## TECHNOLOGY AND THE STUDY OF AWARENESS

### INTRODUCTION

A concise, comprehensive, and singular definition of language awareness in second language acquisition (SLA) is not easily found, nor constructed. Given the inclusive nature of the Encyclopedia, however, and for the purposes of this article, we accept the broadest definition possible to incorporate all knowledge of and about language. Language awareness is an internal phenomenon that can be externally affected by consciousness-raising or attention-focusing techniques.

The implementation of technology in the study of second language (L2) awareness is a recent development: the field caught full speed only recently, in the mid-1990s, becoming one of the most innovative areas in SLA research. Technology is used to address questions about external conditions leading to awareness, levels of awareness attained during input processing, the association between awareness and language development, and individual variables (such as cognitive capacity) that are posited to explain the differential effects that the same conditions have on the development of awareness. The range of technology used in this subfield of SLA research—which began with audio and video recordings and old-fashioned overhead transparencies—today includes computers that deliver multimedia treatments and tests, as well as recording performance (both accuracy and reaction time), and which are fast replacing paper-and-pencil materials. Computers are also used as tools to record verbal (think-aloud) protocols and to track performance (e.g., click behavior). Furthermore, more complex devices are now being adapted from cognitive psychology and neurolinguistics for use in research on second language awareness.

Computer-based research on language awareness can be classified into descriptive, question-generating designs, descriptions of procedures or best practices, reviews of specific technology or software, and quantitative, hypothesis-testing studies with designs borrowed from cognitive psychology.

### EARLY DEVELOPMENTS

Early studies involving technology and awareness are summarized in Levy (1997) and Chapelle (2001). Levy's volume is one of the first

books devoted entirely to the field of computer-assisted language learning (CALL). It describes projects from the sixties and seventies (PLATO, TICCIT), as well as advances in the eighties (Hypercard, The Athena Language Learning Project) and nineties (The International Email Tandem Network, CAMILLE). The author discusses implications of the role of computers—either as a tool, as in computer-mediated communication (CMC), or as a tutor, as in CALL—in terms of learning environment, methodology, the role of teacher and learner, implementation in the curriculum, and evaluation. Chapelle (2001) goes back to the fifties in evaluating different computer applications to the study of SLA, including research, language learning, and language testing. Her volume draws on different disciplines, such as Educational Technology and Computational Linguistics, and applies primary concerns in those fields to CALL in order to better address the question of how computers can improve language learning. An evaluation of the different theoretical and empirical issues suggests the need to develop an integrative approach that incorporates ideal cognitive and socio-affective conditions for L2 learning.

A brief overview of the role of technology in L2 learning is provided by Blake (1998), who explains the changes the field has undergone in the last 30 years with regard to the hardware base, the role of the learner, and the presentation format. In addition, Blake provides suggestions for teachers on how to use CALL materials and on how to benefit from CALL research that is related to SLA.

Focusing on the use of computers for research, Hulstjin (1997) reviews 20 published studies that have used computers for input presentation, learning instructions, feedback, and the elicitation and registration of responses, with or without reaction times. Hulstjin (2000) describes the various ways in which computers have been used to elicit L2 data, including grammaticality judgment tasks, the preferred technique for measuring metalinguistic awareness, and others, such as sentence matching tasks, and word recognition. Research conducted by Hulstjin himself during the nineties included computer-aided designs that investigated the use of electronic dictionaries in language learning and measured reaction times in word and sentence recognition.

#### MAJOR CONTRIBUTIONS

Major contributions to the field have appeared both in acquisition journals (*Studies in Second Language Acquisition*, *Modern Language Journal*, *Language Learning*, *System*), usually focusing on awareness and its operationalization and measurement, as well as in technology journals (*CALICO*, *Language Learning & Technology*, *ReCALL Journal*), usually focusing more on technological details. As opposed to a more

descriptive approach in the earliest reviews, the field has recently taken a more analytical point of view. Warschauer (2004) argues that the discipline started with a structuralist standpoint during the seventies, then moved on to a more communicative position during the eighties, and eventually led to the present integrative content-based approach. However, Bax (2003) claims that Warschauer's classification is ambiguous and does not account for aspects such as the evolution of the software or the type of activities implemented in CALL. As a consequence, Bax proposes an alternative analysis in which he includes three approaches (restricted, open, and integrated) that incorporate, among other elements, the following: the type of task, the teacher's role, and the feedback offered to the student.

Zhao's metaanalysis (2003) concludes that technology-based language instruction can be as effective as teacher-delivered instruction in almost all areas of language education, and suggests several issues that need to be addressed, including curriculum and content development, as well as empirical evaluations.

Studies implementing computerized treatments in their designs have addressed a current concern in SLA, namely, whether language development is possible without attention or awareness during input processing (Schmidt, 2001). Attention and awareness in relation to language development has been measured either online, with think-aloud protocols (Rosa and Leow, 2004), or offline, with debriefing questionnaires (Robinson, 1997b). Robinson (1997b) investigated whether different computerized treatments (i.e., implicit, incidental, and rule search) on simple and complex grammatical rules in English could lead to different levels of awareness (i.e., noticing, looking for rules, ability to verbalize rules). The results revealed that participants in the rule-search and instructed conditions looked for rules more than those in the implicit condition. Moreover, it was found that only awareness at the level of looking for rules and ability to verbalize the rules positively affected learners' accuracy. Rosa and Leow (2004) further investigated the role of awareness in L2 development by implementing verbal protocols. Participants were exposed to [+/- explicit] computerized treatments (LIBRA cards) to teach Spanish contrary-to-fact past conditional sentences. The study concluded that greater explicitness in learning conditions led to a higher level of reported awareness, and that higher levels of awareness were related to greater L2 development.

Technology has also been implemented in studies that attempt to investigate the roles of type of practice, feedback, and grammar explanation in L2 development under an attentional framework. Some of these studies are reviewed briefly in the later paragraphs, whereas others are presented in [Table 1](#). Computer-assisted research has compared input-based and output-based practice (Morgan-Short and Bowden, 2006;

Table 1 Implementing technology to the study of pedagogical variables: four studies

Nagata, 1998). Implementing Authorware 5, Morgan-Short and Bowden (2006) observed that although there was no difference between groups on interpretation measures, the output-based group outperformed the input-based group on the production of Spanish preverbal direct-object pronouns, although this difference disappeared after a three-week period.

Research on feedback includes various consciousness-raising or Focus on Form conditions (Ayoun, 2001; Nagata and Swisher, 1995; Sanz, 2004). Nagata and Swisher isolated the effects of explicit (i.e., with metalinguistic information) and implicit written feedback. After four computer sessions of practice with a translation task, type of feedback had not affected production of verbal predicates, but metalinguistic information was beneficial for the production of particles. Sanz (2004) showed that explicit feedback provided for input-decoding performance during online sentence processing did not enhance the acquisition of morphosyntax as measured by interpretation and production tasks. She concluded that the effects of explicit feedback appear to depend on whether it is provided during production or input processing, and in combination with task-essential practice or simple exposure.

Other studies have investigated a combination of feedback and grammar instruction (DeGraaff, 1997; Robinson, 1996, 1997a; Sanz and Morgan-Short, 2004). In addition, the effects of rule presentation have also been studied without feedback (DeKeyser, 1995; Ellis, 1993). Ellis (1993) examined rule presentation of a grammar structure (Welsh soft mutations) with or without examples and concluded that provision of computerized explicit grammar with instances of the target form allowed for generalization at both explicit and implicit levels, thus facilitating language development. Likewise, DeKeyser (1995) showed that explicit rule presentation, as opposed to more implicit conditions, had beneficial effects for the acquisition of categorical rules, and that rules, in fact, were not acquired by the implicit group. In this study, computers were used to expose participants to combinations of written sentences in an artificial language and their corresponding pictures. De Graaff (1997) assessed the effects of explicit rule presentation when participants practiced target forms in eXperanto through interaction with a computer lesson developed using TAIGA (1987). Although the results revealed that explicit rule presentation was beneficial, only one of the types of practice proposed required learners to make form-meaning connections during practice, and the amount of feedback was not controlled. To avoid this problem, Sanz and Morgan-Short (2004) isolated the effects of explanation and feedback in their investigation of the acquisition of Spanish word order by comparing four groups combining [+/- explanation] and [+/- explicit feedback]. All groups were exposed to structured input through practice tasks.

The implementation of LIBRA allowed for provision of feedback that was immediate, individualized, and focused on the target form. Contrary to previous studies, results from Sanz and Morgan-Short showed that no group outperformed any other group on the interpretation and production tests. The authors concluded that exposing L2 learners to structured input through task-essential practice was sufficient to promote acquisition, and that in such a context, providing rule explanation, feedback, or both, does not significantly add to the knowledge gained through practice.

The rest of this section summarizes research on electronic glosses and incidental vocabulary learning, on CMC, and on the field of data-driven learning and the use of corpora and concordances in language learning and awareness. Research conducted in the nineties concluded that the use of electronic glosses had a positive effect on incidental vocabulary learning, and thus, recent contributions have explored the cognitive processes involved. Bowles (2004) compared computerized with traditional paper-and-pen glosses. Analysis of verbal protocols did not identify differences in noticing, and no differences were identified regarding L2 vocabulary development. A study by Nagata (1999) compared annotations with or without feedback and concluded that computerized feedback leads to deeper lexical processing. Laufer and Hill (2000) investigated the relationship between different dictionary lookup preferences and incidental learning, concluding that lookup behavior differed depending on learning style and multiple glossing options seemed to be more beneficial than single options. Finally, DeRidder (2005) explored the effects of enhanced glosses on incidental vocabulary learning, text comprehension, and word retention over time. Results suggested a lack of relationship between enhancing and the three variables, and enhancing was not shown to decrease the degree of attention.

CMC research has often taken an interactionist perspective, addressing the role of negotiation in fostering conscious processing mostly through feedback. Kötter (2003) examined negotiation of meaning and codeswitching in online tandems between English and German learners, and found that clarification requests were the most common types of repairs used. A recent study by Morris (2005) showed that when nonnative speaker children interacted with each other, they provided mostly implicit negative feedback in the form of negotiation of meaning and recasts. Finally, Smith (2003) observed that negotiation of meaning also occurred in CMC between nonnative speakers, although the effects varied depending upon the type of task.

Corpus linguistics is leading to the development of theories about language, which challenge existing orthodoxies in applied linguistics. It also raises a number of questions, such as how corpus data should be interpreted and how it can be applied to areas in which applied

linguistics is active, including language teaching. Hunston as well as Granger, Hung, and Petch-Tyson, both published in 2002, are accessible introductions to corpus linguistics and essential for anyone interested in corpora and its impact on applied linguistics. Granger, Hung, and Petch-Tyson (2002) analyzes the advantages and disadvantages of automated and semiautomated approaches and the capabilities of linguistic software. It describes in detail the corpora and compilation processes, thus giving practical insight to those planning on compiling a corpus of L2 data or working with such a corpus. Finally, Gaskell and Cobb (2004) presents preliminary results from an empirical study with intermediate classroom learners on concordance information as feedback to sentence-level written errors, while describing a URL-link technology that allows teachers to create and embed concordances in learners' texts.

#### WORK IN PROGRESS

A substantial number of projects that implement technology in the study of language awareness are currently underway. Some use technology to enhance the development of awareness. For others, technology allows for the observation and measurement of awareness. More integrative projects combine both motivations to include technology, an example of which is *The Latin Project*. Designed by Sanz and graduate students Bowden and Stafford, it is an investigation of the interaction between prior experience with language (bilingualism), and type of input (varying in degrees of explicitness) that includes cognitive variables (working memory and awareness) as moderating variables. The focus is on processing strategies, specifically the use of word order, case, and number morphology to assign semantic functions in L3 Latin by speakers of different L1s and L2s. The design is experimental with computer-delivered treatments and tests, including oral and written interpretation, grammaticality judgment, and production, combining old items (present in the treatment) and new items. Computers also administer a battery of working memory tests, debriefing questionnaires, and gather think-aloud data for the study of the role of awareness during online processing. The design consists of a web-based application combining Flash and ColdFusion programming tools that delivers oral and written input combined with images. The application also gathers reaction time and accuracy data and stores it in a database available online. Web delivery allows for data gathering wherever a personal computer can access a high-speed network. While the goal of the input-based treatments is to promote language development, in designing the tests the researchers strived to provide the most comprehensive picture of language knowledge and its degrees of automatization to include both explicit and implicit knowledge.

Within the most promising group of studies that implement technology to enhance awareness, there is research on CMC, and specifically on the potential long-term effects of computer-delivered recasts now underway at Penn State University (Sagarra). In combination with CMC, and within Mackey and Gass' stimulated recall technique to elicit awareness of recasts, Mackey (December 2005, personal communication) suggests "enhanced stimulus recalls" using a split screen (picture in picture) with a close-up of, for example, participants' hands during typing. For contexts other than CMC, such as classroom interaction or pair work, Mackey suggests a close-up of the participants' gaze or some other nonverbal cue to prompt verbalizations when subjects exhibit traces of memory decay.

Mackey's ideas, like the studies described in this and the next paragraph, address the use of technology to operationalize and measure awareness. We provide short descriptions of designs that use click-tracking techniques, eye-tracking devices, and neuroimaging. In computerized task-based instruction, the combination of concurrent verbal protocols and software applications designed to track learners' interactions with the task at hand provides the researcher with valuable insights into the cognitive strategies deployed by learners in their interaction with both the task and L2 input. Cerezo's study, in particular, shows whether a task really achieves its goals in terms of pursued degrees of processing, or whether, on the contrary, it may be "decomplexified" and redefined by the learner; also, it is a good informer of the learners' motivation toward the task, and reveals how often-overlooked intervening variables such as boredom may decrease learners' attention to L2 input. The data from the computerized tracking protocols consist of succession of clicks of all the participants in complex conditions. Sagarra and Dussias have brought to the study of SLA the eye-tracking technique, which they use to study attention and specifically the competition between lexical and morphological cues to assign tense at the sentence level during online processing across different proficiency levels.

Recently, SLA researchers have begun to discover the potential contributions of neuroimaging techniques to the study of SLA (see also Ellis, *Explicit Knowledge and Second Language Learning and Pedagogy*, Volume 6). Two such techniques are event-related potentials (ERPs) and functional magnetic resonance imaging (fMRI). ERPs measure the brain's electrical activity and provide precise temporal information that reflects the neural processing of a preceding event. fMRI measures the brain's hemodynamic response to an event and can provide spatial information about what part of the brain is activated in response to an event. Currently, research such as Bowden and Morgan-Short's dissertations use ERPs to investigate the role of experience in the neurocognition of adult SLA. Specifically, they use ERPs to

compare the neurocognitive bases (i.e., declarative vs. procedural memory systems) of L2 learning at various levels of experience/proficiency and after exposure to implicit vs. explicit evidence.

The earlier-mentioned research by Cerezo, Mackey, Morgan-Short, Sagarra, and Sanz and colleagues was presented in the year 2005 at the *Second Language Research Forum (SLRF)*, the *Georgetown University Round Table (GURT)*, and the *Association Internationale de Linguistique Appliquée (AILA)*. Other related topics addressed at the SLRF conference included more research on computerized feedback in relation to task-essentialness, to reactivity, and in comparison to natural or classroom environments.

### PROBLEMS AND DIFFICULTIES

Researchers find in technology an array of tools that allow them to go further than ever in their attempt both to induce language awareness and to measure it. These researchers face practical, methodological, and theoretical challenges. Practical challenges relate to the availability of samples, hardware, software (programming tools), and technical help. Finding samples that are large and homogeneous is no easy task. Also, institutional review boards often make sampling even more difficult. Participants are not always available or willing to participate; they have to be compensated to go to laboratories as data-gathering usually takes place outside of class time. Often compensation for programmers, equipment rental and acquisition make this research much more expensive than classic paper-and-pencil designs, and requires patience and time spent waiting within those institutions in which different researchers share laboratories. These conditions make the availability of institutional funding a determining factor.

We began this article with the theoretical statement that there is not one definition of language awareness but many, and that, for the purposes of the article, we accepted the broadest definition possible to incorporate all knowledge of and about language. A narrower definition would include only conscious knowledge of the language, that is, knowledge of which the learner is aware. An even narrower use of awareness, linked to Schmidt's noticing hypotheses, distinguishes between language information that has been processed in working memory under attention, a required condition for input to become intake ready to feed the acquisition process, and that which has not (see also Robinson, *Attention and Awareness*, Volume 6). Confusion over terminology is a serious problem: awareness, consciousness, and explicitness are often used as synonyms. Sometimes they are applied to input processing, to knowledge, to input, even to pedagogical techniques. Naturally, because constructs are hard to define, measurements will also be challenging.

Most constructs, not just awareness, are elusive identities, difficult to define and thus equally or more challenging to operationalize in order to be measured. It is often necessary to reformulate tests, revise coding procedures, and recode after discussion among raters to avoid interrater reliability problems. Researchers have to make decisions about which technique to include in the design: online measures, such as concurrent think-aloud protocols, might turn against the researcher by altering the very same processes under investigation (i.e., reactivity). Offline measurements, like debriefing questionnaires and stimulated recalls, have problems of veridicality: is the participant making up processes that never took place while completing the task? And, of course, that researchers cannot conclude that awareness was not present from lack of verbalization is also a significant caveat within the measurement schemata. Distinguishing between explicit and implicit knowledge of language is not any easier. Most acquisitionists hold that competence is equivalent to implicit knowledge, so the litmus test for effectiveness of a pedagogical technique is whether it positively affects implicit knowledge. The problem is how to determine that performance is not tainted by explicit knowledge, i.e., that learners did not use their conscious knowledge of rules to monitor their responses. Including multiple tests (interpretation, production, judgments), measures like latency (i.e., reaction time), and techniques such as eye-tracking and neuroimaging in the design are ways in which researchers are taking advantage of technology to avoid these limitations. Finally, a common limitation that L2 researchers outside the cognitive approach associate with the studies reported here is that of validity. Often, researchers have to choose between a preference for naturalistic language behavior at the risk of complexifying analysis and even eliciting too few exemplars to be able to proceed with the analysis and controlled collection procedures that result in highly restricted, sentence-level data. In those studies that compare teacher-directed versus computer-assisted language instruction, the Hawthorne effect is almost unavoidable. And to conclude, as in most SLA research, the disparity of methods implemented and the lack of replication are a challenge for any scholar trying to draw general conclusions for the research (Sanz, 1997).

#### FUTURE DIRECTIONS

In cognitive psychology, laboratory studies that use technology (including computers) for data collection are the norm as technology allows for tighter control of individual and environmental variables as well as finer measures of the effects of treatments. For example, response time, gaze (direction), time spent on particular portions of written input (eye-tracking), response tracking for the analysis or

frequency and type of errors during treatment, in addition to classic accuracy scores are all measurable thanks to the use of technology. Research on awareness in SLA is nowadays intimately connected with advances in cognitive psychology, but it is less advanced on the methodological side. Acquisitionists are striving to adapt to the study of SLA techniques that are common in cognitive psychology. In terms of measurements of awareness, including all its varied definitions, this is the direction researchers are following into the future.

As for treatments, technology is rapidly replacing paper-and-pencil delivery. Rather than instruction delivered by one individual to a group of students, the application of technology to the instructional design allows for individual exposure to the treatment. This facilitates randomization of participants to different experimental treatments including the placebo, which makes the study truly experimental. It is also possible to control key variables in the treatment, such as the amount and type of feedback to which each participant is exposed, and even to individually adapt treatments based on performance, something that is impossible in a group situation, thus leading to a fine-grained analysis of the effects of the treatment. Incorporating computers into the design of a study also make it more convenient: Instead of simultaneous use of an overhead projector, a VCR, TV sets, and multiple copies of the testing and treatment materials, all that is needed is a computer. If the application is web-based, as in *The Latin Project*, both data gathering and access to the database are possible in multiple sites simultaneously. Other advantages are also important: Multimedia capabilities make the lesson far more attractive to the user and allow for provision of video and audio input simultaneously, thus accommodating different learning types.

To conclude, laboratory research on language awareness will continue to increase the implementation of computers in the design as more and larger laboratories become available, research institutions hire information technology technicians, and software becomes more adaptive and affordable. Furthermore, the field is moving beyond computers to make use of specialized devices such as eye-tracking machines and advances in neuroimaging techniques.

## **Section 4**

### **Knowledge about Language, Bilingualism and Multilingualism**

## KNOWLEDGE ABOUT BILINGUALISM AND MULTILINGUALISM

### INTRODUCTION

For many decades, one of the key questions about bilinguals and multilinguals has been about their implicit and explicit knowledge not only of each language they speak, but especially their understanding of the linguistic and psychological contact between their two languages. This has mostly been researched as the ‘metalinguistic awareness of bilinguals’.

This chapter begins by presenting research up to the 1970s on bilingual’s metalinguistic awareness. It then outlines the last two decades of research, particularly from Ellen Bialystok and colleagues, which suggests that bilinguals have specific advantages over monolinguals in analyzing knowledge of language and in controlled attention to their language processing. Research on a bilingual’s knowledge about language goes wider than metalinguistic awareness. Hence, this chapter includes a synopsis of research on bilingual’s sensitivity to communication, social uses of codeswitching, language interpretation and brokering. The chapter concludes with a discussion of the limitations of research in this area, and likely future directions (e.g. cultural and aging aspects of a bilingual’s knowledge about language).

### EARLY DEVELOPMENTS

Leopold’s (1939–1949) case history of the bilingual (German–English) development of his daughter, Hildegard, noted a looseness of connection between word sound and meaning which he attributed to bilingualism. Favourite stories, songs and rhymes were not repeated with exactly the same wording. Instead, vocabulary substitutions were made, thus showing that the meaning predominated over exact repetition of words. This suggested to Leopold that Hildegard’s bilingualism gave her an advantage: there was implicit knowledge that meanings of words resided separately from the sounds of the words. A possible metalingual advantage (see Berry, 2005, for a discussion of ‘metalingual’ terminology) for bilinguals was thus hypothesized.

It is Ianco-Worrall (1972) who is usually credited with the initial experimental evidence for such metalinguistic awareness in bilinguals.

Researching on 30 Afrikaans–English bilinguals aged four to nine, the bilingual group was matched with monolinguals on IQ, age, gender, school grade and socio-economic group. In the first experiment, a typical question was: ‘I have three words: CAP, CAN and HAT. Which is more like CAP: CAN or HAT?’ A child who chooses HAT would appear to be making a choice based on the meaning of the word, as HAT and CAP refer to similar objects. A child who says that CAN is more like CAP would be classed as making a choice determined by the sound of the word.

Ianco-Worrall found that there was no difference between bilinguals and monolinguals in their choices by age seven. Both groups chose HAT indicating development in concentrating on meaning and not sound. However, she found that with four- to six-year-old bilinguals tended to respond to word meaning, whereas monolinguals more to the sound of the word. In a further experiment, Ianco-Worrall asked the following type of question: “Suppose you were making up names for things, could you call a cow ‘dog’ and a dog ‘cow’?” Bilinguals mostly felt that names could be interchangeable. Monolinguals, in comparison, more often said that names for objects such as cow and dog were not interchangeable. Thus bilinguals tend to implicitly know that language is more arbitrary. This appears to be a result of owning two languages, giving the bilingual child awareness of the free, non-fixed relationship between objects and their labels.

Ben-Zeev (1977a, 1977b) suggested that bilinguals and multilinguals subconsciously analyze and implicitly scrutinize their languages. This stems from the need to separate their two or more languages. Using the symbol substitution test with 5 to 8 year olds, Ben-Zeev (1977a) asked children to substitute one word for another in a sentence. For example, they had to use the word ‘macaroni’ instead of ‘I’ in a sentence (e.g. ‘Macaroni am warm’ thus avoiding saying ‘I am warm’). She found bilinguals to be superior in this kind of test, demonstrating a knowledge about language in advance of monolinguals. Bilinguals appeared to be more flexible and analytical in language skills.

## MAJOR CONTRIBUTIONS

### *Early Beginnings*

The foundations of knowledge about bilingualism start very early. From 22 to 24 weeks, and especially in the late stages of pregnancy, the foetus can discriminate between different voices and speech sounds. Mehler et al. (1988) found that newborns can distinguish their parents’ native language sounds from unfamiliar foreign language sounds. Maneva and Genesee (2002) showed that language-specific patterns and some

speech differentiation may thus occur before the first birthday. Research has found that bilingual children (two years old or earlier) know which language to speak 'to whom' and in 'what situation' (Deuchar and Quay, 2000; Meisel, 2004). Such foundations of knowledge about bilingualism are important as they derive from the foetus stage and the first two years after birth. However, research on bilinguals and their knowledge about languages tends to wait until they are around three to five years old.

### *Metalinguistic Awareness*

The metalinguistic awareness advantages of bilingual children has been studied in some depth (Bialystok, 2001a, 2001b: see also Jessner, *Language Awareness in Multilinguals: Theoretical Trends*, Volume 6). In research comparing bilingual and monolingual children on metalinguistic awareness, Bialystok found that bilingual children were superior on the cognitive control of linguistic processes. For example, Bialystok (1987a) conducted three experiments each involving around 120 children aged five to nine. The children were asked to judge or correct sentences for their syntactic acceptability irrespective of meaningfulness. Sentences could be meaningfully grammatical (e.g. why is the dog barking so loudly?); meaningful but not grammatical (e.g. why the dog is barking so loudly?); anomalous and grammatical (e.g. why is the cat barking so loudly?); or anomalous and ungrammatical (e.g. why the cat is barking so loudly?). The experimental protocols required the children to focus on whether a given sentence was grammatically correct or not. It did not matter that the sentence was silly or anomalous. Bialystok (1987a) found that bilingual children in all three studies consistently judged grammaticality more accurately than did monolingual children at all the ages tested.

Bialystok (1987b) also found that bilingual children were ahead of monolingual children in counting the number of words in sentences. It can be surprisingly difficult for children under about seven years old to count how many words there are in a sentence as it depends on knowledge of the word boundaries and the relationship between word meaning and sentence meaning.

A synopsis of research on bilinguals' metalinguistic abilities can be summarized as follows (Bialystok, 2001a, 2001b; see also Jessner 2005, and Jessner, *Language Awareness in Multilinguals: Theoretical Trends*, Volume 6 for research on multilinguals). While bilinguals do not have all-embracing metalinguistic advantages or universally superior metalinguistic abilities, bilinguals whose both languages are relatively well developed have increased metalinguistic abilities particularly in those tasks that require *selective attention* to information (e.g. when there is

competing or misleading information). Such selective attention relates to two components: bilinguals' enhanced *analyzing* of their knowledge of language; and their greater *control* of attention in internal language processing. Bilinguals tend to show superiority in control but not necessarily in analysis, but this is 'a formidable advantage in cognitive processing' (Bialystok, 2001b, p. 179). This may be due to bilinguals need to differentiate between their two languages. Since both languages remain active during language processing (rather than a switch mechanism occurring), there may be control of languages when in conversation so as to avoid incursions (Bialystok, 2001a).

Such research findings have important implications for bilingual children beyond the experimental tasks, particularly in literacy and biliteracy development. For example, phonological awareness and the cognitive skills of symbolic representation are needed to read and write. Letters are symbols without inherent meaning and do not resemble the sounds they represent. Bilinguals appear to understand the symbolic representation of words in print earlier than monolinguals as they see words printed in two separate ways. In turn, this may facilitate earlier acquisition of reading. Metalinguistic awareness is a key aspect in the development of reading in young children (Bialystok, 1997; Bialystok, 2001a). This suggests that bilinguals may be ready slightly earlier than monolinguals to learn to read. However, there are many intervening variables that make statements about bilingual's metalinguistic advantages and early literacy dangerous. The child's experience and level of proficiency in each language, the relationship between the two languages and the type of writing systems employed by each language are examples of intervening variables.

### *Communicative Sensitivity*

In Ben-Zeev's research (1977b) on the comparative performance of bilingual and monolingual children on Piagetian tests, she found that bilinguals were more responsive to hints and clues given in the experimental situation. That is, bilinguals seemed more socially and linguistically sensitive in an experimental situation. This gave rise to a hypothesis that bilinguals have social (and not just cognitive) advantages in 'communicative sensitivity'.

Bilinguals need to be subconsciously (and occasionally consciously) aware of which language(s) to speak with whom in which situation. They implicitly monitor the appropriate language(s) in which to respond, or in which to initiate a conversation (e.g. on the telephone). Not only do bilinguals often attempt to avoid socially unacceptable mixing of their two languages, they also have to pick up clues and cues when to switch languages. The literature suggests that this may give a

bilingual increased sensitivity to the social nature and communicative functions of language.

An experiment on sensitivity to communication by Genesee, Tucker and Lambert (1975) compared aged 5 to 8 year old children in bilingual and monolingual education on their performance on a game. In this simple but ingenious research, the children were asked to explain a board and dice game to two listeners. One listener was blindfolded, the other not. The listeners were classmates and not allowed to ask any questions after the explanation. The classmates then attempted to play the game with a person giving the explanation. It was found that bilingual children were relatively more sensitive to the needs of listeners than monolinguals. The bilinguals gave relatively more information to the blindfolded children than to the sighted listener compared with the monolingual comparison group. The authors concluded that the bilingual children 'may have been better able than the control children to take the role of others experiencing communicational difficulties, to perceive their needs, and consequently to respond appropriately to these needs' (p. 1013).

In a variety of cognitive tests with bilingual and monolingual samples among the Konds (Kandhas) in Orissa, India, Mohanty (1994) found an increased sensitivity to messages among bilinguals. This links with sociolinguistic competence and suggests a heightened social awareness among bilinguals of verbal and non-verbal message cues and clues in communication. This implies that bilingual children may be more sensitive than monolingual children in a social situation that requires careful communication. A bilingual child may be more aware of the needs of the listener. But much more research is needed to define precisely the characteristics and the extent of the sensitivity to communication that bilinguals may share. Research in this area is important because it connects cognition with interpersonal relationships. It moves from questions about the 'knowledge about language' cognitive abilities of a bilingual to their 'knowledge about language' social abilities. The social abilities of bilinguals that derive from their knowledge about languages are illustrated in the social purposes of codeswitching.

### *Codeswitching*

Codeswitching reveals knowledge about languages in contact that is distinctive among bilinguals and multilinguals. Codeswitching will vary according to the people in the conversation, the topic, and the context in which the conversation occurs. Such variations imply a knowledge about languages that is needed by competent bilinguals and multilinguals. Familiarity, projected status, the ethos of the context and the perceived linguistic skills of the listeners affect the nature

and process of codeswitching (Martin-Jones, 2000; Simon, 2001). This suggests that codeswitching is not just linguistic; it relates to social and power relationships. The bilingual needs to have implicit knowledge about these factors to perform appropriately in moving between languages.

Some illustrations follow

- Words, phrases and sayings in languages may not correspond exactly and the bilingual may switch to a language (especially if the listener is bilingual) to express an idea that has no exact equivalent in the other language.
- Codeswitching may be used to express identity, communicate friendship or family bonding. For example, moving from the common majority language to the home language or minority language both the listener and speaker understand well may communicate friendship and common identity. Stroud's (2004) research shows that codeswitching between Portuguese and Ronga in Mozambique relates to social identities that are constructed in tensions between competing political, economic and cultural pressures.
- Codeswitching may be used to signal a change of attitude or relationship. For example, a codeswitch signals there is less or more social distance, with expressions of less commonality or a growing affinity indicated by the switch. A change from a minority language or dialect to a majority language may indicate the speakers' wish to elevate their own status, create a distance between themselves and the listener, or establish a more formal relationship.

These illustrations suggest that the perceived status of the listeners, familiarity with those persons, atmosphere of the setting and perceived linguistic skills of the listeners are examples of variables that may foster or prevent codeswitching. Such factors operate in children as young as two years of age. Whereas a two-year-olds mixing of language has tended to be seen as 'interference' or a lack of differentiation between languages, research has shown that codeswitching by two-year-olds can be context-sensitive, for example according to who is being addressed (Deuchar and Quay, 2000). Thus, a very young bilingual has knowledge about language that affects codeswitching.

### *Language Interpreters and Brokers*

Such early knowledge about languages in contact is also found in children acting as interpreters for their parents and others (Kaur and Mills, 1993; Valdés, 2003). Bilingual children (and adults) are frequently expected to act as go-betweens and language brokers by interpreting from one language to another (Valdés, 2003). Such an interpreter's

role requires a particular knowledge about the relationship between languages.

For example, in immigrant families, parents may have minimal or no competency in the majority language. Therefore, their bilingual children act as interpreters across a variety of contexts. When there are visitors to the house, a parent may call a child to help translate. The child interprets for both parties (e.g. the parent and the caller). Similarly, at school, stores, hospitals, the doctor's, dentist's, optician's and many other places where parents visit, the child may be taken to help interpret (Valdés, 2003). Interpretation may be needed in more informal places: watching the television, reading a local newspaper or working on the WWW. Rather than just transmitting information, children act as information and communication brokers (Tse, 1996b), often ensuring the messages are 'acceptably culturally translated' as in the following example:

Father to daughter in Italian: '*Digli che è un imbecille!*' (Tell him he is an idiot!)

Daughter to trader: 'My father won't accept your offer.'

Such language brokering depends on more than fluency in two or more languages. It requires knowledge about the relationship between the two languages that influences the message. For example, children may be expected to be adult-like when interpreting (e.g. medical information) and child-like at all other times. Such brokering also affects their knowledge about the status of the two languages. Children may quickly realize when language brokering that the language of power, prestige and purse is the majority language. Negative attitudes to the minority language may result.

Language brokering has potential positive outcomes for the child, including in creating extra knowledge about languages in contact. First, it can bring parental praise, reward and status within the family for playing a valuable and much prized role. Such translation ability may gain both esteem from others and raise self-esteem. Second, the child learns adult knowledge quickly and learns adult language and communication. Early maturity has its own rewards in the teenage peer group. Third, Kaur and Mills (1993) found that children accustomed to acting as interpreters learned to take the initiative. For example, a child may give the answer to a question rather than relaying the question to the parent. This puts children in a position of some power, even of control. Fourth, the cognitive outcomes for child language brokers may be valuable. Children who are regular interpreters for their parents may realize early on the problems and possibilities of translation of words, figures of speech and ideas. For example, such children may learn early on that one language never fully parallels another, and that it is hard to translate exactly the inner meaning of words and metaphors. This may lead

such children to be more introspective about their languages. Thus, interpretation may both require and stimulate metalinguistic awareness (Tse, 1996a).

### PROBLEMS AND DIFFICULTIES

Before concluding, it is important to state the potential limitations of our current understanding about a bilingual's implicit and explicit knowledge about their languages.

1. Not all cognitive processing studies are 'favourable to bilinguals' (Bialystok, 2001a). Some research locates differences that favour monolinguals in language specific processing (e.g. reaction times, an initial developmental lag in vocabulary knowledge specific to a language). For example, Gollan, Montoya and Werner (2002) suggest that a monolingual's semantic fluency is a little faster than that of a bilingual (e.g. as bilinguals need to ensure the correct word is chosen from their two languages) and that bilinguals are more likely to report a 'tip of the tongue' state (unable to immediately retrieve a word) possibly because they use some words in each language less often (Gollan and Acenas, 2004). However, none of these studies suggest that bilinguals have a mental overload, process inefficiently or in everyday thinking have weaknesses compared with monolinguals. In areas such as speed of reaction in retrieving words, the milliseconds difference is of little or no importance in everyday functioning.
2. Researchers who find cognitive advantages mostly focus on relatively balanced bilinguals. Carlisle et al. (1999) found that the degree of bilingualism constrains or enhances metalinguistic performance. Those in the early stages of bilingualism do not share the benefits until sufficient vocabulary development, in both languages, has occurred. Similarly, Bialystok and Majumder's (1999) research showed that balanced bilinguals in Grade 3 were superior to partial bilinguals on non-linguistic problem-solving tasks requiring selective attention. Galambos and Hakuta (1988) suggest that a certain level of proficiency in both languages must be attained before the positive effects of bilingualism on metalinguistic awareness can occur. This is usually termed the thresholds theory (Cummins, 2000).
3. Causal relationships and delineation of the key influencing variables may also be problematic. For example, parents who want their children to be biliterate, bicultural and bilingual may emphasize particular thinking skills, encouraging creative thinking in their children and fostering metalinguistic skills. The parents of bilingual children may be the ones who want to accelerate their

children's knowledge about language. Such parents may give high priority to the development of languages and metalinguistic abilities within their children compared with monolingual parents. So is it bilingualism per se in a child that is more or less influential than the socio-cultural and parenting environment? This suggests taking care about defining what are the determining factors in a bilingual's knowledge about languages. It may be that it is not only language that is important. Other non-language factors may be influential as well (e.g. the immigrant experience, political pressures, subtractive and additive contexts).

4. We need to ask which types of bilingual children share the metalinguistic benefits of bilingualism? Do children below average in cognitive abilities also gain the advantages of bilingualism? There is a tendency in research to use children from the middle classes, particularly those of above average ability. Do the findings relate to bilingual immigrants in subtractive (assimilative) language environments? Further research is needed.

#### FUTURE DIRECTIONS

Is it the case that different languages, or combinations of languages, influence the thinking of individuals? For example, does the structure, concepts (e.g. of time, number, space) and discourses of a particular language affect thinking (the neo Whorfian hypothesis, see Pavlenko, 2005a)? Does someone who learns a second language also acquire new meanings, concepts and enhanced perspectives? Do they change the thinking of the individual? Do such new insights become only partially translatable across a bilingual or multilingual's languages?

Pavlenko (2005a) argues that research on bilinguals assumes that such cognitive effects of bilingualism are universal. But, do different languages and cultures (and their multilingual combinations) have specific cognitive effects? The contested Sapir-Whorf hypothesis has been that different languages may give their speakers different views of the world (linguistic relativity). Learning a second language is thus partly a socialization into new understandings, perspectives and ways of speaking. Recent neo-Whorfian views suggest that different languages may variedly influence individual's thought contents (e.g. concepts) and processes (e.g. selectively attending, remembering, reasoning). Evidence for this can be located in the experiences of colour, number, space, motion, time, autobiographical memory, personhood and the Self in different languages (Pavlenko, 2005a). Such evidence is also present in cross-linguistic differences in terms and understandings about emotion. Pavlenko (2002) showed that in English, emotions are relayed through adjectives as emotional states, whereas in Russian the tendency

is to convey emotions more via verbs as actions and processes, with for example, more attention to body language. Bilinguals may therefore have access to different conceptual representations, experience different imagery and index more varied discourses and identities (Pavlenko, 2005a and b).

Pavlenko (2005a) reviews studies on the concepts of colour, shape, number, motion, space, time, emotions, personhood (e.g. egocentric, socio-centric), discourse and autobiographical memory. For example, while a monolingual Hindi has no term for 'gray', an English–Hindi bilingual is likely to have the concept of gray. She shows that a specific language will sensitize and socialize speakers to particular aspects of a concept. That sensitization will vary from language to language. It will also vary between bicultural simultaneous (early) bilinguals, late bilinguals and incipient language learners (e.g. in a 'foreign' context). She concludes that bilingualism can be advantageous for enriching a person's linguistic repertoire. Bilingualism can provide varied and alternative conceptualizations which enable flexible and critical thinking (Pavlenko, 2005a).

Are the metalinguistic advantages of relatively balanced bilinguals temporary and located mainly with younger children? Do they give a child an initial advantage that soon disappears with growing cognitive competence? Are the effects in any way permanent? Current research is turning its attention to older bilinguals and possible longer term metalinguistic advantages.

De Bot and Makoni (2005) examine the relationship between aging (in its physical, psychological and social dimensions) and language. One suggestion is that being bilingual may allow access to additional cognitive processes and storage as memory functions decline with age. Bialystok, Craik, Klein and Viswanathan (2004) provide some early evidence across a series of experiments that a metalinguistic advantage persists into adulthood, and furthermore helps lessen some of the negative cognitive effects of aging in adults.

In a much publicized study, Bialystok, Craik, Klein and Viswanathan (2004) used the Simon Task to compare groups of younger and older bilinguals and monolinguals. In the Simon Task, coloured stimuli are presented on either the left or the right side of a computer screen. Each of two colours (or two pairs of colours) are associated with a response key on the two sides of the keyboard underneath the stimuli. A subject has to press the key on the correct side. For example, a correct 'congruent' response occurs when the person presses the left key when red is presented on the left side of the screen. A correct 'incongruent' response is when the subject presses the left key when red is presented on the right side of the screen. An incorrect response is when red is presented on the right side and the person presses the right key. The

time taken to respond is an important measurement (i.e. 'incongruent' trials have longer reaction times and this is termed the Simon effect). Longer reaction times tend to occur with aging.

Across a series of experiments, Bialystok, Craik, Klein and Viswanathan (2004) found superior performance among bilinguals on the Simon task. This result was apparent in younger and older bilinguals. Bilinguals tended to perform the Simon Task quicker than 'matched' monolinguals, irrespective of age, and showed less interference in the 'incongruent' trials. A key finding was that bilingualism reduced the age-related lower performance as older bilinguals performed significantly better than the older monolinguals. This implies that 'the lifelong experience of managing two languages attenuates the age-related decline in the efficiency of inhibitory processing (Bialystok, Craik, Klein and Viswanathan, 2004, p. 301). Thus, lifelong bilingualism may provide a partial defence against the normal decline in cognitive control associated with aging.

The Simon effect is similar to advantages found in bilingual children who appear to be superior in selective attention to problems, plus inhibition of attention to misleading information. The bilingual advantage appears to be in complex cognitive processing that requires executive control. This advantage may be due to bilinguals working in one language while both their languages are active. 'The joint activity of the two systems requires a mechanism for keeping the languages separate so that fluent performance can be achieved without intrusions from the unwanted language' (Bialystok, Craik, Klein and Viswanathan, 2004, p. 291).

From these experiments, such inhibitory control appears to last for a lifetime (Bialystok, Craik, Klein and Viswanathan, 2004). 'The simple experience of bilingualism that relies on some aspect of these processes to control the production of the relevant language appears to yield widespread benefits across a range of complex cognitive tasks' (Bialystok, Craik, Klein and Viswanathan, 2004, p. 302). This suggests that future research can valuably engage the range and boundaries in the metalinguistic profiles of bilinguals across the lifespan, from fetus to fading.

LANGUAGE ATTITUDES AND MINORITY  
LANGUAGES

INTRODUCTION

As the research literature throws up a variety of definitions of attitudes, the general and relatively straightforward definition provided by Sarnoff (1970, p. 279) is widely used as a starting point—for him an attitude is ‘a disposition to react favourably or unfavourably to a class of objects’. In the case of language attitudes, the ‘class of objects’ which instigate such reactions are, of course, always language related. Baker (1992, p. 29, cited in Garrett, Coupland and Williams, 2003, p. 12) has observed that some or all of the following ‘objects’ have formed the focus of language attitude studies: language variation, dialect and speech style; learning a new language; specific minority languages; language groups, communities, minorities; language lessons; parents of children learning languages; language preferences and language use. Even this list is not exhaustive. Giles, Hewstone and Ball (1983, p. 83), for example, would also include ‘opinions concerning . . . language policies’. This vast research corpus has already generated several integrative studies and reviews (e.g. Baker, 1992; Bradac, Cargile and Hallett, 2001; Garrett, Coupland and Williams, 2003; Giles and Billings, 2004; Giles and Coupland, 1991; Ryan, Giles and Sebastian, 1982). It is not possible, within the confines of this chapter, to review this literature in detail, but an attempt will be made to collate the more important elements and to add some priorities of my own.

Language attitudes, as defined earlier, are clearly important in a variety of minority language policy contexts. For school pupils from minority language backgrounds, it is frequently the case that their second language rather than their first is the dominant language in the community, and the associated attitudes arising from this juxtaposition greatly changes the dynamics involved in learning the second language (Gardner, 2002). For similar reasons, language attitudes held by both the majority and minority groups affect the success or failure of entire minority language planning strategies. Typically, the dominant language group promotes its patterns of language use as the model required for social and economic advancement. This may not only affect the resources made available by the state for minority language policies, but the attitudinal response of minorities themselves is often even more complex. A minority language

that is valued for its identity and solidarity functions may simultaneously be seen, even by its own speakers, as weakly endowed in terms of status (or linguistic capital, Bourdieu, 1991). The tension set up by these competing evaluations can be extremely difficult for individuals and communities alike to contain and resolve.

More than 20 years ago, in a review of attitudinal research at the time, it was observed that 'in every society the differential power of particular social groups is reflected in language variation and in attitudes toward those variations' (Ryan, Giles and Sebastian, 1982, p. 1). This statement rather neatly captures the principal relationships which have formed the focal points in the field of research under review ever since—between language attitudes and language variation; between social structures and language variation and, finally, between language attitudes and social structures. While there has been a considerable degree of continuity in the central concerns of those working in the field, the emphasis over this period has shifted from the first set of relationships noted earlier towards the second, and more recently still, towards the third.

Not surprisingly, therefore, the contributions of several different disciplinary perspectives are of relevance. Attitudes in general, and language attitudes in particular, are of considerable interest to social psychologists, sociologists, sociolinguists and political scientists.

Lastly, in these introductory comments, it should be noted that while studies of attitudes towards major world languages forms a considerable part of the language attitudes literature, it is with regard to minority languages that the most pressing policy concerns arise. For this reason, the following review is presented primarily from a minority language perspective. In this context, 'minority language' is understood as the language spoken by a socially—and usually numerically—subordinate group within the total population of a given society. While it is recognized that minorities, so defined, can vary widely in demographic and sociolinguistic terms, the implications of such variations for language attitudes cannot be explored in a chapter of this length (see, however, the case studies in Heller and Martin-Jones, 2001; Schieffelin et al., 1997).

### EARLY DEVELOPMENTS

The methodological and theoretical foundations for researching attitudes were established in the parent disciplines of sociology and psychology in the first half of the twentieth century. In the inter-war years, research into attitudes was a central, if not defining, focus of the emerging discipline of social psychology. In this period, interest in attitudes centred on issues of content and method (in particular on the construction of scaling techniques). In the same period, the work

of Lazarsfeld and his associates pioneered several of the main techniques of survey research within the sociological field. This phase of research was characterized by significant developments in attitude measurement, methods of questionnaire construction and sampling technique.

However, while Giles and Billings (2004, p. 188) cite an 1931 study as an early example of language-related attitudinal research, it is generally agreed that systematic empirical research into the relationship between attitudes and language variation dates primarily from the 1960s and 1970s (Bradac, Cargile and Hallett, 2001). This suggests a relationship between the conduct of this type of research and other policy and technical developments which occurred at this time. Firstly, technical developments in the computer industry made it possible to process large volumes of data quickly and cheaply. Secondly, the emergence of language issues on to the policy agenda of many states, and a simultaneous shift to the operational procedures of planning in governmental decision making, all created a demand for reliable, up-to-date data about public attitudes and the attitudes of specific groups such as teachers and school pupils. Attitudinal research was seen to meet this need in the process of formulating and implementing language policy. Since then a large volume of descriptive data has been collected and methodological and theoretical approaches are being continuously developed and refined.

Within the sociological perspective, the first specifically language attitude surveys in the developed world were conducted in Canada in 1965 for the Royal Commission on Bilingualism and Biculturalism (see Pool, 1973 for a detailed account). Two national sample surveys were conducted in 1965 among adults and teenagers. The surveys were primarily designed to collect information about opinions on a wide range of language policy issues, but they also collected considerable additional information about the language background of the respondents, their competencies, behaviours and attitudes. In, or about the same time, Fishman, Cooper and Ma (1971) were using similar methods to examine the attitudes of the Spanish-speaking community in New York.

The foundations of the social psychological perspective on language attitudes were established with the introduction of the 'matched guise' technique by Lambert, Hodgson, Gardner and Fillenbaum (1960). Lambert's (1967) review of a series of matched guise studies, in which the same speakers are heard using the contrasting varieties, provided the impetus for the many so-called indirect studies which have been conducted in language-contact settings across the world. The approach based on this work has become, arguably, the dominant element of language attitude work. While 'certain methodological and substantive assumptions have proven extremely tenacious', 'many things have

been added to the paradigm in the last quarter century' (Bradac, Cargile and Hallett, 2001, p. 141).

From a sociolinguistic perspective, researchers have followed the lead of Labov in focusing on the association between specific linguistic features and characteristics of the social group and situational contexts in which they occur, and understanding the inferences listeners make about these associations (Ryan, Giles and Sebastian, 1982). However, Giles and Billings (2004, p. 190) have argued that Labov's explorations in the attitudinal area owe much to the innovations of Lambert.

Finally, several of the earlier reviews of the field of language attitudes (e.g. Ryan, Giles and Sebastian, 1982) distinguish yet another type of attitudinal study, which they term 'content analysis of societal treatment'. Fishman's (1966) study of language loyalty in the USA is cited as an early example of the genre.

#### MAJOR CONTRIBUTIONS

Over the past 40 years, the social scientific study of language attitudes has relied mainly on three investigative approaches: 'societal treatment or content analyses, direct measures, and speaker evaluations' (see Ryan, Giles and Sebastian, 1982).

The societal treatment approach is in fact often overlooked in contemporary discussions of language attitudes research (Garrett, Coupland and Williams, 2003, p. 15), but 'it is undoubtedly an important source for gaining insights into the relative status and stereotypical associations of language varieties'. The rather heterogeneous group of studies includes studies using anthropological techniques such as participant observation and ethnographic studies, as well as studies of language use in various official and private domains. It is regrettable that the attitudinal data in many ethnographic studies, in particular, are rarely reviewed in the social psychological literature, despite the frequent pleas for 'an interdisciplinary' approach (Knops and van Hout, 1988).

The direct approach to investigating language attitudes is characterized by survey and interview techniques in which the informants themselves report their attitudes. One central methodological issue here, which distinguishes the quantitative nature of this research from the qualitative ethnographic approach, is whether subjects' verbal statements of their attitudes and their behavioural reactions in concrete situations can both be interpreted as manifestations of the same underlying dispositions.

However that question is resolved, both policy makers, sociologists and political scientists have continued to use quantitative survey methods to measure and collect data on language attitudes. The Canadian research was followed in 1973 by the national language attitudes surveys conducted in Ireland (see Ó Riagáin, 1997 for details) and, later

in the 1970s, by a number of surveys conducted in Finland. In the 1980s, the Minority Languages Survey Project was undertaken in the UK among immigrant groups. The 1990s saw the geographical spread of language use surveys become yet wider with surveys in The Basque Country, Ireland, Friesland, Wales and in a number of other regions such as Galicia, Languedoc-Roussillon and Sorbia (see Garrett, Coupland and Williams, 2003 for details of these and other surveys).

As already noted, within the social psychological perspective, the speaker evaluation approach—using the indirect matched guise procedure—has been used most widely (Cargile, 2002). In this procedure, selected samples of listeners are told that they are to hear the voices of different speakers, reading some neutral passage of text and are then asked to form an impression of these speakers using a series of person perception rating scales (e.g. intelligence, sincerity, etc.). Unknown to the listeners, all of the speech extracts are, in fact, produced by one speaker using realistic guises of different languages or speech characteristics. The first study using this indirect method was that of Lambert, Hodgson, Gardner and Fillenbaum (1960). English Canadian and French Canadian subjects rated in-group and out-group speakers (i.e. English Canadian and French Canadian speakers, respectively). English Canadians were found to view speakers of their own ethnic group as superior to those of the other ethnic group whereas the French Canadian subjects seemed to have adopted the inferior position assigned to them by the majority culture around them. This first study precipitated an outpouring of further speaker evaluation studies, the findings of which have recently been reviewed by Giles and Billings (2004) among others.

The findings of this research have been generally consistent. ‘Speakers of “high” or “powerful” languages or speech styles tend to be rated highly on competence and traits related to socio-economic status, while speakers of “low” or “powerless” languages or speech styles are evaluated less favourably along these dimensions, even by judges who themselves have “subordinate” ethnic speech markers’ (Giles, Hewstone and Ball, 1983). Attitudes are not, however, one dimensional. Edwards (1999, p. 102) suggests that ‘two particularly salient evaluational categories account for most of the variance: social status (which is, here, more or less equivalent to competence) and solidarity (roughly combining integrity and attractiveness)’. Thus, although lower-class, minority and ‘provincial’ speech styles often have positive connotations in terms of integrity and attractiveness, their speakers are typically assessed as being less competent, less intelligent and less ambitious than are those who enjoy some regional, social or ethnic majority status (see Edwards, 1995, for a review). More recent matched guise research has incorporated this finding by using factor

analysis to confirm the clustering of personal traits along these two dimensions (Woolard and Gahng, 1990, p. 312).

It might be noted in passing, that this general finding, established with the 'indirect' approach, is not far removed from the conclusions of those researchers using more direct methods. For example, the Irish language attitude surveys report that 'public support for Irish is shown to be very positive when attitudinal questions in surveys tap into the role the Irish language is perceived to have in defining and maintaining national cultural distinctiveness. While there is a weak relationship between this dimension of the attitudinal pattern and actual language use, . . . the general population is willing to accept a considerable commitment of state resources to ensuring its continuance and even to support a considerable imposition of legal requirements to know or use Irish on certain groups within the society, such as teachers and civil servants. (However) for most people, it is within the educational system that they have the most direct contact with Irish language policy. Not surprisingly, given the relationship between educational achievements and the qualifications needed for entry into the largely English-speaking labour market, the public are not prepared to support policies which would discriminate strongly in favour of Irish' (Ó Riagáin, 1997, p. 279).

Finally, it might be noted that there have been numerous studies of the relation between attitudes and achievement in language learning. The basic premise underlying attitudinal research in second language acquisition studies is that language is a major defining attribute of a group of people, and, thus, to learn a language involves some degree of identification with the group that speaks it. That is, language is more than a symbolic system that facilitates communication. Language is a defining behavioural feature of a cultural group, and thus acquiring the language involves taking on patterns of behaviour of that group. As a consequence, an individual's attitudes toward that group and toward other cultural groups in general will influence his or her motivation to learn the language, and thus the degree of proficiency attained (see Gardner, 1985, 2002 for a more detailed review of this literature).

#### WORK IN PROGRESS

One feature of the language attitudes research that has changed in recent decades is the theoretical basis of research. Whereas the early research was largely atheoretical, recent studies are more likely to invoke theory, e.g. accommodation theory (Giles and Coupland, 1991), models of the language-attitude process (Bradac, Cargile and Hallett, 2001). Also, theories not focusing specifically on language

have been extended to language attitudes, creating new theoretical perspectives (see Bradac, Cargile and Hallett, 2001 for a review).

However, perhaps the more striking feature of work involving language attitudes over recent decades has been the emergence of a number of theoretical perspectives which subsume language attitudes within larger frameworks. Among these new developments may be mentioned those perspectives built around the concepts of *ethnolinguistic vitality* (Harwood, Giles and Bourhis, 1994), *language ideology* (Schieffelin, Woolard and Kroskrity, 1998), *linguistic habitus* (Bourdieu, 1991) and, more specifically within the field of language education, *language awareness* (van Lier, 1995).

Before commenting on these developments, it must also be noted that there has been a degree of continuity as well as change within the social psychological field. Although the features outlined earlier represent enduring features of a small scientific paradigm, many things have been added to the paradigm in the last quarter century. Specifically, message recipients' reactions to variables beyond whole languages and dialects have been examined. The newer variables focus on specific language features *within* languages and dialects, and primarily syntactic and semantic as opposed to phonological (Bradac, Cargile and Hallett, 2001). These developments lie at the interface between sociolinguistics and social psychology (Milroy and Preston, 1999).

The notion of 'ethnolinguistic vitality' provided a conceptual tool to analyse the socio-structural variables affecting the strength of ethnolinguistic communities within intergroup settings. The vitality of an ethnolinguistic group was defined as 'that which makes a group likely to behave as a distinctive and collective entity within the intergroup setting'. It was proposed that the more vitality an ethnolinguistic group has, the more likely it will survive and thrive as a collective entity in the intergroup context. Conversely, it was suggested that ethnolinguistic groups that have little or no vitality would eventually cease to exist as distinctive linguistic groups. Three broad dimensions of structural variables were proposed as most likely to influence the vitality of ethnolinguistic groups: these were demographic, institutional support, and status factors.

In a subsequent development, questions were included to measure respondents' assessments of in/out-group vitality on each of the items constituting the demographic, institutional support and status dimensions of the objective vitality framework (Harwood, Giles and Bourhis, 1994).

Williams (1992, p. 211) is critical of the ethnolinguistic vitality approach because of the 'omission of any discussion of power' and the reduction of the majority-minority relationship to measures of

demographic, institutional and status factors as they relate to individual evaluation. By contrast, works conducted within the *language ideology* perspective deal explicitly with the exercise of power, and the reproduction of dominant/subordinate relations.

While *language ideology* is emerging as an important concept for understanding the politics of language in multilingual situations, the term 'ideology' is used in different ways, but as Schiefflin, Woolard and Kroskrity note (1998, p. 58), 'What most researchers share, what makes the term useful in spite of its problems, is a view of ideology as rooted in or responsive to the experience of a particular social position ...'. Language ideologies are thus about more than individual speakers' attitudes to their languages, or speakers using languages in particular ways. Rather, they include the values, practices and beliefs associated with language use by speakers, and the discourse which constructs values and beliefs at state, institutional, national and global levels (Blackledge and Pavlenko, 2002, p. 122).

The operationalization of the term *language ideology* in this context, and its relationship to language attitudes, raises some methodological issues. The approach has been described as 'sociolinguistic ethnography' (Heller, 1999) with a preference for studies that link analyses of interactional practices to what might more broadly be understood as ethnography (Heller and Martin-Jones, 2001, p. 12).

The complex ways in which language ideologies are produced and reproduced can also be understood in relation to Bourdieu's (1991) concepts *habitus* and *market*. Like the concept of the 'market', the 'habitus' derives from Bourdieu's wider sociological programme. It is understood as a system of lasting, transposable dispositions and attitudes which, integrating past experiences, functions at every moment as a matrix of perceptions, appreciations and actions and makes possible the achievement of infinitely diversified tasks (Thompson, 1991, p. 12). These dispositions are formed primarily in childhood, especially in the home and school, by the internalization of the practices of adults which in turn reflect the family's social position. It is thus a group or class phenomenon. While the linguistic habitus reflects past and present conditions, it is also informed by the 'social trajectory', that is, realistic expectations of the upward or downward mobility facing the family or social group to which they belong. 'What expresses itself through the linguistic habitus is the whole class habitus of which it is one dimension, which means in fact, the position that is occupied, synchronically and diachronically, in the social structure' (Bourdieu, 1991, p. 83).

The relationship between the linguistic habitus and the linguistic market thus works to define the acceptability of a language. The durable dispositions, perceptions and attitudes which constitute the

linguistic habitus are linked to the market as much through their conditions of acquisition as through their conditions of use. It follows therefore, that strategies of language ‘assimilation and dissimilation’ (Bourdieu, 1991, p. 64) are inevitably and unavoidably linked to the more general strategies of social reproduction adopted by groups and individuals (i.e., the strategies by which each generation endeavours to transmit to the following generation the advantages it holds).

However, the field of language ideology is not tied to a particular methodological tradition of research. And Van Dijk (1998) presents a widely held view when he observes that ‘in a theory of ideology, the notion (of attitude), when properly analysed, is crucial’. Therefore, language attitudes research ‘constitutes a coherent and, we would argue, central set of methodological options for ideology analysis’ (Garrett, Coupland and Williams, 2003, p. 11).

### PROBLEMS AND DIFFICULTIES

Notwithstanding the importance of the attitude concept, there is a lack of consensus among researchers as to its nature, definition, measurement (Giles, Hewstone and Ball, 1983). This problem is compounded by the theoretical and methodological differences between the various disciplines that are involved. As Garrett, Coupland and Williams (2003, p. 219) have noted, the central problem concerns the latent quality of language attitudes as constructs. In practical terms, when questions are asked about language attitudes in large-scale surveys, it is often unclear whether the replies elicited from respondents really express the attitudes the researcher is attempting to identify and measure. There remains the possibility that the survey responses have been influenced or inhibited by other processes. On the other hand, indirect methods such as the matched guise procedure have their own problems of validity (Giles and Billings, 2004), and ethnographic-based approaches have the usual problems associated with qualitative research of representativeness.

These difficulties may be responsible for the lack of accord sometimes found between attitude and behaviour. As Garrett et al. (2004) observe, this ‘discrepancy may be due more to a failure to gather reliable and valid data on attitudes, than to a real disjuncture in the everyday practices of individuals. In other words, although there may be a gap at times between what we take to be someone’s attitude on the one hand, and what we know to be their behaviour on the other, it may be the case that there is no discord whatsoever between their behaviour and their “real” or dominant attitude, but that we have simply failed to identify what their “real” or dominant attitude is’ (Garrett et al., 2004, p. 9).

One of the functions of language attitudes concerns ‘identity maintenance’ and refers to the evaluative biases laid down in cognitive structures which maintain the self-esteem or the group identity. Language attitudes often serve to differentiate in-group from out-group on positive dimensions, maintain social distance and justify intergroup differences. This has wide-ranging implications for public policy in that proper and full appreciation of existing circumstances, which is always vital for successful policy, must include examination of the functions fulfilled by community attitudes towards languages (Giles, Hewstone and Ball, 1983). In this regard, it has to be noted, with some concern, that many studies conducted in this field draw their respondents from a narrow segment of student and/or middle class sub-samples of minority communities. However, it is apparent from a number of studies that there is, or can be, quite dramatic variation in attitudes towards minority languages. Not only do differences exist between minority groups, but there are also differences within groups (Giles, Hewstone and Ball, 1983).

In much of the research reviewed in this chapter, there is an on-going emphasis on speakers, particularly on their many styles and forms of language (Bradac, Cargile and Hallett, 2001). Investigators have not, however, gone very much beyond such fairly gross explanations; that is, they have typically not related speech evaluations to particular speech attributes (Edwards, 1999). ‘Speech samples submitted for judgment have differed broadly, and rarely has the inquiry extended to consider which linguistic elements (or which combinations or frequencies of elements) were chiefly responsible for the judgments elicited. This lack of linguistic detail and sophistication has been one of the criticisms leveled at attitude studies’ (Preston and Milroy, 1999, p. 5).

Other researchers would place an emphasis on the listener rather than the speaker, arguing that ‘a hearer’s evaluations or communication strategies may be influenced as much by factors internal to the hearer as by speaker behaviors’ (Bradac, Cargile and Hallett, 2001). Relations between and within groups do not occur in a vacuum but rather are influenced by a range of socio-structural and situational factors which can fundamentally affect the nature and quality of contact between and within groups. Given the importance of language in intercultural relations, it appears prudent to allow for the complexity of language attitudes (Giles, Hewstone and Ball, 1983).

#### FUTURE DIRECTIONS

Language attitudes can be viewed as playing two crucial roles in the implementation of language planning. First, in *all* situations, attitudes

will have an effect on the degree to which policies calling for changes in language behavior are implemented, once adopted by governmental authorities. And second, in *certain* situations, language attitudes will have an effect on whether or not a given language policy is officially adopted in the first place (Pool, 1973, p. 55). From a policy perspective a number of matters need urgent attention.

More than 20 years ago, Ryan, Giles and Sebastian (1982, p. 19) pointed out that their particular publication was concerned with the social psychological perspective, they stressed that the ultimate goal was 'an interdisciplinary approach which has social policy implications'. It cannot be said that that goal has yet been achieved. One recent work, which set out with the admirable ambition 'to show how particular methods in the study of language attitudes, in combination with each other, can build richly differentiated accounts of the ideological forces at work in a community' is still ultimately a product of the social psychological approach (Garrett, Coupland and Williams, 2003).

As Giles and Billings note (2004, p. 188), while academics from many disciplines agree that language attitudes are an important enterprise, they differ widely with regard to the theories and methods which they have chosen to analyse such attitudes. All research methods have their advantages and their limitations. There is currently an urgent need for research approaches which combine several methods in a single piece of research, on a scale not heretofore attempted, and using each to supplement and check on the others.

Secondly, there is a need to track changes in language attitudes over time in a more systematic and organized way. One example of changing language attitudes comes from Woolard and Gahng (1990) who collected speaker evaluation data in Barcelona in 1980 and then again with a matched sample in 1987. Since the first piece of research, a law was passed giving the Catalan language co-official status alongside Castilian in the public sector. When replicating the study in the wake of these language policies, Woolard and Gahng found an even stronger status superiority for Catalan yet a 'loosening of the bond between the Catalan language and native Catalan ethnolinguistic identity'. Such examples are not very common, and this is possibly a task more suited to research institutes and centres, rather than individual researchers, as the former have both the resources and longevity to engage in long-term programmes of this nature.

Finally, in evaluating the findings of language attitudinal research it is necessary to avoid the tendency to regard the incidence and distribution of attitudes as autonomous phenomena. The dangers of such an approach are widely appreciated. Gardner (2002, p. 167) is not alone among social psychologists in calling for more attention to environmental factors that influence second language acquisition. He argues,

inter alia, that characteristics of the cultural milieu can affect the opportunities to use and experience the language, as well as to know and have personal experiences with members of the other language community. But the point is of wider relevance, and needs to be approached in a more structured way. The social uses of language owe their specifically social value to the fact that they are organized in systems of social interaction which reproduce the system of social differences (Bourdieu, 1991). The various dimensions of language attitudes are heavily conditioned by the way the economy and, in turn, society are structured. The state plays a very dominant role in shaping socio-economic development and thus it is necessary to examine state policies which relate to economic, and social (particularly education) issues. It is probable that, in total, their consequences for language attitudes were, and are, extensive and of more importance than language policies per se.

## KNOWLEDGE ABOUT LANGUAGE AND LINGUISTIC LANDSCAPE

### INTRODUCTION

The linguistic landscape is around us all the time. We can see language signs on the streets, in the countryside, in hospitals, at schools and in shops. Are we aware of the language on street signs, billboards, graffiti, or posters? It is difficult to believe that everybody has a full knowledge of the linguistic landscape but most of us sometimes notice the language(s) used and the specific linguistic characteristics of the linguistic landscape.

Nowadays, with an increasing predominance of visual information there are more signs than ever before. When one takes a look at pictures or postal cards of shopping streets of 100 years ago it is obvious that the number of linguistic signs has increased enormously. The highest density of signs can be found in cities and towns, in particular in the main shopping streets, commercial and industrial areas. This era of visual information is also reflected in school classrooms, corridors and halls where official boards, children's work, teaching material, notices and ads fill the walls that were barely used in the past.

The study of the linguistic landscape focuses on the analysis of the written information that is available on language signs in a specific area. This chapter summarizes the main findings in this field, the work in progress and future directions. The linguistic landscape can provide important insights and a different perspective on our knowledge about language.

### EARLY DEVELOPMENTS

The interest in the study of signs has a long tradition in semiotics but the specific study of the linguistic landscape in its own right is a relatively recent development. This increasing interest is shown in the number of recent publications and special colloquia at conferences that we refer to in the other sections. The study of the linguistic landscape focuses on the identification of the informative and symbolic functions of linguistic signs. Nowadays most research studies are based on the analysis of digitized pictures.

Before researchers conducted systematic analyses of language signs there was also interest in the linguistic landscape and the use of different languages in public signs has been regulated in many areas as part of language planning. Some states, provinces or cities have developed specific recommendations and even legal measures to regulate the use of languages in the linguistic landscape. Among the more famous cases is the Charter of the French Language of 1977, better known as ‘Bill 101’ in Québec (Bourhis and Landry 2002). The bill required, among others, that advertising be done in French alone and that all commercial signs be in French. Later these measures have been relaxed and English is now acceptable in signs provided that French be given priority. Another well-known case is the so-called ‘Toubon-law’ introduced in France in 1994. The law insisted on the use of the French language in official government publications, advertisements and other contexts in France.

Some other regulations try to limit the spread of signs in order to avoid the presence of an abundant linguistic landscape everywhere. In particular the sprawl over natural areas is an issue that gets attention of policy makers. The European Landscape Convention—better known as the Florence Convention (Council of Europe 2000) which entered into force in March 2004, points to the importance to recognize the value and importance of landscapes, and to adopt measures to maintain and improve the quality of natural, rural but also of urban landscapes.

Some specific studies to analyse the use of different languages were also carried out some years ago. The two included in this section were carried out in Israel.

One of the first studies of the linguistic landscape was reported by Rosenbaum, Nadel, Cooper and Fishman (1977). They analysed language signs, transactions, planted encounters and interviews in Keren Kayemet Street a street in West Jerusalem. The data were collected in 1973 and the part of the street selected for this study included 30 shops, 3 restaurants, 10 private offices and 9 government offices. The main focus of the study is the spread of English and in the case of language signs the three categories identified were the following: no Roman script, some Roman script but Hebrew script dominant and Roman and Hebrew script with equal prominence. The results indicate that approximately one-third of the signs belongs to each of these three categories and that the Roman script corresponds in most cases to the English language. The results of the analysis indicate that the Roman script is more common in private (bottom–up) signs than in public (top–down) signs. Rosenbaum, Nadel, Cooper and Fishman (1977) acknowledge what they call the ‘snob appeal’ of English and also consider that there is a gap between the official language policy and the tolerance towards other languages and mainly towards English in language signs.

Another interesting study on linguistic landscape also took place in Israel and it is reported in Spolsky and Cooper (1991). This study analyses 100 language signs in Jerusalem. Apart from the interest of the results of the analysis this study also contributes to the development of the study of the linguistic landscape in other ways. First, it provides different criteria to establish taxonomies of language signs and gives three possible taxonomies: (i) according to the function and use of the signs (street signs, advertising signs, warning notices, building names, informative signs, commemorative plaques, signs labelling objects and graffiti); (ii) according to the materials from which the sign is made or its physical form (metal, tile, poster, wood and stone) and (iii) according to the language used in the sign and the number of languages (monolingual signs, bilingual signs and multilingual signs).

Spolsky and Cooper (1991, pp. 81–84) also give three sign rules. These rules focus on the motivation for using some languages and not others on language signs. The sign rules are also of different types.

- *Sign rule 1 ('sign-writer's skill' condition—necessary, graded): write signs in a language you know.*
- *Sign rule 2 ('presumed reader' condition—typical, graded): prefer to write signs in the language or languages that intended readers are assumed to read.*
- *Sign rule 3 ('symbolic value' condition—typical graded): prefer to write signs in your own language or in a language with which you wish to be identified.*

According to Spolsky and Cooper (1991) sign rule 1 is a necessary graded condition, that is, the sign-writer must have knowledge of the language(s) on the sign to a certain degree of proficiency. This rule is closely related to the skills of the sign-writer.

Rules 2 and 3 are considered typical but not necessary. They are both graded, so it is possible to consider readers with different degrees of proficiency (rule 2) and also different degrees of identification with a language (rule 3). Rule 2 has an economic motivation and it is informative while sign rule 3 is symbolic. It has a more political and socio-cultural motivation and is related to language loyalty. According to Spolsky and Cooper (1991) rules 2 and 3 can be in conflict with each other but rule 1 is a necessary condition. It would be interesting to analyse if these rules apply to different contexts because it seems that in some cases the symbolic value condition can be so important that even rule 1 may not apply.

#### MAJOR CONTRIBUTIONS

As it has already been said there is a growing body of research on the linguistic landscape in the last 10 years. This research has been

published in different journals including a special issue of the *International Journal of Multilingualism* (Gorter, 2006) and language signs have also been the focus of attention of the geosemiotics approach (Scollon and Scollon, 2003).

One of the most influential studies of the linguistic landscape is the one by Landry and Bourhis (1997). These authors provide a definition of the linguistic landscape that is followed by many other researchers:

*The language of public road signs, advertising billboards, street names, place names, commercial shop signs, and public signs on government buildings combines to form the linguistic landscape of a given territory, region, or urban agglomeration.* (Landry and Bourhis, 1997, p. 25)

Landry and Bourhis (1997) make a clear distinction between the informative and the symbolic functions of language signs. This distinction was already pointed out by Spolsky and Cooper (1991) but Landry and Bourhis approach it from a social psychological perspective focusing on relationships between the ingroup and the outgroup. The informative function of language signs indicates the borders of the territory inhabited by a linguistic group and also the availability of a specific language to communicate in that territory. On the other hand the symbolic function refers to the perception that members of a language group have of the value and status of their languages as compared to other languages. When language is the most salient dimension of ethnic identity the linguistic landscape becomes the most 'observable and immediate index of the relative power and status of the linguistic communities inhabiting a given territory' (p. 29)

Landry and Bourhis (1997) explore the relationship between linguistic landscape and specific aspects of vitality beliefs, ethnolinguistic identity and language behaviour in multilingual settings. Their study includes 2,010 Canadian Francophone students and their findings indicate that the linguistic landscape emerges as an independent factor in the individual network of language contacts and that it is strongly related to the subjective vitality scores. They consider that the linguistic landscape can be a very important factor in promoting the use of one's own language and therefore in the processes of language maintenance and language shift.

The importance of the linguistic landscape as related to different areas has also been highlighted in other studies conducted in different parts of the world. In the rest of this section, we focus on the most prominent areas discussed in a number of recent papers on the linguistic landscape: multilingualism, the spread of English, differences between public and private signs and the effect of language policy.

### **The spread of multilingualism**

Different factors including globalisation, immigration, the revitalization of minority languages and tourism have influenced the development of multilingualism and multiculturalism at the beginning of the twenty-first century. Ethnic, socio-cultural, religious and commercial diversity contribute to cultural diversity and linguistic diversity in many parts of the world. Studies on the linguistic landscape conducted in different settings indicate that there is cultural and linguistic diversity in the use of different languages when studying language signs. For example, Ben Rafael, Shohamy, Amara and Trumper-Hecht (2006) compare patterns of linguistic landscape in Jewish, Palestinian Israeli and non-Israeli Palestinian settings in Israel. They report that multilingualism is one of the characteristics of language signs either when considering different signs in different languages or bilingual and multilingual signs. The main languages used in these settings are Hebrew, Arabic and English but other languages such as Russian also contribute to multilingualism. There are important differences in the use of the three main languages in these settings and the use of Hebrew and Arabic is completely different in Jewish and non-Israeli Palestinian settings.

The use of different languages is also reported in two studies conducted in Asia. Huebner (2006) analysed different areas of Bangkok and reported the use of different languages including Thai, Roman and Chinese scripts but also Arabic and Japanese. Backhaus (2006) analysed bilingual and multilingual signs in Tokyo, which were a surprising 20% of the total number of signs. The most common languages in these signs were English and Japanese but in some cases the signs also included Chinese and Korean and many other languages.

Cenoz and Gorter (2006) conducted a comparative study of two cities, Donostia-San Sebastian in the Basque Country (Spain) and Ljouwert-Leeuwarden in Friesland (The Netherlands). They found that 55% of the signs in Donostia-San Sebastian and 44% of the signs in Ljouwert-Leeuwarden were bilingual or multilingual.

These studies show that the study of the linguistic landscape can contribute to the study of multilingualism because language signs are indicators of the languages used in a specific setting. The study of the linguistic landscape in these studies and the early studies also confirm the spread of multilingualism.

### **The spread of English**

The linguistic landscape usually includes English as one of the languages used in different contexts in different parts of the world. The spread of English, due to different causes including historically the

spread of the British Empire and more recently the important influence of the USA in different fields is visible in language signs. Globalisation and modernity are nowadays important reasons as well. At first sight, the use of English in commercial signs could be interpreted as informational mainly aimed at foreign visitors but it is obvious that its increasing presence has a strong symbolic function for a non-English speaking local population. The use of English can activate values such as international orientation, future orientation, success, sophistication or fun orientation (see Piller, 2001, 2003). Nevertheless, the use of English can also raise issues of identity and power and can have consequences regarding the balance between the languages in bilingual and multilingual situations (see Ammon, Mattheier and Nelde, 1994; Fishman, Conrad and Rubal-Lopez, 1996; Pennycook, 1994; Phillipson, 2003). For example, English spoken in India has its own characteristics that identify its speakers with the upper layers of society.

The process of globalisation is made visible through the presence of English in the linguistic landscape in all the studies mentioned earlier. For example Ben Rafael, Shohamy, Amara and Trumper-Hecht (2006) reported that between 25% and 75% of the items analysed in their study were in English, depending on the specific area. Backhaus (2006) and Huebner (2006) also reported the extensive use of English in Tokyo and Bangkok. Cenoz and Gorter (2006) found that English was present in 28% of the signs in Donostia-San Sebastian and 37% of the signs in Ljouwert-Leeuwarden. The earlier studies on linguistic landscape also report the extensive use of English. These data indicate that the spread of English is clearly reflected also in the linguistic landscape.

### **The differences between public (top–down) and private (bottom–up) signs**

Studies on the linguistic landscape have found important differences between these types of signs.

- a. Public signs are ‘government’ signs such as official signs for street names. These signs reflect a specific language policy: road signs, building names, street names, etc.
- b. Private signs are mainly commercial or informative signs such as the signs on shops and they may be influenced by language policy but mainly reflect individual preferences: shops, advertising, private offices, etc.

Both early studies and more recent studies on the linguistic landscape indicate that there are important differences between the two types of signs and as Landry and Bourhis (1997) point out there is more diversity in private signs.

Ben Rafael, Shohamy, Amara and Trumper-Hecht (2006) reported differences between public (top-down) and private (bottom-up) signs in all the areas where they collected the data and they found very interesting patterns. They reported interesting differences between the different languages used in public and private signs in the different areas mainly in the case of Hebrew and Arabic. Huebner (2006) reported that official signs were generally in Thai or in Thai and English but other languages were used in commercial signs. Backhaus (2006) found that the languages eligible to be used on official signs were Japanese, English, Chinese and Korean. Other languages were also used in non-official signs. Cenoz and Gorter (2006) also found differences between public (top-down) and private (bottom-up) signs mainly regarding the use of English.

### **The effect of language policy**

Some state and regional authorities have included signage as one of the targets of their language policy. In such cases there is usually also a well developed language policy for the use of languages in the media or in education. As Landry and Bourhis (1997) point out the use of different languages in language signs in bilingual and multilingual countries or regions can be of great symbolic importance.

The use of place names in a minority language or in the dominant state language has been a regular issue of linguistic conflict in some areas (Gorter 1997, Hicks 2002). Painting over of signs with the 'wrong' names has been popular among language activists in many minority regions of Europe. This clearly tells passers by about the struggle over language rights and ensuing claims to the territory. The conflict may be not only over which place names to use but also about the prominence and the position of the languages on the signs. Governmental language policy is mainly seen in official signs but it can also affect commercial, non-official signs. For example, in Catalonia there is a legal obligation to have at least some presence of the Catalan language on all public and private signs. The use of different languages in the signs not only reflects the use of the languages but also their power and status. Cenoz and Gorter (2006) found that a relatively strong language policy in the case of Basque had a measurable effect on the linguistic landscape as compared to Frisian where no such effect was found. Basque on its own or in combination with other languages appeared in over 50% of the signs while Frisian only appeared in 5% of the signs even though the percentage of speakers who are fluent in Frisian is higher than those fluent in Basque. The effect of language policy to promote the use of Basque in language signs is reflected in both public and private signs even though there is more Basque used in official signs.

## WORK IN PROGRESS

The study of the linguistic landscape can be approached from different perspectives and it is related to different disciplines: linguistics, communication studies, sociology, sociolinguistics, economics, social geography, landscape architecture, psychology and education. Most studies conducted so far have focused on the linguistic and sociolinguistic aspects of the linguistic landscape but other work in progress is using other approaches as well.

For example, Diane Dagenais from Simon Fraser University and her colleagues from the University of Montreal are studying the linguistic landscape in the context of education. They are looking at the linguistic landscape in the environment of different schools and they are using the signs recorded as pedagogical material for the development of language awareness. This is indeed a very interesting perspective in the study of the linguistic landscape and it can open a new line of research.

A different approach in the context of second language acquisition studies is that taken by Gorter and Cenoz (2004). They are interested as Landry and Bourhis (1997) were in the perception of the linguistic landscape but from a second language acquisition perspective rather than a social psychological approach. The basic questions they ask are the following: ‘How is the linguistic landscape perceived by L2 users?’, ‘What is the role of the linguistic landscape as an additional source of language input in SLA?’ or ‘What attitudes do these L2 users have towards the linguistic landscape?’ The basic assumption is that the linguistic landscape contributes to the construction of the sociolinguistic context because people process the visual information that comes to them. This approach also considers that the language in which signs are written can certainly influence L2 learners’ perception of the status of the different languages and even affect their own linguistic behaviour. Therefore, the linguistic landscape or parts of the linguistic landscape can potentially have an influence on our knowledge about language and language use.

A different approach to the study of the linguistic landscape is that conducted in the ‘Sustainable Development in a Diverse World’ European Commission FP6 network of excellence ([www.ebos.com.cy/susdiv/](http://www.ebos.com.cy/susdiv/)). Adopting an interdisciplinary approach based on sociolinguistics and economics the aim is to apply theoretical models of environmental economics which can contribute to the discovery of non-market benefits and the added value of the multilingualism. The methodology does not only include the analysis of digital pictures but also comprises interviews with shop-owners and authorities, who are responsible for putting up the signs, and with customers and tourists so as to see their perception and preferences of the signs. This line of research can contribute to

our better understanding of the ways in which the linguistic landscape is an important part of the preservation and the continued existence of different languages.

More work in progress in the study of the linguistic landscape was presented at the symposium 'Linguistic landscape and multilingualism: theoretical and methodological issues' at the Aila 2005 conference in Madison, Wisconsin and at the two symposia 'Linguistic Landscape: Advancing the Study of Multilingualism' and 'Semiotic Landscapes, Tourism, Mobility, and Globalisation' at the Sociolinguistics Symposium 16 in Limerick 2006 (see also Edelman, 2006; Hult, 2003). Some of the papers presented at these symposia approach the study of the linguistic landscape from different new perspectives such as language ecology, social actors' behaviour, socio-political relationships, or communication as a multimodal phenomenon. Some papers also extend the studies on multilingualism in the linguistic landscape to other areas such as Ireland, Sweden, Ethiopia, Belarus, Taiwan or the USA (see also Shohamy and Gorter, forthcoming).

#### PROBLEMS AND DIFFICULTIES

The study of the linguistic landscape is a recent area of interest, which faces some problems and difficulties both at the theoretical and methodological levels. The main problems are the following:

*Theoretical problems.* As the study of the linguistic landscape is multidisciplinary, it can be related to different theories in sociolinguistics, city planning, language mixing, language policy and other disciplines. Some studies (Ben Rafael, Shohamy, Amara and Trumper-Hecht, 2006) have used existing sociological theories (Boudon, 1990, Bourdieu, 1983, 1993; Goffman, 1963, 1981) to the study of the linguistic landscape but there is still a lot of work to be done at the theoretical level. Many studies of the linguistic landscape so far are mainly descriptive and not explanatory; future studies could certainly profit from the application of existing theoretical concepts of the different disciplines.

*The unit of analysis.* The large number of language signs next to each other makes it difficult to decide what each linguistic sign is. Are all the linguistic items in a shop window part of 'one' language sign or should they be considered separately? What about other ads, graffiti or posters next to the shop window? Can a whole street be considered a unit of analysis? There are indeed advantages and disadvantages with each of these choices. Decisions regarding the unit of analysis are important because it is a crucial methodological issue to allow for comparability between studies.

*The dynamic nature of the linguistic landscape.* Some signs are fixed for many years but many others change over time and in some cases

from one day to the next or from one hour to the next. Signs on buses and cars are also part of the linguistic landscape but there are not usually included in studies. Some signs such as posters or graffiti can also change very quickly. This dynamic nature of the linguistic landscape makes its study more difficult.

*The problem of sampling and representativity.* It is impossible to take pictures of all the language signs in one city or in one area but it is important to establish criteria that improve the representativity of the language signs under analysis. One possibility is to select areas or streets that share the same characteristics but are placed in different cities and countries and to analyse all the signs. It may also be important to select localities, which represent the different ethnocultural communities in the same country or city so as to see their differences. Interesting methodological work on these problems has been done in Italy by Barni (2006).

*The use of different taxonomies.* Researchers distinguish between public (or ‘top–down’ or ‘official’) and private (or ‘bottom–up’ or ‘non-official’) signs, and they usually analyse the language or languages used in the sign and the type of establishment where the sign is located. There are many other aspects of the signs that can be considered when coding. For example, we can look at the location on the sign, the size of the font used, the order of languages on multilingual signs, the relative importance of languages, whether a text has been translated (fully or partially), the material of the sign, etc. The use of similar coding schemes can facilitate comparability between studies conducted in different parts of the world.

#### FUTURE DIRECTIONS

The different studies we have discussed in this article prove that research on linguistic landscape can certainly contribute to the knowledge about language in different ways. For example, they can give us insights on the development of multilingualism, the spread of English, the effect of linguistic policy or language awareness in schoolchildren. The study of the linguistic landscape has had a very important development in recent years in different directions and all of them are likely to develop in the near future. The theoretical development of studies in the linguistic landscape will also develop further and in different directions. The directions which are very likely to develop are the following.

*Education.* More research on the linguistic landscape in education is certainly necessary because the linguistic landscape is present both at school and in its environment (see Garcia, *Multilingual Language Awareness and Teacher Education*, Volume 6). Schools are not isolated from the environment in which they are placed and schoolchildren see

language signs on the streets and these signs may be in the language(s) of instruction or in language(s) studied at school or not. Schools also use signs for advertising or to name their buildings and these signs contribute to having a specific image. Nowadays language signs inside the school are very common. The differences between official and non-official signs can also apply to the educational setting. Even though there can be more control on the use of the languages in students' signs in the case of students' work the characteristics of the private signs can also be seen in these contributions to boards where students put their own ads or notices. The use of the linguistic landscape as teaching material to develop language awareness has already been referred to in the 'Work in progress' section. Another approach to the study of the linguistic landscape in education focuses on language ads in the educational setting and has been carried out in India (Ladousa, 2002). This study shows that there are differences in language use when the advertisements of different schools are compared and also when these advertisements are compared to those of private tutors. There is a trend to use more English in advertisements of private schools than in the case of public schools and private tutoring.

*Historical dimension.* The linguistic landscape is dynamic and changes over time and can be very informative about the role of different languages in different periods. This approach was already discussed in Spolsky and Cooper (1991) who give very interesting examples about signs in from different periods in Israel. Backhaus (2005) also focuses on the diachronic development of the linguistic landscape in Tokyo. The study of the linguistic landscape contributes to the study cultural heritage because languages are part of this heritage and the sustainable development of linguistic diversity is seen as an important aspect of it.

*Language contact.* The study of language contact from a linguistic perspective in language signs is also another area that needs to be developed in the near future. As Huebner (2006) points out the use of different kinds of contact phenomena on language signs poses several questions regarding the boundaries of speech communities or even the boundaries between languages. Many signs are examples of highly creative displays of language mixing, innovation or hybridization.

The major contributions to the study of the linguistic landscape along with the work in progress and the future directions show that the study of language signs can significantly increase our knowledge about language in different ways.

## LANGUAGE AWARENESS IN MULTILINGUALS: THEORETICAL TRENDS

### INTRODUCTION

Interest in language awareness or knowledge about language has grown over the last twenty years, mainly stimulated by the language awareness movement in the UK. A literature survey reveals considerable discrepancies in definition and terminology (language awareness, metalinguistic awareness, linguistic awareness, etc.) and the reasons seem to be linked to the vast theoretical scope of the field with studies stemming from linguistics, developmental psychology and education (Pinto, Titone and Trusso, 1999). Over the last decade the growing interest in multilingualism has given rise to a wave of research emphasis on the role of language awareness in multilingual learning and education.

In the following sections I try to bring together the various strands of research, from their beginnings to their current works. Problems in the field will be discussed with regard to terminological confusion and various dichotomies in relation to the consciousness-debate. In the final section I discuss a number of issues that present a challenge for future studies on multilingualism covering first, second and third language learning and use. The main focus of this contribution is on studies of the contact between two or more languages.

### EARLY DEVELOPMENTS

In his review article Van Essen (1997 and *Language Awareness and Knowledge about Language: A Historical Overview*, Volume 6) goes back to the works by Wilhelm von Humboldt (1767–1835) to mark the beginnings of the early history of language awareness studies. Jespersen (1904) followed as another prominent scholar dealing with foreign language teaching. Like Humboldt he assumed that conscious reflection on language form and use would be beneficial for the language-learning process.

Apart from Leopold's famous study of the German-English development of his daughter Hildegard (1939–1949), for a long time most studies of language awareness focused on the onset of metalinguistic awareness in monolingual children and formed part of cognitive psychology. Most influential contributions stem from Flavell (1979),

who stated that metalinguistic abilities form an integral part of metacognition, and Tunmer, Pratt and Herriman (1984) who dealt with questions concerning the relationship between metalinguistic awareness and literacy or language acquisition (see review by Gombert, 1997, Volume 6). Tunmer, Pratt and Herriman (1984, p. 12) defined the onset of metalinguistic awareness as 'to begin to appreciate that the stream of speech, beginning with the acoustical signal and ending with the speaker's intended meaning, can be looked at with the mind's eye and taken apart'.

That emergent metalinguistic abilities form the reflection of underlying changes in cognitive abilities was already pointed out by Piaget and Vygotsky who stated out that '... a child's understanding of his native language is enhanced by learning a foreign' (Vygotsky, 1986, p. 160). Interestingly enough, the publication of Vygotsky's book 'Language and Thought' in English in 1962 (1934 in Russian) coincided with the publication of the meanwhile classical study by Peal and Lambert. Their work introduced a rather enthusiastic attitude towards bilingualism, following a detrimental phase which described the bilingual as cognitively handicapped (!), and a neutral phase where no differences between monolinguals and bilinguals were reported (for a historical overview see Baker, 2006, pp. 144–148). Although the study of Peal and Lambert has been subject to criticism, as described in Baker (2006, p. 148ff), it evidenced the positive relationship between bilingualism and intelligence for the first time. The authors related the cognitive advantages of 10-year-old middle-class bilingual children over their English-speaking counterparts, on both verbal and non-verbal measures in the Montreal area to the metalinguistic abilities of their subjects. Since then various studies conducted in other sociolinguistic contexts, such as Ianco-Worrall (1972) on Afrikaans-English bilinguals and Ben-Zeev (1977) on Hebrew-English bilingual children in New York and Israel followed and proved the superiority of the bilingual groups on measures of cognitive flexibility and analytic thought. Mohanty (1994) summarized several investigations carried out between 1978–1987 in an Indian context which showed that bilingual Kond tribal children proficient in Kui and Oriya performed significantly better than unilinguals (Kui) on a variety of metalinguistic tasks. Hamers and Blanc (1989, p. 50) published a list of the cognitive benefits of bilingualism, including a variety of metalinguistic tasks which all function at the higher level of creativity and reorganization of information. Translation, a natural characteristic of bi- and multilingualism, which was described as a 'composite of communicative and metalinguistic skills—skills that are 'translinguistic', in the sense that they are not particular to any one language' by Malakoff and Hakuta (1991, p. 142), also has to be included in a comprehensive listing.

Since the 1980s an increase in interest in the topic has been stimulated by the pedagogically motivated 'language awareness' movement (see e.g. Hawkins, 1984; James and Garrett, 1991; Van Lier, 1995). Language awareness was posited both as a new bridging element and as a solution to illiteracy in English, that is, failure to learn foreign languages and divisive prejudices as failures of the UK schools (for a history of the movement in the UK see Donmall-Hicks, 1997).

### MAJOR CONTRIBUTIONS

As noted in the introduction, in a survey of research on metalinguistic awareness one has to take account of several approaches linked to the theoretical background which the research is embedded in. We can find work rooted in (i) linguistics, (ii) developmental psychology and (iii) educational linguistics (Pinto, Titone and Trusso, 1999). However, frequently research interests have also been of an interdisciplinary nature.

Over the last years the 'language awareness' has intensified due to a number of research activities from different theoretical backgrounds, many of which have been published in *Language Awareness*, the official journal of the Association of Language Awareness. The aims of the journal have been described as exploring the role of explicit knowledge about language in the process of language learning, in language teaching and in language use (e.g. sensitivity to bias in language, manipulative aspects of language, critical language awareness and literary use of language).

#### **Linguistics**

Both the creation of the adjective 'metalinguistic' and its noun form 'metalanguage' is rooted in linguistics. For instance, Jacobson (1963) included metalanguage among the secondary functions of language and referred to it as an activity consisting in speaking of the word itself and language itself becoming its own content. In contrast to a psychological perspective which describes things from the point of view of the human subject by concentrating on processes, abilities and behaviour, a linguist is interested in metalanguage only in terms of words, referring exclusively to other words and classes of meaning such as in linguistic terminology. Metalingual and metalinguistic are both used as adjectives of metalanguage but not always as synonyms (for an overview of the discussion on metalanguage see Berry, 2005).

#### **Developmental Psychology**

Metalinguistic abilities, which expand along with the cognitive and linguistic development of children, can be observed in children as young as two years of age when they are capable of self-corrections of word form, syntax and pronunciation, show concern about the proper word

choice, pronunciation and style and comment on the language of others (for an overview see Birdsong, 1989). Gombert (1992, p. 13) described metalinguistic activities as 'a subfield of metacognition concerned with language and its use—in other words comprising: (i) activities of reflection on language and its use and (ii) subjects' ability to intentionally monitor and plan their own methods of linguistic processing (in both comprehension and production)'. Karmiloff-Smith's RR-model (1992) could be seen as the most influential contribution to the field. Representational Redescription is defined as 'a process by which implicit information *in* the mind subsequently becomes explicit knowledge *to* the mind, first within a domain, and sometimes even across domains' (Karmiloff-Smith, 1992, p. 17f). The RR-model attempts to account for the emergence of conscious access to knowledge and for children's theory building. This involves a cyclical process by which information already present in the organism's independently functioning, special-purpose representations is made progressively available, via redescriptive processes, to other parts of the cognitive system.

Differential development of metalinguistic awareness can be related to numerous variables, one of which has been identified as the exposure to other languages (e.g. Van Kleeck, 1982, p. 260). As pointed out by Baker (2006, p. 156) recent work on the development of bilingual thinking has focused on the process rather than the product of thinking as known from earlier work. Since the early 1990s research of metalinguistic awareness in bilingual children has been influenced by Bialystok's work (for an overview see e.g. 2001). This research has recently been extended to investigations of adult processing which found that lifelong bilingualism protects older adults from cognitive decline with growing age (Bialystok, Craik, Klein and Viswanathan, 2004, see also Baker, *Knowledge about Bilingualism and Multilingualism*, Volume 6). In a number of her earlier studies Bialystok focuses on analysis and control as the metalinguistic dimensions of bilingual proficiency, thereby showing accelerated mastery of specific processes for bilingual children. Analysis of control is the process by which mental representations of information become increasingly structured and through the process of analysis, contextually embedded representations of words and meanings evolve into more abstract structures. Analysed knowledge is structured and accessible across contexts; unanalysed knowledge exists only to the extent that it is part of familiar routines or procedures. Bialystok (2001) concludes that there are no universal advantages, but that bilinguals who have attained high levels of proficiency in both languages have an advantage on tasks which require more analysed linguistic knowledge (see also Mohanty, 1994). Bialystok has also applied her work on analysis and control to second language acquisition (e.g. Kellerman and Bialystok, 1997).

### **Educational Linguistics**

By taking into account the British model, in a number of European countries such as Germany (e.g. Edmondson and House, 1997), France (e.g. Candelier, 2003) and Austria (e.g. Matzer, 2000) educationalists have focused on awareness-raising in the classroom. Several terms in education-oriented SLA studies dealing with consciousness raising, input enhancement and focus on form have been used to refer to similar concepts which all imply the use of metalanguage and the facilitation of learning through an attention to form (see e.g. Sharwood Smith, 1997). A number of studies have concentrated on the metalinguistic knowledge, often expressed as terminology, of both teachers (e.g. Andrews, 2003, see also Andrews, *Teacher Language Awareness*, Volume 6) and students (Fortune, 2005).

Swain's output hypothesis (1995) which is based on metalinguistic skills developed in language learning has exerted considerable influence in the field. According to Swain output can, under certain conditions, promote language development since language learners become aware of their linguistic deficits during language production in the L2. The language output serves three functions that are noticing, hypothesis formulation- and testing and the metalinguistic function, enabling the learner to control and internalize linguistic knowledge or in other words, when learners reflect on the language they produce, learning would result.

Finally, it has to be emphasized that the theoretical background of the studies has also been reflected in the methodology chosen for investigation. For instance, in the field of educational psycholinguistics one of the most comprehensive testing battery of metalinguistic abilities in children was developed by Pinto (e.g. Pinto, Titone and Trusso, 1999). On the other hand, in second language acquisition research grammaticality judgement tests to elicit metalinguistic data have been widely acknowledged as predictors of success or failure in the language-learning process and to judge interlinguistic competence (Birdsong, 1989). The differences in scientific backgrounds have also resulted in controversial attitudes towards testing methods. For example, whereas applied linguists accept intro- and retrospective methods to test metalinguistic awareness, (psycho)linguists would rather call them speculative.

### WORK IN PROGRESS

In the study of language awareness the distinction between implicit and explicit learning and/or knowledge, is fundamental but presents at the same time a rather controversial issue related to the consciousness-debate (see also section on problems later). Whereas knowledge refers to a product, that is knowledge existing in the mind of a learner, learning

refers to a process of how other language knowledge is internalized (R. Ellis, 1997, see also Ellis, *Explicit Knowledge and Second Language Learning and Pedagogy*, Volume 6). Whereas Krashen (1982) opposed to the interface between implicit and explicit knowledge, in his weak-interface model R. Ellis (1994) claimed that explicit L2 knowledge functions as a facilitator of implicit L2 knowledge. And nowadays pedagogical research of language awareness focuses on the contribution that formal instruction can make to language learning, and if so, how implicit learning can be made explicit and vice versa, a highly ambitious goal if we take the following studies into consideration. Steel and Alderson (1995) stated that metalingual knowledge is not related to general language proficiency. In contrast Renou (2001) found that the increase in metalinguistic awareness is concomitant with an increase in L2 proficiency. However, as noted by R. Ellis (1997, p. 113), it might be that 'it is explicit knowledge as awareness rather than as metalanguage which is important'.

In recent years, the study of language awareness has also been intensified in research on third language acquisition and trilingualism which have concentrated on the detection and identification of differences and similarities between second and third language learning. One major interest has concerned the effects of bilingualism and/or the qualitative changes in language learning. Additive or catalytic effects in language learning have been linked to enhanced metalinguistic awareness in multilinguals as one of the key variables contributing to the advantages of bilinguals over monolingual learners (Cenoz, 2003).

According to holistic approaches to the study of multilingualism the bi- or multilingual speaker is not two or more monolinguals in one person. Cook (2002), who bases his ideas on multicompetence on Grosjean's bilingual view of bilingualism (2001), describes the L2-user, the term that he prefers to bilingual, as having a different perspective of her/his L1 and L2, a different kind of language awareness and a different cognitive system. In consequence, the bi- or multilingual's communicative competence is not comparable to a monolingual's and is constantly changing as pointed out by Herdina and Jessner (2002) in their dynamic model of multilingualism (DMM). According to the systems-theoretic approach the concept of multilingual proficiency is defined as a cumulative measure of psycholinguistic systems in contact (LS<sub>1</sub>, LS<sub>2</sub>, LS<sub>3</sub>, etc.), their crosslinguistic interaction and the influence that the development of a multilingual system shows on the learner and the learning process. These effects of multilingualism, which the authors refer to as M(ultilingualism)-factor, contain an enhanced level of metalinguistic and metacognitive awareness, language management and language maintenance. Hence, the learner develops skills and

qualities that cannot be found in an inexperienced learner and this change of quality is related to the catalytic effects in third language learning. Crosslinguistic interaction as defined in DMM is intended to cover linguistic and cognitive transfer phenomena with non-predictable dynamic effects of a synergetic and interferential nature which determine the development of the multilingual system.

Since DMM is a theoretical model, researchers have started to explore its validity, in particular the effects of the M-factor, by applying it to particular multilingual contexts (Brink, 2005; Moore, 2006). In her book on linguistic awareness in multilinguals Jessner (2006) focuses on crosslinguistic interaction in third language learners of English with the aim to contribute to our understanding of the emergent properties of multilingual systems. She suggests that the construct of metalinguistic awareness, which most commonly refers to grammatical knowledge, has to be widened to meet the requirements of research on multilingual learning and use. In her introspective study on lexical search in third language production Jessner found that crosslinguistic awareness and metalinguistic awareness, tested in the form of explicit metalanguage, exerted influence on the activation of the individual languages in the multilingual mental lexicon.

