on reading, reflecting on and discussing literature as the personal voice of a culture (Fenner, 2001) in the foreign language classroom and thus develop the learners' cultural awareness and identity.

A second recent development is citizenship education, expressed through CLIL (Content and Language Integrated Learning, see also Marsh, *Language Awareness and CLIL*, Volume 6) and Human Rights teaching. Although Human Rights have been a part of curricula in all subjects in some countries, there is now a need to focus on these subject areas in foreign language learning in, for instance, the new democracies of Europe. Such subject matter can only emphasise the importance of content in the process of developing intercultural awareness as well as emphasising the interdependence of language and culture. The aim of teaching and learning through discussing Human Rights extends the development of self to include the development of communities. Human Rights education, promoted in particular by the British Council, almost ironically reflects the opposite of what Foucault calls the oppressor's role (Falzon, 1998): 'Learning a new language gives access

to potential new identities. This challenges any notion of citizenship as associated primarily with monolithic national identities' (Starkey, 2005, p. 66).

A third fairly recent development related to cultural awareness, which concerns English as a foreign language, is the debate on what is termed international English. There is a strong linguistic and educational movement towards removing the language from its cultural roots and regarding it as a globalised lingua franca. Up to now, the work done on cultural awareness is based on the interrelationship between language and culture where culture and language cannot be regarded as separate. Risager sees a much more complex relationship between language and culture: 'language *practice* can have a thematic (cultural) content, 'the language', on the other hand, is a discursive construction and can, consequently, have no thematic content' (Risager, 2003, p. 422).<sup>1</sup> Up until now, foreign language learning has mainly been bilateral. English as a foreign language has been linked to the cultures of the countries where the language is spoken. In many countries, the main focus has been on Great Britain and the USA. Recently this narrow view of English-speaking cultures has been extended to also include Australia and some African and Asian cultures. Extending it further to include English as an international language will be a huge challenge. It means redefining the relationship between language and culture, and it also means redefining language learning in many countries as a national educational project to see it as part of a globalisation process (Risager, 2003, pp. 48–49). Teaching and learning language as separate from its cultural roots and not as integral part of cultures of a specific community, seems an almost impossible task.

## TEACHER LANGUAGE AWARENESS

### INTRODUCTION

Teacher language awareness (TLA) is a label applied to research and teacher development activity that focuses on the interface between what teachers know, or need to know, about language and their pedagogical practice. In principle, the concerns of TLA are relevant to teachers of all subjects. Generally, however, although by no means exclusively, most TLA activity relates to teachers of language (L1 or L2—in this review L2 refers to any language other than L1), their cognitions (knowledge, beliefs and understandings) about the specific language they teach and the ways in which those cognitions might potentially impact upon their teaching. The conceptualisation of TLA in the literature is constantly evolving: it has moved on from a rather narrow concentration on knowledge about language (KAL) to incorporate teachers' cognitions more broadly, both about language in general and about the specific language they teach, as well as (in the case of L2 teachers) their awareness of their students' developing interlanguage (see, for example, Wright, 2002). While acknowledging the wide-ranging relevance of TLA, this chapter focuses on teachers of language, with particular reference to the subject matter cognitions of L2 teachers, since these have been the focus of most published TLA work.

### EARLY DEVELOPMENTS

Teachers' KAL and the potential importance of that knowledge in teaching and learning is now an area of attention and concern worldwide, especially in relation to debates about teacher professionalism (see, for example, Fillmore and Snow, 2000, for discussion in the US context). However, much of the early systematic attention towards such issues in relation to language teaching emerged in Europe, especially in the UK. Although a number of factors may have contributed to this development, two unrelated stimuli seem to have been particularly significant: the growth of interest in Language Awareness (LA) among teachers of the L1 and/or modern foreign languages, especially from the early 1980s (see the various chapters on LA in this volume for a more detailed discussion) and the development of private-sector pre-service TEFL courses incorporating a focus on language analysis.