New approaches to multilingual education describe how to raise the pupils' awareness of other languages in the classroom (e.g. Candelier, 2002 and "Awakening to Languages", and Educational Language Policy Volume 6), how to teach related languages, how to teach learning strategies and how to make use of prior linguistic knowledge in the classroom (see, e.g. Hufeisen and Lindemann, 1997; Cenoz, Hufeisen and Jessner, 2001). In a number of projects, the concept of multicompetence as defined by Cook (see earlier) has been applied—although quite often without drawing on the concept or without even being aware of its existence—to multilingual learning contexts. These new approaches, which take into account the cognitive differences between mono- and bilingual thinking, treat the L2 or L3 student as a learner who has developed a different perspectives of both L1 and L2 and whose prior language knowledge should be integrated into the language-learning process (for a more detailed discussion see Jessner, *Multicompetence Approaches to Language Proficiency Development in Multilingual Education*, Volume 5). In his discussion of a crosslinguistic approach to language awareness James (1996) suggested including the metalinguistic dimension in classroom-based contrastive analysis. The experienced learner is more aware of structural similarities and differences between languages, and able not only to expand her or his repertoire of language-learning strategies but also to weigh the strategies, as originally discussed by Mc Laughlin (1990) and later on supported by Mißler (1999) and O'Laoire (2001). The number of language-learning strategies

available to a learner turned out to depend on prior linguistic experience and the proficiency levels in the individual languages and today there is no doubt about the usefulness of learning strategy training in order to make students aware of how to learn a language during language apprenticeship (Hawkins, 1999). The EuroCom (European Comprehension) project ([www.eurocom-frankfurt.de](http://www.eurocom-frankfurt.de)) for instance, aims to provide European citizens with a solid linguistic basis for understanding each other, at least within their own language family. Optimal inferencing techniques have been developed in typologically related languages to help develop at least receptive skills in the new language. Other projects have advocated a cognitive approach to language teaching, that is, creating synergy in language learning by learning and teaching beyond language borders (e.g. Hufeisen and Neuner, 2003; see also Clyne, 2003).

### PROBLEMS AND DIFFICULTIES

As already mentioned at the beginning of this entry, one of the main problems that scholars who start working in the field of language awareness have to become acquainted with is the sometimes confusing terminology, related to the various theoretical and linguistic backgrounds of the studies. In the following the main terminological and conceptual differences resulting in a number of dichotomies and competing terms will be discussed.

According to Pinto, Titone and Trusso (1999, p. 35) the terminological and conceptual variation is based on

- a. different scientific backgrounds or conceptual orientations to explore metalinguistic consciousness and awareness;
- b. different signifiers such as metalinguistic awareness, language awareness, declarative knowledge of the rules of a language, metalinguistic ability, etc. which refer to the same ability;
- c. different signifiers which refer to different concepts, that is metalinguistic ability refers to a specific ability; metalinguistic task refers to a specific task or test.

James (1999) referred to four competing terms, that is, language awareness, linguistic awareness, metalinguistic awareness and knowledge about language. He concluded from a comparison between language awareness and the other terms that language awareness is broadly constituted of a mix of knowledge of language in general and in specific, command of metalanguage (standard or *ad hoc*), and the conversion of intuitions to insight and then beyond to metacognition. According to James (1999:102) there are two versions of language awareness, that is consciousness-raising and language awareness proper.

The first kind, LA [language awareness] as cognition, works from the outside in, so to speak: one first learns about

language or something about a language that one did not know before. You can stop here, in which case you have done some linguistics. Or you can go on and turn this 'objective' knowledge towards your own language proficiency, making comparisons and adjustments. This is to personalise the objective knowledge gained. The second variant, LA as metacognition, works in the opposite direction: one starts with one's own intuitions and through reflection relates these to what one knows about language as an object outside of oneself. (see also Preston, 1996 on the notion of availability).

Other scholars have provided different definitions such as Masny who proposed a distinction between language awareness as a concept driven mainly by applied linguistics theory and pedagogy, and linguistic awareness based on psycholinguistic and cognitive theories (see also Rampillon, 1997, p. 176). Lately Jessner (2006) stated that the study of metalinguistic awareness in bi- and multilinguals has shown that the two types of awareness present overlapping concepts (see also James, 1999, p. 102) and therefore proposed linguistic awareness (a) to include both dimensions of awareness and (b) as a synonym for metalinguistic awareness in multilingualism.

Different terminology is also linked to languages. Whereas in Italian there are two interchangeable terms *consapevolezza* and *coscienza*, in English 'awareness' and 'consciousness', although clearly rooted in metacognition, are not regarded as synonyms. In French *conscience* and *prise de conscience* are used to mark notions of a process whereas in German *Sprachbewusstsein* is the term most commonly used and a terminological distinction between awareness and consciousness is not possible. As a consequence, translations of the individual terms into English have also led to confusion.

This confusion is also linked to the long-lasting interdisciplinary consciousness-debate. Nowadays Schmidt's (1994) distinction between four rather different senses of consciousness in language-learning studies is the main point of reference. He refers to

- a. consciousness as intentionality (the intentional/incidental learning context);
- b. consciousness as attention (focal attention and noticing versus peripheral attention);
- c. consciousness as control (controlled versus automatic processing, automaticity, explicit/implicit memory);
- d. consciousness as awareness (contrasts between explicit/implicit learning and knowledge).

At the same time he warns against the use of 'conscious' and 'unconscious' as umbrella terms.

All these kinds of consciousness have been discussed in the language-learning context where the idea of consciousness is clearly related to the distinction between implicit and explicit learning (cf. R. Ellis, 1997: Volume 6; N. Ellis, 2002; *Implicit and Explicit Knowledge about Language*, Volume 6; Van Essen, *Language Awareness and Knowledge about Language: A Historical Overview*, Volume 6).

#### FUTURE DIRECTIONS

Since the study of language awareness is rooted in a variety of theoretical backgrounds, the number of steps towards a better understanding between the individual research trends is certainly high. To reach a definition of language awareness which could be acknowledged by all linguistic disciplines might present an unrealistic albeit wishful endeavour.

In future research of language awareness, to focus on the boundaries between consciousness/awareness and explicit/implicit learning and/or knowledge would seem to lead to fruitful contributions. This discussion might result in redefinitions or new approaches following a discussion of the usefulness of such categorizations in hitherto neglected language-learning contexts.

The definition of the role that language awareness plays in multilingual learning and use certainly presents a challenge to research on language learning in general and to common theoretical paradigms in particular. Multilingualism has been defined as an umbrella term to include first, second and third language-learning processes and products (e.g. Cenoz, Hufeisen and Jessner, 2001), and would accordingly provide the adequate framework for a synthesis of interdisciplinary studies on language awareness. New methodological approaches to the study of language awareness are needed. One such promising path is rooted in neuroimaging studies, but a lot more of that kind of research is needed for firm conclusions (Franceschini, Krick, Behrent and Reith, 2004). Better insights into learning artificial languages might also prove fruitful. Apart from the effects that bi- and multilingualism show on the cognitive system, certain social skills such as communicative sensitivity and metapragmatic skills which also seem to develop to a higher degree in the multilingual system, also deserve further attention in the study of language awareness. More suggestions for new designs in language teaching which focus on the essential part of metalinguistic knowledge to language learning are certainly welcome.

Questions which need to be addressed in research to come could include the following (partly based on Jessner, 2006):

Is there a relationship between monitoring and metalinguistic awareness?

Does a heightened level of metalinguistic awareness relate to a high level of attention in multilingual production?

What is the exact role of metalinguistic awareness in a model of TLA?

How does metalinguistic awareness relate to crosslinguistic interaction in multilinguals?

What is the difference between the constructs of language aptitude and metalinguistic awareness?

Which part does metalinguistic knowledge play in the organization of the (multilingual) mental lexicon?

How can language awareness be integrated in language testing?

## AWARENESS RAISING AND MULTILINGUALISM IN PRIMARY EDUCATION

### INTRODUCTION

The study of language awareness raising and multilingualism in primary education is a very recent domain of investigation and is linked to two key contextual factors: increasing globalisation and the increasing mobility of populations. Both these factors have resulted in greater linguistic and cultural diversity among pupils in our classrooms and thus set challenges to the monolingual habitus of most education systems. Two main questions will be addressed here:

1. Are there models of language education, at primary level, which are able to accommodate the plurilingual repertoire of a growing number of pupils without threatening the place of the school language (or standard national language in monolingual states), while at the same time fostering motivation for foreign language learning (FLL) and developing positive attitudes towards plurilingualism?
2. Can such models help teachers to shift their representations of multilingualism from being a problem to being a resource and in which way?

Multilingualism in the primary classroom can be discussed from two points of view: (i) the languages known by the pupils and (ii) the number of languages offered by a school system. In other words, do schools value the languages spoken by their bi/multilingual pupils and what steps do education systems take to help all pupils to become multilingual citizens? While these questions relate to other domains within the larger framework of language education (such as mother tongue education, second language support for curriculum learning, bilingual education and foreign language education), there is one model of language education which attempts to address these issues at the classroom level: the model is known as “language awareness”.

The main goal of language awareness is to support multilingualism both at the institutional and at the individual level, through educating all pupils together (monolinguals and bi/multilinguals) to respect linguistic and cultural diversity and through taking into account all the languages of the pupils in a class, or in the environment of a school. Thus language awareness is quite distinct from all the models mentioned earlier and particularly from FLL.

## EARLY DEVELOPMENTS

The term “language awareness” (LA) was first used by Hawkins (1984) who felt that the traditional teaching about language in Britain was incoherent, that there was a lack of co-operation between teachers of English and other language teachers, as well as excessive eurocentrism in traditional approaches to foreign languages. At the same time, various state reports had also pointed to major problems in mother tongue and foreign language teaching and Hawkins challenged the absence of any investigation into the phenomenon of language itself. He then proposed to develop a “bridging subject” which aims were “to stimulate curiosity about language as the defining characteristics of the ‘articulate mammal’, too easily taken for granted, to integrate the different kinds of language teaching met at school, and to help children to make an effective start on their foreign language learning” (Hawkins, 1999, p. 413). Throughout the 1980s, many secondary schools in Britain included language awareness courses in their curriculum but the advent of the National Curriculum in 1989 put a stop to such courses with the introduction of the “literacy hour” (see also Cots, Knowledge about Language in the Mother Tongue and Foreign Language Curricula, Volume 6; Van Essen, Language Awareness and Knowledge about Language: A Historical Overview, Volume 6).

However, the pioneering work of Hawkins was of much interest to researchers in Europe. As early as 1980, Eddy Roulet in Switzerland had proposed a theoretical framework to bridge the gap between the pedagogical approaches for learning the school language and those for the foreign language (German). His assumption was that pupils needed to be exposed to linguistic diversity if they were to understand how language works. A few years later, Dabène in France developed two major projects on the role of metalinguistic awareness in FLL and on multilingualism and the learning “problems” of pupils from ethnic minority background. Dabène (1991) proposed the French translation of “éducation au langage” and one of her students (Nagy, 1996) wrote the first thesis on LA in France.

During the 1990s, several projects developed throughout Europe under different denominations: *Begegnung mit Sprachen in der Grundschule* (Haenisch and Thürmann, 1994; Oomen-Welke, 1998) which was not solely about teaching foreign languages in the primary but made a point of including migrant languages and cultures. Very attractive pedagogical booklets were published with different languages presented in a parallel way to illustrate various themes (e.g. proverbs). In Austria, the “Zentrum for Schulentwicklung” developed a project called *Sprach- und Kulturerziehung* with teachers’ books and classroom materials. In Switzerland, Perregaux and Magnin-Hottelier (1995) and De Pietro

(1995) elaborated their own approach called *Education et ouverture aux langues à l'école* (EOLE),<sup>1</sup> which was followed up in 1998 by a bigger project under the responsibility of COROME<sup>2</sup> (Perregaux, De Goumoëns, Jeannot, and De Pietro, 2003). In France, Macaire (1998) started a project called *Education aux langues et aux cultures*, involving approximately 100 primary schools; some teacher education modules were developed alongside classroom materials. Finally, a bigger project was funded by the European Commission from 1997 till 2001, "EVLANG, l'éveil aux langues à l'école primaire"<sup>3</sup> (Candelier, 2003a, see also "Awakening to Languages" and Educational Language Policy, Volume 6) in which approximately 2,000 students took part in 5 countries (Austria, France, Italy, Spain and Switzerland), which provided the first wide-scale evaluation of the LA model in the primary sector in Europe.

### MAJOR CONTRIBUTIONS

In 1994, Dabène and Coste organised a conference on the notion of language awareness with colleagues from France, Switzerland, Germany and the UK. The contributions published by Moore (1995) dealt with the concept of LA from a theoretical point of view as well as with the difficulties in translating the term language awareness in French and German. These researchers (and others a few years later, see Billiez, 1998), did much to define the aims of LA and to explain how different they are from FLL. LA aims to develop a first awareness of the workings of language and languages in different contexts. Thus LA does not mean learning many different languages but learning about language in general and languages in the plural. LA activities confront learners with a multiplicity of languages which are not usually taught in schools and eventually make them aware of linguistic variation, without neglecting a necessary reflexion on the school language.

Furthermore, as Dabène (1989) insisted early on, LA also has a "welcoming" function because the pedagogical activities are meant to welcome pupils into the very diversified world of languages and into the diversity of their own language(s). This means the languages of children from ethnic minority backgrounds are included in the activities.

<sup>3</sup> See [http://jaling.ecml.at/english/welcome\\_page.htm](http://jaling.ecml.at/english/welcome_page.htm) for more details on the EVLANG evaluation. The EVLANG project was a Socrates Lingua Action D programme. EVLANG is now followed by another project for older learners called Janua Linguarum-The Gateway to Languages (JALING) (Candelier, 2003b) run by the European Centre for Modern Languages (ECML) based in Graz, Austria. This project is run in ten European countries.

This dimension is central because as Byram (2000, pp. 57–58) argued: “We have to admit that the fact of teaching foreign languages is not enough to guarantee either the development of a multilingual identity or other values such as tolerance, understanding of others and the desire for justice as is often proclaimed as a declaration of intent”.

Most researchers in the field today (Candelier, 2003a, b; Hélot and Young, 2006; Perregaux, 1998) see LA as Hawkins did, not as a new school discipline but as a bridging subject which holds three main dimensions: a cognitive dimension dealing with reflecting upon language and languages (including the school language), an affective dimension addressing attitudes such as opening to others, developing tolerance, etc. and a sociocultural dimension aiming at developing a form of plurilingual socialisation.

The main difference between LA and FLL lies in the fact that FLL usually means pupils are being confronted with two languages, the school language and one foreign language (English predominantly in most non-English speaking European countries<sup>4</sup>), whereas LA approaches are centred on the notion of diversity (the EVLANG and EOLE projects include pedagogical materials based on approximately 70 different languages) and on adopting a comparative approach of linguistic systems.

LA activities are inclusive of diversity in the sense that they make it possible to include all the languages or varieties of languages spoken by pupils in a class, irrespective of their status in society. Thus, it enables bilingual learners to see their first language legitimised at school, it gives speakers of regional and minority languages a new role since their competence in their L1 becomes visible, and through giving all languages an equal place, more positive attitudes towards multilingualism can be promoted. LA activities can also help young learners to move away from the ideal of the native speaker (always implicit in FLL) and to understand that different languages can serve different functions and work as resources for speakers who know them.

LA activities are usually task-based, centred on comparative information about the functioning of several different languages and cultures with exercises meant to develop metalinguistic reflexion within a larger framework than just one or two languages. Thus, the approach can be said to be translinguistic; it is also cross-curricular in that it is closely related to other school subjects such as history, geography, music, art, literacy, etc. These activities usually include materials to help pupils reflect upon the relationship between languages and cultures, the history of languages, language borrowing, the relationship between

---

<sup>4</sup> See Eurydice: 2005, Key Data on Teaching Languages at School in Europe, Brussels, <http://www.eurydice.org>

oral and written forms of language, the different writing systems, the question of languages and states, of language acquisition by children, of bilingualism and plurilingualism in the world, etc.

Hélot and Young (2006) carried out an ethnographic and longitudinal study of a primary school LA project run from 2000 till 2004 in Southern Alsace (Didenheim, France). They give a detailed evaluation of the sociocultural dimension of LA and explain the impact such a project can have on the learning community as far as changing attitudes towards multilingualism. The project was started because of an increasing number of racist incidents in the school and because the pupils did not show any motivation for the learning of German<sup>5</sup> as a foreign language. The teachers decided on a collaborative approach based on parents' participation and on confronting linguistic and cultural differences in a constructive way. Thus the Didenheim project was mainly about developing in children the ability to understand our multilingual and multicultural world and to learn to live in it.

Each of the 18 different languages proposed was encountered through the personal testimony of a parent of one of the pupils in the school. The use of the word personal here is key, because by linking language and culture, through the personal, the human, the affective, greater participation and a better adherence to the objectives of the project were achieved by both the pupils and the teachers. Castellotti and Moore (2002) explain that when children learn a FL at school they imagine themselves on their own, as if the speakers of the FL did not really exist and they note that this is reinforced when young pupils do not meet native speakers.

The personal encounters in Didenheim also meant that the relationship between the languages and their sociolinguistic context was stressed as well as the cultural dimension inherent to language. The heuristic approach allowed the children to ask a lot of questions directly to the parents, not only about language, but also about life styles, about reasons for migration as well as more controversial questions about race and colour. In other words, new spaces were open where pupils were given plenty of opportunities to widen their horizons, to distance themselves from the school language, and even to "decentre", which means being able to view one's own culture through the eyes of someone who does not belong to the same cultural group, to distance oneself from one's own cultural cocoon. In this sense, the kind of competence developed through such activities can be referred to as "cross-cultural awareness".

---

<sup>5</sup> German is the only FL offered in this school as in most schools in Alsace. This is part of the national and regional education policy to support the German language in the face of the growing hegemony of the English language.

The danger of tokenism is sometimes invoked in relation to the LA model. But LA activities, when they are part of a project based on promoting tolerance and on teaching the values of democratic citizenship, involve much more than just exposing pupils to different languages and cultures. More than just language education, it meets the goals of intercultural education (Perregaux, 1998) because “intercultural education seeks to prepare students for a life in a heterogeneous and complex world where they have to interact with various kinds of differences” (Sjögren and Ramberg, 2005, p. 31).

Another very important point should be made concerning pupils from ethnolinguistic minorities: LA activities allow for the languages spoken by these pupils and their families to be used for the pedagogical activities. The psychological effects were very clear: once their language had been presented to their class and as a result their bilingualism revealed, the pupils started participating more in learning activities in general, “they started to exist in the class, before they did not really exist” one teacher in Didenheim said. As they were given the opportunity to be language models for their peers and their teachers, they witnessed their home knowledge (and their parents’) legitimised at school, and they saw their teachers depending on their parents for the lessons. The first step was taken towards bridging the gap between home and school cultures: “the walls of the school have come down” commented another teacher, and in the process, the school integrated linguistic and cultural diversity and changed its outlook on multilingualism.

The Didenheim project is quoted here as an example of good practice and also to illustrate that at the ground level, the process of moving from a monolingual habitus to one where multilingualism is valued is complex and takes time. The teachers in Didenheim were not aware at the outset of all the implications their project would have but they were prepared to build a collaborative approach with parents which meant that they were open enough to welcome the parents’ knowledge as central to reaching their goals. As most of the parents were from ethnic minority background, a process of empowerment (Cummins, 2000) could be observed, with positive effects on the children who saw their teachers valuing their language, their culture and their families.

#### WORK IN PROGRESS

European policy makers see two goals for language education: plurilingual awareness as a value and education for plurilingualism as the targeted competence. While both aspects are closely linked and interact with each other, plurilingual awareness does not actually involve

the acquisition of language skills but focusses more on education for linguistic tolerance. This is the precise domain where LA activities find their *raison d'être*: they constitute a first basis for plurilingual education because they make it possible to welcome and value the repertoire of multilingual pupils, even if the different languages do not have the same function and even their language abilities are of a different level or nature.

Looking at linguistic diversity positively and recognising the plurilingual repertoires of speakers at an individual level are the two main components of the notion of “plurilingual education” as it is defined in recent publications of the Council of Europe, such as *The Guide for the Development of Linguistic Policies* (Beacco and Byram, 2003) and the *Common European Framework for Language* (CEFL, Council of Europe, 2001). Apart from insisting on the notion of plurilingualism as the form of language education appropriate to European reality, the authors reexamine (at the individual level) the concept of a “plurilingual repertoire”. They argue that all the languages known by a speaker should be recognised and then developed so that the various linguistic competences of a speaker find their legitimate place. This means that languages learned outside of formal schooling are also recognised and links made between the various languages which make up the speaker’s repertoire. “The plurilingual approach emphasises the fact that as an individual person’s experience of language in its cultural contexts expand, from the language of the home to that of society at large and then to the languages of other people (whether learnt at school or college or by direct experience) he or she does not keep these languages and cultures in strictly separated mental compartments, but rather builds up a communicative competence to which all knowledge and experience of language contributes and in which languages interrelate and interact” (Council of Europe, 2000, p. 4).

Beacco and Byram (2003) put forward the hypothesis that a necessary first step of awareness of plurilingualism will enhance motivation for learning languages. They write: “Education for plurilingual awareness, which aims to make people aware of the way the various natural languages function in order to bring about mutual comprehension among the members of a group, may lead to increased motivation and a curiosity about languages that will lead them to develop their own linguistic repertoires” (p. 65).

As far as recognising multilingualism, it is clear that the LA model meets this objective but as to developing multilingualism, the question is more complex. Indeed, the possibilities for developing one’s own linguistic repertoire (in the case of young learners in particular) are constrained by the choice of languages offered in a school. And even when this choice is ample, as is the case in the French primary

curriculum<sup>6</sup>, the availability of certain languages, like Arabic for example remains very rare.

Even if it were shown that LA activities have an effect on the motivation to learn languages, one should not forget that in most education systems the unequal power relationships across languages mean that it is far easier to learn dominant languages in schools and far more difficult to develop one's literacy in a minority language (Hornberger, 2003). However, as a model of language education, LA is clearly not about acquiring knowledge that will give more power to those who already have it, it is about transforming the knowledge of those who have no power into a resource. As argued by Hélot (2006), LA activities can help teachers change their perception of linguistic and cultural diversity in their classroom and go beyond the power relationships at work in the curriculum and in the wider environment of their schools.

It should be stressed that LA activities are aimed at all children irrespective of their social origins and that it envisages languages in a perspective of exchange, enrichment and openness to others, even if such activities do help in particular bi/multilingual learners to negotiate their identities, for one of the aims of LA is also to address the affective dimension in language use.

It is hoped that initiatives across Europe (like the projects being run by the European Centre for Modern Languages in Graz<sup>7</sup>), added to the policy work developed by the European Commission and the Council of Europe to promote language learning and to ensure the protection of linguistic and cultural diversity will eventually make some headway towards the recognition of the value of multilingualism also at primary level. More and more researchers are involved in different projects, as attest the numerous participants present at the conferences run by the Association for Language Awareness<sup>8</sup> and the publications in its journal *Language Awareness*<sup>9</sup>. We cannot mention them all here, suffice it to say that there are projects being run in many different parts of the world. In Europe, the “Janua Linguarum—The Gateway to Languages (JALING)”<sup>10</sup> counts 15 countries which aims are to disseminate the LA model widely and to integrate in the curriculum activities promoting linguistic and cultural education in their diversity (see Candelier, “Awakening to Languages” and Educational

---

<sup>6</sup> The choice is theoretical because most schools only offer one language and at the most two, even if in the curriculum eight FLs are included (Arabic, Chinese, English, German, Italian, Portuguese, Russian and Spanish) along with some regional languages.

<sup>10</sup> [http://jaling.ecml.at/english/welcome\\_page.htm](http://jaling.ecml.at/english/welcome_page.htm)

Language Policy, Volume 6). ELODIL<sup>11</sup> (Eveil au langage et ouverture à la diversité linguistique) is another project, started in Quebec in 2002, and later implemented in British Columbia, which plans to investigate with children the notion of linguistic landscapes.

The European Commission in Brussels also supports many projects in the domain of teacher education. We shall quote one here which deals specifically with supporting multilingualism in the primary. In 2004, the University of Hanover started to develop a Comenius Project for teachers working with 3–10-year-old pupils in six European countries. The 2-year project called TESSLA<sup>12</sup> aims to produce pilot courses in each country for teachers to understand why and how they should support bi/multilingual pupils. The objectives of the course are the following: to raise awareness among student teachers of the rich linguistic and cultural diversity of their schools, to support them to develop a critical awareness of language discrimination and the attitudes underlying it, and to equip them with strategies to maximise the potential of children from ethnic minority backgrounds. The underlying principles of the course are that student teachers should learn to critique the monolingual/monocultural habitus of schools and to model strategies to transform it. The curricula designed in the various countries are planned for a module of 24 hours and final evaluation will be available on the web site in the fall of 2006.

#### PROBLEMS AND DIFFICULTIES

One of the main difficulties regarding innovative approaches like LA lies in the area of evaluation: what do the children learn and how does one evaluate it? So far, the only evaluation report available has been carried out by the members of the EVLANG project (Genelot, 2001). The 800 page report shows a rather limited impact on metalinguistic aptitudes: no positive effect on L1 competence and only pupils who were part of the long programme (40 hours) improved their oral discrimination and memorisation of non-familiar languages. Concerning motivation to learn foreign languages, the results were contrasted but on the whole in France and Spain for example, the desire to learn minority languages grew while interest in dominant languages diminished. As to attitudes towards linguistic and cultural diversity, not surprisingly, the pupils who had taken part in the EVLANG project were more open

<sup>11</sup> <http://www.elodil.com/>

<sup>12</sup> See web site at: <http://cms.phil.uni-hannover.de/org/tessla/www/htdocs/>. The modules will be available on DVD support in English, Estonian, French, German, Swedish and Turkish and a handbook will be published in English with summaries and abstracts in the six languages of the partner countries.

and curious than their peers who had not. Furthermore, the pupils who showed the greatest motivation were the ones coming from a multilingual family background. Perhaps, the most interesting result of this evaluation is to be found in the fact that the EVLANG activities had more positive benefits for low achieving pupils. Finally, the results show a clear link between positive effects and the length of the programme: Genelot concludes that a LA curriculum should last a minimum of 40 hours if it is to have any impact on the pupils. But such a statement begs the practical question of where in the primary curriculum one is going to find 40 hours on top of the time devoted to FLT?

As a model of language education LA does not preclude FLL, on the contrary, it is envisaged as a complementary model which should foster a taste for languages and motivation to learn them, but the integration of LA alongside the FL curriculum has yet to be worked out. This problem is rather salient when one addresses the issue of teacher education: how and where does one find the spaces to integrate LA? Dabène (see Billiez, 1998) suggested moving beyond the didactics of one FL to a “didactics of plurilingual situations”, a proposition taken up in recent European policy documents but not easy to implement in the face of the priority given to the teaching of one FL at primary level. Perhaps, more promising is the notion of educational sociolinguistics argued by Perregaux (2006) who does not envisage LA only in relation to FLL, but as a means to develop a different relationship to language and languages within the perspective of intercultural education.

Intercultural education is still rather marginal in most teacher education institutions, but a growing body of research (Akkari, Changkakoti, and Perregaux, 2006) is investigating the pedagogical challenges of cultural diversity and the strategies and practices in teacher education. For LA is not just a matter of having a first encounter with “otherness”, it is also vital to place diversity at the heart of the learning process, be it language learning, citizenship education or any other subjects.

Both the EVLANG and the Didenheim evaluations have shown that most of the teachers who participated in these projects became more open to linguistic diversity. However, Candelier (2003a, b) admits that some of them questioned the relevance of the reflective dimension of metalinguistic activities, and others were at a loss on how to develop a real dialogue based on the diversity of pupils. It seems obvious that giving very attractive materials to teachers is not sufficient to make them aware of what it means to transform a basically monolingual approach into one which makes space for many different languages and cultures, often totally unknown to teachers.

This is the reason why the parents’ participation in Didenheim made all the difference: not only could they answer the children’s questions but, over 3 years, the teachers got to learn about the experience of

diversity from real people who were prepared to share their own history of migration, their schooling difficulties, their hesitations towards their competence in French, etc. And it is through these encounters that the teachers' points of view and attitudes towards diversity and multilingualism were transformed. Now they have changed their mind about the use of the home language, now they advise parents to speak and to read to their children in their L1, and now they understand the cognitive value of making the pupils' L1 legitimate at school.

LA approaches obviously demand different kinds of competence from teachers than FLT: while FLT focusses on aptitude in the given language, LA is more concerned with attitudes towards pluralism. And we know that working on attitudes demands more in terms of teacher education than designing activities with teachers and reflecting upon them. Alleman-Ghionda, De Goumoëns, and Perregaux (1999) write that in Switzerland for example, many teachers still have a very limited personal experience of linguistic and cultural diversity. My own experience as a teacher educator in France for 15 years would attest the same: most teachers in France continue to teach as if all their pupils were white, middle class and monolingual. But how can teachers change the monolingual habitus of our school systems when they are asked to implement top-down curricula which, on the whole, do not address the question of societal pluralism?

#### FUTURE DIRECTIONS

Today most European countries have introduced early FLL in their primary curricula, even if researchers who have studied the age factor in FL acquisition remain hesitant towards the supposed benefits of starting early (Gaonach, 2002; Singleton, 1995; Vogel 1995). In France, Blondin et al. (1998) even showed that if there are benefits, they do not last and they only concern high achievers.

The introduction of FLT in the primary curriculum tends to be interpreted by the learning community as a move on the part of educational authorities to tackle the growing multilingualism of our societies. While this cannot be argued here, one should not forget that some languages have found their place in the primary curricula and some have remained excluded. Even in France, where the Ministry of Education has made a point of diversifying the languages on offer, in reality, 85% of pupils choose English. Everywhere in Europe, English is the most taught language and its dominant position is becoming even stronger and one wonders whether learning a dominant language like English from a very early age does not inhibit motivation to learn other languages later on.

It could be argued that the LA model is particularly well suited to counterbalance the hegemony of a dominant language like English, because it presents children from the start of their language education with a large pallet of languages, and it includes regional and minority languages which often find it hard to find a place in formal schooling. In other words, as a model of language education, LA can be instrumental in protecting minority languages which are always at risk in the face of the importance given to the school language and to dominant FLs. The Didenheim project showed that schools can indeed play a role in the transmission of these languages when it gives them some legitimacy at school and when parents are supported to keep using them at home.

In this sense, LA can be said to be an “ecological” model of language education, because it values all languages equally as resources to be respected and nurtured, it sows the seeds for learning languages which are not necessarily the most well-known, and it shows children that languages like all resources on earth should be shared. LA activities can be envisaged for young learners in particular as learning to grow one’s own language garden, where variety makes for beauty, where patience and hard work make for bountiful harvests and where creativity means reaching out to others.

MULTILINGUAL LANGUAGE AWARENESS  
AND TEACHER EDUCATION

INTRODUCTION

In the last two decades, we have developed a substantial, although incomplete, body of knowledge about what teachers need to know and be able to do, to build on and/or develop many languages and literacies present in twenty-first century classrooms and communities. Less understood, however, is how to educate teachers in ways that ensure not only the acquisition of those understandings, but also the teachers' enactment of those understandings in their teaching, as well as the relationship that this kind of teaching holds for their children's learning. This chapter starts out by describing different kinds of language awareness that are necessary in diverse schools, specifically focusing on what we call multilingual awareness (MLA) for today's multilingual schools. The chapter focuses on the pedagogy of MLA that must be the core of ALL teachers education programs. Although the discussion that follows is relevant for the entire world, we focus here on North America and Europe.

EARLY DEVELOPMENTS: LANGUAGE AWARENESS  
AND AWARENESS OF LANGUAGE

Since the publication of Bolitho and Tomlinson's *Discover English: A Language Awareness Workbook* in 1980, the term "language awareness" has been increasingly used in the language teaching field, especially as a result of the burgeoning of the TESOL profession. Generally, language awareness (LA) or knowledge about language (KAL) in teaching is used to encompass three understandings: about language, its teaching, and its learning (Andrews, 1999, 2001; Wright, 2002; Wright and Bolitho, 1993, 1997; building on the roles described by Edge, 1988):

1. *Knowledge of language (proficiency)*. (*The language user*)  
Includes ability to use language appropriately in many situations; awareness of social and pragmatic norms.
2. *Knowledge about language (subject-matter knowledge)*. (*The language analyst*)  
Includes forms and functions of systems—grammar, phonology, vocabulary.

### 3. *Pedagogical practice. (The language teacher)*

Includes creating language learning opportunities; classroom interaction.

The Association for Language Awareness (ALA) defines language awareness as “explicit knowledge about language, and conscious perception and sensitivity in language learning, language teaching and language use” (ALA home page). Its journal *Language Awareness*, published since 1992, states its goal as the study of, the role of explicit KAL in the process of language learning; the role that such explicit KAL plays in language teaching and how such knowledge can best be mediated by teachers; the role of explicit KAL in language use: e.g., sensitivity to bias in language, manipulative aspects of language, literary use of language, etc.

Wright (2002) distinguishes two roles for language awareness:

1. As a goal of teacher education, it develops the teachers’ sensitivity to language, what Wright calls their “linguistic radar.”
2. As a method, a task or activity type, students work with authentic language data.

Language awareness has been mostly used for teachers of second languages (most especially ESL teachers), as well as teachers of foreign and modern languages. The focus has been on the target language, that is, the language the teacher was trying to teach in the classroom, with little understandings of the students’ language, except as it “interfered” with the language being taught. The understandings that these teachers must have in these classrooms can be rendered as in [Table 1](#); that is, the

Table 1 Language awareness for second/foreign language teachers

|   | Language #1 | Language #2/3 | Bilingualism |
|---|-------------|---------------|--------------|
| Knowledge of (proficiency)                                  | +           |               |              |
| Knowledge about (subject-matter)                            | +           |               |              |
| Pedagogical practice  | +           |               |              |
| Understandings of social, political, and economic struggles |             |               |              |

*Note:* Because I am writing from a multilingual perspective, I will not refer to an L1 or L2 because these are inaccurate concepts from the perspective of multilingual communities, or to target language because a multilingual education has multiple target languages as objects of attention. Instead I refer to Language #1 and Language #2/3, etc. pointing to the language which is the object of attention of the teacher.

teacher must have knowledge of and knowledge about the language she is teaching, as well as knowledge of pedagogical practice. The teacher does not need to have any knowledge of or knowledge about the “other” language, or of bilingualism, or of understandings of social struggles. She is simply a language teacher.

In his classic book, *Awareness of Language*, Eric Hawkins (1984) describes “awareness of language” as a way of bridging all aspects of language education (native language/foreign language/second language/ethnic minority language/classical language) that presently takes place in isolation. Although language focused, Hawkins interest is not on teaching languages per se, but in promoting questioning about language to develop linguistic understandings and challenge linguistic prejudices (see also Cots, *Knowledge about Language in the Mother Tongue and Foreign Language Curricula*, Volume 6; Van Essen, *Language Awareness and Knowledge about Language: A Historical Overview*, Volume 6). Hawkins proposes a series of topics for such a curriculum, one for all teachers, and not just language teachers: (1) human language and signals, signs and symbols, (2) spoken and written language, (3) how language works, (4) using language, (5) languages of the UK, Europe, and the world, and (6) how do we learn languages. In 1988, the Committee of Inquiry into the Teaching of the English Language in England (the Kingman report, 1988) developed KAL as a possible component of the English National Curriculum. The purpose was to have teachers improve their competence in their mother tongue, improve their language learning through comparisons between other languages and their own, and increase their linguistic sensitivity to other languages (Tulasiewicz, 1997). The understandings and awareness of language that teachers must have to work in these educational contexts can be rendered as in [Table 2](#); that is besides all the understandings of the target language, the teacher also needs to know about bilingualism and to teach bilingual children.

#### MAJOR CONTRIBUTIONS/PROBLEMS AND DIFFICULTIES: MULTILINGUAL AWARENESS

This chapter builds on concepts of language awareness (LA), awareness of language, and KAL to examine the MLA needed by teachers for multilingual schools. Multilingual schools bring to the foreground, more than any other type of schooling, language practices that often differ significantly from the ways in which the standard variety of the nation-state is used in school. Additionally, these different language practices are often manifestations of social, political, and economic struggles. MLA then must always build a fourth understanding—“the *understanding of the social, political and economic struggles surrounding the use*

Table 2 Awareness of language for all teachers

|   | Language #1 | Language #2/3 | Bilingualism |
|---|-------------|---------------|--------------|
| Knowledge of (proficiency)                                  | +           |               |              |
| Knowledge about (subject-matter)                            | +           |               | +            |
| Pedagogical practice  | +           |               | +            |
| Understandings of social, political, and economic struggles |             |               |              |

of the two languages—what has become known as *critical language awareness*” (see Fairclough, 1990, 1999). Although this fourth understanding is very important for all teachers, it is crucial for anyone working in multilingual schools.

In talking about *language awareness* in the context of multilingual schools, Shohamy (2006, p. 182) refers to understanding the ways in which languages are used “in undemocratic ways to exclude and discriminate.” She further posits that “language awareness needs to lead to language activism.”

But *multilingual schools* are of many kinds and have different goals and needs. Thus, they employ at least three different kinds of teachers who impart diverse instructions and need diverse degrees of MLA.

1. Teachers who actively draw on children’s multilingualism to educate.
2. Bilingual teachers using one of two languages in instruction, the result of team-teaching with a teacher using the other language, either in the same classroom or in a side-by-side model.
3. Bilingual teachers using two languages to educate.

As we will discuss, these three kinds of teachers need different MLA to effectively educate.

### *Teachers Actively Drawing on Children’s Multilingualism*

Schools in countries in Africa, Asia, and Latin America, have had to contend with multilingual populations being schooled in languages

other than their mother tongues throughout the twentieth century. But schools in the USA and Europe have until recently most often ignored the multilingualism of their autochthonous and indigenous peoples. However, as a result of the movement of people both physically and ideologically occasioned by wars, poverty, globalization, and new technologies, schools in the developing world have had to face the multilingualism of their school-aged children. Twenty-first century classrooms throughout the world have students who speak many different languages, often languages different from those spoken by the classroom teacher. Thus, classrooms teachers most often teach content in languages other than those the children speak at home and in communities. These teachers are not language teachers, and yet, to be successful content teachers they need to have specialized knowledge of language, and especially of the bilingual and multilingual contexts in which the children live, and of the social practices that produce certain discourses.

When teaching second language learners, these content teachers need to have deep understandings about the language system in which they are teaching. They also need to be thoroughly familiar with pedagogical practices surrounding bilingualism and the development of bilingualism. They need to understand, for example, the important role that the first language has on the development of the second, and of the interdependence of both languages (Cummins, 1979). And beyond psycholinguistic understandings, these teachers need to know how to build on their students' first language and literacy to develop literacy in the second. This has been shown, for example, by the work of Danling Fu (2003) in the New York Chinatown as teachers build on their recently arrived students' Chinese literacy to write English language texts. Teachers also need to understand the importance of scaffolding (Gibbons, 2002) for these students.

But beyond teaching second language learners, most children in the world today speak languages at home that are different from that which the school system calls the "standard." Thus, I would argue that all teachers need to have specialized knowledge about the social, political, and economic struggles that surround the languages, about pedagogical practices surrounding bilingualism, and about bilingualism itself. For example, Cummins (2006) has recently shown us how important the school's use of "identity texts" are in the teaching of children who speak languages other than that of the school at home and in community. We can render the MLA these teachers need as in [Table 3](#). Of course, it would be desirable that these teachers have knowledge of and knowledge about the students' many languages, but given the linguistic heterogeneity present in today's classroom, this might be a theoretical impossibility. However, it is not impossible to require that

Table 3 Multilingual awareness for teachers in true multilingual classrooms

|   | Language #1 | Language #2/3 | Bilingualism |
|---|-------------|---------------|--------------|
| Knowledge of (proficiency)                                  | +           |               | +            |
| Knowledge about (subject-matter)                            | +           |               | +            |
| Pedagogical practice  | +           |               | +            |
| Understandings of social, political, and economic struggles | +           | +             | +            |

all teachers be bilingual and thus knowledgeable of how two languages function in one's life.

#### *Bilingual Teachers Using One of Two Languages in Instruction*

Where bilingual or multilingual schools have been organized, teachers may teach only in one language. In effect, these teachers are individuals with different degree of bilingual proficiency who serve as monolingual teachers often in a team-teaching situation within the same classroom or in neighboring classrooms. It is the combination of two of these bilingual individuals/monolingual teachers who make a child bilingual (Table 4). This is often the arrangement in elite enrichment bilingual education programs. This is also the preferred way of staffing multilingual schools teaching in more than two languages, including bilingual schools for autochthonous and indigenous groups who are also interested in teaching their children English (see, Cenoz and Genesee, 1998), as well as European multilingual schools (Baetens Beardsmore, 1993). Immersion bilingual schools often use this type of staffing.

Although full proficiency in and full knowledge about Language #2 is not required (although desired), having some degree or proficiency in Language #2, knowledge of bilingual development, contrastive features among languages, and especially full knowledge of how the other language is taught (a result of team-teaching), as well as the interdependence of the two languages in pedagogical practice is extremely important. For these teachers, I would outline the understandings they need as in Table 4.

Table 4 Multilingual awareness for teachers in bilingual/multilingual schools

|   | Language #1 | Language #2/3 | Bilingualism |
|---|-------------|---------------|--------------|
| Knowledge of (proficiency)                                  | +           | +             | +            |
| Knowledge about (subject-matter)                            | +           |               | +            |
| Pedagogical practice  | +           | +             | +            |
| Understandings of social, political, and economic struggles | +           | +             | +            |

### *Bilingual Teachers Using Two Languages in Instruction*

Finally, we find bilingual schools that employ only *one teacher* for whom knowledge of two languages, that is, bilingualism and biliteracy is an absolute necessity. The teacher serves as both the content teacher and the language teacher. These schools use two languages in instruction, sometimes with the goal of developing the children's bilingualism and biliteracy (developmental bilingual education programs or two-way dual language bilingual education programs), but other times with a transitional goal of encouraging language minority children's shift to a majority language (transitional bilingual education programs) (Table 5). Most of the developmental bilingual schools are for indigenous or autochthonous peoples, or for language minority students when they are fortunate, and two-way dual language classrooms encompass both language minority and language majority children. But this pedagogical arrangement is very prevalent in transitional bilingual education classrooms.

For these teachers, the four understandings about language identified earlier: (1) Knowledge of language (proficiency) in both languages, (2) Knowledge about the two languages (subject-matter knowledge), (3) Pedagogical practice in the two languages, (4) Understandings of the social, political, and economic struggles surrounding the use of the two languages—are absolutely necessary. In addition, however, these teachers need to develop understandings of and about *bilingualism* itself, since the two languages spoken by the teacher and the students are often in contact and in code-switching interaction. Developing pedagogical practices building on the students' bilingualism and biliteracy, for example, ways of translanguaging in the Welsh sense (see Baker,

Table 5 Multilingual awareness for bilingual teachers

|   | Language #1 | Language #2/3 | Bilingualism |
|---|-------------|---------------|--------------|
| Knowledge of (proficiency)                                  | +           | +             | +            |
| Knowledge about (subject-matter)                            | +           | +             | +            |
| Pedagogical practice  | +           | +             | +            |
| Understandings of social, political, and economic struggles | +           | +             | +            |

2003), or of code-switching with pedagogical intent (see Van der Walt, Mabule, and de Beer, 2004), would be extremely important. The understandings these true bilingual teachers need are then the same as identified in Table 5 including full knowledge about language #2 as in table 5.

#### *From Language Awareness to Multilingual Awareness*

Clearly, the language awareness programs of the past are not relevant for teacher education in the twenty-first century, for in most of the world, the multilingualism of children is evident in today's classrooms. It is thus important to think of how to teach teachers in ways that develop their "MLA" and that empowers them to use this MLA in their teaching. From least to most complex MLA needed for different kinds of teachers, one can identify the following continuum:

1. Language awareness for language teachers
2. Awareness of language for all teachers
3. MLA for teachers with multilingual populations (all teachers)
4. MLA for bilingual teachers in bilingual/multilingual schools
5. MLA for sole bilingual teachers.

Because of the higher complexity of situations (3–5), and because there has been little attention given to how these understandings of MLA can be developed through teacher education, the rest of this chapter focuses on these three cases. I discuss teacher education for MLA first from the perspective of the nonspecialized situation, that is, situation #3. I deeply believe that this is needed by ALL teachers in today's classrooms. I end with what else is needed in the specialized bilingual/multilingual schools of situations #4 and #5.

WORK IN PROGRESS/FUTURE DIRECTIONS:  
BUILDING TEACHERS' MULTILINGUAL  
AWARENESS IN INCLUSIVE TEACHER EDUCATION  
PROGRAMS

*The Why of the Centrality of Multilingual Awareness Pedagogy  
and Curriculum for ALL Teachers*

Given the complex multilingualism of the school-aged population throughout the world, teacher education programs must do much more than just “adapt” what they have done in the past for second language learners and bilingual children. When public school systems throughout the world are increasingly populated with multilingual children, it behooves teacher educators to put language difference *at the center* of the educational enterprise. Most teacher education programs pay little attention to multilingual differences, educating their teachers as if all students were native speakers of the dominant language of the nation-state. Sometimes, they include a requirement of a course in the teaching of the majority language as a second language or in bilingual education. But a single course is not enough to acquire the sophisticated MLA that teachers need today, especially in developed societies with increased immigration. Instead, MLA must be a thread that runs throughout the entire teacher education curriculum.

*The How of the Pedagogy of Multilingual Awareness for ALL Teachers*

The question for teacher education, however, is how teacher education programs can go about instilling and developing these understandings of, and disposition towards, MLA, and abilities of how to use this MLA pedagogically. With Freire (1973), Cummins (2001) and other transformative educators, I believe in a critical pedagogy that is situated in practice. I base our transformative pedagogy on the four elements developed by the New London Group (1996) for their multiliteracies pedagogy:

1. *Authentic situated practice* and immersion of students in such practice
2. *Overt instruction* to develop awareness and understanding of practice
3. *Critique of practices* as socially particular through critical framing
4. *Transformed practice* through experimentation with innovative practices that are a result of reflection, overt instruction, and critical framing.

In the following section, I develop how our transformative pedagogy works with teachers to develop appropriate MLA.

*The What of a Curriculum for Multilingual Awareness for ALL Teachers*

It is clear from the earlier discussion that a course in MLA, or even a linguistics course, can do little to transform the MLA of teachers. Instead, the explicit instruction about the system of language that students get in a language-focused course—be it a linguistics course or language/literacy courses that focus on what Schulman (1987) has called pedagogical content knowledge (PCK)—must be combined with authentic situated practice, critique of practice, and the resulting transformed practice in order for learning to take place.

Throughout the years, I have developed ways to immerse teachers in language and literacy practice, critique of such practice, and transformed practice, as well as building in explicit instruction at times. I developed such ways especially as Dean of a School of Education in Brooklyn, New York that had a large bilingual and bidialectal student body who wanted to become teachers, extending them when I joined Teachers College, Columbia University, as faculty in bilingual education. The six strategies that I share later, however, were developed with my colleagues at the Brooklyn Campus of Long Island University, most especially Cecelia Traugh.

**Descriptive Review of a Bilingual Child's Language Use.** Elsewhere (García and Traugh, 2002) we have described how descriptive inquiry, a disciplined process of research in teaching and learning, can enable a group to cut through generalities and abstractions, make the complexity of the lived reality more visible, and enlarge understandings that can generate ideas for action. One way of enabling teachers to understand bilingualism in its complexity is to engage them in observing children closely and describing them fully, working to withhold judgment or interpretation and being respectful of the child as the maker of words and worlds. Basing ourselves and extending the Descriptive Review of the Child process proposed by Carini (2000), prospective teachers are taught to describe one child fully under six headings—physical presence and gesture, disposition and temperament, connections with others, strong interests and preferences, modes of thinking and learning, and use of languages with different interlocutors and in different contexts (for more on the Descriptive Review of the Child, see also, Himley and Carini, 2000).

The purpose of this close observation and careful description is two-fold. On the one hand, the child's language use is seen and described within the context of other activities and student characteristics, and not in isolation. This is important in not reifying language, forcing ourselves to see language not as object in itself, but as an instrument used by the child and used by the teacher in describing the student. On the

other hand, the child's language use is seen and described from the child's own perspective, and not from a sociopolitical or sociohistorical context, contexts that may shape how the child uses language, but that are important to separate from the child's language use.

Another purpose of the Descriptive Review of the Bilingual Child is to bring this detailed description back to the community of practice, sharing it with fellow prospective teachers. Fellow prospective teachers (and the teacher educator) listen attentively as the reviewer shares observations. Afterwards, they first ask information questions, opening up possibilities for further reflection. The process ends with participants, one at a time, giving recommendations to the reviewer to generate new ideas, new practices, new viewings and re-viewings of the child's language and literacy use.

The advantage of the Descriptive Review of the Bilingual Child is that it enables the prospective teacher not only to become a better observer of language, but also a better user of language, as s/he works to be descriptive and withhold judgment of the child's language use. Another advantage is that based on what Carini calls "human capacity widely distributed," it builds a community of practice, a collaboration, in which the changing ways in which language is used is the spur for further action.

**Ethnography of Speech Communities and Sociolinguistic Study of the Linguistic Landscape.** Prospective teachers are also given the tools to look closely and describe richly the "linguistic landscape" (Shohamy, 2006) of the school community or of those from which the children come from (see also Gorter and Cenoz, *Knowledge about Language and Linguistic Landscape*, Volume 6). To do so, they are initially sent out to document—using photography and videos—the languages they see in the community public signs, in the newspaper and magazine stands. They listen to conversations and sounds in the street, and make recordings of that discourse. They interview leaders in the community, as well as common folk, about ways of using languages, and about the sociopolitical and socioeconomic struggles the community faces. They also gather information of the institutions/organizations that support the use of those languages, and of the struggles those organizations face. An important part of this language ethnography is the home of the child itself, and in particular, the funds of knowledge of the parents (Moll and Gonzalez, 1997). In the twenty-first century, it is also important that prospective teachers develop a broad understanding of language use, and that they include in their descriptions the multicode *within* one language, that is, the images, music, art, graphs that make up today's ways of using language, especially by youth—what others have called varied ways of *linguaging* (Kress and Leeuwen, 1996).

Prospective teachers are then encouraged to compare the language data and the information they have gathered with the print and information they find in the internet, and with readings they have done for class. Based on this authentic data that prospective teachers have gathered, the teacher educator provides explicit instruction about aspects of language that are found naturally in what students have collected. It is this explicit instruction that gives prospective teachers the tools to analyze their material further. Prospective teachers become familiar with internet sites, and with translation capabilities of the Internet, tools that will enable them to become lifelong learners about the languages and literacies that they will continue to encounter in their changing communities.

Problem sets for different language use situations are collaboratively generated in class. For example, banks of examples of code-switching in media and print, as well as in oral discourse could be generated. Video clips of different language and literacy uses in the home could also be developed. These problem sets would then be subjected to further analysis and could be the focus of explicit language and literacy instruction. These problem sets also serve as ways of building social, political, and economic consciousness about language use in different contexts and for diverse purposes.

**Descriptive Review of Language and Literacy Practices in Teaching.** Using descriptive inquiry as the process which we described earlier, prospective teachers are also engaged in close observation and description of how language and literacy is used by the teacher and the students inside the classroom in different contexts and practices—class arrangements, lessons, assignments, and testing. In sharing the description with other prospective teachers in other classrooms, complex views and understandings are generated. Collaboratively, the group examines how the particular discourse is used by the teacher and students to include or exclude and how discourse works within particular social practices.

Occasionally, the prospective teacher tapes herself with the children, again describing closely the language used, and sharing it with the collaborative group as a way to build texts of practices that could be subjected to explicit analysis, and as a way to encourage transformation of practices. Again, as a collaborative group, the prospective teachers with the teacher educator review the practices to generate new and transformed practices. The teacher educator explicitly points to promising practices and strategies and provides microanalyses of some discourses.

In describing language and literacy practices within the classroom, the prospective teachers can draw from the data they have gathered outside the classroom and in the community. This comparison can serve

well to help teachers anchor language use in particular domains and for specific purposes. Critical framing of the different events can generate transformed practices.

**Makers of Multicultural and Multilingual Texts.** Both in the more theoretically oriented courses, as in the more practice-oriented courses, students are engaged in producing multicultural and multilingual texts. Specifically, this is done by encouraging the use of double-entry journals, where students react to the academic texts they are reading from their own personal perspective, contributing their experiences, their cultural and linguistic understandings to make sense of the text. Sometimes, these reactions/reflections are written in the students' many languages. At other times, they are written in the class language, with the hybrid use that a personal reflection enables.

Again, these double-entry journals are shared with their fellow classmates and the teacher educator, as a way to build multicultural and multilingual understandings of the same text and to generate different understandings from multiple perspectives.

**Curriculum Meaning-Makers.** As prospective teachers are made "wide awake" (see Greene, 1995) by the attention paid to detail and description of the language use of the child, the speech community, the classroom, and themselves, they start to develop ways of developing curriculum that build on these understandings. The curriculum courses use all this authentic material in creating true multilingual and multicultural curriculum for actual classes and for student teaching.

Prospective teachers try out curriculum in actual classrooms where the cooperating teacher and the college supervisor serve as sounding boards for further reflection and transformation of practices.

**Language and Social Activists.** All descriptions, collaborative sharing of understandings, materials, products, and explicit teaching practices developed through the strategies described earlier result in action that has the potential not only to transform practice, but also to transform the lives of children and communities. This action is sometimes at the individual level, i.e., helping a child's family with translation services, but sometimes it is at the level of local and even national policy. For example, one semester a group of prospective teachers learned about the difficulty of immigrants learning English, since there were no free English language classes available. They gained understandings not only of the inequity that this presented, but also of how this affected their children's learning and their own teaching. With the help of a local immigrant rights organization, they organized a letter campaign, went on radio programs, spoke to politicians. As a result,

funding for adult classes in English was increased the following funding year.

*The What of a Curriculum for Multilingual Awareness for Bilingual Teachers*

In addition to everything that has been said before, bilingual teachers need additional abilities and understandings—in particular, proficiency in Language #2, and sociocultural understandings of the groups who speak Language #2.

With regards to proficiency in Language #2, bilingual teachers (whether one of two or the sole teacher) need to already have some degree of bilingual proficiency before being accepted in a program to educate bilingual teachers. This is because it is almost impossible for a teacher education program to develop the specialized curricular and pedagogical knowledge needed, as well as linguistic ability in a second language. However, bilingual education programs must assess the candidates' bilingual ability upon admissions. And they must provide contexts for students' development of that initial proficiency so that they are capable of teaching academic subjects in Language #2. In every teacher education course for bilingual teachers, readings in two languages are included, and writing assignments in the two languages are required. Student teachers are also required to develop curricula in two languages and to become familiar with instructional material in two languages. This is especially important in the area of children's literature where prospective bilingual teachers should be deeply familiar with children and young adults literature in the two languages. In addition because of the possibility that a bilingual teacher will be hired to teach in the two languages, the prospective teacher is given practice teaching in the two languages and is observed and evaluated doing so in two languages.

Beyond familiarity with the language and all its language varieties, bilingual teachers must gain deep understandings of the sociohistorical and sociocultural contexts of the group that speaks the second language. This is done by requiring that prospective teachers not only take courses that cover such issues, but also by ensuring that this is an integral part of the ethnography of the speech communities and the interviews with community participants.

## CONCLUSION

In the twenty-first century, it is MLA that all teachers need. This article has placed MLA within the framework of language awareness, extending it to include other important abilities and dispositions for the twenty-first

century. In particular, however, this article describes ways in which teacher education programs can develop these understandings in all their students, building more specific ones for specialized bilingual teachers.

# **Section 1**

## **Assessing Language Domains**

## ASSESSING ORAL AND LITERATE ABILITIES

## INTRODUCTION

What does a language assessment assess? Defining the domain of a language assessment involves:

- conceptualizing what a language is
- demarcating the purpose and scope of the assessment
- specifying relevant components and contexts of language use and knowledge
- analyzing empirically how people perform in such contexts
- establishing ways of evaluating and reporting
  - on these performances, as well as reflexively
  - on the effectiveness of the assessment instrument and procedures.

There are many ways to cut each of these pies, and complex combinations of ingredients within and among them, as the subsequent chapters in this volume demonstrate. The present chapter reviews research and practices of assessment that conceptualize second and foreign language abilities comprehensively in respect to oral and literate modes of communication.

## EARLY DEVELOPMENTS

The long-standing convention for designating domains of language assessment comprehensively has been to assess the four ‘skills’ of reading, writing, listening, and speaking (see Purpura, *Assessing Communicative Language Ability: Models and their Components*, Volume 7). Typically, each of the ‘four skills’ is assessed separately through batteries of tests for reading, writing, speaking, and listening. Individual scores are reported for each skill component and/or compiled as an aggregate score. This approach conveys a sense of comprehensiveness about examinees’ abilities to perform across a range of oral/aural and literate modes of communication. Distinctions are also made between receptive (reading, listening) and productive (writing, speaking) modes of communication. Further distinctions are made between subcomponents of knowledge or performance associated with each skill domain (e.g., pronunciation, intonation, and fluency for speaking; or grammar, vocabulary, and discourse functions for reading). Rationales for this approach were elaborated by Lado (1964) and others applying concepts

from descriptive and structural linguistics to establish formal principles for language test design in the 1960s.

This manner of demarcating and assessing the so-called “four skills” was articulated influentially in Carroll’s (1975) model of skill learning and applied to his comparative assessments of students’ achievements in French in secondary schools in eight countries. It has since become so entrenched as the foundation for language education throughout the world that most accounts of language assessment, policy, or pedagogy are, to some degree, framed in respect to them (Cumming, 1996). Precedents for this fourfold distinction have a relatively lengthy history. Spolsky’s (1995) authoritative history of language testing shows that they coincided with the expansion of formal education systems and refinement of psychometric methods over the past century. They were also concurrent with the spread of teaching of a select (formerly colonial) set of international languages (e.g., English, French, German, Italian, Spanish, but also increasingly Arabic, Chinese, and Japanese) around the world as well as increasing migration to programs of higher education, settlement, and work in Europe, North America, and Austral-Asia (see Spolsky, *Language Assessment in Historical and Future Perspective*, Volume 7). Various concerns have been raised to challenge the premises and practicality of the “four skills” model. But these challenges tend to have been incorporated within, rather than to serve as genuinely alternative options to, the guiding framework for defining language assessments broadly as literate domains of reading and writing and oral domains of listening and speaking.

Challenges to the “four skills” model started in the 1980s as researchers conceptualized language abilities in respect to new models of communicative competence (e.g., discourse, grammatical, lexical, sociolinguistic, and strategic competencies) that spanned oral and literate modes of communication (Bachman, 1990, 2000; Harley, Allen, Cummins, and Swain, 1990). A widely cited concept is Cummins’ (1984) distinction between “basic, interpersonal communication skills,” which students can develop relatively rapidly for simple conversational interactions in a second language, and the “cognitive, academic language abilities,” required for literate tasks and tests of academic achievement, which develops more slowly over several years.

The purpose of most language education is to develop students’ general capacities to use a language in a multidimensional range of oral and literate activities (Widdowson, 1983). Surveys invariably show that students need high levels of proficiency in almost every oral and literate aspect of a language to be able to function effectively in education in that language (North, 2000; Rosenfeld, Leung, and Oltman, 2001). Accordingly, in most educational systems, the primary basis for defining

language abilities, both in curricula and assessments over the past decade, has become a broad set of standards or benchmark competencies in reading, writing, listening, and speaking. These are usually demarcated by a range of attainment or proficiency levels, as described later (and see Fulcher, *Criteria for Evaluating Language Quality*, Volume 7; Kunnan, *Large Scale Language Assessments*, Volume 7). The remaining sections of this chapter describe the considerable knowledge that has accumulated over the past two decades to inform these standards for language education as well as to validate formal tests of language proficiency.

### MAJOR CONTRIBUTIONS

Research and development on the assessment of oracy and literacy have concentrated on the consolidation of knowledge about language assessment generally and about test validation particularly. During the 1990s, most leading researchers on language testing produced books, suitable for course texts in programs of teacher education or graduate studies, that articulated principles and practical advice about the design and techniques of assessment for oral and literate language abilities: Bachman (1990), Davies (1990), Rea-Dickins and Germaine (1992), Weir (1993), Cohen (1994), Alderson, Clapham, and Wall (1995), Bachman and Palmer (1996), Brown (1996), Genesee and Upshur (1996), McNamara (1996), O'Malley and Peirce (1996), and Bailey (1998). In addition to these books in English, standard references likewise appeared in languages such as French: Chaudeson (1995) and Lussier and Turner (1995). Increasingly, books have focused on specific components of oral and literate language assessment, such as books on reading (Alderson, 2000), writing (Ferris, 2003; Hamp-Lyons, 1991; Weigle, 2002), listening (Buck, 2001; Flowerdew, 1994), speaking (Fulcher, 2003; Luoma, 2003), and vocabulary (Read, 2000) (see Purpura, *Assessing Communicative Language Ability: Models and their Components*, Volume 7).

As these latter topics suggest, the trend toward consolidation has reinforced the fourfold division of language ability (into the skills of reading, writing, listening, and speaking) while continuing to emphasize knowledge about language (such as vocabulary). Assessment of literacy is conventionally taken to mean the assessment of reading or writing. Assessment of oracy is conventionally taken to mean the assessment of listening and speaking. Studies of language assessment have given surprisingly little emphasis to current conceptualizations of the ways in which human interactions increasingly tend to cross and combine modalities of communication as multiliteracies (Cope and Kalantzis, 2000). For example, language assessments seldom

account for the prevalent uses of new multimedia technologies, such as the Internet or text messaging, and the resulting concepts of visual or media literacy (Cummins and Sayers, 1995; Kelly, 2005; Lankshear, Gee, Knobel, and Seale, 1997), nor respond to the widespread questioning of standard varieties of languages and fixed sociolinguistic categories as norms for assessment (Canagarajah, 2006; Lowenberg, 2002), nor address arguments that literacy is negotiated through local, culturally and historically defined activities—many of which may in fact be multilingual—rather than established as universal or monolingual behaviors or attributes (Martin-Jones and Jones, 2000; Street, 1993; Triebel, 2005). These notions of hybridity, contextualization, and multimodality challenge the very idea of there being unique constructs for particular language skills, let alone distinctions between oral and literate abilities.

Other consolidating steps have included

- the appearance of specialized scholarly journals (*Language Testing*, *Assessing Writing*, and *Language Assessment Quarterly*)
- the formation of an international professional association, the International Language Testing Association (ILTA) and its code of ethics for language testing practices and web site: <http://www.dundee.ac.uk/languagestudies/lttest/ilta/ilta.html> (see Davies, Ethics, Professionalism, Rights and Codes, Volume 7)
- an annual forum to share research on language assessment, the Annual Language Testing Research Colloquium, held in various locations around the world
- the compilation of a dictionary of technical terminology (Davies et al., 1999)
- extended historical analyses (Barnwell, 1996; Spolsky, 1995; Weir and Milanovic, 2003)
- published critiques of major language tests (e.g., Stoyloff and Chapelle, 2005; ongoing reviews of tests in journals and in annual and online editions of Buros' Mental Measurement Yearbook: <http://buros.unl.edu/buros/jsp/search.jsp>).

Consolidation of conventional concepts about oracy and literacy has probably also appeared because a major focus of theory and research has been test validation. Conceptualizations have converged on Messick's (1989) unified theory of construct validation to establish that a test assesses what it intends to assess (Alderson and Banerjee, 2001/2002; Bachman, 1990; Chapelle, 1999; Cumming and Berwick, 1996; Kunnan, 1998; see Xi, *Methods of Test Validation*, Volume 7). Rather than assuming that any one set of evidence might suffice to assert the validity of a test, professional expectations are now that test validation is a continuing process that involves precise specifications of the construct that the test intends to assess and the ongoing accumulation of multiple sources of

empirical evidence to demonstrate that it does so. Professional agreement on this responsibility has, in addition to improving the bases for evaluating the quality of formal language assessments, had at least three general effects.

One effect has been to acknowledge that the long-term consequences or washback of language tests are integral to their validity (Bailey, 1999; Cheng, Watanabe, and Curtis, 2004; see Cheng, Washback, Impact and Consequences, Volume 7). This matter is vitally important for tests that evaluate students' literate and oral abilities comprehensively, particularly when the stakes of a test are high—in determining students' grades, certification, or entry to educational programs or career opportunities. Limited test formats (e.g., multiple choice) and limited content sampling (e.g., grammatical knowledge) may narrow the focus of studying and teaching in preparation for the test and thus students' opportunities to practice or improve their language abilities. In turn, a restricted set of literate routines are highlighted and privileged over diverse forms of oral communication. This concern has led educators increasingly to emphasize performance, task-based, and alternative assessments, though such forms of assessments that integrate oral, literate, and other abilities have tended to appear more in innovative curricula than in formal tests (Darling-Hammond, Aness, and Falk, 1995; see Fox, *Alternative Assessment*, Volume 7; Wigglesworth, *Task and Performance based Assessment*, Volume 7). Nonetheless, a prevailing expectation is that assessments should require examinees to produce extended written and spoken discourse creatively in test contexts rather than to respond simply to fixed test items in a way that might be coached or narrowly rehearsed.

A second effect of the professional consensus on the centrality of construct validity has been to diversify and extend the types of research that establish the validity of language tests. Psychometric methods to evaluate language tests have become increasingly sophisticated, for example, accounting for the combined effects of test content and methods as well as the characteristics of test-takers and raters over time, through techniques such as structural equation modeling (Bachman, 2000; Kunnan, 1999) or Rasch scaling (McNamara, 1996) (see Chalhoub-Deville and Deville, *Utilizing Psychometric Methods in Assessment*, Volume 7). In turn, qualitative methods of inquiry have assumed an important role. For example, data collected through verbal reports reveal examinees' thinking processes while taking language tests (e.g., strategies for responding to test items, Yamashita, 2003) or describe raters' decision making while either evaluating spoken or written texts (Brown, 2003; Cumming, Kantor, and Powers, 2002; Lumley, 2005). Likewise, discourse analyses have evaluated whether the linguistic qualities of examinees' oral or written production correspond to that intended in test

specifications. Such inquiry, however, has tended to treat separately analyses of speaking, for instance through conversation analysis (e.g., Lazaraton, 2002; Young and He, 1998), from analyses of writing, for instance through text and rhetorical analyses (e.g., Cumming et al., 2005) (see Lazaraton, *Utilizing Qualitative Methods for Assessment*, Volume 7).

A third effect is that substantial resources are required to conduct systematic programs of validation research. Such resources tend to be available only to large, internationally oriented testing organizations (such as the University of Cambridge Local Examinations Syndicate, Educational Testing Service, or the Paris Chamber of Commerce) or to national or state level agencies, funded or compelled by examination requirements or other legislation for public education or by policies for higher education programs, professional qualifications, or immigration. This situation may well lead to improved validity in a select set of language tests administered on large scales. But the impact may also be to reduce the number, types, and local relevance of tests that evaluate students' oral and literate language abilities comprehensively because of the extensive resources required to develop, validate, and administer them on a local or regional basis. Wesche (1987), for example, described the development of a comprehensive battery of English proficiency tests that a consortium of universities in Ontario could not afford to maintain because of the ongoing costs of developing, validating, and administering them. The concentration of resources and activity within a few international language tests may be yet another reason for the continuing tendencies to define oracy and literacy as they are operationalized—as reading, writing, speaking, and listening—in the main components of these tests, rather than, for example, as multiliteracies or other recent concepts of literate or oral communications.

#### WORK IN PROGRESS

Much recent attention in the assessment of oral and literate abilities has focused on innovations to integrate modalities of communication (i.e., reading, writing, listening, and speaking) and to understand better classroom formative assessment and self-assessment. The developers of major language tests have conscientiously adopted particular approaches to respecting the conventional domains of 'four skills' (described earlier), while addressing the inherent interdependency of these language modalities by adopting more integrated views of literate and oral abilities. For example, a person has to read to be able to write, speaking inevitably involves listening, and subcomponents of language ability such as vocabulary or grammar span separate skills and media. Educational Testing Service has conducted a major program

of research over the past decade to revise its Test of English as a Foreign Language (TOEFL) to “include more tasks that integrate the language modalities tested” in order to be “more reflective of communicative competence models” and to provide “more information” about “students’ abilities to use English in an academic environment” (Jamieson, Jones, Kirsch, Mosenthal, and Taylor, 2000, pp. 3–6; and see numerous monographs and research reports at [www.ets.org/pub/toefl](http://www.ets.org/pub/toefl)). In contrast, Cambridge initially designed its International English Language Testing Service (IELTS) to integrate “the four skills” but recently separated their measurement into unique components. This step aimed to improve the test’s construct validity and to eliminate “the potential for confusing the assessment of reading ability with the assessment of writing ability” (Charge and Taylor, 1997, pp. 375–376). It accompanied other developments in their First Certificate in English (Weir and Milanovic, 2003; and see diverse research reports at [www.cambridgeesol.org/rs\\_notes/index.cfm](http://www.cambridgeesol.org/rs_notes/index.cfm)). These contrasting approaches may reflect different cultures of assessment in North America (valuing formal tests) and in Europe (valuing public examinations), as suggested by Bachman, Davidson, Ryan, and Choi’s comparative analysis (1995; see Inbar-Lourie, *Language Assessment Culture*, Volume 7). A wholly different conceptualization was adopted for the Certificates in Spoken and Written English (cf. Brindley, 1998, 2000; NSW AMES, 1995) for adult migrants in Australia. This assessment focuses primarily on people’s language production (i.e., speaking and writing) in the context of integrated tasks (that involve reading and listening), based on competency descriptions derived from theories of systemic–functional linguistics.

Publications about language assessment have mostly focused on formal tests of language proficiency or achievement. Greater understanding is needed about ordinary practices of assessment in classrooms and other informal contexts of learning and teaching. Assessment is integral to teaching. It requires considerable expertise and knowledge as well as specific techniques to address students’ development of oracy and literacy (see Malone, *Training in Language Assessment*, Volume 7). The extent to which practicing language teachers may separate or combine assessments of students’ oral and literate abilities is unclear, and it probably varies, though an orientation toward written, rather than oral, tests appears evident from most analyses and documentation (e.g., Grierson, 1995; Rea-Dickins, 2001). Certain books have highlighted classroom formative assessment to address the interests of language teachers, aiming to develop their knowledge and abilities for assessment, for example, in respect to portfolio assessments or responding to students’ written or oral language production (e.g., Ferris, 2003; Genesee and Upshur, 1996; O’Malley and Peirce, 1996). Moreover,

authors such as Lynch and Davidson (1994), Brindley (1998, 2000), Brown (1998, 2002), and TESOL (1998a, 2001) have demonstrated the value of criterion-referenced and performance assessments for interrelating assessment, curricula, teaching, and learning. But research has only started to describe systematically teachers' usual practices for formative language assessment (Cumming, 2001; Ferris, 2003; Rea-Dickins, 2001; Wigglesworth and Elder, 1996) and the conditions under which this expertise may develop or be promoted (Bailey, 1998; Edelenbos and Kubanek-German, 2004). It remains unclear to what extent teachers' classroom practices for assessment actually combine or separate modalities of communication, acknowledge multimodalities or mixing of first and second languages, or capitalize on multimedia technologies—in contrast to the relatively uniform constructs that reading, writing, speaking, and listening are presumed to be in most formal language tests, curricula, and textbooks.

A related issue is self-assessment of oral and literate language abilities. There has been a long-standing acknowledgment of the importance of learner autonomy and strategy development in language learning. But the principles for learners' self-assessment established in Oscarson (1978) have only recently been elaborated upon by Ekbatani and Pierson (2000), evaluated in Ross' (1998) meta-analysis, and made technically feasible on a large scale by the Council of Europe's Dialang project: [www.dialang.org](http://www.dialang.org) (Alderson, 2005; see Fox, *Alternative Assessment*, Volume 7). Recent initiatives in self-assessment have continued to treat the "skills" of oral and literate abilities as primarily separate rather than integrated components.

#### PROBLEMS AND DIFFICULTIES

A major dilemma for comprehensive assessments of oracy and literacy are the conceptual foundations on which to base such assessments. On the one hand, each language assessment asserts, at least implicitly, a certain conceptualization of language and of language acquisition by stipulating a normative sequence in which people are expected to gain language proficiency with respect to the content and methods of the test. On the other hand, there is no universally agreed upon theory of language or of language acquisition nor any systematic means of accounting for the great variation in which people need, use, and acquire oral and literate language abilities. For example, language tests tend to specify tasks to represent a construct, then examine the performance of testees on these tasks in order to determine empirically what the range of abilities are on these tasks. No theories guide or explain these interpretations of difficulty or success in language test performance, as Fulcher (1996)

demonstrated for the construct of fluency in oral interviews or as Jarvis, Grant, Bikowski, and Ferris (2003) demonstrated for the progression of text features in ESL written compositions. Moreover, most language tests are written, and in highly conventional, literate genres, rather than informal oral modes of communication (Peirce, 1992). For this reason, accounting for the comprehensive range of oral and literate abilities expected in most programs of second or foreign language education is a dilemma of daunting complexity and uncertainty. This is particularly so around the world as educators are increasingly required to account for their activities and the outcomes they may produce.

To resolve this dilemma, most educational systems have developed their own sets of benchmarks, standards, or competencies to define the domains of a language to be taught and learned and, in turn, to be assessed (Brindley, 1998; North, 2000). Typically, these standards have been established through professional consensus among committees of educators, and so are grounded more in perceptions of educational practices than in empirical evidence or theories about language acquisition. There are innumerable sets of curriculum standards at a state, national, or even institutional level for public education. Most tend to separate reading, writing, listening, and speaking as fundamental organizational units, though many combine oral and literate abilities and some add elements of visual or media literacy as well. Notable international examples are the Council of Europe's Common Framework of Reference (2001), TESOL's Standards (1998b), or ACTFL's Proficiency Guidelines (1986). Such standards may suffice for educational purposes, particularly to guide classroom instruction in a uniform way or to provide a common framework of reference within an educational system. But they are contingent on the quality of professional judgment and confidence in the standards. Moreover, the approach involves a logical circularity (Brindley, 1998; Johnson, 2001). The abilities that learners are expected to acquire are defined by the standards, which are taught and then assessed in reference to the standards, as a kind of achievement testing. But such standards themselves seldom have independent theoretical or empirical validity, or firm construct definitions of oracy or literacy, other than through professional consensus and status as an educational policy. So their applications may appear to function as assessments of achievement in relation to, although without direct verification of, what has been taught or studied in a curriculum. In turn, such standards are general frameworks for curriculum, not actual instruments of assessment, so their applications should not be misinterpreted as evaluations of proficiency or competency generally or by extension to contexts other than the curriculum standards or local educational conditions.

## FUTURE DIRECTIONS

Future developments are bound to continue in most of the directions outlined earlier. Particularly important will be research, such as that of Brindley (2000) or North (2000), to validate and refine empirically the curriculum standards that now inform major language education programs and assessment instruments related to them. In particular need of substantiation are the ad hoc conceptualizations of literacy and oracy that now feature in these standards and accompanying assessments. Equally important are guidelines such as TESOL (1998a, 2001) to orient educators to using these standards effectively in their pedagogical and assessment practices. As Luke (2005) has argued for education generally, diverse and multiple forms of evidence need to be incorporated into curriculum and assessment frameworks and to address new multimedia literacies critically (Cope and Kalantzis, 2000). New technologies will surely feature in future developments of language assessments in both literate and oral media, as they have increasingly in recent years (Chapelle, 2001) (see Chapelle, *Utilizing Technology in Language Assessment*, Volume 7). The potential for innovations in assessment via the Internet are only now being established in such projects as Dialang (Alderson, 2005; for comprehensive self-assessments in multiple languages related to the Council of Europe's Common Framework of Reference, 2001) and the new Internet-based version of the TOEFL, accompanied by diverse preparatory and instructional materials. But as noted earlier, these major tests continue to feature conventional constructs of reading, writing, listening, and speaking—though in multimedia formats. So they may offer relatively little change from conventional notions of oral and literate abilities. Look for advances particularly in computer-adaptive testing (Chalhoub-Deville and Deville, 1999), tailored to individual abilities and interests, as well as computer-generated scoring of written and oral language performances (Shermis and Burstein, 2003) as well as challenges that such technical advances may reduce, rather than enhance, assessments by replacing sophisticated human judgments with routine mechanical procedures (Ericsson and Haswell, 2006).

At the same time, knowledge about language assessment needs to continue to accumulate and be evaluated professionally. Such knowledge is required worldwide because of the pressures for public accountability about education and other public policies (such as immigration or professional certification), which are often implemented through assessment programs, and because of trends toward greater international mobility. Attention should, in turn, continue to shift in education to knowledge about ongoing formative assessment practices, of both

oral and literate abilities, to supplement and prepare learners for the present emphasis on summative assessment in formal language tests.

In sum, much knowledge has accumulated in recent decades about particular as well as general aspects of language assessment. Numerous assessment practices and instruments have been established and refined. A bifurcation remains, however, between the professionally determined standards that inform language education and the empirical research that informs international suites of language proficiency tests. Existing knowledge and debate now focus either on curriculum standards, established as formal policies for language education, or on major language tests, validated by scientifically oriented investigations. In between these established pillars of the comprehensive assessment of oral and literate abilities are spaces that need to be described more precisely and conceptualized more thoroughly—to help the pillars support language education constructively. Key dimensions of these spaces are ordinary practices of language learning and teaching as well as theories and policies that integrate, explain, and evaluate their relations as evidenced in formal and informal language assessments.

Multiple approaches are needed to understand these spaces in ways that compare to the knowledge that has accumulated, over the past two decades, about formal language tests and curriculum policies. Ordinary practices of language assessment in teaching contexts need to be documented and analyzed through case studies, ethnographies, and action research, and their findings synthesized and evaluated. Balanced attention needs to be given to oral as well as literate dimensions of language abilities as well as hybrid or multimodal relations among them and other media and technologies. Theories of literacy, oracy, and learning need to be applied rigorously to understand these assessment practices and determine their value, such as Hornberger's (2003) continua of biliteracy or sociocultural theories of learning (Wells, 1999). Comparative studies need to describe and assess commonalities and differences in language assessment policies and practices internationally, as in Dickson and Cumming (1996). Policies for language assessment need to be informed, and extended, by multiple forms of evidence, as Luke (2005) has argued, encompassing historical, sociological, linguistic, psychological, and philosophical sources. Moreover, practical means need to be established to integrate, apply, and evaluate them in relation to fundamental educational purposes as well as diverse societal and international contexts.

## ASSESSMENT IN MULTILINGUAL SOCIETIES

### INTRODUCTION

The issue of assessment in multilingual societies has become important especially in the last three decades as we realize that multilingualism is now a legitimate reality around the world. Given that multilingualism is the norm rather than the exception, maintaining and developing multilingual competence (MC) becomes a necessity. Shohamy (2006) makes a strong case for encouraging MC and arguably so, since a majority of students arrive in schools with MC and hold multiple identities; and even if they arrive as monolinguals, it is imperative that they have opportunities to acquire additional languages from peers or from instruction. There is also evidence to suggest that multilinguals may have advantages over monolinguals in areas such as negotiating, working with people from culturally diverse backgrounds, interpreting and communicating information and thinking creatively (see Baker and Jones, 1998; Bialystok, 2001; Graddol, 2006).

The present chapter looks mainly at assessment of English language (henceforth assessment) in a multilingual environment and suggests that the assessment issues and concerns discussed here can also be extrapolated to other languages. Assessment here refers to all methods of testing and assessment, including alternative assessment. Testers sometimes make a distinction between testing as a standardized, large-scale exercise that fulfils the requirements of validity and reliability as opposed to assessment as school based tests that might not be consciously guided by such requirements. This distinction is not maintained here and therefore the terms testing and assessment are used interchangeably. Further, a multilingual society is one where more than one language or language variety is spoken. In this sense, multilingualism also includes multidialectalism. In what follows, this chapter discusses the various assessment issues that are relevant to multilingual societies.

### EARLY DEVELOPMENTS

Work on assessment in the last several decades has centred around the notions of ‘what’ and ‘how’ in testing, i.e. what constitutes language proficiency and therefore what aspects of proficiency one needs to test and how to test it. In tracing the early developments in the area, it is

necessary to understand the developments that different models of language proficiency have undergone vis-à-vis the kind of norms that are applied in a given testing situation. We will examine the issues in turn and look at what obtains at the present moment and what the future promises for the testing field.

### *Models of Language Proficiency*

The discussions about models of language proficiency in the area of language testing have been vibrant with ongoing debate in the last three decades. McNamara's (1996) comprehensive review provides a trajectory of developments in this area. Beginning with the theory proposed by Hymes (1967) on communicative competence and its implications, and Savignon's (1972) experiment based on the premise that language skills should be assessed in an act of communication with 'native speaker' as the reference point, we seem to have come a long way in our understanding of the concept of language proficiency. Morrow (1979) emphasized the notion of behaviour in a communicative context, i.e., the candidate's ability to use the language to translate the competence (or lack of it) into actual performance in ordinary situations. Responding to this discussion, Wesche (1992) stressed the importance of including non-linguistic factors in performance assessment instead of a vain effort to develop context-neutral, universally fair language tests. According to Jones (1979) a performance test is more than a basic language proficiency test, since it is possible for someone to compensate for inadequacies in one area with astuteness in other areas.

The seminal work done by Bachman (1990) based on Canale and Swain (1980) proposed a model of *Communicative Language Ability* in which three components were: language competence, strategic competence and psychophysiological mechanism/skills. His model has two important dimensions that are of interest to the issue in question. One, the notion of strategic competence which is understood as ability, capability or capacity in an area of knowledge that differentiates the performance of native speakers as well as of non-native speakers. In tasks requiring negotiation, it may be that performance is affected more by strategic competence than by the specific areas of competence the test was originally intended to measure. Strategic competence then seems to include factors other than language ability, for example, "language users' willingness to exploit what they know and their flexibility in doing so" (Ibid, p. 105). The second is the notion of interaction of the components of communicative competence: "... it attempts to characterize the processes by which the various components interact with each other and with the *context in which language use occurs*" (Bachman, 1990: p. 81; emphasis mine). Even illocutionary competence

is supposed to be a sentence type whose interpretation depends very heavily on the circumstances under which the act is performed (p. 91).

Bachman and Palmer's model (1996) adds another dimension, that of affect. "The affective schemata determine, to a large extent, the language user's affective response to the task and can either facilitate or limit the flexibility with which he responds in a given context" (p. 65). This is a significant development over the earlier model and deals with Hymes' ability for use in terms of affective or volitional factors.

The foregoing account of the development of language proficiency models point to the following main features (with my emphasis) in the concept of proficiency:

1. The *context* in which language use occurs or circumstances under which the communication takes place;
2. Language users' *willingness* to exploit what they know and their *flexibility* to adapt to a given situation, with the *affective factor* facilitating or limiting this flexibility;
3. Ability to *translate* one's competence into *actual performance* in contexts that correspond to *real life*;
4. Performance as *more* than language proficiency; and
5. The importance of *non-linguistic factors* instead of *context-neutral, universally fair* language tests.

It is to be noted that while these 'models' essentially emphasize the importance of context and go beyond language, including flexibility, willingness, affect etc., they do not in any conscious or explicit manner take account of the multilingual environment to which the language user might belong, nor the purposes for which s/he might be using English. The notion of looking at language use in intra- and inter-language communities had not gained currency, although, interestingly, the models seem to have provided for it.

What emerges is a model that has taken into account the 'context' in which communication takes place. The problem, however, is what counts for correct and appropriate language use in a given context. This has been informed by monolingual native speaker norms since the debate about World Englishes (WE), English as an International Language (EIL) and English as a Lingua Franca (ELF) is only recent. Still more recent is the discussion about what kind of English is valid in assessment procedures.

### *Norms for Assessment*

Closely linked to the notion of language proficiency is the norm for assessment, i.e. the kind of English that tests expect test takers to aim for. In the early days of testing, the language proficiency continuum was seen to lie from zero to ultimate attainment, i.e. 'native-speaker'

competence. Lado's (1961) comment that "when the (test) items have been written and the instructions prepared the test is ready for an experimental administration to native speakers of the language. . . ." (p. 93), clarifies the position abundantly. The assumption was that any language test should assess proficiency in Standard English, i.e. American or British English. Further the principal goal of Modern Language teaching was teaching and testing of the written language. Although oral proficiency was valued, it is only recently that oral proficiency testing was considered an important part of foreign language testing. The Test of English as a Foreign Language (TOEFL) did not include a section on writing until recently let alone an oral component. The oral component was a much later addition on the insistence of various state politicians whose children couldn't understand the speech of the foreign teaching assistants who taught beginning courses in mathematics and computers (Spolsky, 2006). The notion of the native speaker (or Standard English) as the norm for assessing proficiency has continued to dominate the English language testing scene: on proficiency scales such as Foreign Service Institute (FSI), the Australian Second Language Proficiency Ratings (ASLPR), the highest level of competence described is that of an educated native speaker (see Davies, 2002 for a discussion of this point).

The issue of choosing a model for language tests was fairly simple and straightforward as scores on English tests were needed largely for use in English speaking, i.e. inner circle countries. Therefore the question of which or whose English is an ideal candidate for deciding on the norm was not relevant until recently when the global spread of English brought into focus the need to examine the consequences of such a spread.

## MAJOR CONTRIBUTIONS

The last few years, the last decade in particular, have witnessed a growing interest in issues related to multilingualism in assessment. A major development with regard to the English language is the way it has spread globally and its implications for language tests in terms of what counts for a norm. This section presents briefly the kind of debate that sociolinguists, educationists and language specialists around the world are currently engaged in which in turn take us to a discussion of assessment issues in multilingual contexts (see Rubdy and Saraceni, 2006 for a very lively debate on the issue).

### *The Spread of English*

Since the second half of the twentieth century, the spread of the English language has been unprecedented. This is a result of post-modern

globalization which is a geo-political relationship, and is a consequence of different social and technological forces that has generated a new relationship among communities visible through diaspora groups, trans-national travel, internet, media, international business and the like (cf. Quirk, 1985). One result of this spread is that sociolinguists have begun to recognize the growing varieties of English known now as EIL and WE resulting in an emergence of a range of legitimate non-native varieties. More importantly, the NNS language variety is distinguished from *interlanguage* implying thereby, first of all, that since new norms for ELF are being developed, there is no reason why multilingual speakers should defer to exonormative standards dictated by the 'inner circle' (Kachru, 1986) when they communicate with each other in English (for a comprehensive discussion see Jenkins, 2003; McArthur, 1998; Seidlhofer, 2000). This means that the inner circle speakers are no more 'norm-providing', and the other two circles not 'norm-developing' or 'norm-dependent'. The statistic provided by Crystal (2003) and Graddol (1997) are even more convincing in that English is used in multilingual contexts more than in homogeneous contexts of monolingual speakers making the notion of 'periphery' questionable. Canagarajah (2006) suggests therefore that while we need not necessarily announce the 'death' of the native speaker, we need to first of all start working with Crystal's notion of English as a 'family of languages' or McArthurs' egalitarian model (quoted in Canagarajah) where different varieties relate to each other. A second corollary, as Lowenberg (2002) demonstrates, seems to be that the creative processes involved in NS and NNS linguistic innovation tend to be the same, although some may label the NNS creativity as 'error', a case of linguicism. Jenkins (2006) provides a persuasive argument for the spread of English vis-à-vis its implications for testing.

While Kachru's (Ibid) concentric circles provide for a movement of English from the inner circle to the other circles, it is to be reckoned, in principle at least, that they are concentric circles and are therefore separate. Canagarajah (2006) identifies the features that are characteristic of the globalized world, i.e. the international involvement at diverse levels, the porous nature of the national boundaries with a flow of social and economic relationships resulting in a hybrid language, communities and cultures. In the light of these, he questions the Kachruvian model that brings about a crisis in the previously held assumptions underlying the three concentric circles. He argues that each variety, such as Indian English, is valid not only in the respective country, but even outside it since business obligations such as the BPO industry require it. Similarly, even in expanding circles, English is used even within the country to a much larger extent making the ESL/EFL distinction invalid.

This view, however, represents one perspective. Another equally persuasive viewpoint discussed is that while the definition of native speaker competence is widening, a question that needs urgent attention is what 'English' is being taught and learnt (and therefore assessed) in different teaching and learning contexts around the world. Seidlhofer (2000) argues that this issue has not been on the agenda so far, as is clear, for example, when Medgyes (1994) confides about his inferiority complex because of glaring defects in his knowledge of English, or when Crystal (1997) considers himself fortunate to be a fluent user of the language (he means English), and dreams of an ideal world where everyone would have that kind of command over the language. Within the ELT context, Davies, Hamp-Lyons, and Kemp (2003) quote Lukmani who reports that teachers of English in India aim for standard English, although it is not clear whether they provide a Standard English model for their students at all educational levels. It seems that Indian tests (may) have a non-standard variety in tests and exams but teachers may not be aware that it is a non-standard variety; they would like to have a standard and just believe that they do have one, not knowing that it is not standard. According to Spolsky (2006), the position that there exists a single correct form of English, derivable from a study of the best authors (with their occasional lapses removed) and enshrined in standard grammar books and dictionaries is based on a traditional and Classical approach, still widely believed by lay people and linguistically untrained teachers. At the same time, the power of this belief makes it a significant factor in setting goals for English teaching.

### *Assessment in Multilingual Settings*

An important milestone in the assessment of language proficiency that is of relevance to us is the Assessment of the Language Proficiency of Bilingual Persons (ALPBP) project, carried out in the USA. The Language Proficiency Assessment (LPA) symposium, a component of the ALPBP project, represented a major effort toward integrating the insights from the research conducted and the implementation of the teacher training programme of the project. This is captured in three volumes (see, for example, Rivera, 1983). Of particular relevance to the issue in question is the framework proposed by Cummins which initiated a dialogue among other scholars in the field (see Rivera, 1984). They pointed out that from a sociolinguistic perspective, it lacked a detailed and serious understanding of the broader social context in which language development and use occur.

Other major activities that reflect a growing interest in the area are: the 'Symposium on Assessment Issues in Multilingual Settings' in 2000, organized by ACROLT (Academic Committee for Research on

Language Testing) at Kiryat Anavim, Israel. Although the papers presented at the symposium have not been published, the papers, as is evident from some of the titles, addressed some key issues in the area: issues and challenges in assessment of multilingual societies, testing indigenous languages, reforming language policy through assessment, among others. Recently ALTE's 'International Conference on Assessment in a Multilingual Context: Attaining Standards, Sustaining Diversity' discussed, among others, issues such as equity, the role of smaller languages in the face of the spread of English, language tests as covert policy tools in multilingual societies.

A significant development that seems to be promising is in the area of English language teaching in multilingual settings which indicates that work in the area of testing may not be far behind. In India, for example, the three-language formula ensures national unity, and facile intra-state, inter-state and international communication (see Biswas, 2004). The National Curriculum Framework developed by the National Council of Educational Research and Training (2005) promotes multilingualism in schools since the positive relationship between multilingualism, cognitive growth and educational achievement is well established. There are thus indications that classrooms are becoming more multilingual and democratic allowing for plurality and heterogeneity in terms of the different languages, cultures, and understandings that learners bring to the classroom. Agnihotri (1995) makes a strong case for using multilingualism as a classroom resource and recommends moving away from monolingual norms and practices for better education and social change. Elsewhere (1996) he asserts that "enforcing monolingual norms involving homogenization and standardization will only be indicative of ethnocentrism and authoritarianism. Both in our society and in our schools, we need to create space for different languages represented in our society" (p. 43).

Jacob (2001) illustrates a set of five discourse functions in a context specific methodology for the English Studies curriculum in two urban university situations at Pune University, India. An ethnographic study of a series of classroom encounters revealed five central discourse functions, directed towards nurturing equitable social access to the educational process and collective advancement of competencies. This also enabled the polarities between advantage and disadvantage to dissolve as the apparently disadvantaged learner at one stage could occupy a position of advantage.

In the area of language assessment, Shohamy (2004) has been particularly influential in proposing a model of critical language testing (CLT), an area that applies critical pedagogy and critical applied linguistics to testing which emerges from the need to examine, question and monitor the uses of assessment tools in education and society,

especially since they are often introduced in undemocratic and unethical ways mostly for carrying out the policy agenda of those in power. The power of tests to define knowledge in narrow ways and to manipulate educational systems is unquestionable. The social and educational consequences of such powerful uses are of special significance in multicultural societies, as tests are often used to force minority groups to accept the knowledge of the dominant group (see Bourdieu, 1991). Shohamy (Ibid) discusses three conceptions of knowledge that are an important outcome of multiculturalism, i.e. the assimilative model, the recognition model and more recently the interactive model, where the knowledge of the minority groups is seen to affect that of the dominant group and enrich it in a two-way interaction. Clearly the interaction model is not simple to apply as there is often resentment by the dominant group who are eager to maintain and preserve their identity in society and who view the other forms of knowledge as challenges to their existence. Even in situations where multiculturalism is recognized, tokenism prevails and education systems use a variety of overt and covert mechanisms to strive for homogeneous knowledge. In a multilingual country like India, for example, many Indian English medium schools demand that students use only English while in school and not any of the other languages they come with. They are penalized if they do so.

In a similar vein, Shohamy (2001a) calls for democratic assessment which requires shared authority, collaboration, the involvement of different stakeholders including test-takers, and monitoring the use of test results. Assuming that tests are neutral only allows those in power to misuse tests. Studying the use of tests as part of test validation on an ongoing basis is essential for the integrity of the profession.

#### WORK IN PROGRESS

The growing interest in issues related to multilingualism in assessment in the past decade has been phenomenal. The inclusion of a chapter on this topic in the present edition of the volume on Language Testing and Assessment of the Encyclopedia of Language and Education but not in the first, testifies to this. It is since then that there has been a spurt of research activity along with the development of a theoretical base, which has enriched the area substantially. There are a number of areas in which work is in progress.

##### *Test Development Based on Local and 'Native' Norms*

As multilingual speakers focus more on meaning rather than grammatical correctness they are developing new norms of English that are different from both the local and the metropolitan varieties. Tests in

English are being developed according to local norms and the objective is the need to assess one's ability to use ELF in the local community. The test developed for English teachers in Indonesia is a good example of this (Brown and Lumley, 1998). On the other hand, for contexts that demand inner circle norms (as is the case with TOEIC, TOEFL and IELTS) one has to adopt international norms. Language assessment has moved from the traditional 'deficit' model based on how far away the test taker is from the top of the scale to giving credit to what s/he can do. The development during the 1990s of the can-do statements developed by the Association of Language Testers of Europe (ALTE) and the Common European Framework (Council of Europe) exemplify this approach (Taylor, 2006).

### *Studies in Cross-Cultural Variability*

The CCSARP, a project concerned with the notion of pragmatics in cross-cultural speech act realization patterns, requests and apologies, in eight languages or varieties: Australian English, American English, British English, Canadian French, Danish, German, Hebrew and Russian, raises the issue of universality: to what extent is it possible to determine the degree to which the rules that govern the use of language in context vary from culture to culture and from language to language? The analysis of the data revealed rich cross-cultural variability (Blum-Kulka and Olshtain, 1984). With a modified version of the discourse completion questionnaire (DCQ) used on the CCSARP, Durairajan (2000) tested the proficiency of the same set of Indian learners in two languages, namely, Tamil and English to examine the nature and amount of codeswitching and found that code switching is not attempted out of deficiency but is carried out for effect. The fact that the more proficient speakers of the language code switched more than the less exposed highlighted this effectively.

In a similar attempt in India, Mehrotra (1995) found that verbalization of politeness in Indian English varies considerably from British and American English. Based on a small study, he generated data on how students studying at a University used expressions they would use in borrowing a pen. Interestingly, they listed 75 verbal ways of borrowing a pen, out of which 52 expressions showed a single occurrence each. This clearly indicated a relatively lower percentage of standard and fixed forms of verbalizing simple request in Indian English than is the case with British or American English. The study highlights certain 'special qualities' and 'regional characteristics' of sociolinguistics in India as distinct from sociolinguistics in other parts of the world.

Cohen (2004) reported on work related to the notion of inter-language pragmatics, i.e. it is not enough to know the equivalent

words and words in a second language, but one needs to determine situationally appropriate utterances. Pragmatics is at the intersection of language culture. He discusses the ‘what’(whether learners are able to deploy appropriate modifications of the speech act) and the ‘how’ (open and closed types) of assessment of speech acts as well as the rating of oral and written production. He suggests that since pragmatic behaviour by its very nature varies, it is best to use more than one approach such as portfolio assessment rather than the one-size-fits-all approach.

Intachakra (2004) investigated the notion of intercultural competence, i.e. knowledge of culturally appropriate ways of communicating in a cross-cultural context using a second or foreign language. The study of the characteristics of conversational routines in British English and Thai with a focus on apologies and thanks revealed a number of subtle differences between the two speech communities. It was found that while some situations may prompt the British to apologize, the Thais would make do without saying anything at all. Also, the British may have many direct strategies to choose from when it comes to expressing thanks whereas the Thais have less explicit strategies, each with minute sociocultural overtones.

More recently, Spolsky (2006) quotes Derwing, Rossiter and Munro (2002), who look at the question of training people to understand second language learners, and show that linguistic instruction and cross cultural awareness training makes social workers much more confident in their ability to interact with Vietnamese speakers of English.

### *Test Development Methodology*

Cambridge ESOL’s tests of writing and speaking have used qualitative methods of test development using multiple investigators, multiple theories or multiple methods, as well as different sources of data in order to cross-check the validity of findings (Taylor, 2005). Some of the methodologies used are discourse/conversation analysis, verbal protocol analysis, observational checklists. These have also helped to understand the test-taking processes with benchmarking and standard-setting exercises that are ongoing and help us in the development of new speaking tests and the revision of existing tests in relation to format, content, examiner training and the procedures necessary to monitor and evaluate how oral assessments are carried out.

### *Impact of Testing*

McNamara (1998) discusses a particular area of concern, i.e. the impact of language testing on minority language students in school settings.

He quotes Elder who shows that the supposedly ethically neutral bias detection techniques used in fact inevitably involve questions of values in the choice of the criterion adopted as benchmark in the group comparisons; in other words, bias depends on the definition of the test constructs, in this case, defined politically. Elder's work on the value of dimension of test constructs is a concrete example of Messick's point about the impossibility of value-free test constructs. The context of her studies-language study in ethnically diverse populations as a result of immigration-is relevant in settings beyond the Australian one.

### *Development of Corpus*

The compilation of a corpus of ELF on different aspects is in progress (see, for example, Jenkins, 2000; Seidlhofer, 2000, 2005). The insights from the body of work describing the features of English will allow for the economical use of valuable teaching time to focus on features that are teachable, not teachable but learnable and the like. It would also have implications for curriculum design, and for textbooks and tests. It should be stressed however that linguistic descriptions alone cannot determine what needs to be taught and tested in particular settings; that would be a pedagogical decision (Widdowson, 2003).

### *Other Developments*

In a radical proposal, Makoni and Pennycook (2005) suggest strategies of 'disinvention' to combat the concept of monolingualism, the norm that underlines all mainstream linguistic thought. Here, multilingual norm is simply a pluralization of monolingualism. Language testing also plays a crucial role in this process. That a critical approach to language testing 'implies the need to develop critical strategies to examine the uses and consequences of tests, to monitor their power, minimize their detrimental force, reveal the misuses' (Shohamy, 2001b, p. 131), emphasizes the need to look at how all forms of language testing imply very particular versions of language.