LA came to prominence in the UK as a 'grassroots' movement in the late 1970s/early 1980s, as teacher frustration with learner underachievement in both L1 and L2 led to the creation of local schemes aimed at inspiring learners' curiosity about language as a uniquely fascinating characteristic of human behaviour. The term 'Knowledge About Language' (KAL) is used in much of the related literature of that time, especially in the UK (see, for example, Carter, 1990; Van Essen, *Language Awareness and Knowledge about Language: A Historical Overview*, Volume 6 and *Cots, Knowledge about Language in the Mother Tongue and Foreign Language Curricula*, Volume 6). According to van Lier (1996), the range of interpretations of both terms makes it difficult to decide whether they are synonymous or whether one is a subset of the other.<sup>1</sup> Whichever the preferred term, however, those involved with LA/KAL share a common assumption that there is a link between knowledge of formal aspects of language and performance when using that language (L1 or L2), and that therefore fostering learners' ability to analyse and describe a language accurately is likely to help them become more effective users of that language. Arising from this is the belief that teachers of a language (L1 and L2) need an understanding of how that language works and an ability to analyse that language to function effectively as teachers. As Hawkins noted, one of the principal challenges for the LA movement was to provide adequate preparation for teachers '... to guide their pupils in the kind of discovery-based learning that is required' (Hawkins, 1994, 1938). The nature of the language-related knowledge and preparation required by L1 and L2 teachers continues to be a major pre-occupation for those who work in the area of TLA.

The inclusion of LA ('Language Analysis' or 'Language Awareness') as a core component of the International House, London (IH) pre-service training courses for native-speaker (NS) TEFL teachers was an unconnected earlier development (such courses having first been offered in 1962), but it was motivated by a similar belief, and was further stimulated by the realisation that the vast majority of target NS trainees had no experience of analysing language from the perspectives of learning and the learner. The expansion of the EFL industry from the mid-1970s onwards created an increasing demand for short, intensive pre-service training. The original IH 2-week course evolved into the more familiar '4-week course', which in the late 1970s became the blueprint for the scheme of initial TEFL training

---

<sup>1</sup> In the remainder of this chapter, the terms LA and KAL are treated as if they are synonymous. Where one term is used instead of the other, this is a reflection of the terminology used by the authors of the original work(s) being discussed.

administered by the Royal Society of Arts (RSA). This training scheme, popularly known as the 'Prep Cert' or simply the 'RSA', and leading to the award of the RSA Preparatory Certificate in the Teaching of English as a Foreign Language, was subsequently updated (as CTEFLA and CELTA) under the administration of that part of the University of Cambridge Local Examinations Syndicate (UCLES) now known as Cambridge ESOL. LA continues to have a centrally important prescribed role in courses leading to this certificate wherever they are taught.

Much of the early published work relating to the language awareness of teachers seemed to focus primarily on teachers' knowledge about grammar, either on enhancing that knowledge (in the case of teaching materials) or on analysing and measuring such knowledge. In the TEFL/TESL field, for example, a number of LA materials targeted mainly at teachers have been published in the past 25 years, the first being Bolitho and Tomlinson's (1980) pioneering work *Discover English*. In the main, these materials (see also Thornbury, 1997; Wright, 1994) use data-based language analysis tasks to promote a growing understanding of the way language (particularly grammar) is used. However, rather than attempting to transmit KAL, they employ a consciousness-raising approach.

Most of the early research on teachers' KAL or TLA involved primary teachers, L1 teachers and teachers of modern foreign languages in the UK. These studies generally sought to measure aspects of teachers' KAL, and to find out about their understandings of KAL, rather than to examine the effects of their KAL on pedagogical practice. Research in EFL/ESL from the same period typically has a similar orientation, without necessarily employing the KAL terminology. Palfreyman (1993) is an early example of research analysing the subject matter cognitions underlying teachers' pedagogical practice (in this case the cognitions of trainee EFL teachers as revealed in their planning of a grammar lesson).