Empirical work by Hamp-Lyons and Zhang (2001) has attempted to examine the behaviour of raters of university-led exam essays focussing on the rhetorical patterns found in EFL test essays, specifically at how raters' judgements of the essays interact with their perceptions of the culture-specific or nativized rhetorical features. Issues are raised regarding the raters' degree of tolerance for rhetorical diversity, the appropriacy of 'non-nativelike' rhetorical patterns in university students' written work, and training of essay writers, and the implications of the study for English language writing assessment in localized and international contexts.

Davies, Hamp-Lyons, and Kemp (2003) formulate three questions which frame their ongoing research:

- How possible is it to distinguish between an error and a token of a new type?
- If we could establish bias, how much would it really matter?
- Does an international English test privilege those with a metropolitan Anglophone education?

Work in this area is in progress.

There have been publications that are going to play a significant role in the ongoing work in the area: the publication by Cambridge University of Multilingual Glossary of Language Testing Terms in 2005 which contains a glossary of entries in 10 European languages and will encourage language testing in those languages.

The Spanish National Assessment of Educational Progress (NAEP) aims to assess twelfth-grade students, who have learned Spanish in a variety of ways and for different lengths of time, at the national level only (i.e. in the USA). In this framework, listening, speaking, reading, and writing skills are assessed within three modes of communication: the *interpersonal* mode, the *interpretive* mode, and the *presentational* mode. The goals of assessment include the following:

- gaining knowledge of other cultures;
- connecting with other academic subject areas to acquire knowledge;
- developing insights into the nature of language and culture through comparisons; and
- participating in multilingual communities at home and around the world.

Performances will be evaluated on how well the student understands (comprehension) and can be understood (comprehensibility). The criterion of comprehension/comprehensibility subsumes language knowledge, the appropriate use of communication strategies, and the application of cultural knowledge.

## PROBLEMS AND DIFFICULTIES

An issue that has constantly plagued language testing specialists is that of the tension between validity-reliability. It seemed to surface quite seriously during the communicative language testing era; now in the current scenario where English takes on different forms in different contexts in a chameleon-like fashion, this issue is even more crucial and needs to be addressed in a careful and informed manner. Language testing has had a history of being slow to catch up on advances in teaching. If we do not keep pace with the way the world (and therefore languaging) is changing, we may find ourselves lagging behind in the implementation of notions such as accommodation, bias, fairness,

equity and, more importantly, multicultural competence in specific but varying situations. This is going to be a challenge for testers in the years to come.

More specifically, implementation of scoring criteria by exam bodies seems to be trailing behind theoretical advancements. They would first of all need to decide whether ELF or EIL is the norm in question and this distinction is not as clear-cut as it appears. Secondly, we would need detailed descriptions of the different kinds of Englishes we may want to capture in interactive situations. While it is necessary to set testing criteria based on empirical evidence from actual instances, waiting for the corpus to be of use let alone be exhaustive would delay valid assessment in multilingual contexts. Further, unless testing procedures change, there is little hope teaching will, since tests, especially high-stakes tests, have a powerful washback effect (see Cheng, Washback, Impact and Consequences, Volume 7). Even if certain varieties of English have not been codified to a considerable extent, that is not an argument against developing tests based on local norms.

Developing locally appropriate tests sets difficult but not impossible challenges for those testing companies that want to sell their tests internationally. One of the most important aspects of globalization is that it requires local adaptation.

The question of which Englishes should be privileged on tests is particularly problematic and interesting in academic contexts where traditionally standard forms of English are the only ones accepted (see Davies, Hamp-Lyons, and Kemp, 2003; Hamp-Lyons and Zhang, 2001). This is especially true in countries like India where there is ambivalence about what people want, i.e. Standard English (British English) or Indian English even for internal purposes, more so since there are varieties of Indian English which therefore defy any definition or description. As Davies (2002) asserts, the attempt to ascertain a standard and fix it forever is a vain ambition. Of course, there will always be uncertainty as to the meaning of the term. He feels that the claims of the native speaker from those of proficiency cannot be separated and they seem to be dependent on one another. He has no doubt that “while . . . our models should be educated standard English, it does not absolve us from taking a position on whether the debate about different educated standard Englishes is as linguistic as it is political” (p. 8).

Many proposals have been put forward, some more radical than others that need to be operationalized seriously and implemented in actual situations: ways of acquiring language awareness, linguistic activism, disinvention strategies, democratic approaches to test development and use, to name a few. This is a challenge in the face of established traditional views that might resist new or innovative ways of assessing.

## FUTURE DIRECTIONS

Assessment of MC it seems is a more complex and difficult task than assessing in monolingual settings. Nevertheless, research in the area points to several future possibilities.

Models of language proficiency have already provided for context and for language use in actual situations, which include strategic as well as pragmatic competence. We will need to concretise these notions in multilingual contexts focusing on cross-cultural competence. If multilinguals, as research indicates, are good at negotiating, speech accommodation or shuttling between English varieties and speech communities, working with people from culturally diverse backgrounds, interpreting etc., the assessment procedures would need to focus on these aspects rather than on just linguistic skills, as Canagarajah (2006) has demonstrated. He describes modifications to the different aspects of the First Certificate of English examination, in order to make it a multilingual test. For example, he suggests a broadening of strategic competence to include sociolinguistic and pragmatic skills in multilingual communication such as crossing, speech accommodation and code alternation. For assessing the performance of candidates, he recommends that the raters should be from different English language communities, for example, one from the candidate's own community and the other from the inner-circle community. This would enable the raters to examine whether the candidate is able to negotiate the different varieties they use. With regard to the tasks in the test, i.e. monologue, dialogue and conversation, topics related to candidates' areas of interest and specialization could be chosen in order to make the test discourse specific; further, candidates from different language communities could be paired to examine their proficiency in communicating in different situations and negotiating dialectal differences.

This proposal clearly points to a language construct different from the one we have been working with: there is nothing called a 'general' or 'universal' proficiency, and performance in such tests is only an approximation of the candidates' performance in other situations. This also redefines the notion of subjectivity that should not be shied away from but incorporated into the testing procedure. Given that tests can't be culture free, no single procedure can capture language knowledge and requires multiple and alternative assessment procedures, such as portfolio assessment. An assessment system that has as its guiding principles open and flexible language, interactivenss, multiple approaches, dynamic assessment, and integration of assessment with instruction is recommended. In sum then, assessment has to adopt a multiple approach: multi-task, multi-rater, multi-candidate and multi-norms. We need to move from the 'either/or' orientation to a 'both

and more' perspective. We need to shift the emphases from language as system to language as social practice, from grammar to pragmatics, from competence to performance in our attitude to proficiency.

We would also need to articulate a developmental view of language proficiency (see Durairajan, 2003), which captures different stages of learning especially in a multilingual setting, that would help with the notion of assessment *for* learning, not just assessment *of* learning. This in a sense contrasts with proficiency statements that reflect only end-products. Further, until EIL criteria are established, testing agencies would have to refrain from penalizing the use of those NNS variants, which are emerging through their frequent and systematic use as acceptable EIL variants. Jenkins (2006) also cautions us against EIL/ELF becoming just labels in that the EIL-based criteria should not turn out to be the old native-English criteria.

Constructing local tests for intra-national use would be the need of the hour. The Indonesian test for English language teachers is a good example (see Brown and Lumley, 1998). In the mean time adapting international tests to local norms may be a way forward, especially since these tests are standardized and fulfill the requirements of validity, reliability, usability and the like and would be economical. Other parameters such as impact could be investigated as an ongoing research question while these tests are in the process of being localized.

Another future trend in our testing procedures could be to (i) focus on the candidate in *interaction* rather than on the individual candidate (also see Jacoby and Ochs, 1995 for work on co-construction, Kasper, 2001 for developing pragmatic ability through assisted performance within a sociocultural perspective and de Almeida Mattos, 2003 for evaluation through scaffolded interaction in collaborative settings). The study of interaction has its roots in the traditions of ethnography, ethnomethodology and conversation analysis; and (ii) more importantly, determine beforehand, what we can test and what we cannot; we need to identify the limits of testability (McNamara, 1998).

The whole exercise of test development and use should adopt a democratic approach: involvement of stakeholders, including test-takers, involving teachers for example, in the observation of learners, to monitor language development and map their observations onto the descriptions to come up with provisional ratings in the development of ESL band scales (Scott and Erduran (2004).

Another area of interest is the effect of different accents on work (Spolsky, 2006). One would like to see an exploration of the effect of the different foreign accents on judgements, for example, by asking whether U.K. or Australian or U.S. or assorted non-native judges have observable biases towards specific non-native varieties. Similarly, variables related to performance contexts need to be identified and

investigated. For example, in a speaking test, is the interlocutor a peer candidate, a trained/untrained, NS or a proficient NNS? All these are likely to be significant in influencing the candidates' performance. Again, given the differences that exist among native speaking communities (Scotland, Australia, different groups in the U.S.) would WE be more disadvantaged?

## ASSESSING CONTENT AND LANGUAGE

### INTRODUCTION

A salient feature of the assessment of content knowledge in the context of L2 acquisition and use is that many fundamental aspects await specification by educational practitioners and assessment specialists. Several factors contribute to the late-comer status of content assessment in L2 assessment practice. First, the L2 profession has a long history of describing learners' L2 knowledge in terms of formal features, independent of and separate from knowing a content area. Second, knowing a foreign or second language was typically modeled as a cognitive ability on the part of the individual learner that emphasized processing of sentence-level morpho-syntactic rules and retrieval of lexical knowledge from memory. The kind of discourse or textual environment necessary for handling sophisticated content could not be readily accommodated within such a focus. Third, while communicative language teaching foregrounded language use over knowledge of language forms and conceptualized that use in terms of communicative tasks, even the most elaborated assessment framework, that by Bachman and Palmer (1996), upheld the separation of language knowledge from topical or content knowledge and highlighted the role of strategic competence and affective factors in performance. As a result, even performance tests, the hallmark of the communicative era, focus on aspects of *language* rather than task performance in a deeper sense, where quality performance of a task would require content knowledge (see McNamara's, 1996 discussion of this issue, pp. 45–46). Finally, even the assessment of writing, with its obvious connection to issues of content, has largely confined itself to exploring textual organization, coherence, and cohesion, and the nature of an academic lexicon, rather than addressing how particular language choices themselves contribute to content being communicated more or less successfully.

However, most recently, the need to assess content knowledge in relation to language knowledge has become a pressing issue due to increasing individual and societal multilingualism, demands for integrating L2 learners into existing mainstream curricula with diverse content expectations, the call for proof of the attainment of learning goals made by the outcomes assessment movement, and, last but not least, the use of a second language in diverse professional contexts that

characterizes globalization, in short, the demands for fostering the development of L2 literacy and, by extension, of assessing it.

As a result, the following general questions arise: What exactly is the nature of the content-language link? What kinds of theoretical frameworks are available for imagining and specifying it with an eye to the effects of learner age and level of L2 development? To what extent does education itself help or hinder learners in making the kinds of content-language links that will enable them to express their content knowledge in the L2, what we refer to as L2 literacy? Explicitly focusing on assessment, how might the assessment field carve out a recognizable, delimited, and legitimate testing domain of content within L2 assessment that would differ from assessment of content in mainstream educational assessment? What assessment domains and what assessment instruments would be particularly well suited to the assessment of content knowledge? What additional interpretive and reporting responsibilities might the assessment community need to assume vis-à-vis students, programs, and society given the repercussions of judgments of L2 learners' content knowledge on their educational careers and, ultimately, their ability to lead rewarding and flourishing lives in society? To begin to answer these questions, a look at the kinds of challenges arising in three areas is instructive.

*First, classroom-based content assessment.* Classroom-based content assessment is particularly strong in content-based bilingual programs that strive to enable learners to succeed in mainstream education with its expectation of adequate content knowledge and language abilities. In that case, the results of classroom-based content assessment not only have direct consequences for pedagogies in a particular classroom, but they also have a strong external link into the overall curriculum, something that is likely to affect their very nature. In addition, depending on learners' age and the length of a particular program, increasingly complex and diverse content areas must be assessed (e.g., baccalaureate programs that are conducted bilingually), a challenge that requires a sophisticated awareness of the nature of academic language form and use.

*Second, program- or curriculum-based content assessment.* In content assessment in relation to program or curricular goals, content is typically expressed relatively broadly and abstractly, e.g., in the sciences, social studies, or mathematics. Assessment results are interpreted by constituencies that represent diverse positions, have diverse interests, and different ways of affecting educational practice and policies. Such assessments tend to be particularly important for immigrant and minority student populations. For example, in the USA the federal No Child Left Behind (NCLB) legislation rigorously demands that learners, whether native speakers or English language learners (ELLs), must meet a certain threshold of learning outcomes. Because of its

punitive qualities of funding being withheld from so called ‘failed’ schools and entire school districts, content-based assessment has recently become an extraordinarily high-stakes activity.

By contrast, FL programs generally have neither particular content-learning expectations nor external assessment mechanisms. For example, neither the comprehensive K-16 framework of the Standards for Foreign Language Learning in the United States (*the Standards*) nor the Common European Framework of Reference (CEFR) state content areas in a binding fashion comparable to the curriculum documents that govern bilingual educational programs. As a result, in the US program outcomes assessment that addresses content knowledge in FL programs is just beginning to be considered under the pressures of general outcomes assessment (see the contributions in Byrnes, 2006).

*Third, content assessment in a professional community.* Frequently independent of particular instructional contexts, the kind of knowledge and know-how that characterizes membership in a professional community, e.g., business, law, health care, or commerce and trade, needs to be assessed for purposes of certification, licensure, or hiring (and firing). Here content-knowledge tends to be given greater weight than pure language knowledge and tends to be framed in terms of diverse professional practices that frequently are realized in and through and with language as well as by accumulated professional knowledge and diverse nonlinguistic practices. For that reason close contact between the assessment community and the professional community seems necessary for determining these practices and relating them to the assessment of content knowledge. The particular qualities and challenges of that area have for some time been considered under the rubrics of language for special purposes (LSP) or, more narrowly, English for special purposes (ESP). Assessment of language for academic purposes (i.e., LAP/EAP) is at times grouped with these concerns.

Implied in the previous descriptions is the special role of English. In many contexts around the globe English is both a foreign and second language; it is also crucial for access to many professional contexts in a globalized world. As a consequence, discussion of the assessment of content often assumes English as the L2 in question. For example, high demand for English instruction already in the primary grades in Israel has not only strengthened the link between curricular content, language instruction, and content assessment; it has also questioned the continued dominance of form-focused instruction by many language teachers.<sup>1</sup>

---

<sup>1</sup> Personal communication from Elana Shohamy, May 27, 2006. Because of the resultant shortage of trained ESL teachers, homeroom teachers who take on the role of “English teachers” tend to emphasize content more than their ESL colleagues do, by using the regular content curriculum in those classes as well.

Increasingly, around the world, certain disciplines conduct their tertiary education in English, thus necessitating increased content assessment in an L2 environment. At the same time, content assessment is a prominent concern in immersion programs and in heritage language education.

#### EARLY DEVELOPMENTS IN THE ASSESSMENT OF CONTENT AND LANGUAGE USE

Given the above background, it is not surprising that assessing content in L2 settings first became a central concern in K-12 ESL programs. As bilingual education needed to show that ELLs were acquiring the mandated curricular content, it shifted from communicative to content-based instruction (CBI) and initiated a number of approaches for the assessment of curricular content. Revealing the competing interests of content-based assessment, Brinton, Snow, and Wesche (2003) state that in CBI programs evaluation “should, in theory, be similar to what is done with native speakers in similar courses” (p. 184) but also caution that such a demand must not disadvantage ELLs from diverse linguistic and cultural backgrounds whose limited command of English might lead to unfair evaluation of their content knowledge. Initially, the assessment of content tended to be expressed in terms of general academic abilities or ‘skills’ that any student would need to handle the academic demands of content learning. For example, learners ought to be able to put scrambled sentences into a coherent paragraph, find the central point of a reading and locate its supporting arguments, present academic or complex ideas clearly and without help in both speaking and writing, and have adequate note-taking abilities for academic lectures.

However, recognizing the great variety of emphases in bilingual programs, Weigle and Jensen (1997) call for greater specificity regarding what might be reasonable outcomes for content and language. Thus, sheltered content instruction and adjunct courses show a greater content focus. By contrast, a language focus goes with theme-based CBI instruction. Even as they affirm that all three models foreground the interaction of content and language, they suggest that assessment of content can take different forms, particularly with regard to the role of L1 and L2 in the test instrument. This includes the possibility of testing language and content separately or applying different scoring criteria for different learner groups. In other words, the extraordinary external pressures that can be exerted when L2 learners do not perform well contribute to a continued decoupling of content and language. On the one hand, then, teachers may have good reason to follow well-established assessment practices, even though these were not intended

to assess content knowledge (see Weigle and Jensen's recommendation that teachers follow Bachman and Palmer's assessment framework). On the other hand, careful practitioners recognize the inherent tensions in such an approach. Thus, Short (1993) concludes that it seems impossible to isolate language features from content features in a manner that does not adversely influence the other. Therefore, she opts for alternative forms of assessment, such as checklists, portfolios, interviews, and performance-based tasks, measures that are presumed to have positive effects as well on motivation due to their connection with real-life performance and, in the case of the portfolio, also trace longitudinal development.

### MAJOR CONTRIBUTIONS

Three areas have strongly influenced developments in the testing of content: the challenges inherent in various external demands for learning outcomes assessment, particularly in bilingual education, the assessment of Language for Special Purposes (LSP), and the assessment of Language for Academic Purposes (LAP).

#### *Program Learner Outcomes Assessment*

Beginning with external outcomes assessment regimes of content knowledge (e.g., in key subject matters areas under the NCLB legislation), one response from the US testing community has been in terms of accommodation. Thus Abedi (2004) shows that modification of non-content vocabulary and linguistic structures while retaining the task and terminology of the test enabled limited English proficiency (LEP) students consistently to show higher performance. Similarly Butler and Stevens (2001), questioning the validity of the assessment results of commercially developed large-scale content assessment of ELL/ESL students, modified both the form of tests and test procedures. For them such modifications include the possibility of testing in the L1.

However, such recommendations would not merely change the tests themselves. They also affect the very definition of such ubiquitous terms as ELL, LEP, bilingual student, even academic language use and, by implication, how curricular content knowledge and knowledge of a first or second language should be related to each other in educative assessment. Thus, the finding in Stevens, Butler, and Castellon-Wellington (2000) of only modest correlations between the language and performance of seventh-grade ELLs on two tests, a language proficiency test based on the widely used Language Assessment Scales (LAS) and a standardized test used in the assessment of social studies knowledge within the Iowa Tests of Basic Skills (ITBS), points to

serious shortcomings in the conceptualization and realization in testing practice of the term ‘academic language.’ Specifically, “the language of the LAS is less complex, more discrete and decontextualized, and more limited in its range of grammatical constructions than the language of the ITBS” (19). Accordingly, Butler et al. (2004) highlight the need for operationalizing academic language across different data sources to provide a more solid basis for test development. Following evidence-based methodology they systematically collected evidence for the nature of academic language from three data sources—national and local standards documents, textbooks, and a short excerpt from a classroom video—and analyzed these materials. One may question their structure-based operationalization of academic language (e.g., in terms of average sentence length, average length of noun phrases, and frequency of embedded clauses within a sentence) and their approach to lexical analysis (in terms of frequency of words with three or more syllables, frequency of morphologically derived words, and percent of words that are low frequency according to both general and fifth-grade corpus collections). But their specification of grammatical and lexical features begins to chart a way toward specifying the kinds of language features that are necessary for validly assessing content knowledge (e.g., in the area of reading), and demonstrates how, on that basis, one might develop prototype test specifications and prototype tasks. At the same time, the recently Revised PreK-12 English Language Proficiency Standards developed under the auspices of TESOL retain a purely functional approach. The new document considers four content areas (language arts, mathematics, science, and social studies), differentiates five proficiency levels (from “starting up” to “bridging over”), and includes the four language modalities. But, in the absence of a specification of the kind of language resources L2 learners will need to express and interpret these content areas, teachers and assessment specialists most likely will continue to find it difficult to develop appropriate forms of assessing and evaluating content knowledge *in terms of* an L2.

### *Assessing Content in Language for Academic Purposes Programs*

While this volume separately addresses both the assessment of language for academic purposes (LAP) and the assessment of language of the workplace and language for special purposes (LSP), these two areas are also central to the assessment of content. Thus, Douglas (2005) highlights the necessity of including nonlinguistic elements, specifically background knowledge, in the definition and assessment criteria of LSP. Because that makes it difficult to distinguish LSP assessment from general language assessment that includes situational

features (as the 1996 Bachman-Palmer model does) Douglas recommends that we “interpret test performance in terms of a composite construct of specific purpose language ability that includes both specific purpose language knowledge and field specific content knowledge” (p. 860).

Addressing the same dilemma, Jacoby and McNamara (1999) recommend the inclusion of the “indigenous criteria used in the specialist community: in the study in question, the physicists’ criteria all relate in some way to the communicative challenges set by the genre of the multimodal scientific report and the task of performing such a report before a live audience” (p. 233), that is, they are “inextricably intertwined with the content, argumentation structure, and multimodality of a physics conference presentation” (p. 234). The authors make a dual recommendation for an ethnographic and discourse analytical approach to capture the embeddedness of specialist knowledge within a particular discourse community in ways that can inform testing practices. By comparison, Bhatia (2004) takes a strong genre perspective in his analysis of language use in business, law, and the sciences. He finds both text-organizational and lexicogrammatical stabilities in the genres in question (i.e., “generic integrity”) and also diverse border crossings (e.g., the infomercial or the advertorial in the marketing world). At the same time, forms of language use in the profession are also a fundamentally important expression of identity. Taken together, these findings identify important challenges and also chart possible routes for obtaining the kind of information about language use in professional context that is necessary for the assessment of content knowledge in an L2.

Finally, the extent to which the field is still looking for consensus in these matters can be seen in Clapham’s (2000) recommendation to abandon altogether an English for Specific Academic Purposes category of tests in favor of testing general academic ability. In her proposal what she calls “specific samples of English grammar” (p. 519) would be bolstered by “aptitude tests to find out whether L1 and L2 students would be capable of rapidly acquiring the requisite academic discourse practices once they had embarked on their academic courses” (p. 511). In other words, her approach privileges language-based features, as contrasted with environmental features of language use such as those identified by Bhatia or Jacoby and McNamara, in order to capture fundamental aspects of academic language abilities in relation to content knowledge.

#### WORK IN PROGRESS

Building on this kind of ferment in the assessment of content, work in progress probes these matters even more deeply. In an internal critique

of the prevailing communicative competence model and its consequences for assessment, Widdowson (2001) points to a fundamental flaw in the Hymes model and its extension by Canale and Swain: it fails to specify the relationship between these components in actual performance. According to Widdowson, by proliferating the number of categories in their assessment model, Bachman and Palmer only exacerbate matters. Rather than basing assessment on a psycholinguistically conceived notion of competence that inheres in learners, Widdowson suggests that the construct of 'knowing a language'—and by implication being able to use language to interpret and convey content—might be more appropriately expressed in terms of a 'meaning potential', a notion he adopts from Halliday's meaning-oriented systemic-functional theory of language (SFL). That would involve directing attention to identifying salient features in language in functional terms, with an eye toward establishing a strong implicational value or high probabilities for them in certain environments of language use; in other words, a way of explicitly linking form and meaning, or language and content.

Just such an approach was taken in the teaching of language and content and the assessing of content and language abilities in a disadvantaged school district in Sydney where learners' educational progress in the content mandated by the curriculum was at stake and needed to be documented (cf. Christie and Martin, 1997; Rothery, 1996). Using the theoretical framework of Hallidayan systemic functional linguistics (SFL) with its strong emphasis on meaning, assessment of content begins with the notion that language, like other semiotic systems, resides within social activities. Extensive research has uncovered patterned relationships between those meaning- and content-oriented social activities and language forms at all levels of the language system, from the textual to the lexicogrammatical level. For that reason such a theory seems well suited to supporting a principled approach to the *assessment of content within L2 language environments*. Furthermore, in as much as these patterns have been elaborated not only for English but also for other European and non-European languages, they can help set the stage for a much-needed expansion of the discussion surrounding the assessment of content in assessment practice.

Specifically, the constructs of register and genre, as elaborated by SFL, take on an important role: they can provide textually- and meaning-oriented, rather than sententially- and formally-oriented ways of analyzing language. Thus, Rothery (1996) investigated the language forms that characterize diverse genres of schooling in the sciences, history, and English, differentiating major genre types according to precise linguistic features. She demonstrated that, even if it refers to the same classroom scientific experiment, the 'content' of a text is different when it lists procedures or when it is presented as a lab report that links

the activities to principles valued in the scientific community. If that is so, the extent to which learners' own language use echoes that fact is one way of assessing content knowledge as socially and linguistically construed.

However, because content knowledge in an L2 learning environment is even more a developmental matter than is the case for native language instruction, content assessment would benefit from principles that identify how content and language abilities develop simultaneously in language learning. Coming from instructional practice, and using the construct of genre as typified rhetorical action—that is, content and language being intimately intertwined—Rothery proposes how one might imagine such a movement in the middle school years within the macro-genre of narratives (p. 112). A sophisticated awareness of such progressions would be one way of relating content assessment to learner development. Furthermore, disciplinary genres as structured ways of presenting information in specific content areas might offer a particularly favorable environment for dynamic forms of assessing content, knowledge, and meaning in all modalities.

By exploring the relation between instruction and assessment (see also the recommendations in Norris, 2006; Shohamy, 2006), a genre-based approach might foster the translation of educational tasks that link content and textual language into assessment tasks. As Macken and Slade (1993) summarize, (1) assessment should be a linguistically principled procedure; (2) there is a need to be explicit about the kinds of language resources learners require for performing tasks in different disciplinary contexts; (3) a language-oriented metalanguage facilitates the performance of tasks in particular subjects; and (4) achievement must be linked to specific criteria in different assessment tasks. When content and language are specified in relation to each other content-oriented assessment might be embraced by both teachers and assessment specialists.

Taking these insights from an L1 to an L2 context and from the K-12 environment into collegiate FL education, the curricular project *Developing Multiple Literacies* in the German Department at Georgetown University developed elaborated statements about language features in genres that instantiate the content areas addressed within its integrated genre-based and task-oriented curriculum (see Byrnes, Crane, Maxim, and Sprang, 2006). That effort had both instructional and assessment implications. In the context of writing development and assessment, Byrnes (2002) reports on three interrelated criterial areas. Task performance was expressed through breadth of obligatory and optional genre moves; task content was conceptualized in terms of depth of information provided in each of these moves; and the nature of task language was conceptualized as the quality of language use at the discourse, sentence, and lexicogrammatical level in line with genre expectations.

For example, the final writing task in the fourth semester of an intensive sequence, requires students to prepare the script for a speech to be delivered at a German Rotary Club meeting: they are to argue, either pros or cons, about the comparability between federalist or state-oriented tendencies in the creation of the US constitution and similar issues in the creation of the EU constitution. Assessment guidelines for content state the need to establish the reason for their stance regarding comparability in the first place, to present three to five specific areas that explicate that stance by comparing the situation in the young US with that in the current EU, supported by passages from four previously read texts, and to offer concluding recommendations that might sensibly and sensitively be made by an American guest speaker. Linked to the requirements of the genre public speech in a cross-cultural environment and its registerial and lexicogrammatical expectations, assessment of content is thus, simultaneously and explicitly, tied to features of language that are appropriate for the genre's realization.

Yet another extension of SFL explores how the content-language link can be explored through logico-semantic knowledge structures (KS) that reflect the macrostructures of the expository texts of that situation (cf. Mohan, 1989, p. 103) in their particular language forms. On the theoretical side KSs include classification, principles, and evaluation; on the practice side, an activity includes KSs like description, time, sequence, and choice. Mohan and Huang (2002) illustrate how such an approach can elevate the beginning-level classroom activity of discussing daily routines in a primary school Chinese classroom to an early exploration of such genres as report, recount, description, and procedure genres. While the authors do not specifically address assessment of content they state that "it was possible to see how these learners constructed sequence and classification discourses differently . . . in other words, we assess the use of language as a resource for meaning" (p. 430).

Similarly, Mohan (1998) suggests a content- and meaning-focused reorientation for assessment through oral interviews such as the OPI. Rather than ascertaining what speakers can say, it is more insightful to probe what speakers can mean, particularly when an oral interview is understood as co-constructed between the interviewer and the candidate, a stance that is akin to principles of dynamic assessment (see Lantolf and Poehner, *Dynamic Assessment*, Volume 7): in that case the candidate approaches a content area with a particular kind of knowledge structure and the interviewer follows up by probing its development on the part of the candidate. Assessment then establishes at what depth and breadth the candidate is able to pursue, through language use, the content and meaning opportunities this presents.

Finally, in the increasingly important area of heritage language education, contributions in Schleppegrell and Colombi (2002) show how an explicitly textual and functional approach can enable adult ESL and heritage learners to acquire the language abilities necessary for academic level work. Expanding this approach to the language of schooling in general, Schleppegrell (2004) presents grammar as a meaning-making resource that expresses ideational and interpersonal meanings. More important, she identifies various linguistic means (see Chapter 3) used in different disciplinary areas to establish coherence and cohesion of argument. For a textually oriented understanding of the nature of academic language, her detailed look at school genres and their register features (Chapter 4) constitutes valuable work in progress for furthering the assessment of content.

### PROBLEMS AND DIFFICULTIES

While the previous sections provided brief glimpses of difficulties encountered in the assessment of content in an L2 environment, this section addresses them more directly. The focus is on larger conceptual concerns.

The most obvious and most consequential difficulty lies in the fact that the L2 community cannot as yet readily draw on a theory of language that places meaning and content in the center of its interests and, therefore, its conceptual apparatus and its analytical procedures. That fact has not only made it difficult to specify the link between language form and content, it has also meant that sophisticated assessment practice has been directed elsewhere. Thus, even though the recent sociocultural turn in applied linguistics, the impact of cognitive semantic linguistics, and functionally oriented L2 programs have begun to expand the field's conceptual framework in a way that would make content-oriented assessment more likely, to date only sporadic work exists that explicitly targets the implications of that reorientation for assessment practice in classrooms, much less for large-scale assessment of content.

Second, and related to the previous concern, what is needed are dynamic forms of assessment in line with the dynamic nature of the shaping of content through language. Shohamy (2006) has highlighted what such a dynamic approach might look like in the context of advanced language learning. With regard to the assessment of content knowledge a similar approach that acknowledges that language performance is not individually owned but fundamentally socially construed and passed on through discourse communities may be advantageous. Through a socially based understanding of knowing and learning it might be possible to shape a criterion domain for content learning that could suitably underpin content assessment.

Third, a social semiotic understanding of context and culture in relation to language as exemplified through the construct of genre might also expand how classroom practitioners and assessment specialists can imagine what aspects of content knowledge can be assessed in an L2 setting and what aspects are outside of its proper domain. For example, within SFL the context of culture is related to language as a system of meaning potentialities; context of situation leads to specific instances of language use in specific texts (Halliday, 1999b). Such a theory of meaning relations may be necessary for recognizing the importance of context and for harnessing it for plausible approaches to assessment.

Fourth, combining and extending these aspects, the assessment of content requires a language-based theory of knowing and learning that addresses characteristics of literate language use in all modalities. The issue is not the assessment of content in and of itself, but the assessment of content knowledge in various disciplines, professions, and areas of knowledge in relation to what we call literate L2 language abilities. That means recognizing and understanding educational knowledge as shaped through language that fundamentally differs from language used to transact life's tasks in, for example, social encounters or to seek or provide information—areas of language use that have dominated communicatively oriented educational practice.

Finally, L2 learners are expected, over time, to approximate the abilities of the L1 user in diverse academic, institutional, and professional contexts with their respective content foci. That necessitates a conceptual framework for language-based knowing that shifts from social, interactional, and oral language use to literate language use. To specify that shift, SFL identifies two ways of making sense of the world: what is referred to as a congruent form of semiosis that makes meaning of our experiences in commonsense ways by highlighting functions, processes, and flow, is distinct from a noncongruent form of semiosis that foregrounds structure and stasis and literally reconstrues our world through texts. Developed very much under the influence of education, a key linguistic tool for that second form is grammatical metaphor (Halliday, 1999a, pp. 80–84.). Diverse linguistic phenomena, but particularly nominalization and its consequences for the construal of reality *in language forms*, thus become central features of what educational jargon frequently calls higher-order thinking. Inasmuch as content assessment requires tapping into this form of semiosis as part of academic language abilities, detailed understanding of the phenomenon is crucial. For example: a discussion of weather is fundamentally reshaped in its content whether it is expressed congruently by saying that “in summer it rains a lot” or stated congruently, in terms of general qualities, functions, and categories within a scientific framework, such as in “the frequency of precipitation during the summer months.”

## FUTURE DIRECTIONS

Returning to the three prominent environments for assessing content, the following future directions might enable the young field of content assessment to gain an intellectual and practical foothold.

Classroom-oriented instructional assessment is likely to have the greatest flexibility regarding whether, how, and for what purposes content will be incorporated into assessment practices. This appears true for ESL as well as FL contexts. At the same time, ESL contexts and FL instruction in the primary grades can be expected to be influenced by the extraordinary power of standardized assessment. For the foreseeable future that influence is likely to be constrictive rather than expansive, thereby attenuating what is otherwise the greater creativity of classroom-based assessment, particularly when teachers tackle the task of creating assessment instruments collaboratively. At the same time, its difficulties notwithstanding, externally mandated assessment might well foster innovative approaches to what constitutes academic language in the middle school and upper school years.

By contrast, inasmuch as FL education, particularly at the secondary level, is largely bound to textbooks, the assessment of content will require special initiatives on the part of teachers or program administrators. At the tertiary level favorable program size and institutional context and ethos can spur innovative approaches to content assessment, perhaps within internationally-oriented programs and heritage learner tracks. A potential boost to the assessment of content might also come from various professional and licensing demands, as an international and globalized environment increasingly makes them (e.g., the demands for recognition of degree programs and licenses within the European Union). Even so, the majority of faculty members in collegiate language programs around the world have little interest in the assessment of content in terms of language knowledge. Those that do, among them those concerned with business courses or courses for heritage speakers, are often isolated from professional discussion that might enable them to venture into the assessment of content in an informed and creative way.

Developments for standardized approaches to the assessment of content can be presumed to make further inroads into specifying the nature of academic language. As shown in the Butler et al. study, some directions for further research are already being charted. Absent a comprehensive meaning-oriented theory of language, that route may be arduous and circuitous. But an evidence-based methodology, particularly when its evidence is capaciously conceived, should be able to uncover patterned links between functions and language forms in textual environments that address disciplinary content.

Such a bottom-up approach can be complemented by the work of an increasingly critical group of assessment specialists, who are questioning many of the constructs of assessment. Though they have, to this point, not explicitly addressed the assessment of content, their probing into such central concepts as the generalizability of assessments and their findings, the role of validity in language testing, the fixity of the construct of language performance and, by extension, the notion of variation in different social contexts, should create increasingly favorable environments for the assessment of content.

The insights gained in LAP and LSP assessment, the initiatives toward dynamic assessment, an orientation toward capacity rather than competence or performance, the urgent need to consider the special qualities of advancedness (see Shohamy, 2006), and greater interest in literacy assessment—all these developments permit a cautious optimism about future developments in the assessment of content and language.

ASSESSING COMMUNICATIVE LANGUAGE ABILITY:  
MODELS AND THEIR COMPONENTS

INTRODUCTION

This chapter examines various approaches to the assessment of communicative language ability (CLA) by discussing their starting points—the models of language ability used to generate second language (L2) assessments. It also brings to the forefront the ongoing discussion about what components comprise CLA and how learning and assessment can be differentially affected by these components.

In the quest to understand the nature of CLA and how second or foreign (L2) language knowledge can be used successfully to communicate a variety of meanings in different social and academic contexts, language testing researchers have proposed an array of theoretical models of L2 ability as a basis for assessment. Some of these models (e.g., Bachman and Palmer, 1996; Canale and Swain, 1980; Chapelle 1998; Douglas, 2000; Purpura, 2004) explicitly represent the components of the L2 ability construct along with their presumed interrelationships. Examples of knowledge components specified in these models include, among others, grammatical knowledge, lexical knowledge, discourse knowledge, sociolinguistic knowledge, and pragmatic knowledge. These models aim to reflect the most scientifically credible ways in which learners represent L2 knowledge and the ability to use this knowledge for communication. These models also aim to provide a broad theoretical basis for the definition of CLA in creating and interpreting language tests in a variety of language use settings. Rather than providing a prescription for test development, they represent potential targets of assessment that can be adapted to a range of test purposes and contexts—while at the same time, sharing certain common principles with a unifying framework.

In another approach to assessing CLA, the components of language ability are derived not so much from empirical research or a theoretical model of language ability, but from the opinions of experts with first-hand experience teaching the local curricula and assessing student performance. These experts are believed to have clear ideas about the knowledge and skills needed for successful communication in the target language. In this approach, curriculum and assessment standards are often developed to describe levels of student achievement without

explicit guidance of learning theories or models of language proficiency, or the systematic empirical inquiry needed to verify these standards and their use.

This approach was used, for example, to construct the *ESL Standards for Pre-K-12 Students* (TESOL, 1997). Based on eight working principles of language acquisition identified by language experts, this framework outlines the goals, performance levels and descriptors of the behaviors underlying each standard, and observable indicators of how progress on these standards might be assessed. In other words, these standards for achievement aim to specify, in a generalized way, what learners should be able to do with the language at different proficiency levels within a given grade level. The emphasis is on language use (i.e., “request information and assistance”), with little explicit mention of the components of the language or their role as a resource for achieving successful communication. For example, Goal 1, Standard 2 involves the ability to: “Use English to communicate in social settings. Students will interact in, through and with spoken and written English for personal expression and enjoyment” (p. 31). To meet this standard, an intermediate student in Grade 2 should then be able to “ask WH questions about types of books and storylines from peers” (p. 31). When it comes to assessing levels of proficiency within each standard, however, the components of the L2 knowledge (especially lexis, syntax, and cohesion) are explicitly identified.

Similar to the TESOL Standards, the *Common European Framework of Reference for Languages* (CEFR) (Council of Europe, 2001) represents another attempt to specify, in a generalized way, what learners need to know and be able to do with the language at various proficiency levels. According to the authors, the CERF was based on a set of general competencies (e.g., sociocultural knowledge, intercultural awareness) and a set of language-specific competencies (e.g., linguistic, sociolinguistic, and pragmatic) required for successful L2 communication. For example, the CERF descriptor for overall oral production at C2, the highest proficiency level, states that students “can produce clear, smoothly flowing, well-structured speech with an effective logical structure which helps the recipient to notice and remember significant points” (p. 58). While not explicitly noted in the framework, the first part of this descriptor for this standard clearly aims to tap into a component of L2 knowledge (discourse knowledge).

In yet another approach to assessing CLA, the components of language ability are not so much defined in terms of the formal elements of language knowledge (e.g., grammatical or pragmatic), but rather in terms of how language is used in the context of a language skill (listening, reading, writing, speaking). For example, the *Internet-Based Test of English as a Foreign Language* (ETS, 2005) claims to measure both

the ability to communicate in academic settings and readiness to pursue academic coursework by assessing all four skills. This test measures these components through both independent and integrated tasks. In other words, listening ability is measured separately in some tasks and in others it is assessed together with speaking and/or writing ability.

In each approach to characterizing CLA, separate components of the L2 construct have been identified, either explicitly or implicitly, with the assumption that each component can to some degree be isolated, taught, and assessed independent of the other components, if needed, or each component can be measured in combination with other components. The notion of ‘separate’ and ‘integrated’ reflects the beliefs that a student’s L2 knowledge and ability in one component can be expected to change as a function of deliberate study (Carroll, 1993) or other learning conditions (e.g., exposure) (Kunnan, 1995), while her knowledge and ability in another component may remain stable. It also suggests that her knowledge and ability in one component (e.g., grammatical form) can develop at a different rate and to a different extent from her knowledge and ability in another (e.g., semantic meaning) (Purpura, 2004), and that her L2 knowledge and ability in one component may vary as a function of their interaction with her knowledge and ability of another. Finally, it implies that her L2 knowledge and ability in one component may fluctuate across the contextual attributes of test or language use tasks (Chapelle, 1998).

Currently, most researchers (e.g., Chalhoub-Deville, 1997, 2003; Kunnan, 1998) generally endorse the claim that CLA is multicomponential. This has framed how assessment is organized in both classroom and large-scale assessment contexts. Researchers have not, however, reached a consensus on the specific components that constitute CLA. Some define them in terms of the formal elements of the language, others in terms of standards, and still others in terms of the language skills. Researchers also do not agree on how knowledge of these components is organized in the mind, how the components interact, how learners develop conceptual understanding of these components over time, or how knowledge might develop differentially with diverse learners under different conditions. A related question for assessment researchers concerns whether these discrete components of CLA should be assessed independently or together in the context of performing meaningful social and academic activities. In this chapter, I attempt to shed some light on these issues.

## EARLY DEVELOPMENTS

Influenced by theories of behaviorism and structural linguistics, Lado (1961) posited a “skills-and-elements” model of L2 proficiency that

specified three elements (a.k.a. components) of language knowledge (i.e., phonology, structure, and the lexicon) that could be assessed separately in the context of four language skills (i.e., listening, reading, speaking, and writing). In other words, testers could design tasks to assess each discrete component through one or more skills. For example, in the *Comprehensive English Language Test* (Harris and Palmer, 1970), lexical knowledge was tested in the context of listening activities. L2 proficiency was then inferred by the sum of the component scores for each skill.

Following Lado, Carroll (1968) proposed a skills-and-components model of proficiency including phonology and orthography, grammar (morphology and syntax), and lexis to be measured through the same four skills. Carroll, however, argued that the assessment of language by “discrete-point” tasks (i.e., those which attempt to isolate and measure the formal knowledge components separately) needed to be complemented by integrative tasks (i.e., those which assess the capacity to use several components of language knowledge at the same time—usually while performing some real-life task). Carroll’s work had widespread influence in the field, providing a basis for the design of the first TOEFL, which included both discrete-point and integrative tasks.

Influenced by Carroll’s (1968) call for integrative tasks, Oller (1979) rejected Lado’s skills-and-components approach in favor of a view of proficiency as one unitary global trait underlying L2 performance. He defined this trait in terms of “pragmatic expectancy grammar,” which refers to a learner’s ability to “relate sequences of linguistic elements via pragmatic mappings to the extralinguistic context” (p. 38). This definition of ‘grammar’ thus embodied not only grammatical form (involving phonology, lexis, and morphosyntax) on the sentence and discourse levels, but also involved grammatical form on a pragmatic level through extralinguistic reference elicited by the suppliance of language, appropriate for a particular context. Given this unitary view of language proficiency, Oller argued that one integrative task (e.g., the dictation or cloze) could be interpreted as a measure of language ability if it were administered under normal time constraints.

Oller’s (1979) claims generated much debate and numerous empirical studies on the nature of language ability (see Oller, 1983; Oller and Jonz, 1994), and eventually, the strong version of unitary trait hypothesis was rejected in favor of a multicomponential depiction of language ability. Oller’s hypothesis was refuted on the basis of both analytic flaws in the use of factor analysis (Vollmer and Sang, 1983) and on findings from empirical studies which examined the factorial structure of language knowledge (e.g., Bachman and Palmer, 1982; Harley, Allen, Cummins, and Swain, 1990; Sasaki, 1996). In each study, a multicomponential model of knowledge was better supported by data, with

results showing that language knowledge consisted of a general higher order factor along with several distinct factors.

In sum, while researchers are less likely to agree on the specific nature of the components of L2 ability and their interaction, they have accepted claims of a multicomponential model of language ability. As a result, the days of constructing assessments of language ability solely by means of discrete-point tasks of grammatical knowledge or discrete-point tasks of grammatical knowledge elicited through the skills are long gone. Most current assessments of language ability measure multiple components of L2 knowledge, whether these components are defined in terms of the formal elements of the L2 or in terms of the language skills, or both.

### MAJOR CONTRIBUTIONS

Inspired by Hymes' (1971) theoretical descriptions of language use, Canale and Swain (1980) and later Canale (1983) proposed a multicomponential model of communicative competence consisting of grammatical, sociolinguistic, discourse, and strategic competence (i.e., defined as compensatory communication strategies). This model refuted Chomsky's (1965) notion of competence for failing to account for the sociolinguistic appropriateness of utterances expressed in context. Canale and Swain's widely accepted model of communicative competence significantly broadened our understanding of the L2 ability construct by specifying features of grammatical form alongside other components of communicative competence. While empirical investigation found only partial support in the data for this model (Harley, Allen, Cummins, and Swain, 1990), Canale and Swain's model is credited today for providing the main theoretical framework underlying communicative language teaching and testing.

Building on the work of Canale and Swain (1980) and that of others, Bachman (1990) and later Bachman and Palmer (1996) proposed a multicomponential model of CLA that provided the most comprehensive conceptualization of language ability of the time. This model specified both the linguistic and nonlinguistic components of CLA underlying language use. In this model, a test taker's language knowledge, along with his topical knowledge (e.g., knowledge of facts) and personal characteristics, is hypothesized to interact with his strategic competence (i.e., defined as metacognitive strategies) and his affect. These components, in turn, interact with the characteristics of the language-use or test-task situation. In other words, language ability, consisting of both language knowledge and strategic competence, interacts with what an interlocutor knows about the topic, his personal characteristics, and the attributes of the language-use context.

In Bachman and Palmer's (1996) model, language knowledge consists of two general interacting components: (i) *organizational knowledge*, or how individuals control language to produce grammatically correct utterances and texts, and (ii) *pragmatic knowledge*, or how individuals communicate meaning and how they produce contextually appropriate utterances, sentences, and texts. Organizational knowledge is further divided into *grammatical knowledge* (e.g., knowledge of vocabulary, syntax, and phonology/graphology) and on the discourse level, *textual knowledge* (e.g., knowledge of cohesion, rhetorical organization, and conversational organization). Pragmatic knowledge is defined in terms of *functional knowledge* (i.e., knowledge of how to use organizational resources to communicate language functions) and *sociolinguistic knowledge* (i.e., knowledge of how organizational resources relate to features of the language-use context). This model is considered by many (e.g., Alderson and Banerjee, 2002) to represent the current state-of-the-art, and has been a resource for test development in numerous assessment contexts such as the *Test of Spoken English* (published by the Educational Testing Service).

Despite its currency, the Bachman and Palmer model has not been without its caveats. McNamara (1990) claimed that this model may be somewhat difficult to fully apply in the implementation of performance tests since raters may disproportionately assign importance to one component of language knowledge on a scoring rubric (e.g., grammatical resources) over that of another (pragmatic appropriateness). Also, Purpura (2004) contended that given the central role of 'meaning' in CLA, the Bachman and Palmer model would be strengthened by a theoretical definition of 'meaning' and a clearer explanation of how grammatical resources can be used to convey literal and intended meaning on the one hand and a range of pragmatic meanings (e.g., sociocultural meanings or psychological meanings) on the other. Finally, Chapelle (1998), taking an "interactionist" perspective to construct definition, argued that models of L2 ability in which the construct is defined from a trait perspective (e.g., Bachman and Palmer's model), would benefit from an examination of the construct from a behaviorist perspective, where the relevant attributes of context, credited for influencing variation in response patterns, are carefully specified as part of the construct. Chapelle states that: "Trait components can no longer be defined in context-independent, absolute terms, and contextual features cannot be defined without reference to their impact on underlying characteristics" (p. 43). However, according to Douglas (2000), this is a controversial position since it implies that language knowledge would change from one domain of language use to that of another. Influenced by Chapelle and others, Chalhoub-Deville (2003) argued for a "social interactional" perspective to L2 construct representation, asserting that

by maintaining a separation of the language use situation and the abilities underlying performance, the Bachman and Palmer model failed to account for how a person's CLA might be mediated by the characteristics of context, where knowledge construction is "contextual, culturally embedded, and socially mediated." While Chalhoub-Deville's views on a close consideration of context resonate with language testers, it is unclear how a "social interactional" perspective to L2 construct representation is feasible in large-scale testing situations since elements of context (e.g., the interlocutors, topics) might vary considerably within an assessment context. At issue then is which sources of variability due to context are considered construct-relevant or construct-irrelevant, and how do we make theoretical sense of empirical data beyond the local context? In other words, if the characteristics of assessment tasks (and context) are not, to some extent, controlled so as to provide observation consistencies, then a test might actually be sampling different aspects of CLA for each individual. This complicates how testers can then use such performance samples to generalize about an individual's CLA beyond a particular assessment context to broader domains of language use, and how these assessments might be interpreted with relation to a theoretical model of the construct? On the other hand, in the context of performance assessment in educational contexts, Upshur and Turner (1999) remind us that a one-size-fits-all, construct-only approach to assessing complex performance may mask the influences that task demand (i.e., context) and discourse may have on how raters interpret rating scales in the assessment of CLA. As Upshur and Turner show, our understanding of "how particular aspects of method [e.g., context] affect discourse, how those discourse differences are then reflected in ratings, and how task features influence the basis of judgment" (p. 82) is still woefully lacking.

In my opinion, these theoretical positions should not be viewed as competitive. Instead, they should be seen as aspects of each position that can be combined to generate a more complete picture of CLA for assessment purposes.

#### WORK IN PROGRESS

Since Bachman and Palmer put forward their model of CLA, some researchers have proposed modifications or extensions to it; others have explored alternative perspectives on the components of language ability. I discuss this work in this section.

Influenced by Chapelle's (1998) "interactionist" perspective of L2 construct definition and Clapham's (1996) work on the relationship between background knowledge and language ability, Douglas (2000) proposed an interesting modification of Bachman and Palmer's model

to account for specific purpose language use. His goal was to understand how language ability interacts with test takers' special purpose background knowledge by means of their strategic competence (i.e., their cognitive and metacognitive strategies). In the context of language for specific purpose assessment, and arguably in a wide range of other language assessment contexts, test takers' background knowledge in some contextual domain is inextricably related to how they construct responses in the target language. Therefore, unlike in Bachman or Palmer's model, where topical knowledge may or may not be a part of the L2 ability construct, depending on the purpose of the exam, in Douglas' view background knowledge is defined as a component part of the specific purpose language ability construct (alongside language knowledge and strategic competence). Douglas also argued convincingly that under some conditions (i.e., test takers at the intermediate level of proficiency reading texts with a high level of specificity), specific purpose language performance is strongly influenced by background knowledge. Consequently, he maintained, language testers interested in measuring language through content must understand the contextual conditions impacting test performance, so that the relevant contextual features can be clearly accounted for in test design and in test score interpretation, and not, as others might have it, as part of the L2 knowledge construct.

In another extension of Bachman and Palmer's model, Purpura (2004) addressed the ambiguous role of 'meaning' and 'meaning conveyance' in CLA. He proposed a model of language knowledge with two interacting components: grammatical knowledge and pragmatic knowledge. *Grammatical knowledge* embodies two highly related underlying dimensions: grammatical form and semantic meaning. *Grammatical form* accounts for knowledge of several possible forms at the sentence and discourse levels (e.g., phonological or graphological, lexical, morphosyntactic, cohesive, information managerial, and interactional forms). The individual components of grammatical form can, in some assessment contexts, be assessed separately in terms of grammatical *accuracy* or *precision*, or, as is often the case in performance-based tasks, grammatical form can be assessed globally. *Semantic meaning* (also referred to as 'grammatical meaning') encompasses "the literal and intended meaning of an utterance derived both from the meanings of the words arranged in syntax and the way in which the words are used to convey the speaker's [propositional] intention" (p. 74) in a given context. Semantic meaning is often the default meaning when utterances lack sufficient context for extension, such as in single-sentence grammar tests, or in reading tests that, according to Alderson (2004), focus on "reading the line" and not "reading between or beyond the lines." Semantic meaning accounts for knowledge

of several possible meanings at the sentence and discourse levels (e.g., phonological or graphological, lexical, morphosyntactic, cohesive, information managerial, and interactional meanings). Similar to grammatical form, the individual components of semantic meaning can, in some assessment contexts, be assessed separately in terms of the phonological/graphological, lexical, morphosyntactic, cohesive, information managerial, and interactional meaning conveyed by one or more forms, or as is commonly the case in performance assessments, semantic meaning can be assessed globally in terms of *meaningfulness*, or the student's ability to use grammatical resources to communicate ideas. The assumption underlying the form and meaning dimensions is that L2 learners may know the meaning, but not the form (e.g., \*I shutting the window), or may know the form, but not the exact meaning (e.g., when a Spanish speaker says: "I'm *assisting* class" for "I'm *attending* class").

*Pragmatic knowledge* in Purpura's model refers to knowledge structures that enable learners to understand or communicate meanings *beyond* what is explicitly expressed by the grammatical forms and their literal meanings. For example, a person wanting a window shut has several ways of expressing this request:

1. "Shut the window!"
2. "Can you shut the window?"
3. "Would you mind shutting the window?"
4. "I'm cold."

In the first example, the speaker's intended meaning of the utterance (a request) can be derived from the literal meaning of the words arranged in syntax. In the second and third sentences, the intention can be derived from the literal meaning of the words once the hearer understands the speaker is not asking a question *in this context*, but making a request. Until then, the meaning is potentially ambiguous, and may be lost on L2 learner's ears. In the fourth sentence, however, the speaker's intended meaning can *only* be derived by an extension of the literal meaning of the words in association with the context. In short, pragmatic knowledge involves the ability to understand and use context to map a range of contextual, sociolinguistic, sociocultural, psychological, or rhetorical meanings onto the grammatical and semantic resources of an utterance. Each of the four response choices simultaneously encodes one or more possible implied meanings depending on interpersonal relationships of the interlocutors (sociolinguistic meaning), their emotional and attitudinal stance (psychological meaning), their presuppositions about what is known to each other (contextual meaning), and the norms and expectations of interaction in this setting (sociocultural meaning). Again, the underlying assumption is that the components of pragmatic knowledge can be assessed separately

in terms of the contextual, sociolinguistic, sociocultural, psychological, or rhetorical *appropriateness, acceptability, naturalness, or conventionality* of the utterances, or the components of pragmatic knowledge can be assessed in combination.

Chang (2004) investigated the relationships between the grammatical and pragmatic components of L2 knowledge by studying 682 students' performance on a test of English relative clauses. His test included items designed to measure knowledge of relative clause forms and their semantic meanings on the one hand, and knowledge of how the forms were used to convey pragmatic meanings of sociolinguistic formality on the other. Using covariance structure analysis to model the data, he found that knowledge of relative clause forms was very highly related to knowledge of the relative clause meanings ( $r = .93$ ), and that the ability to use these grammatical and semantic resources was highly related to the ability to convey sociolinguistic meanings of formality ( $r = .78$ ). In examining the difficulty order of the relative clauses, he found that when *only* the grammatical form was considered, the observed difficulty order for relative clauses followed, to some degree, the order predicted by Keenan and Comrie's (1977) noun-phrase accessibility hypothesis (NPAH); however, when both form and semantic meaning were modeled, the results strongly supported the NPAH, suggesting a more complex path to development—one that includes meaning.

Researchers interested in the language skills have explored alternative perspectives on the components of CLA. In the context of writing, Hamp-Lyons and Henning (1991) defined L2 writing ability in terms of communicative quality, organization, argumentation, language accuracy, and language appropriacy. Sasaki (2002) proposed a model of the major factors underlying L2 writing ability which included, among other components, composing processes; and Hinkel (2002) examined the grammatical (syntax and lexis) and rhetorical components of advanced writing achievement. In the context of reading, the componentiality of L2 reading comprehension has generated considerable research, theory and debate. Some researchers have argued against the divisibility of reading comprehension into discrete reading strategies, given the paucity of empirical support, either through the analysis of reading test items (e.g., Weir, 1997) or through expert judgments in content analyses (Alderson and Lukmani, 1989). Others (e.g., Grabe and Stoller, 2002; Lumley, 1993; Purpura, 1999; Weir, 1997) maintain that reading comprehension involves more than a single unitary trait. In fact, Rost (1993), examining the underlying structure of L1 reading, found that while general reading comprehension accounted for 55% of the variance, a second factor, vocabulary knowledge, accounted

for 35%. This pattern has been seen in many studies, thereby questioning the single factor depiction of reading ability.

### PROBLEMS AND DIFFICULTIES

Testing researchers have devoted considerable attention to understanding the theoretical components of CLA. From these efforts they would generally agree that CLA is better seen as multicomponential and that the discrete components of CLA can develop differentially. They would also agree that the components of CLA can be difficult to operationalize in specific contexts and that the decision to assess one or more components at a time depends on the purpose of the test, the constraints in the testing context, and the inferences needed to be drawn from the scores. Finally, testers would concur that full empirical substantiation of the underlying models of these components can be complex (Harley, Allen, Cummins, and Swain, 1990). Contrarily, no consensus has been reached as to what exact components constitute a comprehensive model of CLA, how the components might interact, how the components of CLA are acquired and develop—alone or together, how knowledge of these components is organized in the test-taker's mind or how these knowledge representations generally change as test-takers advance along the interlanguage continuum, or how knowledge of these discrete components might integrate in ways that they can be used as resources for accomplishing meaningful activities under different conditions across diverse contexts. In short, much research still remains.

In assessing the discrete components of CLA, questions often arise as to whether the discrete components of language knowledge should be assessed 'independently' or whether they should be 'integrated' with other components and evaluated through meaningful, social, and academic activities. Despite blanket claims that the purpose of language learning is communicative and, therefore, should not be assessed as a set of unrelated bits, but rather as integrated (Oller, 1983) or that "assessment practices need to move beyond a focus on component skills and discrete bits of knowledge to encompass the more complex aspects of student achievement" (National Research Council, 2001, p. 3), I would argue that in choosing test method, language testers must defer to the purpose of the test, the contextual constraints of assessment, and the supposed claims we wish to make about what learners know and can do. Therefore, if the test purpose is to obtain information about only one discrete component of L2 knowledge, then, it is logically justified to assess that component in isolation—provided that inferences from the scores are appropriately limited. And if the test

purpose is to measure more than one component of L2 knowledge (e.g., accurate use of grammatical forms, meaningful conveyance of ideas, and contextually-appropriate pragmatic meanings) in the context of performing some integrated, meaningful activity, then, it is obviously reasonable to construct such a task.

The call for tests to forego the measurement of component skills and the discrete measurement of language bits for tests that elicit *only* complex aspects of student achievement is curious. In my opinion, both approaches provide complementary assessment information, especially if testers are serious about not only measuring, but also enhancing future learning. In assessing the components discretely, testers can better identify specific lacunae in a test-taker's understanding and use of a range of critical language knowledge features. This information should ultimately translate into targets of further instruction. In assessing the knowledge components together, testers can determine the extent to which test takers are successful in using these components as resources for effective communication.

#### FUTURE DIRECTIONS

Since the early 1960s, theoretical models of the components of CLA have broadened substantially, fostering empirical research and reflection on what it means to have CLA and on how to elicit demonstrations of CLA from test takers. They have also helped us make sense of evidence from observations to identify key sources of variability in assessments and to draw meaningful score-based inferences on what test takers know and can do in the L2. Our expanding knowledge of the components underlying CLA along with renewed conceptualizations of the L2 construct will hopefully promote new efforts in theory building along with empirical data to support them. However, the models of L2 proficiency posited thus far all suffer from one problem, I believe. They have generally been constructed in the absence of a strong connection to a theory of L2 learning and development, based on cognitive findings and SLA research. If the primary goals of assessment are to understand how students represent the components of L2 knowledge at any particular proficiency level, to use these components to perform meaningful activities in diverse contexts, and to develop expertise in these components, then new efforts in theory building must consider the learning perspective. According to the National Research Council (2001):

In any particular assessment application, a theory of learning in the domain is needed to identify the set of knowledge and skills that is important to measure for the task at hand,

whether that be characterizing the competencies students have acquired thus far or guiding instruction to increase learning (p. 44).

To date, few studies in language assessment have attempted to integrate theories of L2 proficiency with theories of learning and development. One exception to this Chang's (2004) which drew on SLA theory to construct a relative clause test and then used the data to compare the components of L2 knowledge from competing models of L2 ability. Also, Purpura (1999), drawing on a model of information processing to examine L2 strategy use, compared the impact of L2 strategy use on grammar and reading performance across high and low proficiency groups. Finally, Shin's (2005) study, while not technically rooted to a theory of cognition or SLA, examined development by investigating whether or not the components of L2 ability grew more or less differentiated as a function of proficiency level (beginning, intermediate, advanced).

Another promising way to investigate how models of CLA can be informed by a model of learning and development is to examine knowledge structures from research on expertise (National Research Council, 2001). In other words, testers might examine how expert users of the L2 components differ from novice users, not only in what they know about the L2, but also how they know it, how they are able to use this knowledge to perform a wide range of simple and complex tasks, and how this knowledge transfers when students are presented with new situations. An understanding of expert-novice differences in different language use contexts could highlight some of the critical features of the components of CLA and provide a more grounded basis for assessment at different proficiency levels.

With regard to future directions in assessing the components of CLA, remarkably little research has been devoted to the assessment of pragmatic knowledge. Research to date (e.g., Hudson, Detmer and Brown, 1995; Roever, 2000; Yamashita, 1996; Yoshitake, 1997) has concentrated on the assessment of pragmatic meanings rooted in contextual meanings (strategies to realize situationally-bound speech intentions) or in sociolinguistic meanings (knowledge of language use based on power, social distance or degrees of imposition), but has virtually ignored the assessment of pragmatic meanings based on psychological (e.g., stance and affect) and sociocultural meanings.

In the end, we still have much to learn about the components underlying CLA and how the assessment of these components, alone or in combination, can provide better information for not only determining whether or not learners have succeeded in meeting achievement standards, but also for providing specific information on which areas of a

component present particular challenges to individual learners, which need to be improved and which do not.

## ASSESSMENT AT THE WORKPLACE

### INTRODUCTION

The assessment of second language skills at the workplace is an important part of Language for Specific Purposes (LSP), which is an established branch of applied linguistics. Within LSP a common distinction is made between languages for academic purposes and languages for occupational purposes. Assessments in language for academic purposes generally focus on whether students have the language skills to commence higher or vocational education whereas assessments in language for occupational purposes (or the workplace) are typically designed to assess whether an individual has the language skills to assume the relevant professional or vocational duties. Most well-known assessments of LSP are proficiency tests that aim to assess an individual's readiness to operate successfully in a particular academic or workplace setting. These tests are normally performance-based assessments in the sense that they require test-takers to achieve particular communicative functions rather than simply display their linguistic knowledge (Basturkmen and Elder, 2004). Workplace assessments in particular often include tasks designed to simulate the demands of particular real-world employment situations. The increased use of performance assessments in employment contexts can be understood as part of a global trend towards demonstrable outcomes of learning in concrete, practical and relevant skills (McNamara, 1996).

### EARLY DEVELOPMENTS

Although LSP testing began in the first half of last century (see Spolsky, 1995, for early examples) major developments since the 1970s can be traced firstly, to the evolution of non-language based performance assessment in occupational contexts and secondly, to the rise of the concept of communicative competence (Hymes, 1967, 1972).

The field of occupational training and personnel selection provided the initial momentum for second language workplace testing through the development of practical tests. Jones (1979), for instance, identified the need for performance as opposed to knowledge (pencil-and-paper) assessments in personnel measurement. He recommended that the approach be extended to the testing of second language proficiency for people such as teachers, airline workers and medical graduates.

Later, Jones (1985) distinguished three main types of performance tests: (a) *direct assessments* involving observation of normal workplace behaviour; (b) *work sample methods* involving more standardised assessment of set tasks again at the workplace and (c) *simulation techniques* involving set tasks completed outside the workplace where performance on these tasks is used to predict performance on similar real-world tasks. The term *work sample tests* is now often used to include both work sample methods and simulation techniques. Jones (1985) recommended the following three stages in the development of work sample tests: (a) make a job analysis, (b) select tasks to represent the job and (c) develop a rating form. These stages have formed the basis of future test development work.

The use of performance assessments in second language contexts was greatly enriched by the theory of communicative language testing which provided a much-needed rationale for their use. Whereas there had been some work on performance assessment before the 1970s, the communicative testing era ushered in new theoretical perspectives on their use (see McNamara, 1996). This perspective was underpinned by the work of Hymes (1967, 1972) including his notion of sociolinguistic appropriateness but, more importantly, his model of language knowledge and language performance which included the abilities that underlie actual instances of communication. Hymes' introduction of the notion of communicative competence has had a far-reaching impact on the theory and practice of performance assessments in the workplace and elsewhere.

Possibly the first modern LSP test which attempted to tap communicative competence in either a workplace or academic setting was the *Temporary Registration Assessment Board* (TRAB), a test introduced in 1975 by the British General Medical Council for the purpose of evaluating the professional and language abilities of medical practitioners trained outside the UK who were applying for temporary registration to practice medicine in Britain (Rea-Dickins, 1987). The language component of the test consisted of a taped listening task, a written essay, and an oral interview in which both professional knowledge and language ability were assessed. All three sections were based on the analysis of the language used by doctors, nurses and patients in British hospitals. In addition, the language testing specialists worked with medical experts to construct the test. The test materials included richly contextualised features which promoted the engagement of the test-takers' language ability and background knowledge in the test tasks. The TRAB bore the essential features of modern LSP test development: analysis of the target language use (TLU) situation, authenticity of task, and interaction between language and content knowledge. It was eventually replaced by the Professional and Linguistic Assessment (PLAB) but "stands as a worthy prototype of the art of LSP development" (Douglas, 2000, p. 4).

## MAJOR CONTRIBUTIONS

McNamara (1996) provides a detailed account of the theory and the practice of second language performance assessment in LSP contexts, particularly the workplace. As an illustration, he focuses on the development and the validation of the *Occupational English Test* (OET), which was introduced in its current form in 1991. Designed as a work sample test administered outside the workplace, the OET assesses the English language competence of medical and health professionals wishing to study, migrate or practice in Australia. These professionals include doctors, veterinarians, occupational therapists, nurses, dieticians, radiographers, dentists, optometrists, speech pathologists and pharmacists. The content of the test is derived from a series of job analyses for each of the professions involved, and simulates a number of job-related performance tasks. The test includes separate assessments of listening, reading, writing and speaking skills that are all task-based in orientation.

In the speaking component of the OET, test-takers are required to participate in role-plays by performing their own professional role (e.g. doctor, nurse) with a trained interlocutor who acts as the patient. The assessment of the test-takers' performance takes into account their overall communicative effectiveness, intelligibility, fluency, comprehension, appropriateness of language and resources of grammar and expression. A rating scale format scoring grid of the semantic differential type is employed to assess candidates' performance: a six-point bipolar rating scale, with each extreme defined by an adjective (such as intelligible or unintelligible, or appropriate or inappropriate), is used for each of the above criteria. These evaluation criteria are restricted to aspects of language performance and do not include non-linguistic factors such as background knowledge, personality, presentation, ability to persuade or reassure. McNamara (1996) argues that such factors are essentially unrelated to an individual's language ability and therefore they do not need to be taken into account in a test such as the OET.

The main issue in test validation for all performance assessments is how and to what extent we can generalise from the test performance to the criterion workplace behaviour. McNamara (1996) suggests that, from their introduction, there has been too much emphasis on *a priori* analyses of the content validity (the representativeness of content) of performance tests at the design stage and not enough on the broader notion of construct validation that is examined both before and after the test is operational. McNamara (1996) provides a detailed account of the construct validation of the OET including the use of Rasch measurement to analyse test scores. He also argues that the predictive validity (how well the results predicted actual workplace performance) and

consequential validity (the extent of their impact on the educational and the training contexts in which they were used) of performance assessments need to be studied empirically and not simply assumed because of their verisimilitude.

Douglas (2000) provides a comprehensive introduction to the theory and the practice of assessing LSP. His work draws strongly on Bachman and Palmer (1996). An LSP test is one in which (a) the test content and methods are based on an examination of a specific purpose target language use situation so that (b) tasks are authentic, that is allowing for an interaction between the test-taker's language ability, their specific purpose content knowledge and the test tasks. Douglas (2000) argues that this kind of test permits inferences about a test-taker's capacity to use language in the relevant domain. His book covers a wide range of topics including the nature of specific purpose language ability and specific purpose contexts, discourse domains, characteristics of target language use and test tasks, strategic competence and its role in mediating between the external context and the learner's content and language knowledge, developing test tasks and the future of the field. Of particular importance is his detailed characterisation of target language use and test tasks as well as the transition from one to the other in the test development process.

Douglas (2000) posits that there are three key distinguishing features of LSP assessments: authenticity, specificity and the inseparability of language and content. In terms of test development, authenticity relates to the question of how to achieve the best fit between the test and the relevant target language use domain, specificity to the issues of how specialised the test content should be and how to ensure that the test-taker's performance is indicative of their ability in the 'real world' target language situation and finally, inseparability of language and content to the important matter of identifying and measuring the relative contributions of language knowledge and specific purpose background or content knowledge. While he agrees with McNamara (1996) that LSP testing should be restricted to making judgements about language ability and not job performance, he sees content or background knowledge as an integral part of the construct to be assessed.

Douglas (2000, 2001a) argues that in LSP testing the test-takers' performance needs to be judged in terms of communicative competence rather than simply their linguistic ability. From this perspective, it is important to interpret test performance from the perspective of test users such as employers or accreditation bodies, not just language experts. Focusing exclusively on linguistic criteria may therefore fail to satisfy the purpose of the test user. Douglas (2000) supports the use of 'indigenous' criteria (Jacoby and McNamara, 1999) identified by professionals within the relevant field of work to supplement linguistic criteria chosen by the language test developer. This work

entails a close but not always easy collaboration between discipline specialists and test developers (Douglas, 2001b).

Douglas (2000) includes detailed reference to a number of workplace assessments in the fields of (a) business: *the Business English Performance Test* (BEPT), the Certificate/Diploma in Spanish for Business, *the Oxford International Business Certificate* (OIBEC), *the Test of English for International Communication* (TOEIC) and *the Certificate in English for International Business and Trade* (CEIBT); (b) teaching: *the Cambridge Examination in English for Language Teachers* (CEELT), *the Proficiency test for Language Teachers—Italian*, *the Taped Evaluation of Assistants' Classroom Handling* (TEACH) and *the English Language Skills Assessment* (ELSA); (c) interpreting and translating: *the Diploma in Public Service Interpreting* (DPSI) and *the Listening Summary Translation Examination* (LSTE)—Spanish; (d) health: The TRAB and the OET both discussed earlier and (e) other highly specialised areas: *the Japanese Language test for tour guides* and *the Proficiency Test in English Language for Air traffic Controllers* (PELA).

It should be noted that McNamara (1996) and Douglas (2000) focus on the use of proficiency tests for assessing second language skills in the workplace. Competency-based assessment (CBA), on the other hand, emphasises the competencies required by the learner to perform a particular job adequately (Davies et al., 1999, p. 27). CBA is widely employed in various countries to ensure that standards of professional competence have been met, for example, in teaching. However, because the focus is on an individual's ability to perform workplace tasks, there is normally no serious attempt to separate out non-language factors such as occupational knowledge and personal qualities from language competence in the assessment. As a result, it is difficult to determine the precise contribution of language ability to these performances and therefore how to assess it.

Finally, an important achievement in workplace assessment is the development of an exit proficiency test of university graduates—*the Graduating Students' Language Proficiency Assessment-English* (GSLPA), a standardised exit test of English for university students in Hong Kong (Lumley, 2003). The content of this test is explicitly geared to the types of professional communication that new graduates face in their careers and includes writing business correspondence and making spoken presentations and summaries. Despite its potential usefulness, the introduction of the GSLPA was resisted in Hong Kong. Berry and Lewkowicz (2000) suggest a number of reasons for its lack of popularity including its potential negative washback and impact on university education and graduation. Nevertheless, the GSLPA provides a very useful model for assessing the language proficiency of university graduates in other countries in the future.

## PROBLEMS AND DIFFICULTIES

Douglas (2001b) acknowledges that the three defining features of LSP assessments he identified in his earlier work—specificity, authenticity and the inseparability of language and content—are also problematic.

In terms of specificity, a very difficult question is to determine what degree of specificity is actually possible in a test. Is it possible or desirable, for example, to produce different tests for different kinds of engineers, given the various branches of the field in existence? Another problem here is whether test performance can be reliably predictive of performance in the target language use situation, given the complexity and the unpredictability of 'real-life'. The key issue here is whether a test can ever claim to be truly representative of the target situation.

Douglas (2001b) suggests that two aspects of authenticity in LSP tests, situational and interactional, need to be present in an LSP test. The first aspect relates to the target language use situation, features of which are then factored in as test method characteristics. The second aspect involves the interaction of the test-taker's specific purpose language ability with the task. It is not always a straightforward enterprise to ensure that both elements are realised in a test, particularly the interactional dimension.

In relation to the issue of the inseparability of language and content, a problem for language tests is to establish the relationship between language knowledge and background knowledge in test performance. This involves understanding how they interact with and influence each other. The fundamental question here is whether they can be separated at all. Douglas (2001b) argues that they are indistinguishable. He suggests that for the moment we can only define specific purpose ability in terms of both language knowledge and background knowledge until further insights into the issue are available.

Despite the advances in thinking about LSP testing in recent years, there is still strong debate about whether an adequate theory of LSP testing has yet been developed or even whether it is possible to do so. In a special issue of the journal *Language Testing* devoted to the topic of LSP testing, Hamp-Lyons and Lumley (2001, p. 129) assert that Douglas' (2000) "simple characterisation" of LSP tests in terms of specificity, authenticity and the inseparability of language and content "does not equal, or lead to, a theory". In the same issue Davies (2001) supports this view suggesting that there is still no adequate theoretical distinction between LSP and general purpose testing. He argues that the use of LSP tests can only be justified in pragmatic rather than theoretical terms.

Drawing on her research into the performance-based assessment of the language proficiency of teachers, Elder (2001) finds all three

of Douglas' characteristics deficient in terms of their conceptual and practical usefulness. In relation to specificity, she questions whether the domain of teacher proficiency can be distinguished from other areas of professional competence on the one hand and 'general' language proficiency on the other. In terms of authenticity, she questions what appropriate task design should be in this kind of test and to what extent 'teacher-like' language can be elicited in the artificial environment of a test. Examining the issue of inseparability from a broader perspective than Douglas (2001b) she also asks whether it is possible to differentiate between non-language factors (such as, in this case, subject knowledge and general teaching skills) that may influence test performance and actual language ability in the assessment.

In terms of the success criteria used in judging performance assessments, Elder (2001) demonstrates that indigenes (and perhaps more authentic) criteria may not always be useful in the LSP testing context as they may be too task-specific to allow for generalisation across tasks. In addition, while making use of both occupational experts and language experts as raters of workplace assessments may be a good idea in theory, their judgements may not always be compatible. Elder suggests that recent research points to the "indeterminacy of performance-based tasks as a means of measurement and a realisation that the LSP testing enterprise of the 1980s and 1990s, in spite of its laudable attempt to capture the particularities of real world communication, raises more questions than it answers" (Elder, 2001, p. 164).

Despite these reservations, Basturkmen and Elder (2004) suggest that there are strong practical arguments for LSP testing: the nature of the assessment is more transparent and thus convincing than general-purpose testing to test-users, LSP tests are more likely to lead to teaching activity that is seen by learners as relevant to their needs. In terms of theory-building, direct measures of language competence have resulted in "greater reflection about the nature of language ability as it is enacted in the world" and "the value of separating language ability from other aspects of communication" in these assessments (Basturkmen and Elder, 2004, p. 688–689).

#### WORK IN PROGRESS

New workplace assessment instruments continue to evolve. Recent examples include tests in the fields of aeronautical radiotelephony, nursing and business.

In 2003, the International Civil Aviation Authority (ICAO), a division within the United Nations, adopted a new set of standards for English language proficiency for pilots and air traffic controllers engaging in international communications. All pilots and air traffic controllers

operating in English-speaking telephony contexts are required to demonstrate adequate proficiency in English by 2008 (Mathews, 2004). A six-band proficiency scale has been adopted by ICAO including the following specific criteria: pronunciation, structure, vocabulary, fluency, comprehension and interactions. The band descriptors are expressed in general rather than in specific terms. All personnel are required to demonstrate proficiency in both standard radiotelephony phraseology as well as plain English at level 4 (operational) or above. As Basturkmen and Elder (2004, p. 684) note, a test that only tapped test-taker's ability to use standard phraseologies would represent an under-representation of the relevant occupational language construct in this context. An example of a recent test that aims to meet these specifications is the *RMIT English Language Test for Aviation* (RELTA), which consists of separate task-based listening and speaking sub-tests. A recent study based on the trialling of the test with representative cohorts of civil airline pilots has shown the test to be valid and reliable, with the test sections adequately reflecting the construct associated with a highly specific and codified language for communication in routine air-ground contexts and natural English for communication in non-routine contexts including emergencies. The results of the study also suggested that exposure to radiotelephony facilitates the acquisition of vocabulary for communication in routine contexts, but not vocabulary outside the radiotelephony language domain (Kay, 2005). Other new tests in this field continue to be developed in response to the ICAO standards.

Another recent initiative is the *Canadian English Language Benchmark Assessment for Nurses* (CELBAN), which is designed to assess the communication skills of internationally educated nurses whose first language is not English (CELBAN, 2006). The test has been introduced to help ease the current shortage of nurses in Canada. Like the OET, it is a task-based evaluation of speaking, listening, reading and writing skills in English. Test results align to the Canadian Language Benchmarks (CLB), a descriptive scale of communicative proficiency in English as a second language. The context and the content of the test tasks of the CELBAN are based on data gathered from the analysis of the English language demands of the nursing profession across Canada. These tasks were created by the test developers with input from nursing instructors or consultants to ensure authenticity. A particularly new feature of this test is the CELBAN Readiness Self-Assessment. Before registering for the CELBAN, prospective test-takers can assess their English language communication skills online free of charge. This ensures that they are ready to take the test.

In the UK, Cambridge ESOL has recently produced two new assessments of Business, the *Business Language Testing Service* (BULATS)

and the *Business English Certificates* (BEC) (Cambridge ESOL, 2006). The BULATS is a multilingual assessment service for companies that require a rapid, accurate means of assessing language skills in English, French, German and Spanish. It is now used by businesses in over 30 countries for recruitment, training, benchmarking and staff development. The BEC consists of a suite of three exams—BEC Preliminary, BEC Vantage and BEC Higher—which test English language ability used in the context of business. They are directed particularly at people preparing for a career in business. The BEC exams are linked to the Council of Europe's *Common European Framework of Reference for Languages*, an important new initiative providing a "a common basis for the elaboration of language syllabuses, curriculum guidelines, examinations, textbooks etc. across Europe" (Council of Europe, 2001). It is likely that an increasing number of workplace assessments will be linked to this framework in the future (see the special issue of *Language Testing* edited by Alderson, 2005, for further discussion).

#### FUTURE DIRECTIONS

There has recently been a renewed interest in the area of needs analysis within LSP which has important implications for workplace assessment. As Basturkmen and Elder (2004, p. 681) suggest, LSP testing activity is based on the premise that "different domains of language use draw on different areas of knowledge and are associated with distinct varieties of language, the characteristics of which can be identified through needs analysis." Long (2005) examines key methodological issues in learner needs analysis including the sources of information and methods for obtaining it. This discussion has clear relevance for the development of workplace assessments, particularly at the job analysis stage. The chapters in his book highlight the usefulness of assessments in needs analysis more broadly to assist with syllabus development, student placement, diagnosis, achievement and program evaluation in occupational language programs. There is a clear need for assessments designed locally for these different purposes to be better documented as the literature has focused almost exclusively on proficiency tests.

Recent literature on English as a Lingua Franca (ELF) has significant implications for assessment in the global workplace and other international contexts in which English is mainly used. While ELF itself is currently researched and theorised (see, for example, Jenkins, 2006; Nickerson, 2005; Seidlhofer, 2004), there has been very little discussion about how it might be assessed. Elder and Davies (in press) propose two different approaches to the assessment of ELF. The first

approach can be distinguished from existing international tests of English by the use of accommodations in delivery and scoring such as using expert ELF users as interlocutors in speaking tests and ensuring that only errors that actually impede communication are penalised in the rating of spoken and written performance. This model assumes that test-takers use varieties of English based on Standard English. Tests based on the second approach assume that ELF is not related to Standard English but is a code in its own right. In this approach, strategic competence takes precedence over linguistic accuracy. In other words, the crucial ability in this case would be the test-taker's capacity to communicate effectively with a range of other non-native speakers including their ability to make appropriate linguistic accommodations (such as rate of speech and adjustment of accent) to the different varieties and proficiencies of their interlocutors. Elder and Davies (in press) suggest that neither approach involves a radical reconceptualisation of current language testing practices while recognising the symbolic and the practical importance of advances in the area. However, they argue that further test development work should be postponed until EIL has been more fully described and understood.

This review ends on a cautionary note. Despite recent initiatives such as those described here, the future of workplace assessment is unclear as occupation-specific tests are increasingly forced to compete with more large-scale tests that may have been originally developed for an entirely different purpose. For example, despite being developed solely as university selection tests of academic English, the *International English Language Testing System* (IELTS) and the *Test of English as a Foreign Language* (TOEFL) have recently been employed for the accreditation of health professionals and also proposed as university exit tests without any serious attempt to validate them for either purpose. The uses of both tests are therefore considered by many language-testing specialists to be unethical. It remains to be seen whether this trend will continue. To a large degree, the future of workplace assessment will depend on whether LSP assessment more generally can establish itself as a legitimate professional activity, both theoretically and practically.

## TESTING APTITUDE FOR SECOND LANGUAGE LEARNING

### INTRODUCTION

In the past, second language (L2) aptitude research was conducted largely to better the placement and selection processes utilized by governmental language programs. Today, L2 aptitude is also assessed to diagnose and treat L2 learning problems (Ganschow, Sparks, and Javorsky, 1998; Sparks and Ganschow, 2001), to inform curricular design (Robinson, 2007; Sawyer and Ranta, 2001), and to see how other cognitive factors, such as working memory, which were not identified or assessed by earlier aptitude tests, are related to L2 learning (Erlam, 2005; Miyake and Friedman, 1998). Underlying this expanded research agenda is the understanding of the differences and similarities between general aptitude (intelligence) and specific components (or factors) of aptitude for language learning (Gardner and Lambert, 1965; Wesche, Edwards, and Wells, 1982; see also Dörnyei, 2005, pp. 45–47 for a recent discussion on L2 aptitude and intelligence). Although the exact nature of these factors is a current subject of theoretical and empirical debate, researchers agree that L2 aptitude is a subset of the cognitive abilities that are related to general intelligence, and that it is a key component of L2 learning success. There is also a current desire to understand L2 aptitude in terms of current communicative, task-based instructional contexts.

### HISTORICAL OVERVIEW

Since the 1950s, linguists have used L2 aptitude tests to predict success in the foreign language classroom (Carroll, 1981). The Modern Language Aptitude Test (MLAT, Carroll and Sapon, 1959), one of the tests first developed for such purposes, is still in use today (Carroll, 1981; Skehan, 1998, 2002). The MLAT, developed through a grant from the Carnegie Corporation, has been called the “benchmark test of FL aptitude” against which new measures must be compared (Grigorenko, Sternberg, and Ehrman, 2000, p. 397). It consists of a selection of 5 weakly-to-moderately intercorrelated test parts (out of 30 that were trialed) that were shown, through factor analyses, to predict L2 learning relatively well. Carroll concluded that there were four components of

language aptitude: phonetic coding ability, grammatical sensitivity, rote memory, and inductive language learning ability. Carroll's MLAT does not directly test the fourth component, inductive language learning ability, because adding another part would make the overall test too lengthy, while the increase in predictive validity would be minimal. Carroll's contributions to a theory of language aptitude were seminal and laid the foundation upon which current aptitude research can build, although there is a desire among researchers to revisit the long-standing construct of aptitude as defined by Carroll and to take a fresh look at individual differences related to success in language learning.

In the 1960s, more aptitude tests were created. Pimsleur created the Pimsleur language aptitude battery (PLAB) (Pimsleur, 1966; <http://www.2LTI.com/htm/plab.htm>). Pimsleur, who was perhaps more interested in maximizing prediction than in constructing a pure measure of aptitude, viewed aptitude as consisting of three factors: verbal intelligence, auditory ability, and motivation. Other measures created included the MLAT-Elementary for grades three to six (<http://www.2LTI.com/htm/mlate.htm>), and the Army Language Aptitude Test (ALAT, see Grigorenko, Sternberg, and Ehrman, 2000, for a short review of the ALAT). The Defense Language Aptitude Battery (DLAB) (Peterson and Al-Haik, 1976) and the VORD were created in the 1970s by the US Department of Defense. The VORD (which means "word" in the artificial language on which the test was based) was an attempt to improve upon the MLAT and ALAT for predictive aptitude to learn non-European languages. However, in a study conducted by the developer (Child) of the VORD, the test's predictive validity was less than that of the MLAT (Parry and Child, 1990).

From the early 1970s when work on the DLAB was being completed, until the 1990s, there was very little interest in language aptitude among academics. The major exceptions were the publication of an edited volume by Diller (1981) that presented a multidisciplinary perspective on L2 aptitude, an article by Wesche, Edwards, and Wells (1982) that investigated L2 aptitude and intelligence, and an article by Genessee and Hamayan (1980) that looked at individual differences (aptitude, teachers' ratings of pupil behavior, the cognitive factors of field independence, etc.) affecting L2 achievement in schoolchildren. These early articles all focused on defining what L2 aptitude is and how it fits within the paradigms of intelligence and individual differences. Many of these works confirmed hypotheses established by Carroll—that L2 aptitude is a subset of the abilities defined by general intelligence, and that individual differences and the language-learning context may affect a learner's ability to maximize his or her L2 aptitude potential. The 1990s began with the publication of the proceedings of a conference that was motivated by an effort to take another look at

language aptitude (Parry and Stansfield, 1990). This was motivated by two thoughts: (a) there has been a great deal of work done in cognitive psychology that might inform the creation of improved measures, and (b) ideas about language teaching methods have changed, and this has affected instructional goals and classroom practice.

#### DEVELOPMENTS IN L2 APTITUDE TESTING

Today, individual parts of the MLAT and PLAB are often used to measure aptitude factors in research studies concerning second language acquisition (SLA) (e.g., Erlam, 2005; Harley and Hart, 1997; Nagata, Aline, and Ellis, 1999). Adaptations of these traditional tests into other languages have been made (French, Italian, Dutch, German, Spanish, Turkish, Thai, Japanese, Indonesian, Hungarian) but, unfortunately, few of these (French, Japanese and Hungarian) can be located today, and among them only the French version is commercially available (see Stansfield and Reed, 2004, footnote 8). Hebrew, Polish, and Chinese versions are currently being developed for research purposes that involve testing the aptitude of native speakers of languages other than English.

In 2000, Grigorenko et al. published an article on the rationale behind, and construct validity of, a new aptitude test, the Cognitive Ability for Novelty in Acquisition of Language (Foreign) Test (CANAL-FT). This aptitude test, grounded in the belief that one of the central abilities required for L2 learning is the ability to cope with novelty and ambiguity, correlates significantly with the MLAT ( $r = 0.75$ ). Thus, Ellis (2004, p. 533) noted that the CANAL-FT “appears to perform very similarly to earlier tests.” In addition, he opined that the theory behind the CANAL-FT may provide a close match between L2 aptitude and specific psycholinguistic processes involved in SLA, and thus may be a useful tool for researching connections between aptitude, classroom-based tasks, and L2 development, which Robinson (2001) has reported as being necessary.

L2 aptitude alone is not enough to predict L2 success in the classroom setting; rather, it is just one of the major factors. It has been shown time and time again that another factor contributing to L2 success is motivation (Dörnyei and Skehan, 2003; Gardner, 1985, 2002; Kiss and Nikolov, 2005), which can override the effect of aptitude (Dörnyei, 2005, p. 65). Whereas high aptitude may not necessarily lead to higher motivation, high motivation may lead to more strategies and time on task, which interplays with the learner’s existing aptitude and maximizes the learner’s potential. This is essentially what Pimsleur (1966) believed and why he included a survey of motivation and study habits in the PLAB. Aptitude tests are rarely used in isolation when administered for practical reasons. For example, in assessing the L2

aptitude of military recruits and governmental personnel, the US Government's Foreign Service Institute and the Defense Language Institute use a motivation questionnaire and a survey of background variables in conjunction with aptitude test scores to select and place students into language programs.

#### MAJOR CONTRIBUTIONS IN THE LAST 10 YEARS

Existing L2 aptitude tests are mostly administered for placement or selection purposes. The primary users of such tests continue to be government agencies and other organizations that must first select individuals who can learn foreign languages and, secondly, assign them to a language whose difficulty is commensurate with their aptitude. For example, the DLAB is used by most agencies of the U.S. government for selecting employees to attend a language school, such as the Defense Language Institute in Monterey, California. The MLAT is used for the same purpose by government agencies in Canada, the United Kingdom, Australia, and New Zealand, and by the U.S. Foreign Service Institute in Arlington, VA. It is also used by international organizations such as the World Bank and the International Monetary Fund. The MLAT is used by many missionary organizations to screen missionaries for language learning aptitude and then to assign them an appropriate language to learn based on their aptitude scores.

In addition to these traditional uses, a growing body of research is pushing the field of L2 education to expand upon the utility of L2 aptitude as a concept. Today, researchers are assessing aptitude in research studies to investigate why some who succeed are not identified as high aptitude learners, why L2 aptitude appears more or less important in different learning situations or contexts, and how (or if) those with low aptitude can succeed despite the odds. Classroom implications include varying tasks and curricula to match the abilities of learners with differing aptitude complexes or profiles (Robinson, 2002; Wesche, 1981). Empirical research along these lines within the field of SLA has focused mainly on questions concerning the role of individual cognitive differences and how they interplay with the L2 learning environment. Several research projects have contributed to this investigation, five of which are reviewed later.

Harley and Hart (1997) investigated whether studying an L2 at an earlier age results in higher language aptitude. Looking at students who started studying French in an immersion classroom either in the first or seventh grade, Harley and Hart found that those who had an early (first-grade) start to the immersion program did not have higher aptitude test scores than those who started later (in seventh grade), thus showing that early L2 exposure does not necessarily contribute to

higher aptitude. This finding agreed with Carroll's definition of L2 aptitude as a relatively fixed or stable trait resistant to prior education or training and aligned with the idea that L2 aptitude is concerned with the relative rate or speed of learning in an L2 classroom environment. Two studies continued this line of inquiry, but looked at the construct of L2 aptitude from the point of learning in a naturalistic setting. Using the Weschler Memory Scale (memory for text) and the PLAB 'Language Analysis' subtest, Harley and Hart (2002) tested the aptitude and the L2 proficiency of 27 native-English-speaking secondary school students who participated in a 3-month French exchange program to Quebec City. They found a nearly significant relationship between age of learning and language analysis (what Carroll defined as "grammatical sensitivity") but no significant association with memory for text. The authors suggest that analytical language ability (Carroll's grammatical sensitivity) is more important for older learners when learning an L2 than younger ones, thus suggesting that although aptitude may remain constant, what features of aptitude are important for L2 learning may change depending on one's age or education level.

Similarly, in an earlier study investigating ultimate attainment and critical period effects in SLA, DeKeyser (2000) tested the hypothesis that adult learners from Hungary, who arrived in the U.S. after the age of 16, could perform English grammaticality judgment tasks (testing Carroll's grammatical sensitivity component) as well as adults from Hungary who arrived in the USA as child learners. Of the six adult learners who scored as high as those who learned English as a child, five scored high on the grammatical sensitivity part of a Hungarian adaptation of the MLAT. DeKeyser argued his study showed that foreign language teaching methods for the adult classroom that do not employ explicit focus on form techniques (i.e., explicit grammar instruction) are denying adults access to one of the mechanisms they need to succeed in the L2—their aptitude for grammatical sensitivity.

Ranta (2002) tested the hypothesis that language analytic ability is important for L2 learning in the classroom environment even when the classroom is truly communicative in nature. The participants in her study were 135 Francophones in sixth grade learning English. Ranta found that students who had strong verbal analytic ability tended to be strong on all L2 tests. Conversely, those with weak verbal analytic ability were also weak on L2 tests. Ranta suggested that perhaps those with low proficiency scores but with relatively high verbal analytic ability were too early in their L2 development to benefit from their higher verbal analytic ability. She concluded that communicative language learning programs do not counteract the effects of learner aptitude; rather, language analytic ability and strategic competence (the ability to put language knowledge to use) may help students learn in any context.

In a study comparing instructional contexts and L2 aptitude, Erlam (2005) assigned 60 secondary school students to three different instructional contexts. The aptitude measures administered were the PLAB Sound Discrimination subtest, the MLAT Words in Sentences subtest, and a written, working memory test that assessed word recall. All students received instruction on direct object pronouns in L2 French in their respective instructional contexts. Erlam concluded that deductive instruction that gives students opportunities to engage in language production minimizes any effect that aptitude may have in L2 development. Looking at the students' L2 writing proficiency test scores, Erlam noted that those with higher language analytic ability and higher working memory capacity benefited most from structured input instruction, which did not have students participate in any language output.

The five empirical studies reviewed above demonstrate how researchers in cognitive linguistics and SLA are investigating aptitude as a multi-componential construct, which interacts with the learning environment differentially depending on individual differences such as the learners' age and/or instructional context. L2 aptitude is now often researched in terms of identifying learners' specific L2 aptitude or aptitudes, and seeing how those complexes of aptitudes (Corno et al., 2002; Robinson, 2002; Wesche, 1981) relate to the instructional setting and how changing the mode of instruction or varying the instructional tasks may affect certain learners' abilities to learn.

#### WORK IN PROGRESS

Recent work in L2 aptitude testing has concerned itself with investigating the components of L2 aptitude, how to most reliably measure L2 aptitude for different populations of L2 learners (such as children or those with non-English L1s), and the role of L2 aptitude in the process of SLA (Dörnyei, 2005). In essence, some researchers no longer consider L2 aptitude an umbrella term. Rather, they view L2 aptitude as being made up of various cognitive factors and processes, including working memory. Dörnyei mentions that there are five purposes for L2 aptitude testing today: (a) for research, (b) for selection, (c) for resource allocation, (d) for program evaluation, and (e) to tailor instruction according to the L2 aptitude of the learners. This list is a somewhat expanded list of the reasons for L2 aptitude research and test development in the 1950s and 1960s, and it articulates the relationship between L2 aptitude as a concept and current SLA research.

Undoubtedly, the growing interest in understanding individual differences in L2 learning has motivated renewed interest in L2 aptitude. A fundamental question is whether certain combinations of cognitive abilities are particularly conducive to learning under certain conditions.

More specifically, do some L2 learners have ‘aptitude complexes’ that function better when faced with specific types of learning tasks or situations? Robinson (2001) theorized that ‘aptitude complexes’ must be a dynamic interrelationship between the learning tasks, techniques for raising awareness of the L2 form, and conditions for practice. He suggested that specific aptitudes must be matched to specific learning conditions and the learning processes that they imply. He also stated that “aptitude, awareness, and age are important learner variables, and that any general theory of second language acquisition is incomplete without an explanation of how, and under what conditions, individual differences in each impact on learning” (Robinson, 2001, p. 369). Robinson’s line of research has described L2 aptitude as a dynamic construct that relates to the learning conditions and instructional techniques at hand. With his view of L2 aptitude in mind, learners no longer possess more or less L2 aptitude. Instead, they have different kinds of aptitude (or aptitude complexes), which relate in unique ways to various types of instructional methodologies. His main suggestion is to change or adapt instruction to fit the aptitude profiles of the L2 learners. Of course, to do this would require a variety of very sensitive new aptitude measures.

As SLA researchers move toward investigating the cognitive processes involved in SLA, better, more streamlined, and accurate tests of L2 aptitude are needed to measure specific populations of L2 learners. Parallel to the developments of the theory of L2 aptitude in SLA contexts is the recent development in L2 aptitude testing, including the CANAL-FT (Grigorenko, Sternberg, and Ehrman, 2000), the Menyet, an MLAT-based test of L2 aptitude for Hungarian learners of English (Ottó, 1996), and a lower level version of the Menyet (Kiss and Nikolov, 2005). In the latter test, MLAT Part 2 (phonetic coding ability) was changed so that it is based on the Klingon language associated with Star Trek, a popular science-fiction television program. Examinees hear and see a transcription of four numbers. Then they hear a large Klingon (composite) number containing one of the numbers heard. The examinee then identifies which of the four numbers was included in the large number. The test contains only 45 items yet yielded a concurrent validity coefficient of 0.63 with an English proficiency index that involved listening, reading and writing. The researchers concluded the test is a valid measure of language aptitude.

There is considerable interest in adapting existing language aptitude tests to other languages because the need to identify those with a high probability for success in language learning exists throughout the world. Stansfield and Reed (2003) developed a framework for adapting the MLAT and the PLAB to other languages. The framework examines the cognitive abilities measured by each subtest of the MLAT, the

MLAT-E, and the PLAB and how the parts address the four components identified by Carroll. The major steps and considerations include: designing appropriate item types in the non-English language that assess Carroll's components, making use of subtests from the MLAT and the PLAB that are not English based, field-testing and then norming the adapted versions, and carrying out studies to establish the validity of the new versions.

In 2005, Second Language Testing Inc. (SLTI) developed and published the MLAT-ES, a Spanish language adaptation of the MLAT-Elementary (<http://www.2lti.com/htm/mlates.htm>). The MLAT-ES is for children in grades 3–7. The MLAT-ES was field tested in Costa Rica and then revised. An initial set of norms on the performance of some 1,200 children in Spain, Costa Rica, Mexico, and Colombia appears in the first edition of the test manual. Norms tables for part and total scores appear for each of five grade levels. The reliability of the MLAT-ES and its part scores is very high and the inter-part correlations are similar to those attained on the MLAT-E, suggesting a successful adaptation of the instrument. However, adequate evidence of its predictive validity still needs to be collected.

The MLAT-ES is envisioned for use in both English- and Spanish-speaking countries. As a measure of foreign language aptitude for native Spanish speakers, it can be used for placement and diagnosis, as well as to identify both those with high aptitude and those with low aptitude. In the case of those with low aptitude, the part scores may be useful in understanding the student's cognitive abilities relevant to language learning and in adjusting to meet the student's needs. For example, low scores on parts 3 and 4 will help the teacher understand that the child has a low propensity for auditory learning, whereas low scores on part 2 indicate that the child is weak in analytic learning ability (Stansfield and Reed, 2005).

Other current L2 aptitude test development projects at SLTI include an MLAT-E Korean and a computer-based version of the MLAT.

## PROBLEMS AND DIFFICULTIES

In the 1980s and 1990s, ideas emerged regarding the use of the MLAT and other L2 aptitude tests for diagnosing language learning difficulties and disabilities. Wesche (1981) suggested that scores on the MLAT and PLAB, along with information on the test taker's individual background, experience, attitude and motivation for language learning, could be used for placement into intensive foreign language programs and for streaming (tailoring instruction to the student's cognitive profile in order to improve learning). Ehrman (1996) described how the MLAT or other language aptitude tests can be used along with measures of

motivation, anxiety, learning styles, strategies, and personality types to assess learner difficulties and to help improve the learning environment for students.

Gajar (1987) investigated the use of the MLAT to identify students with a foreign language learning disability. She administered it to both regular and learning-disabled (LD) students at her university and found a significant difference ( $p < 0.0001$ ) in their scores on all MLAT subtests. The LD group mean was one standard deviation or more below the university mean on all subtests, particularly the subtests relating to grammatical sensitivity and rote learning. The two decades following Gajar's study saw an emerging awareness of the problems that learning-disabled students experience in the foreign language classroom (Ganschow, Sparks, and Javorsky, 1998). Colleges began to offer reasonable accommodations to foreign language students who had been previously identified as learning-disabled or who claimed a learning disability. One common accommodation is the creation of a special section of a language course for such students. Such special sections might include a slower pace when presenting material to be learned, individual pacing, instruction tailored to students' strengths, instruction that addresses students' weaknesses, or simply the careful selection of a teacher who is interested in teaching such students. Other accommodations might include substitute courses, such as descriptive linguistics, survey of world languages, literature in translation, or courses in the foreign culture.

The last decade has seen increasing use of language aptitude tests to determine if a given individual has a foreign language learning disability. Today, at least 150 colleges and universities review MLAT scores in an effort to respond to requests for accommodations for students who claim or suspect they have a foreign language learning disability. Such students typically meet the criteria of having failed one or more foreign language course while doing quite well in other subjects, and they reportedly studied hard to pass their foreign language course. In most cases, colleges and universities will not consider a request for an accommodation unless a student matches the above profile. Perhaps due to the concern about the growing number of students who claim a foreign language learning disability, or perhaps due to a concern for maintaining common graduation standards, the concept of a foreign language learning disability has recently become the subject of some controversy. Sparks, who has published widely on L2 aptitude and its correlates, believes that students who are unable to learn a foreign language are lacking in cognitive skills and in mastery of their native language. Surprisingly, he does not perceive this circumstance as relating to a foreign language learning disability. He and his colleagues also criticize the MLAT for having outdated norms

(Sparks, Jarvorsky, and Philips, 2005), although there is no reason to suspect that the distribution of foreign language aptitude in the population has changed since the MLAT was normed. Sparks has also pointed out that the MLAT was not created specifically as a measure of foreign language learning disability, although a low score on a measure of cognitive abilities strongly suggests a cognitive disability. Reed and Stansfield (2004) have discussed the ethics of using the MLAT for this purpose. Given the long-term nature of the political controversy surrounding accommodations for certain students, especially at the tertiary level, the discussion of using L2 aptitude tests for identifying those who may need accommodations is likely to continue. The PLAB and the MLAT-Elementary are used for similar purposes in secondary and elementary schools—diagnosing and understanding the causes of students' difficulties in learning a foreign language.

### FUTURE DIRECTIONS

A new respect for and interest in the role of L2 aptitude in SLA has emerged in recent years, and this is resulting in the creation of new measures for research. A recent statement by the American Educational Research Association (2006) calls language aptitude the second most important factor (after age) in language learning. SLA researchers will continue to investigate the involvement of individual differences in SLA for some time to come. An outline of future directions for the field of L2 aptitude testing is presented below. While this list is by no means exhaustive of the research agenda lying ahead of us, it represents some of the directions that are already underway and which appear to be of utmost need.

1. For selection purposes, we need to know which aptitude components are most important for achieving high-level proficiency in a language. Prior research has validated L2 aptitude tests mostly with those who have acquired low and intermediate levels of language proficiency. Studies need to be done on those who acquire a high level of L2 proficiency to determine if they have any special cognitive traits. The same applies to aptitude for learning specific languages.
2. For research purposes, there is a need to determine which constructs of working memory are most important for the different aspects of L2 learning. Working memory has been shown to be an important variable in the SLA process; however, there are multiple views on how to define working memory, and multiple ways to test for working memory as a construct of L2 aptitude. L2 aptitude test developers need to follow working memory research being conducted in the fields of SLA and cognitive psychology

very closely to better streamline the development of working memory tests used as part of L2 aptitude research.

3. Curriculum developers and teachers need to keep in mind the results from L2 aptitude studies that show that different instructional techniques and different classroom tasks may be responded to differently by learners who rank differently in the underlying components of L2 aptitude. Rather than teaching just to those who are strong in all aspects of L2 aptitude, teachers should adjust, rotate, and vary their teaching methodologies to benefit all learners in the classroom. In this regard, faster rates of learning for the few may need to give way to a higher quality of learning and a lower attrition rate overall. Research studies that show the long-term effects of such tailored programs and demonstrate successful learning in spite of low aptitude are also needed. These would allow universities to more effectively handle students with low aptitude for language learning.
4. It remains to be demonstrated that better aptitude tests can be developed. Nonetheless, researchers interested in L2 aptitude should continue to search for more valid, reliable, and practical L2 aptitude tests. Carroll himself expressed skepticism that greatly improved measures could be developed, although he invited researchers to try and even suggested some ideas they might pursue (Carroll, 1990). In order for them to be most helpful, new measures should be clearly and unambiguously connected to or differentiated from the framework of L2 aptitude defined by Carroll and others. As Spolsky (1995, p. 338) has said, "In seeking to make further advances in the field, it is unwise not to build on the work of our predecessors."
5. New L2 aptitude tests are needed for specific populations of learners that are of interest in the field of SLA, such as child learners and older learners. The U.S. Government is interested in measures that can identify those who are likely to reach high levels of language proficiency (Reed, 2005). L2 aptitude tests are also needed for native speakers of languages other than English.
6. The use of the computer to deliver L2 aptitude tests will improve the access and deliverability of such tests. In addition, it will facilitate the collection of examinee background data, the reporting of scores, the introduction of new test items, the creation of databases and norms for specific groups. The databases will also provide fertile ground for additional research. The MLAT has recently been put on the computer and a computerized version of the DLAB is underway.

# **Section 2**

## **Methods of Assessment**

## ALTERNATIVE ASSESSMENT

## INTRODUCTION

How the term “alternative assessment” is defined depends largely on what it is providing an alternative to. In the 1997 edition of this encyclopedia, which did not include a separate chapter on alternative assessment, McNamara observed that increasingly performance testing was viewed as a “feature of alternative assessment,” as part of “the move to base assessment not on multiple-choice format tests but on actual instances of use by learners” (p. 132). As McNamara suggested, alternative assessment is most often contrasted with traditional testing (Gipps, 1999; Huerta-Macías, 1995; Maslovaty and Kuzi, 2002; Shephard, 2000), specifically, single event, discrete-point, multiple-choice tests that result in numerical scores and the ranking of individuals.

However, as Birenbaum (1996) points out, alternative assessment has become the “most generic term currently used in the assessment literature” (p. 3)—an umbrella term applied not only to performance testing, but also to other potential alternatives to traditional, discrete-point tests such as ‘authentic’ test tasks, portfolios, conferences, simulations, self- or peer-assessment, diaries, inquiry based learning projects, etc.—all of which are identified as types of alternative assessment.

The term ‘alternative assessment’ is also used to refer to continuous assessment or alternative classroom assessment (Hargreaves, Earl, and Schmidt, 2002), which is used by teachers on a day-to-day basis. Such assessment is characteristically ongoing and informal, and may be accumulated as evidence of learning alongside traditional, formal assessment. As such, some argue (e.g., Bailey, 1998; Brown and Hudson, 1998) that *alternatives in assessment* is a more accurate description of the continuum of assessment approaches that individual teachers use—traditional tests being one of these approaches. This perspective is actively opposed by others (e.g., Lynch, 2001; Lynch and Shaw, 2005) who argue that alternative assessment represents a conception of language that is diametrically opposed to that of traditional tests; that language is “best understood as realms of social life that do not exist independently of our attempts to know them. Judgments or decisions about language ability and use cannot, therefore, be accomplished as measurement tasks: there is no ‘true score’ waiting to be

approximated” (Lynch, 2001, p. 362). These conflicting perspectives are further discussed in the Work in Progress section below.

Yet another use of the term alternative assessment relates to accommodations or alternatives for students who have special needs (see the chapter Abedi, Utilizing Accommodations in Assessment, Volume 7). Such accommodations (including alternative testing) create conditions that will allow students with special needs to best demonstrate their acquired knowledge and competence. For example, alternative testing procedures have been devised in some cases for bilingual, English Language Learners (ELLs) with lower levels of English language proficiency, who are studying in English-medium contexts. Some alternative tests allow ELLs to be tested for achievement in content areas with the use or support of their first language. An extension of this view of alternative assessment links it directly to issues of ethics, fairness, and educational equity (see, for example Darling-Hammond, 1994; Lacelle-Peterson and Rivera, 1994; Lynch and Shaw, 2005; Shohamy, 2001; Taylor, 1994). This view holds that all assessment is value laden, because what is valued in a test defines what is worth knowing or doing, and thus, alternative assessment offers what is potentially a more “ethical” (Lynch and Shaw, 2005), “democratic” (Shohamy, 2001) or “equitable” (Lacelle-Peterson and Rivera, 1994) approach, if the outcome of the assessment process values individual diversity.

#### EARLY DEVELOPMENTS

Shohamy (1996) views traditional testing as part of a “discrete point era” and contrasts it with what she identifies is the current “alternative era.” She links developments in language testing and the onset of the alternative era to changing theoretical definitions of “what it means to know a language” (p.143), arguing that eras in testing reflect changing (or evolving) definitions of the language construct. She identifies three other key eras in a sequence of development that corresponds to changing conceptions of language: the integrative era, the communicative era, and the performance testing era. In defining the alternative era, Shohamy addresses the problem of domain representation arguing that, “there are different types of language knowledge and mastering one type is no guarantee for mastering another, as different instruments are capable of ‘seeing’ different things” (p. 152). She argues that it is impossible for a single test to measure the complex phenomena of language knowledge and thus, there is a need for “multiple assessment procedures” (p.152). She then refines the term ‘alternative assessment’, preferring ‘complementary assessment’ as a more precise label.

Shohamy’s reinterpretation of alternative assessment as multiple or complementary assessment is in sync with others, who conclude that

authentic/alternative assessment is best exemplified by portfolio approaches to assessment. Indeed, there has been a long-standing association of portfolio assessment with alternative assessment in both the educational research literature in general and the second language research literature in particular (see Darling-Hammond, 1994; Hamayan, 1995; Lynch and Shaw, 2005; Shohamy, 1996; Wolf, Bixby, Glenn, and Gardner, 1991). Such assessment involves a collection over time of multiple performances to provide evidence of growth and learning. It requires learners to: actively shape the assessment process by selecting which of their performances will be evaluated; collaborate with other students and the teacher in identifying criteria for evaluation; engage in self- and peer-assessment; and reflect on an ongoing basis on their learning. There have been a number of attempts to use portfolio assessment as an alternative to traditional tests in large-scale, high-stakes contexts (see particularly, the Vermont Portfolio Assessment Program, discussed in the Problems and Difficulties section below).

### MAJOR CONTRIBUTIONS

Major contributions to alternative assessment have occurred at two levels: at the procedural or strategic level, and at the conceptual or paradigmatic level.

#### *The Procedural or Strategic Level*

Huerta-Macías (1995) identifies tools that provide alternatives to traditional testing such as observational checklists, journals, work samples, anecdotal records, and day-to-day activities, which are “non-intrusive to the classroom, because they do not require a separate block of time to implement” (p. 9). Thus, she argues assessment activities are “authentic” because they are the same as learning activities. Such activities engage students in ongoing and active learning. Assessment is an inevitable and inseparable requirement for learning. Performance testing is often cited as an alternative approach to traditional/discrete-point testing. However, portfolios (as discussed earlier) are the most frequently identified example of alternative assessment (see Bailey, 1998; Darling-Hammond, 1994; Hamayan, 1995; Shohamy, 1996; Wolf, Bixby, Glenn, and Gardner, 1991).

Many researchers point out, however, that it is how portfolios are used that determines whether they are truly alternative assessment tools. It is more than a matter of form or format. Portfolios have been used “top down” as “lever[s] of external control” (Darling-Hammond, 1994, p. 5) with foci on product and predetermined content coverage (rather than learning process and growth); on sorting and ranking

(rather than developing learner's individual strengths and addressing their weaknesses); on monitoring, surveillance and accountability (rather than self-directed inquiry); and on externally directed performance for others (rather than reflection and individual or local learning); and on perpetuating the norms of the powerful majority (rather than validating the unique contributions of the minority). Such product-focused purposes are consistent with traditional rather than alternative assessment.

A number of recent approaches associated with alternative assessment are task-based (Bachman, 2002; Brindley, 2001) and include, for example, "embedded assessment tasks" (Spence-Brown, 2001, p. 466) in which assessment is integrated within teaching tasks to enhance interactivity and authenticity of engagement (Bachman and Palmer, 1996); and "dynamic assessment" (for a comprehensive discussion, see Lantolf and Poehner, *Dynamic Assessment*, Volume 7). Dynamic assessment also seamlessly embeds assessment within an instructional activity. It draws on Vygotsky's (1934/1986) notion of the *zone of proximal development*, namely that learning develops from and is embedded in social interactions with others, e.g. people, texts, objects, events etc. Vygotsky observed that what we are unable to do in isolation, we may be able to do in interaction, and that our ability to respond to assistance provided by others suggests our potential for future performance. In dynamic assessment, examiners provide predetermined or spontaneous assistance or mediation for learners to support assessed performances.

Many proponents of alternative assessment argue for multiple-sources of assessment evidence that are drawn "democratically" (Shohamy, 2001) or "pluralistically" (Birebaum, 1996) to reflect the unique and varying strengths (and weaknesses) of individual learners. They argue that, "in a multicultural, multilingual society, assessment policies must seek excellence and equity simultaneously, or they will accomplish neither" (Lacelle-Peterson and Rivera, 1994, p. 57). However, they point out that alternative assessment approaches are not inherently more equitable by design (Darling-Hammond, 1994; Lynch and Shaw, 2005) because they may also be used for traditional purposes, namely, to sort, sanction, and control, and to define which (and whose) knowledge counts, and which (and whose) does not. They note that alternative assessment has the potential to create opportunities for students to actively shape learning outcomes in relation to their unique and individual backgrounds. If the goal of the assessment is to "educate all children well, rather than the talented tenth to be prepared for knowledge work" (Darling-Hammond, 1994, p. 25), then alternative assessment is viewed as a means to greater educational equity, and richly detailed narrative profiles (rather than numerical scores) are the appropriate outcomes of assessment (Delandshere and Petrovsky, 1994; Valdés and Figueroa, 1994). Lynch (2001) links this view of alternative

assessment to critical approaches in applied linguistics. Shohamy (2001) has heightened awareness of the power of tests as mediating tools in the exercise of power, both overt and/or covert. From critical perspectives, alternative assessment is seen as a means of sharing power when it involves collaborative, dialogic interchange between assessor and assessed. It allows for greater equity and fairness in testing by potentially valuing uniqueness and difference (Darling-Hammond, 1994).

*At the Conceptual Level or Paradigmatic Level*

Wiggins (1989) has been a leader in the authenticity movement, which is linked directly to alternative assessment (Kane, Crooks, and Cohen, 1999), in that the performances elicited for the purposes of assessment do not differ in appreciable ways from those that are typical of the target domain. Some equate authenticity in alternative assessment with both reliability and validity: "Alternative assessments are in and of themselves valid, due to the direct nature of the assessment" (Huerta-Macías, 1995, p. 10). In keeping with these notions, Moss (1994) argues for a reconceptualization of reliability based on a "hermeneutic approach," which acknowledges the situated, unique, and varying contexts of assessment. She views arguments for validity as internal to the assessment process itself, and reliant upon dialogue and consensus reached among key stakeholders—learners, raters, teachers, parents, etc. She also challenges the traditional notion that generalization from single (or multiple) performance(s) to the universe of possible performances is the ultimate goal of assessment.

Her perspective is deeply rooted within an interpretive or constructivist tradition, which views language as socially constructed and situated in contexts of use—rather than an underlying trait or ability which remains stable across contexts. Maslovaty and Kuzi (2002) argue that, "alternative assessment is based on the principles of constructivism in that it rests on authentic inquiry tasks which give significance to learning and are relevant to the real world of the learner" (p. 200). Alternative assessment is also linked to sociocultural theory, as Gipps (1999) notes: "By combining interpretive and sociocultural perspectives, we can begin to cast new light on the relationship and power dynamics between pupil and teacher in the context of assessment" (p. 356). These perspectives view language development and learning as interactive, collaborative, and embedded in the social and cultural life of the individual. Key sociocultural concepts, such as Vygotsky's (1978) '*zone of proximal development*' (see above) and 'scaffolding' (Bruner, 1975), or mediated support for cognition and communication, are theoretically consistent with alternative assessment approaches which occur over time and evolve in relation to individual

learner interactions (see the chapters on Lantolf and Poehner, *Dynamic Assessment* in Volume 7). Such concepts are diametrically opposed to traditional testing, in which test takers act in isolation, in response to tests that are external, formalized and hierarchical (Birenbaum, 1996; Gipps, 1999; Lynch and Shaw, 2005).

Alternative assessment, then, is considered by some to be part of a new 'assessment culture' (Wolf, Bixby, Glenn, and Gardner, 1991) that values processes of learning and the unique performance of individuals. In sum, the move to an assessment culture (see Birenbaum, 1996; Lynch, 2001; Wolf, Bixby, Glenn, and Gardner, 1991) is evident in: (1) the centrality of the classroom (teaching practice and learning process); (2) the active role played by students/learners in assessment processes including standard setting, identification of evaluation criteria, procedures, etc.; (3) a heightened valuing of process; and (4) outcomes characterized by summaries of learner competencies which are detailed, descriptive and informative, rather than a single, quantifiable score. A movement to assessment culture is viewed by some as a movement away from traditional 'testing culture' (Wolf, Bixby, Glenn, and Gardner, 1991; Gipps, 1999). Testing culture is associated with positivist or post-positivist perspectives and assumptions (Lynch and Shaw, 2005) and rooted in measurement/psychometric theory, which emphasizes replicability and generalizability (Broadfoot, 1994). Such generalizable measurement at-a-distance, values objectivity by focusing on the measurement of products of learning, which are quantifiable and homogeneous, and allow for the ranking of individuals in relation to degree of mastery, proficiency, ability, etc. Testing culture disallows the unique or the situated nature of individual performance that is typical of learning process. Rather it attempts to control for context or culture as variables in test performance, because they contribute to error in the measurement. (*Note: For a comprehensive discussion of theoretical and practical issues regarding alternative assessment across a range of language learning and teaching contexts, see recent special issues of the journal *Language Testing: Assessing Young Language Learners*, 2000; *Re-thinking Alternative Assessment*, 2001; and *Exploring Diversity in Teacher Assessment*, 2004).*

#### WORK IN PROGRESS

Although currently, much of the attention regarding alternative assessment is directed at either the issues that arise or the challenges that are addressed as a result of its use, some of the most innovative research is occurring in relation to dynamic assessment (see above) and mediated or co-constructed assessment tasks. Another promising line of research relates to issues of equity, fairness, and accommodation. Equity issues

related to traditional tests, particularly high-stakes, external, standardized tests, have been widely discussed in the research literature (Abedi, 2002; Solano-Flores and Trumbull, 2003). There has been a corresponding call for comprehensive and flexible alternative assessment systems (Lacelle-Peterson and Rivera, 1994); for assessment based on ‘overlapping’ information from multiple sources (Genesee and Hamayan, 1994); for assessment systems that culminate in conferences involving key stakeholders (e.g. teachers, parents, students) that lead to “conclusions, recommendations and pedagogical strategies” (Shohamy, 1996, p. 154). Lacelle-Peterson and Rivera (1994) argue for alternative assessment systems for language learners that “provide evidence of what students have accomplished, that facilitate achievement of educational goals, and that meaningfully inform instruction” (p. 66). Hargreaves, Earl, and Schmidt (2002) also argue for a systemic approach: an interactive and collaborative assessment system in which all stakeholders – learners, teachers, parents, schools, policy makers, etc. – make “assessment, learning, and teaching more technologically sophisticated, more critical and empowering, more collaborative and reflective, than they have ever been” (p. 92). One innovative example of an interactive and collaborative system of assessment is the Diagnostic English Language Needs Assessment (DELNA) (Elder, Erlam, and von Randow, 2006). This diagnostic assessment system provides individualized language and academic support on an ongoing basis for university-level students-at-risk.

It is possible to link the complementary or multiple performance view of alternative assessment to a continuum view of assessment approaches (Bailey, 1998; Brown and Hudson, 1998). Proponents of this view (see particularly Brown and Hudson, 1998) argue that although for heuristic purposes it is possible to view alternative assessment and traditional assessment as polar opposites, such a view misses “an important point: that there may be many increments between these poles, and that shades of gray are possible” (Bailey, 1998, p. 207). Thus, Brown and Hudson (1998) argue that such assessment procedures should be viewed not as alternative assessments but rather as alternatives in assessment, noting that “language teachers have always done assessment in one form or another and these new procedures are just new developments in that long tradition” (p. 657).

Brown and Hudson (1998) take a pragmatic position, arguing that portfolios, performance assessments, observations etc. are simply new options in the assessment repertoire. However, Lynch and Shaw (2005) take aim at this position, arguing that assessment can only be considered alternative if it is rooted in a paradigm and culture that is fundamentally different from that of traditional testing. Alternative assessment, they argue, differs: (1) in its requirements for reliability and its arguments

for validity; (2) in the nature of the relationship it presupposes between tester and test taker (teacher and learner); and (3) in its focus on learning and the processes of learning rather than their outcomes or products. They argue along with Birenbaum (1996) that traditional testing culture (see above) with its reliance on test-only strategies, products or outcomes, must give way to an assessment culture, which draws on multiple-sources of evidence to support learning and decision-making.

### PROBLEMS AND DIFFICULTIES

Alternative assessment (in all of its guises) has become a highly conflicted area of debate. Challenges regarding the reliability/consistency and validity of alternative assessment, implementation, cost, uneven assessment expertise, unintended consequences, and the danger that alternative assessment will increase levels of surveillance and control, are widely discussed in the research literature.

The amount of time required for alternative assessment is one of the most frequently cited problems associated with its implementation (Hargreaves, Earl, and Schmidt, 2002). Portfolio assessment, performance assessment, anecdotal comments on learning progress, communication with stakeholders, development of learning profiles, conferences, etc. not only require a great deal of time, but also potentially increase the costs of assessment. Further, such approaches require levels of expertise that may not be fully developed in practice. Students may not have sufficient experience with alternative assessment to value “authentic” learning, and may instead subvert the intended purposes of an assessment (Spence-Brown, 2001), living up to what they perceive are external expectations to perform for marks—to ‘simulate’ reflection, thinking, learning, rather than to actually reflect, think or learn. Teachers may neither be able to connect ongoing assessment in support of individual learning with curricular goals, nor to effectively communicate information about development and growth to parents and other stakeholders. Perrone (1994) warns that “without a growing discourse about curriculum purposes, student understandings, and ways teachers can foster student learning, assessment measures such as portfolios and exhibitions will not have a very long or inspiring history” (p. 13).

Many other issues remain unresolved and contentious:

#### *Issues Related to Conceptions of Reliability*

Much debate regarding alternative assessment is focused on issues of reliability. A number of researchers (Brown and Hudson, 1998; Hamp-Lyons and Kroll, 1996) take issue with Huerta-Macías (1995) and others, who argue that the ‘trustworthiness’ of alternative assessments

(i.e., their credibility and auditability) is sufficient for claims of reliability. Kane, Crooks, and Cohen (1999) argue against Moss's hermeneutic approach to reliability. They see a dilemma with regard to the potential value of alternative assessment, pointing out that if reliability is lost, the relevance of the performance is questionable, because it cannot be measured as a result. Kane, Crooks, and Cohen. argue that the goal, therefore, is to "achieve relevance without sacrificing too much reliability/generalizability" (p. 12).

Indeed, it is the unique and varying nature of the evidence collected through alternative assessment that challenges raters—a challenge faced in all constructed response measurement. When alternative assessment has been used in large-scale, high-stakes contexts, such as Vermont's Portfolio Assessment Program, there have been difficulties identifying scoring guides with an appropriate level of specificity—neither too brief nor too detailed. Indeed, some alternative assessment proponents (Darling-Hammond, 1994) argue that it is inappropriate and misguided to use alternative assessments for norm-referenced purposes—purposes associated with traditional testing culture. They argue that what is essential, is a reconceptualization of appropriate criteria (Birenbaum, 1996; Taylor, 1994 ) or a movement away from measurement models which are detached from situated practice and learning process, to models or criteria which are embedded in the processes of learning.

### *Issues Related to Conceptions of Validity*

There is also considerable discussion regarding the validity of inferences drawn from alternative assessment—particularly in high-stakes contexts. Some argue that alternative assessments must meet the same "requirements of responsible test construction and decision making" (Brown and Hudson, 1998, p. 657) as are expected of traditional tests. Many criticize (see, for example Kane, Crooks, and Cohen, 1999) proponents of alternative assessment who argue that characteristics of authenticity or fidelity are sufficient conditions for claims of validity. Many unresolved issues remain with regard to, for example, the consistency of scoring, the equation of different forms of assessment, the sampling adequacy of performances, and the plausibility of the inferences that are drawn from alternative assessments. Further, questions of task-driven assessment versus construct-driven assessment (Bachman, 2002; Messick, 1994) are raised in relation to alternative assessment. Some argue that alternative assessment is essentially task-driven assessment and ultimately risks under-representation of constructs of interest. Further, issues regarding how to define a 'task', how assessment tasks affect performance assessment, and how test takers interact with assessment tasks remain largely unresolved and problematic (Bachman, 2002).

Proponents argue (as they have in response to issues raised regarding reliability) that expectations for validity must be rooted in an assessment culture rather than a testing or measurement culture. They argue that when the focus is on situated learning and the processes of learning, the nature of the evidence that supports the validity of inferences drawn from performance(s) is different from that of traditional tests. They argue that current conceptions of validity must be extended to reflect the purposes of alternative assessment. “In these models, assessment is used as a learning tool for schools and teachers rather than as a sledgehammer for sorting and sanctioning” (Darling-Hammond, 1994, p. 2). Birenbaum (1996) identifies the “dilemma” (p. 23) resulting from high-stakes alternative assessment programs used for traditional, measurement purposes such as accountability. She points out that alternative assessment tends to “compare unfavorably with traditional assessment devices when evaluated with respect to traditional conceptions of validity and reliability” (p. 23), and argues that the scope of these conceptions must be extended. She observes that the goals of measurement and instruction are in conflict, and considers that the type of testing or assessment that is used must be tied to its purpose, “as one assessment type cannot serve a multitude of purposes and audiences . . . one assessment type does not fit all students” (p. 23). She concludes that issues of validity may best be addressed by collecting evidence from multiple assessment types.

### *Issues Related to Implementation*

There are many challenges to the implementation of alternative assessment particularly with regard to the sociopolitical contexts in which they occur (see, for example Brindley, 1998). As Brindley (2001) notes, politicians are often at odds with alternative assessment procedures because such assessments take more time, draw on more resources, and are more complex to implement than traditional tests. Further, as Brindley (2001), Teasdale and Leung (2000), and others point out, many teachers and administrators are grossly under-prepared to carryout assessment agendas in either high- or low-stakes contexts.

## FUTURE DIRECTIONS

The issues raised regarding alternative assessment will no doubt be debated for years to come. The fact that for the first time alternative assessment is accorded a separate chapter in this encyclopedia is an indication of its growing importance. Whether an assessment culture replaces the current, dominant testing culture remains to be seen. This is the key point in Lynch and Shaw’s (2005) response to Brown and

Hudson (1998). If the issue is 'alternatives in assessment,' testing culture may well remain dominant and traditional measurement-driven notions of reliability, replicability, and generalizability will limit the role that nontraditional/alternative assessment can play. If, however, the trend is toward an assessment culture, we may well be entering an alternative era in testing and assessment, as Shohamy (1996) indicates we are. Alternative assessment, rooted in an assessment culture, will elicit multiple, ongoing performances; draw inferences from collections of evidence of language learning that are dynamic, situated, and unique to individual learners; and necessitate continuing dialogue and debate as part of the process of reconceptualizing reliability and validity within a framework of sociocultural theory.

## TASK AND PERFORMANCE BASED ASSESSMENT

### INTRODUCTION

A performance test is “a test in which the ability of candidates to perform particular tasks, usually associated with job or study requirements, is assessed” (Davies et al., 1999, p. 144). In the assessment of second languages, tasks are designed to measure learners’ productive language skills through performances which allow candidates to demonstrate the kinds of language skills that may be required in a real world context. For example, a test candidate whose language is being evaluated for the purposes of entry into an English-speaking university or college might be asked to write a short academic essay, or an overseas-qualified doctor might participate in a job-specific role play with a ‘patient’ interviewer. These kinds of assessments are increasingly used in specific workplace language evaluations, and in educational contexts to evaluate language gains during a period of teaching.

The relationship between task and performance testing is a complex one. In the context of language testing and assessment, performance assessment has become increasingly important over the last two decades, and has been the focus of substantial empirical investigation. Performance based assessments can be more or less specific in terms of the language skills they are designed to assess. Tests such as the IELTS or TOEFL tests are large-scale, high-stakes tests that are designed to evaluate largely academic language skills, while others have proven valuable tools for assessing candidate performance in specific vocational contexts (for example, the Occupational English Test which is used for assessing the language skills of overseas-trained medical professionals prior to accreditation in Australia). The role of tasks in performance based assessments has recently attracted considerable attention, both from theoretical and practical perspectives. Generally, there is little agreement about where ‘task-based language assessment’ sits in relation to language testing more generally; Bachman (2002) uses the term ‘task-based language performance tests’ (TBLPA); while others (e.g., Mislevy, Steinberg and Almond, 2002; Norris, 2002) refer more generally to task-based language assessment, or TBLA. However, Brown, Hudson, Norris and Bonk (2002) define task-based language testing as a subset of performance based language testing, clearly distinguishing

between performance based testings, in which tasks are merely vehicles for eliciting language samples for rating, and task-based performance assessments in which tasks are used to elicit language to reflect the kind of real world activities learners will be expected to perform, and in which the focus is on interpreting the learners' abilities to use language to perform such tasks in the real world.

#### EARLY DEVELOPMENTS

Performance assessments have been used for the evaluation of second languages for at least half-a-century. McNamara (1996) argues that their development has been the result of two factors. The first stemmed from the need to evaluate the language of second language learners for the purposes of study in English-speaking universities, and from the need to ascertain the language abilities of second language learners entering specific workplace contexts (e.g., doctors, nurses, flight controller, pilots, teachers, tour guides). The second has resulted from the increasing focus in second language learning and teaching of communicative language ability with its focus on the ability to use language communicatively and appropriately in different contexts. Bachman's (1990) model of language proficiency, further developed in Bachman and Palmer (1996), with its focus on the learners' abilities to use language, has been hugely influential in developing the agenda for research into task and performance based language assessments. For test candidates, this trend toward task and performance based assessment means that they are evaluated on a much greater range of language skills than those traditionally measured by the more discrete, paper and pencil-based tests. Thus second language task and performance assessments have evolved in parallel with increasingly multicomponential models of language ability. The more communicative approaches to language learning and teaching have been necessitated by the need to assess language in use, rather than language as object. Building on Bachman's (1990) model of language ability, Bachman and Palmer (1996) articulate a detailed framework of task characteristics intended as the basis for both test design and test-related research. These characteristics focus on the setting, the test rubrics, the input to the task (both in terms of format and language input), the expected response (again in terms of format and language), and the relationship between the input and the response.

Second language performance assessments can be conducted in a variety of contexts. One option is *in situ* (e.g., in the classroom, in the workplace) through observation. McNamara (1996, following Jones, 1985; Slater, 1980) calls this a 'direct assessment' of the way in which language behaviour is evaluated since the language is being evaluated

in the context in which it is being used. Alternatively, second language performance assessments may be evaluated through simulations of real world performance, i.e., tasks tailor-made for the particular communicative purpose of the assessment. McNamara (1996) argues that there are two factors which distinguish second language performance tests from traditional tests of second language: the fact that there is a performance by the candidate, and that this is judged using an agreed set of criteria. Norris, Brown, Hudson and Yoshioka (1998) add a third criterion arguing that the tasks used in performance assessments should be as authentic as possible.

McNamara (1996) argues for a distinction between *strong* and *weak* forms of second language performance assessment, based on the criteria used for judging the performance. In the 'strong' sense, assessment is made on the basis of the extent to which the actual task itself has been achieved, with language being the means for fulfilling the task requirements rather than an end in itself. In the 'weak' sense, the focus of the assessment is less on the task and more on the language produced by the candidate, with the task serving only as the medium through which the language is elicited—successful performance of the task itself is not the focus of the assessment. This distinction is revisited in the later work of Brown, Hudson, Norris and Bonk (2002, pp. 9–11) in which the term *performance based testing* was used where the tasks are used to elicit language samples for the purposes of rating—in McNamara's terms, 'weak' performance assessments—and *task-based performance assessments* involve assessments in which tasks are used to elicit language to reflect the kind of real world activities learners will be expected to perform, and in which the focus is on interpreting the learners ability to perform such tasks in the real world (p. 11)—'strong' performance assessments in McNamara's terminology. This provides two very different ways of defining the construct. In the 'weak' version, the construct is defined as language ability. In the 'strong' version, it includes everything that might contribute to the successful completion of the task, which means that there are more likely to be a range of confounding factors including task characteristics and test-taker interactions with these, which might affect score interpretation and use.

#### WORK IN PROGRESS

In the SLA literature, the properties and characteristics of tasks, and the different conditions under which they can be administered, have been the subject of intense scrutiny. A major focus of this research has been on how learners manage the differential cognitive load associated with different types of tasks and the extent to which these varying conditions and characteristics influence learner productions (see, for example, Ellis, 2003; Ellis and Yuan, 2004; Foster and Skehan, 1996; Skehan

and Foster, 1997; Yuan and Ellis, 2003). Different variables have been systematically investigated incorporating the conditions under which the tasks are administered, i.e., those conditions external to the task. A task condition which has received considerable attention is the provision, or not, of varying amounts of planning time (see, for example, Ellis, 2005). The internal characteristics of tasks have also attracted substantial attention. In particular, the series of studies by Foster and Skehan (Foster and Skehan, 1996, 1999; Skehan and Foster, 1997, 1999) indicate that different task characteristics (e.g., dialogic vs monologic, structured vs unstructured, simple vs complex in outcome) have differential impacts on measures of fluency, complexity and accuracy in the learners discourse (Skehan, 2001).

Much of the earlier work has been motivated by information processing models of second language acquisition (SLA) (see Skehan, 1998) and has used detailed analyses of elicited discourse (written or spoken) to evaluate changes in measures of complexity, accuracy and fluency, which might result from different task conditions and characteristics. However, as Chalhoub-Deville (2001) points out, while the task has been a focus of discussion and empirical investigation for some time in the second language literature, it has not always been the case with the tasks used in performance testing and assessment. Recently, however, a spate of studies have begun to examine task properties in relation to how they might impact on candidate performance in the context of assessment. This research has been conducted in two distinct paradigms: in relation to classroom-based assessment practice and in relation to high-stakes assessments, such as TOEFL and IELTS. The approach taken by many of these studies has been to evaluate learner performances on two levels—externally through rating, and internally through analyses of candidate discourse.

Task-based performance assessments in teaching programmes have proven particularly valuable because task-based assessments can be linked to teaching outcomes, provided outcomes are defined in terms of task fulfilment, rather than purely in terms of language ability. A further consequence can be that well-designed assessment tasks have the potential to provide positive wash-back into the classroom. However, the issues raised by the use of tasks for these types of assessments are considerable. Brindley and Slatyer (2002) examined the effect of varying the characteristics and conditions in listening assessment tasks used in the context of an outcomes-based reporting system in which teachers themselves developed tasks for assessment purposes, and Wigglesworth (2001) undertook a similar investigation of speaking tasks by manipulating a series of task conditions and characteristics. Both studies found small effects as a result of manipulating the variables,

but also point out that interaction affects impact on the variables in ways which are difficult to separate. Such studies, which systematically manipulate different task variables, are of crucial importance since teachers are often involved in the development of assessment tasks, and must understand how these work in order to produce comparable and defensible judgements of students for classroom assessment purposes. As Brindley (2001) points out, in the outcomes-based systems of assessment which are used in some teaching programmes (e.g., the Adult Migrant English Program in Australia), guidelines are needed to assist teachers in developing appropriate assessment tasks. Such guidelines are required to identify for teachers, or for test developers, the ways in which different variables may affect candidate outcomes on the tasks.

In the high-stakes testing context, the recent focus on task properties and characteristics has been addressed in a series of studies which used test scores to investigate potential differences, as well as measures of complexity, accuracy and fluency to determine whether finer distinctions imperceptible to raters are marked in the candidate discourse (see, for example, Elder, Iwashita and McNamara, 2002; Elder and Wigglesworth, 2005; Iwashita, Elder and McNamara, 2001; Wigglesworth, 1997). The general outcome of these studies has been that raters perceive no differences; in general very few, if any, differences have been detected in the discourse. Necessarily, given the testing focus, task difficulty has been a particular focus of these studies, since for testing purposes it would be useful to be able to design tasks of predictable levels of difficulty which can be manipulated to elicit appropriate performances across candidates. Norris, Brown, Hudson and Yoshioka (1998) and Brown, Hudson, Norris and Bonk (2002) provide a comprehensive empirical investigation of the problems of the comparability of real world performance tasks by systematically manipulating three cognitive processing variables (code complexity, cognitive complexity and communicative demand) in a series of test tasks. In summarising their findings in relation to task difficulty, Norris, Brown and Bonk (2002, p. 414) point out the importance of individual responses to tasks, which may impact on measures of task difficulty. They argue that:

initial evidence from this study did not support the use of the cognitive processing factors – as operationalized in our original task difficulty framework – for the estimation of eventual performance difficulty differences among test tasks. While there was some indication that average performance levels associated with the three cognitive task types differed in predicted ways, these differences did not extend to individual tasks. What is more, evidence suggests that examinees may have been responding to tasks in idiosyncratic ways,

in particular as a result of their familiarity with both task content and task procedures.

Elder, Iwashita and McNamara (2002) asked candidates about their perception of task difficulty and found they too were unable to estimate the difficulty of a task even after they had performed it. Indeed, Bachman (2002) argues that the complex nature of task performances, which involve large numbers of interactions (e.g., between candidate and task, task and rater, candidate and interlocutor, etc.) means that task difficulty cannot be conceptualised as a separate factor.

While both writing and speaking performance test tasks need to be subjectively rated, with all that rater variables entail, performance testing in the assessment of speaking skills brings the additional variable of the interlocutor. As Brown (2003) shows the same candidate can produce qualitatively different performances when interviewed by different interviews, and these may mean that the raters interpret the candidate's performance differently. Other studies (e.g., Morton, Wigglesworth and Williams, 1997; McNamara and Lumley, 1997), where raters evaluated not only the candidate, but the interlocutor performance as well, have found that raters tend to compensate for what they view as deficient interviewer behaviour. However, as Brown (2003) points out, such differences in interlocutor behaviour, and how they might impact on the candidate's performance, are not easily predictable. Moreover, it is "simply not appropriate to assume that the variation that is allowed to occur is not relevant to the construct, especially where the construct can be interpreted as encompassing interpersonal communication skills" (Brown, 2003, p. 20).

Another aspect of a task which may influence test scores is the nature of the rating scale used to judge performance. Since judgements are by nature subjective, raters require well-defined rating scales. Rating scales consist of a set of criteria upon which a performance can be judged. They are necessarily limited in scope because no rating scale can attend to all possible aspects of performance, and thus choices about *what* to rate (intelligibility, accuracy, complexity, clarity) must be made, as well as choices about what *proportion* of the score is appropriate to allocate to each rating criterion—in other words are some criteria weighted more heavily than others? Rating scales need to be designed to allow accurate judgements of the speech or writing samples elicited, and need to be valid in terms of the relevant language construct. Rating scales may rate task performance globally, based on a holistic impression, or analytically on a feature-by-feature basis. However, there is considerable debate, although limited empirical investigation, about the advantages and disadvantages of the different types of scales (Weigle, 2002). Real world judgements may vary widely, however, with potential consequences for test fairness. It is now widely

acknowledged that raters differ in both self-consistency and in their severity (Upshur and Turner, 1999) and also in the way they construe the different elements of the rating scale (Lumley, 2002). Rater training thus becomes a critical component in task-based performance assessment. While ideally, rater training may aim to reduce differences in severity across different raters, where this is not achievable, training needs to ensure that raters discriminate consistently in terms of severity across different levels of performance. As a result of these inherent differences in rater severity, best practice in assessment advocates double rating, or even multiple ratings in the event of discrepancy between pairs. Statistical analyses of scores can then be used to gain a greater understanding of how different raters behave or to compensate for individual rater differences.

### PROBLEMS AND DIFFICULTIES

A central tenet of task-based language assessments is that the tasks are designed to represent authentic activities which test candidates might be expected to encounter in the real world outside the classroom. In particular, as Douglas (2000) points out, authenticity is central to the assessment of language for specific purposes, and is part of what differentiates it from more general types of language testing. This is because a “specific purpose language test is one in which test content and methods are derived from an analysis of a specific purposes target language use situation, so that test tasks and content are authentically representative of tasks in the target situation” (p. 19). However, the issue of authenticity is not a trivial one, and the extent to which specific tasks can represent authentic real world activity has attracted considerable debate and empirical investigation, using a variety of different approaches (see, for example, Cumming, Grant, Mulcahy-Ernt and Powers, 2004; Lewkowicz, 2000; Spence-Brown, 2001; Wu and Stansfield, 2001). While there is broad agreement that a needs analysis is a crucial step in addressing issues of authenticity of task (e.g., Bachman and Palmer 1996; Brown, Hudson, Norris and Bonk, 2002; Douglas, 2000; Norris, Brown, Hudson and Yoshioka, 1998), the extent to which inferences can be made from the language elicited by particular test tasks as a reflection of the candidates’ ability to manage the task in a subsequent real world context is not fully resolved.

Concerns that need to be addressed in relation to authenticity relate to the problem of the generalisability of the outcome. In the ‘weak’ view of language testing, where concern is with the underlying language abilities, a criterion of task fulfilment may not be considered of great importance. In the ‘strong’ view of performance testing, a task designed to assess the ability of candidates to carry out the activity in

a real world setting would need to be assessed on a criterion of task fulfilment rather than for its linguistic accuracy, for example. At issue here is who should decide whether the task has been carried out successfully—language specialists, or specialists in the field of the task activity? There are a number of studies which have examined this issue (e.g., Brown, 1995; Elder, 1993; Elder and Brown, 1997) but the question remains one of balancing authenticity and generalisability. While the ‘weak’ view is likely to assess underlying language skills in ways which are relatively broadly generalisable, the ‘strong’ view is likely to produce judgements which are more authentic and relevant to the real life situations toward which the candidate may be moving. These judgements about the quality of performance may not, however, be replicable in other contexts.

Bachman (2002) argues that because tasks in real life are both extremely complex and diverse, and they are subject to great variation depending on a range of factors, it is very difficult to use tasks in a test situation to predict performance in real life. Wu and Stansfield (2001) are less sceptical, but nevertheless argue that the authenticity of task-based assessment instruments need to be verified by eliciting comments and critiques from those who undertake such tasks in the real world at every stage of the test development procedure. This points to the difficulty of task selection—who decides which tasks should be selected, and on the basis on what criteria are these decisions made. The extent to which the tasks in an assessment adequately sample the target language use domain must be evaluated since this impacts on the content relevance and coverage of the test.

The use of integrated tasks goes beyond the notion of assessing skills independently of one another. Thus, reading might be used as a stimulus for tasks which also involve either writing or speaking, or both. This is true of the new internet-based TOEFL (iBT), a test of academic English for candidates intending further study at English-speaking institutions. In addition to enhancing the authenticity of the tasks, integrated tasks also mitigate against some candidates having greater familiarity with the topic than others, since a common source of input can be provided in the form of either a listening and/or reading text for a writing or speaking task. The written script by the candidate must then be based on the information provided in the text. A study by Cumming et al. (2002) of the TOEFL iBT prototype tasks found that ESL instructors viewed such tasks positively, considering that the performances elicited were similar to those produced by the same students in their classes. However, rating such tasks may also be difficult because comprehension (or not) of the input texts may influence the quality of the writing.

Task-based performance testing is attractive as an assessment option because its goal is to elicit language samples which measure the breadth of linguistic ability in candidates, and because it aims to elicit samples of communicative language (language in use) through tasks which replicate the kinds of activities which candidates are likely to encounter in the real world. As a test method, however, it remains one of the most expensive approaches to assessment, and in terms of development and delivery, one of the most complex. There is also the potential for reduced generalizability since tasks used in such assessments tend to be complex and context specific, which means that inferences which are based on them may not always extrapolate to the domains they are intended to represent. An additional difficulty is that of replicating tasks in a way which ensures consistency of measurement.

### FUTURE DIRECTIONS

The development of appropriate tasks for use in performance assessment must be underpinned by an understanding of how the tasks relate to the construct, and of which factors may potentially interfere with their validity and reliability. There is currently only a relatively limited amount of empirical research which systematically examines the types of tasks used in task and performance based assessments, and which can illuminate how different tasks work for assessment purposes. The complex nature of tasks, and their relationship to real world performances, makes it crucial that we understand more about how the various different elements of the task, which impact on candidate performance with the task, interact. As has been pointed out elsewhere (see, for example, Bachman, 2002; Iwashita, Elder and McNamara, 2001), these interaction effects need to be explored in much greater depth. There is a long list of complex interactions which may impact in varying ways on test performance. These potentially include interactions between, among others, the test taker and the task, the interlocutor and test taker, the test takers themselves (in the case of paired or group orals) the interlocutor and task, the rater and rating criteria and the rater and interlocutor. In addition to this there are the affective factors which may impact on the test score, for example, the rater or interlocutor's reaction to the test taker's personality (and possibly vice versa). Other affective factors which may impact on test scores include anxiety and motivation and other characteristics which may impact on an individual performance, or on how an individual rater or interlocutor reacts to a performance on a particular day.

Testing is a socially situated activity although the social aspects of testing have been relatively under-explored (see McNamara and

Roever, forthcoming). Testing and assessment activities take place in a social context, and this is particularly the case with task and performance based assessment. In speaking assessments, the role of the interlocutor has a crucial role to play. However, while the interlocutor is often a trained interviewer, this role may also be taken by another test candidate, or a group of test candidates. In relation to paired and group test activities a whole raft of variables are ripe for exploration since “we can hypothesize that the sociocultural norms of interaction . . . contribute significantly to variability in performance” (O’Sullivan, 2002, p. 291). The extent to which they contribute in systematic ways to the way tasks are interpreted and undertaken is yet to be determined.

## UTILIZING TECHNOLOGY IN LANGUAGE ASSESSMENT

### INTRODUCTION

Most people associate technology with efficiency. Accordingly, applied linguists might consider technology in language assessment by discussing ways in which it streamlines the testing process. Indeed, much progress can be identified with respect to this worthwhile goal, as many language tests today are delivered on microcomputers and over the Internet. An equally important strand of language assessment concerns its effects on language learning, language teaching, and knowledge within the field of applied linguistics. The story of technology in language assessment, therefore, needs to encompass both the efficiency of technical accomplishments, which is evident in part through the success of testing programs in constructing technology-based tests, as well as the effects of these tests. Technology can encompass a broad range of devices used in the testing process, from recording equipment, statistical programs, and data bases, to programs capable of language recognition (Burstein, Frase, Ginther, and Grant, 1996). However, here the focus will be on the use of computer technology for delivering tests and processing test takers' linguistic responses because these are the practices with the most direct impact on test takers and educational programs. The use of computer technology in language assessment is referred to as Computer-Assisted Language Assessment or Computer-Assisted Language Testing (CALT), two phrases that are used interchangeably.

### EARLY DEVELOPMENTS

Early developments in computer-assisted language assessment consisted of a few demonstration projects and tests used in university language courses. Many of these were reported in two edited collections, *Technology and Language Testing* (Stansfield, 1986) and *Computer-Assisted Language Learning and Testing: Research Issues and Practice* (Dunkel, 1991), but others had been published as journal articles before or in the same time period as these. Three important themes were prevalent in this early work.

One was the use of a psychometric approach called item response theory (Hambleton, Swaminathan, and Rogers, 1991; Lord, 1980), which provides a means for obtaining robust statistical data on test

items. These item statistics, obtained from pre-testing items on a large group of examinees, are used as data by a computer program to help select appropriate test questions for examinees during test-taking. Item response theory, which offers an alternative to calculation of item difficulty and discrimination through classic true score methods, entails certain assumptions about the data. The use of these methods, the assumptions they entail, and the construction and use of the first computer-adaptive tests comprised the major preoccupation of the language testers at the beginning of the 1980s. This was the time when the first microcomputers were within reach for many applied linguists, and item response theory seemed to appear at the ideal time to make use of the new technology. Most of the papers in the early edited volumes in addition to journal articles (e.g., Larson and Madsen, 1985) focused on issues associated with computer-adaptive testing.

Other early developments appeared in a few papers exploring possibilities other than adaptivity, which were presented through the use of technology. The first issue of *Language Testing Update* at Lancaster University entitled "Innovations in language testing: Can the micro-computer help?" addressed the many capabilities of computers and how these might be put to use to improve language assessment for all test users, including learners (Alderson, 1988). A paper appearing in *CALICO Journal* at that time raised the need to reconcile the computer's capability for recording detailed diagnostic information with the test development concepts for proficiency testing, which are aimed to produce good total scores (Clark, 1989). A few years later, Corbel (1993) published a research report at the National Centre for English Language Teaching and Research at Macquarie University, *Computer-Enhanced Language Assessment*, which also raised substantive questions about how technology might improve research and practice in language teaching and testing.

These papers, in addition to some in the edited volumes, expressed a similar vision and quest concerning the potential significance of technology for changes and innovation in second language assessment. They presented what appeared to be an agenda-setting collection of questions about how technology might provide the impetus and mechanisms for developments in theory and practice for language assessment. However, a technology agenda for language assessment requires considerable infrastructure in addition to cross-disciplinary knowledge dedicated to problems in language assessment. At this time, decision makers at the large testing companies, where such resources resided, apparently did not see technology-based assessment as a practical reality for operational testing programs, and therefore, substantial resources were not devoted to exploring a broad technology agenda. Instead, discussion of just a few innovative projects produced in

higher education appeared; they described how assessments had been developed to support language instruction (Boyle, Smith, and Eckert, 1976; Marty, 1981).

Despite the handful of projects and reports, early developments in this area comprise a short story relative to other areas in applied linguistics; moreover, what might have been the most significant advances involving computer recognition of examinees' constructed responses remained in research laboratories and out of reach for assessment practice (Wresch, 1993). This frustrating reality coupled with technical hardware and software challenges and the intellectual distance between most applied linguists and technology resulted in a slow start. By 1995, many applied linguists were voicing doubts and concerns about the idea of delivering high stakes language tests by computer, fearing that the negative consequences would far outweigh any advantages. As it turned out, however, the technologies affecting language assessment did not wait for the approval and support of applied linguists, and consequently by the middle of the 1990s, many testing programs were beginning to develop and use computer-assisted language tests.

#### MAJOR CONTRIBUTIONS

The rocky beginning for technology in language assessment is probably forgotten history for most test users, as major contributions have now changed the assessment landscape considerably. Evidence of the impact of technology appears in each of the volumes in the *Cambridge Language Assessment Series*. Whether authors are writing about vocabulary, writing, or speaking, technology is brought up by authors as an important and practice-altering phenomenon. Contributions are complex and varied, but they might be summarized in terms of the way that technology has changed and improved three aspects of testing method.

The use of computer-adaptive testing is perhaps the clearest success for technology in language assessment. Computer-adaptive language tests have been developed and are used routinely for proficiency and placement testing. Many computer-adaptive testing projects have been reported regularly in edited books (i.e., Chalhoub-Deville, 1999, and the ones cited earlier) and journal articles (e.g., Burston and Monville, 1995). By evaluating examinees' responses immediately as they are entered, a computer-adaptive test avoids items that are either too easy or too difficult; such items waste time because they provide little information about the examinee's ability. In addition to creating efficient tests, these projects have raised important issues about the way language is measured, the need for independent items, and their selection through an adaptive algorithm. Therefore, results from this work have prompted conceptual discussion and empirical research which serves

to better understand the use of computer-adaptive testing. One line of research, for example, examines the effects of various schemes for adaptivity on learners' affect and test performance (Vispoel, Hendrickson, Bleiler, 2000). Another seeks strategies for grouping items in a manner that preserves their context to allow several items to be selected together because they are associated with a single reading passage, for example.

A second advance has resulted from the use of multimedia in testing listening. In the past, the testing of listening comprehension was limited to the examiner's oral presentation of linguistic input, either live or prerecorded, to a room full of examinees. They were required to listen and respond according to the timing controlled by the examiner. Such constraints on the input and the expected response are desirable for some test situations, but in view of the variety of situations for which one might wish to test listening, most test developers and users feel empowered by technology that allows them to design listening tests that more accurately assess the specific aspects of listening of interest to their purposes. The use of multimedia provides test developers with the opportunity to contextualize aural language with images, and to allow examinees to control their test-taking speed and requests for repetition. The fact that one can choose multimedia for assessment of listening does not mean that test developers always choose to do so. The availability of this option for construction of a test, however, brings interesting research questions about the nature of listening and the generalizability of listening across different listening tasks.

The third contribution is the use of natural language-processing technologies for evaluating the learners' spoken and written language. One of the most serious limitations with large-scale testing in the past was the over-reliance on selected response items. Dichotomously scored selected response items were chosen in large part because they could be machine scored. Research was focused on developing the best possible selected response items to assess language, but the fact is that language assessment for most situations is better achieved if examinees produce language. After many years of research on natural language processing for language assessment, a number of testing programs have put natural language processing technologies to work to make learners' constructed linguistic responses machine scorable as well. Analysis of learner language by the computer is not widely used and this remains the most advanced technology applied to language testing, but tests of English as a second language now exist with some machine scoring of examinees' constructed linguistic responses, both speech (Ordinate, 2002) and writing (Powers, Burstein, Chodorow, Fowles, and Kukich, 2001).

These technical advances in test methods need to be seen within the social and political contexts that make technology accessible and viable to test developers, test takers, and test users. For test developers, the fact of CALT implemented in large high-stakes testing is a significant accomplishment. Not long ago most test developers felt that the operational constraints of delivering language tests by computer may be insurmountable. Today, however, many large testing organizations are taking advantage of technical capabilities that researchers have been investigating for at least the last 20 years. As computer-assisted language assessment has become a reality, test takers have needed to reorient their test preparation practices to help them prepare for new test items, procedures for registering, and increased fees associated with increased costs for test delivery. Language teachers who have not embraced the use of computer-assisted language learning in their classes need to reconsider the scope of their test preparation. While the effects of technology in language assessment ripple through the educational system, researchers continue to investigate the many issues it raises.

#### WORK IN PROGRESS

The primary impetus for using technology in language assessment has been to improve the efficiency of current testing practice and thus much of the work in progress has centered on this objective. Computer-adaptive testing is one efficiency-oriented practice. Reporting on a computer-adaptive test developed to increase efficiency of placement, Madsen (1991, p. 245) described the goal as follows: "intensive-English directors confirmed that the instrument they needed was an efficient and accurate ESL proficiency test rather than a diagnostic test." He describes the results of the research and development efforts in terms of the number of items required for placement, the mean number of items attempted by examinees, the mean amount of time it took students to complete the test, and students' affective responses to taking the test on the computer. The motivation of efficiency continues to be apparent in much of the work in progress, which extends beyond computer-adaptive testing to the use of natural language processing for evaluating learners' written and oral language.

A related strand of research appears in situations where existing testing practices are targeted for replacement by computer-assisted testing. The objective in these cases is to demonstrate the equivalence of the computer-assisted tests to the existing paper-and-pencil tests. For example, such a study of the Test of English Proficiency developed by Seoul National University examined the comparability of computer-based and paper-based language tests (CBLT and PBLT, respectively).

Choi, Kim, and Boo (2003) explained the need for assessing comparability in practical terms: “Since the CBLT/CALT version of the [Test of English Proficiency] TEPS will be used with its PBLT version for the time being, comparability between PBLT and CBLT is crucial if item statistics and normative tables constructed from PBLT are to be directly transported for use in CBLT” (Choi, Kim, and Boo, 2003, p. 296). The study, which used multiple forms of analysis to assess comparability of the constructs measured by the two tests, found support for similarity of constructs across the two sets of tests, with the listening and grammar sections showing the strongest similarities, and the reading sections showing the weakest.

In addition to the practical motivation for assessing similarity, the scientific question is an important one. Unfortunately, few studies have investigated the comparability of examinees’ performance on computer-assisted tests with their performance on what appears to be comparable paper-and-pencil tests (Sawaki, 2001). The use of technology for test delivery is frequently a decision that is made before research, and therefore the issue for practice is how to prepare the examinees sufficiently so that they will not be at a disadvantage due to lack of computer experience. This was the approach taken by researchers concerned with the computer-based version of the TOEFL. Taylor, Kirsch, Eignor, and Jamieson (1999) gave the examinees a tutorial to prepare them for the computer-delivered items before they investigated the comparability of the computer-based and the paper-and-pencil versions of test items for the TOEFL. In this case, the research objective is to demonstrate how any potential experience-related difference among test takers can be minimized.

Beyond the issues of efficiency and comparability, another area of great interest is the use of technology to expand the uses and usefulness of language tests. Language tests delivered through the Web offer the potential for testing that is readily accessible to learners (Roever, 2001). For high-stakes testing the potential advantages of Web-based testing are offset by the need for security, and therefore the accessibility of the Web is of greatest interest in low-stakes testing. Educators hoping to increase the impact of low-stakes testing are putting technology to work in helping learners to identify their accomplishments and learning needs. The most visible evidence of this is DIALANG. Alderson’s (2005) extensive description of results from the DIALANG project explores its usefulness in offering diagnostic information to learners and increasing their understanding of their language learning. Whereas DIALANG is intended to have extensive impact on language learners due to its accessibility on the Web, other assessments aimed at learning appear in computer-assisted language learning materials. *Longman English Interactive* (Rost, 2003), for example, includes assessments

regularly throughout the process of instruction to help learners to know how well they have learned what was taught in each unit. Such assessments, which also appear in many teacher-made materials, use technology to change the dynamic between test takers and tests by providing learners a means for finding out how they are doing, what they need to review, and whether they are justified in their level of confidence about their knowledge.

All of this work in progress relies on significant software infrastructure for constructing language tests, and therefore another area of current work is the development of authoring systems. Due to limitations in the existing authoring tools for instruction and assessment, most language-testing researchers would like to have authoring tools intended to address their testing goals directly, including the integration of testing with instruction, analysis of learners' constructed responses, and capture and analysis of oral language. As such capabilities are contemplated for authoring tools, so are new methods for conceptualizing the assessment process. Widely used psychometric theory and tools were developed around the use of dichotomously scored items that are intended to add up to measure a unitary construct. The conception of Almond, Steinberg, and Mislevy (2002) underlying their test authoring tools reframes measurement as a process of gathering evidence (consisting of test takers' performance) to make inferences about their knowledge and capabilities. The nature of the evidence can be, but does not have to be, dichotomously scored items; it can also be the results from a computational analysis of learners' production (Holland, 1994). Inferences can be made about multiple forms of knowledge or performance. The emphasis on evidence and inference underlies plans for developing authoring tools for computer-assisted testing that can include a variety of types of items and can perform analysis on the results that are obtained—all within one system.

#### PROBLEMS AND DIFFICULTIES

With the intriguing potentials apparent in current work, many problems and challenges remain in this area. The most evident is the infrastructure to which test developers, researchers, and test takers must gain access. Changing technologies makes it difficult to create a system for authoring that takes advantage of current technical knowledge. Testing programs need to have built-in mechanisms for updating software, hardware, and technical skills of employees. Keeping up with the realities of technology use requires substantial financial investment. It is not surprising then that the large testing companies with the most resources have been the first to move forward with substantial progress in technology. To some extent they have done so by increasing fees for

those using their tests. In some cases costs are borne by language programs, but in many other cases, the costs are passed on to those who are least able to pay—the test takers themselves. The technology-driven cost increases for language tests that are required for admission to higher education present a potentially significant hurdle for many test takers. Small testing organizations, publishing companies for whom testing is just one part of their overall profile, as well as school-based testing programs have to rely on strategic partnerships to combine expertise, limited resources, and technologies. Navigation of these waters in a quickly changing environment requires exceptionally knowledgeable leadership.

Challenges that may be less evident to test users are those that language testing researchers grapple with as they attempt to develop appropriate tests and justify their use for particular purposes. As Bachman (2000, p. 9) put it, “the new task formats and modes of presentation that multimedia computer-based test administration makes possible raise all of the familiar validity issues, and may require us to redefine the very constructs we believe we are assessing.” Chapelle (2003) provided two examples of how technology complicates questions about what a test measures. One example centers on how strategic competence is defined and assessed. For example, in a computer-assisted reading test, the test tasks might allow the test takers access to a dictionary and other reading aids such as images. In this case, the construct tested would be the ability to read with strategic use of online help. The reading strategies entailed in such tasks are different from those used to read when no help is available, and therefore the definition of strategic competence becomes critical for the construct assessed. Should test takers be given access to help while reading on a reading test? One approach to the dilemma is for the test developer to decide whether or not access to help constitutes an authentic task for the reader. In other words, if examinees will be reading online with access to help, such options should be provided in the test as well. However, the range of reading tasks the examinees are likely to engage in is sufficiently large and diverse to make the authentic task approach unsatisfactory for most test uses. The reading construct needs to be defined as inclusive of particular strategic competencies that are required for successful reading across a variety of contexts.

A second example of how technology intersects with construct definition comes from tests that use natural language processing to conduct detailed analyses of learners’ language. Such analyses might be used to calculate a precise score about learners’ knowledge or to tabulate information about categories of linguistic knowledge for diagnosis. In either case, if an analysis program is to make use of such information,

the constructs assessed need to be defined in detail. A general construct definition such as ‘speaking ability’ does not give any guidance concerning which errors and types of disfluencies should be considered more serious than others, or which ones should be tabulated and placed in a diagnostic profile. Current trends in scoring holistically for overall communicative effectiveness circumvent the need for taking a close linguistic look at constructed responses. One of the few studies to grapple with this issue (Coniam, 1996) pointed out the precision afforded by the computational analysis of the learners’ responses far exceeded that of the construct of listening that the dictation test was measuring. To this point assessment research has not benefited from the interest that second language acquisition researchers have in assessing detailed linguistic knowledge; it remains a challenge (Alderson, 2005).

Another challenge that faces language testing researchers is the need to evaluate computer-assisted language tests. As described earlier, current practices have focused on efficiency and comparability. However, one might argue that the complexity inherent in new forms of computer-assisted language assessment should prompt the use of more sensitive methods for investigating validity. When the goal of test development is to construct a more efficient test, then efficiency should clearly be part of the evaluation, but what about computer-assisted tests that are intended to provide more precise measurement, better feedback to learners, or greater accessibility to learners? If the scores obtained through the use of natural language processing analysis are evaluated by correlating them with scores obtained by human raters or scores obtained with dichotomously scored items (e.g., Henning, Anbar, Helm, and D’Arcy, 1993), how is the potential additional value of the computer to be detected?

In arguing for evaluation methods geared toward computer-assisted language tests, some language-testing researchers have focused on interface issues (Fulcher, 2003; Noijons, 2004). This approach focuses on an important area that is distinct for computer-assisted tests. It seems that the challenge is to place these interface issues within a broader perspective on validation that is not overly preoccupied by efficiency and comparability with paper-and-pencil tests. Chapelle, Jamieson, and Hegelheimer (2003), for example, frame their evaluation of a Web-based test in broader terms, looking at a range of test qualities. Chapelle and Douglas (2006) suggest the continued need to integrate the specific technology concerns into an overall agenda for conceptualizing validation in language assessment that includes the consequences of test use. Technology reemphasizes the need for researchers to investigate the consequences of testing. Such consequences might include benefits such as raising awareness of the options for learning through

technology. In this way, CALT may offer a kind of positive washback if, as many teachers and researchers argue, students should have access to learning materials online to increase computer literacy and literacy in the target language.

#### FUTURE DIRECTIONS

These two sets of challenges—the obvious ones pertaining to infrastructure and the more subtle conceptual issues evident to language testing researchers—combine to create a third issue for the field of applied linguistics. How can improved knowledge about the use of technology be produced and disseminated within the profession? What is the role of applied linguist in resolving the complex issues associated with computer-assisted language assessment? What is the knowledge and experience that graduate students in applied linguistics should attain if they are to contribute positively to the next generations of computer-assisted language tests? At present, it is possible to identify some of the issues raised through the use of technology that might be covered in graduate education, but if graduate students are to dig into the language-testing issues, they need to be able to create and experiment with computer-based tests.

Such experimentation requires authoring tools that are sufficiently easy to learn and transportable beyond graduate school. Commercial authoring tools that are widely accessible are not particularly suited to the unique demands of language assessment such as the need for linked items, the evaluation of learners' oral and written production, and the collection of spoken responses. As a consequence, many students studying language assessment have no experience in considering the unique issues that these computer capabilities present to language testing. In a sense, the software tools available constrain thinking about language assessment.

Limitations in accessible authoring tools may account in part for limits in the use of technology in language assessment today. Based on a review of the state of research and practice in computer-assisted language assessment, Chapelle and Douglas (2006) conclude that progress has been evolutionary rather than revolutionary. The evolutionary changes are grounded in maximizing efficiencies by using technology to improve the same testing practices that have been in place for years. Revolutionary changes may be on the horizon based on recent developments such as DIALANG that offer assessment to learners for their benefit, but such developments are likely to come hand in hand with increases in our understanding of language acquisition.

In the meantime, can technology make language assessment more efficient? Probably for those test developers with the resources and

knowledge to take advantage of current computer capabilities. For test users and test takers, the response would have to be more equivocal. However, efficiency is only part of the issue. The question about technology is also about the extent to which computer-assisted assessments have helped to increase the usefulness of assessment throughout the educational process, strengthen applied linguists' understanding of language proficiency, and expand their agendas for test validation. Some signs of progress in these areas are evident.

## LARGE SCALE LANGUAGE ASSESSMENTS

### INTRODUCTION

Large-scale language assessments have become increasingly important in the last 25 years in many parts of the world in the school, college, and university contexts. This type of assessment is used in the school context mainly to monitor student progress through standardized test administration, scoring, and reporting, to collect uniform baseline information from a large group of students across geographical areas, to provide diagnostic information to all stakeholders (teachers, students, parents, school, administrators, etc.), and for state level accountability purposes. At the college and university levels, this type of assessment (popularly known as the entrance examination) is used primarily in the screening and selection of applicants to these institutions, in measuring student achievement across geographical regions for accountability purposes, to encourage competition, and to ensure equal opportunities (as only the highly able can be rewarded with admission to colleges and universities and job opportunities). As varied as these purposes are, the main feature of large-scale language assessment is the uniformity of tests and testing practice (including test administration, scoring, reporting, and score interpretation) across geographical regions, administration time, test raters and score interpretation. This has been largely possible because of the influences of modern educational measurement theory on large-scale assessment practice. While this emphasis on uniformity has served large scale language assessment reasonably well, there have been criticisms regarding the inflexibility of test conceptualization and design, a lack of fairness research, and inadequate skills diagnosis and feedback to test score users. These topics and challenges are discussed after a brief examination of the early developments of large-scale language assessment.

### EARLY DEVELOPMENTS

It can be argued that the prehistory of large-scale assessment system started with the Chinese Civil Service examination system instituted in Imperial China as early as the Han Dynasty (202 BCE to 221CE), continued during the Sui emperors (589–618CE) and T'ang (618–906), with heavy reliance during the Ming (1368–1644) and the Qing emperors

(1644–1911). In all the dynasties, the examination system was primarily created as a way of identifying merit and capability, and offering equal opportunity as an alternative to privilege and patronage in the selection of civil servants, but also to reduce the power of the aristocracy and create a bureaucratic class that was obedient to the emperor. In the examinations at the district, prefectural, qualifying, provincial, metropolitan and the palace levels, the examinations included language tasks such as the ability to write an essay on a political topic, to write poetry on given subjects using set poetic forms or rhymes, calligraphy (called the Imperial rescript or exact article reproduction), along with knowledge of the classics based on questions from the Four Books<sup>1</sup> (Miyazaki, 1976).

In Europe on the other hand, as Durkheim (1938) states “in the university and the colleges of the Middle Ages, the system of competition was completely unknown. In those days, there were no rewards to recompense merit and induce effort. Examinations were organized in such a way that for conscientious pupils they were little more than a formality” (trans. Collins, 1979, p. 261). According to Amano (1983), in the seventeenth century,

“government offices were virtually the property of the aristocracy. Important families directly participated in the sale and purchase of government offices and in the reassignment of officials . . . however superior the Chinese competitive examination system might have been, the necessary social and political conditions for its import were not found in Europe. It was not until the eighteenth century that a competitive examination system became linked to the system for employing government officials” (trans. Cummings and Cummings, 1990, p. 10).

In England’s Victorian era, the idea of examinations took root under the influence of utilitarian thinkers like Bentham, Mill, and Macaulay. Macaulay who entered parliament in 1830 also became a noted supporter of the use of examinations for entry to public office. He developed the argument that early promise in youth is a good predictor of people’s potential for future tasks and examinations were the best way to measure this potential. The examination boards of Oxford and Cambridge had their origins around the same time in the 1850s. In 1857, the University of Oxford Delegacy of Local Examinations was established by statute to conduct examinations as part of a movement to reform universities and make them more socially involved. The University of Cambridge Local Examinations Syndicate (UCLES) was established

---

<sup>1</sup> The Four books are: *Confucian Analects*, (*Lun Yü*), *Mencius*, *The Great Learning* (*Ta Hsiieh*), and *The Doctrine Of The Mean* (*Chung Yung*).

in 1858. The first school level examinations were held in December that year, but it was not until 1913 when the *Certificate of Proficiency in English* (CPE) was developed and administered. The first examination was twelve hours long and was composed of the following sections: translation from English to French, translation from French or German into English, questions of English grammar, English essay, English literature, English phonetics, dictation, reading aloud and conversation. Admittedly, the number of test-takers was small, but by 1946 about 1400 test takers took the examination in many parts of the world (Weir and Milanovic, 2003). It can therefore be said that the ground work for administering a large-scale assessment was set with the CPE.

In the USA, the earliest language testing activity can be traced to French language examinations in 1876. According to Barnwell (1996), the questions included translations from French into English and vice versa, and grammar questions on verb conjugation. Barnwell states “in 1896 the Modern Language Association created a committee to study existing conditions of modern language teaching and make recommendations for improvements in syllabus and teacher training” [and the committee also] “offered some specimen examinations in French and German for college entrance” (p. 2). The College Entrance Examination Board (now known as the College Board) was subsequently set up in 1900 and standardized examinations were offered a year later in French and German, and later Latin and Spanish. Soon, hundreds and thousands of students were taking language examinations. However, the examination questions were still dominated by translation of classical texts (e.g., French translation to English of a Victor Hugo poem), followed by grammar (mainly conjugation of verb tense, possessive adjectives, and pronouns). Barnwell (1996) points out that the College Board was criticized for the content of the tests and for unreliability in the examinations. This type of format was soon replaced in the 1920s with a new design that used different response formats such as true–false, multiple-choice, matching, completion, correct the error, and rearrangement. Vocabulary and grammar testing benefited from these new formats and they were used widely because of increased reliability of scoring. The scope of language examinations expanded somewhat as can be seen in the College Board’s 1934 French examination sections: reading comprehension, objective grammar test, French to English translation and English to French translation, and free composition (Barnwell, 1996).

Although many universities used such tests in their courses and thousands of students took such examinations in the 1930s and 1940s, it was the Army Specialized Training Program of teaching languages (and the testing that accompanied it) during World War II that can be truly considered the beginnings of large-scale language teaching

and assessment. According to Barnwell (1996), the ASTP administered over 500 language courses to military personnel in a wide variety of languages and because the army was keen on continuous assessment, there was a lot of assessment going on. He states that grammatical knowledge dominated tests although at some institutions used other question types such as “paraphrasing spoken anecdotes or situations, oral responses to questions, dictation, and written responses to auditory comprehension questions were used” (p. 81). However, with the cancellation of the ASTP in 1944, scarcely a year after the program began, large-scale language assessment lost momentum until the 1950s when the US government created the Cooperative Research Program which helped the Modern Language Association (MLA) develop standards for linguistic proficiency for teachers of foreign languages. According to Barnwell (1996), the MLA administered 26,000 language tests in 1960 and 43,000 in 1961 on a pilot basis. The tests that came out of these pilots were the MLA Proficiency tests for Advanced Students in 1962 and the MLA Cooperative Tests in 1964. This was truly the beginning of large-scale language assessment in the USA.

#### MAJOR MODERN CONTRIBUTIONS AND ORGANIZATIONS

Three organizations that have made important modern contributions to large-scale language assessments are the University of Michigan’s English Language Institute, the University of Cambridge’s ESOL Division, and Educational Testing Services’ Test of English as a Foreign Language (TOEFL) Program. The major tests from these organizations are discussed in turn and other contributors are briefly mentioned.

The *Michigan Test of English Language Proficiency* was the first large scale assessment that was developed in the USA at the *English Language Institute (ELI) of the University of Michigan* in 1961. It consisted of three parts: the oral rating by the examiner, a written composition and 100 objective four-choice items on grammar, vocabulary, and reading comprehension. This was the beginning of the array of tests that the ELI has developed over the years. It currently administers one admissions test, the *Michigan English Language Assessment Battery (MELAB)*, a four-part test designed to measure proficiency in advanced-level language skills for admission to English-medium colleges and universities particularly in North America; and the *CPE*, a multi-skill, advanced-level test battery that provides successful examinees with an official certificate that can be used as evidence of English-language proficiency for education and employment purposes in the examinee’s home country; and the *Certificate of Competency in English*, a multi-skill, intermediate-level test battery that provides successful

examinees with an official certificate that can be used as evidence of English language competency. The MELAB, the flagship test of the ELI, in its current version has three sections: a 30-min impromptu essay on one of two assigned topics scored by two raters on a 10-step holistic scale; a 50-item listening test delivered via audio-tape in multiple-choice with two the distracter format; and a 100-item section on grammar, cloze, vocabulary, and reading comprehension.

*The University of Cambridge's Cambridge ESOL* (English for Speakers of Other Languages) Division offers a variety of tests for learners of English. The Cambridge ESOL Main Suite exams are designed for learners at all levels from the very elementary level *Key English Test* to the most advanced *CPE*, which was first developed in 1913. The *Key English Test* is an elementary level exam, which tests the ability to cope with everyday written and spoken English communication at a basic level. The *Preliminary English Test* is an intermediate level exam, which tests the ability to cope with everyday written and spoken communications at a slightly higher level. The *First Certificate in English* is an upper intermediate level exam, which aims to test ability to deal confidently with a range of written and spoken communications. This test is the most widely taken exam of this set of examinations. The *Certificate in Advanced English* is an advanced exam, which tests the ability to communicate with confidence in English for work or study purposes. The *CPE* is an advanced-level exam, for learners who have achieved a high level of language skills and are able to function effectively in almost any English-speaking context. In addition, the *Certificates in English Language Skills* introduced in 2002 provide modular assessment of English language skills and are ideal for people who do not need to achieve the same level across all four skills (reading, writing, listening, or speaking). Each skill is assessed separately at each of three levels, and candidates can enter for any combination of skills and levels.

Cambridge ESOL also offers two sets of business English examinations. The *Business English Certificates* (BEC) at the preliminary, vantage, and higher levels. These tests are designed to test English-language ability used in the context of business and they are suitable for adults who are either preparing for a career in business or already in work. The *Business Language Testing Service* (BULATS) is a multi-lingual assessment service for companies that require a rapid, accurate means of assessing language skills in English, French, German, and Spanish. The BEC and BULATS are popular in India and China. A relatively new set of tests titled *Young Learners English* (YLE) *Tests* has also been developed by Cambridge ESOL. The Cambridge *Young Learners English Tests* are designed to assess the English of primary learners between the ages of 7 and 12 at three levels: flyers, movers, and starters. Finally, the *International English Language Testing System*

(IELTS), (administered jointly by Cambridge ESOL, the British Council and IDP Education Australia), is a language test for people who need to demonstrate their level of proficiency in English for a specific purpose, mainly for admission to universities and colleges in the UK and USA, and by employers, immigration authorities, and professional bodies. The test covers all four skills of listening, reading, writing, and speaking and uses multiple response formats with a variety of test input materials.

The TOEFL, developed and administered by the Educational Testing Service (ETS), Princeton, is arguably the most well-known and widely used large-scale language assessment in the world. The idea of the TOEFL formed at the founding conference sponsored by the Center for Applied Linguistics (CAL) of the Modern Language Association of America in cooperation with the Institute of International Education (IIE) and the National Association of Foreign Student Advisors (NAFSA) in 1961. According to Taylor and Angelis (in press),

“the first TOEFL was administered in 1964 at 57 test centers to 920 test candidates. In the following year, ETS and the College Board were given responsibility for continuing the operational program, which they changed gradually to meet growing demand for the TOEFL. In 1973, ETS was given sole responsibility for TOEFL test development, operations and finances.”

In terms of the construct of the test, the decision was to have four separate subsections each providing a separate sub-score: listening comprehension, English structure, vocabulary, and reading comprehension. According to Taylor and Angelis (in press),

“the decision of how to test speaking was deferred to later versions of the test and the recommendation was made that research on techniques for measuring oral production skill be undertaken at once for the possible inclusion of such devices in later test forms. Writing ability was to be tested by objective techniques, not by the scoring of writing samples. However, it was decided that an unscored composition would be furnished to test users to use as they pleased.”

The subtests and item formats followed the discrete-point testing approach (which emphasized isolating skills and components as much as possible and testing one discrete point of language item at a time).

The TOEFL program was revised to include the *Test of Written English* (TWE), a direct assessment of writing ability, and the *Test of Spoken English* (TSE), a tape-mediated speaking ability, two decades later due to the public demand for assessment of writing and speaking. Over the years, the TOEFL (and to a lesser extent the TWE and the TSE) became mandatory for non-American and non-Canadian non-native speakers of English applicants to undergraduate and graduate

programs in U.S. and Canadian English-medium universities. With the phenomenal increase of such applicants in the early 1980s and 1990s, the TOEFL was being administered to close to one million test-takers annually. Although this was a new watermark for large-scale language assessment, the TOEFL content and structure remained more or less the same over the decades (despite the addition of the TWE and the TSE). Thus, a significant project titled New TOEFL (later known as the TOEFL 2000) began with TOEFL staff and the TOEFL Committees of Examiners and Researchers in the 1990s with the intention of revising the TOEFL to include more communicative constructed-response tasks, direct assessments of speaking and writing, integration of skills and modes, more diagnostic information to score users, and the possibility of computer delivery. This project first resulted in 1996 in the development of the computer-based TOEFL (TOEFL CBT) which was more or less the delivery of the existing TOEFL on computer. The internet-based TOEFL (known as the *ibTOEFL*), a more innovative test, was launched in 2005; more about this test in the next section.

A large-scale language assessment that is not widely known, but deserves wider recognition is the *National Matriculation English Test* (NMET) in the People's Republic of China. The NMET is the university entrance test of English and its purpose is to make inferences about candidates' English language ability, which are used in university admission decisions together with the scores from university entrance tests in another five or six secondary school subjects. In 2005, the test was taken by about eight million secondary school students who wished to gain entrance to Chinese colleges and universities. Another test from China that is increasingly important is the *College English Test* (or the CET). Many colleges and universities require the CET certificate as a requirement for a Bachelor's diploma; a new form of the test in 2005 includes listening and oral sections. It is reported that 11 million test takers took the CET in 2006 arguably making this test the largest in terms of test taker volume in the world.

The *Language Testing Research Center in Melbourne*, Australia, is a major center that is exclusively dedicated to language assessment development and research. The Center specializes in development of tests and other instruments for language proficiency measurement, evaluation of programs for language learning and teaching, and delivery of education and training in language assessment and language program evaluation. Among their well-known tests are the *Occupational English Test for Health Professionals (OET)* which assesses and certifies the English language proficiency of overseas-trained, health professionals wishing to gain accreditation to practice in Australia; the *English Proficiency Test for Indonesia*, a test for teachers of English to improve the quality of English language teaching in Indonesian

schools; the *Special Test of English Proficiency (STEP)* used by the Australian Department of Immigration and Multicultural Affairs to assess the functional English proficiency of certain classes of refugees wishing to obtain permanent residence in Australia; the *Australian Assessment of English Communication Skills (access:)* used to assess functional English for use in a range of everyday and professional settings was used to assess the English proficiency of intending immigrants to Australia. Foreign-language tests developed include the *Bilingual Health Language Proficiency Test* (a telephone-based test, available in Arabic, Cantonese, Greek, Italian, Mandarin, Spanish, and Vietnamese), assesses how well bilingual health professionals are able to interact with patients with limited English skills; *Teacher Proficiency Tests: Japanese, Italian and Indonesian* used to identify appropriate standards of language proficiency for the teaching of Indonesian, Italian, and Japanese in schools; the *Japanese Language Test for Tour Guides*, a practical assessment of Japanese-speaking guides' linguistic ability when interacting with tourists in a variety of situations.

*The CAL, Washington DC*, an important test developer has developed several simulated oral proficiency interviews (SOPI) in Arabic, Chinese, French, German, Japanese, Hebrew, Hausa, Indonesian, Portuguese, and Spanish starting in 1985. The SOPI is a performance-based, tape-mediated speaking test and follows the general structure of the oral proficiency interview (OPI) used by government agencies and the American Council on the Teaching of Foreign Languages (ACTFL) to assess speaking proficiency. According to the CAL website [[www.cal.org](http://www.cal.org)], "Whereas the OPI is a face-to-face interview, the SOPI relies on audio-taped instructions and a test booklet to elicit language from the examinee. Unlike many semidirect tests, the SOPI contextualizes all tasks to ensure that they appear as authentic as possible." In recent years, the computer-based oral proficiency interview (COPI) has been envisioned to be the next generation of the SOPI. According to the CAL website, "the goal of the COPI was to use the advantages of multimedia computer technology to improve the SOPI by giving examinees more control of various aspects of the testing situation and by increasing raters' efficiency in scoring the test". The COPI allows examinee choice in the following: thinking and response time, speaking functions and topics, level of task difficulty, and language of directions. The COPI also enables the rater to 'rewind' or 'fast-forward' an examinees' response with a single click, and easily navigate from one task to another, or from one examinee to the next." CAL is currently working on a project to develop and deliver professionally prepared listening and reading proficiency tests in Arabic and Russian via the Internet.

A somewhat similar organization is the *ACTFL* in the USA. It offers oral proficiency testing in more than 65 languages and writing proficiency

testing in 12 languages. The Oral Proficiency Interview (OPI) is offered in popular languages like English, Mandarin, French, German, Spanish, Italian, Japanese, and Russian but also less commonly taught languages in the USA like Albanian, Arabic, Cambodian, Cantonese, Croatian, Czech, Hindi, Hmong, Hebrew, Khmer, Korean, Lao, Swahili, Urdu, and Vietnamese. The writing proficiency testing is offered in Albanian, Arabic, English, French, German, Italian, Japanese, Spanish, and Russian. Many researchers have been critical of the OPI (e.g., see Bachman and Savignon, 1986) but the ACTFL continues to serve major university and governmental agencies.

*The National Institute for Testing & Examination* in Israel constructs and administers standardized tests for entrance to universities. The *Inter-University Psychometric Entrance Test* (PET) administered nation-wide is used as a tool for predicting academic performance. It is used for selecting applicants to institutes of higher learning when these institutes are unable to admit all applicants and can only select those who are most likely to successfully complete their studies. The English test section is part of the PET and the Hebrew proficiency test is an optional test.

Another active organization in language testing is the Association of Language Testers in Europe (ALTE), an association of institutions within Europe, each of which produces examinations and certification for language learners. Started in 1989, today there are 31 members representing 26 European languages including the lesser known languages such as Basque, Bulgarian, Catalan, Estonian, Irish, Latvian, Lithuanian, Slovenian, and Welsh. According to the ALTE website, “the principal objectives of ALTE are to establish common levels of proficiency in order to promote the transnational recognition of certification in Europe, to establish common standards for all stages of the language testing process (for test development, task and item writing, test administration, marking and grading, reporting of test results, test analysis and reporting of findings) and to collaborate on joint projects and in the exchange of ideas and know-how.”

The *Language Training and Testing Center (LTTC)* in Taiwan, Republic of China is an organization that develops and administers large-scale, foreign language proficiency tests in English, Japanese, French, German, and Spanish locally in Taiwan. The LTTC developed the *General English Proficiency Test (GEPT)* in 1999 as part of the Government’s push to promote and encourage the general study of English. The GEPT is divided into five levels with content as appropriate to each level, and each level incorporates listening, reading, writing, and speaking components. The GEPT is used by various government institutions and also by many universities in Taiwan and other schools for entry, classroom achievement, and graduation requirements.

Additionally, the Center administers language tests in Japanese, French, German, and Spanish, administered since 1965. These tests are used by public and private institutions as an element in decision-making on promotion or selection for work or study overseas.

Similarly, there are many other tests developed and administered nationally or internationally. Examples include the *Japanese Language Proficiency Test*, a four-level test of writing-vocabulary, listening, and reading-grammar administered by the *Japan Foundation* in coordination with local host institutions; the Instituto Cervantes' *Diplomas de Español examinations* developed and administered by the *University of Salamanca*, and conducted on behalf of the Spanish Ministry of Education and Science; and the *Sookmyung Women's University's Multimedia-Assisted Test of English* for the Korean context.

Large-scale language achievement tests (based on school-curriculum standards) although not as well-documented as proficiency tests are used in school exit examinations around the world (e.g., in schools in California and New York in the U.S., and schools in India, Egypt, Singapore, and Taiwan). These tests are typically based on set texts and tend to be focused on reading and writing and, in some cases, literature-oriented.

In summary, these large-scale proficiency and achievement assessments (and many more that are not reported here due to lack of space) show that this type of assessment has become increasingly popular and will continue as colleges and universities need to find ways to select and place students, and employers need to offer equal opportunities. Most of the tests listed here (and many in operation) have been reviewed in journals such as *Language Assessment Quarterly* and *Language Testing*. A recently published collection of 20 ESL test reviews by Stoyonoff and Chapelle (2005) provides brief evaluations and necessary background to understand the reviews. From all these reviews in general, it is obvious that while some well-known agencies allocate resources for research, maintenance, and the writing of test manuals, and also execute these projects in a timely fashion, many others develop tests and administer them without ever conducting research, or writing a test user's manual or a technical manual that defend the claims they are making regarding their tests.

#### NEW DEVELOPMENTS AND WORKS IN PROGRESS

One of the most important new developments was the launching of the new TOEFL, now known as *iBTOEFL* (short for internet-based TOEFL) in 2005. It is an important new development as it is a significant step in large-scale language assessment because the test design, content, structure, and delivery are quite different from the TOEFL

and the TOEFL CBT. The main features of the iBTOEFL are a new speaking section in which there are independent and integrated skills tasks, a listening section with longer lectures and conversations with note-taking, a reading section that has questions that ask test-takers to categorize information and fill in a chart or complete a summary, and a writing section that has both an independent and an integrated task.

These tasks were designed, created, piloted, and finally assembled in a five-year long deliberate process. To begin with, project staff and consultants from outside the TOEFL Program developed a series of documents known as TOEFL Framework papers. The general TOEFL Framework paper (Jamieson, Jones, Kirsch, Mosenthal, and Taylor, 2000) outlined the task characteristics in terms of situation (participants, content, setting, purpose and register), text material (grammatical, pragmatic and discourse features), and test rubric (questions/directives, response formats, and rules for scoring). Each of the skill teams (listening, speaking, reading, and writing) then developed separate frameworks [see the TOEFL website for details: [www.toefl.org](http://www.toefl.org)]. The result was a test design that favored assessing language performance in terms of independent and integrated skills, thus eliminating the grammar/structure section.

In addition, the project placed a great deal of emphasis on investigating the language of academic tasks and language use in academic contexts through commissioned research. Biber, Conrad, Reppen, Byrd, and Helt (2002) undertook a study to describe the language of academic tasks by identifying the linguistic features of spoken and written registers that are encountered by North American students in English-medium university classes, to construct tools for test developers to explore the grammatical characteristics of the corpus during task design, and to serve as a potential source for aural texts for listening tasks. Rosenfeld, Leung, and Oltman (2001) conducted a study to understand language use in academic environment through a job analysis of students in North American, English-medium universities. Researchers will have their hands full with similar research studies for the next few years before they can defend their claims regarding the validity of score interpretations, fairness, access, and consequences of the iBTOEFL.

Another important new development is Ordinate's *Spoken English Tests* (SET) which are automated tests of spoken English and the new *Spoken Spanish Test* (SST), which assesses spoken Spanish and ability to understand spoken Spanish. The SET tests are delivered over the telephone and scored by computer in a matter of minutes. Responses to four item tasks are currently used for automated scoring: reading aloud, repeating sentences, building sentences, and giving short answers to questions. According to Ordinate's website, [see [www.ordinate.org](http://www.ordinate.org)], scoring "one correct word sequence is expected for each response to

the reading and repeat items. Expert judgment was used to define correct answers to the short-answer question and sentence-build items. Most of the short-answer and some of the sentence-build items have multiple answers that are accepted as correct. All short-answer questions were pretested on diverse samples of native and nonnative speakers. All items retained in the item banks were answered correctly by at least 90% of the native sample.” Based on research in speech recognition, statistical modeling, linguistics, and testing theory, the Ordinate testing system uses a speech recognition system that is specifically designed to analyze speech components from native and nonnative speakers of the language of the test. It then uses statistical modeling techniques to assess the spoken performance. Ordinate claims that its SET tests are more objective and reliable in operation than today’s best human-rated tests, including one-on-one oral proficiency interviews. Its main advantage over other speaking tests is its practicality; it is computer-scored in a matter of minutes and is available via the phone or the internet. There are questions however, regarding the comprehensiveness of the tasks (considering the test is supposed to assess general speaking ability), the authenticity of the tasks in terms of assessing speaking ability in the workplace (e.g., see Chun, 2006), and the breadth of acceptable responses, keeping in mind the many dialects of American English.

#### INFLUENCES FROM EDUCATIONAL MEASUREMENT<sup>2</sup>

Large-scale language assessment owes a great deal to the developments and advances made in educational measurement and testing over the last 100 years. From the earliest days of normative psychometrics with Cattell, Galton, and Binet in the late nineteenth century, and especially Yerkes and the psychological examination through the Army Alpha exam in the early twentieth century, the focus was on systematic and rigorous assessment of the skills to be tested. According to Stigler (1986), Edgeworth, influenced by Galton’s anthropometric laboratory for studying physical characteristics, articulated the notion of *consistency (or reliability)* in his papers on error and chance. Further, as testing became more popular in the twentieth century, modern measurement theory (with influential treatments from Spearman, Pearson, Stevens, Guilford, and Thurstone) developed techniques including

---

<sup>2</sup> I’m not including equally important influences from other areas such as psychology, discourse and critical theory due to lack of space. These fields have enabled language assessment researchers to use analytical techniques such as verbal protocol analysis (see Cohen, 2006), conversational analysis (see Lazaraton, 2001) and critical language testing (see Shohamy 2001).

correlation and factor analysis. These statistical procedures became the primary evaluative procedures for test development and test evaluation. A quick examination of test reviews in the *Mental Measurements Yearbooks* of previous decades will show how deeply influential reliability and correlational techniques were in the field of educational and psychological testing. Over the years, language assessment researchers also used these rigorous procedures for test development and statistical techniques, including factor-analysis and structural equation modeling, to examine, among others, construct validation and the validity of score interpretations (Bachman and Palmer, 1982; Bachman, Davidson, Ryan, and Choi I.-C., 1995a; Carr, 2006), and relationships between several test-taker characteristics and test performance (Kunnan, 1995; Purpura, 1999). More recently, when item response theory was available as an alternative to classical true score theory, language assessment test developers and researchers embraced it and it is now widely used in both test development and research (McNamara, 1996). Further, when generalizability theory, grounded in factorial design and the analysis of variance, was developed by Cronbach and his colleagues (Cronbach, Gleser, Nanda, and Rajaratnam, 1972), it was used in the field of language assessment to examine sources of measurement error between different facets of measurement (Bachman, Lynch, Mason, 1995b; Lumley and McNamara, 1995). Finally, the development of statistical procedures for criterion-referenced tests by Brennan (1984) saw the application of such procedures to criterion-referenced language tests (Brown and Hudson, 2002; Kunnan, 1992).

In the area of validation, the American Psychological Association's (1954) *Standards* movement (recommendations for educational and psychological tests and manuals) influenced language assessment test development and research. Lado (1961), the first author in modern language assessment, mirroring the *Standards*, wrote about test evaluation in terms of validity (in terms of face validity, validity by content, validation of the conditions required to answer the test items, and empirical validation in terms of concurrent and criterion-based validation) and reliability. Later, Davies (1968) presented a scheme for determining validities listing five types of validities: face, content, construct, predictive, and concurrent, and Harris (1969) urged test writers to establish characteristics of a good test by examining tests in terms of content, empirical (predictive and concurrent), and face. The *Standards* were reworked during this time (APA, 1966, 1974) and the interrelatedness of the three different aspects of validity (content, criterion-related, and construct validities) was recognized in the 1974 version. This trinitarian doctrine of content, criterion-related and, construct validity (reduced in number as concurrent and predictive validity of the 1954 version were combined and referred to as criterion-related) continued to dominate

the field. In 1985, the *Standards* were reworked again titled “Standards for educational and psychological testing” (instead of *Standards for Tests*). This new reworking included Messick’s unified and expanded conceptual framework of validity that was fully articulated in Messick (1989) with attention to values and social consequences of tests and testing as facets of validity of test-score interpretation. Language-assessment researchers like Bachman (1990) and McNamara (1998, 2006) have presented and discussed Messick’s unified and expanded view of validity. Empirical research using Messick’s framework was also popular (see Cumming, 1995; Kunnan, 1998). In the last decade, there have also been advances in how this expanded view of validity has included the concept of fairness (see *Standards for Educational and Psychological Testing* (APA, AERA, NCME, 1999), as well as argument-based validation (see Kane 1992). Bachman (2005) has presented a case for a test use argument in language assessment.

#### CHALLENGES AND FUTURE DIRECTIONS

One of the main challenges in large-scale assessment research facing the field now is the fairness of language assessments. Several organizations have defined the notion of fairness: the *Code of Fair Testing Practices in Education* (1988, 2004), the *Standards for Educational and Psychological Testing* (APA, AERA, NCME, 1999), and the many versions of the *ETS Standards for Quality and Fairness* (2002, 2003, and 2004). In addition, several educational and psychological researchers have defined the concept from the American perspective (Willingham and Cole, 1997; Zieky, 2006) and the British perspective (Gipps and Murphy, 1994; Goldstein, 1993). In the field of language assessment, Kunnan (2000, 2004) has defined fairness in language assessment as the use of fair means (both in test content and test method) for assessing language abilities and the fair use of test scores obtained from tests and has proposed a Test Fairness Framework for conducting fairness reviews of tests. The framework includes the following test qualities: validity, absence of bias, test access, test administration, and test consequences. For example, from the point of view of validity, a fairness review is a way of collecting evidence for construct-relevance, construct-representation, and reliability. In addition, from the point of view of absence of bias, fairness reviews need to be conducted so that evidence of fairness can be collected through empirical analysis of test performance in terms of group membership (gender, race, ethnicity, national, or regional origin, native language, disability, age, and economic status), and in the U.S., particularly for historically disadvantaged groups (such as women, Native Americans, African Americans, Hispanic Americans, and Asian Americans). Evidence of appropriate test access in terms of appropriate

accommodations and modifications for test takers with disabilities, appropriate test administration in terms of physical conditions and test security, and positive social consequences of tests in terms of washback and remedies need to be collected for a fairness review. Thus, a thorough fairness review research is necessary to provide multiple pieces of evidence regarding the fairness of a language test. As Zieky (2006) points out, “the driving force behind fairness review is validity, not political correctness” (p. 363).

When this concept of fairness (and the types of evidence necessary to support it) is applied to large-scale language assessments, many of the assessments may be found wanting in terms of sufficient evidence. Language test reviews published in the *Mental Measurements Yearbook*, *Language Testing*, *Language Assessment Quarterly* and other publications have pointed out weaknesses of tests when measured against traditional notions of validity and reliability which are much narrower in scope (Stoynoff and Chapelle, 2005). And when the scope is broadened to include the notion of fairness, most tests are found to have insufficient evidence (Callet, 2005; Cheng and Qi, 2006; Gorman and Ernst, 2004). In part, this is due to the fact that fairness in testing is relatively new to educational, psychological and language tests and when this concept was used in the past, it was only to conduct item bias reviews and differential item functioning analysis of test performance data. One way to remedy this situation is to bring the notion of fairness in to test development and research: from the test design and creation stage, to construction selection, item writing, test assembly, administration, scoring, and finally to the research stage. Thus, to ensure fairness in language assessment, fairness should be a key consideration in the entire test development and research process along with ethical and professional standards (Kunnan and Davidson, 2003).

A second important challenge is that testing consumers have called for more descriptive test information that allows for meaningful interpretations and fair use of test results in order to improve instructional design and guide students’ learning. Traditionally, the main goal of language tests has been to make quantitative assessments of an individual test-taker’s language ability relative to other students in the normative group. Such norm-referenced interpretation of test results have been criticized for its lack of pedagogically meaningful information because teachers and test-takers cannot understand the meaning of such scores or their strengths and weaknesses in specific academic domains. This has led to a lack of constructive guidance in instructional remediation. Therefore, while a great deal of effort has been made in integrating advances in theories of second and foreign language learning into assessment practice, the use of aggregated test scores as an overall measure of language proficiency or achievement levels has made such

efforts less useful to test score users including principals, teachers, parents, and test takers. This concern has drawn much attention among educational researchers and practitioners (Alderson, 2005; Buck and Tatsuoka, 1998). Recently, several cognitive skills diagnosis models have been applied to second language assessment in reading and listening. For example, the Rule Space Model was applied to a short-answer listening comprehension test administered to Japanese college students (Buck and Tatsuoka, 1998). More recently, the College Board used the Rule Space Model to provide “*Score Report Plus*” to students who took the Preliminary SAT (PSAT) and National Merit Scholarship Qualifying Test (NMSQT). Jang (2005) and Alderson (2005) provide new examples of diagnosis in language proficiency. While these isolated examples are reassuring that researchers are continuing their efforts in this direction, the motivation and the research capabilities of testing agencies to provide such diagnostic feedback to test takers on a routine basis will continue to be a major challenge.

A third important challenge is the development and use of Code of Ethics or practice for the profession. In the last few years, momentum has gathered through publications such as the special issue of *Language Testing* and the special issue on ethics for language assessment in the *Language Assessment Quarterly* both guest-edited by Alan Davies (1997, 2004). The International Language Testing Association (ILTA) recently published a report of the task force on testing standards (1995) which was followed by ILTA’s Code of Ethics (2000) that lays out some broad guidance of how professionals should conduct themselves. In 2006–2007, ILTA is conducting workshops in several locations world-wide to collect ideas for a more inclusive and elaborate Code of Ethics and Practice.

Yet another challenge facing testing agencies that develop large-scale language assessments is the multitude of operational and practical matters that have to be mastered. The best equipped agencies make the operation look simple but there is a great deal that has to be taken care of in a large-scale language assessment. For example, there are many practical and operational matters such as: conceptualizing and designing the test, developing adequate numbers of items and forms, planning and scheduling test administrations to test building parallel test forms, contracting and training item writers, test raters, establishing standard-setting, developing score reports, and dealing with test security, and writing test manuals. Testing agencies can master these challenges with a clear set of steps for test development (Downing, 2006) and with adequate, competent, and trained staff.

Other new challenges that are now surfacing due to the advent of computer and Internet technology include the delivery of tests on

computers and the Internet and innovative item formats that are technically possible on computer (as in *ibTOEFL*), speech recognition, automated computer scoring of essays, test accommodations for test takers with disabilities, test security, and limitations and weaknesses of test score reports of proficiency tests.

Finally, the role of assessment in society or the wider context of a community into which an assessment is deployed or imposed cannot be ignored. Broadfoot (1996) and Spolsky (1995) have raised this concern from different educational contexts. Shohamy (2001) shows empirically how some of these contexts (and the players in them) negatively affect test takers, schools, parents, and the community at large. More recently, Kunnan (2005, 2006) presented a Test Context framework, which includes the political and economic, the social, cultural, and educational, the technological and infrastructural, and the legal and ethical contexts. He argues that these salient contexts should be used to explain the motivations, expectations and successes, and failures of assessments.

There are also many promising ideas on the horizon that could take us forward in the next decade: corpus linguistics (Biber, Conrad, Reppen, Byrd, and Helt, 2002), computer-assisted automated scoring, evidence-centered design (Mislevy and Riconscente, 2006) and assessment use argument (Bachman, 2005; Kane, 2006).