#### MAJOR CONTRIBUTIONS

The first major research focusing on KAL (TLA) in the classroom was the Southampton KAL project (1991–1993), which looked at the beliefs and classroom practices of UK L1 and L2 teachers in relation to five dimensions of KAL: language as system, language learning and development, styles and genres of language, social and regional variation and language change through time (Brumfit, Mitchell and Hooper, 1996). The research suggests that, among the teachers studied, there were distinctive subject-specific approaches to KAL: the L1 teachers focused mainly on whole texts, whereas the L2 teachers worked

on language as system, in the belief that such activity would contribute to the development of learners' target language proficiency.

Brumfit, Mitchell and Hooper (1996) conclude that a long-term programme of research is needed to explore the basis for teachers' beliefs about the merits or otherwise of different kinds of KAL in classroom language development. Alderson (1997) expresses scepticism about the value of giving language teachers '... a good dose of current linguistics' (Alderson, 1997, p. 11), which he sees as a common assumption of the LA movement. According to Alderson, what we need instead are more studies of the implicit and explicit models of language that already exist among teachers and learners. Bolitho and Tomlinson (1995) seem to concur when they say that 'In the classroom the only views of language that really matter are the ones that teachers and learners have built up in their heads' (p. iv). Much of the TLA-related research in the past 10 years has sought to shed light on the beliefs and models of language that underlie language teachers' practices (see, for example, the studies of teacher cognition in grammar teaching reviewed by Borg, 2003a, including his own).

An early major contribution to thinking about TLA was made by Edge (1988) in a short paper, in which he outlines the three competences that the TEFL trainee needs to develop: language *user*, dependent on the teacher's language proficiency, and determining that teacher's adequacy as a model for students; language *analyst*, dependent on the teacher's language systems knowledge base, and referring to ability to understand the workings of the target language; and language *teacher*, dependent on familiarity with a range of TEFL procedures and possession of sufficient theoretical knowledge to make appropriate decisions about using those procedures.

TLA has obvious connections with the second of these competences, but it is much more than just subject knowledge about the language systems. Andrews (2001) emphasises the importance of distinguishing what he refers to as the two dimensions of TLA (knowledge being the declarative dimension and awareness the procedural), noting that the teacher's possession of a high level of subject matter knowledge is no guarantee that such knowledge will be used appropriately in the classroom. At the same time, Andrews (2001) points out that both dimensions are crucial: just as there are teachers who have knowledge but lack awareness (i.e. the sensitivity to use that knowledge appropriately), so there are others who have awareness but whose attempts to engage with content-related issues are undermined by a lack of knowledge.

In teaching, Edge's three competences are interconnected, as Wright and Bolitho point out in a series of papers about LA in English Language teacher education (see, for example, Wright and Bolitho, 1993). Wright and Bolitho (1993) outline a methodological framework for

LA activities, based on the linkage between Edge's three competences. However, they do not equate LA to the adequacy of any particular model of language: rather than delivering pre-digested answers, they see the goal of LA work on teacher development courses as being to enhance participants' sensitivity to the richness, complexity and diversity of language by promoting reflection on their existing understandings. Borg (1994) explores the implications of such an approach for teachers and teacher training, arguing that a reflexive training methodology is an effective way to develop in teachers the kinds of awareness that LA as methodology presumes.

The significance of the interrelationships between Edge's three competences continues to pre-occupy researchers and teacher educators involved with TLA. Andrews (forthcoming), for example, explores a number of aspects of TLA in teaching and learning, including the intertwining of language proficiency (knowledge *of* language) and subject matter knowledge (knowledge *about* language—the declarative dimension of TLA), as well as the relationship between TLA and pedagogical content knowledge, one of the generic teacher knowledge categories proposed by Shulman (1987) as a central part of the professional knowledge base for teaching. Drawing particularly on data from a study of 17 teachers in Hong Kong, Andrews examines the ways in which TLA may affect pedagogical practice, arguing that the significance of TLA comes from its potential impact upon teachers' ability to perform their role as mediators of 'input for learning'.