## CONCLUSION

It has been almost 50 years since the start of the TOEFL in 1961. It was probably the first language test in high enough volume to truly deserve the title of the first large-scale language assessment. Tests from Cambridge ESOL and the University of Michigan among others have followed and now these too could be called large-scale language assessments. The key feature of this type of assessment has been the ability of the test developers to design, develop, and administer assessments in such a manner that they are uniform, stable, consistent, valid, and fair across geographical areas and time periods so that test takers have equal opportunity to demonstrate their abilities. New developments in the field including software make it easier to develop and launch tests relatively quickly. As a result, there are many more large-scale language assessments today. However, not all test developers are able to defend the claims of their tests as they do not invest in test research. This is a critical component of test development; without this part tests will not be worth anything. In order to be able to do this, language assessment agencies need to have the motivation and resources so that they can conduct research to defend the claims of their tests, to continue to improve their

operations to meet current needs, and to continue to use advances from educational and language assessment research.

## CRITERIA FOR EVALUATING LANGUAGE QUALITY

### INTRODUCTION

The desire to establish criteria for the assessment of language quality in performance tests dates from the Second World War. The goal of performance testing since then has been to predict the test-taker's ability to function under 'real life conditions', first in a military and then in an academic context (Fulcher, 2003). To invest numerical test scores with 'real world meaning', language testers have argued that it is necessary to anchor scores in observable behaviour. Performance tests developed since the Second World War have therefore been by definition criterion referenced, and have involved an implicit validity claim that the quality of performance on test tasks, as reflected in the test score, can be generalised to an explicitly defined non-test domain.

Qualitative descriptions of language have been variously described as the scoring *rubric*<sup>1</sup> (U.S.) or the band/level *descriptors* (UK). These are normally placed in a *rating scale* consisting of two or more bands/levels on a nominal or ordinal *scale*. Each level on the rating scale has a descriptor and usually a number of *benchmark*<sup>2</sup> samples that are claimed to typify performances at that level. The rating scale is normally used to match a performance with the most relevant description to generate a score. However, it may also be used for reporting the meaning of test scores to decision makers, or less frequently for guiding the writing of test tasks (Alderson, 1991).

### EARLY DEVELOPMENTS AND THE ACTFL GUIDELINES

Military performance tests suggested by Kaulfers (1944, p. 137) were to be graded on a three-level rating scale, the rubrics of which described what an expert and competent test taker could do with the language

---

<sup>1</sup> In Europe the term rubric is most often used to refer to instructions for test takers (Davies, Brown, Elder, Hill and Lumley, 1999, p. 206).

<sup>2</sup> Benchmark is the process of establishing a standard against which to measure progress (Davies, Brown, Elder, Hill and Lumley, 1999, 15), but the two terms are frequently misused and confounded when used interchangeably as nouns. Benchmark samples are samples of performance (spoken or written) judged to be at a particular level within a descriptive system, that typify performances at that level.

in a non-test military context. Although it is still frequently claimed that what emerged from the US military as the Foreign Service Institute (FSI) rating scale was decontextualised (devoid of context, content or performance conditions) (see Hudson, 2005, p. 209), as early as 1958 descriptors were attached to the FSI scale. The following example shows that from the earliest days some contextualisation was critical for performance testing.<sup>3</sup>

*FSI Level 2: Limited Working Proficiency*

Able to satisfy routine social demands and limited work requirements. Can handle with confidence but not with facility most social situations including introductions and casual conversations about current events, as well as work, family and autobiographical information; can handle limited work requirements, needing help in handling any complications or difficulties; can get the gist of most conversations on non-technical subjects (i.e., topics that require no specialised knowledge) and has a speaking vocabulary sufficient to express himself simply with some circumlocutions; accent, though often quite faulty, is intelligible; can usually handle elementary constructions quite accurately, but does not have thorough or confident control of the grammar (reproduced in Fulcher, 2003, p. 226).

During the 1960s the use of rating scales to anchor scores in the 'real world' became standard throughout the military and security agencies in the USA, resulting in a description of language performance known as the Interagency Language Roundtable (ILR) that was adopted in 1968 and is still in use today (Lowe, 1987).

In the 1970s anchoring test scores in descriptions of what learners can do in non-test situations spread throughout the educational sector, and questions started to be asked about whether the number of levels on existing rating scales were sufficient to describe progress in classroom language learning. In the early 1980s the American Council on the Teaching of Foreign Languages (ACTFL) and Educational Testing Service (ETS) received federal grants to adapt the FSI and ILR to create a description of language performance that could be used nationally and across languages (Liskin-Gasparro, 2003). The ACTFL *Guidelines* were published in 1986 and the speaking *Guidelines* revised in 1999.

---

<sup>3</sup> The initial FSI scale with only weak descriptors for the top and bottom levels appeared in 1952, but work on the scale was abandoned until 1956 when there was once again a political imperative to assess what military and diplomatic personnel could do with language following the war in Korea.

They are the de facto framework for describing language performance in the USA in both education and the workplace (Swender, 2003).

These descriptions combine linguistic and non-linguistic criteria. They are also assumed to be relevant to all languages and therefore *common* in application. The sequence of descriptors on the scale represents an intuitive understanding of the order of second language acquisition and the increasing complexity of real world tasks that learners can perform (see, for example, Fradd and McGee, 1994, pp. 130–134), but for which there is little empirical research evidence (Brindley, 1998; Chalhoub-Deville and Fulcher, 2003).

#### *ACTFL Guidelines 1999. Intermediate Low*

Speakers at the Intermediate-Low level are able to handle successfully a limited number of uncomplicated communicative tasks by being creative with the language in straightforward social situations. Conversation is restricted to concrete exchanges and predictable topics necessary for survival in the target language culture. These topics relate to basic personal information covering, for example, self and family, to daily activities and personal preferences, as well as to some immediate needs, such as ordering food and making simple purchases. At the Intermediate-Low level, speakers are primarily reactive and struggle to answer direct questions or requests for information, but they are also able to ask a few appropriate questions (ACTFL, 1999).

What we term the ‘FSI tradition’ of description has influenced the structure of later scales as well as the wording of descriptors.

The fact that we have concentrated on developments in the USA is notable, and for some may be surprising. While it is certainly true that the Certificate of Proficiency in English (CPE) has had an ‘oral’ component since 1913, the assessment of production was a matter for examiners who had an implicit experiential understanding of the link between performance and score (Roach, 1945; Weir, 2003, p. 10). A review of early work by Lazaraton (2002) similarly concentrates on the USA. Describing student performance in rating scales was a later development in the UK (Weir, 2003, pp. 28–29).

### MAJOR CONTRIBUTIONS: TWO IMPORTANT DESCRIPTIVE SYSTEMS

As many descriptions of language performance are produced by researchers and language teachers for specific purposes, they tend to have little impact beyond the immediate context of use, even if the research and development work is published (see, for example, Chalhoub-Deville, 1995; Fulcher, 1996; Upshur and Turner, 1995). National or trans-national

systems have had the main impact on assessment because they have become institutionalised. As Liskin-Gasparro (2003, p. 484) says of the ACTFL *Guidelines*:

They have been institutionalized in foreign language professional circles in the United States through their prominence in the textbooks used in foreign language teacher preparation programs and, more recently, in the Standards for Foreign Language Learning in the 21<sup>st</sup> Century. The national standards document has, in turn, served as the basis for the curriculum frameworks for foreign language instruction developed by 49 of the 50 states (as of writing this, Iowa is the only holdout).

The process of institutionalisation has led teachers, publishers, and test developers to use a system of description because it is the only *common* language they have, irrespective of whether this language has any relationship with the ‘real world’ it intends to describe. As we have already discussed the FSI tradition, here we will focus on two more recent systems, the Canadian Language Benchmarks (CLB) (Pawlikowska-Smith, 2000, 2002a, b) and the Common European Framework of Reference (CEFR) for Languages: Teaching, Learning, Assessment (Council of Europe, 2001).

### *Canadian Language Benchmarks*

Developed to assess the English of adult immigrants to Canada, it is claimed that the CLB is

1. a descriptive scale of communicative proficiency in English as a Second Language (ESL) expressed as 12 benchmarks or reference points;
2. a set of descriptive statements about successive levels of achievement on the continuum of ESL performance;
3. a statement (descriptions) of communicative competencies and performance tasks in which the learner demonstrates application of language knowledge (competence) and skill;
4. a framework of reference for learning, teaching, programming and assessing adult ESL in Canada (as a framework, the benchmarks provide a common professional foundation of shared philosophical and theoretical views on language education);
5. a national standard for planning second language curricula for a variety of contexts, and a common ‘yardstick’ for assessing the outcomes (Pawlikowska-Smith, 2000, p. 7).

Pawlikowska-Smith (2002a) argues that the CLB is based on a model of communicative proficiency, drawing specifically on notions of linguistic, textual, functional, socio-cultural and strategic competence,

adapted from Bachman and Palmer (1996) and Celce-Murcia, Dörnyei and Thurrell (1995). Competencies and tasks are said to be observable and measurable at each benchmark level, and within the framework there are three general levels (basic, intermediate and advanced), each with four subdivisions, for each of the four skill competencies (speaking, listening, reading and writing). This provides 12 benchmark levels for each of the competencies.

The core of each benchmark is the standard statements that describe what the learner should be able to do at each benchmark. They describe the four selected competencies or 'what the person can do' in the areas of social interaction, instructions, suasion and information, under specific conditions (including situational variables). In situations of a CLB-aligned curriculum, they are 'outcomes' after a session of study, which the learner should demonstrate to achieve the benchmark. The learner's performance is assessed against a mastery criterion (standard of adequate/satisfactory performance). Each benchmark lists some satisfactory performance indicators of effectiveness and quality of communication that a learner can realistically demonstrate to meet each standard. They are specifications of the mastery level of performance. Again, 'mastery' is not to be interpreted as 'perfection'; it is defined as 'satisfactory' or 'adequate' performance. Finally, each benchmark also provides examples of types of communication tasks, which may help demonstrate the required standard of proficiency. They are suggestions for communication tasks that enable the learner to demonstrate the skills or 'what the learner can do' (Pawlikowska-Smith, 2002a, pp. 22–23).

The confusion between 'standard' and 'benchmark' is typical of the literature, but the important aspect of each level descriptor is that it contains not only what a learner can do at that level, but under what *performance conditions* the learner can successfully communicate. Stage 1 of the basic proficiency level is provided as an example in [Table 1](#), from Pawlikowska-Smith, 2000, p. 7.

The associated performance conditions are given as:

1. Interactions are short, face to face, informal and with one person at a time.
2. Learner's speech is guided by questions from the interlocutor.
3. Learner's speech is encouraged by feedback from the interlocutor (e.g., *um, aha, I see, nod*).
4. Instruction is a short two- to three-word utterance.

This is extensively supplemented at each level with characterisations of learners, tasks, discourse and social interaction (CLB, 2006).

Within this framework, language quality is assessed through descriptions of each benchmark level. Stage 1 of basic proficiency in speaking is provided as an example:

Table 1 Basic proficiency stage 1

| What the person can do   | Examples of tasks and texts   | Performance indicators  |
|--|---|---|
| Social interaction <ul style="list-style-type: none"> <li>• Use and respond to basic courtesy formulas.</li> <li>• Indicate problems in communication.</li> </ul>  | <i>Hello, how are you?</i><br><i>My name is Li.</i><br><i>Thank you. Bye. Sorry.</i><br><i>Pardon?</i><br><i>Repeat please.</i><br>(negative + understand), (negative + speak English).<br>Use the above phrases and others in short informal conversations, as needed. | <ul style="list-style-type: none"> <li>• Responds to greetings, courtesy, leavetaking.</li> <li>• May initiate the above.</li> <li>• Apologises.</li> <li>• Indicates problems in communicating verbally or non-verbally.</li> </ul>  |
| Instructions <ul style="list-style-type: none"> <li>• Give two- to three-word basic everyday instructions/directions/commands.</li> </ul>  | <i>Please come in, wait.</i><br><i>Please sit down.</i><br><i>Please repeat. Tell me.</i><br><i>Show me.</i><br><i>Give me.</i><br><i>Tea, please</i> (in a cafeteria).   | <ul style="list-style-type: none"> <li>• Uses single directions and commands.</li> <li>• Listener can follow the information.</li> </ul>  |
| Suasion (getting things done) <ul style="list-style-type: none"> <li>• Attract attention.</li> <li>• Request assistance.</li> <li>• Inquire about and state time.</li> </ul>   | <i>Excuse me, Bob.</i><br><i>Help me, please.</i><br><i>What time is it? It is ...</i>  | <ul style="list-style-type: none"> <li>• Attracts attention to a situation.</li> <li>• Requests assistance in a situation.</li> <li>• Asks about and tells time.</li> </ul>   |
| Information <ul style="list-style-type: none"> <li>• Provide basic personal information related to the context.</li> <li>• Express ability/inability.</li> <li>• Answer questions about basic personal information in short interviews with teachers, other learners and counsellors.</li> </ul> | <i>What's your name?</i><br><i>Where do you live?</i><br><i>What language do you speak?</i><br><i>Where are you from?</i><br><i>Can you read this?</i>  | <ul style="list-style-type: none"> <li>• Responds to questions regarding basic personal data with required information; uses cardinal and ordinal basic numbers.</li> <li>• Expresses ability/inability (can, can + negative).</li> <li>• Listener can understand and use the information.</li> </ul> |

B1 learner can speak very little, mostly responding to basic questions about personal information and immediate needs in familiar situations. Speaks in isolated words or strings of two to three words. Demonstrates almost no control of basic grammar structures and verb tenses. Demonstrates very limited vocabulary. No evidence of connected discourse. Makes long pauses, often repeats the other person's words. Depends on gestures in expressing meaning and may also switch to first language at times. Pronunciation difficulties may significantly impede communication. Needs considerable assistance (Pawlikowska-Smith, 2000, p. 4).

The CLB is a comprehensive system with a range of applications as a heuristic to aid teaching and assessment; its foundations lie in our current understanding of language competence, but it does not have any empirical underpinning, a problem that it shares with previous systems such as the ACTFL Guidelines.

### *Common European Framework of Reference*

The CEFR aims to be a pan-European framework for teaching and testing languages, and claims to provide a common basis for the elaboration of language syllabuses, curriculum guidelines, examinations, textbooks, etc. across Europe. It describes in a comprehensive way what language learners have to learn to do to use a language for communication and what knowledge and skills they have to develop so as to be able to act effectively. The description also covers the cultural context in which language is set. The framework also defines levels of proficiency, which allow learners' progress to be measured at each stage of learning and on a life-long basis (Council of Europe, 2001, p. 1).

Like the CLB it has three general levels of Basic, Independent and Proficient, each subdivided into two levels, providing a six-level system. The system comprises of two parts. The first is a qualitative description of each level. For speaking and writing, it is elaborated in productive, receptive, and interactive modes. This is 'horizontal' in that it does not attempt to help distinguish between levels; it is a taxonomy of the things that language learning is about. The second part is a quantitative description of the levels in terms of 'can-do' statements. This is 'vertical' in that the levels are defined in terms of statements that could be scaled into the six levels. However, there is a confusion of the qualitative and quantitative, in that some of the levels are partially defined by pre-existing qualitative descriptions, so that Waystage (Van Ek and Trim, 1990a) is attached to level A2, Threshold (Van Ek and Trim, 1990b) to level B1 and Vantage (Van Ek and Trim, 2001) to level B2. This provides the descriptive system in [Figure 1](#).

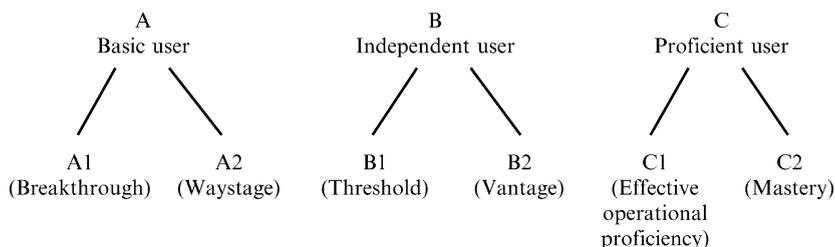

Figure 1 CEFR reference levels.

It is claimed that for assessment this system can be used for:

1. The specification of the content of tests and examinations.
2. Stating the criteria for the attainment of a learning objective, both in relation to the assessment of a particular spoken or written performance and in relation to continuous teacher-, peer- or self-assessment.
3. Describing the levels of proficiency in existing tests and examinations thus enabling comparisons to be made across different systems of qualifications (Council of Europe, 2001, p. 19).

The CEFR itself is not a test or a testing system. However, the document suggests that the scales contained in the CEFR may be used to evaluate the performance of test takers on tasks contained in the tests. The CEFR contains a range of illustrative scales that could be used, including that for spoken interaction (see [Table 2](#)).

While the CEFR has an empirical basis to the construction of the scales that the CLB lacks (see Fulcher, 2003, pp. 107–113), the CEFR does not contain performance conditions for levels, stating that as a *common* system it provides a taxonomy of potentially relevant tasks, situations and domains that could be applied to any level as considered relevant by a user of the framework.

#### WORK IN PROGRESS

Checklists of student progress using can-do statements have been used in classroom assessment for some time (see Genesee and Upshur, 1996, p. 88), but have recently become the basis for a larger programme of research in anchoring performance to levels on a scale. This approach is at the heart of the CEFR scales, as well as the development of the descriptive system of the Association of Language Testers in Europe (ALTE). The ALTE framework is an attempt to allow member testing agencies to claim across languages and tests that these are the ‘typical’ things a student can do. As a European organisation ALTE also wishes

Table 2 Illustrative sample from overall spoken interaction

|    |  |
|----|--|
| B2 | Can use the language fluently, accurately and effectively on a wide range of general, academic, vocational or leisure topics, marking clearly the relationships between ideas. Can communicate spontaneously with good grammatical control without much sign of having to restrict what he/she wants to say, adopting a level of formality appropriate to the circumstances. |
|    | Can interact with a degree of fluency and spontaneity that makes regular interaction, and sustained relationships with native speakers quite possible without imposing strain on either party. Can highlight the personal significance of events and experiences, account for and sustain views clearly by providing relevant explanations and arguments.                    |
| B1 | Can communicate with some confidence on familiar routine and non-routine matters related to his/her interests and professional field. Can exchange, check and confirm information, deal with less routine situations and explain why something is a problem. Can express thoughts on more abstract, cultural topics such as films, books, music, etc.                        |
|    | Can exploit a wide range of simple language to deal with most situations likely to arise whilst travelling. Can enter unprepared into conversation on familiar topics, express personal opinions and exchange information on topics that are familiar, of personal interest or pertinent to everyday life (e.g. family, hobbies, work, travel and current events).           |

Source: Council of Europe, 2001, p.74.

to map its own framework onto the CEFR, as can be seen in the extract from the ALTE can-do statements in [Table 3](#).

The methods for constructing the CEFR and ALTE can-do statements and then establishing their measurement properties are similar, using teacher judgements of statement difficulty and learner self-assessments, which are then subjected to scaling using Rasch modelling.

Also of interest is the development and use of ‘can-do’ statements in the context of the new Test of English as a Foreign Language (TOEFL iBT), generated by the analysis of self-assessments in relation to score data. Here they are explicitly used to “. . . indicate the likelihood that a test taker with that score would be able to perform the language task described” (ETS, 2005, p. 65). This specifically links describing the quality of performance to enhancing score meaning for users. Unlike other sets of can-do statements, however, ETS states the probability that a student at a certain score level will be able to do what the statement describes. This makes the statement less of a level definition and

Table 3 Extract from the ALTE can-do statements

| Levels        | Listening/<br>Speaking   | Reading   | Writing  |
|---------------|--|---|--|
| B2<br>Level 3 | CAN follow or give a talk on a familiar topic or keep up a conversation on a fairly wide range of topics.  | CAN scan texts for relevant information, and understand detailed instructions or advice.                                    | CAN make notes while someone is talking or write a letter including non-standard requests. |
| B1<br>Level 2 | CAN express opinions on abstract/cultural matters in a limited way or offer advice within a known area, and understand instructions or public announcements. | CAN understand routine information and articles, and the general meaning of non-routine information within a familiar area. | CAN write letters or make notes on familiar or predictable matters.                        |

Source: Available from [http://www.alte.org/can\\_do/general.php](http://www.alte.org/can_do/general.php).

more of a heuristic for the interpretation of the test score. This is a welcome step forward in avoiding absolute interpretations of level descriptors.

This ongoing work on both sides of the Atlantic is promising, but is likely to need sustained research for a long period of time before the potential use of these statements becomes clear. The statements are generated and scaled before the collection of performance data, and benchmark samples are then sought to typify performance at levels defined by the statements.

Indeed, this work has hardly begun in the case of the CEFR even though it has rapidly become institutionalised within Europe (see Figueras, North, Takala, Van Avermaet and Verhelst, 2005, p. 275). The methodology in all of this work presupposes that individual performances can in fact be fitted to clusters of general statements aligned in a hierarchy scaled by Rasch measurement techniques, an assumption that remains to be demonstrated. This is very different from data-based methodologies that construct level statements from the direct analysis of performances (see Fulcher, 2003, pp. 88–113). It has been suggested that the former approach makes score meaning generalisable, but less

meaningful to any given individual, whereas the latter may be less generalisable but highly meaningful within specified domains—this is an issue that has not yet been resolved.

An alternative approach is taken through the description and scaling of test tasks, so that success on a task can be evaluated in terms of real world outcomes (Hudson, 2005, pp. 218–221). Of particular note in this work is the evaluation of task-dependent and task-independent rating instruments for the same performance to investigate score generalisability.

With particular reference to the CEFR, one of the claims of the framework is that performances on different language tests, across different languages, can be compared by linking scores on these tests with the framework (Figueras, North, Takala, Van Avermaet and Verhelst, 2003, 2005) primarily using a process of social moderation. For framework developers the question is: how do we know that a level means the same thing for two different people if they have taken different tests on different languages in two different countries? “This follows from the simple logical rule that (a) and (b) are equivalent to each other if they are both equivalent to a third term (c). The CEFR is intended to play the role of (c)” (Figueras, North, Takala, Van Avermaet and Verhelst, 2005, p. 271). This question will inevitably engage language testers within Europe for some time, as there is a political imperative to harmonise a disparate qualifications system for the purpose of cross-border recognition.<sup>4</sup>

## PROBLEMS AND DIFFICULTIES

### *Frameworks or Models?*

It is uncertain that ‘framework’ documents can be used to fulfil their stated aims in their present form. The larger problem is that

... the meta-objective of providing proficiency descriptors that are applicable across languages requires a framework so abstract that it is not a framework, but a model (Fulcher, 2004, p. 258).

Generic models of language proficiency are encyclopaedic and far removed from any given testing situation, whereas frameworks are attempts to mediate between models and actual tests, making it possible both to construct test content and assess the quality of production (Chalhoub-Deville, 1997). Frameworks select from models and provide a rationale for an operationalisation in a specific testing context. It has now been shown that the CEFR is too abstract to fulfil the role

---

<sup>4</sup> The waters are further muddied when political and institutional ‘recognition’ is termed ‘validation’, and ‘recognized’ interpreted as ‘validated’, which is becoming more common in apologies for institutionalized systems, such as Heyworth, (2006).

of a 'framework' in the context of test development (see discussion in Alderson et al., 2006; Fulcher, 2004, p. 259; Weir, 2005, p. 295).

While there is little published material on the application of the CLB, more is now becoming available on the CEFR. Weir (2005a) is explicit in stating where research shows the CEFR to be lacking for direct application in language testing:

1. The scales are premised on an incomplete and unevenly applied range of contextual variables/performance conditions.
2. Little account is taken of the nature of cognitive processing at different levels of ability.
3. Activities are seldom related to the quality of actual performance expected to complete them.
4. The wording for some of the descriptors is not consistent or transparent enough in places for the development of tests (summarised from Weir, 2005).

If there is no way to investigate the quality of performance from a model like the CEFR, it seems highly unlikely that in its present form it could be used to equate tests through a process of social moderation.

### *Describing Performance and Second Language Acquisition*

The CLB documents are clear about what is claimed with regard to the relationship between descriptions of language quality and second language acquisition.

The CLB scale does not claim to reflect the 'natural' sequence of ESL development. The CLB is based on a theory of language proficiency rather than on a theory of second language acquisition: an adequate model based on a description of a natural sequence in the development of adult second language acquisition is not available. The CLB scale does not imply linear, sequential, additive or incremental learning/acquisition processes.

Language learning and acquisition are not just cumulative but integrative processes. The CLB proficiency framework makes no claims as to when and how specific language features in the competencies should be achieved. Its focus is on description of the outcomes, nor on the process and the timing to achieve them. The hierarchical structure of the Benchmark stages implies progressively demanding contexts of language use. Such contexts require increasing levels of quality of communication (e.g., accuracy, range, fluency, appropriateness and an increasingly more sophisticated relationship between function, form and context) (Pawlikowska-Smith, 2002a, p. 32).

In other words, it is the increasing difficulty of a task that defines the scale, and the performance conditions are the task facets that can be manipulated to alter task difficulty. The task descriptions are therefore critical. Although there is no published empirical evidence to suggest that the tasks or performance conditions are ordered according to difficulty in the CLB (Pawlikowska-Smith, 2002b), these claims allow the generation of a feasible research agenda.

The CEFR, on the other hand, avoids the issue of acquisition by reference to the ‘principles of pluralist democracy’, which apparently forbid taking a position in ‘theoretical disputes’.

In accordance with the basic principles of pluralist democracy, the framework aims to be not only comprehensive, transparent and coherent, but also open, dynamic and non-dogmatic. For that reason it cannot take up a position on one side or another of current theoretical disputes on the nature of language acquisition and its relation to language learning, nor should it embody any one particular approach to language teaching to the exclusion of all others. Its proper role is to encourage all those involved as partners in the language learning/teaching process to state as explicitly and transparently as possible their own theoretical basis and their practical procedures. To fulfill this role it sets out parameters, categories, criteria and scales, which users may draw on and which may possibly stimulate them to consider a wider range of options than previously, or to question the previously unexamined assumptions of the tradition in which they are working (Council of Europe, 2001, p. 18).

Although Chapter 6 of the CEFR deals with issues of language acquisition, no guidance is given other than in text boxes, which invite the user to consider issues for themselves. Nevertheless, the fact that the CEFR levels are referred to as “natural levels”, and as the “conventional, recognized, convenient levels found in books and exams” (North, 1992, p. 12), it is not surprising that the level descriptors in the CEFR are mistakenly understood to reflect discrete stages of language acquisition by practitioners in Europe.

There is therefore a very real problem in understanding precisely what a level descriptor is. Is it a stage of language acquisition? An ability to communicate in specified generic situations? Or is it simply an enumeration of useful (non-hierarchical) proficiency descriptors? The temptation is always to treat level descriptors as the former, for this opens the way for institutions to make unsubstantiated, but appealing claims about the amount of time needed to ‘progress’ from one level to another, and to arbitrarily associate tests with specific levels as achievement ‘pegs’.

### *Standards*

This raises the issue of the standard that needs to be achieved to “be in” (have reached?) a level, defined as the “level of performance required” or the “performance criterion, level or cut-score”.<sup>5</sup>

Levels are described by a range of descriptors and/or tasks with specified performance conditions. The key question is ‘how many of these things, at what level of performance, need to be achieved for a learner to be in this level?’ In the CLB Pawlikowska-Smith (2000, p. 38) says that successful completion of 70% of a level’s content is required for membership in that category. For ALTE (ALTE, 2002) the figure is 80%. The CEFR does not address this issue. This is problematic because in the descriptors for the quality of performance it is difficult to know what a percentage of successful completion would look like, whether some aspects of performance are more salient at a particular level and should therefore be weighted, or how performance varies with the task type and performance conditions set in eliciting the performance.

With the rise of what has come to be known as ‘standards based assessment’ and the high stakes that it now carries in many countries, language testers need to be extremely careful in their treatment of such issues. It is a short step for policy makers from ‘the standard required for level X’ to ‘level X is the standard required for . . .’, a step, which has already been taken by immigration departments in a number of European countries. This illegitimate leap of reasoning is politically attractive, but hardly ever made explicit or supported by research.

### *Benchmark Samples*

Samples of spoken and written language that typify descriptive levels should be annotated to show precisely how they exemplify can-do or other level descriptors. This proved difficult within the ACTFL system (Fulcher, 2003, p. 174), and it is uncertain that “international benchmarking conferences” (Figueras, North, Takala, Van Avermaet and Verhelst, 2005, p. 275) will fare any better, unless there is rigorous training of judges *before* the benchmarking exercise. Indeed, the language of the preliminary Manual (Figueras, North, Takala, Van Avermaet and Verhelst, 2003) stresses that extensive ‘familiarisation’ with the CEFR is needed, and that further work can only be undertaken if individuals show high agreement with CEFR descriptor levels (Figueras, North,

---

<sup>5</sup> See Davidson et al. (1995, p. 15) and Davies, Brown, Elder, Hill, Lumley, (1999, p. 185). The use of the term ‘standards’ in language testing is confusing; the only other meaning as a technical term is reserved for language testing standards, interpreted as guidelines for good practice.

Takala, Van Avermaet and Verhelst, 2005, p. 268). This throws us back into the circular validity paradox—training in the system is necessary to agree on benchmark samples, and benchmark samples are needed for training. In short, the ability to agree on benchmark samples is part of a validity argument for a system, but if the agreement is pre-determined by training, the agreement can no longer be used in a validity argument (Fulcher, 2003, pp. 145–147). Training is only legitimate (and necessary) after validation evidence has been collected. Noijons (2006) epitomises this paradox: 25 judges are trained in the use of the CEFR, and then asked to match tasks to CEFR levels. They are then shown recorded performances on the tasks and asked to rate these *using the criteria at the estimated level of the task*. The only thing that is surprising is that there is only 76% agreement between judges when matching a benchmark sample to a level using this method. Such research practices interfere with the subjective probability inherent in judges allocating samples to arbitrary levels, and create the illusion that the allocation somehow flows ‘naturally’ from the level descriptions. The result is the reification of a system that is claimed to be ‘agreed upon’ within Europe.<sup>6</sup>

## FUTURE DIRECTIONS

### *Political Imperatives for Regional Frameworks*

The most influential approaches to describing language quality are those with the support of governments or cross-border institutions, where there is great pressure for systems to become institutionalised. The dangers associated with this have been outlined (Fulcher, 2004), but the motivations for the institutionalisation of ‘frameworks’ need further investigation at the level of policy. Of particular concern is the need of bureaucrats to create or defend regional identities or language economies.

For example, we have recently seen that history is being pressed into the service of creating a European identity (Black, 2005). The teleology of European politics asserts a European identity and European interests in the search for a basis on which to advance political union. The obverse, the creation of an ‘otherness’ for non-European institutions, not only enhances a sense of internal cohesion, but leads to more stringent language-based immigration policies. Within this frame of thought, voters who rejected the European constitution in 2005 were deemed to have ‘made mistakes’ because they did not understand the ‘reality’ of the goal of European integration. This is fundamentally anti-democratic

---

<sup>6</sup> Noijons also argues that there is potential for global agreement on the grounds that five of the raters in the study were US citizens.

despite the constant claims of pluralism. The situation is no different with regard to language testing and the CEFR, which is proposed as *the European system* on which language learning across Europe will be planned, evaluated and compared. When ETS undertook two studies in Utrecht during February 2004 to link the score meaning of TOEFL to the CEFR, some language educators in Europe proclaimed the construct of the CEFR (sic) so different (and superior) to anything from North America that any outcome was meaningless. Similarly, critiques of the CEFR are increasingly labelled ‘polemical’ rather than ‘academic’. Such labelling is the first step to censorship.

This may be closely related to economic concerns. European test providers routinely claim that their tests are linked to the CEFR because many European institutions are requiring such a link for qualification recognition—an original goal of the CEFR. As Figueras, North, Takala, Van Avermaet and Verhelst (2005, pp. 276–277) note, “linkage to the CEFR may in some contexts be required and thus deemed to have taken place . . . .” and this is indeed what is happening, even if evidence of linkage is not provided, or not possible. The claim and acceptance of linkage however, while rejecting the claims from non-European agencies, essentially acts to protect the European testing market from external competition.

The politics of identity and language economies are significant drivers of systems of evaluation of language performance. This is simply more obvious in Europe than in other national systems such as ACTFL, CLB or the Australian Second Language Proficiency Ratings (now the International Second Language Proficiency Ratings), because Europe is not a single state.

### *Traits, Tasks and Construct Irrelevant Variance*

Systems for describing the quality of language performance tend to reflect a trait approach in language testing, where the scale and its descriptors are divorced from task or performance conditions. The latter has traditionally been seen as construct irrelevant, test method facets. The CLB represents an interesting case where the descriptors are still essentially trait oriented, but task difficulty and performance conditions define learner progression. The issue is one of generalisability. It appears that the CLB wishes score meaning to be generalisable beyond the test task to social and work conditions in Canada by not linking descriptors to specific tasks or conditions, while acknowledging that it is the specific context of the task that impacts on performance and test score.

Future research in this area needs to address the socio-cultural approaches to performance assessment, including interactional competence theory, that posit a very close link between the context of speech or

writing and performance. We need to know which aspects are critical to performances *and also* impact on scores. Of particular importance is the effect of the interlocutor in speaking tests, and whether interlocutor related variation is part of the trait of interactional competence or a construct irrelevant feature of test method (Brown, 2003).

### *Domains of Inference*

Changes to our understanding of the relationship between language performance and context should lead us to extend the discussion of specific purpose testing and to consider the roles of new contextual variables in score variation (Douglas, 2000; Krekeler, 2006). In large-scale testing, the extent of score generalisability is very important, but if certain contextual variables are seen to be critical to performances, how they differ across domains may help to find a new meaning for 'specific'. A corollary to this would be that it may also help us to limit the generalisability of some tests, showing that they are not relevant to domains to which they were never originally intended to apply. I have termed the tendency to extend the purpose of a test (usually for opportunistic commercial reasons) the 'retrofitting of test purpose'. Language testers need to develop techniques for investigating the legitimacy of the practice, and deciding what would count as evidence for a successful retrofit (Fulcher and Davidson, 2007).

### *Research on Scale Development*

Directly related to the previous issues is how we develop rating scales. The efficacy of task-dependent and task-independent rating scales requires further investigation (Chalhoub-Deville, 1995; Hudson, 2005; Jacoby and McNamara, 1999). Developmental methods have traditionally been intuitive (using expert judges or relying on experience within an institution) or empirical (describing student performances, establishing binary choices using judges or scaling existing level descriptors) (see Fulcher, 2003, pp. 88–113 for a full description). Holistic and analytic scales have traditionally been written intuitively and applied in proficiency testing, whereas primary- and multiple-trait scales have tended to be empirically derived and applied where a more specific purpose is intended. As we have found it more difficult to apply general scales to specific instances of language use, it becomes more pressing to show that descriptors adequately characterise the performances actually encountered. The question is whether scale descriptors should be written to correspond to performances (e.g. as behaviours), or whether tasks can be designed to elicit performances that provide evidence of competence on the trait or construct as defined

in the rating scale. The most promising way forward is through specification driven testing, in which specifications for tasks hypothesised to elicit construct-relevant language are generated from constructs embedded in rating scales (Davidson and Lynch, 2002; Fulcher and Davidson, 2007).

### *End Note*

Establishing criteria for evaluating the quality of language produced on performance tests has been high on the agenda of language testers for over half a century. Creating a validity argument to show that a test score relates directly to ability to perform on a range of non-test tasks remains the Holy Grail of performance testing. It is therefore not surprising that there are multiple quests, each with its own route and followers. At the present time it would be unwise to ignore any of the attempts to provide enhanced score meaning through better description of language quality; at the same time we must remain critically aware of the social and political agendas that drive some descriptive systems. In the near future, research to demonstrate relationships between evidence elicited through specific tasks and scale descriptors is likely to be much more fruitful than the post-hoc expansion of all-embracing, multi-purpose systems.

## METHODS OF TEST VALIDATION

## INTRODUCTION

Test validation methods are at the heart of language testing research. Validity is a theoretical notion that defines the scope and the nature of validation work, whereas validation is the process of developing and evaluating evidence for a proposed score interpretation and use. The way validity is conceptualized determines the scope and the nature of validity investigations and hence the methods to gather evidence. Validation frameworks specify the process used to prioritize, integrate, and evaluate evidence collected using various methods. Therefore, this review delineates the evolution of validity theory and validation frameworks, and synthesizes the methodologies used to validate language tests.

In general, developments of validity theories and validation frameworks in language testing have paralleled advances in educational measurement (Cronbach and Meehl, 1955; Cureton, 1951; Kane, 1992; Messick, 1989). Validation methods have been influenced by three areas in particular. Developments in psychometric and statistical methods in education have featured prominently in language testing research (Bachman, 2004; Bachman and Eignor, 1997). Qualitative methods in language testing (Banerjee and Luoma, 1997) have been well informed by second language acquisition (Bachman and Cohen, 1998), conversation analysis, and discourse analysis (Lazaraton, 2002). Research in cognitive psychology has also found its way into core language testing research, especially that regarding introspective methodologies (Green, 1997) and the influence of cognitive demands of tasks on task complexity and difficulty (Iwashita, McNamara, and Elder, 2001).

## EARLIER DEVELOPMENTS

The validation of the discrete-point language tests popular in the 1950s and 1960s, including language aptitude tests, was mostly couched in the validity conceptualization by Lado (1961). Taking up the term of criterion-related validity from educational measurement (Cureton, 1951), Lado argued that the validity of a language test can be established indirectly if scores on the test are reasonably correlated with

those of another test or criterion which is valid. When addressing item validity, Lado discussed the content and performance evaluation of multiple-choice items in particular. According to Lado, content validity concerns the degree to which an item contains a language problem that is representative of the problem in real life. The correlation between the performance on an item and on the same problem in the criterion measure constitutes criterion-related validity evidence. Seeing reliability as a prerequisite for validity, Lado introduced the concepts of test-retest reliability and internal consistency of test items.

The 1970s witnessed a trend toward more direct and communicative language tests, yet the focus still centered solely on face or content validity and predictive or concurrent validity (Clark, 1975, 1978). Clark proposed that direct and indirect language proficiency tests begged for different validation techniques because of their different characteristics (Clark, 1975). A direct language test has to show face or content validity by demonstrating its resemblance of 'real-life' language situations in the setting and linguistic content. The validity of indirect language tests as indicators of language proficiency can be established through their high correlations with more direct measures of language proficiency (Clark, 1975). A well-known example is the cloze test, the validity of which was shown through its strong relationships with various direct language tests (Oller, 1972). Another example is semidirect oral tests. Their high correlations with other more direct oral tests, such as oral interviews, were considered as strong validity evidence (Clark and Swinton, 1980). During this time, inter-rater reliability also became a focus of validation research for tests that required subjective scoring (Clark, 1975).

To summarize, earlier conceptualizations of validity, represented by Lado and Clark, focused on a few limited types of validity that support primarily score-based predictions, rather than theoretically and empirically grounded explanations of scores that provide the basis for predictions. Treating validity as different types invited researchers to select only one type as sufficient to support a particular test use. Further, test-taking processes and strategies, and test consequences were not examined.

In keeping with how validity was conceptualized from the 1950s through late 1970s, the validation methods were limited to correlational analyses and content analyses of test items.

Another fairly common line of validation research in the 1960s and 1970s employed factor analytic techniques to test two competing hypotheses about language proficiency, that is, whether language proficiency is a unitary trait or made up of several divisible competences (Oller, 1983).

## MAJOR CONTRIBUTIONS

The late 1970s and early 1980s saw the first hint of the notion of construct validity (Cronbach and Meehl, 1955) in language testing (see Palmer, Groot, and Trostler, 1981, for one of the earliest collections of construct validity studies). During the 1980s, there was a shift of focus from predictive or concurrent validity studies to explorations of test-taking processes and factors affecting test performance (see Bachman, 2000, for a review of relevant studies). These studies attested to the growing attention to score interpretation based on empirically grounded explanations of scores.

As validity theories in educational measurement advanced in the 1980s and culminated in Messick's explication of validity (1989), different types of validity became pieces of evidence that supported a unitary concept of construct validity, highlighting the importance of combining different types of evidence to support a particular test use. Messick also formally expanded validity to incorporate social values and consequences, arguing that evaluation of social consequences of test use as well as the value implications of test interpretation both "presume" and "contribute to" the construct validity of score meaning (p. 21).

Messick's unitary validity model quickly became influential in language testing through Bachman's work (1990) (Cumming and Berwick, 1996; Kunnan, 1998a). However, although theoretically elegant, Messick's model is highly abstract and provides practitioners limited guidance on the process of validation, that is, how to prioritize validation research and gauge progress.

To make Messick's work more accessible to language testers, Bachman and Palmer (1996) proposed the notion of test usefulness. They discussed six qualities: validity, reliability, authenticity, interactivity, and impact, as well as practicality, which functions to prioritize the investigations of the six qualities. Due to its value in guiding practical work, this framework quickly came to dominate empirical validation research and became the cornerstone for language test development and evaluation (Weigle, 2002). Nevertheless, this formulation of test usefulness does not provide a logical mechanism to prioritize the six qualities and to evaluate overall test usefulness. Since the trade-off of the qualities is dependent on assessment contexts and purposes, evaluations of overall test usefulness are conveniently at the discretion of test developers and validation researchers.

Following the shift in focus of validity investigations to score interpretation for a particular test use (rather than the test itself), theories of validity, impact, ethics, principles of critical language testing (Shohamy, 2001), policy and social considerations (McNamara, 2006),

and fairness (Kunnan, 2004) have been formulated to expand the scope of language test quality investigations (Bachman, 2005). Although some aspects of their work contribute to the validity of test score interpretations or uses, others address broader policy and social issues of testing, which may not be considered as qualities of particular tests (Bachman, 2005).

During this period, empirical validation research flourished to address more aspects of validity including factors (test, test-taker, and processes and strategies) affecting test performance, generalizability of scores on performance assessments, and ethical issues and consequences of test use (Bachman, 2000; Cumming and Berwick, 1996; Kunnan, 1998a). Furthermore, the maturity of sophisticated methodologies, both quantitative (Kunnan, 1998b, 1999) and qualitative (Banerjee and Luoma, 1997), and triangulation of different methodologies (Xi, 2005b) took place.

#### WORK IN PROGRESS

The search for a validation framework that is theoretically sound but more accessible to practitioners continues. The major development of an argument-based approach to test validation in educational measurement (Kane, 1992; Kane, Crooks, and Cohen, 1999) has recently inspired parallel advancements in validation frameworks in language testing, represented by Bachman (2005) and Chapelle, Enright, and Jamieson (in preparation).

The notion of a validity argument is nothing new to the field of educational measurement. Nearly two decades ago, Cronbach (1988) started to think of validation as supporting a validity argument through a coherent analysis of all the evidence for and against a proposed score interpretation. Kane and his associates have taken up on this and formalized the development and evaluation of the validity argument by using practical argumentation theories (Toulmin, 2003). They see validation as a two-stage process: constructing an interpretive argument, and developing and evaluating a validity argument. They propose that for each intended use of a test, an interpretive argument is articulated through a logical analysis of the chain of inferences linking test performance to a decision, and the assumptions on which they rest. The assumptions, if proven true, lend support for the pertinent inference. The network of inferences, if supported, attaches more and more meaning to a sample of test performance and the corresponding score, so that a score-based decision is justified. The plausibility of the interpretive argument is evaluated within a validity argument using theoretical and empirical evidence. Their approach also allows for a systematic way to consider potential threats to the assumptions and

the inferences, and to allocate resources to collect evidence to discount or reduce them.

This conceptualization has not expanded the scope of validity investigations beyond that of Messick (1989), which provides the most comprehensive and in-depth discussion of values of score interpretations and consequences of test uses (McNamara, 2006). However, the major strength of Kane's approach lies in providing a transparent working framework to guide practitioners in three areas: prioritizing different lines of evidence, synthesizing them to evaluate the strength of a validity argument, and gauging the progress of the validation efforts. It has considerable worth in helping them answer three key questions: where to start, how strong the combined evidence is, and when to stop. These issues may have been touched upon in passing in past work but have not been addressed with the same level of structure and clarity as in Kane's work.

Although test use and consequences were omitted in the earlier developments of his framework, Kane has increasingly paid more attention to them and extended the chain of inferences all the way up to a decision (Kane, 2001, 2002, 2004). Bachman (2005) and Chapelle, Enright, and Jamieson (in preparation) have adapted Kane's framework in somewhat different ways, but both highlight test use and consequences. In the former, they are dealt with in an assessment utilization argument linking a decision to an interpretation, which is linked by a validity argument to test performance and scores. This conceptualization builds on the distinction between the descriptive part (from test performance to interpretation) and the prescriptive part (from interpretation to decision) in a validity argument in Kane (2001). In the latter, it is seen as an inferential link from an interpretation to a decision in the validity argument, with a more elaborate discussion of the pertinent assumptions than in Kane's work.

Figure 1 illustrates the network of inferences linking test performance to a score-based interpretation and use. The first inference, evaluation, connecting test performance to an observed score, hinges on the assumptions that performance on a language test is obtained and scored appropriately to measure intended language abilities, not other irrelevant factors. The second link, generalization, relates an observed score to a universe (true) score, and assumes that performance on language tasks is consistent across similar tasks in the universe, raters, test forms, and occasions. The third link between a universe score and an interpretation involves two inferences, explanation and extrapolation. It bears on whether examinees' test performance provides adequate evidence about their language abilities that underlie their language performance in a target domain. The assumptions are that language test tasks engage the same abilities and processes as those used in real-world

language tasks in the target domain (explanation) and that test scores reflect the quality of language performance on relevant real-world tasks (extrapolation). The fourth link, utilization, connects a score-based interpretation and a decision. The assumptions are: test scores and other related information provided to users are relevant, useful, and sufficient for making intended decisions; the decision-making processes are appropriate; and the assessment process does not incur any negative consequences.

This argument-based approach to test validation has motivated the development of a validity argument for the new Test of English as a Foreign Language (TOEFL) to organize and evaluate a whole program of validation research (Chapelle, Enright, and Jamieson, in preparation).

Now that the major developments in validity theories and validation frameworks and trends in validation methods have been outlined, the most common validation methods—those that provide evidence for the assumptions on which the inferences rest—are presented. Major review pieces and more recent publications are cited to demonstrate the application of each method.

#### AN OVERVIEW OF EMPIRICAL VALIDATION METHODS

The methods for collecting evidence are discussed with reference to the support they provide for the inferential links in [Figure 1](#).

##### *Evaluation: Linking Test Performance to Scores*

Evidence supporting the evaluation inference is based on the conditions under which the test is administered and the care with which the scoring rubrics are developed and applied.

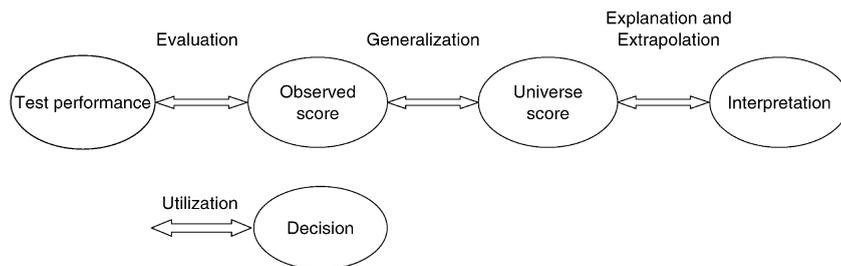

Figure 1 Links in an interpretative argument (modified after Bachman, 2005, and Kane, Crooks, and Cohen, 1999).

**Impact of Test Conditions on Test Performance.** Test conditions may impact the demonstration of intended language skills. Research has been conducted to examine the impact of test conditions on test performance to ensure that the test scores are not influenced by construct-irrelevant factors such as familiarity with computers in a computer-based test (Taylor, Kirsch, Eignor, and Jamieson, 1999). O'Loughlin (2001) examined the equivalence of scores between face-to-face and tape-mediated versions of an oral test and supported his conclusion with analyses of the features of candidates' discourse elicited under the two conditions.

**Scoring Rubrics.** Rubrics that do not reflect the relevant knowledge and skills could lead to erroneous scores. Rater verbal protocols and analysis of a sample of test discourse (Brown, Iwashita, and McNamara, 2005) are commonly used to develop rubrics that are reflective of the underlying skills the test intends to elicit.

Other studies have employed quantitative methods to validate rating scales. Because a rubric with well-defined score categories facilitates consistent scoring, some studies have examined whether differences between score categories are clear using multifaceted Rasch measurement (McNamara, 1996). In addition, multidimensional scaling has been applied to the development of scales for different tests and rater groups (Chalhoub-Deville, 1995).

**Systematic Rater Bias Studies.** In assessments that are scored subjectively, inconsistencies within and across raters is another potential source of error in scores. Analysis of variance and multifaceted Rasch measurement have been used to investigate the systematic effects of rater backgrounds on the scores they assign (McNamara, 1996). Rater verbal protocols, questionnaires, or interviews have been employed to investigate rater orientations and decision processes (Lumley, 2002). Such analyses allow insights into whether raters have failed to note the salient relevant features in students' responses or tuned into any construct-irrelevant factors.

More recent studies have combined quantitative analysis of score reliability and rater self-reported data to account for rater inconsistencies (Xi and Mollaun, 2006).

A related rater bias issue concerns the use of automated engines for scoring constructed response items. Automated scoring may introduce systematic errors if the scoring algorithm underrepresents the intended constructs by not including some highly relevant features or using irrelevant features. Systematic errors may also occur if the scoring model favors or disfavors certain response patterns typically associated with certain groups and the causes for the response patterns are not related to the constructs (Carr, Pan, and Xi, 2002).

*Generalization: Linking Observed Scores to Universe Scores*

**Score Reliability Analysis.** In addition to estimations of interrater reliability and internal consistency of tasks in the framework of classical test theory (CTT), two more sophisticated methodologies have dominated score reliability studies in language testing: generalizability (G) theory and multifaceted Rasch measurement. Both methods provide overall estimates of score reliability. G theory provides useful information about the relative effects of facets, such as raters or tasks and their interactions on score dependability so as to optimize measurement designs (Bachman, 2004). Multifaceted Rasch measurement is more suited to investigate the influence of individual raters, tasks, and specific combinations of raters, tasks, and persons on the overall score reliability (McNamara, 1996). Given that these two techniques complement each other, studies that compared these two methods have argued for combining them to ensure score reliability (Lynch and McNamara, 1998).

In recent years, multivariate G theory has emerged as a technique to estimate the dependability of composite scores based on multiple related measures (Lee, 2006) or dimensions (Xi and Mollaun, 2006). A multivariate G study decomposes covariances among the universe scores and among errors on the composite measures, as well as variances. The covariance components provide additional information about how students' universe scores and errors on composite measures covary. An important application is to estimate the dependability of composite scores with different schemes to weight the composites.

*Explanation: Linking Universe Scores to Interpretations*

The explanation inference rests on the assumption that test tasks engage abilities and processes similar to those underlying performance on real-world language tasks indicated by a domain theory, and therefore can account for performance in the domain. A wide array of methods—both quantitative and qualitative, judgmental and empirical—have been developed to gather evidence to support this assumption.

**Correlational or Covariance Structure Analyses.** Correlational or covariance structure analyses can be used to explore the empirical relationships among items of a test or between the test and other measures of similar or different constructs and methods for measuring them. These analyses can determine if the relationships are consistent with theoretical expectations of item homogeneity, and the convergence and discriminability of constructs and methods (Bachman, 2004).

Factor analysis and structural equation modeling (SEM) are powerful techniques to test theories. Compared with experimental designs,

they have the advantage of investigating a large number of variables in a single analysis.

Exploratory and confirmatory factor analytic techniques have been frequently used to confirm hypotheses or to test competing hypotheses about the factors underlying test performance. These factors may reflect common abilities and processes, concurrent learning of different language skills, or common language learning interests or experiences. Therefore, it is important to look into which one of these really causes the observed score patterns before coming to conclusions about these factors indicating underlying abilities.

SEM subsumes confirmatory factor analysis but can also model relationships between constructs (factors) and measured variables and among constructs that may represent intended abilities, other test taker characteristics, or test methods. Kunnan (1998b) reviewed SEM studies that investigate several research questions, which include (1) identifying the theoretical components that underlie test performance and self-reported test-taker attributes, (2) examining the relationships between test-taker characteristics (both intended abilities and extraneous factors), test-taking strategies, test task characteristics (methods or manipulated task features), and test performance, and (3) investigating factorial structures and invariance across learner groups. For example, in one such study, Purpura (1999) investigates the relationships between learner strategy use and performance on second language tests using an SEM approach.

**Experimental Studies.** In experimental studies, instruction or learning interventions can be carefully planned and task features and testing conditions systematically manipulated (Bachman, 1990). Therefore, they are sometimes more powerful than correlational or covariance structure analyses in establishing causal effects due to treatment interventions or conditions. The effectiveness of an intervention, as measured by gains in test scores, attests to the soundness of the theoretical construct (Messick, 1989). Research on the influence of manipulated task features on task performance can either unveil the relationship between task difficulty and task features (Iwashita, McNamara, and Elder, 2001), or disambiguate a task feature suspected to be construct-irrelevant (Xi, 2005b). In the former case, information about complexity of tasks can guide test design. In the latter case, possible construct-irrelevant sources can be identified and controlled to rule out certain rival interpretations about the invalidity of the tasks.

**Group Difference Studies.** Group differences in test scores can either support score-based interpretations and uses or compromise the validity of a test for a proposed use if caused by construct underrepresentation

or construct-irrelevant factors. Therefore, group difference studies can test theories that groups with certain backgrounds and characteristics should differ with respect to the construct being measured. They can also forestall rival interpretations that construct underrepresentation or construct-irrelevant factors are associated with a test. Group differences can manifest in generalizability of scores, item or test performance (differential item or test functioning), the underlying structures of scores (differential factorial structure), strengths of relationship between the test and the criterion measures (differential criterion-related validity), or score-based decisions (differential utility) (see Xi, 2005a, for a synthesis of methods used to investigate group differences).

Quantitative methods, although powerful in testing hypotheses, are limited in generating new hypotheses and do not offer insights into processes (Bachman, 1990). Qualitative methods can reveal processes and strategies used by examinees during assessment, that is, whether intended abilities and knowledge are engaged by examinees, or whether any factors compromise score-based interpretations and decisions. They help us to better understand and articulate the constructs, or refine them if necessary, which subsequently impact test design.

**Self-Report Data on Processes.** Green (1997) discussed ways verbal protocols can contribute to language test validation and reviewed studies that employ this method. In cases when concurrent verbal protocols are not possible, such as with speaking tasks, stimulated recall (Gass and Mackey, 2000) and retrospective interviews have been used to explore processes and strategies involved in completing language tasks.

Generally, self-report data on processes can help answer the following validity questions (Green, 1997): Does the test engage the abilities it intends to assess? Do specific construct-relevant or construct-irrelevant task characteristics influence performance? Which task types are more effective measures of the intended skills? Do different tests that are assumed to measure the same skills actually do so?

**Analysis of Test Language.** Conversation and other discourse-based analyses of test language also reveal test-taking processes and strategies, although less directly than self-report data. In addition, analysis of the discourse of interaction-based tests, such as oral interviews, can inform the nature and the construct of such test instruments and reveal potential construct-irrelevant factors.

Lazaraton (2002) provided a comprehensive review of studies that employ conversation analysis in language testing. Some examined the conversational features of oral interview discourse to inform understanding of the nature of the interaction, as compared with that of real-life interactions. Others looked at interlocutor and candidate behavior

in oral interviews and the influence of variation in interlocutor behavior on candidate performance.

Other discourse-based analytic techniques including rhetorical analysis, functional analysis, structural analysis, and linguistic analysis have been used to examine whether the distinguishing features of candidate language reflect test specifications and scoring criteria, whether oral interviews and semidirect tests are comparable (Lazaraton, 2002), or whether scores assigned by raters reflect qualitative differences revealed by discourse analysis (Cumming, 1997).

**Questionnaires and Interviews.** Questionnaires have been frequently used to explore test-taking processes and strategies and to elicit examinees' reactions to test tasks and the whole tests. Interviews have been used alone or in conjunction with verbal protocols of test-taking processes to follow up on interesting points (see Banerjee and Luoma, 1997, for relevant studies that use these two methods).

**Observation.** Observational data on test-taking processes are usually combined with post-test interviews to reveal processes or strategies engaged by test-takers or to examine whether the structure of a test or process of test-taking introduces any bias. For example, O'Loughlin (2001) used observation followed up by interviews with test-takers to examine the quality of the interaction between the candidate and the interlocutor and identify potential bias in the way the oral interview was conducted.

**Logical Analysis of Test Tasks.** This kind of analysis usually involves judgmental analysis of the skills and the processes required by test tasks (Grotjahn, 1986). Although experts may experience difficulty in judging what an item measures (Alderson, 1990), their judgmental analyses support the generation of hypotheses that can subsequently be tested by experimental or introspective studies. Logical analysis has also been used to interpret factors or to understand performance differences across groups or experimental conditions.

#### *Extrapolation: Linking Universe Scores to Interpretations*

Two types of evidence may support the extrapolation inference: judgmental evidence that test tasks are representative samples of the domain and empirical evidence that test scores are highly correlated with scores on criterion measures.

Needs analysis to specify the domain and logical analysis of the task content by content specialists (Weir, 1983) are typically used to establish the content-relevance and representativeness of test items in

relation to the domain. Corpus-based studies have recently emerged as a new technique to check the correspondence between the language used in test materials and the real language use in academic settings to establish content relevance (Biber, Conrad, Reppen, Byrd, and Helt, 2002). These studies constitute fairly weak evidence of validity, unless substantiated by further empirical evidence such as analysis of test data and experimental controls. However, they are very useful in identifying an item pool, which can then be tested empirically (Messick, 1989).

The relationships between tests and criterion measures are usually investigated with correlational analyses (see Bachman, 1990, for relevant studies). However, selection of criterion measures that are valid indicators of performance in the domain and the reliability of them are two major issues that need to be addressed.

#### *Utilization: Linking Interpretations to Uses*

Score-based decisions and test consequences presume and build on sound score-based interpretations. Therefore, methods to collect evidence for the explanation and the extrapolation of inferences can support the relevance of an assessment for an intended use. The utilization inference rests on several more assumptions: the score and other information provided to users are useful and sufficient, decision-making processes are appropriate, and no negative consequences are incurred as a result of the assessment process. The relevant methods are those that examine score reports and other materials communicated to users, the decision-making processes, and consequences of test use.

**Score Reporting Practices and Other Materials Provided to Users.** Score reports and supplementary materials provided to score users are the only information that they base their decisions on. Therefore, care should be taken to ensure that they are useful and sufficient for decision-making. The relevant research questions are: If a composite score is reported, are the constructs measured by the components in the composite similar enough to justify aggregating the scores? Are subscores distinct and reliable enough to warrant reporting them separately? Do the subscores and composite scores support intended decisions? Factor analyses (Sawaki, Stricker, and Oranje, in preparation; Shin, 2005) and generalizability studies (Xi and Mollaun, 2006) have been conducted to address the first and the second questions, yet the last question requires more attention from the field.

**Decision-Making Processes.** Decisions based on selection, placement, or licensure test scores usually involve setting the cut scores for minimal requirements. Although score-based interpretations may

well be valid for the intended decision, inappropriate cut score models or cut score requirements may lead to inappropriate decisions, thus compromising the utility of the test scores serving their intended purposes. Collective judgments of a wide range of stakeholders (Sawaki and Xi, 2005) or approaches that make use of test-takers' score data (Stansfield and Hewitt, 2005) have been used to establish appropriate cut scores on language tests.

**Consequences of Using the Assessment and Making Intended Decisions.** Empirical research on consequences of language tests has mostly focused on washback, the impact of language tests on teaching and learning. Since the landmark Sri Lankan impact study (Wall and Alderson, 1993) and description of Alderson and Wall (1993) of a series of washback hypotheses in need of investigation, washback research has blossomed. Both theoretical frameworks and methodologies (including interviews, surveys, classroom observations, and focus groups) to investigate washback have emerged (see Alderson and Banerjee, 2001, for a review).

#### PROBLEMS, DIFFICULTIES, AND FUTURE DIRECTIONS

In the last several decades, language testing has evolved into an independent field that is characterized by well-articulated theories of validity and sophisticated validation methodologies. Nevertheless, a few major issues need to be addressed to move the field forward.

##### *Refining the Argument-Based Approach to Test Validation*

In the next decade, we expect to see refinements of the argument-based approach to validation requiring more rigorous conceptual thinking and more empirical research, as well as a reconciliation of different formulations and terminologies (Bachman, 2005; Chapelle, Enright, and Jamieson, in preparation) to provide a common ground for practitioners. This new validation approach has inspired empirical research and will certainly inspire more. In particular, much more efforts to integrate validity evidence into a coherent argument to support a particular test use, rather than on a piecemeal basis, are expected to take place.

##### *Articulating a Clear, Coherent, and Complete Interpretive Argument*

The argument-based approach offers exciting promise in guiding empirical validation research. However, applying this logical mechanism for

prioritizing and organizing validation research without rigorous thinking can by no means get us as far as intended.

For each assessment use context, the interpretive argument, the network of inferences, and the pertinent assumptions must be adequately articulated through a careful logical analysis of all aspects of the assessment process. A selective argument driven by availability of resources and tendency to collect evidence likely to support a preferred interpretation may very likely have weak assumptions or even more seriously, weak hidden assumptions that are not even articulated in the argument (Kane, 1992). The omission of weak assumptions in an interpretive argument in turn offers validation researchers the convenience to focus on confirming evidence in support of validity, while placing less emphasis, or ignoring potentially disconfirming evidence. This contradicts the very principles of the argument-based approach. Using an argument-based approach can by no means gloss over sloppiness in the validation efforts, or even worse, disguise attempts to cover the loopholes or weaknesses in an argument.

The network of inferences has been fairly well developed and codified for language tests (Bachman, 2005; Chapelle, Enright, and Jamieson, in preparation). However, the pertinent assumptions, which provide support for each inference if proven true, may be specific to an assessment context and be affected by design decisions made in a particular assessment. Therefore, it relies much more on the researcher to make sure that the conclusions or claims follow reasonably from the assumptions specified. Bachman has begun articulating some of the assumptions in an assessment utilization argument; however, a specific challenge for the field is to develop a list of assumptions for each inference that is both comprehensive to guide practitioners and flexible to accommodate individual assessment uses.

### *Test Consequences and Validity*

A few decades of washback research has created a shared understanding that many forces in the educational system have to work in concert for the intended washback effects to take place (Alderson and Banerjee, 2001). Due to the complexity of the washback concept, it may not be feasible to contain all washback and test consequences research in a validity framework.

Messick (1996) contended that washback is a form of test consequences that impacts validity only if it occurs as a result of the assessment itself, rather than other forces in the educational system. This view confines testers' responsibility to producing good assessments.

To disentangle this issue, Bachman (2005) proposed an assessment utilization argument as a complementary and necessary extension to

a validity argument. He asserted that any given test may support multiple interpretations and uses, constitute only one of several pieces of evidence for a decision, or be misused for unintended purposes. Beneficial consequences are considered as a warrant that needs to be backed by evidence in Bachman's utilization argument; however, since intended consequences cannot be engineered by test design alone, it may be difficult to argue all test consequences as being part of test quality.

A model is thus needed to guide testing organizations on best practices of producing and introducing tests that lead to beneficial influences on teaching, learning, the education system, and society. Once this model is established, testing practitioners' responsibilities in ensuring beneficial consequences should be clearly defined. They can be held accountable for negative consequences caused by their failures to fulfill some of them. Bachman (2000), McNamara (2006), and Shohamy (2001) discuss different views of the responsibilities of testing organizations. The 'social responsibility view' advocates that testing organizations have a larger social mission to fulfill and should assume all responsibilities for social consequences. They have an obligation, for example, to ensure their tests are not misused for unintended purposes. The 'professional responsibility view' attempts to regulate testing practitioners by codes of professional ethics and argues that testing organizations be held for "limited and predicted social responsibilities" that are manageable (Davis, 1997). However, what has not been clearly defined is how far exactly these manageable responsibilities should extend and what the dividing line is between testing responsibilities of organizations and test users. In addition to producing good tests, reporting scores in ways that support intended decisions, and explicitly communicating to users the appropriate uses of their tests and test scores, should testing practitioners be responsible for recommending good decision-making procedures based on their test scores given their expertise? Until testing practitioners' roles are clearly defined, it is difficult to provide a proper linkage between test consequences, validity, and test quality, because it remains uncertain how negative consequences should be used as evidence to evaluate a validity or a utilization argument.

In addition, although Bachman (2005) has proposed a preliminary list of warrants in need of backing to support score-based decisions, empirical methods to collect relevant supporting evidence are urgently needed. As Bachman has argued, research on test use, including wash-back studies, critical language testing theory, ethics and professionalism, has been conducted rather independently of validity. Systematic ways to investigate test use and consequences that provide evidence to evaluate the strength of the validity or utilization argument need to be developed and documented.

### *Linking Qualitative Results to Quantitative Results*

The last two decades have seen both pleas (Bachman, 1990; Grotjahn, 1986) and real efforts to triangulate different methodologies to support more conclusive findings (Xi, 2005b). However, multiple independent sources of evidence may strengthen a validity argument, only if they are carefully and appropriately integrated to support a conclusion.

Endeavors to better link and integrate quantitative and qualitative results are fundamental to ensure that qualitative differences result in measurable quantitative differences. First, there should be more discussion and thinking about which quantitative and qualitative methods complement each other and how. Second, general guidelines need to be established regarding the size and representativeness of the sample for specific types of qualitative investigations in relation to the quantitative analyses. In addition, some general guidance in quantifying qualitative results or citing qualitative results to support conclusions is necessary. The argument-based approach to validation provides the conceptual framework for combining quantitative and qualitative methods, because they can be used to support different yet interconnected inferential links in [Figure 1](#).

### *Defining the Role of Performance-Based Language Tests*

Performance-based language tests have introduced complexities in designing both their tasks and scoring criteria, because successful performance in the target domain may require more than language skills. McNamara (1996) notes that most performance-based language tests are actually ‘weak’ in the sense that the scoring criteria are primarily linguistically driven, since using ‘real-world’ criteria that include non-language factors may bring about equity issues. Because test tasks simulate real-world language use scenarios, non-language factors such as knowledge about the topic, job competence, and personality may affect the demonstration of language skills, even when linguistically driven criteria are used. This also adds difficulty for the raters to tease out examinees’ language skills. Theoretical work is required to redefine the constructs of performance-based language tests that reflect the richness in the performance sample elicited while ensuring equity in using the scores for decision-making. However, the conceptual work must be informed by a better understanding of the various factors at play and the complex processes and strategies involved in a performance-based language test.

### *Expanding the Contexts of Language Testing Research*

As Cumming (2004) points out, the knowledge base of language assessment needs to be expanded to include research on contexts and learner

populations other than academically-bound young adults at universities in English-speaking countries. These unique contexts and populations may present us with new challenges in developing validation research paradigms and methods.

### *Summary of Future Directions*

In summary, the argument-based validation approach that is unfolding in language testing has made a major contribution in elucidating the process of validation. Continued work is expected to refine it to suit the specific needs in language testing. This approach has also provoked us to advance our thinking on murky issues such as test use and consequences in relation to validity. In particular, Bachman's proposal to extend the validity argument to a utilization argument has provided us with an effective mechanism to link test use and consequences to validity. Finally, this argument-based approach can serve as a conceptual framework for linking quantitative and qualitative results to make a coherent and convincing argument.

With performance-based language assessments gaining more popularity and momentum, the constructs of language tests have become increasingly more complex and may go beyond what has traditionally been defined. This presents both challenges and opportunities for us to redefine the constructs of language tests and design validation research in light of the expanded constructs.

The horizon of language testing research will also be broadened through expansion to contexts and populations that have been underexplored.

## UTILIZING QUALITATIVE METHODS FOR ASSESSMENT

### INTRODUCTION

In a state-of-the-art paper published in *Language Testing*, Bachman (2000) argues that the field of language testing has shown ample evidence of maturity over the last quarter century—in practical advances such as computer-based assessment, in our understanding of the many factors involved in performance testing, and in a continuing concern over ethical issues in language assessment. However, an equally important methodological development over just the last fifteen years has been the introduction of qualitative research methodologies to design, describe, and validate language tests. That is, many language testers have come to recognize the limitations of traditional statistical methods for language assessment research, and have come to value these innovative methodologies as a means by which both the assessment process and the product may be understood. In what follows, I discuss a number of notable studies that use qualitative methods for assessment, with particular focus on oral language testing; consider some of the problems and difficulties that face the qualitative researcher in language assessment; and conclude with thoughts on how the adoption of these methods reflects the central concern of language assessment—test validity.

### EARLY DEVELOPMENTS

An examination of the body of research on language testing suggests that it can be grouped, methodologically, into two main periods: pre-1990 and post-1990. The earlier period was defined by research that was almost entirely quantitative and outcome-based, and, with respect to speaking assessment, based especially on the Foreign Service Institute Oral Proficiency Interview (the OPI). Construct validation studies, comparisons of face-to-face versus tape-mediated assessments, and analyses of rater behavior were undertaken on not only the OPI, but also on the International English Language Testing System (IELTS), the Occupational English Test for Health Professionals, and the Australian Assessment of English Communication Skills (access Lazaraton, 2002, for a review of this literature). Generally speaking, much of this research (particularly on the OPI) examined issues of test

reliability, that is, consistency in performance elicitation and ratings. However, because reliability is a necessary but not sufficient condition for establishing test validity, criticisms of this early research were put forward for not considering test validity insufficiently, if at all.

Leo van Lier, in his seminal 1989 paper on the assumed but untested relationship between oral interviews and natural conversation, took this early research to task and redirected the attention of a number of language-testing researchers, by stimulating an interest in analyzing empirically the nature of discourse and interaction that arises in face-to-face oral assessment. Specifically, van Lier called for studies that would even go beyond detailing the oral assessment *process*, to inform us about the turn-by-turn sequential interaction in oral interviews and how oral test discourse is structured by the participants. Work along these lines would allow us to determine whether or not conversational processes are at work in the oral interview, and thus whether (and if so, how) test discourse resembles nontest discourse.

The post-1990 period in oral language assessment research dates from this seminal paper, and it is such studies that use qualitative research methods to which we now turn our attention.

#### MAJOR CONTRIBUTIONS

As noted by various applied linguists (e.g., Banerjee and Luoma, 1997; McNamara, Hill, and May, 2002; Richards, 2003), qualitative research in the discipline (and, by extension, in language testing) is comprised of the following ‘tools’:

- Discourse/Conversation Analysis (CA)
- Questionnaires
- Observations
- Verbal Protocol Analysis (VPA)
- Software Programs
- Interviews

The first of these, discourse analysis, has been the most frequently employed qualitative methodology in language testing, as discussed later. Questionnaires and observations have been less frequent, and VPA has begun to emerge as a viable methodology; each of these techniques is discussed in turn. A brief discussion of software programs and interviews concludes this chapter.

#### *Discourse Analysis*

Since 1990, there has been a proliferation of studies that analyze aspects of the discourse and interaction in oral interview contexts, with an eye toward determining features of interview talk, examining innovative testing methods and the variables that may influence interview

language, training and monitoring interviewer behavior, and standardizing test administration. Two features that unite this body of work are that analyses are first based on careful transcriptions of actual language test data, and second reflect a theory of language use, such as conversation analysis, sociocultural theory, or accommodation theory (Celce-Murcia, 1998). A compendium of this research can be found in Young and He (1998); some representative studies are summarized later under three broad headings that capture the ongoing preoccupations of oral language assessment researchers: interviewer discourse, test-taker discourse, and the group oral.

**Interviewer Discourse.** Analyses of interviewer discourse have been particularly fruitful, and particularly important for identifying features of interviewer talk that may compromise the consistent delivery of an oral interview. As a direct result of van Lier's paper, Lazaraton (1991) undertook an examination of the structure and the interaction that took place in a set of ESL course placement interviews at a major American university using Conversation Analysis, an inductive method for finding recurring patterns of talk-in interaction. Though even a cursory overview of CA is beyond the scope of this paper (but see Atkinson and Heritage, 1984; Schegloff, Koshik, Jacoby, and Olsher, 2002; see also Mori and Zuengler, *Conversation Analysis and Talk-in-interaction in Classrooms*, Volume 3), it can be noted that CA, in its pure form, is guided by the following analytic principles:

- Using authentic, recorded data that are carefully transcribed
- 'Unmotivated looking' at data rather than prestatng research questions
- Using the 'turn' as the unit of analysis
- Analyzing single cases, deviant cases, and collections thereof
- Disregarding ethnographic and demographic particulars of the context and the participants
- Eschewing the coding and quantification of data

Videotapes of 20 interviews were transcribed using CA conventions and were microanalyzed for several structural and interactional features that had been well-documented within conversation. For one, the overall structural organization of the interviews was clearly identifiable, in that they proceeded through distinct phases that correspond to the structural boundaries of the interview agenda used by the interviewers. A second finding was that self-assessments of language ability by the interviewees were prevalent and adhered to a systematic modification of the preference organization system in conversation—where agreement with such assessments is preferred and disagreement is dispreferred—as a result of and to accomplish certain interactional goals. Finally, three forms of interviewer question modification in the face of perceived 'trouble' for

the interviewees were found, including question recompletion, or-choice questions, and question turn reformulation. As a result of these findings, Lazaraton concluded first that the interviews import their fundamental structural and interactional features from conversation, but are characteristically and identifiably instances of 'interviews' for the participants, and second that the study suggested a promising approach to the systematic analysis of oral interaction in both testing and nontesting contexts. That is, both the approach and the findings seemed to have the potential to provide support for claims about (oral) test validity (see Xi, *Methods of Test Validation*, Volume 7).

Insights from the SLA theory of accommodation supported Ross's (1992) analysis of OPIs in Japan. Transcribed interviews were coded for seven types of accommodation and five types of 'antecedent triggers' for such accommodation. Ross found that the most salient triggers were candidate response (and its structure) to the previous question, level of the testtaker, and whether the interviewer had used accommodation in the previous question. Ross argues that the amount of accommodation that occurs should be taken into account in assigning final ratings in order for such ratings to be valid. Ross and Berwick (1992), analyzing the same data from a cross-cultural perspective, hypothesized that there is systematic cultural variation in interviewer approaches to conducting an OPI. The discourse of the Japanese interviewer they analyzed indicated "instructional care-taking" with a focus on form; the American interviewer was more focused on content and expected the test-taker to be willing to "engage the issues."

Finally, Brown (2003) analyzed variation between oral interviewers by looking at the discourse of two interviewers who tested the same candidate in an IELTS Speaking Test. Her microanalysis shows the degree to which the interviewers differed in the ways they structured topical talk, the techniques they used in questioning, and the sorts of feedback they provided. Brown concludes that interviewers are inextricably implicated in the construction of the test discourse, and thus, impressions of testtaker ability may be confounded by an interlocutor effect. Again, this finding has implications for the validity of scores derived from a speaking test.

**Test-taker Discourse.** With respect to what test-takers produce in speaking tests, Yoshida-Morise (1998) looked at the effect of proficiency level on the use of communication strategies on the OPI by seven Japanese native speakers. Samples of discourse representing a number of such strategies, gleaned from recent SLA research, showed that six of these strategies showed significant differences in use according to proficiency level. However, the author qualifies her findings by noting that her interrater reliability for classifying discourse segments into

strategy types was low and classification seemed to be affected by the researchers' knowledge of and proficiency in the test-taker's first language (L1).

The consequences of interlocutor familiarity was studied by Katona (1998), who analyzed the meaning negotiation that took place in the Hungarian English Oral Proficiency Examination. By coding the interview transcripts for communication strategy use, she found that the variety of negotiation sequences and exchanges present accounted for a more natural interaction when the interviewer knew the testtaker, while a more formal, stilted interaction containing misunderstandings resulted when the two were unfamiliar to each other.

Lastly, Young and Halleck (1998) looked at the effect of "conversational style" on test-taker behavior in the OPI. Using a topical analysis methodology, they compared the talkativeness of three Mexican Spanish and three Japanese speakers representing different proficiency levels on the OPI. They argue that the transfer of conversational style from the L1 can negatively impact a test-taker's score if that style requires or prefers underelaboration of answers in a setting where elaboration is valued.

**The Group Oral.** One area of current concern is the potential partner effect in the group or pair oral test. Cambridge ESOL, for example, has gone to a speaking test format where two candidates are paired for the assessment, interacting with each other in two of the four phases of the examination, for almost all of its international English language tests. Recent research on the interlocutor effect in this context has shown contradictory findings. Although characteristics such as the gender, cultural or L1 background, and language proficiency of one's interlocutor likely affects the *discourse* produced with a partner, the question remains as to how such an 'interlocutor effect' influences *scores* on the test.

Dimitrova-Galaczi (2004) analyzed the discourse of 30 dyads that took the First Certificate of English (FCE) Speaking Test. The pairs represented a range of L1s, with female-female dyads the most common. Data from the third part of the test, a two-way collaborative task based on a visual prompt, were transcribed using CA conventions. Her two main findings were as follows. First, the conversation analysis of testtaker discourse indicated that paired speakers engaged in collaborative, parallel, and asymmetric talk, which she arrays along various continua. Second, by comparing the scores on the Interactive Communication rating subscale of the FCE and the discourse produced, she was able to determine that high scorers engaged in predominantly collaborative talk, while the talk of low scorers was mainly parallel in nature. In addition to implications for rater or interlocutor training and standardization, Dimitrova-Galaczi provides crucial information for the development of performance-based

descriptors on the Interactive Communication rating scale, a current validation concern in ongoing FCE research.

Davis (2005), in a multilevel analysis of oral performance within a paired classroom speaking task, looked at spoken data obtained from 24 first-year students at a Chinese university, divided into groups of relatively high and low oral English proficiency. Each student was examined three times; once paired with a partner of similar proficiency, once paired with someone of different proficiency (higher or lower), and once working alone in a monolog format. The speaking tasks consisted of photographs combined with a discussion question, similar to tasks used in the Cambridge FCE Speaking Test. Student scores obtained in these three test formats were quantitatively compared; language output from a subsample of participants was also transcribed, and specific linguistic and discourse management features were examined for each test condition. The results indicate remarkably similar discourse features *and* outcome scores across formats. Davis suggests that, at least for lower-stakes classroom testing, the paired format is an acceptable, if not desirable means of assessing oral proficiency, given that it takes less time than one-on-one testing and it mirrors much classroom ELT instruction.

To summarize, then, discourse analysis is a tool that allows for a deeper understanding of the nature of talk in oral assessment contexts, which was for too long overlooked in the test validation process. Discourse or conversation analysis has much to offer as a means of providing validation evidence for oral language tests. One important contribution that such analyses can make is that the data are accessible, as are the claims based on them. That is, for a number of applied linguists, highly sophisticated statistical analyses are comprehensible only to those versed in those analytic procedures. The results from discourse analysis are *observable*, in the form of transcribed data fragments, even when one does not agree with the conclusions at which an analyst may arrive. As such, qualitative research in language testing has the potential to reach a much larger, less exclusive readership.

Discourse analysis has proved a fruitful methodology for understanding the nature of oral assessment. Other qualitative techniques are only recently gaining recognition and respect in the language testing community; three of these—questionnaires, observations, and VPA—are discussed in the next section.

## WORK IN PROGRESS

### *Questionnaires*

Although questionnaires that seek demographic information from test-takers have been around for some time, it is only recently that they have

been used in supporting testing policy in large-scale language assessment. Taylor (2005) reports on a small-scale survey of European language test providers to determine perceptions, policy, and practice regarding native speaker norms and native-speaker and non-native-speaker language varieties. The 4-page questionnaire was comprised of 3 parts with 16 open-ended questions. Nine respondents, representing 8 languages, who described the challenges facing their organizations in determining a common standard which is socially meaningful and useful, which acknowledges linguistic diversity, and which avoids linguistic imperialism. From the results, Taylor formulates several principles for good language testing practice that cover the selection of test input, evaluation of test output, and training and standardization of interlocutors and raters. Taylor argues for a principled and well-conceived approach to testing policy and practice—one which is both transparent and well articulated.

### *Observations*

One of the more innovative qualitative research techniques in language testing has been developed by Cambridge ESOL to study the nature of testtaker language output in its speaking tests: the Observation Checklist (OC) developed by O'Sullivan, Weir, and Saville (2002). This approach is intended to complement the discourse analysis of fine-tuned transcripts as discussed earlier, which require both significant expertise and a great deal of time to produce and analyze. As an instrument that can be used in real time, the OC allows for a larger number of performances to be scrutinized, thus providing more information for test development and interpretation. The features on the checklist were derived from spoken language, SLA, and assessment literature, and are characterized as *informational*, *interactional*, and *management of the interaction* in nature. Based on piloting, revision, and a mapping of the checklists onto transcriptions of candidate talk, it was concluded that they were working well, and they offer a promising avenue for understanding testtaker output in other contexts.

### *Verbal Protocol Analysis*

VPA is another innovative research methodology, used in the field of cognitive psychology, which generates inferences about cognitive processes based on what respondents report verbally, either by talking aloud or thinking aloud. Verbal protocols may be generated either 'concurrently'; that is, while the respondent is completing a task, or 'retrospectively' after task completion. Respondents may be asked questions to stimulate responses, or may be allowed to respond freely. The verbal

protocol (or verbal report) is comprised of the verbal utterances that a respondent makes. Multiple protocols from one respondent or different respondents form the dataset for analysis. A fundamental underpinning of VPA is the tenet that such verbalizations constitute “an accurate record of information that is (or has been) attended to as a particular task is (or has been) carried out” (Green, 1998, p. 2).

According to Green, there is a series of phases involved in VPA. These include:

- Task identification
- Task analysis
- Selecting an appropriate procedure
- Selecting subjects
- Training subjects
- Collecting verbal reports
- Collecting supplementary data
- Transcribing verbal reports
- Developing an encoding scheme
- Segmenting protocols
- Encoding protocols
- Calculating encoder reliability
- Analysing data
- (Green, 1998, p. 15)

Obviously, there are disadvantages to this approach. As Green (1998, p. 117) notes, VPA is time-consuming, may disrupt natural behavior, and may suffer from variability in the respondents’ ability to produce protocols. Nevertheless, the results of VPA can provide insights into what testtakers and raters attend to during an assessment task in ways that other research techniques cannot, because it can “capture the dynamic nature of skilled performance” (see also Lumley and Brown, 2005, on this point).

Not many empirical studies employing VPA have been published, but two can be mentioned here. Orr (2002) examined how FCE Speaking Test raters reported their thoughts while scoring four FCE performances (and immediately after watching a video recording of each test). Orr found a great deal of variety and numerous contradictions in the ratings of the same performance: different raters applied different rating standards, they “did not focus on scoring criteria in the same way” (p. 149), and they considered various ‘noncriterion’ information in rating each performance. Raters particularly commented on three aspects of testtaker performance: “the candidate’s presentation her/himself, for example, effort, body language preparedness for the test; how the candidate compared with another learner; and the global impression formed of the presentation” (p. 151). Orr concludes that the raters found it difficult to adhere to the stated assessment criteria, and

suggests more explicit training in the nature of the assessment criteria as well as the process of rating.

In a study with a different focus, Milanovic and Saville (1994; as cited in Green, 1998, p. 61) examined rater strategies in assessing written compositions on the Cambridge ESOL Certificate of Advanced English (CAE) examination. The researchers posed the following questions:

- (i) Is it possible to abstract a model of good marking behavior?
- (ii) What distinguishes good examiners from poorer examiners?
- (iii) What influences rater consistency?
- (iv) Do raters adjust their marking behavior according to the level of the script?

Twenty raters who were pretrained and then trained further on-site marked 20 scripts, using a scale of 0–5 in a think-aloud, concurrent format. They also completed a short retrospective written report and a background questionnaire.

In developing a coding scheme, Milanovic and Saville generated categories that captured commonalities between behaviors so that a range of common classes of behavior could be identified for a given task/situation. They identified three primary categories on a first pass of the data: Marking behavior (e.g., initial reaction to script, personal response), Evaluative responses of the rater, and Metacomments. The protocols were then segmented and coded.

Based on their VPA, Milanovic and Saville concluded, among other things, that “good scripts elicit attention to details such as register, style, layout, and content. Raters focus less on these features as script quality declines. Instead they focus more on composition elements, such as spelling and grammatical accuracy, task understanding, and task completion” (1994; as cited in Green, 1998, p. 115).

## PROBLEMS AND DIFFICULTIES

The drawbacks of these qualitative methodologies for language assessment are much the same as they are for the larger field of applied linguistics. First, both discourse or conversation analysis and VPA require a large time commitment to master; expertise in them can take years to acquire. Engaging in the techniques themselves is quite time consuming as well. Careful transcriptions of data can take hours, if not days, and the iterative, cyclical nature of analysis requires a sustained time investment.

A second problem is the sheer volume of data that are collected and analyzed. A set of careful transcriptions can run 10, 25, even 50 pages, and to select representative examples that meet the space requirements of publication outlets is quite a challenge. In the near future, authors

may be able to provide text links to transcripts or audio or video files, but until that time the reader of this work must rely on what the author chooses to include. This task itself—of choosing prototypical examples—must be made transparent to readers.

On a more basic level, of course, is the question of whether the intensive nature of the qualitative research enterprise really pays off. The often-heard criticism that this work is impressionistic and subjective—it is not ‘generalizable’—is perhaps even more loudly voiced in a discipline, which since its inception has been enamored of high-powered statistical techniques to answer questions about language test reliability and validity. Qualitative research in language assessment may be tolerated by some testing researchers, but it is really embraced by very few.

Finally, the value placed on qualitative research is not helped by the fact that it remains unclear how this sort (in fact, many sorts) of research is to be judged—What are the criteria for evaluation? Clearly, this is a pressing issue for discussion, not just for language testing but also for applied linguistics in general. Lazaraton (2003) reviews various criteria that have been proposed for applied linguistics, such as those in *TESOL Quarterly* (which have since been revised and expanded; see the 2003 issue, Volume 37, No. 1), and concludes that the goal of defining one set criteria for different types of qualitative research cannot be met. Even within one qualitative approach, for example, which criteria should be privileged—“methodological rigor? Sociopolitical impact? Substantive contribution? Report accessibility?” (p. 8). These are questions that must be grappled with by the research community.

#### FUTURE DIRECTIONS

One area where qualitative research in language assessment has barely delved is into computer software for data analysis. Séror (2005) refers to these tools as Computer-Assisted Qualitative Data Analysis Software (CAQDAS), and include programs such as NUD\*IST, NVivo, and others he describes.

Generally speaking, CAQDAS makes for easy databasing and data retrieval.

According to Séror, qualitative researchers can easily change and build on their analyses; ‘project unity’ is also created by having all information in one place and easily accessible. Furthermore, current software packages allow more than just ‘code and retrieve’ tasks—researchers can now record memos, create formats to visualize the analysis, and the like.

However, Séror points out that the “tactile-digital divide” means that not everyone is comfortable working with computers; learning to use this software is also quite time consuming. Seror also notes that “CAQDAS also creates perceptions of closeness to and distance from the data that require caution” (p. 324). The researcher may in fact worry that his or her analytical processes may be influenced, or even worse, dictated by the design of the software.

Green’s (1998) book on VPA does describe how software programs such as NUD\*IST allow the researcher to structure and index verbal protocol data by dividing protocols into text units, to browse for text or search for words, and to create and modify hierarchical coding schemes.

A second area where qualitative methods seem particularly suitable in language assessment is in understanding the *consequential validity* of language tests; that is, their impact and social uses (see McNamara, *The Socio-political and Power Dimensions of Tests*, Volume 7). According to Lumley and Brown (2005), “research concerned with the consequences of test use tend to draw heavily on ethnographic research methods such as observation, interviews, and questionnaires, with stakeholders in the test under examination as the main sources of data. Impact studies, as they are termed, are typically case studies of single-test implementations” (p. 841). Shohamy (2001) suggests questions such as the following for these studies:

How do decision-makers use the test?

Are language tests used according to their intended purposes? Are they used fairly?

What are the consequences of tests? What is their impact on learning and teaching?

I do hope that we can look forward to more work on these and other important questions in the future, as language assessment continues to undergo a change in perspective on the utility of various complementary research methodologies for validating language tests. It seems clear that the established psychometric methods, with their emphasis on score data, are certainly effective, but they are also limited in their ability to shed light on questions about the assessment process, its impact, and its consequences (Lumley and Brown, 2005). I am optimistic that the language testing community will continue to welcome those whose research expertise and interests lie outside the conventional psychometric tradition. Discourse analysis, VPA, and impact studies—along with other qualitative research methods—now offer language testers complementary evidence for, if not viable solutions, to a range of test validation tasks.

UTILIZING PSYCHOMETRIC METHODS IN  
ASSESSMENT

INTRODUCTION

The *Dictionary of Language Testing* (Davies et al., 1999) defines ‘psychometrics’ as:

The *measurement* of psychological *traits* such as intelligence or language *ability*. In addition to deciding about *item types* and *test content*, the test developer needs to consider the psychometric or measurement properties of the *test items*, such as the *level* and range of *item difficulty* and *discrimination*. . . . It is based on assumptions of normal distribution. . . . Psychometric tests have properties such as *objective scoring* . . . (italics in original, p. 157).

This definition is quite encompassing, incorporating the whole enterprise of measuring the language construct, which includes the development of test items, the analysis of items, and the interpretation of scores.

Bachman (1990) provides a similar all-inclusive interpretation of the term and emphasizes the link to measurement theories and analyses, such as generalizability theory and item response theory. In addition, Bachman indicates that norm-referenced tests are considered psychometric tests because they are often constructed so that scores conform to a normal distribution and maximize the variability among test-takers. Bachman, therefore, clearly underscores the quantitative aspects of psychometric activities.

Hamp-Lyons and Lynch (1998) portray the psychometric approach as belonging to the positivistic paradigm. They maintain that “positivist/psychometric denotes an approach to research that assumes an independently existing reality that can be discovered (and measured) using objective, scientific methods” (p. 254). They note that psychometrics refers to objective item types and scoring, quantitative or quantifiable ability measures, empirical inquiries, and statistical methods, with a heavy emphasis on reliability. They distinguish psychometrics from other types of research that are qualitative, ethnographic, discursive, or narrative in nature.

The wide-ranging definitions of psychometrics make it challenging to use them as a guiding principle to organize the present investigation. Our delimited, operational definition focuses on the measurement and

statistical procedures aspects of the term. Thus, for our purposes, we eschew an expansive definition of psychometrics and concentrate instead on the term as it applies to quantitative analytical techniques. This definition allows us to examine language testing journals to determine to what degree psychometric methods are present in journal publications and what trends are apparent in the journals across the years.

#### EARLY PERSPECTIVES ON PSYCHOMETRICS

Language testing very often involves psychometric procedures and quantitative methodologies. This orientation is evident from early publications in the field. For example, the back cover of Davies' (1968) book publicizes the chapters as dealing with topics that "range from the particular application of language aptitude tests to more widely relevant statistical methods of measurement and evaluation." In the *Introduction* section of the TESOL 1978 language testing colloquium, the editors, Brière and Hinofotis (1979), remark that "the field of language testing is desperately in need of a great number of experimental studies in order to provide us with some empirical answers to the complex and nagging questions involved in language proficiency" (p. viii). Similarly, Oller and Perkins (1980) emphasize in the *Preface* of their edited volume the importance of performing "appropriate empirical research to obtain answers" (p. ix).

In the earlier years of the field, many Language Testing Research Colloquium (LTRC) presentations were compiled into book publications, for example, Palmer, Groot, and Trosper (1981). A quick survey of the chapters of this Volume shows the dominance of a psychometric approach and the use of a variety of statistical item analysis methods to language test development and research, for example, multitrait-multimethod (Stevenson, 1981), principal component analysis (Engelskirchen, Cottrell, and Oller, 1981), as well as analysis of variance and multiple regression (Hinofotis, Bailey, and Stern, 1981).

Early journal publications in the field also tended to emphasize empirical, quantitative evidence to support the quality of language test instruments. In the very first issue of *Language Testing (LT)* a range of psychometric procedures were employed, for example, statistical estimates of error in reliability (Krzanowski and Woods, 1984), multiple regression and discriminant analysis (Fletcher and Peters, 1984), and latent trait measurement or Rasch procedures (Perkins and Miller, 1984).

Spolsky (1977) discusses the early structuralist-psychometric trend in language testing and laments the triumph of psychometric objectivity and reliability at the expense of integrative, communicative testing.

He portrays the interplay between the structuralist approach to test content or test items and the emphasis on objectivization in psychometrics in negative terms:

The quantifiable results provided by the mechanistic scoring of short true-false or multiple-choice questions, and the opportunity that large numbers of marks afforded of replacing judgments of individual performances by statistical norms, gave every appearance of solving the problem of reliability. Whatever it was that was being measured, at least it was being measured consistently (p. 53).

The use of more sophisticated statistical procedures and the embrace of more communicative tasks compelled Bachman (1990) to redefine Spolsky's structuralist-psychometric trend in language testing in more positive terms. He labels this trend as a psychometric-communicative approach. Bachman argues that "theoretical advances generate the need for more powerful tools, and the availability of more sophisticated tools can lead to advances in theory. Such a relationship can be seen, for example, in the history of research into human intelligence and factor analysis, as well as in econometrics and causal modeling" (p. 299). In other words, the psychometric-communicative approach symbolizes a productive relationship that enables us to document the quality of our tests and the resulting scores, and affords us robust tools to pursue research about the nature of the language construct.

#### RECENT CONTRIBUTIONS

Our charge in this chapter was to report on the use of psychometric methods employed by language testers over the years. Several such review articles have appeared on this topic already (Bachman, 2000; Bachman and Eignor, 1997; Hamp-Lyons and Lynch, 1998; Lumley and Brown, 2005). Reviews of Bachman (2000) and Bachman and Eignor (1997) focused primarily on quantitative methods, while Lumley and Brown (2005) also included substantial information on the growing body of work in the field employing qualitative methods. In each review article, the authors cited specific publications that made use of a particular methodology or analytical technique. Hamp-Lyons and Lynch (1998), on the other hand, took a systematic and historical look at abstracts submitted to LTRC. They discussed the notion that language testers have traditionally adhered to a positivist paradigm in their research philosophy and practice and demonstrated how the LTRC abstracts reflect that perspective.

Basically, the reviews indicate that the empirical, psychometric orientation in language testing publications persists as researchers

embrace various and often novel statistical methodologies. These methodologies include generalizability theory (Bolus, Hinofotis, and Bailey, 1982), multidimensional scaling (Chalhoub-Deville, 1995), structural equation modeling (Kunnan, 1995), multifaceted Rasch (Weigle, 1998), rule-space methodology (Buck and Tatsuoka, 1998), as well as new approaches to test development and administration that capitalize on technological innovations, for example, computer-based or adaptive testing (Chalhoub-Deville and Deville, 1999).

Rather than once again survey the use of psychometric methods and discuss their capabilities and limitations, we chose in the present review to examine all articles published in the field's premier—and until recently, only—journal, *LT*, since its launch in 1984. We also looked at the publications from the field's new journal, *Language Assessment Quarterly (LAQ)*. We undertook this review of articles in these journals to determine (1) the relative frequency of published work that could be considered psychometric, and (2) the discernible trends in these frequencies over the years. (Admittedly, any analysis of trends in *LAQ* is somewhat premature at this time.) Our goal was to ascertain the extent of published psychometric research in the field's journals. Our concern is that publication of a single, dominant research and epistemological approach may eventually limit the field's progress.

#### LANGUAGE TESTING JOURNALS

To focus on the psychometric, quantitative aspects of our profession is to address fundamental, dominant approaches to how language testers undertake their research and test development. We have chosen to explore the use of psychometrics in articles published in the two principal journals in the language testing field, *LT* and *LAQ*. With its first issue in 1984, *LT* is the older, more established journal. In 1993, *LT* was formally acknowledged as the “house-journal” of the International Language Testing Association (Davies and Upshur, 1992, p. i). *LAQ*, first published in 2004, is a more recent publication. *LAQ* represents not only growth in the field, but also new perspectives and opportunities (Cumming, 2004). Before we delve into an examination of the journal articles themselves, it is productive to examine the editorial statements, which encapsulate the research (essentially quantitative) orientation promoted in the journals. In examining the statements, more space is dedicated to *LT* simply because the journal has had a longer life, over 20 years, and has experienced multiple sets of editors. *LAQ*, on the other hand, is only 2 years old and has had one editor.

In the inaugural *LT* issue of 1984, Hughes and Porter state in their *Editorial* that:

Intending authors should note that our preference will be for articles which bear upon theoretical issues and which are based on empirical research . . . . Our concern will also be with more than purely statistical significance of results. . . . we might wish to publish work which throws up interesting issues, even if results are not statistically significant, or no clear conclusions can be drawn (p. 1).

Clearly, the founding *LT* coeditors encouraged the submission of articles that followed an empirical, quantitative approach to language testing investigations.

A review of the subsequent *LT* editors' statements over the years shows that while the mission of the journal continued to expand and embrace diverse research paradigms, its empirical, psychometric orientation continued to dominate. For example, in 1994, Davies and Upshur quote the founding editors' position on the research orientation espoused by the journal (see quote above) and indicate their commitment to that original vision. They state: "These aims continue to represent the present editors' views of the role of the journal. We reiterate them here while at the same time extending them" (Davies and Upshur, 1994, p. i). A similar affirmation of the psychometric paradigm was expressed by Alderson and Bachman when they took on the role of coeditors in 1997 and by Douglas and Read, who assumed the editorship in 2002. One might question, however, if *LT* did actually extend the scope of research orientation in the journal (see tables in Results and Discussion).

*LAQ* publishes not only research articles, but also interviews and commentaries (in addition to the traditional test and book reviews), as well as special issues. It presents itself as an alternative to what has traditionally been published in language testing (Kunnan, 2004). *LAQ* promises to deepen and broaden the theory, research, and practice within the field, and to invite cross-fertilization from related disciplines (Cumming, 2004). *LAQ* explicitly endorses methodologies beyond the empirical, quantitative approach. In his editorial statement, Kunnan promotes "novel ways of thinking about emerging issues (conceptual, empirical, clinical, historical, methodological, or interdisciplinary), the use of varying research methodologies (quantitative, qualitative, ethnographic) and narrative styles . . ." (p. 1).

The editorial statements, in essence, set the scene for the type of research to be expected in each journal. With these statements in mind, we now move into the main part of our survey, that is, examining the nature of the articles published in *LT* and *LAQ*. The editorial statements lead us to hypothesize that *LT* publications rely more on quantitative procedures. Additionally, we expect this psychometric orientation to have less of a presence in *LAQ* articles, where we anticipate finding more diverse approaches and methodologies based on the editorial statements.

## METHODOLOGY AND ANALYSES

The methodology employed in the present study follows a commonly used approach of surveying research published in the literature and documenting how the variable of interest has been represented. For studies using this approach, albeit investigating a different variable, see Lazaraton (2005) and Rex et al. (1998). Lazaraton, for example, whose focus is somewhat similar to the present investigation, surveyed articles published over the period of 11 years in 4 applied linguistics journals. The purpose of the survey was to “determine what the actual research methods employed were” (p. 209).

The present review of psychometrics surveys all articles that appeared in *LT* and *LAQ* starting with their first issues of 1984 and 2004, respectively, and ending with the last issues published in 2005 (see Tables 1 and 2 ). Until 1992, *LT* produced two issues annually. In 1993, the journal was expanded to three issues per year and in 1999 to four. Given *LAQ*'s young age, only seven issues were available for review. Three issues were published the first year (issues 2 and 3 were published jointly in one document) and four were available in 2005. Despite the wide gap in the ages of the two journals, it may still be informative to compare the trends or orientations of the articles that appear in the two journals. The present analysis focuses on the *Articles* sections of the two journals and does not consider the other sections in these journals, for example, test and book reviews, responses or commentaries, and interviews.

In selecting the articles to be reviewed for her study, Lazaraton (2005) excludes special issue articles. She argues special issue articles do not typically provide “an accurate reflection of normal editorial policy or normal submissions to the publication” (p. 213). While we understand Lazaraton's reasoning and agree that special issues represent somewhat of a departure from normal journal review procedures, we maintain that editors seek and approve of these special topic issues and thus the articles signify an aspect of the journal's general policy. Moreover, special issues could be dedicated to exploring new areas of growth or highlighting research using a specific methodology, for example, the *LT* (1998, Issue 3) issue on structural equation modeling, and as such, they are pertinent to the present investigation. Therefore, to obtain a more comprehensive understanding of the nature of articles published in *LT* and *LAQ*, our survey includes both regular and special topic issue articles. We anticipate, however, differences between regular and special topic issue articles in terms of their incorporation of psychometric, quantitative procedures.

We settled on our criteria to classify an article as psychometric or not only after having gone through all of the *LT* publications, culling out

Table 1 Counts and percentages of *Language Testing* articles employing psychometric methods

the various analysis techniques, and discussing how we view the piece in terms of its ‘psychometricness.’ For our purposes, a publication was considered psychometric if it included statistical analyses, simple counts, or frequencies. We recognize that the dichotomizing approach we employed, that is, the article has a psychometric orientation or not, is somewhat tenuous. While it served our purpose here in allowing us to provide a rather crude categorization, the dichotomy is a bit misleading. Indeed, the publications could probably be placed on a continuum according to how psychometrically ‘loaded’ they are. That said, any continuum of ‘psychometricness’ would be just as arbitrary as the present dichotomy. In the end, any such classification of articles serves a heuristic—not stringent research—purpose.

In need of specific mention is how we dealt with think pieces that did not provide specific analyses but which did rely heavily on psychometric literature as an important foundation in the discussion of the particular topic (see Mislevy, 1995; North and Schneider, 1998). While these articles did not present analyses from a particular study, we classified them as psychometric because of their reliance on and compatibility with quantitative research techniques. Moreover, we maintain that our familiarity with the authors of such articles and their body of work justifies our placing their work in the psychometric category.

## RESULTS AND DISCUSSION

The present survey focuses on identifying the articles in both *LT* and *LAQ* deemed to have a psychometric approach. This involved a straightforward tallying of the number of psychometrically based articles. In discussing the results of the tally, a comparison is made

between the number of psychometric articles published in *LT* versus *LAQ* and those that appear in the regular versus the special topic issues.

An initial glance at [Table 1](#) might lead one to conclude that overall, the number of *LT* articles using quantitative procedures is high. One would also observe that the percentages fluctuate from year to year, most notably in more recent years. These deductions, however, should be qualified by examining the impact of the special issues on the counts and percentages.

From the very beginning, *LT* dedicated issues to special topics, for example, IRT (1985, 2) and the 25th anniversary of the field (1986, 2; 1987, 1). At the time, these were not called special issues. The *LT* editors did not designate an issue as a special topic until 1993, when Davies and Upshur (1993) indicated that Volume 10, Issue 3, was to be “the first of the special issues we are planning to publish annually” (p. i). Over the years, these special issues have addressed diverse themes. The themes tended to: showcase projects or practices in certain regions, for example, language assessment in Australasia, *LT* (1993, 3); introduce research employing specific methodologies, for example, structural equation modeling (1998, 3); highlight topics not been widely represented in *LT* publications, for example, speech–language pathology (1999, 3); bring focused attention to particular, emerging topics, for example, ethics (1997, 3); or commemorate special occasions, for example, the 20th anniversary of *LT* (2003, 4). For the most part, and as [Table 1](#) shows, articles published in the special issues have been less psychometric in their orientation.

In the special issues from 1993 to 2005, only 43 of 89 articles (48%) were seen as psychometric. Even when we include the special issue articles that predate the official commencement of the policy, the figures do not change considerably, that is, 67 out of 126 articles (53%) are categorized as psychometric. Obviously, if we were to remove the special issues from the tally, the counts and percentage of psychometric articles would increase drastically. The tally shows that 172 out of 187 articles (92%) that appear in the regular issues from 1984 to 2005 are psychometric in nature. These counts and percentages are comparable for the periods 1984–1992 and 1993–2005, with 60 out of 64 (94%) and 112 out of 123 (91%), respectively. The bottom line is that while the special issue articles employ fewer quantitative procedures, overall the psychometric tradition appears to be alive and well in *LT*.

In terms of *LAQ*, [Table 2](#) shows that the number of psychometric articles is quite different for 2004 and 2005. One of the 11 articles (9%) published in 2004 is considered psychometric. This psychometric article appears in the special issue on ethics. It was surprising to note that 5 of the 6 articles (83%) in the 2005 issue can be classified as

quantitative, number-wise hardly different from *LT*. Overall, 6 of the 17 *LAQ* articles (35%) have a psychometric orientation. If we exclude the special issue, 5 of the 9 (56%) were seen as psychometric.

*LT* and *LAQ* counts and percentages seem to *partially* corroborate our stated hypotheses. The results support our expectation that, overall, *LT* articles incorporate more psychometric, quantitative procedures than *LAQ*. This conclusion, however, would need to be considered with caution, given *LAQ*'s young publication life and the drastically different figures available for 2004 and 2005. Finally, it is important to keep in mind that *LAQ* includes other sections such as interviews that play a central role in serving the mission of the journal (not being research articles, these were not included in the present compilations). Four have been published so far. For both *LT* and *LAQ*, we anticipated a difference between the articles published in the general versus the special topic issue journals. This hypothesis was borne out in the present investigation. The special issue articles appear to be less psychometric in their approach.

#### CHALLENGES AND FUTURE DIRECTIONS

It is important to mention LTRC in conjunction with *LT* because the orientation of the journal has been, to a large extent, dependent on the orientation of the researchers in the field who have presented at LTRC since its inaugural meeting in 1979.

LTRC has been crucial for the journal in the sense that a considerable number of our articles have originally been presented and discussed at the colloquium before being submitted for publication, as indicated in the following quote:

“... the initial LTRC had a substantial role in setting the research agenda that has been pursued through the pages of the journal in the last two decades” (Read and Douglas, 2003, p. 351).

In other words, as long as LTRC presentations rely on a psychometric paradigm, *LT* will continue to have a source of publications that meet this orientation. If LTRC presentations put forward other perspectives and paradigms, then *LT* would likely embrace these as well. The field can only benefit from broader perspectives as to what constitutes research and what is published in its journals, for example, as exemplified in the special issues. *LAQ*, with its distinct focus, at least as articulated in the editorial statement, represents a timely journal that may well meet the needs of less quantitatively focused researchers. While we believe that the field, and its journals, have been well-served by the emphasis on psychometric research over the years, we also recognize the exciting research emerging from others (e.g., Brown, 2003,

who uses discourse and conversational analyses techniques) and hope to see more such work in our journals.

Given its young life, it is difficult ascertain the capability of *LAQ* to engender a paradigm shift and an expansion of methodologies employed in language assessment research and development. Future surveys should examine what the impact of *LAQ* might be on expanding the publication of studies employing various research methodologies and on the sorts of research questions investigated. Future investigations could also document whether scholars who have typically shied away from the LTRC community and have not published in *LT* because of the dominant psychometric orientation of the field, find *LAQ* to be an appropriate and welcoming outlet for their work. The challenge for *LAQ* in this undertaking is to reach those communities not traditionally represented in our field. Two sound strategies that *LAQ* is pursuing in this regard is populating the editorial board with professionals from those nonrepresented areas and targeting presentations at conferences beyond those at LTRC.

In terms of *LT*, it will be interesting to observe whether the existence of *LAQ* results in a repositioning of *LT* publications, perhaps most notably in terms of the special issues targeted. In addition, broadening the statistical methodologies, and concomitantly the professionals employing them, should continue to be a goal for *LT*. One methodology has shown promise for diagnostic testing and we anticipate that publications using this approach will appear in *LT* publications in the near future (Henson and Templin, 2004). New methodologies can open the door for new questions and sometimes even answers.

## TRAINING IN LANGUAGE ASSESSMENT

### INTRODUCTION

This chapter addresses major issues involved in training language instructors to make informed decisions throughout the assessment process. Within the context of the chapter, the ‘assessment process’ refers to developing, scoring, interpreting and improving classroom-based assessments as well as selecting, administering, interpreting and sharing results of large-scale tests developed by professional testing organizations (Stoynoff and Chapelle, 2005). This chapter also explores the gap between language testing practice and the training of language instructors in language assessment, and the importance of bridging this gap for improved learning, teaching and assessment (Trim, 2005). The term ‘assessment literacy’ has been proposed to describe what language instructors need to know about assessment (Boyles, 2005; Stiggins, 1997; Stoynoff and Chapelle, 2005). This chapter closes with a discussion of this term.

As pressure for language instructors and educational institutions to provide information on students’ progress has increased since the 1880s and skyrocketed in the past decade (Brindley, 1997; Spolsky, 1995), attention has focused on testing within language teaching and learning. The 2001 passage of *No Child Left Behind* (NCLB) legislation in the US mandates annual assessment of the English language proficiency of all English language learners in K-12 and highlights the need to track student outcomes (Alicea, 2005). Although Europe and other countries have followed a less “legislative” approach than the USA (Stoynoff and Chapelle, 2005, p. 6), in that member nations are not mandated to adopt it, the Common European Framework of Reference for Languages (CEFR), exerts great influence on the teaching and assessment of language (Alderson et al., 2006) not only in Europe but beyond.<sup>1</sup>

Despite the growth of standards-based education, standards for teacher certification and an increase in tests administered, there is no consensus on what is required or even needed for language instructors to reliably and validly develop, select, administer and interpret tests. Therefore, the question remains as to what can be done to support

---

<sup>1</sup> Versions of the CEFR have been translated into a number of languages, including Japanese (Trim, 2005).

and train those who “have to do the real work of language teaching” (Carroll, 1991, p. 26) when they assess their students.

In addition to the practical and pedagogical concerns about assessment knowledge, the political arena also impacts student assessment. With the arrival of NCLB in the USA and the CEFR in Europe and beyond, assessment of language learners’ progress has only strengthened in political, practical and pedagogical importance. This chapter examines how the underlying philosophies of training in assessment have changed over time, in response to societal and educational changes in policy and practice. It also examines how different formats for training in language assessment, from textbooks to distance learning, have altered such training. Finally, it examines ongoing challenges and future directions for increasing the ‘assessment literacy’ of language instructors to improve how teacher training meets the pre-service and in-service needs of language instructors.

### EARLY CONTRIBUTORS

This part of the chapter describes the three early periods of language testing and discusses how each period’s philosophies were reflected in available assessment training. Spolsky (1977) has divided language testing into three major periods: pre-scientific, psychometric and sociolinguistic.<sup>2</sup> The pre-scientific approach, as practiced in the USA and Europe, relied mainly on the judgments of instructors as they assessed a translation, composition or oral performance, or another open-ended task presented to students. The very term ‘pre-scientific’ judges this approach ‘unscientific’; the lack of science as applied to language testing during this period resulted in debates as to the reliability of written and oral exams administered to large groups of students and rated by different instructors. The literature does not reveal any systematized, required training for instructors on how to develop the questions for these tests, guidelines for rating the test results or available training for the instructors in rating the examination performances.<sup>3</sup> As far back as 1888, debates ensued as to the reliability of these written (or oral) exams administered to large groups of students and rated by different instructors with varying understanding of expected outcomes (Spolsky, 1995). Despite these criticisms, it is important to note that such exams, such as the Indian Civil Service Exam, supplemented patronage alone for candidates to the civil service. Early language tests, though their

---

<sup>2</sup> Spolsky (1981), Barnwell (1996) and others have alternative names for this period; this piece uses the original terms.

<sup>3</sup> While some large-scale tests for admittance to universities or professions included oversight by committees, there is no evidence of such oversight for classroom assessment.

developers and raters may have lacked rigorous formal training in language assessment, were often viewed as a more democratic means of admitting students to university and the workplace than simply using personal connections to secure university places and professional positions (Spolsky, 1995).

By contrast, the second, psychometric period, emphasized statistics and measurement and moved away from open-ended test questions to test items focusing on discrete aspects of language, such as vocabulary, grammar, pronunciation and spelling. The format for testing also changed; while in the pre-scientific period, students may have responded to one or two questions by essay or oral response, tests in the psychometric period included more, but shorter items. It was at this time that item types such as multiple-choice, true/false and similar short-answer questions gained popularity in testing. As this approach became popular, it was reflected in course offerings at institutions of higher education; Joncich (1968, as cited by Spolsky, 1995) reports that by 1920, courses in educational measurement were being offered by most US state universities.

Therefore, the shift from fewer test items with long responses that took time to score to more test items with short, easy-to-score test items, was underway. While this new phase in language testing addressed some of the criticisms of the pre-scientific phase, it introduced new challenges. Despite Joncich's (1968) reference to the development and availability of educational measurement courses, there is no indication that such courses were uniformly required of teachers. During this period, the work of testing and teaching was divided; testing organizations developed large-scale tests to measure student progress and teachers provided instruction to students (Stoynoff and Chapelle, 2005). Therefore, a gulf developed between instructors and tests.

By the 1970s, changes in society, educational measurement and theories of language learning resulted in a shift toward the sociolinguistic period.<sup>4</sup> During this period, a new shift occurred from discrete-point testing toward tests meant to measure meaningful communication (Omaggio Hadley, 1993). A great deal of literature is devoted to how language instructors should (and should not) be trained to assess according to variations of this approach (Bachman and Savignon, 1986; Lantolf and Frawley, 1985). One of the most popular approaches to assessing communicative competence during this period in the USA was the *ACTFL Proficiency Guidelines*, while in Europe, work began on what would become the *Common European Framework of Reference*. By the early 1980s, training in various approaches to assessing communicative competence became available to instructors.

---

<sup>4</sup> Canale and Swain (1982) and other refer to this as "communicative competence" or "the proficiency approach" (Barnwell, 1996).

As effects of the sociolinguistic period in testing spread into the 1980s, educational reform in the United States and efforts by the Council of Europe to reform language teaching prodded the testing field toward measuring outcomes based on shared standards for language learning (Stoynoff and Chapelle, 2005). Standards-based learning was viewed as so important in the United States at this time that, when the U.S. Department of Education did not fund the development of standards for English as a Second Language, Teachers of English to Speakers of Other Languages (TESOL) provided funding for the *Standards for ESOL preK-12*, as well as *Scenarios for ESL Standards-Based Assessment*. *Scenarios*, a companion piece to the *TESOL Standards*, included both basic information an assessment as well as real-life assessment scenarios for preK-12 learners of English. The standards movement had a tremendous impact on training of instructors; over 2,000 instructors had participated in workshops on the CEFR by 2005; (Trim, 2005); an equal number of US instructors have been introduced to or trained on the TESOL preK-12 standards (Smallwood, 2006, personal communication).

The gap in knowledge of assessment between teachers and test developers that developed during the psychometric period was reduced during the sociolinguistic period and narrowed further with the introduction of and incorporation of standards in the language classroom during educational reform. With the 1980s and 1990s, a new era of language testing with roots in the education reform movements in Europe and the USA emerged.

### *Current Trends*

Overlapping the sociolinguistic period, the literature shows an increased emphasis on authentic, performance- (or outcomes-) based assessment, to reflect what students need to do with the language in real-life settings (Wiggins, 1994) as well as an increased importance on shared, common standards with which to assess students. During this time, methods of collecting information from students gained popularity, such as portfolios of student work, student self-assessment and increased emphasis on the authenticity of the task the student was to perform with respect to language use in daily life (Moore, 1994). Since the 1990s, emphasis on testing, including language testing, has risen steadily. The release of the CEFR in Europe and beyond and the passage of NCLB in the USA have only magnified the importance of testing worldwide. Not only has the importance of language testing increased, but these new trends in general and the CEFR in particular have allowed approaches such as portfolios and self-assessment to be clearly exemplified for use in the language classroom (Trim, 2005). The connection between assessment, standards and politics

highlights the importance of training language instructors so that they can adequately assess their students' progress toward local, national and/or international goals and standards.

### MAJOR CONTRIBUTORS

Any history of language testing will readily name a number of influences on language assessment; it is more difficult to pinpoint at what point changes in the language testing arena begin to impact the training of classroom teachers. The impetus for the three periods described in the previous section began with primarily large-scale assessments, such as admission to university and professions; the extent to which results and lessons learned from large-scale assessments are passed on to instructors and incorporated into pre-service teacher texts differs, but it has clearly strengthened in recent years. This emphasis is reflected in not only the volume of assessments available throughout the world but also in the number of texts available for training instructors in assessment.

In this section, I will address two major contributions to training in language assessment: traditional text-based materials, and technology-mediated materials and information that became available in the 1990s and beyond.

#### *Text-Based Materials*

To examine contributions to professional development in language assessment, the first place to look is at teacher training programs and the instructional texts used. There are several ways to examine language testing textbooks, including length, content and quantity of available textbooks. Cohen (1994) references seven other textbooks on language testing available at the time of printing, and points out that there were not as many available in the edition published 15 years earlier. This gap shows the crux of the issue of training in language assessment; during the psychometric period, "large-scale standardized instruments [were] prepared by professional testing services to assist institutions in the selection, placement and evaluation of students" (Harris, 1969, p. 1) and the focus was on training professionals to develop items for standardized tests rather than training language instructors to assess their students. Looking at the bibliographies of over 50 language testing texts, the author selected ten published from 1967 to 2005 to contrast on page lengths, number of references and number of times the book has been cited as listed in GoogleScholar<sup>5</sup> (see Table 1).

---

| Stoynoff and Chapelle<br><i>ESOL tests and testing: A resource for teachers and program administrators</i> | 2005                | 166         | 180                  | 1                          |

While [Table 1](#) includes only a very small sample of textbooks available in language testing from the late 1960s until present, it shows differences and similarities over time. For example, while Valette and Harris were contemporaries, the lengths of their textbooks were different; however, they had far more similarities in their number of references. By contrast, Oller (1979) included more references than any other work until Bachman’s (1990), which includes more references than any two textbooks listed above, indicating the amount of research that guided the work. A quick search on GoogleScholar reveals that the two most cited language testing textbooks are Bachman (1990) with 751 citations and Hughes, with 343. Obviously, newer texts would have fewer references relative to their time in the field.

In preparing this chapter, the author examined over 100 language testing publications; [Table 2](#) shows the countable differences in Hughes’ and Cohen’s textbooks over time. Besides the gap between page length and number of citations that exists between various texts, there is also a difference between earlier and later editions of texts, as Cohen (1994) points out.

The differences in length and references mirror additions of content to the text. While all texts referenced earlier include descriptions of reliability, validity, basic statistics, item development and practicality, the later versions include more references to assessments such as portfolios and other practices that became widespread in the 1980s. Discussions of validity also grew, in part due to the incorporation of new theories of validity (Messick, 1989). In addition, Hughes added a chapter on assessing children because of the increased emphasis on testing this age group (Hughes, 2004). Cohen (1994) more than doubled the number of references and pages, suggesting that teachers required more information in the 15 years that passed between publications. As assessments change, the field shows us, textbooks used in teacher training have changed as well.

Table 2 Changes in Hughes’ and Cohen’ textbooks

| Author | Date of publication | Page length | Number of references |
|--------|---------------------|-------------|----------------------|
| Hughes | 1989                | 154         | 66                   |
| Hughes | 2004                | 217         | 186                  |
| Cohen  | 1980                | 132         | 172                  |
| Cohen  | 1994                | 362         | 433                  |

However, as assessment methods became standard classroom practice, the texts needed to move beyond theory to provide instructors with tangible, usable examples. While early textbooks often combined theoretical explanations with sample assessment tasks, the 1990s saw an explosion of texts that could supplement or supplant existing ones by providing examples that could be readily included in the classroom. These texts included both variety and quantity in the examples of assessment provided for instructors.

O'Malley and Valdez Pierce's (1996) *Authentic Assessment for English Language Learners: Practical Approaches for Teachers* combined theory and practice in an accessible volume for classroom teachers. Its rubrics, checklists and practical advice on applications could easily be incorporated into the classroom. Similarly, Brown (1998) produced a volume with 18 different activities, which included input from three to eight contributors from around the world for each activity type. Others in language testing also joined forces to model and explain solid theories of language testing coupled with practice. Bachman and Palmer (1996) and Genesee and Upshur (1996) published textbooks on language testing geared toward classroom teachers in both their titles and tone. Unlike previous language testing textbooks, both volumes emphasized the specific issues and problems faced by classroom teachers and aimed to combine a theoretically strong approach to language testing with practical help. For example, Genesee and Upshur (1996) included conferencing and portfolios, both approaches that gained popularity in the 1990s.

In the spirit of combining the information of a language testing textbook and the practicality of a 'how to' manual for teachers, Davidson and Lynch (2002) have produced *Testcraft: A Teacher's Guide to Writing and Using Language Tests*. They emphasize the importance of developing solid test specifications based on language testing research as well as practical issues of teamwork in the test development process and ways to approach inevitable conflicts. *Testcraft* also includes scenarios applicable to situations their readers may encounter.

Most recently, Stoyhoff and Chapelle (2005) published *ESOL Tests and Testing*, a volume which includes reviews of common English Language tests, as well as chapters on the 'basics' that language instructors should know before using any test. Stoyhoff and Chapelle stress the importance of making informed decisions in all aspects of the testing process, and the structure of the volume supports this approach. The reviews are embedded in the book, rather than appearing at the beginning or the end, and this sequence emphasizes the importance of contextualization in test selection. This volume points to the issue of 'assessment literacy' in language instructors, and the need to

provide practical and usable resources to language instructors to ensure that tests are selected and used properly.

While the above provides only a glimpse into the kinds of text-based materials offered to classroom teachers, the very existence of such materials points to the importance of assessment for language instructors, as well as an understanding on the part of textbook authors and publishers that theoretical texts were insufficient to provide a broad understanding of both testing and classroom applications to language instructors.

### *Beyond Text-Based Assessment Training*

In addition to training provided by written texts, other formats have become available for training language instructors on assessment. While one format for training in assessment has always been the workshop, this format can be expensive and time-consuming and limited in its ability to reach all language instructors. Technology can provide new responses to the growing need for more training. For example, CEFR materials, while readily available in print, have been translated into a variety of languages and are accessible via the web for downloading (<http://www.coe.int/t/dg4/Linguistic/>). Not only are the materials downloadable, but the CEFR includes a number of interactive materials, such as self-assessments, that make use of the Internet for training in language assessment. This section outlines self-access materials, or materials that instructors can access on their own, including both earlier, pre-Internet formats and newer formats available by computer.

### *Self-Access Materials*

Professional development workshops are frequent approaches to help instructors in all subjects supplement their formal training and improve their classroom effectiveness. In the USA, the communicative competence movement afforded to language instructors opportunities to participate (for a cost) in 4-day training on oral proficiency assessment; a format that was previously restricted primarily to government employees. However, as mentioned, such workshops cannot possibly reach all language instructors. Therefore, self-instructional materials can and have supplemented workshops for training in language assessment.

Earlier technologies afforded opportunities for such supplements. As tape-recorded materials, accompanied by text materials, could begin to replace live, face-to-face workshops, Kenyon and Stansfield (1993) and Kenyon (1997) investigated a new format: allowing potential language

raters to participate in training through use of a kit rather than a live training workshop. Such self-instructional approaches allowed teachers, educators and language instructors to participate in training on new formats of language assessment to use in with their students. Similarly, ETS developed self-training kits for raters of the SPEAK test; these kits included tapes and ancillary materials. These new formats allowed instructors to participate in training on new types of assessment; just as student self-assessment allows students to take responsibility for their own learning, self-instructional materials allow instructors to learn about topics in assessment in which they are interested. However, monitoring the outcomes of self-instructional materials is far more difficult than tracking face-to-face encounters. It is easy to count the number of workshop participants; it is far more difficult to determine how many instructors have used the self-instructional materials ordered and sent.

As access to the Internet increased, computer-based approaches gained in popularity throughout education. So too, did access to more information on language assessment training. Since 1995, Fulcher (2006) has hosted the *Resources in Language Testing* webpage (<http://www.le.ac.uk/education/testing/ltrfile/ltrframe.html>, retrieved 1/10/07), which includes references, relevant organizations and streaming video of well-known language testers responding to frequently asked questions in language testing on topics such as reliability, validity, test impact, item writing and statistics (Fulcher and Thrasher, n.d.). This page contains a great deal of useful information; the extent to which language instructors regularly consult this page is unknown.

Another internet-based format includes portfolio-based 'passport' to demonstrate student progress on the CEFR that students and instructors can complete to show student growth (CEFR, 2005). These resources are available on the web and can be downloaded for use by instructors, and the self-assessments can be completed online. An important point here is that such formats are not limited to Europe, but, with the Internet, can be used worldwide. The Centre for Canadian Language Benchmarks provides resources for learners and assessors on its website, including guidelines and resources for test development ([www.language.ca](http://www.language.ca), accessed December, 2006). However, unlike the internationally based CEFR, the Centre for Canadian Language Benchmarks includes fewer interactive and more downloadable materials.

#### WORKS IN PROGRESS

Many of the current projects described are simultaneously works in progress. As CEFR grows and questions about its use continue to be discussed, available resources and applications of these resources

may change. The CEFR webpage reveals regular updates of policies, materials and resources for its users as does the Centre for Canadian Language Benchmarks. In the USA, NCLB affords a number of opportunities for language instructors to receive training online with both access to policy and position papers as well as online training in test administration for some tests developed to meet NCLB ([www.wida.us](http://www.wida.us), accessed March 11, 2007).

However, additional materials and resources fail to inform the language testing field as to the level of assessment literacy of language instructors. To address this need, Swender et al. (2006) reported on a web-based survey of assessment uses and needs of 1,600 US foreign language instructors. In addition to highlighting tests currently being used and needed for language instructors, the survey also highlighted a lack of understanding of many testing concepts, such as appropriate test use, by those who responded (Swender, Abbott, Vicars, and Malone, 2006). In response to requests from users, the results of ACTFL's survey and other reports, the Center for Applied Linguistics is updating its current foreign language test database and developing an online tutorial for users in test selection. While this work has just begun, early focus groups of language instructors from pre-school to university level have indicated that such a tutorial will help them to make informed decisions about language assessment (Gallagher, Montee and MacGregor, 2006).

## PROBLEMS AND DIFFICULTIES

Although the landscape for including more stakeholders in the language assessment process and educating these stakeholders about language assessment is encouraging, it is nonetheless a daunting task. The amount of resources available in print and online is bewildering, and a language instructor inexperienced in language assessment might not understand how to select from among the many resources in the world.

The first major problem is providing instructors with consistent and relevant pre-service training in language assessment (Taylor and Nolan, 1996). Such a restructuring would reflect the importance of assessment in language instruction. At the same time, more training alone is insufficient to meet the needs of training in language assessment. It is important that such training includes the necessary content for language instructors to apply what they have learned in the classroom and understand the available resources to supplement their formal training when they enter the classroom.

A second issue is that of regular in-service training. Language instructors should benefit from regular in-service training to supplement what

they learned (or did not learn) in their pre-service teacher training program. Such ongoing professional development can keep teachers abreast of current developments in language assessment and allow them to apply new developments to the language classroom.

Perhaps the most serious issue, though, is that of assessment literacy and the field's lack of knowledge as to the extent of this professional knowledge about assessment among language instructors. Swender, Abbott, Vicars, and Malone (2006) have revealed that major gaps exist in the applications (or perceived applications) of foreign language tests by language instructors. This survey does not define all the issues and gaps in instructor knowledge of assessment. Perhaps the first step is to determine what language instructors need to know about assessment in order to perform their jobs and secondly, to determine how to provide such training.

### FUTURE DIRECTIONS

This chapter has briefly outlined the challenges and opportunities of training in language assessment. Assessment training has changed over time to reflect trends in language testing as defined by Spolsky (1995). Currently, outcomes-based assessment aligned with shared standards is the primary focus of language assessment. These changes have been reflected in the content of texts on language assessment, as well as in the number of texts that have become available over time. As information has become available, text-based materials have been supplemented and even supplanted by self-access materials; this media has created new opportunities to inform teachers about assessment. At present, two of the major forces in language assessment, the CEFR and NCLB, have shaped and will continue to impact trends in language assessment.

Challenges still exist, however Swender, Abbott, Vicars, and Malone's (2006) survey report of a small sample of language instructors indicates that misconceptions about test use abound among language instructors. Future studies using more observational, ethnographic or longitudinal data could provide greater insight into the actual state of professional knowledge and practices surrounding language testing.

However, the Swender, Abbott, Vicars and Malone (2006) study provides initial support for the need for improved and expanded pre-service training to increase the assessment literacy of language instructors as they prepare to develop, select, administer and report the results of assessments. An equally taxing problem is that of professional development for in-service teachers in language assessment to fill earlier gaps in their training and to keep them abreast of current developments. Online approaches to training in assessment have proven helpful; future projects may be tailored to the specific needs of a group.

As this work continues, it is important to identify the gaps that exist, namely: what do instructors know about assessment, what do they need to know and how can this information best and most effectively be shared?

Despite the many challenges of training in assessment across the world, there is much promise, particularly with the CEFR in Europe and beyond, practical training of language instructors to meet NCLB in the USA, and new formats and content for language testing texts, such as that by Stoyhoff and Chapelle (2005), to empower language instructors in their language assessment development and decision-making. While suggestions have been made to mandate participation by pre-service language instructors in practical, theory-based courses in language assessment, both pre-service and in-service training must address current issues in language assessment. Hopefully, changes made in training for pre-service and in-service instructors will improve the language assessment being conducted and promote positive wash-back to teaching and learning.

#### ACKNOWLEDGEMENTS

The author wishes to thank Elana Shohamy, Jamie Schissel, Colleen Gallagher, Meg Montee and an anonymous reviewer for their comments on this chapter.

## USING CORPORA FOR LANGUAGE ASSESSMENT

### INTRODUCTION

Since the early 1990s the term ‘corpus’ has been used to refer to a large collection of texts stored in a computer database which can be subjected to various types of linguistic analysis (see Stubbs, 2004). Language corpora containing millions of running words sampled from hundreds or thousands of written or spoken texts are still used for large-scale lexicographic research, although these are now balanced by an increasing number of smaller, more specialised corpora which are used for qualitative research. Corpus content may be selected according to specific sociolinguistic or text-type parameters (e.g., Cambridge Learner Corpus, see Barker, 2004), or it may aim to capture a broad and balanced language sample (e.g., COBUILD Bank of English, see Renouf, 1987). An essential feature of most modern corpora, whatever their size, is that they are computer-readable using specially designed software programs, such as concordancers; this allows linguistic features in the data to be identified, sorted and analysed. More sophisticated analyses are possible if a corpus has been annotated with additional linguistic information, e.g., when the content has been POS-tagged or syntactically parsed (e.g., International Corpus of English, see Greenbaum, 1996).

The 1997 *Encyclopedia of Language and Education* appeared to include no mention of the use of corpora in language education generally, let alone in testing and assessment. This suggests that in the early 1990s language corpora and corpus linguistic tools still played a relatively minor role in pedagogy and assessment despite research conducted in the fields of language and education, e.g., the work of the CHILDES (Child Language Data Exchange System) Project—an extensive speech database with accompanying tools for researching first/second (L1/L2) language acquisition and other areas (see MacWhinney, 1996), and outcomes from international organisations such as ICAME, the International Computer Archive of Modern and Medieval English at the University of Bergen, Norway. ICAME has collected and distributed corpora and software since the 1970s and shares research findings through its website, journal and annual conferences.

## EARLY DEVELOPMENTS

Small-scale, computer-readable corpora existed from the 1960s onwards (e.g., Brown University Corpus for American English (Francis and Kučera, 1964), Lancaster-Oslo/Bergen (LOB) Corpus for British English (Johansson, Leech and Goodluck, 1978)), though there is little evidence that these directly influenced language assessment. Given their original design purpose, this is perhaps not surprising. Both these corpora contain 1 million words from 15 genres of edited English prose including press reportage, biography, memoirs and fiction from 1961 and both were developed for comparative genre studies. They nevertheless established a standardised corpus format that shaped the development of many later corpora.

Alongside written corpora, collections of spoken data were also being developed throughout the 1950s and 1960s, for example the 500,000 word Oral Vocabulary of Adult Workers corpus based on Australian workers' speech (OVAW; see Schonell et al., 1956). One of the first machine-readable spoken corpora was the 500,000 word London-Lund Corpus of Spoken English (see Svartvik, 1990) which contains spoken British English from the 1950s to 1980s. This corpus developed out of the Survey of English Usage at University College London (UCL) (1959 onwards) which aimed to describe the grammar of educated adult native speakers of English, and the Survey of Spoken English at Lund University (1975 onwards). The International Corpus of English (ICE) started in 1990 at UCL to collect written and spoken material reflecting regional or national varieties for comparative studies of English worldwide (see Greenbaum, 1996).

Although corpus developments in the 1970s and 1980s provided applied linguists with valuable insights into the grammatical, lexical and discourse features of written/spoken native speaker English—of British and other varieties—they did not as yet impact significantly on the language assessment community. By the mid-1990s, however, several new large-scale corpora of English, e.g., COBUILD Bank of English launched in 1991 and British National Corpus (BNC) built in 1991–1994, were beginning to shape developments not only in applied linguistics but also in language pedagogy through the use of corpora in teaching (see Tribble and Jones, 1990) and the publication of learner dictionaries (e.g., Collins Cobuild English Language Dictionary, Sinclair et al., 1987), grammars (e.g., Longman Grammar of Spoken and Written English, Biber, Johansson, Leech, Conrad and Finegan, 1999; Collins COBUILD Grammar pattern books described in Hunston and Francis, 2000). Corpus-informed language teaching materials were also being developed, including general and exam-focused ELT courses and reference publications for grammar, vocabulary and other areas

(e.g., Cambridge University Press's English in Use series). In addition to collections of British English, major corpora of other varieties were being instigated by the end of the 1990s, for example, the American National Corpus (ANC, Ide and Suderman, 2004) and the American content of the Cambridge International Corpus (which informed development of Cambridge University Press's adult ELT course *Touchstone*).

More directly relevant to language testers is the development of collections of learner language, which began in the early 1990s. Pioneering work took place in Louvain-La-Neuve, Belgium, under Sylviane Granger who oversaw the development of the International Corpus of Learner English (ICLE). The Centre for English Corpus Linguistics (CECL) at Louvain was amongst the first to compile a corpus of written learner data. Separate teams are contributing 200,000 words each to ICLE from argumentative essays or literature papers from advanced learners of English (see Granger, 1998). Background data are also collected in a 'learner profile' (age, languages spoken at home, etc.). A corpus of spoken English from French L1 learners and native speakers (LINDSEI) was started in 1995 and is currently expanding to include other L1 backgrounds. The CECL team also built a comparative native writer corpus (LOCNESS) to allow direct comparisons between native speakers (NS) and non-native speakers (NNS) for their work on contrastive interlanguage analysis (CIA) (see Granger, 1996). The CECL website bibliography suggests a stronger focus on the pedagogical rather than the assessment applications of learner corpora (see Granger, *Learner Corpora in Foreign Language Education*, Volume 4).

During the same period collections of language learner texts were being assembled in other parts of the world. In 1993, the EFL Division of the University of Cambridge Local Examinations Syndicate (UCLES) in the UK established the Cambridge Learner Corpus (CLC) in collaboration with Cambridge University Press. The CLC was developed to inform both test development and publishing activities. It contains exam scripts (i.e., candidates' responses) from the written component of Cambridge's General English examinations, initially at intermediate and higher proficiency levels. Scripts are keyed in exactly as candidates have written them (i.e., with errors intact) to form a computer-readable version; these scripts are accompanied by comprehensive candidate information and score data so that the corpus can be searched by variables such as age, gender, L1 or grade achieved on the written component. A distinguishing feature of the CLC is the error-tagging system (see Nicholls, 2003). The corpus is searchable through proprietary software either on particular types of error, or lexically through a concordancer, collocation search or frequency word

lists. The CLC, which grows by 2–3 million words annually, is one of the few learner corpora to have been compiled using only examination scripts selected according to candidates' L1.

Although these early learner corpora focused on English, references to learner and NS corpora of languages other than English—and proficient non-native-user corpora—appeared more frequently in conference proceedings, journals and other publications throughout the second half of the 1990s. Useful summaries of learner corpora can be found in Pravec (2002) and Granger (2004).

In the language assessment community, Charles Alderson was among the first to signal a potential role for corpora (Alderson, 1996). While acknowledging the impact they were starting to have in linguistic analysis and language pedagogy, he noted that corpora had yet to find an application in the assessment of language learning and proficiency. In 2003 a symposium on exploring the relationship between corpora and language testing at the Language Testing Research Colloquium in Reading considered the ways in which corpora are becoming increasingly useful to the language testing community and pointed to current and future uses of corpora in language assessment in the UK context (Taylor, Thompson, McCarthy and Barker, 2003). The speakers discussed uses of corpora in the testing of writing and reading (Thompson), how oral testing may benefit from recent work in spoken corpus linguistics (McCarthy) and learner corpora and their direct applications in language testing (Barker).

#### MAJOR CONTRIBUTIONS

With an increasing number of NS and learner corpora available to them in the late 1990s, language testers began actively exploring their application in language assessment, particularly corpora which had been developed with an assessment focus in mind. UCLES EFL (now Cambridge ESOL) drew extensively on both the BNC and COBUILD together with their own Cambridge Learner Corpus to inform the revision of their tests (e.g., Weir and Milanovic, 2003). Other early applications included using corpora to devise new test formats (Hargreaves, 2000), and creating/revising test writer and candidate word lists (see Barker, 2004).

The English Language Institute (ELI) at the University of Michigan in the USA started developing a spoken corpus of academic texts in 1997 to investigate the characteristics of contemporary academic speech and how these might differ by speaker groups and academic disciplines. The Michigan Corpus of Academic Spoken English (MICASE) includes recordings and transcriptions of around 200 hours (1.7 million words) of academic speech and is used to study changes

in speech patterns over time within a university context and to develop English as a second language (ESL) and English for academic purposes (EAP) teaching and testing materials (see Gunnarsson, *Professional Communication*, Volume 4).

MICASE has been used by researchers interested in both academic speech and assessment-related research, and several papers have been given on its use in EAP tests. For example, Briggs and Lee (2002) investigated the use of a Lexical Database of Academic Spoken English (LDASE) for developing language proficiency tests. They studied a range of existing word lists for criterial features such as frequency, range, and dispersion as well as collocational and other information about words or multi-word units. Their research also reported on features of the corpora from which word lists are produced (discourse, academic domain) and grammatical word class and discourse meaning.

Also in the USA, the TOEFL 2000 Spoken and Written Academic Language Corpus (T2K-SWAL) was built to investigate university level language skills required by candidates taking the TOEFL test (Test of English as a Foreign Language), a high-stakes test offered worldwide by the Educational Testing Service (ETS) (see Biber et co-researchers, 2004; see Kunnan, *Large Scale Language Assessments*, Volume 7). The T2K-SWAL corpus contains 2.7 million words from 423 written/spoken texts and is grammatically tagged. An earlier study had shown that TOEFL reading and listening texts differed from the actual nature of the registers being tested (Biber et al., 2004, p. 2). Biber et co-researchers extended the analysis beyond the traditional academic registers (i.e., research papers, academic lectures) to institutional registers such as handbooks, web pages, service encounters and classroom management talk. The TOEFL 2000 team sought to design diagnostic tools to help test writers produce exam texts more representative of 'real-life' language use in the academic context. A further motivation was to provide an empirically-grounded alternative to the intuitions of test constructors in deciding what to test, and of test writers in writing materials. This is a familiar challenge for language teachers and language testers alike: how to obtain information about naturally occurring communicative interaction and how to decide what to teach or test in various domains or at different levels of language proficiency. For the language tester it relates directly to issues of construct definition and representation (Alderson, 1996; Douglas, 2000).

#### WORK IN PROGRESS

Alderson (1996) proposed a range of applications for corpora in language assessment including test writing, test construction, test scoring and score reporting; examples of some of these are considered here

along with other uses that emerged in the past decade (see Xi, *Methods of Test Validation*, Volume 7).

Both NS and learner corpora play a useful role in the creation and validation of test materials. For example, test writers can draw on NS corpora (e.g., BNC or a corpus of business texts) as a source of original input texts for reading and listening tests, or as a means of checking the authentic features of specially written reading and listening texts (Biber et al., 2004); such corpora can also generate authentic question stems and potential distractors for test tasks with a lexico-grammatical focus, e.g. open or multiple choice cloze, sentence transformations (Weir and Milanovic, 2003). Collocation is generally recognised as a distinguishing feature of advanced learner knowledge, and both NS and learner corpora are useful for querying collocational information on words and phrases to be used in test items or tasks assessing this aspect of language proficiency (Hargreaves, 2000; see Nation, *Lexical Awareness in Second Language Learning*, Volume 6).

Learner corpora can help identify typical errors at a given proficiency level which can inform the focus of test items or tasks for a particular test-taker population as well as test preparation publications (see the Cambridge University Press website for corpus-informed examples). A learner corpus can be used routinely to validate test writer intuitions about language features and frequencies associated with different proficiency levels. Test writers and constructors often work within specified constraints relating to domain or level (e.g., appropriate topics, lexis and structures), and corpus-derived word lists based on frequency data can help to control domain coverage and proficiency level. Both NS and learner corpora therefore enable test writers to base their testing tasks more closely on authentic rather than contrived language and texts, and to target more readily those aspects of language use of direct relevance to the test-taking population of interest (see Barker, 2004).

In relation to test scoring and rating, NS corpora are sometimes regarded as a useful reference point against which to compare test-taker responses; however, the continuing usefulness of the traditional native speaker criterion for assessing L2 performance has been a matter for debate (see Taylor, 2006). Analyses of NS and learner corpora can nevertheless be useful in identifying relevant performance features to inform decisions about assessment criteria and the development of rating scales. Hasselgreen (2005) studied spoken fluency markers among adolescent learners of English in Norwegian secondary schools. She analysed a corpus of audio tapes and transcripts of over 80 students (Norwegian and British) from a paired-format speaking test of English to validate her assessment criteria and rating scales, especially in regard to assessing spoken fluency. Hawkey and Barker (2004) used learner corpus analyses to identify distinguishing features of writing

performance across different proficiency levels as part of a project to develop a common scale for assessing L2 writing.

Work is ongoing to develop increasingly sophisticated systems for the automated evaluation of essays and short answer responses in content-based tests. In 1999 ETS introduced software for scoring essays; a selected corpus of previously scored essays is used to 'train' the software to predict the holistic score for an essay. Other ETS research has explored automated scoring of short-answer, content-based responses (Burstein et al., 2001). Automated scoring of speaking test performance is a more complex endeavour but rapid developments in natural language processing (NLP) and computer-based speech technology are bringing this ever closer as an operational reality.

Corpora of language test content (input) and of test-taker performance (output) provide language testers with important archives that enable them to address key issues such as comparability across test forms, rater training and standardisation, standard setting and maintenance of standards over time, and investigation of test bias across different test-taker populations. Corpus analyses allow detailed comparison across tests at different proficiency levels (e.g., beginner, intermediate and advanced) as well as for different domains (e.g., general, study-related and work-related) in terms of lexical, structural, and functional content; they also assist in placing tests within a larger framework of reference such as the Common European Framework of Reference (CEFR) and support the development of performance descriptions in the form of can-do statements (Council of Europe, 2001; see Broeder and Martyniuk, *Language Education in Europe: The Common European Framework of Reference*, Volume 4).

Subsets of larger learner corpora or small-scale collections of written/spoken performance are often used to undertake more research-focused studies which can have direct or indirect relevance for language tests. For example, findings from studies of small, specially constructed corpora of International English Language Testing System (IELTS) performances informed changes to the Speaking and Writing tests in 2001 and 2005 (e.g., Taylor and Falvey, 2007; see Freed, *Second Language Learning in a Study Abroad Context*, Volume 4).

Although the focus in this review is mainly on the applications of corpora in the context of large-scale, high-stakes standardised assessment, it is worth noting that corpora are being used more widely in the language learning classroom for less formal, low-stakes or alternative approaches to assessment. For example, learners can be presented with a set of concordance lines from NS reference corpora and asked to make judgements about language data, or to correct typical examples of errors from their own classroom learner corpus (see Fox, *Alternative Assessment*, Volume 7).

## CHALLENGES AND DIFFICULTIES

A central issue in the building and use of language corpora is the sampling approach adopted, since the nature of corpus content and the criteria by which it has been selected and organised constrain what it can be used for. The representativeness and relevance of a corpus, including its size and age, need to be carefully considered when interpreting the outcomes of data analyses and using these in decision-making (Alderson, 1996). Language corpora and their exploitation face the same challenge as all language tests—their potential for generalisability.

Furthermore, the level and quality of additional information available in a corpus may constrain what it can provide. It may be important to be able to refer to background information on a writer/speaker's gender or age, for example, or the purpose or context of their writing/speech. If corpus content is not tagged for part-of-speech (POS), it will be more difficult to disambiguate whether words are being used in their noun/verb forms, for example. If they are error-tagged, learner corpora (e.g., CLC and ICLE) provide richer insights into the linguistic problems faced by language learners at different proficiency levels and across L1s. Spoken corpora benefit from the inclusion of phonological information and can be enhanced further with digitised sound or video files of the spoken interaction, to form multimodal corpora, a current trend in corpus linguistics.

Although annotated corpora provide a much richer resource for analysis, the technical challenges and the cost in terms of resources should not be underestimated. Manual tagging is time-consuming and labour-intensive, and probably most appropriate for small-scale research-focused corpora; where possible an automated or semi-automated system is preferable for tagging elements such as parts of speech and syntactic structures. Automatic error tagging and tagging at the semantic and discourse level remain more challenging, since however they are tagged the corpus data must remain analysable using the available software tools (see website links later).

Interpreting outcomes from corpus linguistic analyses requires the same care and caution as the interpretation of statistical analyses in testing and assessment. This can be a particular challenge where the corpus data are strongly influenced by a task effect, which is noticeably true for any corpus of test-taker performance. Both Granger (1998) and Hasselgreen (2005) highlight the value, and sometimes the necessity, of undertaking complementary manual analyses in addition to the automatic analyses which result from using corpus software or tools.

Corpus developments often involve substantial costs in terms of time, money, expertise and other resources. It is therefore not surprising that collaboration is commonplace between universities, examination

boards and publishers to build and exploit large-scale corpora for research, educational and commercial purposes. One example is the Cambridge International Corpus used by Cambridge University Press—of which the CLC is one component; another component is CANCODE, Cambridge University Press and the University of Nottingham's Cambridge and Nottingham Corpus of Discourse in English. Other large corpus collections include the Longman Corpus Network and Macmillan's World English Corpus. Issues of confidentiality, data protection and intellectual property rights also need to be carefully considered, especially when constructing learner corpora that store data on test-takers' performances, scores and background (see Davies, *Ethics, Professionalism, Rights and Codes*, Volume 7). Granger (2004) makes a useful distinction between commercial and academic corpora as this often has an impact on access to and results made public from a corpus. The value of small-scale, specialised corpora—both NS and learner—should not be under-estimated as these can provide language testers with useful insights into task- or domain-specific issues as well as resources for classroom testing and assessment. The British Academic Spoken English (BASE) corpus and its written counterpart (BAWE), for example, contain current academic English from lectures, seminars and assignments and were developed at Reading and Warwick Universities in the UK while the Cambridge and Nottingham Spoken Business English Corpus (CANBEC) contains formal and informal business English from a range of settings (see website links).

Although several different corpora can provide language testers (and other users) with multiple points of reference, it is important to remember that every corpus is designed with differing parameters and purposes in mind. For example, the CLC was designed as an archive and to be used for both general and specific test development and validation projects across many different types and forms of test; the T2K-SWAL corpus, however, was designed for the revision of one specific test with an academic focus. The MICASE corpus and companion corpora, such as the BASE corpus, seek to provide data for researchers rather than professional language testers, and the ICLE corpus in Belgium is also a research-focused resource.

#### FUTURE DIRECTIONS

Hunston (2002) commented that corpus studies only recently assumed significance in the world of language testing and that work in this field is in its early stages. To some extent this is true, though, as this overview shows, language testers made significant progress using language corpora in a number of areas during the late 1990s and the early part of the 21st century.

Some of the more long-established corpora are finite and, though 'frozen' in time, they remain valuable archives for linguistic research and can continue to inform the work of language testers. Most other corpora of interest to language testing are those which will expand and perhaps branch out into new directions. From 2000 onwards exam scripts from other general, business and academic English tests were added to the CLC representing a wider range of L1s; in 2006 the CLC contained 25 million words taken from 75,000 exam scripts from 20 different exams across five proficiency levels; it constitutes the largest learner corpus derived from a single source.

Field-specific reference corpora are likely to assume greater relevance as language testing becomes increasingly domain-focused, e.g., for professions such as law, accountancy, aviation, as well as the traditional academic and business fields (see O'Loughlin, *Assessment at the Workplace*, Volume 7). Douglas (2000) highlights the value to language testers of analysing field-specific corpora, arguing that these lead to a richer understanding of the linguistic properties (lexis, syntax, functions, pragmatics) of special purposes speech and writing. However, such field-specific corpora are currently relatively few in number; more will need to be constructed and analysed if valid and reliable domain-related tests are to be produced. Similarly, as the testing and assessment of younger language learners increases worldwide, age-specific NS, non-native user and learner corpora will be needed to improve our understanding of the criterial distinctions between child, adolescent and adult L2 proficiency (Hasselgreen, 2005; see Bailey, *Assessing the Language of Young Learners*, Volume 7).

There will be a continuing role for corpora in the study of L2 proficiency development in terms of lexical, grammatical, semantic, discourse and other features. For example, Cambridge ESOL is using the CLC and a spoken learner corpus under development (compiled from Cambridge speaking tests) to specify lexis at the six proficiency levels (A1-C2) of the CEFR (Council of Europe, 2001). Findings from this project are expected to feed into a much larger, collaborative project to produce a comprehensive reference level description for English. In time it may prove possible to classify and report test-taker performance against the 'norms' of a suitable reference corpus (Alderson, 1996). Corpora of test performances will also be valuable for investigating more closely the effects of task and context in performance assessment (see Wigglesworth, *Task and Performance-based Assessment*, Volume 7). A major advantage of using learner corpora in assessment is that they can help language testers keep learners in mind as the central focus of their activity.

Other corpora of growing interest to language testers will be those focusing on language varieties, particularly (but not exclusively) international varieties of English, e.g., the Vienna-Oxford International Corpus of English (VOICE). Analyses of such corpora may help to codify new or revised models of English for teaching and testing and could inform decisions about the level of linguistic variation to be included in language tests (see Taylor, 2006, for a discussion of the issues as they relate to language assessment; see Tarnopolsky, *Non-native Speaking Teachers of English as a Foreign Language*, Volume 4).

At a practical level, the spread of computer-based testing worldwide (e.g., internet-based TOEFL and computer-based IELTS) should permit easier corpus-building in future as test-takers' written responses feed straight into a database without the need for labour-intensive keying; rapid advances in audio and speech recognition technology will make it easier to store, search and analyse speaking test data, including automatic transcription and/or tagging. The growth in accessible software programs for corpus construction and analysis means that language teachers and testers should find it increasingly easy to build and exploit their own specially designed small-scale corpora for research or practical applications in their teaching and assessment (see Winke and Fei, *Computer-assisted Language Assessment*, Volume 4).

Another application of corpora to testing and assessment which may increase in importance concerns the development of software programs for detecting cheating and malpractice. The issues surrounding plagiarism are currently receiving increasing attention in the literature and at conferences, and the use of plagiarism detection software is growing in academic and other high-stakes assessment contexts. Eventually, this may contribute to new types of assessment (see Chapelle, *Utilizing Technology in Language Assessment*, Volume 7).

Alderson (1996) cautioned against being seduced by the 'cleverness' of new technology and encouraged language testers to keep in mind in their test development and validation activity the fundamental theoretical considerations (e.g., construct definition, issues of validity and reliability) as well as the results of empirical study. The past decade can perhaps be viewed as a period of initial exploration by the language testing community into how their world interfaces with the world of corpora and corpus linguistics. Interest in and experience of using corpora to design and process language tests is reflected in increased reporting at language testing conferences and in the literature; corpus-related issues were presented and discussed during the Language Testing Research Colloquia held in St Louis, USA (2001), Hong Kong (2002), Reading, UK (2003), Temecula, USA (2004) and Ottawa, Canada (2005).

It is impossible to do justice in a review chapter to the many initiatives now taking place worldwide at the interface of corpora and language assessment. Hopefully, we have demonstrated that, after more than 40 years of computerised corpora, the application of corpora and corpus linguistics to the evaluation of L1 and L2 language proficiency is established and has a promising future.

# **Section 3**

## **Assessment in Education**

## CLASSROOM-BASED LANGUAGE ASSESSMENT

## INTRODUCTION

The evidence base in classroom language assessment has been growing over the last decade, prompted by a number of developments more generally. For example, the 1990s have witnessed considerable growth in the teaching of languages to young learners (e.g., Kubanek-German, 1998) and, inevitably, the appropriate assessment of these young language learners has been of some concern. Thus, questions that are being posed relate to the specific methods through which young learners should be assessed—through formal measures or through informal teacher assessment integrated within their teaching and learning programme. Government-sponsored English-as-an-Additional/Second Language programmes (EAL/ESL) have also flourished during this period in which there has been a need for teachers to develop an awareness of the progress of their learners informally at the classroom level as well as to track formally learner achievement for accountability purposes. A systemic demand for accountability continues to fuel the development and use of assessment frameworks, standards and examinations, only some of which have any orientation at all to the language assessment needs of teachers and learners in language learning contexts. However, it is not necessarily the case that the developments arising from such initiatives have included a classroom language assessment focus. On the other hand, classroom assessment research is very much alive in the field of educational assessment, and has been for over a decade (e.g., Broadfoot and Black, 2004) where distinctions have been made between assessment *of* learning, i.e. focused on achievement and summative in orientation, and assessment *as* learning, i.e. that is formative in purpose providing feedback to learners so that they can improve their learning. In what follows, however, I focus the discussion primarily around notable studies in the applied linguistics literature that have investigated interfaces between language assessment and classroom curricula and pedagogy, i.e. studies that have taken a classroom assessment process perspective, rather than the development of assessment tools *per se* (see Fox, *Alternative Assessment*, Volume 7 for a review). In this chapter, I am using classroom assessment in an inclusive manner, as a broad term, that includes teacher assessment, irrespective of whether it is summative or formative in purpose.

## EARLY DEVELOPMENTS

The strength of the early assessment studies is in how they have developed our awareness of issues that have subsequently emerged as central in current language assessment research. Interestingly, the unfolding research agenda for classroom language assessment has been shaped in EAL/ESL rather than in foreign language learning contexts and was originally linked, as suggested earlier, to specific policies for the language development of EAL/ESL learners that had significant resource implications. The work of Brindley has been significant in this respect. His 1989 survey of assessment practices in the Adult Migrant Education Program involved individual and group interviews with programme administrators, questionnaire responses from teachers with follow up interviews; learner perceptions had been gathered in an earlier study (1984, cited in Brindley, 1989). Two central conclusions were that teachers expressed a preference for informal observation driven approaches to assessment which they perceived as an integral part of their teaching (p. 131) and, reporting that this ongoing teacher assessment did not provide the kind of explicit information on learner achievement required by administrators, they tended to downplay the importance of satisfying requirements of external accountability. We thus observe early indications of the centrality for teachers of classroom-embedded or 'in-flight' teacher assessment and the tensions that may exist where there is a strong policy requirement for data in a standardised form for public accountability purposes—an issue to which Brindley returned in later publications, evidencing how for example the wider political context in which children are assessed may constrain desirable assessment practices (e.g., 1995a, 1998, 2001a; see also McNamara, 2001).

Subsequent research by Brindley (e.g., Brindley 1990, 1995b) has likewise contributed to the 'issues' agenda. For example, McKay (1995) drew our attention to the ways in which language proficiency Bandscales may serve as "concrete assessment tools for teachers . . ." with context and content relevant to primary and secondary phase ESL learners. Grierson (1995), through teacher interviews, raised the important issue of teacher levels of competence in assessment. Focusing on teacher understandings of 'language', he found that these were "based on a restricted and somewhat 'traditional' view of communicative language ability" (1995, p. 227; see also Gardner and Rea-Dickins, 2001). Teacher capacity-building was also addressed in the articles by Cram (1995) and Wilkes (1995), with specific reference to self- and peer-assessment. Subjectivity in assessment inevitably emerged as an issue in the classroom action study of Gunn (1995), in which she described how a small group of teachers devised, implemented, and evaluated a set of assessment procedures, observing, too, how the 'native speaker' was positioned as the norm for ESL learners (see Leung and Teasdale, 1997 later).

Similar findings have emerged through ethnographic case studies of teacher assessment practices. For example, Rea-Dickins, Gardner and Clayton (1998) identified tensions for teachers between the need for summative assessment data of learner achievement for bureaucratic reporting purposes and formative language assessment for their own instructional planning. Teachers also reported that observation and the collection of language samples were the most useful means for monitoring their learners' language progress (see Gardner and Rea-Dickins, 2002).

Further, again from research within the ESL/EAL mainstream school context, Teasdale and Leung (2000) questioned the epistemological bases of different types of assessment, highlighting the inappropriacy of mapping traditional validity criteria on to all classroom assessment activities. In this respect, Rea-Dickins and Gardner (2000), drawing on Harlen and James (1997), suggested that the validity of teacher assessment is a cumulative process that builds up over time. Leung (2004) has reiterated his position that "insufficient account has been taken of the differences in the epistemological concerns of psychometric measurement and formative teacher assessment—psychometrics treat the attributes used to be sampled as a property of the individual . . . whereas formative teacher assessment has to take account of the interactive and contingent nature of student performance in the classroom which is dynamic and co-produced with the teacher and others" (p. 22).

As a final foregrounding issue, there are methodological perspectives to consider. In a review of discourse studies in language assessment research, McNamara, Hill and May (2002, p. 231) commented on "a marked absence of studies using discourse analysis in the context of classroom assessment, a situation that matches the neglect of classroom assessment research in the field more generally." There are two points to make here. First, since McNamara's observations, a number of studies have analysed both the discourses of assessment (e.g., Rea-Dickins, 2006a) and assessment as discourse (e.g., Leung and Mohan, 2004). Second, McNamara has also signalled (e.g., 2001) the importance of researching assessment in classroom settings, that is as social practice, thereby contributing insights into the lived assessment experiences of teachers and learners, to which—as examples—the studies of Rea-Dickins (e.g., 2007), Spence-Brown (2001) and Leung and Mohan (2004) have responded. In this last respect, research in general educational assessment is highly relevant; see for example Filer (2000) and Broadfoot and Black (2004).

#### MAJOR CONTRIBUTIONS

Separating out 'Major Contributions' from 'Work in Progress' is not straightforward. In this section, I discuss empirical studies that raise

what I consider to be ‘established’ and substantive issues in classroom-based language assessment. In the ‘work-in-progress’ section, I present studies that are more ‘preliminary’ in nature or not yet published but which, in my view, have the potential to contribute new and emergent insights into classroom assessment processes.

### *Approaches to Researching Classroom Language Assessment*

In 2004, Cumming expressed views similar to McNamara (see earlier) in identifying the need to broaden the scope of language assessment studies beyond the core interests represented in mainstream language testing research. A number of studies have done precisely this. These are discussed, first, with reference to their methodological framing and, second, to the ways in which classroom assessment discourses have been analysed.

**A Sociocultural Perspective.** Four studies in particular have investigated teacher assessment practices and the processes with which teachers engage in the support of their learners (Leung and Teasdale, 1997; Rea-Dickins, 2003 (ESRC Grant R00238196); Scott, 2005; Yin, 2005). These have adopted a broad sociocultural approach, which emphasises the need to understand assessment practices and their language learning potential within the social and cultural context in which they take place. This theoretical approach led to a methodology in which assessment was studied in depth within the ecology of the classroom, within a relatively small number of schools, and one in which assessment practices were analysed from an interactional perspective through the analysis of classroom discourse, captured through videotaped classes. In the development of her assessment case studies, Scott (2005), for example, gathered data in both primary (elementary) school and home contexts to explore different perceptions of high-stakes statutory tests, including parents, and the ways in which washback from these measures was manifest in teaching and learning practices. The research of Spence-Brown (2001) also analysed assessment at the point of implementation, capturing the students’ on-line engagement in an assessment task through tape recordings that they made themselves and subsequent stimulated recall with the students.

**Assessment-as-Interaction.** To reveal some of the complexities of classroom-based assessment, several studies have used different approaches and/or conceptual frameworks for the analysis of classroom discourse. For example, Leung and Mohan (2004) drew on systemic functional linguistics in their analysis of a decision-making task, in

terms of whether and how students suggested an answer to the group, gave reasons for or against an answer, or responded to each other's suggestions. Scott (2005) used a reiterative process of analysis to arrive at thematic categories (see Holliday, 2002), narrative descriptions of assessment episodes, as well as deductive coding of data for instances of negotiation of meaning, focus on form and learner scaffolding. A further example is Edelenbos and Kubanek-German (2004) who reported the development of a systematic observation scale used in 50 lessons to analyse teachers' diagnostic and corrective feedback strategies. This data set was subsequently enriched by retrospective teacher interviews held immediately after the classroom observations.

### *Conceptualising Classroom Language Assessment*

**Underlying Constructs.** Until recently, the constructs of formative and summative assessment have been undertheorized and oversimplified in the language assessment literature. Ongoing research, however, suggests some rather complex interactions between these two purposes for assessment. Rea-Dickins (2006a), for example, has shown that an assessment planned by the teacher to be summative may also provide formative assessment opportunities for learners. This is interesting, given the typical positioning of these constructs as performing quite distinct functions. There is, too, a tendency in the literature to write about assessment activities as being intrinsically formative or summative (e.g., Ke, 2006, p. 212). However, whilst a teacher may select a particular assessment activity for its formative potential, it is only at the point of implementation and use that the characteristics of an assessment become apparent (e.g., Rea-Dickins, 2006a).

**Teacher Roles, Responsibilities and Cognitions.** In classrooms, teachers are expected both to develop and to measure their learners' language learning (e.g., Rea-Dickins, in press, 2007). In shifting between these two roles—of facilitator of language development and assessor of language achievement—tensions arise, as suggested by the much earlier research of Brindley (1989). In respect to rating practices, there is now an accumulating knowledge base about teachers' underlying decision-making processes. For example, Arkoudis and O'Loughlin (2004) have shown how teachers draw on their implicit knowledge about students in the rating of written work and how this may differ from externally prescribed rating Bandscales. Thus, tensions may arise from competing agenda within the rating process when, for example, the stakes for positive achievement data are linked to funding from an external authority. Through a 'think aloud' study of teachers' rating processes, Davison (2004) also observed conflicts

between teachers' own professional judgments of learner performance and the external standards they were required to use on the rating task. She posited a cline of teacher rating orientations (e.g., assessor as 'technician', as 'arbiter of community values', as 'God') and noted that these differed across two different assessment contexts: teachers in Melbourne and in Hong Kong. Both these studies have brought in-depth understandings of teacher rating processes and dilemmas.

Two other relevant studies are those of Reali et al. (2000, cited in Yin, 2005, p. 20) and Leung and Teasdale (1997). In the former study, 25 school teachers plus two senior staff members were invited to provide a written rationale for the grades they each assigned to samples of student writing. These teachers showed "four assessment patterns, varying in how they judged aspects internal and external to the text, and how secure they were in their judgments" (Yin, 2005, p. 20). In the latter study, Leung and Teasdale explored the extent to which teachers shared a common set of assessment criteria and whether these criteria were congruent with those in the national (i.e., for England) assessment scheme. They found that teachers did have some shared understandings of general criteria to assess speaking and listening, particularly around the concept of being 'native speaker-like' (see Gunn, 1995) and that these were not covered in the national assessment scheme.

#### WORK IN PROGRESS

As indicated earlier, much research on classroom language assessment is recent and, thus, constitutes 'work-in-progress'. Later, (see Future Directions), I also mention five emergent areas of importance to our understandings of effective school-based language assessment processes.

##### *Teacher Beliefs, Capacities and Knowledge*

This first has to do with teachers' assessment cognitions. Within an EAP context, Yin (2005) investigated the mental activities behind teachers' assessment practices and the sources of these activities. He found "a wide array of mental processes, resources, and considerations were involved" (p. 144) as teachers assessed their students. He posited an "assessment cognition network," comprising "interactive cognitions": for example, teachers' assessment principles and the constructs they use when assessing learner performance, their projections about what a student might be able to do in target language use situations, and the development of emergent profiles of their students. Yin also located the sources of such cognitions to be teacher training handbooks, previous teaching experience, colleagues, and other personal

experiences (p. 146). Rea-Dickins has explored teachers' assessment cognitions through a focus on decision-making, in particular those teachers take when planning their assessments (2007). She also found curriculum documentation and professional contexts to be influential in the formation of teacher assessment cognitions (2001, 2003).

In reference to understandings of language, Gardner and Rea-Dickins (2001) showed how the teachers in their study drew partially on many different models and views of language: for example, traditional grammar (see Grierson, earlier), notional functional grammar with its concepts of functions and their linguistic realisations (e.g., contrast/differs from), discourse and genre theory. These teachers represented language as complex, amenable to analysis from a range of perspectives and for a variety of different assessment-related purposes.

In their 2004 study, Edelenbos and Kubanek-German posited the concept of 'teacher diagnostic competence', providing exemplar features at six different levels. This included the skill with which a teacher can guess what a child wants to say from a fragmentary sample of language and be able to reword this or motivate the child to do so. Another feature is a teacher's ability to provide concrete examples of an individual child's language growth over a given period of time. The points they make resonate with Shohamy (1998a) and the implications of a 'multiplism approach' (i.e., one that is required in classroom assessment contexts) for the development of teacher capacity. Their concept, in my view, would be an excellent starting point for the development of teachers' knowledge about, and skills and strategies in, classroom language assessment.

### *Language Acquisition and Formative Assessment*

This second area has to do with the interface between formative assessment and second language acquisition (SLA) (e.g., Shohamy, 1994), in particular the nature of feedback to learners. Afitska (2004)<sup>1</sup>, in her study of two Literacy and two Numeracy lessons, found that teachers provided implicit corrective feedback 3–4 times more frequently than explicit feedback and that general rates of learner uptake in all classrooms regardless of the subject-matter of the lessons was very low. Rea-Dickins (2006b) in a detailed analysis of three lessons found that in some cases rates of successful learner uptake followed peer-rather than teacher-feedback (see Future Directions later).

---

## PROBLEMS AND DIFFICULTIES

There are several challenges facing the effective and fair implementation of assessment, one of which has to do with the nature of teacher expertise and what teachers need to know to support effective and fair classroom language assessment. Three others are signalled: policy as a constraint, assessment systems and standards and approaches to researching classroom assessment.

*Teacher Capacity Building*

This is not restricted to the technical skills that teachers may or may not have in the development of appropriate assessment procedures but embraces their understandings and awareness of language, constructs underlying effective classroom assessment practices and processes both of assessment and of learner language acquisition. The research to date (e.g., Grierson, 1995; Gardner and Rea-Dickins, 2001; Oliver, Haig and Rochecouste, 2005; Yin, 2005) suggests a real need for teacher capacity building (see also Bachman, 2000). That teachers may not be equipped for their different classroom assessment roles is not to be interpreted as a criticism. As Brindley (2001b, p. 127) observes, teachers “assess constantly through such means as observation, recycling of work, diagnostic testing, learner self-assessment, various forms of corrective feedback and *ad hoc* tests. With experience, many teachers will become skilled judges and observers capable of evaluating the quality of language performances and making fine-grained diagnoses of learners’ difficulties.” The challenge, then, is for appropriate and wider availability of professional development opportunities for teachers.

*Policy as a Constraint*

As we have seen earlier, policy agendas may constrain or distort assessment practices. First, bureaucratic requirements for achievement data may have the consequence of creating an imbalance in the range of assessment opportunities that teachers provide for their learners, leading to an orientation towards ‘language display’ rather than ‘language development’ opportunities. Second, although policy and the accompanying documentation may be seen as a trigger for professional engagement and the development of theoretical understandings, the reality is that it can be a significant inhibitor to the development of enhanced professional understandings. In England, as an example, the knowledge on assessment is frequently fragmentary, contradictory, ambiguous and mixes the discourses of, on the one hand, standardised testing with its focus on the reliable measurement of learner attainment at fixed

national levels and formative assessment on the other (e.g., Leung and Rea-Dickins, forthcoming).

### *Assessment Systems and Standards*

A number of assessment frameworks and standards have developed since the early contributions by McKay, Hudson and Sapuppo (1994) and, as Leung and Lewkovitz (2006, p. 223) observe: “system-wide standards-based and outcomes-based assessment frameworks are often introduced by dint of political arguments and ideological commitments. They are not necessarily motivated by sound educational and pedagogical principles,” (see also Fulcher, 2004; McKay, 2000; McKay Hudson and Sapuppo, 1994; Scott and Erduran, 2004; and Fulcher, *Criteria for Evaluating Language Quality*, Volume 7). Some, however, notably the NLLIA bandscales (1994) and the TESOL ESL Standards (1997; TESOL, 2001), encourage teachers to assess and sample learners’ language performance in different situations through a rich diversity of interactional opportunities mediated by a wide range of activities, and exemplify how they may provide support for language learning. Yet, there are risks in the implementation of frameworks as a greater emphasis on the assessment of achievement might have unwanted consequences for classroom assessment. For example, standards and descriptors may be used normatively or operationalised as checks of a child’s language achievement against a target standard or goal, thus limiting opportunities for teachers to assist learner performance within instructional sequences. There is, then, the danger that assessment frameworks may be used reductively when translated into professional practice, but this is not necessarily the case. In one of few assessment implementation studies, Breen et al. (1997) found that Australian teachers using the NLLIA ESL Bandscales based their assessments on a synthesis of “on-going and experientially informed intuitions” (p. 96). Teachers did not have to use the exemplar assessment activities provided. They could design their own and, importantly, they also based their assessment on informal observation, collection and analysis of pupil work, discussion with pupils and peer and pupil self-assessment, as well as planned assessments (McKay, Hudson and Sapuppo, 1994). In other words, these teachers demonstrated use of the NLLIA Bandscales as originally intended, where assessment itself is integrated within instruction and normal classroom activities.

### *Methodological Approaches to Researching Classroom Language Assessment*

Lazaraton, in *Utilizing Qualitative Methods for Assessment* (Volume 7) draws attention to the drawbacks of qualitative methodologies for

language assessment on grounds of the time it takes both to acquire the requisite skills and apply the techniques themselves. This comment is equally applicable to the development of case studies of assessment implementation. This drawback should not, however, be seen as a legitimate reason for not conducting implementation studies. As Cumming (2004, p. 7) invites: “surely we need more studies that simply describe educators actually doing language assessment as well as critical analyses of the principles and variables these practices entail.”

#### FUTURE DIRECTIONS

Classroom language assessment research is still in its infancy: it represents a ‘new’ entry for this encyclopaedia. In spite of evidence of considerable progress since the last edition (1997), there are still only a small number of studies about classroom-embedded language assessment, in particular, in *Language Testing* (cf. issues 17/2 and 21/3) and *Language Assessment Quarterly*. In several respects, therefore, McNamara’s call (2001) “for assessment to respond to the theoretical challenges presented by advances in validity theory ... [and] to make our research more answerable to the needs of teachers and learners ...” remains highly relevant. There are several directions that future classroom assessment research could take. I mention four, together with a methodological point.

The first potentially significant contribution to our understanding of language development in intact classes would be a greater alignment of research in the areas of formative assessment and SLA. Although there have been several specialist colloquia focused on the interface between language testing and SLA, (e.g., AAAL, 2006), one book (Bachman and Cohen, 1998) and several articles (e.g., Shohamy, 1998b), I am not confident that ‘tight’ connections have in fact yet been realised. My own research (e.g., Rea-Dickins, 2003) suggests that while classroom assessment has the potential to enhance language learning, it often fails to do so (e.g., Afitska, 2004).

A second, and related, line of research connects to the roles and responsibilities of learners in classroom language learning. The work of the Assessment Reform Group (<http://www.assessment-reform-group.org.uk>; see also Gipps, 1994; Tunstall and Gipps, 1996) points to the importance of learner engagement in effective classroom assessment. Should we, therefore, within the context of language assessment, be investigating more systematically learner roles and different modes of classroom participation by, for example analysing the potential for learning through self-assessment and from peer feedback (cf. Mackey, Gass and McDonough, 2000; Rea-Dickins 2006b)? Research with a learner cognitions’ focus would contribute to the emergent research

on teacher cognitions (e.g., Yin, 2005). At the same time there is a need to develop learner agency through skills development in self- and peer-assessment within collaborative working opportunities in classrooms. Byon (2005), for example, used a range of techniques to develop a sense of the classroom as a 'learning community', and to encourage students to "become more actively interested in the process of learning itself" (p. 186).

Third, firmer conceptualisations of classroom language assessment are needed, not only in terms of the constructs underlying assessment processes, such as formative, summative and dynamic assessment (e.g., Poehner and Lantolf, 2005), but also in relation to the epistemic challenges that language assessors face in determining the validity of classroom assessment processes and tools. As has been argued elsewhere (e.g., Rea-Dickins and Gardner, 2000; Teasdale and Leung, 2000), traditional and psychometric approaches are incompatible with the values underlying particular pedagogies and curricula, i.e. at the point of implementation of classroom language assessment. I would envisage such studies involving the analysis of classroom language assessment as socially situated practice (but see Problems and Difficulties earlier on the feasibility of sustained assessment implementation studies).

Fourth, I discern a trend in educational research studies towards a phasing of research in terms of an initial identification and mapping of key issues followed by specific intervention studies that are informed by the first phase. One such intervention in general educational assessment (Black, Harrison, Lee, Marshall and Wiliam, 2003) took the form of researcher guided teacher action research to develop teachers' skills in implementing effective formative assessment in English (as a subject), Maths and Science classes in secondary schools. In their study, they suggest that learner gains "equivalent to between one quarter and one half of a GCSE grade (a national examination in England for 16 year olds) per student per subject are achievable" (p. 29). In the context of language assessment, this would imply a systematic analysis of learners' language development and, hence, the relevance of closer connections between formative assessment and processes of SLA (see earlier).

Finally, implementation studies have demonstrated how, for example, teachers actually used a set of assessment standards (Breen et al., 1997) and Spence-Brown (2001) has shown how task authenticity needs to be evaluated at the point of implementation. Thus, essential to the ongoing development of our understandings of the complexity of classroom language assessment are observation driven implementation studies.

In concluding this chapter, we need also to be mindful of other central considerations: retaining sensitivity to ethical issues and fairness

through seeking to evidence the validity of our interpretations of learner performance and the consequences that our assessment practices may have, for example, ensuring that the policy and rhetoric of standardised testing do not predominate in school-based assessment. Writing of the situation in England, Safford (2003) observes: “We could have a national framework for EAL learning and assessment that is parallel to the National Curriculum. EAL could be a subject specialism in teacher training. We could be using theory, research and evidence instead of a funding formula to assess pupils’ language needs and abilities” (p. 12). At the heart of our knowledge development is a broader notion of assessment that encapsulates the social character of assessment as it unfolds through routine classroom interaction (McNamara, 2001).

## DYNAMIC ASSESSMENT

### INTRODUCTION

For some time language testing researchers have recognized the potential value of bringing their field into closer contact with research on second language learning and teaching (see Bachman and Cohen, 1998). Alderson (2005, p. 4.) argues that the type of testing most relevant for teaching and learning is diagnostic assessment because it includes feedback and suggestions for improvement. For instance, Alderson's DIALANG, a computer-based language diagnostic, offers several types of feedback, including a display of missed test items along with the correct response and descriptors of a learner's current and next attainable ability level. Although we concur that a closer nexus between instruction and assessment is needed, we believe that these processes are fully integrated in an approach developed by L. S. Vygotsky known as *Dynamic Assessment* (henceforth, DA).

In DA, assessment and instruction are a single activity that seeks to simultaneously diagnose and promote learner development by offering learners *mediation*, a qualitatively different form of support from feedback. Mediation is provided during the assessment procedure and is intended to bring to light underlying problems and help learners overcome them. Lidz (1991, p. 6.) explains that DA focuses not on what individuals can accomplish on their own but on their "modifiability and on producing suggestions for interventions that appear successful in facilitating improved learner performance."

### EARLY DEVELOPMENTS

Vygotsky's writings on the Zone of Proximal Development (ZPD) provide the theoretical underpinnings of DA. Central to the ZPD is the notion that higher forms of thinking (voluntary memory, attention, planning, learning, perception) are always mediated. Initially, these functions are mediated through our interactions with others and with physical and symbolic artifacts (e.g., books, computers, diagrams, language, etc.). These interactions are internalized and give rise to new cognitive functions. One's relationship with the world is still mediated, but this is accomplished on the psychological rather than social plane.

Given this view of cognition, Vygotsky (1998, p. 201.) argued that assessments of *independent problem solving* reveal only a part of a person's mental ability, namely those functions that have already fully developed. He termed this the *actual* level of development and contrasted it with the person's *future* development, which he submitted could only be understood through their responsiveness to assistance when engaging in tasks they could not complete independently. He further argued that providing appropriate mediation allows one to intervene in and guide development.

Potential development varies independently of actual development, meaning that the latter, in and of itself, cannot be used to predict the former. Moreover, the former is not an a priori prediction but is derived from concrete activity mediated by others or by cultural artifacts. Vygotsky laid the foundation for DA in his explanation of the ZPD, which he often illustrated with a case such as the following. Two seven year-olds performed similarly on tests of general ability but responded very differently when offered mediation. One of the children was able to solve items at the level of a seven-and-a-half year-old while the other progressed to the level of a nine-year-old. Vygotsky concluded that the children were equivalent in terms of their actual development but had different ZPDs. That is, their responsiveness to mediation revealed they were at different stages with regard to abilities that were in the process of developing. Given Vygotsky's construal of development in the ZPD, assessment and instruction are inseparable components of the same dialectical activity. As Lantolf and Poehner (2004) put it, assessment and instruction become as tightly conjoined as two sides of the same coin—and there are no one-sided coins.

## MAJOR CONTRIBUTIONS

### *Interventionist versus Interactionist Approaches to DA*

There are two general approaches to DA: interventionist and interactionist. In the former, mediation is standardized, thus permitting greater use of inferential statistics in analyzing and comparing results; in the latter mediation is attuned to the responsiveness of the individual (or group) and is therefore much more sensitive to the ZPD. The fundamental difference between these orientations is that interventionist approaches quantify performance as an "index of speed of learning" (Brown and Ferrara, 1985, p. 300) in terms of the amount of help required for a learner to quickly and efficiently reach a prespecified end point. Interactionists focus on ensuring individual development regardless of the effort required and without concern for the endpoint of development.

*Interventionist DA—‘Sandwich’ and ‘Cake’ Formats*

Within interventionist DA, assistance can be provided in two formats, which Sternberg and Grigorenko (2002) label ‘sandwich’ and ‘cake.’ The ‘sandwich’ format, pioneered by Milton Budoff (e.g., Budoff, 1968), differs from other versions of DA by not offering mediation during the assessment but instead introducing a training phase between a traditional pre- and post-test. Examinee performance is reported in terms of a pretraining score, post-training score and post-training score adjusted for pretest level. These profiles are then used to group learners as high scorers (i.e., those whose pretraining scores were already high, and therefore do not manifest much improvement as a result of training), gainers (i.e., those whose scores showed marked improvement as result of training), and nongainers (i.e., those who performed poorly on the pretest and did not profit from instruction).

In the ‘cake’ format, the examinee is provided with mediation drawn from a standardized menu of hints, ranging from implicit to explicit, during the administration of the assessment. The metaphor alludes to the layering of test items and hints in such a way that a menu of hints can be accessed, as required by the examinee, for each question or problem *before* moving on to the next item on the test. For example, in the *Leipzig Learning Test* (LLT) developed by Guthke (1982), learners who produce an incorrect response are first asked to reattempt it and then offered more explicit prompts, such as reminders of directions, hints to focus their attention on specific aspects of the problem, clues regarding the solution, and so on until the correct answer is provided along with an explanation. Results are reported as a score, based on the number of prompts needed and the amount of time taken to complete the test, and a profile. The latter comprises an analysis of types of errors made and forms of assistance to which the examinee was most responsive. The profile serves as the basis for subsequent instruction aimed at redressing the problems. Learners may then be re-tested.

*Interactionist DA*

Minick (1987, p. 127) points out that for Vygotsky the ZPD is neither a way to assess learning potential, nor a means of measuring learning efficiency, but “a means of gaining insight into the kinds of psychological processes that the child might be capable of in the next or proximal phase of development and a means of identifying the kinds of instruction, or assistance that will be required if the child is to realize these potentials.” Unlike in interventionist DA, which has a strong propensity toward quantification and psychometric analysis, interactionist

approaches follow Vygotsky's preference for "qualitative assessment of psychological processes and dynamics of their development" (Minick, 1987, p. 119). Indeed, Vygotsky (1998, p. 204.) insisted that "we must not measure the child, we must interpret the child" and this can only be achieved through interaction and cooperation with the child.

Reuven Feuerstein is a staunch advocate of interactionist DA (see Feuerstein, Rand, and Rynders, 1988). He argues that traditional conceptualizations of the examiner/examinee roles should be abandoned in favor of a teacher–student relationship in which both are working toward the ultimate success of the student. At the heart of Feuerstein's approach is the 'Mediated Learning Experience' (MLE), in which an adult mediator carefully selects, schedules, and repeats as necessary, culturally determined stimuli for presentation to the individual to ensure that "the relations between certain stimuli will be experienced in a certain way" (Feuerstein, Rand, and Rynders, 1988, p. 56.). This enables the learner to more easily internalize the cultural practice he or she is participating in with the mediator. This process of internalization occurs as a result of the child's imitation of the models provided by the mediator. The individual must also extend what has been internalized by anticipating outcomes that are likely to result from specific actions (Sternberg and Grigorenko, 2002, pp. 50–51). In Minick's (1987, p. 138) view, Feuerstein's model reflects Vygotsky's ZPD in allowing the assessor greater freedom to interact with the learner and thereby deploy a wide array of assistance to help the individual develop. In addition, the approach allows for a robust diagnosis of development because it brings to the surface processes that underlie performance and that often remain hidden during traditional assessments.

To provide a specific example of DA in language leaning, we will consider examples from Poehner's (2005) research with advanced learners of L2 French. Participants were asked to produce oral narratives based on clips from popular movies as well as passages from Voltaire's *Candide*. Focus was on appropriate use of verbal aspect (i.e., *passé composé* and *imparfait*) in the narratives. Mediation was carried out through flexible interaction with each learner. Following this, learners participated in an individualized enrichment program inspired by Feuerstein's MLE. They then repeated the original task and completed a series of more complex tasks aimed at what Feuerstein describes as *transcendence*, or the degree to which learners could extend their ability in using appropriate aspect to new communicative problems, a necessary feature of development.

Amanda (pseudonym) initially had difficulty producing the correct verb forms in French and was also unable to provide appropriate explanations for her choice of aspect. In the following narration, Amanda narrates a video clip in which two characters have a conversation while driving to a friend's home:

1. (A)manda: *Samuel et Rebecca \*se sont conduit chez Sean—*  
drove themselves to Sean's—

(M)ediator: so using the *passé composé*?

A: *passé composé*

M: because?

A: because driving somewhere has a specific beginning and end point? so they have a destination so there is an end point.

M, the mediator, does not correct Amanda's selection of perfective aspect but instead focuses on her reason for using it. Her explanation reveals that she does not fully understand verbal aspect. She knows that it concerns the completion of actions, but she fails to appreciate that it is not the identification of an action's beginning or end that determines aspect but the temporal perspective one wishes to take. Consequently, M's interactions with Amanda focused on developing a deeper understanding of aspect that would allow her to bring events into discourse according to the precise meanings she wished to portray.

Evidence of Amanda's enhanced understanding of aspect and improved control over the relevant forms can be found in her renarration of the same clip following the enrichment program:

2. A: . . . *ils \*se se se conduisaient et Samuel parlait de ses opinions de des*

they were driving themselves and Samuel was talking about his opinions of of

*parents et de leurs responsabilités des enfants*

parents and their responsibilities of children

M: yeah that's good just a little more

A: *et pendant pendant il parlait Rebecca a dit oui oui et enfin um il ou elle a annoncé qu'elle était enceinte et Samuel a crié quoi et il a perdu contrôle*

and while while he was talking Rebecca said yeah yeah and finally um he or she announced that she was pregnant and Samuel screamed what and he lost control.

Amanda required very little support and when questioned her explanations of aspect choice revealed that she understood how the forms conveyed the appropriate meaning. For instance, referring to (2) Amanda explained that "they were driving he was talking and then she said that she was pregnant." Two weeks later, during a transcendence assessment focusing on a complex literary passage from *Candide*, Amanda appropriately used the *passé composé* and *imparfait* throughout. When asked to reflect on her choices, she responded that she had selected aspect not based on correct or incorrect French but rather according to how she wished to temporally frame the events.

Other researchers have begun to explore the potential relevance of DA for L2 pedagogy. Kozulin and Garb (2002) report on the implementation of a DA-based EFL reading comprehension program for

at-risk young adults in Israel. The goal of the project was to assess the learning potential of the students based on the quality of mediation required for them to perform basic reading tasks with the aim of developing individual learning plans tailored to students' specific needs. For example, students with high learning potential can be given more independent learning opportunities with more challenging materials, while those with lower potential would require greater mediation with less challenging materials. Antón (2003) reports on the implementation of DA as a placement procedure in a Spanish foreign language program at a North American university. The goal of the assessment was to place students into courses where they would receive instruction more attuned to their ZPD. Students who were able to modify their performance under prompting were considered to be at a more advanced stage of development than students who could not. Therefore, instead of a generic advanced grammar course, students were placed in courses that were more adequately tailored to their needs.

#### WORK IN PROGRESS

While there is a substantial body of research on DA in psychology and general education, it has only recently come to the attention of L2 researchers and very little work has been published to date in this area. That said, a number of projects are currently underway. Ableeva (2007) used a dynamic procedure in assessing listening comprehension in university-level L2 learners of French. Through mediation Ableeva was able to uncover the source of comprehension problems that in one case hinged on a single lexical item and in another on cultural knowledge. This revealed that learners' abilities were more developed than one would have surmised from unmediated performance. Erben, Ban, and Summers (2007) report on the consequences of reformulating the ESOL teacher endorsement examination at a large urban university from a traditional to a dynamic version. They discuss the reactions, both positive and negative, from the ESOL faculty, the administration of the college of education, and the preservice teachers who took the exam. The authors found that examinees expressed greater confidence in their subject matter knowledge as a result of the mediation provided during the exam and showed a great deal of interest in eventually using DA in their own teaching.

Two book-length projects are currently underway. Poehner's (to appear) is an expanded version of his 2005 dissertation that includes analysis of aspects of mediational interaction (e.g., learner reciprocity and transcendence) and includes recommendations for profiling learner development and systematically reporting results of classroom-based DA. Lantolf and Poehner (2007) provide a theoretical introduction and guidelines for implementing DA in language classrooms. The *Teacher's*

*Guide* includes a series of case studies and a video component that provides concrete examples of mediated interactions with detailed discussion and analysis. The authors are currently using the *Guide* as part of a DA initiative with primary-school students of L2 Spanish in a laboratory school affiliated with a major eastern research university. A key focus of this work is to outline principles for dialogically mediating groups of learners (see below discussion of group-based DA).

Several lines of research, while not directly tied to the L2 domain, nonetheless represent important theoretical and methodological advances in DA. The first of these deals with children diagnosed with L1 reading disabilities (Duvall, in progress). Duvall used a combination of interventionist and interactionist DA to identify and help children overcome their reading problems. One of the most interesting outcomes relates to a child who assumed that he knew very little and that the only way he was able to perform on the standard reading assessments administered by the school was to guess. Through DA he discovered that he actually did know a lot about the world and was then able to bring this knowledge to bear in his reading.

An additional site of current interest is the use of DA as a means to postpone or offset cognitive decline among elders. Researchers in Spain have been using DA with elders experiencing mild cognitive impairment (MCI) and dementia (e.g., Calero and Navarro, 2004). In one study, these authors followed a sandwich approach, administering the Spanish language version of the 'Mini Mental Exam,' *Mini Examen Cognoscitivo* (MEC), a widely used standardized test for diagnosing dementia, to a group of elders prior to introducing a dynamic intervention. The MEC was re-administered one year and two years following the intervention. Participants' initial scores were used to identify them as either healthy or MCI. The researchers found that among both MCI and healthy elders, some but not all, showed improved performance as a result of intervention. Importantly, none of the elders who benefited from the intervention showed cognitive decline on the post-tests but those who had not improved declined at statistically significant levels (Calero and Navarro, 2004, p. 657.). Thus, as the researchers suggest, elders' cognitive modifiability may prove to be an indicator of future decline, and could be used to identify individuals in need of ongoing intervention for maintenance of cognitive abilities for as long as possible.

#### PROBLEMS AND DIFFICULTIES

Because of its theoretical assumptions on the nature of development, in particular the relevance of mediation for diagnosis and prognosis, DA has been open to challenge from the psychometric community, including from some who have worked with the concept. Budoff, for

example, criticizes interactionist approaches, arguing that “it is difficult to distinguish the contribution the tester makes to student responses from what the student actually understands and can apply” (Budoff, 1987, p. 56.). Budoff seems to be trying to determine how much of the performance can be attributed to the ‘environment’ as represented by the tester and how much is to be attributed to the student. Glutting and McDermott (1990, p. 300) similarly criticize the “creative latitude” in interactionist DA because some children receive more help than others. In our view, this criticism fails to appreciate Vygotsky’s call for a new ontology of the individual as a socially constituted being where the environment is not a circumstance but the very source of development (Vygotsky, 1998, p. 198.). For Vygotsky improvisation and creativity are essential to providing appropriate forms of mediation within the ZPD (Newman and Holzman, 1993).

Snow (1990, p. 1135) objects to DA on the premise that without linking assessment in some way to measurement, “fundamental in all science,” the term is “meaningless”. Bachman (1990, p. 18.) defines measurement as “the process of quantifying the characteristics [physical as well as mental] of persons according to explicit procedures and rules.” Büchel and Scharnhorst (1993, p. 101.) suggest that DA researchers can link assessment and measurement through “standardization of the examiner–subject interaction,” a characteristic of interventionist approaches to DA, but not of interactionist approaches. For Vygotsky measuring a child’s performance provides little more than “a purely empirical establishment of what is obvious to persons who just observe the child” and adds nothing new to what is already known through direct observation (Vygotsky, 1998, p. 205). This gets at the fundamental purpose behind and meaning of assessment: in Vygotsky’s view, the task of the psychologist is not to *measure* but to *interpret* the individual (Vygotsky, 1998, p. 204).

All of this points to the relevance of test reliability and validity as they relate to DA. Both psychometric concepts are built on a foundation that privileges the autonomous individual as the site from which performance and development emerge. DA, on the other hand, is built on a foundation which privileges the social individual, or as Wertsch (1998) puts it “person-acting-with-mediational-means.” It also must be remembered that DA is not an assessment instrument but is instead a procedure for carrying out assessment. Therefore, the question of concern is whether DA as a process “compromises” an assessment instrument deemed reliable and valid. We address the matter of reliability first.

Test reliability derives from a commitment to standardization (Büchel and Scharnhorst, 1993) whereby all sources of potential error, including test methods effects, such as test-taking strategies, preferences for a particular type of test, age, gender, and cognitive style are minimized to ensure that the observed score is as close to the true score

as possible (Bachman, 1990, p. 161). A test is reliable if it yields the same score through multiple administrations across different learners of similar ability at the same point in time or across different points in time for the same learner, assuming his/her abilities have not changed. Once the likelihood of error is minimized, any changes in performance for the most part can be attributable with some confidence to real change in the variable (e.g., language proficiency) under scrutiny. Tests must also be internally consistent so that performance does not radically fluctuate from one item or from one subsection of a test to another (Bachman, 1990, p. 172). The matter of generalizability also plays a major role in test reliability to the extent that one can have confidence that performance on a particular test will carry over to nontesting contexts.

Since the examiner is called upon to participate actively in an assessment administered dynamically, on the face of it, DA appears to represent a powerful test methods effect which seriously compromises the reliability of a test. From the ontology of the autonomous individual, the foundation of the psychometric approach to assessment, DA's goal of promoting development through assessment is problematic. However, from the ontology of the social individual and the clinical perspective on assessment, the examiner's participation in the process is essential and therefore cast in a positive light. As Lidz (1991, p. 18) cogently argues, "the word 'dynamic' implies change and not stability. Items on traditional measures are *deliberately* selected to maximize stability, not necessarily to provide an accurate reflection of stability or change in the 'real' world." In other words, because DA integrates teaching and assessment change is necessarily an artifact of the test.

We will limit our discussion of validity to three topics: construct, predictive, and consequential validity. While the nature of the construct under assessment (e.g., language, language proficiency) is critical in all approaches to testing (How language and proficiency are constructed is also relevant for SCT and has been discussed in Lantolf and Thorne, 2006), dynamic administrations of assessments are also very much concerned with the general construct of development. Development, as discussed in the writings of Vygotsky, is the ability to regulate oneself in carrying out any activity. This means that the person understands the nature of what is to be done, is able to bring the appropriate resources to bear, and can evaluate her or his performance in the activity. For a dynamic procedure to be truly effective it must promote development and to the extent that it succeeds in this regard, it can be considered to have demonstrated construct validity.

Closely allied with construct validity is predictive validity. The prediction of future performance, as Bachman (1990, p. 253) points out, must be linked to a valid definition of the construct that is assessed. Recall that the ZPD, which is the foundation of DA, is itself an empirically grounded

prediction of learner development—what is at one time carried out interpersonally will eventually be carried out intrapersonally. Specifically, this means that during the course of an assessment or from one assessment to another, mediation is expected to become less frequent and less explicit as learners display greater control or self-regulation over the construct under consideration. In addition, according to the principle of transcendence, learners are further expected to extend their abilities to increasingly complex activities once they have internalized the mediation (see the discussion of Poehner's research above).

Because it addresses the issue of rights and values of individuals and institutions involved in assessing, consequential validity is perhaps the most intriguing and controversial facet of validity in a dynamic framework. From the perspective of the social individual, there are serious ethical problems using the outcomes of assessments based exclusively on solo performance to make decisions that impact the lives of individuals and the institutions in which they function. For instance, how appropriate is it to place students into the same language course on the basis of their solo performance knowing that their relative mediated performance could vary significantly and that therefore the individuals in question would require different forms of instruction? Moreover, given that assessment and instruction are integrated in DA, how ethical is it to knowingly miss an opportunity to help someone develop during an assessment for the sake of maintaining psychometric principles? As Feuerstein puts it, in DA “everything is done in order to *undo* the predictive value of the initial [independent] assessment by modifying functioning through the mediational process” (Feuerstein, Rand, and Rynders, 1988, p. 199).

#### FUTURE DIRECTIONS

Two important strands of research that, in our view, will solidify a central place for DA in the L2 domain are computerized and group-based DA. The former represents an attractive approach to large-scale assessment contexts that mandate standardization while the latter is especially relevant to classroom settings where teachers may be concerned with the feasibility of dialogically mediating twenty or more learners.

Computerized DA (C-DA) would likely follow an interventionist model with mediation offered from a menu of predetermined clues, hints, and leading questions selected in a lock-step fashion (moving from most implicit to most explicit) by the computer. While computer-based assessments typically only indicate the correctness of a response, C-DA tracks learners' errors as well as the precise forms of mediation that prove beneficial. Summers (in progress) is currently pursuing C-DA for use with university-level learners of L2 French but additional work will be needed to overcome the inherent challenge of this approach: offering learners

mediation that is standardized and yet as sensitive as possible to their emergent needs. Guthke and Beckmann (2000), for instance, have proposed a computerized LLT that is also relatively adaptable to individuals' needs whereby training tasks are introduced when examinees produce errors. After these tasks are completed, the test is resumed, but if similar problems arise later during the test it is possible to return to the training tasks. Thus, mediation cycles are determined by the nature of examinee errors. To date, Guthke and colleagues have not reported empirical results from their project but it is certainly a model language testers will wish to explore.

In group-based DA, the concept of the social individual comes to the fore in a powerful way. Vygotsky (1998) himself suggested the possibility of appropriately mediating a group ZPD, and Gibbons (2003) illustrates this notion in her analysis of a teacher's interactions with several ESL learners during a lesson that required the use of scientific terminology. Although Gibbons does not remark on the episode's potential as an assessment, she argues convincingly that through dialogue the teacher reveals the groups' level of understanding and moves them forward collectively, and this of course is the defining characteristic of DA. Further research is needed into the processes of group mediation and how the results of group DA procedures can best be reported.

## LANGUAGE ASSESSMENT CULTURE

### INTRODUCTION

The notion of ‘culture’ represents a fundamental basic human concept that underlies historical developments and the creation of civilizations. Though there are numerous ways of defining culture, it is often perceived as referring to the shared ways of thinking and behaving, to common attitudes and beliefs that a social community shares, and to the products the social community has created (Kramsch, 1995). In management organizational literature ‘culture’ is used to indicate the internal cohesion of organizations whose members share espoused values and basic assumptions (Schein, 1992). The concept of ‘culture’ is currently applied broadly to refer to, depict and characterize sets of shared beliefs and modes of practice in diverse areas, including in the sphere of education (e.g., ‘learning cultures’; ‘school culture’) and educational assessment. Hence the relatively novel term in both general educational and language assessment domains—‘assessment culture’.

Assessment culture refers to educational evaluation practices that are compatible with current ideologies, social expectations, attitudes and values. It is grounded in and shaped by constructivist theories about how knowledge is developed and processed, critically acknowledges the social role of assessment and values its vital contribution to the teaching-learning process (Broadfoot and Black, 2004). Though initially coined as a reaction to testing cultures, assessment cultures presently refer to broader theoretical and practical frameworks for assessing knowledge. Assessment data are collected via multiple tools from various micro and macro sources, with stakeholders taking an active part in the assessment process (Shepard, 2000).

Similar beliefs and practices have recently permeated the language assessment field. These developments signify a move in the field of ‘language testing’ towards a broader assessment framework encompassing areas that have hitherto received little voice in the language testing literature. This is particularly apparent with regard to classroom and formative assessment (see Rea-Dickins, *Classroom-based Language Assessment*, Volume 7), and how they interact with external assessment measures.

The review will commence with a description of the concept of ‘assessment culture’ as it has transpired over the last decade or so in general education paradigms, followed by its recent emergence in the

area of language assessment. It will then illustrate the implementation of the concept in a number of language assessment contexts with a brief focus on research on the role of language teachers in assessment cultures.

### EARLY DEVELOPMENTS

As cultures are grounded in the macro- and micro-levels of society (Cole, 1996), the emergence of assessment cultures needs to be discussed with reference to current views on learning and education and the social role of assessment (Broadfoot, 1996). Contemporary society is marked by an epistemological paradigm shift which redefines knowledge in the 'Knowledge' or 'Information Age': while previously the concept of knowledge was regarded as a universal, fixed and measurable commodity accessed mostly through formal schooling, massive easily accessible data are now transforming post-modern views of knowledge to an evolving, individually and contextually formed entity (Hofer and Pintrich, 1997).

This view marks a major move from previously held behaviourist models which perceive learning as the accumulation of atomized bits of knowledge hierarchically attained. New competencies are needed to process the immense amounts of knowledge, to locate, attain and efficiently utilize it for various functions. Thus the locus of studies in this millennium is shifting towards skills acquisition, rather than knowledge accumulation, for autonomous self-directed and life-long learning (Perkins, 2004). Similarly, major changes have also occurred in perceptions regarding intelligence, with intelligence currently being viewed as contextually framed (Sternberg, 1997) and multi-dimensional (Gardner, 1983).