Although they do not refer explicitly to TLA, Johnston and Goettsch (2000), also draw on Shulman's (1987) model in their investigation of the knowledge base of language teaching as exemplified in the grammar explanations of four experienced ESL teachers in the USA. Their research highlights the importance in ESL teaching (at least for the teachers in their study) of knowledge about grammar, the complex interrelationship in practice of the different elements of teacher knowledge and the '... situated, process-oriented, contextualised nature of the [ESL teacher's] knowledge base' (Johnston and Goettsch, 2000, pp. 464–465).

Tsui, in her ground-breaking study of expertise in language teaching, also emphasises the situated nature of teacher knowledge and what she describes as the dialectical relationship between teachers' knowledge and their world of practice (2003, p. 64). Tsui does not refer directly to TLA, but her study has considerable implications for those seeking to understand the field, not least in her analysis of the knowledge embedded in her four case study teachers' enactment of the grammar area of their ESL/EFL curriculum.

Tsui emphasises the overlap between knowledge and beliefs, speaking of the powerful influence of conceptions of teaching and learning

(i.e. teachers' metaphors, images, beliefs, assumptions and values) on pedagogical practice (2003, p. 61). Recognition of this overlap links TLA research with studies of teacher cognition in language teaching more generally. According to Johnson (2006), the most significant factor over the past 40 years in advancing our understanding of L2 teachers' work is the emergence of research in the area of teacher cognition (see Borg, 2003b, for a wide-ranging review of studies of language teacher cognition).

This link between TLA and language teacher cognition is particularly apparent in studies of teacher cognition in grammar teaching. Borg (2003a) provides a detailed review of research in this latter area relating to both L1 and L2 classrooms. Among the papers discussed are several of Borg's own, based on the study of EFL teachers in Malta. Each of Borg's papers explores aspects of '... the complex, personalised pedagogical systems which teachers draw on in teaching grammar' (Borg, 2003a, pp. 102–103), offering insights into teachers' instructional practices when talking about language (including their use of grammatical terminology) and the factors shaping those practices, as well as the connections between teachers' knowledge about grammar and their approaches to formal instruction.

Although TLA-related research has tended to focus primarily on grammar, there has been work in other areas. McNeill (2005), for example, focuses on vocabulary, examining teachers' sensitivity to students' language difficulties as revealed in their ability to anticipate the problems learners encounter when exposed to particular texts. Meanwhile, Derwing and Munro (2005) have explored issues relating to teachers' phonological/pronunciation awareness.

#### WORK IN PROGRESS

Because TLA is a comparatively new research area, many of the major contributions are inevitably recent, and much of the work in progress is linked to or draws inspiration from studies already mentioned. The volumes edited by Trappes-Lomax and Ferguson (2002) and Bartels (2005) illustrate the increasing interest worldwide in the language dimension of language teacher education, with both books offering a range of examples of teacher–trainers/applied linguists reflecting on and researching their TLA/KAL practices. The variety of contexts featuring in these books underlines the extent of the current active involvement with TLA and the intellectual engagement with TLA-related issues. Trappes-Lomax and Ferguson (2002) contains papers relating, for instance, to the language awareness of teachers of ESP and of modern foreign languages, as well as EFL teachers in the UK, Europe and Asia. Meanwhile, Bartels (2005) includes 21 studies from around the

world focusing on different aspects of KAL (the term used by Bartels in preference to TLA), in which the authors examine their own theories about language teachers' knowledge and language teachers' learning, and the use of KAL in pre-service and in-service teacher training. The breadth of focus in the Bartels volume is indicative of the vitality of this area, with the reported research focusing not only on grammar and lexis, but also on phonetics and phonology, discourse analysis and pragmatics. Although the majority of the studies concern EFL/ESL, there are also papers dealing with the preparation of teachers of L1 English, as well as L2 Spanish and Chinese.

One area of continuing interest in TLA-related research is the relationship between TLA and the professionalism of language teachers. Andrews (2005), for example, explores the issue of professional standards in TEFL, with specific reference to subject-matter knowledge, arguing that professionalism for teachers of EFL entails the possession of adequate knowledge *of* the language (language proficiency), adequate knowledge *about* the language (content knowledge: the declarative dimension of TLA) and the ability to make effective use of such knowledge in pedagogical practice (procedural TLA). The paper outlines the experiences and the difficulties in the Hong Kong context of attempting to set appropriate standards in the first two of those areas.

The measurement of aspects of TLA, whether or not linked to standards setting, has formed part of TLA-related research for some time and is an on-going concern for practitioners. In the TEFL context, for example, centres offering pre-service training courses have commonly used LA tests to screen applicants, while subject knowledge is a major part of one module of the 'Teaching Knowledge Test' launched by Cambridge ESOL in 2005 as a basic level qualification for EFL/ESL teachers worldwide. One particularly interesting strand of measurement-focused TLA research has been focusing on the predictive value of LA tests (see, for example, Morris, 2003), as part of an investigation of the knowledge base, learning and performance of undergraduate TESL trainees in Quebec, aimed at identifying valid and reliable criteria for selecting course participants, and providing them with appropriate support once they have joined the course. Morris (2003) examines the correlations between different forms of linguistic and metalinguistic knowledge and the academic performance and progress of two groups of TESL undergraduates. The study provides confirmation of the predictive value of vocabulary profiles, as suggested by earlier phases of the investigation, and finds metalinguistic knowledge (as measured by results on a grammatical explanation task) to be an especially good predictor of academic performance.

A noticeable characteristic of much current TLA-related research is that it is pushing back the boundaries of what has hitherto been treated

as TLA. As a result, it obliges us to re-examine what we mean by TLA, and to reflect on the usefulness of TLA as anything more than a rather loose umbrella term, given the complexity of the language teacher's language-related cognitions to which the label refers and of their interaction with other domains of teacher cognition. Walsh (2003) is a case in point. Based on the evidence from his study of seven teachers' use of language in L2 classes, Walsh suggests that teachers' enhanced understanding of interactional processes can facilitate learner involvement and increase opportunities for learning, leading him to argue that a crucial component of the TLA of L2 teachers is their interactional awareness. Meanwhile, Song (2005), based on a study of L2 teachers' beliefs and practices regarding their L1 use in the L2 classroom, proposes that the conceptualisation of TLA should be broadened to include awareness of the role of the medium of instruction (MOI) in the language class. Song argues that, in L2 classes where the students and teacher share the same L1, the TLA concerning the role of MOI has the potential to play a crucial role in pedagogical decision-making.

#### PROBLEMS AND CHALLENGES

The previous section has noted the growth in TLA-related research activity. At the same time, however, TLA is still a comparatively new focal area of research within the larger domain of language teacher cognition. As a result, it faces a number of the challenges that might confront any research area at a similar stage of development:

1. Although there is a considerable and ever-growing body of research relating to this rather loosely defined area that some refer to as TLA, there is at present no unifying conceptual framework (see, for example, the discussion in Borg, 2003b, p. 106). The relationship between language teachers' subject-matter cognitions and other aspects of their cognition and practice is clearly very complex, as is that between TLA and language proficiency. Further work is needed both to develop a conceptual framework and to explore these relationships.
2. There is also a lack of a common language in the literature relating to this area. Andrews, for example, uses both teacher metalinguistic awareness (TMA) and TLA to refer to the same aspect of teacher cognition. Meanwhile, Borg does not use either term, although his 1994 paper refers to teachers' awareness of language and the need for teachers to be linguistically aware.