The beliefs regarding knowledge and intelligence at different points in time are reflected in the dominant educational assessment traditions that society has endorsed. The psychometric measurement paradigms that dominated the measurement scene throughout most of the twentieth century were compatible with behaviourist perceptions of knowledge, and with views of intelligence and learners' achievements as innate. The uniform external tests employed viewed knowledge as their major goal, disregarding the learning context, with reliability and norm-referencing being of prime concern (Wolf, Bixby, Glenn and Gardner, 1991). As such, external public tests fulfilled the role assigned to assessment: ranking individuals for the purpose of gate keeping, monitoring and surveillance. The assessment focus of this measurement paradigm is described as 'assessment of learning' (Gipps, 1994), and the views and assumptions underpinning it constitute a 'culture' referred to as a 'testing culture' (Wolf, Bixby, Glenn and Gardner, 1991).

Testing cultures are at odds with the changing role of assessment, for as post-modern societies are increasingly employing more democratic inclusion and deferred selection policies in education, the role of assessment is shifting. Assessment is currently perceived as a means to promote learning (rather than monitor it), in order to facilitate social and academic mobility, hence 'Assessment for Learning' (Gipps, 1994; Stiggins, 2002):

Assessment for Learning is the process of seeking and interpreting evidence for use by learners and their teachers to decide where the learners are in their learning, where they need to go and how best to get there. (Assessment Reform Group, 2002).

This contemporary understanding of the function of assessment is gaining prominence and presently dominates approaches to assessment reforms in various parts of the world. It is grounded in the theories and assumptions that are shaping current educational practices, referred to as 'cultures of learning' (James, 2001) or 'learning cultures' (Shepard, 2000), that follow Vygotsky's cultural-historical activity theory emphasizing the cultural context of individual meaning-making. Learning cultures approaches are also rooted in Piaget's cognitive development theory and in situated practice theories, which perceive learning as "an integral and inseparable aspect of social practice" (Lave and Wenger, 1991, p. 31).

Communities which endorse the assumptions of learning cultures recognize intelligence as multi-faceted and aim to provide opportunities for all students to learn in modes consistent with their linguistic, idiosyncratic and social background, without prior labelling of predicted capacities. School tasks are closely linked to real world settings and address higher order cognitive skills. Learning is context-bound and teachers' feedback plays a major role in supporting, scaffolding and promoting students' learning (Black and Wiliam, 1998; James, 2001; Shepard, 2005). The emerging 'assessment culture' is compatible with these principles and views assessment as a value-embedded social activity (Filer, 1995) with learning and assessment intertwined (Shepard, 2000).

Though the discourse of assessment culture is closely aligned with arguments that initially supported using alternatives in assessment, the assumptions underlying it presuppose the existence of a new understanding of the interactive nature of learning and the role of assessment and assessors in the instructional-learning cycle (Black and Wiliam, 1998). Hence the change can not be confined to employing different assessment tools (rather than only tests), but rather to reconsidering the psychometric paradigm and premises which dominated testing cultures: summative-formative dichotomies as well as the positivist

traditional conceptions of validity and reliability, the role of standardization (Moss, 1994; Brookhart, 2003) and the breaking of the so-called ‘robustness of tests’ code, versus the apparent lack of scientific vigor of teacher-made assessment instruments (Leung and Lewkowitz, 2006).

Assessment culture can comprise part of the culture of educational organizations such as schools, providing that the members of the organization adopt the beliefs and assumptions regarding the nature of assessment and its role in the learning process as outlined earlier. These views are integrated with the norms, values and cultural artifacts shared by the school community, i.e., the school culture (Prosser, 1999). Since assessment culture emphasizes the link between assessment and learning, the merge between the two cultures (school and assessment), will impact the on-going practices and decision-making of all the stakeholders in the school. The school culture may then become more ‘evaluation-minded’ (Nevo, 1993) and utilize internal and external student evaluation in a meaningful manner.

The introduction of a new assessment culture has not eliminated testing cultures. With the legitimization of internal assessment by classroom teachers there is also a corresponding increase in large scale external assessment measures, a notion that Broadfoot (1996) refers to as the ‘checks and balances’ phenomenon. However, contrary to testing culture traditions which viewed external and internal assessments as dichotomous and detached, assessment cultures acknowledge the value of broadening the assessment construct by augmenting assessment data from different sources and from different informers (including learners), using an assortment of assessment tools. Some of the data are internally obtained and some realized outside the classroom or school premise. Yet both sources are recognized as equally significant for facilitating and promoting learning goals:

Each of these assessments is important—those that occur in daily classroom interactions among teachers and students, those set by teachers at the end of a particular phase in the work, and those developed and administered by external agencies. (Atkin, Black, Coffey, 2001)

Additionally, once external tests are integrated with learning and focus on higher cognitive skills and critical abilities, they can have a meaningful role in the learning-assessment cycle, as “tests worth teaching to” (Yeh, 2001). Tests which assess high cognitive skills can also induce educational changes that will foster the development of the skills the test aims to assess, what Fredriksen and Collins (1990) refer to as “systematic validity”. The shift towards the integration of external and internal assessment within a criterion-referenced framework for learning improvement is presently evident in varying degrees in a

number of national assessment systems (see, for example, Strachen, 2002, for a description of the reform in New Zealand's senior secondary assessment system).

The current trends in general education and assessment with regard to shifting paradigms and the changing role of assessment in society have also resonated through the *language* learning and evaluation domains. The emergence of language assessment cultures can initially be traced to reactions against the flaws of testing cultures and the ensued move towards using multiple assessment measures (Huerta-Macias, 1995). Subsequently and more recently there is an evident acknowledgement of the significance of formative classroom assessment (Leung, 2004; Rea-Dickens, 2004), and some discernible examples of adopting the principles of assessment cultures in language education. The assessment reform is noted to be a conceptual change, for "the true soul of assessment lies not in the components or tools, but in the perspective or set of assumptions motivating their use" (Lynch and Shaw, 2005, p. 265).

Discussion of the underlying beliefs and practices which have impacted assessment reforms in the case of language evaluation needs to be considered with reference to language-related facets, specifically definitions of language knowledge and teaching approaches. The move from an atomized view of language knowledge to what is known as communicative competence, and to communicative and task-based approaches to language teaching (see Volume 4), has accentuated the incongruity of existing assessment measures. Calls for matching language learning and evaluation have been repeatedly made since Morrow (1979) urged language testers over three decades ago, to bridge the gap between communicatively focused teaching goals and the testing procedures used to gauge them. The limitations of tests (external but also internal), have also been highlighted in view of current constructivist views of language learning (Kaufman, 2004) and learner-centered approaches, along with the growing criticism of the role of tests as powerful and undemocratic devices (Shohamy, 2001).

However, though alternative assessment practices are alluded to in the language testing literature, language testing research has by large focused on high-stakes proficiency testing, with discussion and references to the concept of assessment culture still relatively rare. An early attempt to provide a framework (in the form of proficiency guidelines) to link external testing to learning (though not to teacher-made tests), can be traced to the introduction of the American Council for the Teaching of Foreign Languages Proficiency Guidelines (ACTFL, 1983), intended to assist at "setting language learning goals, in planning learning activities and in evaluating proficiency" (ACTFL, 1983).

More focused allusions to the need for a paradigm shift in the language assessment domain can be found in the recent critical reviews of language measurement issues, particularly within the areas of ethicality, fairness and equity (Kunnan, 2005), and the conceptualization of language assessment as a social activity (McNamara, 2001). Lynch (2001) introduces the concept of 'assessment culture' in language assessment contrasting it with the paradigm of 'traditional testing culture'. Drawing on Wolf, Bixby, Glenn, and Gardner (1991) and on Birenbaum (1996), Lynch specifies the premises for assessment culture: the integration of teaching and assessment, the active role students take in the assessment process, assessing both process and product and the profile (rather than numerical score) created to report results (Lynch, 2001, p. 360). Assessment culture is grounded in the interpretivist (rather than positive) paradigm, and is underlined by socially constructed assumptions about the nature of reality.

These views are echoed in proposed assessment models which criticize centralized language testing-culture mechanisms, and take a different view of the role of assessment in society. Shohamy (2001) argues for democratic shared assessment paradigms in which local stakeholders collaborate with language testing professionals and authorities to create contextually suitable frameworks. In terms of the knowledge examined, democratic local models evaluate the relevant knowledge the stakeholders themselves uphold, rather than externally induced forms of wisdom. Solano-Flores and Trumbull (2003) likewise posit that there is a need for new paradigms for assessing language learners in view of the complexities of language knowledge and the cultural issues embedded in language acquisition, especially with regards to immigrant students learning a new language. They propose a framework which would enhance greater validity and equity in language assessment, whereby the test development process is conducted by local educators supported by professionals from different relevant areas. English language learners are offered accommodations in the form of bilingual items "in accordance with item content specifications and in alignment with state and national standards" (Solano-Flores and Trumbull, 2003, p. 9).

Thus language assessment cultures argue for the incorporation of social values and beliefs in the assessment framework. They recognize the significance and implications of political and social contexts, and offer broad assessment frameworks which promote equity and ethicality in the assessment process. Language assessment cultures (like educational assessment cultures) also question the suitability of applying traditional psychometric theory to alternative forms of language assessment, and contend for adopting different assumptions specifically in the way validity is conceptualized (Leung and Lewkowitz, 2006; Lynch and Shaw, 2005; Teasdale and Leung, 2000).

MAJOR CONTRIBUTIONS AND  
WORK IN PROGRESS

The concept of language assessment culture is gradually being introduced to portray language assessment frameworks in different contexts, with summative testing of language learning outcomes increasingly integrating formative language learning assessment (e.g., see Edelenbos (2005) for a study which surveyed the assessment culture of 25 European Union countries). Examination of the reported assessment culture cases shows that they demonstrate the premises that characterize assessment cultures as set by Lynch (2001) earlier, specifically in terms of combining assessment with teaching, assessing different facets of the language learning experience, providing on-going feedback and collaborating with different stakeholders in the process. In addition, some of these assessment episodes describe the assessment practices with reference to an external criterion-based framework, emphasizing the mutual dialogue between the internal and external assessments and the empowerment of the local stakeholders.

A notable current example is assessment referenced to the Common European Framework of References to Languages: Learning, Teaching, Assessment (CEFR). The CEFR is described as a framework intended for facilitating teaching and learning as well as for creating assessment tools (Council of Europe, 2001). Though criticized for its suitability for test design and validation (Fulcher, 2004), the CEFR reportedly serves (along with the European Language Portfolio, ELP) diagnostic (see Alderson and Huhta, 2005), formative and summative needs of external and also local assessment systems which adapt and contextualize the CEFR levels and portfolio guidelines to fit their target population and designated purposes.

Two such examples of creating an assessment culture in schools by using modified versions of the scales can be found in reports by Little (2005) and Hasselgreen (2005). Little (2005) shows how “the CEFR and ELP can contribute to the development of an assessment culture in which self-assessment can help to bring the learning process into a closer and more productive relation to tests and examinations than has traditionally been the case” (Little, 2005, p. 324). This is illustrated in the Irish primary school context where an ESL curriculum was developed based on adapting the CEFR descriptors to the age of the learners and to the learning foci. The original CEFR benchmarks and ELP were revised in collaboration with the practicing teachers to fit the local context, with professional support and electronically available materials. Seeing that the teaching and the assessment share identical criteria, the modified benchmarks are reported to serve both assessment purposes and teaching objectives. In addition to self assessment other

instruments were developed including test batteries, with the rating scales referenced to the CEFR levels with devised sub-levels.

Likewise, the Norwegian educational system has taken on the CEFR and ELP as anchors for developing assessment frameworks and tools for language assessment (Hasselgreen, 2005). The ELP was adapted and supplemented for learners younger than the ones for which it had initially been intended. 'Can-do' statements compatible with the ELP were designed "preserving the essence of the ability described in the CEFR levels" (ibid, p. 346), but also (content-wise) reflecting the world of young teenagers. Following adjustments and modifications supplementary self and teacher-assessment materials were created. In another reported project the CEFR scale was used for reporting results and for defining writing criteria for a national test in English and in mother tongue reading and writing. The results of the assessment are reported in the form of profiles rather than scores, allowing for feedback that can lead to potential learning improvement.

References to language assessment culture are also evident in the context of assessment reforms in Hong Kong where the 'assessment for learning' approach was embraced. Davison (2004a) describes this reform characterized as "a shift from a 'culture of testing' to a 'culture of assessment'" in the English teaching domain. Currently school-based and external language assessments are both conducted within standards-referenced frameworks. Classroom assessment complements the outcomes syllabus and includes diverse formal and informal procedures to evaluate both process and product language use, with school-based assessments intended to be one of the components of the public examinations. Importantly the reform includes the school community at large and requires joint planning and discussion among the different stakeholders: "Fundamental changes in school assessment practices to bring a better balance across assessment for learning and assessment of learning need to be planned, discussed, shared, negotiated and agreed by all teachers in each school" (The Curriculum, Development Council, 2002). The enormity of the cultural (rather than merely organizational) reform is emphasized, as well as the different measures that need to be taken for the assessment revolution to transpire: changed sets of values and beliefs about the goals for assessment and the formative summative differentiation and the rethinking of psychometric paradigms (Davison, 2004a).

A move towards using internal assessment for external purposes is evident in a recent EFL assessment reform in Israel, where classroom tasks in the form of projects are included as part of the external oral EFL school leaving examination. Model tasks and materials are made available to teachers and students on an interactive site, where teachers can post their own projects for receiving feedback and for the benefit of

others, as well as acquaint themselves with the underlying rationale for the assessment framework ([http://space.ort.org.il/@home/scripts/frame.asp?sp\\_c=698806542](http://space.ort.org.il/@home/scripts/frame.asp?sp_c=698806542)). In this case, as in the other reported scenarios, the role of technology as a facilitating factor in introducing the cultural change and in supporting and professionalizing teachers, is of paramount importance.

Recognition of the indispensable mediated role that *teachers* play in the language assessment cycle has brought to the fore research-based interest in teachers' beliefs and assessment practices in contexts where the teachers are relied on to take an active part in the assessment culture (Brindely, 2001; Davison, 2004b; Leung, 2004; Rea-Dickens, 2001, 2004; Rohl, 1999). The studies survey teachers' practices and beliefs, and the impact of external norm-setting and tests on these practices. They also question the practitioners' language assessment craftsmanship and the quality of their assessments (Brindley, 2001). A number of realizations emerge from the studies. The first relates to the profound perception change involved in the move from language testing to language assessment cultures. This transformation applies to all the stakeholders but in view of the formative nature of classroom assessment it is the teachers who have the most meaningful role in instigating the new culture, a process that can not be induced by policy decisions alone (Leung, 2004). A second overriding finding is the vast individual and group differences among teachers with regard to assessment practices and espoused beliefs, impacted by context-bound variables which reflect the values and practices that the local community and the educational authorities uphold.

The third observation is the visible difficulty teachers experience when asked to align their assessment with external criteria. The conflict centres on negotiating the difference between the externally determined criteria-referenced scales and the teachers' own reactions to the students' work (Davison, 2004b). This underscores some main premises of assessment cultures and raises questions relating to the relative legitimacy and worth of contextual formative interpretations and assessments versus the external ones, and the assumed shared indicators for judging language proficiency. It also raises questions as to rethinking conventional reliability measures which presuppose rater agreement, while constructivist paradigms view variability in assessment as a valuable data source (Moss, 1994).

### PROBLEMS AND DIFFICULTIES

Notions of language assessment culture are considered and gradually adopted to varying degrees in language learning contexts as alternatives to testing cultures. Yet their effective implementation as viable assessment frameworks is rooted in issues of power and dominance,

as well as in the ability of the internal assessment to live up to the challenge. The main question is whether and to what extent external authorities, often triggered by agendas and motives that are neither educational nor pedagogical (Brindley, 2001), will genuinely grant internally practiced assessment sites mandates for decision-making. In other words, is assessment culture discourse a lip service paid by assessment authorities, or a sincere attempt at assessment reforms? This is not clear, for at present practitioners in different contexts (some supposedly assessment culture-oriented), are expected to simultaneously function within two non-compatible cultures: encouraged to pursue an assessment culture, while concurrently required to abide by the rules of testing cultures (Arkoudis and O'Loughlin, 2004). This ambivalent predicament creates tension between two sets of sometimes contradictory beliefs and values, with high stakes external testing cultures usually prevailing over internal assessments (Hargreaves, Earl and Schmidt, 2002).

A closely related issue has to do with the criterion-referenced frameworks within which the assessment cultures function, their presumed hierarchical learning progression, and the degree of flexibility and latitude allowed for contextual modifications and collaborative practitioner construction (as is evident in Little, 2005). This is particularly relevant with regard to possible measures taken to ensure equity for specific groups, like language minority students assessed in the mainstream classes via external tests (see Abedi, 2004, on assessing LEP students under the No Child Left Behind Act, 2001), as well as for adapting the criteria to curriculum contents and goals or age relevant specifications. It is also becoming significant with regard to setting standardized language norms in view of World Englishes and the emergence of English as a Lingua Franca (Seidlhofer, 2004). Future criteria for language quality may depend to a great extent on the standards established by local experts, and hence assessment cultures will need to modify the general uniform linguistic criteria to differential context-dependent linguistic indicators (Leung and Lewkowitz, 2006).

Though teacher formative assessment, a vital assessment culture component, is favourably recognized for its value in conducting curriculum-embedded assessment and for promoting learning, questions still remain as to the nature of classroom assessment: how it differs from 'standardized language assessment' (Leung and Mohan, 2004), and how teachers interpret and use external frameworks in different contexts (Rohl, 1999). In addition, the quality measures used to ensure teacher-based assessment are in need of further critical examination, as are issues related to the integration of teacher assessment with assessment conventions such as summative marks (Rea-Dickens, 2001). Although measures to ensure teacher education and professionalization are generally part of the assessment culture initiative, not

enough is known about the value of these endeavours. More importantly, it is not clear whether (or to what extent) teachers share the beliefs of the new culture, and whether they are willing to invest in the change process that the move from the old culture to the new one entails.

### FUTURE DIRECTIONS

When discussing future directions in language assessment culture one needs to differentiate between macro- and micro-levels of assessment, between the teachers' and schools' assessment practices and those of assessment authorities and agencies. Since the language education field has been endorsing constructivist-oriented teaching and learning paradigms and task and content-focused approaches, it can be assumed that on the classroom and school levels the shift towards assessment cultures will gain momentum in the future. Not only will the role of assessment as part of the learning process be further acknowledged, but the sophisticated use of assessment data from a variety of internal and external sources will become part of the ecology of schools that have embraced assessment culture as part of their school culture.

However, at the same time on the macro-levels, it is presumed that due to social, political and economic considerations the external assessment mechanisms which accompany the culture shift, will not relinquish their gate keeping and surveillance mandates. The balance between the assessment and testing cultures will therefore most probably be tremulous, with possible shifts in either direction depending on forces in, but mostly beyond, the assessment arena. Decisions as to whether to enforce testing culture conditions with regard for example to acceptance criteria for educational institutions, may be governed by political motives on national or local levels. Similarly tests may also be used as mechanisms for enforcing gate keeping policies, and for providing or denying financial support to schools, districts or individuals.

Notwithstanding the above it is worthwhile noting that the interface between the two cultures, and the interactive dialogue they conduct, can positively impact future assessment practices in both external and internal assessment sites. In terms of external assessment, tests may form a meaningful part of the learning experience if constructed to promote critical thinking and foster and tap higher order skills along the lines suggested by Yeh (2001). Once implemented, the democratic, context-based assessment models proposed by Shohamy (2001) and Solano-Flores and Turmbull (2003) can broaden the testing framework to include different perspectives and localized relevant input. Since assessment culture views assessment as a context-relevant activity grounded in learning, the constructed tests will be sensitive to

contextual variables, to the learners' cultural and linguistic backgrounds and to the knowledge they bring with them to the assessment encounter.

In terms of internal classroom and school-based assessments, utilization of external and internal assessment data in a non-threatening manner can transform the school into a learning community that examines its current practices and achievements, linking assessment information from different subject areas in a socially interactive environment. Such practices will allow both teachers and students to get a complete picture of “where the learners are in their learning, where they need to go and how best to get there” (Assessment Reform Group, 2002).

More specifically, practitioners can benefit from the interaction and collaboration with external experts in a number of ways:

- Gaining expert knowledge in language assessment and other language-learning areas;
- Using model tasks and tests as prototypes for teacher-made tasks;
- Learning how to interpret assessment data;
- Integrating data into their own assessment and vice-versa—providing data to external authorities for decision-making purposes.

Future research needs to focus on the implementation of assessment cultures particularly on this interactive external/internal process and its impact on forms of assessment, on the way different stakeholders use data from different sources and for what purpose, on how they utilize the data, on where the students fit in, and on who stands a chance to gain or to lose in this assessment environment.

As was noted earlier technology will have an increasingly significant part to play in enhancing and maintaining the various facets of the assessment cycle: promoting and facilitating teacher development, allowing for discussion on the integration of learning and assessment according to given or modified criteria, facilitating self monitored language assessment, providing space for on-line feedback on language needs, and finally, creating a community of practice which comprises different protagonists working jointly to create an assessment culture in which assessment data is constructively employed to promote learning.

## ASSESSING SECOND/ADDITIONAL LANGUAGE OF DIVERSE POPULATIONS

### INTRODUCTION

With increasing movements of people across international boundaries and the unabated spread of plurilingualism into national education systems, intergovernmental cooperation and multinational business enterprises, the teaching and assessment of second/additional language proficiency have continued to be a major item on the educational agenda in many world locations. In this chapter, we focus on (i) second language assessment designed to measure the second language development of linguistic minority students in a context where this language is the predominant majority language in society,<sup>1</sup> and (ii) second/foreign language assessment designed to measure language development of learners of a language in diverse contexts. These two themes are discussed in two ‘mini’ parallel themed sections on developments and problems identified to date. Although we mainly deal with English as a second or foreign language (ESL/EFL), our discussion refers to work in other languages where appropriate. We refer to some recent developments in Europe which, in our view, signal likely future directions reflecting progressive societal recognition of the value of a person’s proficiencies in different languages. ‘Assessment’ is used as a super-ordinate term through this discussion to refer to all forms of assessment, including standardized tests.

#### THEME 1: ASSESSING ESL AS A DISTINCTIVE CURRICULUM PHENOMENON

##### *Early Developments*

The ESL student populations in English-speaking countries have been growing steadily. For instance, in 2004 the ESL student population in

---

<sup>1</sup> The terms ‘second language’ and ‘additional language’ are used interchangeably in some education systems. In this discussion, we do not use the term ‘additional language’ to avoid a potential conceptual overlap with ‘foreign language’. The term ‘foreign’ language is used to refer to the teaching and learning of a language where this language is not used as a medium of wider social communication. In the USA, the term English Language Learner is being used increasingly widely to refer to students from ethnolinguistic backgrounds who are learning to use English in school.

the USA was approximately five million (just over 10% of the total school population), and this represented a growth of approximately 65% over a 10-year period (NCELA, 2005). Similarly, the numbers have been increasing in England and in 2005 the ESL students constituted 11.7% of the total population in elementary schools and 9.1% in secondary schools (DfES, 2005a). Since the early 1990s, there have been two related but, paradoxically, opposite developments in the assessment of the second language development of linguistic minority students in English-speaking countries. In a number of education jurisdictions there has been a major effort to develop distinctive ESL assessment frameworks; at the same time many national systems, sometimes in the same countries where a good deal of research and development in distinctive ESL assessment can be found, have adopted an inclusive policy and practice of putting all students through large-scale standardized public assessment schemes without distinction. These two opposite developments are discussed in turn.

There has been a growing awareness on the part of some educators and policy makers that second language development in the context of mainstream schooling and social participation is different from first language development and foreign language learning (e.g., learning French as a subject in an English-medium school curriculum). ESL students enter their local school system at different ages and with varying background in English language learning. Learning English and learning to use English for curriculum learning purposes can add considerable demand to the challenges faced by individual students. For these reasons, a good deal of effort has gone into the systematic development of dedicated ESL assessment frameworks across a number of education jurisdictions.

### *Major Contributions*

One of the first of such attempts is the National Language and Literacy Institute of Australia (NLLIA) framework (McKay, 1992) which sets out to provide grade-level classroom-based ESL assessment descriptors. The descriptors take into account the use of English for subject content learning in ordinary classroom contexts in Australia (initially developed in Queensland). Another Australian framework is the ESL Scope and Scales produced by the South Australian curriculum authorities (SACSA, undated). This framework provides a link to the learning content of the mainstream school curriculum and ESL descriptors for formative assessment. The professional association Teachers of English to Speakers of Other Languages (TESOL, 1996) in the USA has produced a set of K-12 ESL Standards that has been designed to provide teachers with broad requirements of ESL development for

social and academic purposes at different stages of schooling. Teachers are encouraged to use these descriptors to generate specific local ESL assessment criteria. (For an account of other similar developments, see McKay, 2000, 2005 for a further discussion.)

In the past decade, we have also seen that the policy move towards greater central control, public accountability and economic rationalism, which originated in the 1970s, has been further consolidated in many countries. Broadfoot and Pollard (2000, p. 13) capture this powerful trend thus:

The 1970s and 1980s had seen a growth in international economic competition. This, together with growing financial pressures and an increased demand for state institutions to be accountable, underpinned a desire to curb the professional autonomy of teachers and to replace it with a much greater measure of central control. The underlying rationale here [emphasizes] the beneficial role of market forces and competition in driving up standards, and controlling 'producer interests' . . . In such a model, assessment and measurement has a particular role in providing 'objective' information on which educational 'consumers' such as parents and governments can base their decisions.

Many education systems have adopted the use of standards-based assessment and public reporting of student performance as part of policy implementation and monitoring. The current legislation connected to the No Child Left Behind (NCLB) policy in the USA, for example, requires regular assessment and reporting of results for all school students. Similar legal requirements exist in places such as Australia and England. Second language education has not been exempted from this process. Proponents of this approach argue that this 'common treatment' contributes to social integration and equal educational opportunities (Travers and Higgs, 2004).

### *Problems and Difficulties*

This use of assessment to promote a particular kind of public policy is not, however, unproblematic in terms of potential misuse of assessment as a policy instrument and in terms of 'fitness-for purpose' issues. The recent case of use of data by the education authorities in Arizona is a case in point, especially in the context of the on-going language policy debate in the USA. In the past 10 years, there has been a good deal of public discussion on the advantages and disadvantages of bilingual education for linguistic minority students in the USA. This highly emotive and ideologically charged debate has been centred around two opposing positions: pro-bilingual education vs. English-medium education (with

some short-term ESL provision). The critics of bilingual education argue their case on grounds of educational effectiveness (i.e., bilingual education is non-cost effective, as compared with ESL, because students fail to achieve in these programmes) and social cohesion (bilingual education encourages diverse ethnolinguistic groups to remain separate, whereas English-medium education promotes social integration through a common language) (for further discussion, see Crawford, 1997; Cummins, 2000; Leung, *in press*; Thomas and Collier, 2002; Unz, 1997, 1999).

In 2004, the State Education Department in Arizona (2004) published a set of school student performance data purporting to show that the Structured English Immersion programmes were producing higher levels of achievement in English language, reading and mathematics than the bilingual programmes within the state. Structured English Immersion is “a form of English-only education that allows for the smallest amount of native-language instruction necessary to supplement an English-only curriculum” (Arizona Department of Education, 2004). These data were used by the Education Department officials to promote their preference for the Structured English Immersion programmes. This use of student assessment data to support the state’s educational policy was highly contentious and it was contested by TESOL (2004) on grounds of methodological shortcomings (e.g., a lack of clarity in the ways different programme types and student backgrounds have been operationalized), and misuse of research data (e.g., the data did not support causal relationships).

The use of assessment as a policy instrument for public accountability has also tended to be associated with the use of a set of common criteria for students of diverse language backgrounds. Common criteria that are used to assess all students are usually modelled on first language development and performance of the language majority population in society. In Australia, England and some parts of the USA, for instance, the government-sponsored assessment of English (the term ‘literacy’ is used sometimes) is based on the system-wide rating scales to be applied to ‘everyone’. The statutory assessment of elementary and lower secondary students in England requires the National Curriculum assessment criteria, with a small modification for young second language beginners, to be applied to all, irrespective of first or second language backgrounds:

Summative assessment for bilingual [ESL] pupils, as for all pupils, should be based on national curriculum measures . . . It is not recommended that additional locally developed scales of fluency are used . . .’ (DfES, 2005b, p. 6)

McKay (2000, p. 186) reports that a similar situation exists in Australia, where a set of common “Literacy Benchmarks based on

English-speaking background . . . learner progress through school are being used as a basis for monitoring literacy development.”

The use of common assessment criteria for all students without exception may be justifiable on grounds of an ‘inclusive’ approach to education. Here ‘inclusiveness’ is taken to mean common educational treatment irrespective of differences in terms of language backgrounds (see Leung, 2001, for a detailed discussion). In terms of usefulness of assessment outcome, however, the appropriateness of using first language development models for the assessment of second language development is questionable. For instance, in the English (subject) National Curriculum the attainment target for Level 4 Speaking and Listening (expected level of attainment for 11/12-year olds) is as follows:

Pupils talk and listen with confidence in an increasing range of contexts. Their talk is adapted to the purpose: developing ideas thoughtfully, describing events and conveying their opinions clearly. In discussion, they listen carefully, making contributions and asking questions that are responsive to others’ ideas and views. They use appropriately some of the features of standard English vocabulary and grammar (DfEE and QCA, 1999, p. 55).

This attainment target statement provides, arguably, a reasonably workable general description of the range and kinds of spoken language use for school purposes by first language speakers. Note that the students are not only expected to use spoken English to engage in a range of academic activities, but they are also expected to do within socio-culturally acceptable ways; qualifiers such as ‘with confidence’, ‘thoughtfully’ and ‘appropriately’ all point to the sort of language repertoire expected of someone who has had substantial exposure and use of English in a native language speaking environment. This level description would not even begin to make sense for either summative or formative purposes in the case of a 12-year-old beginner learner of English, say, from Poland. Yet, if we turn to a lower level description, there tends to be an odd sense of misfit because of the age and maturation factors built into first language scales. The Level 1 description for Speaking (threshold, officially adapted to EAL already), for instance, is as follows:

Pupils speak about matters of immediate interest in familiar settings. They convey meaning through talk and gesture and can extend what they say with support. Their speech is sometimes grammatically incomplete at word and sentence level (QCA, 2000, p. 13).

Here the level description is clearly modelled on a much younger child, about the age of 5 or 6, who may be happy to engage with others in an

uninhibited manner. A 12-year-old English beginner is unlikely to talk about matters of immediate interest in a secondary school setting. The greatest challenges for such a student are likely to be finding the necessary vocabulary and phrases, grammatically complete or not. This example shows that assessment criteria that have been developed with first language development norms and assumptions can be conceptually ill-fitting and, worse, misleading in terms of the assessment outcome yielded.

In the content areas a similar situation exists. ESL students, irrespective of their English language proficiency and schooling backgrounds, are expected to participate in standardized subject assessment, which has been devised with native speakers in mind. For those students who are still learning to use English for academic purposes effectively, the English language in standardized assessments can pose an additional linguistic challenge that distorts their ability to demonstrate their content knowledge. Whenever this happens it would make the test scores “invalid as indicators of content knowledge and achievement” (Butler and Stevens, 2001, p. 411). In a study of the test performance of approximately 15,000 Chinese- and Spanish-speaking background school students (Grade 2–11) in reading and other school subjects, Katz, Low, Stack and Tsang (2004) report that it takes 4–5 years of being in the English-medium school system before English language proficiency ceases to have a depressing effect on their test scores. All of this raises serious fundamental questions about the validity of using a set of non-differentiated criteria for the assessment of second language students’ English and curriculum achievements.

## THEME 2: ASSESSING SECOND/FOREIGN LANGUAGE DEVELOPMENT OF LEARNERS IN DIVERSE CONTEXTS

### *Early Developments*

Within the diverse linguistic context of Europe, there is an increasing need to identify and recognize “the kinds of language proficiency needed by European citizens to interact and co-operate effectively” (Figueras, North, Takala and Verhelst, 2005). This has been facilitated by a number of Council of Europe initiatives, starting in 1957 with the first intergovernmental conference on European co-operation in language teaching. One of the most important early developments of the Council of Europe was the publication in 1975 of the Threshold Level, “the specification in operational terms of what a learner should be able to do when using the language interactively.” The 1990s subsequently

saw the specification of intermediate (Waystage) and higher level (Vantage) objectives and the development of the Common European Framework of Reference for Languages (CEFR) (Council of Europe, 2001). The CEFR now provides a yardstick against which language proficiency in the different languages of Europe can be described.

### *Major Contributions*

Although the CEFR has broad educational objectives impacting on the teaching and learning of languages, it also has specific concerns relating to testing and examinations. It aims “to help partners to describe levels of proficiency required by existing standards, tests and examinations in order to facilitate comparisons between different systems of quantifications” (Council of Europe, 2001, p. 21).

The CEFR is made up of a descriptive system of language activities broken down into ‘Can-do’ statements, which, drawing on extensive research carried out by North and his colleagues (North, 2000; North and Schneider, 1998), have been placed on a common language proficiency scale. This scale is divided into three broad categories A (Basic User), B (Independent User) and C (Proficient User), each of which is further subdivided into two levels: A1 (Breakthrough), A2 (Waystage), B1 (Threshold), B2 (Vantage), C1 (Effective Operational Proficiency) and C2 (Mastery), with C1 and C2 being described as follows:

C1: Can understand a wide range of demanding, longer texts, and recognise implicit meaning. Can express him/herself fluently and spontaneously without much obvious searching for expressions. Can use language flexibly and effectively for social, academic and professional purposes. Can produce clear, well-structured, detailed text on complex subjects, showing controlled use of organisational patterns, connectors and cohesive devices.

C2: Can understand with ease virtually everything heard or read. Can summarise information from different spoken and written sources, reconstructing arguments and accounts in a coherent presentation. Can express him/herself spontaneously, very fluently and precisely, differentiating finer shades of meaning even in more complex situations (Council of Europe, undated).

A related and very significant development in the assessment of modern languages in Europe has been the introduction of the European Language Portfolio (ELP) (Council of Europe, undated). The portfolio was inspired by the Council of Europe as a result of the 1991 Rüsclikon Symposium (see Little, 2003, for more details). It was introduced at a

time when not only was the number of users of English in Continental Europe growing, but when the need for multilingualism in the UK was rising (King, 2001).

The ELP “is a personal document designed to make the language learning process more transparent to the learner and to report an individual’s achievement at any level and in any language in an internationally transparent way.” The portfolio is made up of the following three obligatory components:

- A language passport, which summarizes the owner’s linguistic identity by briefly recording second/foreign languages learnt, formal language qualifications achieved, significant experience of second/foreign language use, and the owner’s assessment of his/her current proficiency in the second/foreign languages he/she knows
- A language biography, which is used to set language learning targets, monitor progress, and record specially important language learning and intercultural experiences
- A dossier, which contains a selection of work that in the owner’s judgment best represents his/her second/foreign language proficiency. (Little, 2002, p. 182).

The ELP has a number of key features that distinguish it from other means of language assessment. First and foremost, it promotes equal recognition of all languages learned by individuals’ using a model developed after extensive piloting across a spectrum of 15 countries within the Council of Europe (Little, 2005). The established model is one that has a standardized language passport for all adults, but that allows for variability within the different sections of the portfolio, thus reflecting the Council of Europe’s ideal of ‘unity in diversity’ (Little, 2002, p. 184).

The formative nature of ELP assessment allows individuals to engage in the portfolio process from an early age and to continue updating its contents as its owner perceives necessary. It has been designed to supplement official certificates and diplomas awarded through formal education, allowing its owner to demonstrate any language learning that has taken place outside the formal educational setting, e.g., within a bilingual home or while traveling abroad.

Comparability across languages within a single portfolio or across different portfolios is made possible through the use of the CEFR. The CEFR also provides a means for self-assessment, which is an integral part of the portfolio. This central aspect of the ELP is believed to promote self-reflection and an improved understanding among learners of the assessment process: “learners gain ‘insider’ access to the processes of ‘social moderation’ that underlie the CEFR’s common reference levels and to the interaction between curriculum and assessment

that is fundamental to any worthwhile educational enterprise” (Little, 2005, p. 335).

A further European development which aims at recognizing the need for assessment across many of the diverse languages of Europe is that of DIALANG.<sup>2</sup> This is a low-stakes, computer-based and internet-delivered test of reading, writing, listening, grammatical structures and vocabulary covering all levels from beginners to advanced as articulated in the CEFR. The test can either be used by individuals who want to assess their language level in one of 14 languages, or by institutions for diagnostic or placement purposes. It is readily and freely available to users, providing them with feedback on their performance and with information on how they can improve their proficiency (for details, see Alderson and Huta, 2005).

### *Problems and Difficulties*

Despite the comprehensive nature of the CEFR, the framework is abstract and complex to apply making, *inter alia*, performances particularly at adjacent levels difficult to distinguish. Recognizing this, the Council of Europe (2005) has commissioned a manual to aid users in developing and describing their tests. This manual is likely to go some way in addressing user’s difficulties (the pilot version of the manual is currently under discussion—for more information, see Figueras, North, Takala and Verhelst, 2005). However, there are a number of inherent flaws in the system, which need to be addressed if the ideal of comparability and transparency across all language and at all levels of proficiency is to be achieved. A detailed look at the specifications provided above for levels C1 and C2 should help exemplify some of these. Although both levels are specified in ‘Can do’ terms, there is no indication as to how adequate each performance needs to be to qualify for the particular level. It is also difficult to distinguish between these two adjacent proficiency levels as it is unclear what the difference would be between ‘Can understand a wide range of demanding longer texts’ and ‘Can understand with ease virtually everything heard or read’. How long are longer texts and how wide-ranging do they need to be to qualify for C1 and not for C2? In addition, the specifications do not detail the nature of tasks that would be appropriate for each level or account for the development of cognitive and meta-cognitive processing as one progresses from one level to the next (for a comprehensive discussion of these and related issues, see Weir, 2005).

## WORK IN PROGRESS

The inclusive use of mainstream-oriented assessment has led to the advocacy and use of a variety of test accommodations in assessment, particularly in relation to subject curriculum content. By accommodation is meant modification to an assessment, which may enable second language students to participate on a more equal footing. There are two approaches: modifications to aspects of the assessment tasks and modifications to the assessment procedure. The former includes assessment in the students' first language, vocabulary change and use of additional/different visual support and so on; the latter includes extra time allowance, oral directions in students' first language, use of dictionaries and so on (Butler and Stevens, 1997). In a study on maths performance of grade 8 students in southern California, Abedi, Hofstetter, Baker and Lord (2001) report that accommodations such as simplified English (e.g., syntax in maths items), and provision of a glossary with extra time benefited the students with limited proficiency in English. In another California-based study Castellon-Wellington (2000) finds that grade 7 second language learners' performance in a social studies test did not improve significantly even when they were given the accommodation of their choice (extra time or reading test items aloud). In a discussion on the translation of Hebrew-medium tests into other languages, Beller, Gafni and Hanani (2005) observe that, in addition to the considerable technical complexity in establishing an acceptable version of the original test in another language on content and socio-cultural grounds, the use of translated tests may not automatically benefit test-takers from linguistic minority communities because they may have varying amounts of first language literacy knowledge and skills. They report that some Russian immigrants who have studied in Israel for several years may prefer to take university entrance examination in Hebrew with a Russian glossary for key words. These and other studies on accommodations strongly suggest that the relationships between students' first and second language proficiency, the types of accommodation offered and their performance are very complex and a good deal more research is needed to unravel the intricacy (see Butler and Stevens, 2001; McKay, 2005 for a further discussion).

In the wake of the NCLB legislation, individual states (often working in consortia) in the USA are developing new English language proficiency tests. Abedi (2004) reports that there are currently six such state-level initiatives. One such effort is the ACCESS test<sup>3</sup> being developed by

---

<sup>3</sup> ACCESS is the acronym for Assessing Comprehension and Communication in English State to State for English Language Learners (<http://www.cal.org/projects/wida.html>, accessed on 11/08/2005).

the WIDA<sup>4</sup> consortium. The declared purposes of ACCESS are consistent with the standards-oriented national legislation: to identify the English proficiency of students with respect to state-wide performance standards, to identify students requiring ESL services and to assess annual English proficiency gains using standards-based assessment, to provide information for local ESL programme evaluation and staff requirements, to provide data for compliance with federal and state statutory requirements, and to provide positive washback for pedagogic purposes (WIDA, 2004). As these new tests are being implemented progressively in the future interesting questions will be asked in terms of the extent to which they have been able to meet all the measurement, pedagogic, administrative and statutory goals.

Perhaps as a response to the widespread use of large-scale standardized assessment, there has been growing interest in classroom-based teacher assessment in the past few years, particularly for formative purposes. The work of the Curriculum Reform Group (2002) has been influential in setting out the general arguments for pedagogically oriented assessment of learning, in other words, assessment for learning. Formative assessment carried out by teachers is seen as part of everyday classroom activity—teachers observe student responses to questions and tasks, and use their observations to form feedback to promote desired learning. Formative assessment, at least as an educational perspective, has been publicly endorsed by a number of education systems, e.g., England (QCA, 2001), Hong Kong (Education and Manpower Bureau, 2004) and Wales (Dougherty Report, 2004). In relation to second language students, particularly in contexts where second language and first language students are integrated and follow a common curriculum, formative assessment of both English and content learning is likely to demand a high level of teacher knowledge and expertise. Not only do teachers need to be knowledgeable about models and trajectories of second language development in a curriculum context, they will also need to be familiar with the relationships between subject content and the language expressions associated with the subject content, and how such relationships bear on second language development. At the present time, there are at least three types of important questions that require further research:

- What do teachers do when they carry out formative assessment? Do teachers do something different from, or in addition to, their everyday teaching when they assess formatively? (If formative

---

<sup>4</sup> WIDA is the name of a consortium comprising Wisconsin, Delaware, Arkansas, Rhode Island and many other educational jurisdictions (<http://www.cal.org/projects/wida.html> accessed on 11/08/2005).

assessment is really the same as ‘ordinary’ teaching, then the concept has no meaning.)

- What theories or benchmarks do teachers use when they make judgments and decisions?
- What do teachers look for when they are assessing? Are teachers’ theories and benchmarks translated into criteria for sampling and interpreting student performance? If yes, how?

For a more detailed discussion, see Leung (2004, 2005), Leung and Mohan (2004) and Leung and Rea-Dickens (forthcoming).

#### FUTURE DIRECTIONS

One of the unintended consequences of including second language students in inclusive system-wide assessment is that increasingly the fundamental question of what constitutes English language proficiency in the context of full curriculum participation is being raised. Some school-oriented second language assessment frameworks have attempted to cover mainstream subject contexts in a generic way, e.g.,

- Learners of ESL use a range of vocabulary to form complex word groups and phrases constructing specialized and complex technical fields . . .
- Expanding vocabulary in technical fields:  
nominalising processes: *developing* becomes *development*, *measure* becomes *measurement* . . . (SACSA, undated, Middle years Band: 23).

Where students are required to participate in the full range of curriculum study and assessment, it is necessary to ask the following language model- and construct-related questions: How should assessment deal with the relationship between curriculum content and classroom language use? What is English language proficiency in curriculum contexts?

A similar set of issues has arisen in relation to the ELP and CEFR. These were initially developed with adults in mind. They are, however, increasingly being applied to adolescents and young learners so necessitating adaptation to their particular circumstance. Young learners have their own interests, and assessment tasks designed for them need to reflect their needs, interests and realities as demonstrated by the Bergen ‘Can-do’ Project (Hasselgreen, 2005). In this project, initially developed for Norway, but extended to the Nordic/Baltic region, the ‘Can-do’ statements in the CEFR/ELP have been adapted in such a way as ‘to preserve the integrity of the CEFR levels, and yet take into account the particular characteristics of children and young teenagers’ (Hasselgreen, 2005, p. 351). There is evidently a need for such adaptation to be extended, ensuring that the adaptations apply not only to

English, which was the primary focus of the Bergen project, but also to a full range of European languages (as initiated at the Ganz, 2002 seminar reported in Hasselgreen, 2003).

Although considerable emphasis is being placed on alternative assessment and the implementation of the ELP, it is widely recognized that tests and examinations are also necessary. The Council of Europe's aim is to have such language assessments developed and aligned with the CEFR and there are attempts to do this as in the case of the National Testing project in Norway (see Hasselgreen, 2005 for details). However, such projects have encountered difficulties in, for example, ensuring consistency of rating among those judging pupils' performances and ensuring pupils are correctly placed on the CEFR scale. This, according to Weir (2005, p. 282), is not surprising given that:

- The CEFR scales are premised on an incomplete and unevenly applied range of contextual variables/performance conditions
- Little account is taken of the nature of cognitive processing at different levels of ability
- Activities are seldom related to the quality of actual performance expected to complete them
- The wording of some of the descriptors is not consistent or transparent enough in places for the development of tests.

In relation to English, we would also add that ELP and other similar packages will have to take account of the growing use of English as lingua franca (ELF), particularly in the European higher education context where an increasing number of courses are being offered in English (Coleman, 2006). There is now convincing evidence that ELF is a commonplace phenomenon (Jenkins, 2006; Seidlhofer, 2006). The use of ELF, normally in contexts where the majority, if not all, of the participants are non-native speakers of English and where Anglo-phone sociolinguistic rules do not necessarily apply, different linguistic forms and pragmatic practices have emerged. Any language assessment designed for transnational use will have to pay attention to these new forms and practices. The challenge in the near future will be to address these issues so that the CEFR can be applied in the way aspired to by the Council of Europe, achieving transparency, consistency and uniformity across languages and levels of proficiency.

Another issue that needs to be addressed within the context of young learners is how knowledge of all languages can be simultaneously valued. Given the virtually unrestricted freedom of movement within the European Union and high levels of immigration into Europe generally, many classrooms in Europe are faced with pupils from a range of different L1 backgrounds and with variable knowledge of second/foreign languages. Little (2005), for example, notes that in Ireland some primary schools have no non-English speaking pupils, whereas

others have as many as 100. This inevitably poses problems not only in terms of helping the migrant children in adjusting to their new learning contexts (discussed earlier), but also for teachers in being able to assess and cater for the language needs of all their linguistically diverse pupils. They require training in assessment, particularly formative assessment, which is all too often lacking (Rea-Dickins, 2000, 2001).

### CONCLUDING REMARKS

This discussion on assessment of second/additional language has focussed on key conceptual and design issues related to two domains of diverse populations: second language in mainstream education and second language across borders. Although the work in these two domains has to address different substantive issues, both share a broad common goal—to build systems and frameworks that can effectively represent language learners' achievement in a world of increasing population mobility. The school-oriented ESL assessment frameworks and the CEFR/ELP are examples *par excellence*. At the same time, the international policy trend towards public accountability has introduced conceptual challenges—in both domains language assessment criteria modeled on one kind of population is being used for another. A key problem of assessment within each domain stems from a similar issue—that of benchmarking performances in relation to inadequate or inappropriate descriptors. In the mainstream education context, the problems arise from using first language descriptors for assessing second language performance whereas in the European context adult-oriented language descriptors are being used as a model for assessing young learners. Progress towards resolving this fundamental issue is likely to require both technical and conceptual development through systematic research, and some form of public policy re-alignment to accommodate diversity in assessment criteria.

## ASSESSMENT IN INDIGENOUS LANGUAGE PROGRAMMES

### INTRODUCTION

Indigenous minority populations continue in their struggle to recover from a history of suppression and assimilation by colonising forces. That some indigenous languages have not survived while others hover on the brink of extinction, is testament to the effectiveness of such campaigns. The shared history of many indigenous languages and cultures is one where education has been used effectively as a mechanism to eradicate language and culture and where indigenous experiences have been pathologised and positioned within deficit theorising. A surge in activity by disenfranchised indigenous communities has been witnessed in the last few decades. This includes the targeting of schools as sites for linguistic and cultural recovery and regeneration with the expectation that the often well publicised underachievement of indigenous minority students will also be addressed. Assessment, and in particular formal testing, has therefore become a high stakes activity upon which the legitimacy and therefore continued existence of such programmes depend. The development of assessments to specifically meet indigenous aspirations is, however, often subsumed by demands for achievement information about students in the majority language, which is still perceived as the barometer for measuring academic success.

### EARLY DEVELOPMENTS

Bilingual education is the product of the historical socio-political experiences of language communities around the world. Language maintenance, in some places referred to as heritage language, and bilingual education, is a classification used to describe those bilingual programmes where the native, home or heritage language of language minority children is given prominence as a medium of instruction and where bilingualism, biculturalism and biliteracy are considered major goals (Baker and Prys Jones, 1998).

A variety of international examples comprise language maintenance bilingual education. Some of the most vulnerable initiatives belong to those indigenous communities whose language is struggling for survival within its ancestral territory or country of origin. Examples include

the Navajo and the Hawaiians in the United States, the aborigines in Australia and the Māori in New Zealand.

Most indigenous minority peoples share a history of subordination and domination by a colonising power. A common denominator in those histories is the systematic use of an imposed education system to engineer the replacement of indigenous language and culture with the vernacular and culture of the colonisers. Pre-existing education systems were considered inferior, particularly those rooted in traditions of orality as opposed to those that could also lay claim to an extensive written or printed literature. Furthermore, it was argued that the use of indigenous language in school settings and in communities hindered educational progress. Subsequently, educational policies and practices promoting subtractive bilingualism were encouraged and in many cases, enforced. Many indigenous people also supported the abandonment of their natal language in the hope and belief that this would improve their access to the new economic wealth and resources that had quickly become the preserve of the non-indigenous majority population.

This language imperialism not only successfully facilitated and later consolidated the power and dominance of non-indigenous majority populations but also helped create a legacy for indigenous peoples that has invariably seen them marginalised, disenfranchised and negatively overrepresented in the social indices of modern nation states.

Recent decades have seen indigenous peoples more rigorously demand and exercise their rights to self-determination in education. This has given rise to the emergence and establishment of indigenous schooling initiatives designed to reverse indigenous language loss, reconnect indigenous people with their culture and address academic underachievement by providing alternative learning programmes which reflect indigenous epistemologies and pedagogies and are delivered wholly or partly in the indigenous language.

When schooling initiatives are part of the public education system, the non-indigenous majority language population, who largely direct what happens in education, expect and assume that they should retain proprietorship over all of its domains. This means that educational priorities to support the majority language tend to dictate and determine what and how things happen for the indigenous minority language. The extent to which an indigenous language community is therefore able to exercise control over important issues such as curriculum content, curriculum delivery and assessment practices varies and is often directly related to levels of dependency upon the state for funding.

While the shift from an oral tradition to a written one has been contentious and an uneasy transition for some indigenous minority language groups, it is generally acknowledged that being able to read and write in that language is critical to its survival. As a result, literacy

instruction in the threatened language is vigorously promoted in school-based language recovery programmes. Where bilinguality and biliteracy are desired outcomes, provision for instruction in another language (usually the majority language) is also accommodated. Continuing support for such initiatives (from both majority and the indigenous population) relies heavily on the academic performance of students. This throws assessment of literacy achievement into sharp focus as this is the means by which judgements about the efficacy and legitimacy of such programmes are often made.

#### MAJOR CONTRIBUTIONS

The underachievement of indigenous minority students in monolingual majority language programmes is well documented and often overemphasised in many western education systems. The cause of this underperformance is often attributed to deficiencies considered inherent in the indigenous minority population in particular, its attendant language and culture. Substantially less is made of the failure of those systems to cater adequately for these particular groups of students while privileging others.

Evidence is being accumulated (albeit slowly and in small quantities), that demonstrates the positive impact of heritage language bilingual programmes, on the academic performance of indigenous minority students in the majority language. Access to comprehensive information about the academic performance of indigenous students in the heritage language by comparison is very limited. This can be attributed in part, to the lower status afforded that language within its own national context. Performance in the majority (non-indigenous) language, particularly performance quantified by formal testing (as opposed to wider assessment practices), is presumed as the preferred terms of reference for measuring success and therefore more likely to be publicly reported. Assessment information in the heritage language on the other hand, is treated more as a concession to indigenous aspirations by the majority population and afforded far less importance and value. It also indicates that generally, assessment development for some heritage language bilingual programmes is still in its infancy and is characterised by local arrangements for gathering assessment information which tend to be less publicised.

Heritage language revitalisation schooling initiatives that have gained international recognition include (but are not limited to) those located in the United States and Aotearoa/New Zealand, countries where English is the majority language.

Schools at Rough Rock and Rock Point represent efforts by native American Indian communities to maintain the Navajo language in the

state of Arizona. This has become more urgent as increasing numbers of Navajo learners are becoming English dominant and losing their heritage language despite the relative geographical isolation of these two communities which in the past has afforded them some protection from this language encroachment. Recently legislated language policies that give further priority to English medium instruction continue to undermine Navajo efforts.

Rough Rock is the site of the first Indian community controlled school while Rock Point Community School is attributed with implementing one of the first modern indigenous literacy programmes in the early 1970s (McCarty, 2003). Navajo has only 'achieved literate status' within the last century with the acceptance of a particular orthography as the standard after several earlier attempts were rejected (Lee and McLaughlin, 2001; McGroarty, Beck and Butler, 1995). This has made the development and implementation of formal literacy programmes in the Navajo language possible in schools where previously print literacy related activities were only available in the English language.

It has been reported from analysis of data collected since the 1970s from Rock Point school that monolingual Navajo-speaking children who learned to read first in Navajo, outperformed their cohort of Navajo students in English-only programmes on English language literacy measures. A seven year-long study beginning in 1998, tracked levels of bilingualism and biliteracy for students in their first four years in the English-Navajo Language Arts programme at Rough Rock School and compared the performance of these students with Navajo students who did not participate in the bilingual programme. Both qualitative and quantitative methods were employed using localised standardised tests and other assessments. Although the results for both groups remained below national norms, the students in the English-Navajo Language Arts programme consistently outperformed those in the study who received instruction exclusively in English (McCarty, 2003).

In Aotearoa/New Zealand, Māori medium education has become the umbrella term to describe the various schooling options in the compulsory education sector where Māori language is used to deliver a national curriculum. Schools are funded according to the extent to which Māori is the language of instruction ranging from level 4 (0–30%) to level 1 (81–100%), the higher the levels of immersion, attracting higher levels of funding. Most bilingual units and schools invariably deliver instruction in English and Māori simultaneously (i.e., both languages are used to varying degrees in tandem). Māori immersion education on the other hand has tended to deliver the school curriculum by starting instruction exclusively in Māori and then introducing English language instruction successively (i.e., later).

The intergenerational transmission of the Māori language and culture has been interrupted to the extent that most students in immersion in Māori education, their parents and their teachers are predominantly second language speakers of Māori. Earlier reports (Cummins, 2000) describe as the norm the exclusive use of the target language (Māori) and the absence of English language instruction from total immersion in Māori programmes at elementary school levels. This no longer is the case as most programmes now make provision for explicit instruction in the English language. They continue to grapple however with how English might be accommodated without detracting from the fact that the regeneration of the Māori language is the priority.

In her analysis of the effectiveness of a home-school intervention programme to 'transition' Māori medium students in years 6 to 8 into English, Berryman (2001), reported that participating students were mostly scoring at age appropriate levels and better on a measure of reading using normative data, in stark contrast to results for Māori students in English-only programmes. This is one of the earliest indications that existing Māori immersion configurations can lead to high levels of achievement in English language. Rau (2005a) also reported similar results for year 4–8 students receiving explicit instruction in English using English language measures in three other total immersion schools.

According to McCarty (2003), reversing the plight of the Hawaiian language represents perhaps the most dramatic example of language revitalisation within the American context. A renaissance movement in the 1960s gained further momentum in 1978 with the introduction of a new state constitution that mandated that Hawaiian language, culture and history be promoted (Warner, 2001 cited in McCarty, 2003). Previously, legislation banned the use of Hawaiian language as a medium of instruction and made it compulsory that government business be conducted in the English language.

Many parallels can be drawn between the Hawaiian and the Māori experience. Similarities in orthology, morphology, phonology and syntax have also meant that indigenous educators from Aotearoa/New Zealand (where the language is in a comparatively healthier state), have been able to assist with Hawaiian efforts at language rescue. Adaptations of educational initiatives developed in Aotearoa/New Zealand such as Kōhanga Reo (Preschool Māori language nests) have been successfully implemented in the Hawaiian context, hence for example the emergence of Punana Leo, the Hawaiian version of Kōhanga Reo.

#### WORK IN PROGRESS

Hawaiian and Navajo Indian experiences have reported better academic achievement in English for students in immersion programmes

than their respective indigenous cohorts learning in contexts where English language is used exclusively or predominantly as the medium of instruction. Despite such promising results, the vast majority of indigenous students continue to receive instruction in English language dominant programmes by design or choice or because limited access to such initiatives restricts schooling choices.

Under the Bush administration in the United States, federally mandated standardised testing in English has been introduced for all students from the fourth grade. While providing increased opportunities for academically based comparisons to be made using language (or languages) of instruction as the criterion, this recently introduced legislation is also having a devastating effect on indigenous language revitalisation efforts in educational settings. The ‘No Child Left Behind Act’ (Public Law 107–110, January 2002) designed to improve public education has placed the spotlight on accountability by requiring that all students annually meet set academic standards. The consequences of not meeting these standards impacts negatively on such things as funding to schools and grade promotion of students with teachers and administrators held directly responsible (Romero-Little, 2006). In particular, the renewed prominence given to English language proficiency leaves educators and parents alike questioning the viability and value of heritage language programmes. Such policies demand significant concessions to be made by heritage language initiatives and represent a reconstitution of assimilatory practices that have characterised the histories of indigenous minority peoples. For languages like Navajo, the situation is further complicated by the fact that in Arizona (as with some other states) the use of languages other than English in schools is prohibited. Up until now, Navajo language programmes have been exempt but recent changes mean that they are no longer protected by the 1990 and 1992 Native American Languages Acts and must therefore also comply with this English-only approach (Romero-Little, 2006). Such moves have been interpreted by educators involved in Navajo and Hawaiian indigenous language education as tacit language discrimination policies. Unfortunately, the effects of such policies are far reaching and are likely to persist even in the event that there is a future softening of these language policies or, alternatively, they are abandoned. There is a real danger that the demise of these indigenous languages will be accelerated and recovering from the impact will be even more difficult than it has been in the past.

While Māori medium programmes in Aotearoa/New Zealand are not (yet) subject to mandatory nationwide testing regimens, they are every bit as vulnerable to internal and external factors as their American counterparts. All schools funded by the government are required to conform to the National Curriculum Framework that “sets out national

directions for schooling and provides for consistency in classrooms” (Ministry of Education, 1993, p. 3). English medium education invariably provides the terms of reference which is why the current curriculum documents in Māori so closely parallel those developed in English. They have therefore been criticised by Māori medium educators because even though there is opportunity for the inclusion of indigenous knowledge, the majority of these documents default to and privilege knowledge valued by the majority language. Because pedagogical and assessment practices are expected to be aligned to curriculum requirements it means for Māori medium that western derived understandings infiltrate all aspects of school academic activity. As Te Aika (1997) warns, care must be taken when English language ideologies and practices are modified for other linguistic groups as these can undermine and transform those of the indigenous language and culture. There appears to be a genuine attempt to allow a more independent development for Māori medium with the review of the curriculum documents currently taking place. According to Carr et al. (2000), the development of a curriculum should ideally encompass the simultaneous development of an assessment programme which reflects and fulfills the intentions of the curriculum. Potentially then, the review may enable other Māori medium-specific responses to emerge.

There has been unprecedented development and growth in Māori medium education, in the last decade. Māori medium education is still considered a relatively new initiative. This has coincided with an increased nationwide emphasis on accountability leaving Māori medium educators ‘scrambling’ for instruments to provide information about student achievement. This has created forces that conspire against the imperative of Māori medium for self-determination and autonomy manifesting itself in ways that are less than satisfactory. For example, one of the early solutions for addressing a shortage of assessment procedures in Māori was to translate standardised tests originally designed for measuring the competencies of first language speakers of English. Often carried out by novice test developers (mainly teachers) unaware that psychometric properties do not readily transfer or translate from one language to another, these tests would quickly circulate other Māori medium classrooms in other schools where further changes would often be made seriously compromising the reliability and validity of the tests. Even test development under ‘laboratory type’ conditions has been controversial. For example, in its early days, the National Education Monitoring Project (NEMP) which cyclically samples student performance both English and Māori medium (total immersion) contexts, much energy and resource was expended in providing ‘close’ translations of English language tasks. Treatment, no matter how careful, cannot eliminate the inherent bias

that places at a disadvantage, those being tested using translated versions particularly when the test is presented in the test taker's second language. NEMP has also included tasks for learners in English medium that assess Māori language knowledge and more recently there has been significant movement toward the independent development of tasks in Māori.

Other responses to demands for student achievement information include reconstructions of existing English language tests which allow for more flexibilities and concessions than is possible with direct translations. Rau (2005b) reports the positive implications for Māori medium education of one such reconstruction, a procedure that is highly valued both nationally and internationally. This has generated robust literacy achievement data for students in Māori medium to boost the limited pool of information that currently exists. Rau (2005b) further states that when it can be demonstrated that minority students in an alternative learning environment are experiencing success using a yardstick that is understood and valued by the majority culture, confidence in the results is undoubtedly boosted. The simultaneous or delayed parallel development in English and Māori of new tests, are other alternatives that most typically characterise assessment development for Māori medium. With translations, reconstructions and parallel developments, scoring schedules that are the same for both the English and the Māori versions, create the potential for inappropriate comparisons between the performances of students across the different language contexts to be made. With all of these scenarios, English medium defines for Māori medium what competencies will be tested and how they will be measured. It also means that at best, only partial representations of indigenous language structural and content domains are possible.

The option most preferred by educators in Māori medium is the development of original (new) tests and assessment frameworks sensitive to issues of second language acquisition, commensurate with a Māori worldview and consistent with the broader issues of Māori language and cultural rescue. A few original literacy tests and literacy assessment frameworks have been commissioned by the Ministry of Education (for example see Rau, Whiu, Thomson, Glynn, and Milroy, 2001) but have not (yet) been promoted nationally by the Ministry. Other work is seminal at this stage.

At present, preference is given to instruments or approaches derived from or aligned with English language initiatives. This approach has high appeal particularly for government officials and parents seeking proof and reassurance that Māori medium programmes are providing adequately for student achievement. This is unfortunate because it places huge and somewhat unrealistic expectations upon this medium

to accomplish the very things that, to date, a much better resourced general stream education system has clearly failed to do for Māori students in their first language (English). The trend that Māori medium programmes replicate and mirror general stream approaches continues.

#### PROBLEMS AND DIFFICULTIES

Four to six years of consistent high quality instruction is advocated in the second language if students are to acquire the cognitive academic language proficiency necessary to reach grade-level norms and perform intellectually challenging tasks such as those required to engage in literacy activity (Thomas and Collier, 2002). This is probably a conservative guideline for minority languages given the challenges indigenous minority language programmes face. These include insufficient, interrupted funding, a lack of professionally produced resources, shortages in the supply of teachers proficient in the heritage language and well versed in theory and practice for second language learning contexts as well as diminished exposure to the language outside school settings. May, Hill and Tiakiwai (2003) for example recommend six to eight years for Māori medium programmes.

Assessment and testing have become high stakes activities for heritage language recovery programmes which operate in environments where a colonising agenda continues to be embedded in educational policy in the form of national curricula and national testing regimens. Baker and Prys Jones (1998) contend that where a minority language nationally and internationally has less status power and support, it is often imperative that heritage language programmes demonstrate achievement on a par or better than mainstream schools. Publicity regarding their success becomes extremely important especially in political climates where academic achievement in the majority language is thought to only be possible at the cost of learning in the minority language. When an education system favours evidence of achievement in the majority language over achievement in the minority language, striking a balance so that the expectations of all stakeholders are realised can be very difficult. When test items intended to measure competencies and knowledge valued by indigenous people in the indigenous language are packaged and quantified within non-indigenous majority definitions, control and power over those things remain situated with the majority. Assessment information considered essential by external agents is often less relevant to members of an indigenous language or competes with their attempts at linguistic and cultural recovery.

Instruments and procedures developed in the indigenous language must meet the criteria of governmental agencies if they are to be accepted and promoted nationally. High demand by a relatively small

market does not make the commercial production of minority language tests and other types of assessments a viable proposition. All of these factors tend to lower the perceived quality of assessments in the indigenous minority language.

Assessment instruments developed in such circumstances tend to be less focused on the integration and interaction of cognitive development and language proficiency because with first language learners, these elements are assumed. This leaves indigenous educators having to rigorously defend and argue for tests assessments that measure oral language proficiency.

Schools expect assessment and accountability to be constant and persistent themes. An overemphasis on assessment for accountability at the system level however means that energies are concentrated on providing assurance about the quality of education and less resource is available to support the development of assessment for classroom and school purposes. Educators in heritage language programmes are trying to fill the void for assessment that meets all of these demands.

#### FUTURE DIRECTIONS

In this age of globalisation, there is reduced tolerance for linguistic and cultural diversity. Indigenous peoples continue to negotiate and fight for access to their own linguistic and cultural capital within environments where it is often accredited little educational value. Heritage language programmes are vulnerable to changes in political climate and their very survival depends upon continued efforts to resist or navigate around direct and indirect threats that conspire against them.

The pursuit of autonomy continues to be thwarted because indigenous minorities do not control the framework for education at the system level. Seeking ways to influence and convince those in power of the educational legitimacy of heritage programmes as well strategically placing indigenous people in positions of influence needs to continue as a strategy.

The private sponsorship of heritage language programmes or programmes located in communities that supplement those provided by schools might allow for a more independent development and more readily achieve indigenous aspirations. Unfortunately, the level of funding required is often beyond what most indigenous communities can source.

Continuing the interaction and collaboration between indigenous groups (and others) means that the cross-fertilisation of ideas and responses to the challenges of reviving languages at risk, provides a rich source of mutual support and direction for ongoing and future development.

Heritage language programmes represent sites of struggle. Indigenous people often look to the past for encouragement and inspiration. The following Māori proverbial saying (*whakatauki*) is a reminder that seemingly insurmountable challenges can be overcome.

*Iti Rearea*

*Teitei kahikatea,*

*Ka taea*

Small though the bellbird might be, its determination and resilience enables it to scale the heights of the tall kahikatea tree.

## UTILIZING ACCOMMODATIONS IN ASSESSMENT

### INTRODUCTION

An equitable assessment and accountability system requires that all students be included in large-scale national and local assessments. However, there is a substantial performance gap between those for whom the assessment language is a second language and those students who are native speakers of the assessment language, particularly on academic subjects that are high in language demand (Abedi, 2006a). The literature suggests that this performance gap is explained by many different factors including parent education level and support, SES, the challenge of second language acquisition (Hakuta, Butler, and Witt, 2000; Moore and Redd, 2002) and a host of inequitable schooling conditions (Gándara, Rumberger, Maxwell-Jolly, and Callahan, 2003). Yet, it is also often the case that the measurement tools are ill-equipped to assess the skills and abilities of second language learners. To offset these challenges, nonnative speakers of the assessment language are provided with “*test accommodations*.”

Test accommodations refer to changes in the test process, in the test itself, or in the test response format. The goal of accommodations is to provide a fair opportunity for nonnative speakers of the assessment language and students with disabilities to demonstrate what they know and can do, to level the playing field, so to speak, without giving them an advantage over students who do not receive the accommodation.

The issues concerning accommodations are important in all countries where there are students who do not have high proficiency in the language of instruction and assessment in schools; usually these are immigrants and indigenous groups. Since the USA has conducted more research on accommodations than many other countries, in this chapter we present an overview of major research findings that are reported in the American research journals for English language learners.

### EARLY DEVELOPMENTS

Historically, the concept of *accommodations* was first introduced in the field of special education. Many students with disabilities need specific forms of assistance in the classroom setting to deal with their disabilities, i.e., to level the playing field. For example, deaf and hard

of hearing students need hearing aids to offset the effect of their inability to hear at the same level as regular students. Similarly, blind or visually impaired students need to use the brail version of a test to be able to read the test items. These accommodations are used to increase equity in the classroom as well as during assessment conditions. The concept of accommodations was then extended to English language learners (ELL). Unfortunately, however, not only the concept but the actual accommodation strategies that were created and used for students with disabilities were used for ELL students, many of which may not be relevant for these students.

By definition, accommodations are used for students with disabilities (SD) to assist them with their disabilities. For ELL and nonnative speakers of the assessment language the goal of accommodations is to help with second language needs. Another goal is to reduce the performance gap between SD/ELL and non-SD/non-ELL students, without jeopardizing the validity of assessments. In the USA, there are many forms of accommodations which are used for both ELL students and students with disabilities in different states (Abedi, Kim-Boscardin, and Larson, 2000; Rivera, Stansfield, Scialdone, and Sharkey, 2000; Thurlow and Bolt, 2001). Yet, as will be shown below, there is little evidence to support the effectiveness and validity of assessments using these accommodations.

There are many policy-related issues concerning accommodations that need to be carefully reviewed. For example, one must examine the validity of criteria used for decisions on the provision of accommodations and the appropriateness of the type of accommodations used for particular groups of students. Different criteria are used for the selection of accommodations and the lack of a national or local master plan for accommodations creates controversies over the use of accommodations.

Most accommodations that are currently offered to ELL students and to a lesser extent to SDs, have a limited empirical research base and states in the USA often use a 'common sense' approach in choosing accommodations. With regard to the validity of accommodations, research results are available only for a few forms of accommodations, while the validity for others has yet to be examined. For some accommodations there may not be enough research to judge the effectiveness and validity of the accommodations for a particular group of students.

#### MAJOR CONTRIBUTIONS

As noted above, the main focus of this chapter is on accommodations for ELL students in the USA. However, a short discussion on accommodations for students with disabilities is included as well, due to some

historical connections between the accommodation policies and practices for these two subgroups of students. In fact, some accommodations that are currently used for ELL students were initially proposed and used for students with disabilities (see, for example, Rivera, Stansfield, Scialdone, and Sharkey, 2000).

Review of literature on accommodations suggests that: (1) existing research on some forms of accommodations is not conclusive, and (2) for many forms of accommodations used by different states there is very limited empirical data to support their validity. It should be noted that the term ‘validity of accommodations’ is used here within the general framework of assessment; therefore, validity of accommodations refers to the ‘validity of accommodated assessments.’ In other words, an accommodation strategy may not be valid or invalid unless it is considered within the assessment framework. In presenting the research summary it will be shown that: (1) some accommodations that are used for ELL students are designed for students with disabilities and are not relevant to ELL students, and (2) in some cases, findings from different studies about accommodations are not consistent. Below is a list along with a summary of research for some commonly used accommodations.

*Braille* is used for students with blindness or significant visual impairments. Braille versions of a test may be more difficult for some items than other items such as items with diagrams and/or special symbols (Bennett, Rock, and Kaplan, 1987; Bennett, Rock, and Novatkoski, 1989; Coleman, 1990). This is clearly an accommodation for SD (blind) students only.

*Computerized Assessment* is used for students with physical impairments that have difficulty in responding to items in a paper-and-pencil format. Some studies suggest that this accommodation increases the performance of students (Russell, 1999; Russell and Haney, 1997; Russell and Plati, 2001). Other studies have not found computerized assessments to be effective (MacArthur and Graham, 1987), or not as effective as traditional assessments (Hollenbeck, Tindal, Stieber, and Harniss, 1999; Varnhagan and Gerber, 1984; Watkins and Kush, 1988). In a study with grade 4 and 8 students in mathematics, Abedi, Courtney, and Leon (see, Abedi, Hofstetter and Lord, 2004) found that computerized assessments can be highly effective in making tests more accessible to ELL students. The study did not find any validity issues with the computerized assessment suggesting that the computerized assessment was not different than the traditional assessment for non-ELL students.

*Dictate Response to a Scribe* (someone writes down what a student dictates with an assistive communication device). This accommodation has been shown to have an impact on the performance of students with learning disabilities (Fuchs, et al., 2000; MacArthur and Graham, 1987). Tippetts and Michaels (1997) found this accommodation, in

combination with other accommodations, such as read aloud and extended time, helps students with disabilities. However, there are concerns over the validity of this accommodation. Koretz (1997) found this accommodation helped students with learning disabilities; however, Thurlow and Bolt (2001) recommended that if students are unable to handwrite but can efficiently use a computer, the use of a computer should be considered.

*Extended Time.* This is one of the most commonly used accommodations. Under this accommodation, students receive extra time (usually 50% more time) to respond to the test items. It is used for both English language learners and students with different types of disabilities. Thurlow, House, Boys, Scott, and Ysseldyke (2000) suggested that disagreement between states may be a concern regarding the validity of extended time accommodation. Chiu and Pearson (1999) found extended time to be an effective accommodation for students with disabilities, particularly for learning disabilities. Some studies found extended time to help students with disabilities in Mathematics (Chiu and Pearson, 1999; Gallina, 1989). However, other studies did not show an effect of extended time on students with disabilities (Fuchs, et al., 2000; Marquart, 2000; Munger and Loyd, 1991). Studies on the effect of extended time in language arts did not find this accommodation to be effective (Fuchs, et al., 2000; Munger and Loyd, 1991). Some research studies showed that extended time affects the performance of both SD and non-SD students, and therefore makes the validity of this accommodation suspect. For ELL students, research on extended time has produced mixed results. Abedi, Hofstetter, and Lord (2004) found no effect of extended time for ELL students. On the other hand, Hafner (2000) found extended time to be an effective accommodation for ELL students.

It must be noted at this point that many school districts in the USA allow unlimited time in taking both Title I and Title III (Rivera and Collum, 2006) assessments under the No Child Left Behind (NCLB, 2001) accountability requirements. That is, the state tests are often considered as *power* tests and not as *speed* tests. Therefore, extended time is not viewed as an accommodation and consequently there is no concern over the validity of assessments using extended time since everyone receives extra time in testing.

*Interpreter for Instructions.* In this accommodation an interpreter translates test instructions in sign language. This accommodation is recommended for students with hearing impairments. Adaptations in the directions may help deaf children score the same as other students (Sullivan, 1982).

*Large Print* is used for students with visual impairments. Research has indicated that this accommodation has helped reduce the performance gap between students with visual impairments and students without

disabilities (see, for example, Bennett, Rock, and Jirele, 1987). The results of a study by Bennett, Rock, and Kaplan (1987) revealed that using this accommodation for visually impaired students does not affect the construct under measurement. Other studies suggest that extra time may be needed with this accommodation (Wright and Wendler, 1994). Large print has also been used for students with learning disabilities. Several studies have shown no impact of this accommodation for students with learning disabilities. One study, however, showed that large print helps students with learning disabilities (Perez, 1980). This accommodation has also been used for ELL students (Rivera, 2003; Sireci, Li, and Scarpati, 2003) although it is not clear how relevant this accommodation is to ELL students.

*Mark Answer in Test Booklet* in which students write their answers directly on the test booklet rather than on an answer sheet. This accommodation can be used for students who have a mobility coordination problem. Some studies on the effectiveness of this accommodation did not find significant difference between those students tested under this accommodation and those using separate answer sheets (Rogers, 1983; Tindal, et al., 1998). However, other studies found lower performance for students using this accommodation (Mick, 1989). In fact, many school districts in the USA have used this accommodation for ELL students (Rivera, 2003), yet there is no evidence on the relevance or effectiveness of this accommodation for ELL students.

*Read Aloud Test Items* is used by students with learning disabilities and students with physical or visual impairments. While some studies found this accommodation to be valid in mathematics assessments (Tindal, et al., 1998), others have concerns over the use of this accommodation on reading and listening comprehension tests (see, for example, Burns, 1998; Phillips, 1994) since this accommodation may impact the validity of assessment by altering the construct (see also, Bielinski, et al., 2001; Meloy, Deville, and Frisbie, 2000). Read aloud as an accommodation has also been used for ELL students in the USA (Rivera, 2003), again, without any indication of the relevance or effectiveness of this accommodation for this group of students.

*Read or Simplify Test Directions* is appropriate for students with reading/learning disabilities. A study by Elliot, Kratochwill, and McKeivitt (2001) suggested that this accommodation affects performance of both students with disabilities and students without disabilities. There are therefore concerns over the validity of this accommodation especially since it has also been used frequently for ELL students; the use of this accommodation is of particular concern in reading assessment.

*Test Breaks* where students receive multiple breaks during the testing session can help students with different forms of disabilities. A study by DiCerbo, Stanley, Roberts, and Blanchard (2001) found

that students tested under the *multiple-breaks* administrations obtained significantly higher scores than those tested under standard testing conditions with no additional breaks. The study also showed that middle and low-ability readers benefited more from this accommodation than high-ability readers. However, another study (Walz, Albus, Thompson, and Thurlow, 2000) found that students with disabilities did not benefit from a multiple-breaks test administration while students without disabilities did. These results show quite the opposite of what is expected of valid accommodations. Sometimes *test breaks* as a form of accommodation has been recommended for ELL students (Rivera, 2003) as it may help some ELL students but may not be relevant for other ELLs since it does not address their English language needs.

*Providing an English Dictionary* and extra time (Abedi, Hofstetter, and Lord, 2004; Hafner, 2000; Thurlow, 2001) may affect performance of all students (see also, Maihoff, 2002; Thurlow and Liu, 2001). This suggests that the results of accommodated and nonaccommodated assessment may not be aggregated.

*Translation of Assessment Tools into Students' Native Language* may not produce desirable results and may even provide invalid assessment results if the language of instruction and assessment is not aligned (Abedi, Hofstetter, and Lord, 2004.)

As noted earlier, in spite of the concerns expressed by researchers over the validity, effectiveness, and feasibility of some forms of accommodations, these accommodations are used frequently by states and districts across the USA. That is, decisions on the type of accommodations for English language learners and students with disabilities do not seem to have been influenced much by the research findings.

*Accommodation Issues for English Language Learners:* Accommodations are meant to 'level the playing field' for ELL students by accommodating their potential language limitations in an assessment. Unfortunately, there are major equity issues with many of the accommodations used for ELL students. The practice of using accommodations for ELL students that are initially developed for students with disabilities (Rivera, Stansfield, Scialdone, and Sharkey, 2000) is extremely problematic as some accommodations that are used for students with disabilities are not relevant for ELL students. For example, using large print may be an effective accommodation for some students with visual impairments while ELL students need specific accommodations to address their linguistic needs. As discussed above, there are major issues concerning accommodations for both ELLs and students with disabilities. While these issues deserve equal attention for both SD and ELL students, the focus in the next section will be on accommodation issues for ELL students.

## WORK IN PROGRESS

As the number and percentage of English language learners increase in the USA, assessment equity and validity are becoming priorities for educational policymakers. Between 1990 and 1997, the number of US residents born outside the country increased by 30%, from 19.8 million to 25.8 million (Hakuta and Beatty, 2000). According to the National Clearinghouse for English Language Acquisition, over 4.5 million Limited English Proficient (LEP) students were enrolled in US public schools in 2000–2001, representing nearly 10% of the nation's total public school enrollment for prekindergarten through Grade 12 (Kindler, 2002).

To reduce the impact of language factors on the assessment outcome of ELL students, assessment in students' native language has been proposed as an accommodation. While this seems to be an attractive idea and many districts and states in the USA use this approach, research results do not support its fairness (Abedi, Hofstetter, and Lord, 2004). One major issue here is the possibility of lack of alignment between the language of instruction and language of assessment. If the language of assessment is not the same as the language of instruction, then the assessment outcome may be even less valid, again raising fairness as a serious issue. For example, when a native Spanish speaker learns content-area terminology in English, but is tested in Spanish, the outcome of the assessment may not be valid due to the student's lack of content terminology knowledge in Spanish. A student may be a fluent speaker of a language but not necessarily proficient in the academic language of his or her native language.

Some educational researchers and policy makers suggest that rather than testing students in their native languages (L1), they should be assessed by providing them with language accommodations such as a customized dictionary or a linguistically modified version of the test to help them with their English language needs. This seems to be a reasonable approach if the focus is on learning English as quickly as possible. However, others argue that students' knowledge of their first language could benefit their academic progress and testing them in English may not properly utilize their knowledge of L1.

## PROBLEMS AND DIFFICULTIES

The purpose of testing accommodations is to assist students with certain limitations that they might have and provide them with a fair assessment. It is therefore important to examine the appropriateness, effectiveness, validity, and feasibility of accommodations for the targeted student populations.

*Appropriateness.* How appropriate are accommodations that are provided for ELL students? Since the common characteristic that distinguishes ELL from non-ELL students is their possible limitation in English proficiency, it is reasonable to expect that accommodations that help ELL students with their language barriers would be the most relevant. However, in many places, the current practice of accommodations for ELL students is to simply use accommodations that are easily available or those that decision makers find relevant. These accommodations may not always be appropriate for these students. For example, Rivera (2003) presented a list of 73 accommodations that are used nationwide for ELL students. Our analyses of these accommodations (Abedi, 2006b) revealed that of these 73 accommodations, only 11 (15%) of them were highly relevant for ELL students in providing assistance with students' language needs. The list included accommodations such as:

- Subtests flexibly scheduled
- Tests administered at a time of day most beneficial to test-taker
- Tests administered in small groups
- Tests administered in a familiar room
- Colored stickers or highlighters for visual cues provided
- Copying assistance provided between drafts
- Test-taker types or uses a machine to respond (e.g., typewriter/word processor/computer)
- Test-taker indicates answers by pointing or other method
- Test-taker verifies understanding of directions

Since none of these accommodations address ELL students' language needs, they may not be adequate or appropriate for these students.

The National Assessment of Educational Progress (NAEP) also uses some accommodations that, at face value, are not very relevant to ELL students' language needs. For example, among the accommodations NAEP used for ELL students in the 1998 civics assessment were large print, extended time, reading questions aloud, small group testing, one-on-one testing, and scribe or computer testing (see Abedi and Hejri, 2004). While some of these accommodations may be helpful for students with disabilities, they may not be effective for ELL students.

Studies have found that the provision of accommodations in NAEP increased the *inclusion* rate of these students (Mazzeo, Carlsom, Voelkl, and Lutkus, 2000). However, research has shown that accommodations did *not* increase ELL student scores on the NAEP; that is, providing accommodations did not reduce the performance gap between ELL and non-ELL students. For example, no statistically significant differences were found between the performance of accommodated and nonaccommodated ELL students in the 1998 NAEP main assessments in reading, writing, and civics for students in fourth and eighth grades (Abedi and Hejri, 2004). Among the most likely

explanations for this is the lack of *relevant* accommodations. As indicated earlier, if the accommodations provided to ELL students have no relevance to their needs (mainly English language proficiency), then one would not expect any positive impact of accommodations on the outcome of assessments. Examples of relevant accommodations for ELLs and nonnative speakers of the assessment language include providing a glossary of noncontent terminology or modifying complex linguistic features as these accommodations directly address ELL students' language needs.

Another major issue in the provision of accommodations in NAEP was the very small number of ELL students who were accommodated. In the main NAEP assessments, the number of ELL students who were included in the study comprised between 7 and 8% of the sampled students, but only a fraction of these students, who had been accommodated by their schools in earlier assessments, received NAEP accommodations. For example, in the main assessment of the 1998 Grade 4 reading test, 934 ELL students were included, but only 41 (4%) of the included ELL students were provided with accommodations. In the Grade 8 sample, 896 ELL students were included, but only 31 (3.5%) were accommodated. Similarly, in the 1998 main assessment in civics, 332 ELL students in Grade 4 were included and only 24 (7%) were accommodated. In the same assessment, 493 ELL students were included in Grade 8 but only 31 (6%) were accommodated (Abedi and Hejri, 2004).

*Validity.* Invalid accommodations affect the outcome of assessments for individual students as well as for the group in which students belong. If accommodations affect the construct, then the accommodated and nonaccommodated assessments cannot be aggregated. Studies have found that some forms of accommodations may alter the construct being measured (see, for example, Abedi, Hofstetter, and Lord, 2004). For example, providing a published dictionary may affect the measurement of the construct, since it may provide content-related information which students can use to answer the questions. Abedi, Hofstetter, and Lord (2004) found that providing a glossary plus extra time increased performance of non-ELL students for whom the accommodation was not intended, thereby increasing the performance gap between ELL and non-ELL students. Thus, the validity of many commonly used accommodations is questionable. Unfortunately, research on the validity of accommodations is very limited and the validity of only a handful of accommodation strategies used for ELL students have been experimentally examined (Abedi, Hofstetter, and Lord, 2004; Francis, Lesaux, Kieffer, and Rivera, 2006; Sireci, Li, and Scarpati, 2003).

*Feasibility.* Feasibility of implementation is another issue with accommodation strategies. Accommodation strategies should not be a

logistical or financial burden to implement. For example, computer testing could be a burden if a school lacks funding for adequate computer resources. One-on-one testing may also be logistically challenging in large-scale assessments. Providing a dictionary as a form of accommodation is another example of a feasibility concern. To control for extraneous factors (e.g., differences in the type of dictionary and experience working with the dictionary), it is important that the same dictionary be provided to every student, which obviously creates major logistical issues.

### FUTURE DIRECTIONS

*Research-supported accommodations.* The main goal of an accommodation is to make assessments more accessible across subgroups of students who otherwise could be affected unfairly by many nuisance variables that would make the assessment unfair and invalid. The discussion above casts doubt over the ability of many of the current accommodation practices to reach this important goal. There is no firm evidence to suggest that the accommodations used widely by school districts are effective, feasible, and valid. However, results of recent studies introduce some accommodation strategies for ELL students that, in addition to being valid, are also effective in reducing the performance gap between ELL and non-ELL students in content area assessments.

One major assessment issue is that a student's level of proficiency in the language of assessment may severely impact the validity of the assessment results. Students may have the content knowledge (e.g., in math and science) in their native language but may not be fluent enough in the language of assessment to express their knowledge on a test. To reduce the impact of language factors on the assessment outcomes of students, the linguistic modification of test items has been proposed in the literature (see, for example, Abedi, Lord, and Plummer, 1997). A linguistic-modification approach helps test developers reduce the level of unnecessary linguistic complexity in test items by controlling for sources of linguistic complexity (for a detailed description of linguistic modification approach, see Abedi, 2006a).

Earlier in this chapter research-based evidence about accommodations was presented. This evidence raises concerns about the validity of the accommodations used in schools for ELL students. The main question for the future is whether there are accommodations that would be beneficial to ELL students but do not affect the construct under measurement. Below is a short survey of accommodations that studies have shown to be effective and valid.

Recent studies at the National Center for Research on Evaluation, Standards, and Student Testing (CRESST) have examined several

different forms of accommodation. Abedi, Hofstetter, and Lord (2004) and Maihoff (2002) examined the linguistic modification approach and found it to be an effective and valid accommodation in the assessment of ELL students. Rivera and Stansfield (2001) found this accommodation to have no impact on the non-ELL student group suggesting that the accommodation is valid for ELL students. With this approach, simpler versions of items with language that might be difficult for students were drafted; the task remained the same but noncontent vocabulary and unnecessary linguistic complexity were modified (see Abedi, 2006a, for further discussion of the nature of and rationale for the linguistic modifications). These studies compared student scores on NAEP test items with comparable modified items in which the mathematics tasks and mathematics terminology were retained but the language and/or linguistic structures were modified.

Following are a few examples of studies on the effectiveness and validity of the linguistic modification approach as a form of accommodation for ELL students. Abedi and Lord (2001) examined the effects of this accommodation with 1,031 eighth grade students in southern California. Test booklets with either original English versions or modified English versions of the items were randomly assigned to the students. The results showed significant improvements in the scores of students in low- and average-level mathematics classes who received the booklets with linguistic modifications. Among the linguistic features that appeared to contribute to the differences were low-frequency vocabulary and passive voice verb constructions. English language learners and low-performing students benefited the most from the linguistic modification of test items.

In another study, Abedi, Hofstetter, and Lord (2004) examined the impact of linguistic modification on the mathematics performance of English learners and non-English learners. Using items from the 1996 NAEP Grade 8 Bilingual Mathematics booklet, three different test booklets (Original English, Modified English, and Original Spanish) were randomly distributed to a sample of 1,394 eighth grade students in schools with high enrollments of Spanish speakers. Results showed that language modification of items contributed to improved performance on 49% of the items. The students generally scored higher on shorter problem statements.

A third study (Abedi, Hofstetter, and Lord, 2004) examined the impact of four different forms of accommodation on a sample of 946 eighth grade students tested in math. The accommodations were (1) Modified English, (2) Extra Time only, (3) Glossary only, and (4) Extra Time plus Glossary. These four accommodation types, along with a standard test condition, were randomly assigned to the sampled students. Findings suggested that some accommodations increased

performance of both English learners and non-English learners, compromising the validity of the assessment. Among the different options, only the Modified English accommodation narrowed the score gap between English language learners and other students.

Other studies have also employed the language modification approach. Kiplinger, Haug, and Abedi (2000) found linguistic modification of math items helpful in improving the math performance of ELL students. Maihoff (2002) found linguistic modification of content-based test items to be a valid and effective accommodation for ELL students in math. Rivera and Stansfield (2001) compared English language learner performance on regular and modified fourth and sixth grade science items. Although the small sample size did not show significant differences in scores, the study demonstrated that linguistic modification did not affect the scores of English-proficient students, indicating that linguistic modification is not a threat to score comparability.

While the current prevalent trends in accommodation practices are not supported by research (Solano-Flores and Trumbull, 2003), there is growing evidence that states are paying more attention to research findings on the effectiveness and validity of accommodations. The increasing use of research-supported accommodations for ELL students (such as linguistic modification of items) is encouraging. This trend may result in fairer assessments for ELL students.

English language learners and students with disabilities are faced with many challenges in their academic career and need special attention. For ELL students, the challenge of learning English and at the same time competing with their native English speaking peers in learning academic concepts in English is enormous. Similarly, for students with disabilities, it is quite challenging to learn at the same rate as their nondisabled peers given their disabilities. Even more serious is the case of ELL students with disabilities. These students are faced with dual challenges—learning a new language and dealing with their disabilities. Such inequity in educational opportunity creates a substantial performance gap between these students and their peers. While accommodations are provided to offset these challenges it has been shown that these accommodations are often not relevant or helpful and have limited supported research. It is especially important that accommodations for ELL students must be language-related in order to be effective in making assessments more accessible for these students.

One of the major issues for the future is the need to expand the research in the area of accommodations as there is not enough research to judge the effectiveness and validity of many of the existing accommodations for both SD and ELL students. For example, score comparability is highly related to the outcome of accommodated assessment. If provision of accommodation alters the construct being measured,

then accommodated assessment outcomes may not be valid and as a result the accommodated and nonaccommodated assessment outcomes cannot be aggregated. Additional research is needed to help schools choose the best accommodations and to ensure that the outcome of accommodated and nonaccommodated assessments can be aggregated. Recent publications reporting results of research on accommodations for ELL and SD students, including the taxonomy of accommodations provided in Rivera and Collum (2006), could help schools make better choices in selecting existing accommodations rather than using a common sense approach in their decisions.

It must be noted at this point, however that some accommodations may have a limited impact on assessment outcomes and may only be considered a quick fix because they may not be able to systematically address the underlying issue of equitably assessing immigrants and ELL students in providing an assessment in the appropriate language. Other accommodations, however, may help make assessments more accessible—and consequently more valid and fair—for immigrants and ELL students. For example, Levin, Shohamy, and Spolsky (2003) found that if bilingual students are able to take a test in both of their languages, their performance improves because they construct meaning in two languages rather than one. Findings of a study by Levin and Shohamy (2006) indicated that “immigrants, rather than being deficient [in terms of their language resources] have a clear advantage that should be included in an expanded view of the construct of academic language” (p. 19). Obviously, the native language assessment is effective under the condition that the language of instruction and the language of assessment are aligned.

It is also important to understand how instruction and assessment interact. Students can benefit more when accommodations are provided under both assessment and instruction conditions. This combination provides an opportunity for bilingual and ELL students to become familiar with the accommodations that are used in their assessments.

The concept of academic language is an extremely important consideration when dealing with the assessment of immigrants and English language learners in content-based areas such as math and science. While everyone, particularly immigrants and ELL students, can greatly benefit from assessments with clear language, these students must also be familiar with the language that facilitates content learning, i.e., academic language. As Levin and Shohamy (2007) pointed out, content literacy rather than language per se greatly impact students’ performance in content-based areas. For example, Levin and Shohamy indicated that, “. . . not only the vocabulary and symbols but also the norms, values, and conventions that are characteristics of the discipline” (p. 18).

Finally, the differential item functioning (DIF) approach may help identify specific items that discriminate against students who are not proficient in the language of assessment. The effectiveness of accommodations can then be examined on test items that exhibited a high level of DIF (C-DIF) (see, for example, Uiterwijk and Vallen, 2003).

## WASHBACK, IMPACT AND CONSEQUENCES

## INTRODUCTION

Testing, large-scale high-stakes testing in particular, tends to induce consequences for its stakeholders. It is clear that “testing is never a neutral process and always has consequences” (Stobart, 2003, p. 140). Testing is a differentiating ritual for students: “for every one who advances there will be some who stay behind” (Wall, 2000, p. 500). It is well known in the field of education that there is a set of relationships, intended and unintended, positive and negative, between testing, teaching and learning. The earliest literature can possibly be traced back to Latham (1877) when he referred to an examination system as an “encroaching power,” and

How it influences the prevalent view of life and work among young men, and how it affects parents, teachers, the writers of educational books, and the notion of the public about education (p. 2).

Washback and impact of language testing is, however, a relatively new concept. Comparatively, there is a longer and more substantial amount of research conducted in general education where researchers refer to the phenomenon as *measurement-driven instruction* (e.g., Popham, 1987), *test-curriculum alignment* (Shepard, 1990), and *consequences* (Cizek, 2001) (see Cheng and Curtis, 2004 for a detailed review). The concept of *measurement-driven instruction* stipulates that testing should drive instruction. *Test-curriculum alignment* focuses on the relationship between test content and curriculum, which can result in narrowing of the curriculum by teaching the test. Consequences of high-stakes testing refer to both intended or unintended and positive or negative aspects of instruction, students, teachers, and the school.

Only since the late 1980s, there has been a rapid increasing number of studies conducted in language testing (see Alderson and Wall, 1993; Bailey, 1996; Wall, 1997 for a review of earlier washback studies). Wall (1997) defines *impact* as “any of the effects that a test may have on individuals, policies or practices, within the classroom, the school, the educational system or society as a whole.” She also points out that “*washback* (also known as *backwash*) is sometimes used as a synonym of impact, but it is more frequently used to refer to the effects of tests on teaching and learning” (p. 291). Some language testers consider

*washback* as one dimension of *impact* (Bachman and Palmer, 1996; Hamp-Lyons, 1997). Hamp-Lyons (1997) suggested a view of test influence that would fall between the narrow one of *washback* and the all-encompassing one of *impact*.

Primarily, the effects of testing on teaching and learning have been associated with test validity (*consequential validity*) where Messick refers to washback as “only one form of testing consequences that need to be weighted in evaluating validity” (Messick, 1996, p. 243). He promotes the examination of the two threats to test validity, *construct under-representation* and *construct-irrelevant variance*, to decide the possible consequences that a test can have on teaching and learning. Bachman (2005) proposes a framework with a set of principles and procedures for linking test scores and score-based inferences to test use and the consequences of test use. In addition, the effects of testing on teaching and learning are increasingly discussed from the point of view of critical language testing (Shohamy, 2001) including ethics and fairness in language testing (Elder, 1997; Hamp-Lyons, 1997; Kunnan, 2000; Davies, Ethics, Professionalism, Rights and Codes, Volume 7), all of which are expressions of social concern. Shohamy (2001) pointed out the political uses and abuses of language tests and called for examining the hidden agendas of the testing industry and of high-stakes tests. Kunnan (2000) discussed the role of tests as instruments of social policy and control. He also drew on research in ethics to link validity and consequences and created a test fairness framework (Kunnan, 2004). Hamp-Lyons (1997) argued for an encompassing ethics framework to examine the consequences of testing on language learning at the classroom as well as the educational, social, and political levels. All of the above has led to the creation of a Code of Ethics for the International Language Testing Association (see Davies, 2003).

#### EARLY DEVELOPMENTS

The work of Alderson and Wall (1993) and Wall and Alderson (1993) marked a significant development in shaping the constructs of washback studies for the field of language testing. Alderson and Wall (1993) explored the potential positive and negative relationship between testing, teaching and learning, and questioned whether washback could be a property of test validity. They consequently proposed 15 hypotheses regarding the potential influence of language testing on various aspects of language teaching and learning, which thus directed washback studies for years to come. The study of Wall and Alderson (1993) was the first empirical research published in the field of language testing, investigating the nature of washback of a new national English

examination in Sri Lanka by observing what was happening inside the classroom.

A review of the early literature indicates there seems to be at least two major types of washback studies: those relating to traditional, multiple-choice, large-scale standardized tests, which are perceived to have had mainly negative influences on the quality of teaching and learning (Shepard, 1990) and those studies where a specific test or examination has been modified and improved upon (e.g., assessment with more communicative tasks in Wall and Alderson, 1993) in order to exert a positive influence on teaching and learning (see also Cheng, 2005). In fact, many studies in language testing have focused on this aspect of the washback mechanism, that is, changing teaching and learning using the influence of language testing although these studies have shown positive, negative and/or no influence on teaching and learning.

In 1996, a special issue in *Language Testing* published a series of articles which further explored the nature of washback and empirically investigated the relationship between testing, teaching and learning. In this volume, Messick (1996) suggested building in validity considerations through test design in order to promote positive washback and to avoid construct under-representation and construct-irrelevant variance. Although Messick did not specify how researchers could go about studying washback through test design validation, he pointed out that test washback could be associated with test property—the potential relationship between test design and its consequences on teaching and learning. In this way, he brought us a coherent argument to investigate the factors in testing in relation to the factors in teaching and learning. Bailey (1996, p. 268), however, argued that any test, whether good or bad in terms of validity, can have either negative or positive washback “to the extent that it promotes or impedes the accomplishment of educational goals held by learners and/or program personnel.” Her argument indicated that washback effects (positive or negative) might differ for different groups of stakeholders. Wall (1996) stressed the difficulties in finding explanations of how tests exert influence on teaching and turned to innovation theory to offer “insights into why attempts to introduce change in the classroom are often not as effective as their designers hoped they would be” (p. 334).

The three empirical research studies reported in the same special issue further demonstrated that washback effects occur to a different extent in relation to different individuals and different aspects of teaching and learning within a specific educational context. In particular, language tests are seen to have a more direct washback effect on teaching content rather than teaching methodology. In their study of washback on Test of English as a Foreign Language (TOEFL) preparation

courses, Alderson and Hamp-Lyons (1996) found that the TOEFL test affects both what and how teachers teach, but the effect is not the same in degree or kind from teacher to teacher, and the simple difference of TOEFL versus non-TOEFL teaching did not explain why the teacher taught the way they did. Watanabe (1996) investigated the effect of the university entrance examination on the prevalent use of the grammar-translation method in Japan. His analyses of the past English examinations, classroom observations and interviews with teachers showed very little relationship between the test content and the use of this particular teaching methodology. Rather, teacher factors, including personal beliefs, past education, and academic background, seemed to be more important in determining the teaching methodology a teacher employs. Shohamy, Donitsa-Schmidt, and Ferman (1996) pointed out that the degree of impact of a test is often influenced by several other factors: the status of the subject matter tested, the nature of the test (low or high stakes), and the uses to which the test scores are put. Furthermore, the washback effect may change over time and may not last indefinitely within the system. In summary, testing may be only one of those factors that “affect how innovations [through testing] succeed or fail and that influence teacher (and pupil) behaviors” (Wall and Alderson, 1993, p. 68).