Within the restricted focal area of language teachers' subject-matter cognitions, there are on-going challenges for those involved with TLA, either as researchers or as teacher-trainers. One such challenge concerns the interconnection between the declarative and the procedural

dimensions of TLA. In TLA-related research, this has been explored to some extent, but there is clearly a need for further investigation, particularly of the factors that seem to impact positively and negatively on the language-related pedagogical decisions (i.e. the procedural dimension of LA) of teachers in various contexts, and of the congruence (or otherwise) between their language-related beliefs and actions. Meanwhile, in teacher development, this interface between declarative and procedural TLA, the creation of the ‘... shift from new knowledge to classroom reality’ (Wright, 2002, p. 128), which represents the vital stage in the LA learning cycle, continues to challenge both trainers and trainees. As Wright (2002) acknowledges, the LA materials published up to now have not always succeeded in making the link required to promote knowledge transfer.

For researchers, exploring the relationship between TLA and students’ learning outcomes also poses particular challenges. It is an article of faith among those involved in TLA that ‘the more aware a teacher is of language and how it works, the better’ (Wright and Bolitho, 1993, p. 292), the implication being that learners are likely to benefit from being taught by a language-aware teacher or conversely suffer at the hands of the teacher who lacks such awareness. There is, however, little or no empirical evidence for such an assumption: for all we currently know, language learning may (or may not) take place regardless of any TLA. The methodological challenges for researchers seeking to shed light on the nature of the relationship between TLA and the quality of the learning that takes place as a result of formal instruction are formidable, given the complex interplay of potential influences on learning. They are nevertheless challenges that need to be confronted, particularly in light of a conceptualisation of TLA that incorporates an awareness of the learner’s developing interlanguage.

#### FUTURE DIRECTIONS

According to Freeman (2002), the meeting of teacher and student views of language that takes place in the language classroom sets up the possibility of three potentially conflicting levels of subject-matter representation: the teacher’s linguistic knowledge, the students’ language background and the classroom language interactions. Those involved with TLA would probably argue that the language-aware teacher possesses the understanding and sensitivity to resolve any such conflicts. However, the exploration of those views of language, of the classroom consequences as they potentially come into conflict, and of the qualities teachers need to handle such conflicts is likely to continue to occupy the attention of TLA researchers, while fostering teachers’ language-related understandings and sensitivities will continue to be

a primary goal for LA-focused professional development work with teachers.

As the present chapter has shown, there is a growing body of TLA-related research. The area is nevertheless still under-researched, and there is scope for a wide variety of research activity focusing on aspects of language teacher cognitions about subject matter, as well as on the interface between Freeman's (2002) three levels of subject-matter representation and the interaction between TLA and other domains of teacher knowledge. Key issues for further research in this area include: the role of subject-matter knowledge in L2 teaching; the nature of the knowledge that L2 teachers need about language in general and the target language in particular to teach; and the amount and type of subject-matter knowledge needed to teach different types of learner at different stages of their learning.

In addition to these, and the questions (mentioned earlier) of the relationship between declarative and procedural TLA, of the transfer of knowledge from the declarative to the procedural, and the impact of TLA on learners and learning, there are a number of other issues that would be valuable foci for future TLA-related research. These include comparisons of the TLA of native-speaker and non-native-speaker (NNS) L2 teachers (the papers in Llurda (2005) reflect the growing interest in the characteristics and competences of the NNS L2 teacher); influences upon the development of TLA (including professional training); teachers' awareness of aspects of the language systems apart from grammar; their awareness of the stages and processes of learners' interlanguage development; factors affecting the impact of TLA on pedagogical practice; and ways in which TLA might best be developed (focusing in particular on the procedural dimension and the issue of knowledge transfer).

In the continuing search for improved approaches to TLA development, advances in technology are likely to play a significant role in suggesting and supporting future directions, via the use of corpora, increasingly user-friendly concordancing tools, and improved communication networks. Action research linked to innovative approaches to TLA development represents another exciting avenue for future research related to TLA.