#### MAJOR CONTRIBUTIONS

The 10 years since the 1996 special issue in *Language Testing* have seen a flurry of empirical studies investigating different tests within different teaching and learning contexts. These studies have investigated the influence of testing on teachers (including teaching assistants) and teaching (Borrows, 2004; Cheng, 2005; Ferman, 2004; Hayes and Read, 2004; Nazari, 2005; Scaramucci, 2002; Saif, 2006; Wall, 2006), textbooks (Read and Hayes, 2003; Saville and Hawkey, 2004; Yu and Tung, 2005), learners and learning (Andrews, Fullilove, and Wong, 2002; Chen and He, 2003; Robb and Ercanbrack, 1999; Watanabe, 2001), attitudes toward testing (Cheng, 2005; Jin, 2000; Read and Hayes, 2003), and test preparation behaviors (Stoneman, 2005). Some of these studies investigated the influence of a national English examination on the local English language teaching and learning due to its high-stakes nature in a particular country such as Brazil (Scaramucci, 2002), China (Jin, 2000; Qi, 2004, 2005; Zhao, 2003), Hong Kong (Andrews, 1995; Andrews, Fullilove, and Wong, 2002; Cheng, 2005), Iran (Nazari, 2005; Nemati, 2003), Israel (Ferman, 2004; Shohamy, Donitsa-Schmidt, and Ferman, 1996), Japan (Watanabe, 1996), Romania (Gosa, 2004), Sri Lanka (Wall, 2005), and Taiwan (Chen, 2002; Shih, 2005). Some of these studies investigated worldwide English testing

such as the International English Language Testing System (IELTS) (Green, 2003; Hayes and Read, 2004; Nguyen, 1997), TOEFL (Alderson and Hamp-Lyons, 1996; Robb and Ercanbrack, 1999), and the Michigan Examination for Certificate of Competency (Irvine-Niakaris, 1997).

Two major longitudinal studies by Dianne Wall (2005) and Liying Cheng (2005) (also published in various journal articles since the 1990s) have made a substantial contribution to the understanding of the complexity of washback and offered methodological implications for washback studies. Wall (2005) documents a study examining one of the widely believed ways of creating change in an education system by introducing or by redesigning high-stakes examinations. Her study analyzed the effects of a national examination in English as a Foreign Language in Sri Lanka that was meant to serve as a lever for change. Her study illustrated how the intended outcome was altered by factors in the exam itself, as well as the characteristics of the educational setting, the teachers and the learners. Her study reviewed the literature of examination impact and innovation in education, and provided guidelines for the consideration of educators who continue to believe in the potential of examinations to affect curriculum change. This method is not foolproof, however, as there are many factors, which can affect the impact of such an innovation (Wall, 2005).

Cheng investigated the impact of the Hong Kong Certificate of Education Examination in English (HKCEE), a high-stakes public examination, on the classroom teaching and learning of English in Hong Kong secondary schools—a situation similar to that reported by Wall (2005) where an examination is used as the change agent (see Cheng, 2005). The washback effect of this public examination change was observed initially at the macrolevel, including different parties or levels of stakeholders within the Hong Kong educational context, and subsequently at the microlevel, in terms of classroom teaching and learning, including aspects of teachers' attitudes (also learners'), teaching contents and classroom interaction. This was a large-scale, three-phase study using multiple methods to explore the multivariate nature of washback. The findings indicate that the washback effect of the new examination on classroom teaching is limited, although the new examination was specifically designed to bring about positive washback effects on teaching and learning in schools. Her study further demonstrated a similar situation found in Wall and Alderson (1993), that is, that the change of the examination has informed what teachers teach, but not how.

Cheng, Watanabe, with Curtis's *Washback in Language Testing: Research Context and Methods* (2004) is a cornerstone collection of washback studies—an area of research, which attracted the initial attention of the field of language testing about 20 years ago. This

volume is the first systematic attempt to capture the essence of washback and has, through its collection of washback studies from around the world, responded to the question “what does washback look like?” (Cheng, Watanabe, and Curtis, 2004, p. ix)—a step further from the question “does washback exist?” posed by Alderson and Wall (1993). This volume consists of two sections: the first section highlights the concept and nature of washback by providing a historical review of the phenomenon by Cheng and Curtis, the methodology to guide washback studies where Watanabe disentangles the dimensions and aspects of washback research, and a further critique of washback and curriculum innovation by Andrews where he pointed out that “it is precisely the power of high-stakes tests (or the strength of the perceptions which are held about them) that makes them potentially so influential upon the curriculum and curricular innovation” (p. 37). The second section showcases a range of studies conducted in:

The USA—Stecher, Chun, and Barron investigated the influence of tests on school practices as a result of the introduction of test-based reform efforts at the state level;

The UK—Saville and Hawkey looked at the impact of IELTS on the content and nature of IELTS-related teaching materials;

New Zealand—Hayes and Read reported their study of the impact of IELTS on the way international students prepare for academic study in New Zealand;

Australia—Burrows explored the differences between teachers’ classroom practices prior to and after the introduction of a new competency-based curriculum and assessment taking into account teachers’ belief systems and their consequent response to the change;

Japan—Watanabe explored the teacher factors mediating washback through detailed classroom observations within the school setting;

Hong Kong—Cheng used repeated survey measure investigating the effects of a newly introduced examination in Hong Kong on teachers’ pedagogical practices;

China—Qi explored the intended washback on secondary school English teaching and learning from the point of view of both the test developers and that of the senior teachers;

Israel—Ferman investigated whether and how a national high-stakes testing affected the educational processes, teachers and students, and their teaching and learning.

This book brings together washback studies on various aspects of teaching and learning conducted in many parts of the world and constitutes a substantial body of research that has contributed to our understanding of washback and impact of our tests. Once the washback effect had been examined in the above empirical studies, we no longer could take for granted that where there is a test, there is a direct effect.

Washback is a highly complex phenomenon, and these studies show that simply changing the contents or methods of an examination will not necessarily bring about direct and desirable changes in teaching and learning. Rather, various factors within a particular educational context are involved in engineering desirable washback. However, questions remain about what factors are involved and under which conditions beneficial washback is most likely to be generated.

#### WORK IN PROGRESS

Recently, several important projects commissioned by major testing agencies such as Cambridge ESOL and Educational Testing Services (ETS) have increasingly played a major role in producing clusters of washback and impact studies. These studies are conducted in many countries around the world on the same test, for example, TOEFL or IELTS. These studies tend to be large-scale, multiphased, and multifaceted, and offer important directions for future research.

Impact (including washback) is a key focus of the Cambridge ESOL research and validation program, which is designed to ensure that all ESOL assessment products meet acceptable standards in relation to the four essential test qualities of validity, reliability, impact and practicality. With impact being one of the key assessment properties, long-term research on IELTS such as the three-phase IELTS impact study has been implemented through the Cambridge ESOL Research & Validation Group. Hawkey's study (2006) exemplifies test impact work in the context of Cambridge ESOL's test production methodology and ongoing validation program. This book provides illustrative examples of how impact studies may be undertaken from both the IELTS impact study and from the *Progetto Lingue 2000* impact study in Italy. The two studies provide thorough and detailed information on the washback and impact of the tests on a range of stakeholders, candidates and learners, teachers, education managers, and receiving institutions. The data presented provide direct relevant feedback to the test and program validation.

In addition to such fairly large-scale impact studies, 65 projects under the joint IDP Education Australia/British Council IELTS funded research program which is managed jointly with Cambridge ESOL, have included, since 2002, around 20 studies directly investigating test impact and washback (see further details at [www.CambridgeESOL.org/rs\\_notes](http://www.CambridgeESOL.org/rs_notes)). These studies have been conducted in different parts of world with test-takers taking IELTS, and have investigated aspects such as:

- Candidate identity, their learning and performance, with specific reference to the affective and academic impact of IELTS on successful IELTS students

- Ethnographic study of classroom instruction, and of the relationship between teacher background and classroom instruction on an IELTS preparation program
- The impact of IELTS on receiving institutions, for example, tertiary decision-maker attitudes to English language tests; the use of IELTS for university selection, and IELTS as a predictor of academic language performance
- Perceptions of the IELTS skills modules, for example, the speaking test and the writing test, features of written language production, the impact of computer versus pen-and-paper versions.

These clusters of studies not only investigated the encompassing consequences of IELTS on a broad range of factors in relation to IELTS (*impact* as defined in the Introduction), they also investigated the effects of IELTS on classroom teaching and learning (*washback*).

It seems clear that worldwide high-stakes language tests such as IELTS exert a powerful influence on large numbers of language learners and teachers. Similar to IELTS is the TOEFL test. With the introduction of the Next Generation TOEFL (TOEFL iBT) in 2005, ETS has funded a series of studies, two of which aim at examining the impact of the TOEFL test (see Hamp-Lyons and Brown, 2007; Wall and Horak, 2006).

The study reported by Hamp-Lyons and Brown was designed to be in three stages: the first stage developed and validated instruments for the impact study; the second stage collected and analyzed data on TOEFL preparation in the USA, China and Egypt in the period immediately preceding the introduction of the TOEFL iBT in 2005. In the third stage, data is to be collected and analyzed in the same countries and institutions in order to identify change and constancy in beliefs, attitudes, methods, and the content of instruction under the influence of the significant changes to the existing TOEFL. Within these three countries, university-based and commercial institutions have been studied, and subjects from both TOEFL-taking and non-TOEFL-taking contexts have been included. This study is designed so that the collection of data at several points along the continuum of dissemination of information about the changes to TOEFL will enable change to be observed as it happens. The study primarily uses questionnaire data from teachers and students in all centres. However, it also incorporates classroom observation data in the USA, student participant logs in China, and teacher and student interviews in the USA and China. The initial findings have revealed differences in perceptions and attitudes between TOEFL teachers and their students, but surprisingly few differences between the views of students who are preparing for TOEFL and those who are not. There are also differences emerging across the three countries.

The TOEFL Impact Study in Central and Eastern Europe (Wall and Horak, 2006) investigated whether the new version of TOEFL—TOEFL iBT—contributed to changes in teaching and learning after its introduction. Phase 1 was a ‘baseline study,’ which described the type of teaching and learning that was taking place in commercial language teaching operations before details of the test were released about the content and format of the new TOEFL test. This would give a point of comparison for any changes that might occur in the future. Phase 2 was a ‘transition study,’ which traced the reactions of teachers and teaching institutions to the news that was released about the TOEFL iBT and investigated the arrangements they made for new preparation courses in the future. Phase 3 aimed to find out whether textbook accurately reflected the new test and what use teachers make of them in the classroom. Data was collected via computer-mediated communication with informants providing not only responses to questions about activities in their classrooms and institutions but also reactions to tasks which have been designed to probe their understanding of the new test construct and format.

Apart from the main projects commissioned by the two testing agencies, there are an increasing number of doctoral level washback studies, which add to our understanding of the complex nature of washback and impact (e.g., Glover, 2006; Gosa, 2004; Gu, 2005; Scott, 2005; Shih, 2006; Stoneman, 2005). Glover (2006) explored the washback on how teachers teach by analyzing teacher talk and established some links between testing and certain aspects of teacher talk. Gosa (2004) used student diaries to investigate the influence of the Romanian national examination on learners. Gu (2005) conducted her study in both case study settings and nationwide contexts on the College English Test (CET) in China. A wide range of stakeholders (4,500 in total) were involved using multiple research methods. Her findings indicate a mix of positive and negative washback effects on teaching and learning. Certain test formats, that is, speaking and writing, seem to induce positive effects leading to the increasing of such activities in classroom teaching and learning, while multiple choice test items induce negative effects—where multiple-choice became the way teachers teach and students learn. The author concludes “the CET is part of the complex set of factors that determine the outcome of College English teaching and learning” (Gu, 2005, p. 2). Scott (2005) conducted an exploratory case study of the effects of high-stakes statutory testing on primary English as an Additional Language (EAL) learners in the UK. Her findings illustrated the extent to which there is congruence and/or dissonance between EAL-oriented teaching and washback from high-stakes testing. Shih (2006) investigated stakeholders’ perceptions (including department heads, teachers, students, and their partner/

spouse) of the Taiwan General English Proficiency Test and its washback on school policies and teaching and learning. Stoneman (2005) examined and compared the nature and extent of test-preparation of university students. She suggested that, as a strategy to promote desirable changes in learners and their learning, testing may or may not bring out the predicted results.

#### PROBLEMS AND DIFFICULTIES

Although there has been an increasing number of empirical washback and impact studies conducted over the past 20 years, since the late 1980s, researchers in the field of language education still wrestle with the nature of the washback and do not know exactly how to induce positive and reduce the negative washback and impact of our tests. As indicated above, washback is one dimension of the consequences of the testing on classroom teaching and learning and impact studies include broader effects of testing (as defined in Wall, 1997); both assume a causal relationship between testing, teaching and learning which has not been established up to now. Most of the washback and impact empirical studies have only established an exploratory relationship. In many cases, we cannot be confident that certain aspects of teaching and learning perceptions and behaviors are the direct and causal effects of testing. They could well be, within certain contexts, however, this relationship has not yet been fully disentangled. Further, apart from the studies on IELTS and TOEFL, where a worldwide test influences teachers and learners across countries and educational contexts, the majority of the empirical studies are carried out in order to study the effects of one single test, within one educational context, and using the research instruments designed specifically for that particular study. The strength of these studies is they have investigated factors that affect the intensity of washback<sup>1</sup> such as test factors (test methods, test contents, skills tested, purpose(s) of the test), prestige factors (stakes of the test, status of the test), personal factors (teachers' educational backgrounds and their beliefs), micro-context factors (the school/university setting), and macro-context factors (the specific society in which the tests are used) (Cheng, Watanabe, and Curtis, 2004). In fact, many of the factors related with the influence of testing on teaching and learning illustrated in Wall (2000) have been empirically studied. However, not only does little overlap exist among the studies regarding what factors affect washback, but little overlap also exists in researchers' reports of the negative and positive aspects of washback (Brown,

---

<sup>1</sup> 'Washback intensity' refers to the degree of the washback effect in an area or a number of areas of teaching and learning that are affected by an examination (Cheng, 2005, p.33).

1997). Further, the existence of washback effects is evident in various contexts, yet there does not seem to be an overall agreement on which factors affect the intensity of washback and which factors promote positive or negative washback.

This is a challenging feature of washback and impact studies, since researchers set out to investigate a very complex relationship (causal or exploratory) among testing, and teaching and learning. Such a relationship can be influenced or mediated by any of the factors of a test and/or within a particular educational system. Such complexity causes problems and difficulties in any washback and impact research, which in turn challenges any researcher who wishes to conduct, is conducting, or has conducted such studies. In many ways, the nature of such a study requires subtle, refined and sophisticated research skills in disentangling the relationship. Researchers need to understand the specificity, intensity, length, intentionality, and value of washback/impact and how (or where and when) to observe the salient aspects of teaching and learning that are potentially influenced by the test. They also need to identify their own bias, analyze the particular test and its context, and produce the predications of what washback/impact looks like prior to the design and conduct of the study (see also, Watanabe, 2004). Washback and impact studies are, by definition, studies of evaluation, which require researchers not only to understand but also to make a value judgment about the local educational context as well as the larger social, political, and economic factors governing teaching and learning in relation to a test/examination or a testing system. Researchers need to acquire both the breadth and depth of necessary research skills to avoid research based on investigating random factors of teaching and learning, which may or may not have a direct relationship with testing.

#### FUTURE DIRECTIONS

It is clear that the future direction of washback and impact studies to investigate the consequences of language testing need to be multiphase, multimethod and longitudinal in nature. Washback and impact of testing take time to evolve, therefore longitudinal studies are essential with repeated observations (and measures) of the classroom teaching, including teachers and students as well as policy, curriculum, and assessment documents. Also, researchers need to be immersed in the educational system interacting with a wide range of stakeholders. In addition, researchers should pay attention to the seasonality of the phenomenon, that is, the timing of researchers' observations may influence what we discover about washback (Bailey, 1999; Cheng, 2005; Watanabe, 1996). Examples like the IELTS impact studies (see Hawkey, 2006) and the two impact studies on TOEFL iBT across different countries and continents

over a few years (Hamp-Lyons and Brown, 2007; Wall and Horak, 2006) have a great deal to contribute to our understanding of this complex phenomenon. Studies of a single test within an individual context by a single researcher can still offer valuable insights for that particular context, however, it would be the best use of resources if a group of researchers could work collaboratively and cooperatively to carry out a series of studies around the same test within the same educational context. In this way, researchers can investigate a range of different aspects of this phenomenon as discussed in the Introduction. The findings of these researchers could then be cross-referenced and can portray a more accurate picture of the effects of the test, avoiding the blind elephant syndrome.

In addition, the methodology (and the methods) used to conduct washback studies need to be further refined. For example, more sophisticated methods, for example, those linking directly with test-takers' characteristics, learning processes, and their learning outcomes (test performance) need to be employed beyond classroom observations and survey methods (interviews and questionnaires) commonly used by the studies reviewed in this chapter. Building on the increasing numbers of studies carried out on the same test or within the same educational context, future researchers can replicate or refine certain methodology and procedures, which was not possible 20 years ago. The replication would allow researchers to build on what we have learned conceptually and methodologically over the years and further our understanding of this phenomenon.

While it would be useful to continue to study the effects of tests on broad aspects of teaching, it is essential to turn our attention to investigate the effects on student learning as they receive the most direct impact of testing (see Wall, 2000). What has not been focused in previous studies is the direct influence of testing on students (e.g., their perceptions, their strategy use, motivation, anxiety, and affect) and on their learning (e.g., what and how they learn or how they perform on a test). It is also important to investigate the impact of the test constructs, test methods and the function of the test on students and on their learning processes (including test-taking processes) and learning outcomes (test scores or other outcome measures) (see Cheng, Klinger and Zheng, in press, for an example). Based on these investigations, it is also important to use the results to do in-depth observations of the students. Furthermore, these studies should be conducted directly in relation to a test, for example, test takers' responses (cognitive, psychological and emotional) to a test. This type of research can actually links the consequences of testing with test validity. It would be also worthwhile for washback and impact studies to look at the test taker population more closely, for example, the characteristics (learning and testing) of the students in the study. We know high-stakes

testing like IELTS or TOEFL influences students. However, will the impact of the test be different on students learning English in one country than in another where the educational tradition (beliefs and values) are different? If so, what are the different factors inducing washback? Without a thorough understanding of where these students come from and the characteristics they bring to their learning and testing, it is unlikely that we can fully understand the nature of test washback and impact.

In the end, washback/impact researchers need to fully analyze the test under study and understand its test use. Bachman (2005, p. 7) states that “the extensive research on validity and validation has tended to ignore test use, on the one hand, while discussions of test use and consequences have tended to ignore validity, on the other”. It is, then, essential for us to establish the link between test validity and test consequences. Therefore, it is imperative that washback/impact researchers work together with other language testing researchers as well as educational policy makers and test agencies to address the issue of validity, in particular, fairness and ethics of our tests.

## EDUCATIONAL REFORM AND LANGUAGE TESTING

### INTRODUCTION

Educational reform involves systematic attempts by governments or other educational authorities to change educational policies and practices with a view to improving learner outcomes (see Farrell, 2000; Fox, 2005; Tollefson and Tsui, 2004). It typically has its origins in the identification of aspects of an educational system that are viewed as problematic such as

- falling standards of student achievement
- poor performance by students in international comparisons
- lack of national standardization in assessment
- lack of comparability of outcomes across different educational systems
- lack of transparent accountability reporting
- public concerns about teacher competence.

Testing has long been used by educational policy makers as a tool of reform for a variety of reasons (Linn, 2000; Shohamy, 2001):

- it is relatively cheap compared to other major reforms such as reducing class sizes or improving teaching standards
- it can be externally mandated as opposed to trying to change the culture of what happens in classrooms
- policy changes can be rapidly announced and implemented during a single electoral term
- results are visible and measurable; standardized test scores can be reported by the media in terms the public can understand and used to show that change has (or has not) taken place

In describing the role of testing in educational reform, a number of dimensions need to be considered. These are:

- the social and political context of the reform
- the process by which it is implemented and adopted
- its effects on teaching and learning

### EARLY DEVELOPMENTS

The use of tests as a lever for reform has a long history. Spolsky (1995) notes that the use of formal examinations for selection dates back as

early as 201 BC in China, and describes how competitive examinations evolved in eighteenth and nineteenth century Europe as a means of controlling the instructional process, thus disempowering teachers and learners. He argues that the uniformity that is imposed by the use of external examinations leads to “the pernicious and inevitable outcome” of narrowing the curriculum (p. 16).

In the context of language testing, it is only relatively recently that researchers have turned their attention to the social and policy issues surrounding test development and use (see McNamara, 1998 for an overview). However, an early account of the use of language tests as a means of curriculum reform is provided by Davies (1968) who describes a study of the feasibility of introducing a compulsory oral English test at the ‘O’ level stage of secondary education in West Africa. He outlines the aims of the test as seen from the perspective of its proponents, which were:

- to update the version of the test that was in use at the time
- to encourage and improve the teaching of spoken English in secondary schools
- to raise standards of spoken English throughout West Africa (p. 169).

Davies’ discussion of the political climate in which this initiative was proposed provides an interesting illustration of the difference between long-term and short-term goals in assessment reform, and shows how easily they can become confused. He notes that a good test would assure the achievement of the first two aims but that the third aim of raising standards “which seemed least distinct and which kept emerging as the real need,” would not be achievable for some time, since the new exam would only be taken by a small group of elite candidates.

During the 1980s and early 1990s, the important role of tests in changing and improving the teaching of languages was acknowledged in a number of publications. Johnson and Wong (1981) discuss the proposed introduction of a communicative test of English for junior secondary students in Hong Kong at a time when the language teaching syllabuses and materials used reflected the teaching of English “as a formal, textbookish, discursive, academic subject” (p. 285). They note that the test designers saw the introduction of the test as an opportunity to promote curriculum change and therefore constructed a test containing a range of texts that reflected language use in a range of real-world contexts. Johnson and Wong express the hope that the test would be a “precursor of syllabus revision at all levels of the school system” (ibid.) that would improve teaching practice. In a similar vein, Pearson (1988) describes a project aimed at reforming public examinations in English in Sri Lanka. He reports that the Ministry of Education set out with the deliberate intention of using the new tests “as levers which will persuade the teachers and learners to pay serious attention to communicative skills

and to the teaching and learning activities that are more likely to be helpful in the development of such skills" (p. 106). In the context of foreign language education in the USA, Shohamy (1990) attributes a similar role to the ACTFL guidelines and the accompanying oral proficiency interview which she identifies as "the main vehicle by which progress and change were expected to occur" in language teaching (p. 385).

Although the key role of testing reform in curriculum change was thus beginning to be acknowledged, it was not until the early to mid-1990s that the first empirical studies of the effects of testing reform on language teaching and learning were carried out. Some influential work in this area was carried out by *inter alia*, Shohamy (1993), and Wall and Alderson (1993). These studies will be reported in the following section on Major Contributions.

### MAJOR CONTRIBUTIONS

Since the early 1990s, language assessment researchers have investigated the process of assessment reform from a variety of perspectives and in different educational contexts. Some have examined the sociopolitical environment in which reform originates, with the aim of exposing the ways in which governments use tests as policy tools to control teaching and learning (see McNamara, *The Socio-political and Power Dimensions of Tests*, Volume 7). Others have analyzed the impact of new tests and assessment systems on various aspects of the teaching and learning process, with a particular focus on teachers' attitudes and practices (see Cheng, *Washback, Impact and Consequences*, Volume 7). In the latter line of research, one recent theoretical advance has been the use of insights from educational innovation theory to describe and account for factors affecting the introduction of assessment reform.

#### *Assessment as a Policy Tool*

Shohamy (1993) was one of the first language testing researchers to critically examine the use of tests in the implementation of educational policy, focusing in particular on ways in which tests are used as instruments of power and control. She analyzed the impact of three national language tests that were introduced in Israel, each of which had a clearly defined goal of reforming the curriculum in some way. Using a range of data collection techniques, including document analysis, interviews, surveys and classroom observations, Shohamy found that the introduction of the three tests had resulted in a narrowing of the curriculum in each case, with teachers consistently using more test-like activities in class. In some cases, she reports that test results were used to blame or reward teachers. Summarizing these findings, Shohamy

suggests that testing reforms are typically imposed when policymakers, often under pressure from the public or media to ensure that certain topics are taught, use tests as a ‘quick fix’ way to communicate educational priorities to teachers, who “are reduced to simply following orders” (p. 17). Although all of the tests achieved their stated goals and had a demonstrable impact, she makes a distinction between short-term *instrumental* impact and longer-term *conceptual* impact involving meaningful changes in teaching and learning, and argues that “bureaucrats are interested in simplistic, instrumental solutions where gains can be seen immediately” (p. 18).

Another important study of the implementation of a major national language test was conducted in China by Qi (2004, 2005) who investigated the washback effects of the National Matriculation English (NMET) test, a high-stakes test that is used for University entry. The test was introduced by the Ministry of Education with the aim of bringing about a shift in language pedagogy from knowledge-based instruction to more communicative practices. In order to investigate the extent to which these intentions had been realized, Qi conducted a large-scale study of the effects of the NMET on teaching, using questionnaires and interviews with teachers, students, test constructors and school inspectors. She found that teaching practices were driven by the selection function of the test which “compels teachers and students to work for the immediate goal of raising scores” (Qi, 2005, p. 163). Instead of focusing on language use, teachers tended to focus on linguistic knowledge which many of them interpreted as the test construct, contrary to the test constructors’ intentions. Teachers also spent a large amount of time on explicit test preparation activities such as teaching to the test content and administering mock tests. Qi (2005, p. 164) concludes, “high stakes tests, powerful as they are, might not be efficient agents for profound changes that are believed to promote the development of educationally desired knowledge and ability.”

Some researchers have examined assessment reform in the broader political context, with a view to identifying the influence of political agendas on the nature of the implementation process (see e.g., Brindley, 1998; Moore, 1996, 2001; McNamara, 1998). For example, Moore (1996) examined the policy issues and tensions surrounding the implementation of ESL assessment frameworks in the school and adult sectors in Australia (see Chapter 17, Rubrics, Benchmarks, Standards, Frameworks, Rating Scales). She traced the evolution of two competing frameworks for mapping the language development of school age learners of English as a second language (ESL), one state-mandated and linked to existing national subject profiles, the other developed collaboratively by teachers and researchers. She portrays the differences between the frameworks as a reflection of a struggle

between a technocratic, accountability focused and normative approach that seeks to ‘mainstream’ ESL learners in contrast to one that portrays a complex picture of individual learner development and reflects teachers’ specialist knowledge (p. 205). Moore argues that since the state-endorsed framework is designed to be “‘product accountable’, as sought by politicians, business and unions, and legitimated by technical procedures” (p. 211), it is likely to be better resourced and widely used.

The accounts of the social and political circumstances surrounding the introduction of the tests described above illustrate the complex and subtle interplay between bureaucratic and educational agendas that accompanies the implementation of assessment reform. They highlight several recurring themes that emerge both from these and subsequent analyses of reform initiatives, namely that:

1. Testing reforms may be used by governments both to further broader political agendas and to assert power and control over teachers and educational systems
2. High-stakes tests that are introduced in order to produce qualitative changes in teaching and learning may not have the desired effect as long as the selection and evaluation functions of the test remain predominant
3. Stakeholders tend to have different perspectives on the purposes of high-stakes tests and the ways in which the results should be used. In some cases, this may result in teachers’ local and contextualized knowledge being devalued.
4. The imposition of high-stakes tests without adequate accompanying professional development resources is likely to engender the narrowing of the curriculum.

### *Impact of Assessment Reform on Teaching and Learning*

One of the first in-depth empirical investigations of assessment reform in the context of language teaching was conducted by Wall and Alderson (1993) who examined the effects of the introduction of a new English language examination in Sri Lankan secondary schools that was intended to encourage a more communicative approach to teaching. While they found that the test had affected the content of teaching, there was no evidence of changes in teachers’ methodology. They also found that many teachers did not fully understand the nature of the new examination and were not adequately prepared to implement the recommended methodology. They concluded that “. . . if an exam is to have the impact intended, educationalists and education managers need to consider a range of factors that affect how innovations succeed or fail and that influence teacher (and pupil) behaviours. The exam is only one of these factors” (p. 68).

*Change Dimensions of Assessment Reform*

Since Wall and Alderson's pioneering study, the findings from a range of washback studies have reinforced their conclusion that the success or otherwise of assessment reform is governed by a range of complex individual, educational and sociopolitical factors, and that the introduction of a new test is likely to have a range of unintended consequences (for a range of illustrative examples see Cheng, Watanabe and Curtis, 2004). In this context, language assessment researchers have in recent years increasingly drawn on the substantial body of research that is available from educational innovation theory (e.g., Farrell, 2000; Fullan, 2001; Nicholls, 1983; Rogers, 1983) in order to explore how and why new forms of assessment are (or are not) adopted and what can be done to create the conditions for successful implementation (see e.g., Brindley, 1989, 1998; Burrows, 2004; Wall, 1996, 2000). This interest in the role of contextual factors is also reflected in analyses of curriculum innovation by applied linguists such as, *inter alia*, Holliday and Cooke (1982), Markee (1997), White (1988), and Henrichsen (1989). These studies highlight the complexities of curriculum reform in language teaching and draw attention to the close connection between educational innovation and organizational change.

What emerges from these studies of curriculum and assessment reform in language teaching contexts are a number of key messages that are also reflected in the mainstream educational literature:

1. Centrally driven educational reform initiatives rarely succeed. The changes that last are generally those that are local and locally adapted (although see Fox, 2005 for a rare counter-example).
2. Successful change involves shared control and decision-making
3. Teachers are the key factor in the implementation of reform; the likelihood of whether a change will be implemented depends on the degree to which it is linked to daily classroom practice
4. Ongoing inservice education is vital in ensuring the sustainability of an innovation

## WORK IN PROGRESS

*Language Assessment Reform in Europe and the Common European Framework of Reference*

The Common European Framework of Reference (CEFR) for teaching and learning of foreign languages was created with the aim of promoting transferability of qualifications and ensuring commonality of assessment and reporting across 14 European languages (Council of Europe, 2001). Its adoption by a range of EU countries has been accompanied

by a number of large-scale test development initiatives. Recent reports by Eckes and group (2004) provide informative insights into the issues and problems surrounding the implementation of these reforms, and a number of common themes emerge from their account. The first of these is that although assessment reform has been successfully implemented in many countries in the form of new or improved national tests, resources have not always been forthcoming to create the infrastructure that is necessary to support ongoing test production and quality control. In order to develop high quality assessments that are internationally acceptable, Eckes and group (2004, p. 375) highlight the need to develop training programs for item writers, markers and examiners, and to conduct ongoing validation research, both into test content and the impact of the assessment reforms at both national and local level. They also draw attention to the critical importance of political factors in implementation, pointing out that “many of the reforms have been hindered by political failings such as the failure on the part of decision makers either to understand the nature of test development in general or to appreciate the potential impact on learning of politicians’ decisions relating to tests” (p. 376). To address the problems arising from this lack of awareness, they suggest that “a long process of dialogue and persuasion” (p. 376) will be necessary.

A further theme that emerges from the current debates surrounding assessment reform in Europe is the inherent tension between the political and the educational aims of the CEFR. Some language testing researchers have suggested that the political needs for comparability and harmonization of levels have taken precedence over issues of validity and reliability. In this context, the empirical foundation of the proficiency levels that are defined by the Framework has been questioned. Fulcher (2004, p. 260) comments that “for teachers, the main danger is that they are beginning to believe that the scales in the CEF represent an acquisitional hierarchy, rather than a common perception.” Allied to this problem of validity is the question of the comparability of the tests that are used to assign CEF levels. Testing researchers have disputed claims that the CEFR can be used as a basis for test development or for making comparisons across different examination systems, pointing out that the constructs embodied in the scales are inadequately defined and incomplete (Fulcher, 2004; Weir, 2005).

### *The Role of Teacher-led Formative Assessment*

A feature of many current assessment reform initiatives in educational systems worldwide is the shift from standardized large-scale testing to outcomes or standards-based assessment and reporting in which school-based assessment (SBA) conducted by teachers plays a major role (see Chapter 18, *Assessing Language and Instruction*).

Researchers have recently begun to explore the ways in which these changes are being played out in language assessment contexts. Davison (forthcoming) examines the adoption of school-based English language assessment in Hong Kong and identifies a range of sociocultural, theoretical and practical issues affecting the implementation of SBA. She points out that the introduction of new modes of assessment is not a matter of simply developing 'teacher training' packages (see Malone, *Training in Language Assessment*, Volume 7); rather, it entails a significant cultural and attitudinal change on the part of the entire school community, especially in contexts such as Hong Kong where public examinations have traditionally been the dominant form of assessment. Piloting of SBA and teacher surveys also revealed that practical problems such as lack of access to assessment resources were a key factor affecting implementation. Not surprisingly, teachers' principal concerns related to the implications of adding increased assessment responsibilities to an already heavy teaching and assessment schedule. Davison concludes, however, that once the new types of assessment activities have become a regular part of classroom practice, they should not add significantly to teachers' or students' workload.

Another aspect of the shift towards formative assessment that has recently begun to receive the attention of researchers is the tension between assessment as a professional activity and assessment as an instrument of policy. In this context, Leung and Rea-Dickins (forthcoming) deconstruct the official discourse surrounding an important policy change which raises the status of teacher-conducted classroom assessment of learners of English as an Additional Language (EAL) in the UK, revealing in the process a major gap between the rhetoric of assessment reform and its implementation in practice. Via a critical analysis of key curriculum documents enshrining this change, they show that the official discourse positions teacher assessment within a 'measurement' paradigm that uses the discourse of summative assessment and pays little attention to the key aspect of classroom discourse as a mediator of formative assessment. According to Leung and Rea-Dickins, this reflects a static perspective which "does not link into current perspectives on effective classroom assessment as embedded within interaction and on learner agency in assessment processes, thus failing to take into account the actions that the learners themselves might take in this process."

*The Effect of Reform on Minority Populations:  
English Language Learners*

As we have noted, large scale educational reform initiatives are usually based on the premise that the introduction of new assessment regimes will result in improved outcomes for all learners. However, researchers

have argued that in the case of minority populations such as English language learners (ELLs) in English-speaking countries who are facing high-stakes assessments, this assumption cannot be made, pointing out that practices such as assessing content area knowledge in English are unfair and potentially invalid. In recent years, researchers have therefore critically examined major reforms such as the No Child Left Behind (NCLB) legislation in the US, with a view to identifying ways in which equitable assessment can be provided for ELLs (e.g., Bailey and Butler, 2004). The issues and problems raised by these researchers demonstrate the complexities involved in introducing assessment reforms that do not take account of differences between sub-populations. However, despite the controversies that surround it, NCLB has had some beneficial side effects in that it has drawn attention to the inadequacy of the assessment that is provided for ELLs, prompting a major effort to meet the assessment needs of this population (for further discussion, see Chapter 8, *Alternative Assessment* and Chapter 21, *Using Accommodations and Modifications in Assessment*).

## PROBLEMS AND DIFFICULTIES

### *Tensions Between Political and Educational Perspectives on Reform*

As has already been noted at several points in this review, fundamental tensions exist between policy maker and educational perspectives on the purposes of reform and the role of assessment in its implementation. Whereas politicians and government officials tend to see assessment as a tool for implementing and managing policy, teachers and educationists are primarily concerned with ways in which it can be used for the improvement of learning (Shohamy, 2001). While these goals may occasionally coincide (see Moore, 2001), in reality policy makers are usually less concerned with the longer-term effects of reform on the learning process than they are with publicly demonstrating that decisive action has been taken and that accountability requirements are being met (Linn, 2000). One consequence of this focus on short-term policy objectives is that factors that are vital to ensure the sustainability of assessment reform initiatives such as professional development programs, ongoing test development, and validation research may be downplayed or ignored (Eckes et al., 2005).

### *Lack of Research Evidence on the Effectiveness of Reform*

Discussing the NCLB legislation in the USA, Hess (2004, p. 57) comments that “debates over accountability are sorely lacking in empirical measures of what is actually transpiring.” This is not only the case in

general education but also in the field of language learning. Although assessment reform is usually initiated with the stated aim of improving teaching and learning, both in terms of learner outcomes and classroom learning processes, the evidence base on which to evaluate the success or otherwise of reform initiatives is still relatively thin. In particular, it is still unclear to what extent the introduction of standards-based assessment schemes, such as those initiated in countries such as the USA, the UK, Australia and Hong Kong, have succeeded in raising standards of teaching and learning, although the research reported in the previous section on Work in Progress is beginning to throw some light on these issues. What is clear, however, both from washback studies and recent observational research into classroom-based assessment is that reform initiatives are rarely implemented as intended and that their effects on teaching and learning cannot be predicted (Wall, 2000; Cheng, Watanabe and Curtis, 2004).

### *Evaluating Conflicting Research Evidence*

A further problem that confronts the external observer who is trying to judge the pros and cons of assessment reform is how to evaluate conflicting research evidence. As numerous commentators have noted, the field of assessment is deeply politicized, particularly where high stakes are involved, and has become a battleground on which ideological wars continue to be waged, against a background of strident (and often sensationalized) media commentary (Ungerleider, 2004). In such a climate, the nature and quality of research evidence and the means by which it is obtained have themselves increasingly become matters of dispute. For example, in the context of the high profile controversy concerning the impact of NCLB in the USA, research by Amrein and Berliner (2002) that found overall negative effects for standardized testing has been hotly contested on methodological grounds, provoking a succession of claims and counter-claims in professional journals.

Discussing the research into NCLB assessment, Hess (2005, pp. 56–57) suggests that judgments of the worth or otherwise of assessment reform are influenced by “factors that stretch beyond scholarly inquiries into the working of educational accountability” and may not be amenable to rational argument on the part of measurement experts. In the context of language education, this view is echoed by McNamara (2006, p. 86) who comments that:

second language assessments carried out on behalf of state agencies are increasingly required to work with test constructs that are dictated by policy and not open to empirical evidence or argument on the part of assessment researchers.

## FUTURE DIRECTIONS

In the current social and political climate in which increasingly heavy emphasis is being placed by governments of all political complexions on the importance of accountability in public education, there is no doubt that assessment will continue to be used as a key instrument of educational reform. As we have seen, such initiatives are based on the assumption that implementing changes in assessment systems will increase accountability, change teacher behaviour and improve student learning outcomes. Yet the findings of research in both general education and language learning contexts cast serious doubt on the validity of these assumptions. What emerges from a range of policy analyses and impact studies is a considerably messier picture in which the effects of assessment reform are unpredictable and highly variable across individuals and institutions. Thus, in a comprehensive review of the effects of high-stakes educational testing across a range of developing countries, Chapman and Snyder (2000) conclude that "... changing national examinations *can* serve as a successful vehicle for shaping teachers' instructional practices, but that success is not assured. It depends on the government's political will in the face of potentially stiff opposition and the strategies used to help teachers make the transition to meet the demands" (p. 462, emphasis in original). Wall (2000, p. 507) issues a similar warning about language testing when she states "policy-makers and test designers should not expect significant impact to occur immediately or in the form they intend. They should be aware that tests on their own will not have positive impact if the materials and practices they are based on have not been effective."

To those who are familiar with principles of educational change, these conclusions are not surprising. It is clear from over thirty years of research that the mere issuing of policy directives will not automatically cause change to take place. However, governments are driven by different priorities: not only do they work within short-term electoral cycles, they are also subjected to heavy pressure from the media and the general public to address perceived educational problems and to show immediate results. In addition, policy makers and government officials may not understand the technical details of test construction and validation or be amenable to budgetary arguments concerning the need for infrastructural support. Under these circumstances, it is not surprising that top-down assessment reform initiatives continue to proliferate, despite the many well-documented instances of the failure of coercive approaches to change (see Brindley, 1998 for a range of examples).

If this situation is to change in the future, as a first step it is essential that communication between stakeholders in the assessment process is improved. Although, as Alderson (2001) notes, a climate of distrust has

typically existed between teachers, teacher educators and educational bureaucrats, there are some signs of increasing dialogue concerning major assessment issues (see e.g., Newton, 2003; Wiliam, 2003). Current or former government officials are also beginning to make useful contributions to educational journals, bringing a much needed policy-maker perspective to assessment debates (see e.g., Ungerleider, 2004). While improved dialogue will help to increase mutual awareness of both the political and educational realities of assessment reform and thus improve its chances of success, careful ongoing research in language classrooms will also be needed to identify and document the nature and extent of resourcing that is needed to enable teachers to implement new assessment systems and techniques. In this way it may eventually be possible to arrive at a better understanding of the complexities of the reform process and to place future initiatives on a firmer empirical footing.

## ASSESSING THE LANGUAGE OF YOUNG LEARNERS

### INTRODUCTION

The specific differences between the language-learning population at large and the young language learners that Inbar, Shohamy, and Gordon (2005) refer to earlier necessitate this chapter. Much of what has been examined elsewhere in this volume (e.g., Abedi, Utilizing Accommodations in Assessment; Chapelle, Utilizing Technology in Language Assessment; Xi, Methods of Test Validation, Volume 7) is reconsidered in this chapter from the points of view of those who must create valid (i.e., fair and effective) tests for assessing the language of young learners, and those who must administer and interpret them. These view points require familiarity with testing purposes, and an understanding of developmental and cultural issues as they impact the design and use of language assessments.

While not exclusively the case, this chapter deals predominantly with tests of students' English language development (ELD). This is a reflection of both the increasing number of young children learning English in various contexts around the world (Graddol, 2006), and the fact that much research has been conducted on the assessment of English. From a recent review of the available assessments for measuring language minority students' progress in English language and literacy in the USA, it appears that much is still to be done to improve the assessment of English (August and Shahanan, 2006).

The chapter is organized around five main sections: First, I provide construct definitions that will prove important for establishing a common understanding of testing issues with young children, starting with a definition of the term 'young learner' itself. Second, I review the types (e.g., summative, formative) and purposes (e.g., accountability, diagnostic) of language testing in preschool and elementary (primary) school contexts. Third, I address the developmental child level concerns that need to be taken into account in assessing this population of test takers, including a review of general guidelines and best practices for assessing young children. In the fourth section, I consider culture as an additional contextual factor that, while possibly impacting all language-testing situations, may have particular significance for the testing of young children. Finally, in the fifth section, I conclude

with work in progress and some future directions for test development involving school-based research, standards-setting endeavors, and technology initiatives.

### CONSTRUCT DEFINITIONS

Many key constructs already encountered in other chapters will need special definition in the context of assessing young language learners. Constructs such as ‘foreign language learner’, ‘language for specific purposes’, and even the language modalities themselves will need adjustments to definitions for their application to testing young children.

#### *Defining Young Language Learner*

I start with the most crucial of all definitions for this chapter, that of the *young language learner*. Defining young language learner is complicated by the range of language-learning experiences, the range of ages to be covered by the qualifier ‘young,’ and by the fact that in different parts of the world different school systems introduce students to second language and foreign language instruction at different points in their school careers.

In Europe, young learner is often applied to students in only the very earliest school years (ages 5–7) or before. In the USA, where the introduction of foreign language teaching often does not take place until the secondary grades, the notion of a ‘young learner’ can continue through the entire preschool and elementary years (ages 3–11). Obviously for second language learners, the onset of a second language can start before the start of formal schooling or at anytime during the primary school years for those who emigrate as school-age language learners. Looking to definitions of young learner in prior research and in current testing practice, there is some precedence for including children as mature as 12 years (e.g., McKay, 2006; UCLES, 2003). Much of the focus of this chapter, however, will be on young learners from preschool through the earliest elementary years. Where issues might differ for slightly older learners, these will be noted.<sup>1</sup>

#### *Defining the Language-Learning Context*

Turning next to language construct definitions, prominent among these are English as a second or additional language (ESL or EAL),

---

<sup>1</sup> Young learners of English are variably referred to as English learners (ELs), English language learners (ELLs), English as a second (ESL) or additional language (EAL) students, or students with non-English-speaking backgrounds (NESB). Throughout this chapter, I simply use young language or English learners.

bilingualism, and due to the demand for English in non-English-speaking countries around the world, English as a foreign language (EFL).<sup>2</sup> Second and foreign languages other than English will also be pertinent to a broader discussion of young language learners everywhere. Language assessment for young monolingual speakers is primarily confined to the literate uses of a language (e.g., reading and writing) and rarely to the assessment of oral language skills, with the exception of instances when a language disability is suspected or has been diagnosed and monitored for improvement after intervention.<sup>3</sup> Review of such clinical assessments is outside the scope of this chapter (see Miller, 2002 for a review of assessing the language of young children with language-learning disabilities).

Second language acquisition (SLA) such as ESL is made more complex in the young learner context by the existence of bilingual first language acquisition (BFLA) (De Houwer, 1998), in which children may be acquiring two languages, each as a native language. As they enter preschool environments or, later, begin compulsory education, these children may become literate in only one of the two languages if the schooling system favors one language over the other, or if parents do not opt to enroll their children in two-way bilingual education programs. The language-learning experiences of young children may also be characterized by immersion in a second language they are yet to acquire. In Canada, for example, children have the opportunity to learn English and French (and other desired languages) in this environment from an early age (see Menyuk and Brisk, 2005 for a recent overview of the educational options available to bilingual and second language-learning school-age children).

EFL (and other foreign language acquisition) characterizes learners who acquire a language after their native language has already been acquired, just as ESL learners acquire English. However, the EFL context differs from the ESL context in that learners acquire English outside an English language environment. For the very youngest preliterate language learners that may mean learning a foreign language without the aid of the print medium that is available to older youngsters and adult learners. Older learners can garner literacy abilities in their L1 to augment their learning of oral English, as well as transfer print skills in their L1 to reading and writing in English. The latter is

---

<sup>2</sup> ELD will be used throughout this chapter to refer to the process of English acquisition regardless of whether it is being acquired as a second or foreign language.

<sup>3</sup> There are few norms for the oral language development of monolingual school-age children (Nippold, 1995). As a consequence perhaps, there are few assessments of oral language proficiency in a first (and often only) language.

particularly enhanced if their L1 shares the same orthography and possibly even cognate words with English.

### *Defining Language Varieties*

This chapter adopts a broad definition of language including all four modalities of listening, speaking, reading, and writing, and where relevant, further denotes subskills such as phonological awareness and pronunciation (Schrank, Fletcher, and Alvarado, 1996) (for discussion of differences, see also Cumming, *Assessing Oral and Literate Abilities*, Volume 7). Additional construct definitions that need to be taken into account in the assessment of young learners include the social and academic language constructs (Bailey, 2006; Cazden, 2001; Chamot, 2005; Schrank, Fletcher, and Alvarado, 1996). While the distinction between the language used in a scholastic environment and the language used in everyday (out-of-school) contexts may not be as great during the early years of schooling as it is once children begin to take discipline-specific classes (e.g., history, algebra) the distinction arguably still exists. Preschool children are observed to ‘play’ at being in school and modify the register they use in order to successfully participate in such play (Andersen, 1986). For example, children use the ‘script’ of being a teacher, including the lexicon, syntactic structures, and language functions of classroom tasks and management (*Sit quietly! Raise your hands if you know the answer*).

However, the existence of an academic language construct is not without controversy, especially in what constitutes fair assessment of obvious scholastic uses of language at this young age—reading and writing. *Should the reading and writing skills in English of young learners be assessed differently from those of native English students who are also just beginning to learn to read and write?* If young English learners are already literate in their L1, there are implications for how we assess their literacy in English. Environmental print (i.e., sight words) from the content areas such as science, mathematics, and history may make appropriate content for assessing the literacy abilities of young school-age learners. However, there may be no positive transfer for literacy skills from children’s L1 to their L2 if the orthographies of the two languages do not match (Bialystok, McBride-Chung, and Luk, 2005). Furthermore, the reading and writing modalities are also problematic when operationalized for testing with young children. For example, reading and writing are frequently tested orally which requires children to *listen* to directions not simply demonstrate their literacy abilities. Conflating these skills may result in ambiguous information for teachers wishing to effectively target their instruction.

## TYPES AND PURPOSES OF ASSESSMENT

There have been abuses of assessment with young children by using tests designed for one purpose with another purpose in mind (National Educational Goals Panel [NEGP], 1998). As with assessments developed for use with older children and adults, there is a range of purposes for language assessment with young learners. However, due to the maturational constraints and the need for developmentally relevant measures, we witness far greater variety in the purpose and use of informal assessment in this young population.

*High-Stakes Assessment*

With standardized, norm-referenced assessments, the content is a sampling of all that a student may have been taught in a given period. These assessments are summative of knowledge gain and are often considered 'high-stakes' for the student (e.g., a deciding factor in being reclassified as a fluent English speaker for instructional placement), or 'high-stakes' for those who educate them (e.g., evaluation of teacher or school performance) especially in immigration contexts. Also considered 'high-stakes' but not summative, are assessments designed to screen a student's abilities for weaknesses that need immediate amelioration or flagged for possible future attention. Such screening purposes can also be considered 'high-stakes' for both the individual and the schooling system. An individual needs to be accurately identified for further instruction or services if these are necessary to their development. These are the cases when the schooling system also needs accurate information; providing services to individual students who are falsely identified as in need of services will not be cost effective, and those who are falsely identified as sufficiently able when they are not may require more costly remediation at a later point in time (Vellutino and Scanlon, 2001). Technical quality of a test in terms of validity and reliability are of course major considerations when the stakes for testing young students are high such as in the contexts of immigrant students (McKay, 2005; McLoughlin and Gullo, 1984; Schrank, Fletcher, and Alvarado, 1996).

*Assessment for Learning*

Assessment for instructional or diagnostic purposes can either take the form of standardized, norm-referenced assessments, or classroom-based formative assessments. Standardized assessments will offer the language teacher information about a sample of items within a domain

of language such as vocabulary or sentence structure, and how well a student is doing on these skills relative to other students his or her age, grade, or level of overall language proficiency (e.g., the Language Assessment Scales, De Avila and Duncan, 1991). The information gained can be used to categorize students, for example, into different reading levels. However, the information from a standardized diagnostic assessment is likely to be neither sufficiently refined nor contain a critical number of like items to effectively target specific subskills.

Alternative or formative assessment is, however, designed with this purpose in mind as Wiliam (2006) explains:

What makes an assessment formative, therefore, is not the length of the feedback loop, nor where it takes place, nor who carries it out, nor even who responds. The crucial feature is that evidence is evoked, interpreted in terms of learning needs, and used to make adjustments to better meet those learning needs (Wiliam, 2006, p. 285).

Assessment for learning, such as formative assessment, is especially pertinent in the case of young learners still acquiring a new language. Formative assessments can capture a broad array of relevant information for their teachers that is closely tied to the young learners' instructional needs (Davidson and Lynch, 2002; Frey and Fisher, 2003; Genesee and Upshur, 1996; Weir, 2005). Formative assessment can be conducted by teachers either informally while 'on-the-run' as part of on-going instruction, or it can be formal, that is planned in advance to address certain aspects of student language knowledge (e.g., McKay, 2006).

Formative assessments may include extra-child characteristics such as the classroom environment, parental involvement, home literacy habits, etc., and take many different forms (see Tsagari, 2004 for a brief overview of the nomenclature, and strengths and weakness of alternative assessments in the language assessment context). The use of informal observations, for example, allows for a range of skills (e.g., peer-to-peer oral discourse) not always amenable to more formal or standardized assessment environments. Observations can also be made formally and used to evaluate the quality of the language environment of a classroom rather than individual students (e.g., the Sheltered Instruction Observation Protocol, SIOP, Echevarria, Vogt, and Short, 2000). The use of progress maps on a developmental continuum in order to estimate a student's growth over time (Masters and Forester, 1996), and the use of portfolios to create individual profiles of language-learning progress and achievement (e.g., Butler and

Stevens, 1997; Puckett and Black, 2000) are alternative methods well suited to documenting the language of young learners (as well as other areas of their development, e.g., Meisels, 1993) and facilitating teachers' decision making for further learning.

#### DEVELOPMENTAL CONSIDERATIONS

Motivation for this chapter comes primarily from the recognition that there are developmental and contextual factors that must be taken into account with the assessment of young language learners (e.g., Inbar, Shohamy, and Gordon, 2005; McKay, 2006; Rea-Dickins and Rixon, 1997). Ten years ago when Rea-Dickins and Rixon (1997) prepared their chapter on young learners of English as a foreign language, there was a dearth of research in this area. This lack of information may have been a consequence of the marginality of foreign language instruction for young school-age students living in countries with major centers of research such as the USA. Since that time however, there has been considerable effort in the test development and research areas with initiatives under way in most English-speaking countries as a result of government mandates to assess progress in ELD of school-age learners. For example, in the USA, as a consequence of the passage of the No Child Left Behind Act of 2001 each state must create or join a consortium to create an assessment of ELD aligned to the individual states' standards for ELD (Gottlieb, 2003). In Australia, Canada, and the UK, similar initiatives have placed increasing emphasis on school systems to be held accountable for tracking progress in the language development of young students (McKay, 2005, 2006).

Also over this period of time, English has risen to its current status as the 'world' language—the language of a globalized economic and audio-visual/Web-based society (Graddol, 2000). No doubt in response to this status (however temporary), there has been an increase in young children studying English as a foreign language in non-English-speaking countries. In 2003 alone, the Cambridge *Young Learners English Tests* (YLE Tests, University of Cambridge ESOL Examinations, 2003) were taken by nearly 295,000 7–12-year-old children in 55 different countries (UCLES, 2003). Graddol (2006) reports that:

The age at which children start learning English has been lowering across the world. English has moved from the traditional 'foreign languages' slot in lower secondary school to primary school—even pre-school. The trend has gathered momentum only very recently and the intention is often to create a bilingual population (Graddol, 2006, p. 88).

An interesting prediction stemming from this situation is that in the future there will be only 'young' learners of English as older members of societies will have already acquired English earlier in life. Consequently, it is appropriate that learners in this young age range receive emphasis in future assessment development and research efforts.

In a recent review of research on the assessment of school-age language learners conducted in various parts of the world, McKay concludes that

Young learner assessment deserves to be established as a highly expert field of endeavor requiring, for example, knowledge of the social and cognitive development of young learners, knowledge of second language literacy development, and understanding of assessment principles and practices (McKay, 2005, p. 256).

Beginning with the impact of McKay's assertion on our understanding of assessment principles and practices, particularly test design with young children, Inbar, Shohamy, and Gordon (2005) identify three main areas: (1) format (whether individual, small group or whole class), (2) choice of item and task types, and (3) choice of contextualized, age-appropriate stimuli. Explicitly identifying these three areas raises specific challenges for test development practices with young children. In each case, design decisions must take the learning context into account to establish a match between instructional environment and assessment.

### *Test Format*

The language modality and age of the test taker will certainly dictate the appropriate format in which to assess young learners. Individual assessment will be necessary for coverage of many of the skills in the speaking and listening modalities. However, in the preschool setting, many classroom teachers also call upon children to respond in unison (e.g., sing-a-longs, calling out key words as a chorus, and providing en masse actions/enactments to stories and poems, Tabors, 1997). A child's ability to both comprehend and participate in such group activities should be at least one focus of assessment with the youngest language learners in this early instructional context.

Assessment of early literacy may need to be carried out in individual or in small group contexts because test takers cannot be relied upon to be sufficiently proficient to read directions for responding to print items or tasks, nor to maintain their attention in group settings. No matter the format, limiting the duration of the test to avoid testing fatigue will be of far greater concern with this young population than with older test takers.

### *Test Item and Task Types*

Choice of item and task types will need to correspond to the cognitive processing capabilities and degree of task familiarity of young learners. For example, Weir (2005) provides a language test item that requires making meaning from a bar chart. This type of task presents information in a way that primary school children will encounter in graphics during mathematics, science, or social studies lessons. An item type that requires responding to a series of questions based on information extracted from a graphic would be appropriate once children have, as part of the school curriculum, received explicit instruction in ‘reading’ graphic displays of information, otherwise the item type would be unfamiliar and the task demands too great for the young learner; simply put, the demands of the assessment should match the demands of the curriculum. Other cognitive developments that will restrict the range of tasks include attention span and memory. For example, multistep items that require sequential manipulations of information or lengthy passages of text followed by comprehension questions may be outside the cognitive capacity of the youngest language learners.

To lessen the negative impact of processing demands, and to capitalize on the sensitivity of learners’ abilities to obtain assistance from more expert others (Vygotsky, 1978), the revised *Pre-K/K IDEA Proficiency Test*, an assessment of ELD, includes partial credit items. These items are designed to account for the degree of verbal scaffolding given by the test administrator to support a response from the young ESL test taker (Bailey, Luoma, Cho, and Seretis, 2006). This strategy allows for diagnostic information to be generated. The differing levels of response reveal how much knowledge a child has and how much they still need to learn to succeed without assistance.

### *Task Content*

The content of the tasks needs to be relevant to the young learner in terms of cognitive demands and cultural specificity (culture is addressed further in the later section). The younger the learner the more contextualized the items will need to be in order for the test taker to make meaning of them. That is, items will need to be topically appropriate for the target age of the test taker, and the ability to answer the items should not require knowledge of information not already provided in the tasks or test items. Cognitive developments impacting these considerations include an awareness of testing procedures or the ‘test genre’ (i.e., cooperation in attempting to answer all items and providing adequate constructed responses), as well as an understanding of and opportunity to use decontextualized language—that

is, responses will be sufficiently explanatory for the absent test grader to make meaning of them. For the youngest learners, a number of easy ‘warm-up’ items can be used to familiarize the child to the tester and testing procedures and should not be scored. Bailey, Luoma, Cho, and Seretis (2006) introduced a hand puppet—‘Teddy as tester’—to administer several items on the *Pre-K/K IDEA Proficiency Test* to keep the child’s interest, as well as to establish rapport. Manipulatives (i.e., toy farm animals, dolls) can be incorporated in both item questions and response formats. According to research, young children are more successful on both production and comprehension tasks if the tasks use objects rather than pictures (e.g., Cocking and McHale, 1981; Serna, 1989 cited in Beck, 1994); objects help contextualize the task in the cognitively less demanding ‘here and now.’

Choice of age-appropriate content in test construction is made more complex with young learners than in other testing target groups because language development is concurrent with developments in other areas (e.g., scholastic, cognitive, and social developments). Because a child may begin learning a second or foreign language at any point in their early school years, the development of the language can be asynchronous with developments in other areas. The beginner status of young learners in the later elementary grades makes choosing content difficult (i.e., restrictions on availability of age-appropriate topics from which to select beginning level vocabulary and simple discourse contexts). This is also the situation if a test is to span an age range rather be targeted at individual grades or ages.

#### IMPACT OF CHILD DEVELOPMENT ON TEST INTERPRETATION

Cognitive and social developments not only impact test design, but also the manner in which tests are administered and interpreted. Assumptions upon which validity arguments are made with standardized assessments (e.g., Davidson and Lynch, 2002; Weir, 2005) are often compromised when administering such tests with young children. For example, the assumption of uniformity of the testing experience for all the test takers is not met with young children whose attention abilities and familiarity with test taking can vary tremendously (Powell and Sigel, 1991). Moreover, what is considered ‘typical’ for this young age range also varies tremendously. This raises the issue of whether using certain types of assessment with very young children is desirable. If the purpose of assessment is accountability of the program, then group level and classroom-related indicators (e.g., amount of student

engagement, ESL experience of teaching staff) may be most appropriate. If the purpose is diagnostic, then information on individual students may be preferred. However, caution is required because of the compromises outlined earlier. Interpretations from formative assessment approaches rather than from administration of standardized assessments may be more meaningful, as Hughes and Caiza's (2006) experiences with the Head Start National Reporting System (NRS) clearly demonstrate. In one preschool, based on individual testing of alphabet knowledge as part of the formal NRS testing battery, an external examiner was forced to conclude that few of the preschoolers knew their ABCs. However, after the examiner left, the researchers witnessed the preschoolers give a lusty rendition of the ABC song in English.

### *Guidelines for Assessing Young Children*

While not specifically targeting the assessment of language, there are now several general test administration guidelines for use with young learners. For the very youngest learners in the USA, the NEGP (1998) created the *Principles and Recommendations for Early Childhood Assessments*, which include but are not limited to the following guidelines:

- Assessments should be tailored to a specific purpose and should be reliable, valid, and fair for that purpose
- Assessment policies should be designed recognizing that reliability and validity of assessments increase with children's age
- Assessments should be age appropriate in both content and the method of data collection
- Parents should be a valued source of assessment information, as well as an audience for assessment results

Specific guidelines for assessment practices with young English learners have also recently been published by the National Association of the Education of Young Children (NAEYC, 2005).

As the basis for all assessment (clinical, scholastic, and linguistic) in K-12 education in the USA, the *Standards for Educational and Psychological Testing*, published by the American Educational Research Association (AERA), the American Psychological Association (APA), and the National Council on Measurement in Education (NCME) (1999) include comprehensive guidelines for the testing of individuals of diverse linguistic backgrounds, and researchers working with language minority students have additionally made contributions to guide assessment practices (e.g., Kopriva, 2000).

Suggested practices include use of test accommodations such as extra time and use of bilingual dictionaries or glossaries during test administration with English learners taking scholastic assessments (e.g., Abedi, Courtney, and Leon, 2003; Abedi, Lord, Hofstetter, and Baker, 2000). In the UK, accommodations have recently been extended to the use of a translator for 11-year-old students taking mathematics and science tests (Garner, 2006). Accommodations are thought to vitiate the interpretation of the test results obtained with ELL students (for a general discussion, see also Abedi, *Utilizing Accommodations in Assessment*, Volume 7). However, interpretation of accommodated results as valid indicators of content area knowledge has real consequences for students; we should still be cautious in our interpretations because as Davidson (1994) points out, norming studies of such scholastic assessments have often not included learners who reflect the full range of language proficiencies found in schools.

Other impacts on administration and interpretation of language assessments include the training needs of teachers who often must administer assessments to school-age language learners. General education teachers may have little training in language development (Wong Fillmore and Snow, 2000), and many have little experience in administering and interpreting assessments whether for language or the content areas (William, 2006). Scoring and reporting the test performance of young learners also proffer challenges to teachers and test developers. Scoring concerns include the degree of teacher variance in what is considered an acceptable answer. For example, children's immature articulatory abilities or their productions influenced by L1 may make responses difficult to decipher and thus score reliably.

Multiple sources of evidence should be used to prevent over-reliance on any one assessment that may yield a biased view of performance due to cognitive or social development constraints. Studies of expert teachers suggest that they use their knowledge of teaching and learning to create an on-going cyclic process of teaching and assessment involving a repertoire of both formal and informal assessments (Rea-Dickins, 2001). For example, evidence of language proficiency can come from combining a student's performance on formal assessments and informal quizzes, and from teacher observation during class time (e.g., Frey and Fisher, 2003; Genesee and Upshur, 1996; Salinger, 2001).

Finally, reporting the results of a test performance to young children also needs to be carefully considered and made age-appropriate to avoid issues of demotivation or threats to a child's self-esteem. However, reporting results to children and reporting results to teachers and parents need not be the same process, and teachers will need item level or subskill level information from assessments in order to make effective instructional modifications.

## IMPACT OF CULTURE ON ADMINISTRATION AND INTERPRETATION

Culture impacts the fair and valid testing of young children's language abilities when there is a mismatch between home practices in communication and those practices commonly used for assessment (for a general discussion, see also Davies, Ethics, Professionalism, Rights and Codes, Volume 7; Leung and Lewkowicz, *Assessing Second/Additional Language of Diverse Populations*, Volume 7). For example, Peña and Quinn (1997) report that Latina and African-American mothers typically do not label objects in their children's environment (as is the case for most vocabulary assessment), but rather engage in games that more often require descriptions. Thematic content of an assessment also needs to be compatible with children's home culture (at least culturally appropriate for the majority of learners taking the test, if known). Alternatively, assessors have successfully administered dynamic assessments using a test-teach-test design with preschool children to reduce bias from lack of cultural familiarity with vocabulary (Peña, Iglesia, and Lidz, 2001). In addition, many children come from cultures where they are expected to learn from observation rather than overt participation and to demonstrate their comprehension nonverbally (e.g., Beck, 1994; Scollon and Scollon, 1981). Collectively, this research should impact test development design, encouraging more development of dynamic assessments, or in the case of listening comprehension, creation of items that do not rely exclusively on verbal responses to signal accurate comprehension.

Early childhood agencies, such as Head Start in the USA, recommend assessing bilingual children in both languages the child is acquiring, although currently only Spanish and English language assessments are available to Head Start staff assessing the language and literacy development of 4-year-old children from low-income families (NRS, n.d.). In the UK, the need for caution with the interpretation of language assessments (e.g., the need to take account of all the languages a child knows in educational decision-making) has recently caught the attention of the Department of Education and Skills (for discussion, see Mahon, Crutchley, and Quinn, 2003).

## WORK IN PROGRESS AND FUTURE DIRECTIONS

The twenty-first century has begun with a new era of educational accountability, requiring massive test development efforts in many parts of the English-speaking world. In the USA, add to this mandate the anticipated expansion of publicly funded education to young, preschool-age children, many of whom are the children of immigrants

from non-English-speaking countries. In Australia, add to this the increased focus on the language-learning needs of aboriginal students (McKay, 2006). In Europe, add in the expansion of the European Union and the increased mobility this brings to families with young children settling in countries where they do not speak the dominant language. The Committee on Early Childhood Pedagogy (National Research Council, 2001) has made central to its mission the advancement of state-of-the-art assessments to support learning, the promotion of teacher knowledge of assessment use, and the integration and effective use of technology. These three recommendations can help guide the future of language test development with young learners.

*Recommendation 1: Advance the Technical Quality of Language Assessments*

To create assessments of the highest technical quality, test design will need further research on the use of specific test formats, item and task types, and test content taking into consideration the child developments reviewed in this chapter. For example, the relevant language construct(s) will be needed to be operationally defined through empirical research in classrooms, community settings, and social contexts continuing the work of several research initiatives in the last few years (e.g., Bailey, Butler, Stevens, and Lord, 2006; Gibbons, 1998). These efforts will help establish the developmental trajectories for language acquisition and characterize the language demands placed on young learners in various settings with sufficient detail to create effective specifications for test development.

While traditional notions of validity and reliability cannot be easily applied to establishing the technical quality of formative assessment approaches, criteria for establishing the effectiveness of formative assessment in the classroom can be created, discussed, tried out, and refined. Certainly, validity arguments for a formative assessment can still be made by addressing the meaningfulness, utility, and other roles the assessment might play in a student's language learning.

The effort to advance the technical quality of language assessments will also require the revision/creation of ELD standards for the pre-school through school-age levels. To date, few standards have been validated and many are written as vague aspirational goals rather than as descriptors of achievement objectives. Standards, if constructed and validated through expert review and research, can serve as a blueprint for assessment development and instructional practice (McKay, 2000). Standards are not cast in stone and must be periodically revised as our knowledge of the language constructs to be tested changes (F. Butler, personal communication) (for a general discussion, see also

Xi, *Methods of Test Validation*, Volume 7). Further research will also be needed to establish clear, principled procedures for making accommodation decisions (e.g., Bailey and Butler, 2004, 2006; Butler and Stevens, 2001; Haladyna and Downing, 2004). To achieve these ends, we need to encourage the participation in test development efforts of second language speakers who were once themselves young language learners. Individuals with such backgrounds can offer valuable insight and help develop expertise in this assessment area.

### *Recommendation 2: Teacher Professional Development*

Training teachers to create and/or administer tests and interpret the evidence they generate has emerged as an important topic in recent reviews of assessment practices (e.g., Wiliam, 2006). While some research has shown expert teachers to use assessment for learning (e.g., Rea-Dickins, 2001), more research is needed in the area of professional development to answer the question: “How do teachers effectively implement and use a wide repertoire of assessments for a variety of summative and formative purposes?” To that end, Davison and Hamp-Lyon (2005) have a project underway in Hong Kong to establish the efficacy of the decision made by authorities to introduce a school-based assessment component to the examination for the school certificate in English. This initiative involves extensive teacher training in school-based assessment and the creation of a DVD/Web-delivered training system. This aspect of the initiative brings us to a final focus for future research.

### *Recommendation 3: Leveraging Technology for Language Assessment of Young Learners*

Technology can provide teachers who lack familiarity with students from diverse language backgrounds with ways to more accurately assess their young language learners. For example, speech recognition technology is being utilized to provide teachers with automated assessment of English language and literacy skills in Spanish first language students (Alwan et al., 2006). Technology can also be used as a data management tool, especially in this era of using multiple assessments to establish a comprehensive view of student performance. Data management systems can help make formative assessment practices more effective by systematizing the information that teachers may record formally or ‘on-the-run.’

Technology is also especially suited to the assessment of young children (see also Chapelle, *Utilizing Technology in Language Assessment*, Volume 7). The graphic capabilities that technology offers can

also provide a child-friendly context for assessment, with testing made enjoyable for young test takers by mimicking familiar games, or cartoons. Moreover, a generation who has grown up with computer technology will be best placed for creating human–computer interfaces in ways perhaps current language testers cannot begin to imagine (Dunbar, 2005).

I conclude with a call to action. We urgently need the assessment of young language learners to evolve into what McKay called “a highly expert field of endeavor.” To achieve this goal, we need to follow rigorous test development procedures that begin with empirical research of the test design process including study of relevant language constructs, establishing criteria for judging effective practices in the area of formative assessment, the creation of validated standards for language development, and, in the case of large-scale assessment, the extensive and iterative piloting of items tailored to the learning needs of young children. With so many cognitive, social, and linguistic developments interacting with the test development process, and too little research providing the necessary specificity, such steps are critical in the creation of fair and valid tests of the linguistic achievements of our youngest learners.

#### ACKNOWLEDGMENT

I would like to thank Frances Butler, Margaret Heritage, Elana Shohamy, Frank Ziolkowski, and two anonymous reviewers for comments and suggestions during the preparation of this chapter.

## **Assessment in Society**

## HIGH-STAKES TESTS AS DE FACTO LANGUAGE EDUCATION POLICIES

### INTRODUCTION

In many school systems around the world, a single test score is used to determine achievement, learning level, grade promotion, and even graduation. Because of these high-stakes consequences, this type of test carries major implications for language education and language learners. In addition to awarding or barring an individual student from future opportunities, such tests are used in schools to guide a wide range of educational choices, including curriculum content, textbooks, materials, teaching methods, teacher preparation, programming, and language medium of instruction. The higher the stakes of a test, the greater the effects it has on the education that students receive. In this way, high-stakes tests act as *de facto* language education policies.

Yet rarely do policymakers speak about tests from a language policy perspective. Instead, the language policies embedded within high-stakes exams are typically implicit rather than explicit, though extremely powerful in shaping changes at the classroom level (Shohamy, 2001). When the language policy implications of high-stakes tests are not understood from the outset, this can result in effective language teaching being undermined. A new line of research has very recently been generated which explores high-stakes testing from a language education policy perspective, as shall be outlined in this review. Researchers in this area offer support for the connection between testing and language policy, and show how high-stakes tests rarely have the consequences intended by policymakers, in large part because teachers are the final arbiters of policy implementation.

In order to review the research in this area, it is first necessary to define language education policy (for a more detailed discussion of language policy, see Volume 1). For Spolsky (2004), language policy is defined as all of the “language practices, beliefs and management of a community or polity” (p. 9). Language policies can be ‘top-down’ or ‘bottom-up’ (Cooper, 1989; Kaplan and Baldauf, 1997). Shohamy (2003) offers the following distinction between language policy and language education policy:

Language policy is concerned with the decisions that people make about languages and their use in society, whereas

language education policy refers to carrying out such decisions in the specific contexts of schools and universities in relation to home languages and to foreign and second languages . . . (Shohamy, 2003, p. 279).

Language education policy therefore pertains to which language(s) will be the medium of instruction in schools, which languages will be taught, how they will be taught, and to whom they will be taught.

Sometimes language education policies result from language planning but, as described in this review, at other times they are simply incidental results of testing policies. Because schools engage in a wide assortment of language policymaking activities in this way, the definition of language education policy in this review includes the full range of 'bottom-up' and 'top-down' policies. In recent years, scholarly attention has been paid to social justice aspects of language policy, and to ensuring that school language policies do not contribute to language loss or social disparities because of language (Corson, 1999; Cummins, 2000; Skutnabb-Kangas, 2000; Tollefson, 1991). While some schools have contributed to language loss in their policies, others have contributed to language maintenance or revitalization as in the case of Quechua bilingual education in Peru or Hebrew revitalization in Israel (Hornberger, 1997; Spolsky and Shohamy, 1999).

#### EARLY DEVELOPMENTS

A standardized test is an exam administered and scored in a predetermined, standard way; accordingly, the administration, content, format, language, and scoring procedures of the test are the same for all test takers (Popham, 1999; Wilde, 2004). Standardized tests are taken around the world, and often used by school systems for high-stakes decision making. For this reason, this review begins by exploring the history of the standardized testing movement, with particular attention to the implementation of such tests with language minorities and immigrants. Because the link between testing and language education policy is very recent in research, this section discusses testing alone while later sections clarify the connection between testing and language policy.

Today's standardized tests have historical roots in the mental measurement movement that focused on Intelligence Quotient (IQ) testing (Spolsky, 1995; Wright, 2004). Spolsky (1995) reports that the whole testing movement initially flourished in the USA, and has spread globally since World War I. The advent of this movement has historical ties to language minorities and immigrants, as the development of intelligence tests, and IQ testing in particular, coincided with a rapid increase in immigration to the USA at the turn of the twentieth century (Hakuta, 1986). Alfred Binet is credited with creating the first IQ test in 1904 at

the request of the French government, for identifying children to be placed into special education programs. In 1917, after being translated into English, IQ tests were used by H.H. Goddard to test immigrants arriving to the USA via Ellis Island. Of 30 adult Jews tested, 25 were found to be “feeble minded” (Hakuta, 1986, p. 19).

Carl Brigham, one of the founders of the testing movement, applied IQ tests to two million World War I draftees in the USA and analyzed why test takers born in the USA or in the USA for 20 years or more outperformed recent immigrants (Spolsky, 1995). Basing his findings on national origin, race, ethnicity, and English literacy, he found that blacks were inferior to whites. Brigham categorized Europeans as “Nordics, Alpines, and Mediterranean races,” and found that Alpine and Mediterranean races were inferior to the Nordic race (Hakuta, 1986; Wiley and Wright, 2004; Wright, 2004). Hakuta (1986) critiques these findings with regard to immigrants, for failing to acknowledge the critical role that language proficiency plays in poor exam performance.

The political use of IQ testing was not limited to immigrants, as the tests were used as a sorting mechanism in education for all students; immigrants as well as other minorities have historically been particularly vulnerable to high-stakes decisions made on the basis of test scores. IQ tests justified racial segregation of US schools in the twentieth century and test scores resulted in the hierarchical ranking of students within schools of that era (Mensch and Mensch, 1991). In addition, the findings Brigham reported in his book, *A Study of American Intelligence*, influenced Congress to pass an act restricting immigration by “non-Nordics.” As Wiley and Wright (2004) summarize:

English literacy became a gatekeeping tool to bar unwanted immigrants from entering the United States when nativists began clamoring for restrictions. Simultaneously, literacy requirements barred African Americans at the polls . . . Thus, the so-called scientific testing movement of the early 20th century was intertwined with racism and linguicism at a time when the push for expanded uses of restrictive English-literacy requirements coincided with the period of record immigration (pp. 158–159).

From the beginning, testing has been exploited as a means to exert power, authority, and control. Scientifically proven to be neutral and impartial, tests very effectively sort, select, and punish (Shohamy, 1998; Spolsky, 1995). The sections that follow explore the intersection between testing and language education policy.

#### MAJOR CONTRIBUTIONS

In recent years, researchers have begun to examine high-stakes testing from a language policy perspective within the contexts of foreign

language and second language education. Their research explains the language policy implications of testing, and shows how the consequences of high-stakes testing are often different from what was intended. In her groundbreaking research, Shohamy (2001) describes why testing is a language policy issue in the introduction to her book, *The Power of Tests*. As she writes:

Professor Bernard Spolsky and I were asked to propose a new language policy for Israel. Given my background and interest in language testing, I again learned about the power of tests as it became clear to me that the ‘language testing policy’ was the *de facto* ‘language policy’. Further, no policy change can take place without a change in testing policy as the testing policy becomes the *de facto* language policy . . . It was then that I realized what an excellent mirror tests could be for studying the real priorities of those in power and authority, as these are embedded in political, social, educational, and economic contexts (Shohamy, 2001, p. xiii).

In Israel, a new national reading test was introduced in grades 4 and 5 which aimed to assess and monitor reading comprehension levels. The introduction of this test resulted in an increased focus on reading comprehension and ‘test-like’ teaching which, in essence, became the new curriculum (Shohamy, 1998). According to the local education inspector, the test was intended to cause major changes to teaching; as such, the actual purpose was different from the stated one (Shohamy, 2001). Similarly, a new test of Arabic as a foreign language was introduced in Israel for seventh, eighth, and ninth grades, which a government official explained was intended to raise the prestige of Arabic among Hebrew speakers. After several years, Shohamy (2001) found that the test had influenced teaching, learning, and the curriculum, to the extent that teaching and testing essentially became synonymous. While the test had changed teaching and learning, it had not successfully raised the status of Arabic. These cases show how policymakers use tests to create *de facto* policies that will promote their agendas and communicate their priorities, a top-down practice which Shohamy (1998, 2001) characterizes as unethical, undemocratic, and unbeneficial to the test-taker.

More recently, Shohamy (2006) highlights the following as the three major language policy implications of testing: determining prestige and status of languages, standardizing and perpetuating language correctness, and suppressing language diversity (p. 95). For example, the use of the Test of English as a Foreign Language (TOEFL) internationally to determine school or university entrance contributes to the high status and prestige of English as a global language.

Uniformity of approach and content is a common result when assessment systems act as language policy, both in foreign language

and second language education. In Europe, a 'Common European Framework' was developed with the intention of unifying language testing and assessment across different countries. Though the document states it does not seek to create a single system, within the context of a merging European Union in which individual countries are concerned about maintaining their independent identities, teachers believe the Common European Framework represents a sequence of how and what learners learn (Fulcher, 2004). In spite of what the document states are its intentions, teachers interpret it as prescriptive, so it is creating a single system in actuality.

The language education research on what is termed testing 'washback' offers further evidence for tests as *de facto* language policies in education (see also Cheng's review of Washback, Impact and Consequences, Volume 7). 'Washback' refers to the effects of tests on teaching and learning (Cheng, Watanabe, and Curtis, 2004; Wall, 1997). Cheng and Curtis (2004) note that the concept of washback is "rooted in the notion that tests or examinations can or should drive teaching, and hence learning" (p. 4); according to their perspective, washback can be either positive or negative. The findings in this area of research, however, seem to indicate that the effects are usually negative and not what was intended.

One major critique of testing is that classroom curriculum and instruction is narrowed as a consequence, covering primarily or solely the material on the test; within a high-stakes testing context, 'teaching to the test' becomes commonplace. This is reported as far back as 1802, when a new examination was introduced at Oxford and criticized because it resulted in a student's education becoming narrower than before and focusing only on the subjects being assessed (Simon, 1974 as cited in Wall, 1997). More recently, in Britain, Freedman (1995) found that revised writing tests did not lead to improved student performance, but rather impeded the curriculum and caused it to change in negative ways. Hayes and Read (2004) demonstrate how changes to the English language testing system in New Zealand show washback effects, with teachers and students narrowly focused on test tasks rather than on academic language proficiency in the broader sense.

In research on the National Matriculation English Test (NMET) in China 15 years after it was first implemented, Qi (2005) shows that the exam has not had the positive effects that were intended, as teaching of linguistics knowledge rather than communicative competence is still emphasized and the type of language taught is limited to the skills tested. As the author states:

When crucial decisions are made on the basis of test results and when one's interests are seriously affected, who can afford not to teach to or study for the test? This is especially true when the sole measure of the success of the educational

process being evaluated is the test scores . . . [H]igh-stakes tests, powerful as they are, might not be efficient agents for profound changes that are believed to promote the development of educationally desired knowledge and ability. This is because the very function that empowers the test is likely to be in conflict with its intended washback effect, making it too blunt an instrument for promoting desirable changes in teaching and learning (Qi, 2005, p. 163).

The higher the stakes of an exam, the more likely it is that the test will shape teaching, learning, and language policy. As the author explains, the notion of using high-stakes testing to positively change teaching is innately problematic, due to the pressure it creates to teach to the test.

Cheng (2004) studied changes to language testing in Hong Kong that, like the NMET in China, were intended to change instruction in a top-down way. She found that the Hong Kong Examinations Authority had successfully changed “the *what* in teaching and learning”; however, “the extent to which this new examination has changed the *how* of teaching and learning was limited” (Cheng, 2004, p. 164). The author concludes that the washback effects are negative because high-stakes exams drive teaching and learning in the direction of drilling what is required of the exam. By definition, the scope of what is learned is limited, and drilling or rote memorization activities overshadow possibilities for authentic language use.

From these studies, it seems that the possibilities for positive washback effects from high-stakes testing are limited by the nature of the exams themselves. Washback research explores the ways that testing changes teaching and learning, though little attention is paid in this literature to the effects of testing on the lives of educators and students in schools. This differs from research on testing from a language policy perspective, which considers the impact of testing on language education, but also explores the social justice implications when a test acts as *de facto* language policy.

#### WORK IN PROGRESS

The current situation in the USA provides a unique example of testing as *de facto* language policy, and research is now beginning to be generated which examines this movement in light of the complex sociopolitical issues which surround it. More immigrants arrived to the USA during the 1990s than any other single decade, and the population of non-English speakers has expanded by 40% (US Census Bureau, 2000). In schools, a renewed focus on standardized testing has emerged at a time when immigration rates are soaring. High-stakes

exams have resulted in radical changes to the education that immigrant and language minority students receive, including the elimination of bilingual education programs and the penalization of students for not being proficient in English. Current policies in the USA have not only impacted immigrants, but have also affected foreign language education, as foreign languages are not required for high-stakes decision making and therefore dismissed as less relevant.

In 2001, *No Child Left Behind* (NCLB) was passed into law by Congress. The current law mandates that English language learners (ELLs)<sup>1</sup> be included in the state assessments that all students take, and that their performance on the assessments shows “adequate yearly progress towards mastering academic content and English proficiency” (US Department of Education, 2001). Schools must demonstrate student progress in order to continue to receive federal funding without sanctions. Most states have interpreted the law by requiring all students to take standardized tests in English to meet the assessment and accountability requirements; in this way, a single test score now carries high-stakes consequences and has resulted in the creation of incidental language policy.

NCLB replaced and repealed the *Bilingual Education Act*, which was part of the preceding federal education legislation. Because the law no longer mentions bilingual education or the use of languages other than English in instruction, researchers argue that it encourages English-only approaches (Evans and Hornberger, 2005). Moreover, because the assessments being used by states to comply with NCLB are usually in English, they place ELLs at a disadvantage. In addition, by intertwining the English language with content learning, Byrnes (2005) shows how foreign language learning has become sidelined.

Menken (2005) has documented the effects that NCLB testing policies are having on ELLs from a language policy perspective. Her qualitative research in New York City examines the effects of a recent requirement that ELLs pass state exams in order to graduate from high school—part of the state’s accountability system in accordance with NCLB. This study found that all of the exams rely heavily on language proficiency, which poses enormous challenges for ELLs and their teachers. Each year, scores attained by ELLs range from 20 to 50 percentage points below native English speakers (New York City Department of Education, 2005 as cited in Menken, in press).

As a result, tests have become *de facto* language policy in schools: they shape what content is taught in school, how it is taught, by whom

---

<sup>1</sup> Language minority students in need of language support services to succeed in English-medium classrooms are termed ‘English language learners’ or ELLs in the USA.

it is taught, and in what language(s) it is taught (Menken, 2005). School administrators and educators in the sample changed their language policies to respond to the demands of the exams, most often by increasing the amount of English instruction students receive; however, one school instead increased native language instruction as a test preparation strategy. As she writes:

The tests themselves leave the task of interpretation to teachers and schools, who decipher the demands of the exams and use them to create school-level language policies. These educators become language policymakers, deciding how native language is used in the classroom, if at all, and using an array of strategies to prepare their students for the exams (Menken, 2005, p. 267.).

These changes are troubling because they are being driven by the tests, which were not developed to meet the specific educational needs of ELLs; as a result, this research found that many of these changes reduce the quality of education that students receive. Additionally, testing is a defining force in the daily lives of ELLs and the educators who serve them, and has created a context in which language is a liability for these students because the tests are mainly punitive in result.

These findings are recurrent nationally, where ELLs are disproportionately failing high-stakes tests and being placed into low-track remedial education programs, denied grade promotion, retained in grade, and/or leaving school (Valenzuela, 2005). Sloan (2005), McNeil (2005), and Hampton (2005) report a narrowing of school curricula and large amounts of instructional time devoted to test preparation in Texas classrooms. They uncover that science and social studies are being abandoned at the elementary level, because tests of English and math are the areas required under NCLB, and 'curriculum inspectors' are being used to ensure that teachers are actually doing required test preparation. Further support for findings regarding narrowed curricula and impact on teachers and students is offered by Wright (2002), who conducted qualitative research at an elementary school in California.

Crawford (2004) reports that NCLB testing policies undermine bilingual education programs when the tests are provided in English only. In a dual language bilingual education program in Montgomery County, Maryland, in which instructional time was balanced equally between English and Spanish, children took a full range of language and content courses in both languages. However, the school district became concerned with poor reading scores by ELLs on high-stakes exams, and mandated two and a half hour blocks of English phonics each day. This increased the amount of English instruction, which disrupted the bilingual program's equal instructional time in each

language. This language policy change was not explicitly mandated by NCLB, but rather done implicitly (Crawford, 2004).

Other studies also point to the ways that high-stakes testing in the USA promotes English-only policy when the tests are only provided in English, particularly in California and Arizona where they have also passed anti-bilingual education legislation. Gándara (2000) and Gutiérrez et al. (2002) note how difficult it is for schools to retain native language instruction when the sole measure of accountability is performance on a state test that is only offered in English, connecting recent testing reforms to English-only policy. Although bilingual teachers in California continued native language instruction immediately after the passage of the anti-bilingual education mandate, they expressed feeling pressure to teach more English because of the English-only state assessments (Alamillo and Viramontes, 2000).

In a study of high school exit exams in four southwestern states with large ELL populations, García (2003) notes a major negative consequence of requiring ELLs to pass an exam in English for high school graduation is the implementation of an incidental English-only policy. As she writes:

A third problem is the possible simultaneous adoption of English-only language policy as a byproduct of education policy. The implementation of a high school requirement demanding the use of English, as most exit exams do, is tantamount to making English the official language (García, 2003, p. 444).

More recently, Wiley and Wright (2004) set the NCLB act within the historical context of language policy in the USA, noting how the word 'bilingual' has now completely vanished from federal legislation. They critique the inclusion of ELLs into tests in English when they have not had sufficient time to acquire the language, highlighting the similarity between current high-stakes tests and literacy and intelligence tests administered during the early twentieth century to bar immigrants from entering the USA. They argue that although NCLB allows for bilingual programs, the law is more likely to encourage English-only approaches (Wiley and Wright, 2004).

Byrnes (2005) states that language education policy is embedded within NCLB more generally, extending beyond the education of ELLs to encompass foreign language education as well. She notes how a primary effect of the law is the "symbolic power of authenticating American English as the 'normal' language of American public education and, by implication, of American institutional and public spaces" (Byrnes, 2005, p. 280). In this way, the learning of languages other than English does not 'count' as much as English under current US education policy.

PROBLEMS, DIFFICULTIES, AND  
FUTURE DIRECTIONS

As described above, language policies are created by high-stakes testing at every level of educational systems around the world in ad hoc, uncoordinated, and often competing ways. More often than not, this is done implicitly, with the language policy implications of tests rarely being discussed openly or explained from the outset, and with test scores being interpreted by the general public as neutral and independent from the sociopolitical context surrounding schooling. Yet tests wield enormous power over the lives of the students and educators most closely affected by them and affect how testing policy is exercised in schools and societies. For example, they shape the instruction and educational experiences of students in school, and also determine students' futures. This is extremely crucial for immigrant, minority, and poor students who are most vulnerable to inequitable educational decisionmaking based on test scores; race and class remain the greatest predictors of educational performance as measured by standardized tests (Orfield, 2001). In addition, tests affect the status of languages and limit their diversity in schools.

Whether done explicitly or implicitly, the findings from the studies cited here show that the effects of high-stakes tests as *de facto* language policy are often unintended. The acknowledgment in research of the intersection between testing and language policy is very recent; overall there is very little research on this critical topic. Yet major decisions are being made in school systems every day based on test scores. At the school level, curriculum and teaching is narrowed to the material on the tests, and certain languages are privileged over others in education. Moreover, tests can offer a justification for the perpetuation of societal inequities in schools, a trend from the past being repeated in schools today.

In light of these complex issues and limited research on testing as language education policy, there is a need for further research in this area. The following are possibilities for future directions:

- More research is needed which explores how testing shapes language education policy and can offer guidance for the use of assessment to inform educational practices and instruction in positive ways. For example, it would be useful to learn if the use of multiple measures of student achievement (e.g., the use of portfolios, an array of samples of student work, grades, classroom performance, and teacher recommendations) for high-stakes decision-making would have an equal impact on choices of language medium of instruction, language standardization, and language status as the use of a single test score has.

- Likewise, research on the development of clear and cohesive school-wide language policies in individual schools would be valuable to learn if tests impact language education policy as greatly in schools with strong language policies already in place.
- There is a need to examine the impact that language education policy has on testing policy, as well as vice versa.
- Given the power of tests, another area for future research is to determine what impact testing has beyond schools, if any, on wider language policies.

## THE SOCIO-POLITICAL AND POWER DIMENSIONS OF TESTS

### INTRODUCTION

Language tests have a long history as a social practice, but the social and political functions of tests are neglected in most of the basic texts on language testing, and in the training of students and researchers preparing to work in language testing as a practical or as a research field. While in earlier eras, as Spolsky (1995) has pointed out, there was considerable awareness and discussion of the ‘encroaching power’ of tests, this awareness began to diminish with the advent of the period in which language testing came to be seen as a science, particularly in the USA during the Cold War. Psychometrics, or the measurement of cognitive abilities, a discipline combining psychology and statistics, was, given its intellectual sources, relatively asocial. Furthermore, the linguistics which provided the intellectual discipline for thinking about the content of language tests was, at this time, also largely asocial, focussing on *langue* not *parole*, on competence rather than performance. While this has changed considerably since the advent of communicative language testing, the structuralist heritage of linguistics has been difficult to shake off, and in any case even a socially informed linguistics has tended to focus on the immediate social context of communication and has had little to say about the broader social and political context in which language tests are commissioned and used. Taken together, the cognitive orientation of psychometrics and the relative lack of social theory in linguistics, has meant that language testing as a field has been relatively handicapped in understanding itself as a social practice. There are, however, signs that this situation is beginning to change, although the task ahead remains formidable.

### EARLY DEVELOPMENTS

The social function of language tests is emblematically represented by the story of the shibboleth in the *Book of Judges*, a language test of identity. Defeated soldiers of the tribe of Ephraim tried to pass as conquering Gileadites, but were outed as they tried to escape by being forced to pronounce the word *shibolet*, meaning ‘an ear of wheat’, or possibly ‘a stream’, which as Ephraimites they pronounced *sibolet*.

An Ephraimite identity was thus ‘uncovered’ through a language test; the Ephraimite soldiers so revealed were put to death in their tens of thousands. Shibboleth practices continue to be found in every age in every culture (for a detailed discussion, see McNamara and Roever, 2006, Chapter 6)—in medieval Christendom, in the medieval Muslim world, in Europe of the Renaissance and Reformation, and in the twentieth and twenty-first centuries, for example in Japan in 1923, in the USA during the Second World War, in Sri Lanka in 1958 and in 1983, during the Lebanese Civil War of the 1980s and in contemporary Botswana, to name just a few examples. In each case, fraught inter-group relations involve the identification of insiders and outsiders through tests of pronunciation of language. Such tests are not always used offensively, but also defensively, against oppression, as in shibboleths used as passwords among forces fighting the Nazis in the Netherlands and Czechoslovakia during the Second World War.

While these informal tests are not *formal* tests of language proficiency, they have great symbolic significance as exemplifying, in terribly dramatic fashion, the widespread social functions of formal language tests in inter-group settings, particularly in contested ones. And while such informal tests obviously lack psychometric rigour, a fact which in some cases seriously hampers their efficiency, an improvement in their psychometric qualities would not alter their social function; it would simply make them more efficient, but also, in some cases, arguably fairer. In fact, within the psychometric tradition, the concern that the tests be fair (Kunnan, 2003) represents the principal form of attention to the social dimensions of tests. Psychometric practice recommends that response data to tests be analysed for test bias, that is, a tendency of the test to favour one social group over another, for example, boys over girls, or speakers of one language over speakers of another. A range of sophisticated psychometric techniques is available to detect differential item functioning (DIF), and these techniques have recently been complemented by others which can deal with performance data, for example data from judges estimating the quality of performances in speaking and writing. A number of possible interactions between different facets or aspects of the testing situation can be explored using such techniques, and this is important as all of these represent potential sources of bias. They include interactions between the gender of judges and the gender of candidates (Brown and McNamara, 2004; O’Loughlin, 2002), the language background of judges and the language background of candidates, or the character of certain workplace related communicative tasks and the degree of work experience of such tasks among judges themselves (Brown, 1995). The goal of such analysis is to develop a fair test, one which is not unfairly biased against one group or another. But the actual uses

of tests are not investigated in such analyses. The test use is treated as an unproblematic given, and the investigation is restricted to the presence of group bias (understood in statistical terms) in its administration. In general, the capacity of psychometrics to deal with social issues is restricted, because it struggles to adequately conceptualise test use.

### MAJOR CONTRIBUTIONS

Discussions of validity in language testing have begun to find a space for consideration for the social and political functions of tests, following developments in validity theory within general educational contexts. The evolution of the discussion of validity to acknowledge the social dimension of assessment can be observed in the work of Cronbach between the 1950s and 1980s. Cronbach's early work on validity (Cronbach, 1971; Cronbach and Meehl, 1955) treated measurement purely cognitively, that is, within a social vacuum. In his work in programme evaluation, however, he acknowledged the social context of the evaluation very explicitly, and to the extent that this involved the use of test scores, began to theorise the social dimension of test use. This theorisation ultimately spread to his work in psychometrics, and found its best expression in the subsequent work of Messick, which it influenced strongly.

A concern for the social context of test use is included in Messick's widely cited discussion of validity (Messick, 1989). In addition to a psychometrically orthodox concern with the reasonableness of inferences about candidates based on test performance, including in specific contexts of use, that is, about fairness, Messick went further to theorise test use itself. There were two aspects of this: first, he stressed that test constructs embody values, which will have social and political meaning; and second, that tests when used have social consequences. Michael Kane (1992, 2001), whose work is strongly influenced by Messick, sets out the stages in an interpretative argument to justify the inferences about candidates that we draw on the basis of test scores, and significantly includes test use as a stage in the argument, that is, as requiring articulation and defence.

Within language testing, the response to Messick's concern for test consequences has been most clearly seen in work on test washback (the influence of tests on teaching and learning leading up to the test: Alderson and Wall, 1996; Cheng, Watanabe and Curtis, 2004) and on test impact (the test's influence on the wider society: Wall, 1997). A broader general discussion of the social responsibilities of language testers is enshrined in professional codes of ethics, such as the International Language Testing Association's Code of Ethics (ILTA, 2000) and draft Code of Practice (ILTA, 2005), and the Code of Practice

and accompanying quality assurance framework from the Association of Language Testers in Europe (ALTE, 1994).

Spolsky's *Measured Words* (1995) marks a return to the systematic consideration of the political function of tests after a long fallow period in which purely psychometric considerations were paramount. In this landmark work, Spolsky traces the evolution of the modern psychometric tradition of language testing, and in the second half of the book shows how this development was crucial in determining the institutional struggle for control of the Test of English as a Foreign Language, or TOEFL, a battle eventually won by Educational Testing Service (ETS). The book shows how ETS's commitment to psychometric rigour was instrumental in gaining control of this gatekeeping test of English for international students.

A further landmark text is *The Power of Tests* by Shohamy (2001). Shohamy has developed a field known as critical language testing, in which the socio-political function of tests, particularly when these are covert, is revealed through research, and alternatives to existing assessment practices are canvassed. The work explores the oppressive potential function of tests in the context of education, immigration and citizenship, and is a programmatic statement of research that needs to be done in the field.

McNamara and Roever's *Language Testing: The Social Dimension* (2006) builds on the work of Spolsky and Shohamy to offer a critique of the psychometric tradition and to advocate a more socially aware approach to language testing. This book explores in detail the psychometric tradition of concern for test fairness as one way in which the social dimension of language testing is addressed, and the difficulty experienced within that tradition in dealing with test use, and argues that we need conceptual frameworks beyond those countenanced within validity theory if we are to adequately conceptualise testing as a social practice.

Examples of research focusing on the social and cultural value dimensions of language testing constructs are beginning to appear. Akiyama (2004) considered the case of the English language test used as part of the highly competitive tests used to control entry to senior high schools in Japan, where there is a fierce competition for places at the most prestigious schools. To date the senior high school entrance examination has not included an assessment of spoken language skills, even though an emphasis on spoken language skills is part of the official curriculum both for the junior high school and the senior high school. English language teaching at the senior high school is in fact dominated by preparation for the University entrance examination, which again is highly competitive and involves high stakes, and again does not include tests of spoken language. The absence of a test of

spoken language in the senior high school entrance examination has a negative influence on language teaching in the junior high school. In exploring the feasibility of introducing a speaking test, Akiyama discovered a number of objections on practical grounds, but more relevantly here, there were objections on cultural grounds in terms of the values that test constructs represent. It seems that one of the goals of the education system in Japan, as in many countries, is to build the moral character of citizens, and this is seen as achieved by demanding subject matter which is both cognitively challenging and which requires stamina and consistent effort on the part of the student. Skill in speaking is not held to be evidence of intellectual achievement and does not necessarily require the discipline and hard work that the school system encourages. As the skill is not prized culturally, it is not considered to be a worthy subject for examination. The cultural values embedded in the constructs represented in the existing test represent a major obstacle to its reform.

Another study demonstrating the presence of values in test constructs is the work by Helen Moore (Moore, 2005) on the political and social struggle in the 1980s and 1990s to determine the form of assessment of English as a second language development in students in Australian primary and secondary schools. The demands of government policy and the need for accountability in the educational system meant that the government insisted on a form of reporting achievement in conformity with reporting in other parts of the education system than English as a second language. This latter form of reporting embodied deeply held political values about the role of minorities in the educational system and equality and access within the system. These views were at odds with the views of experienced language teachers who were concerned with the welfare and the language development of English as a second language students in the schools. They felt that their framework for assessment was better targeted and more sensitive to the needs of these students, but this approach was at odds with the government policy of the time, and was not adopted.

Moore's study shows in general the role of government policy in determining and dictating test constructs, an issue which is apparent in educational systems all over the world. This has been documented extensively by Brindley (1998, 2001), Kunnan (2005) and others. For example, in the 'No Child Left Behind' policy, adopted in 2001 in the USA, compulsory assessment of achievement in English and other subject areas is a condition for the continued independence of the school. Schools which cannot demonstrate what is called 'adequate yearly progress' of their cohort of students on the tests involved, and where they are failing or falling short, do not show improvement year by year, are subjected to severe sanctions. Again, the role of language

assessment and other forms of assessment is to achieve government policy goals, and the implications of this policy in terms of its consequences throughout the whole system, is currently the subject of intensive study. Many of the consequences are unexpectedly negative.

A further example of the role of assessment frameworks as a tool of government policy is evident in the influence of the Common European Framework of Reference (Council of Europe, 2001) throughout language education in Europe, where a single reporting system is influencing language education at every level.

#### WORK IN PROGRESS

A number of studies are currently being undertaken on further aspects of the social and political dimensions of tests. These include studies of the use of language tests in the processing of asylum seekers, in immigration contexts, in citizenship procedures, and as instruments for the implementation of educational policy.

A number of governments around the world are using language tests as part of the process of determining the claims of *asylum seekers* (Eades, 2005; Reath, 2004). Under international refugee conventions, if a refugee is from a state where there is evidence of persecution or human rights abuse, he or she has a right to asylum in other countries that are signatories to this convention. Establishing the nationality of the refugee claimant is thus crucial, but rendered problematic by the fact that the asylum seekers, given the circumstances of their departure, typically arrive without documentation. Receiving governments tend to want strong proof of nationality, on the grounds that sometimes false claims are made about nationality in order to claim refugee rights illegitimately.

One of the investigative tools used to determine nationality is a form of language test, in which the applicant is required to demonstrate proficiency in a variety held to be associated with a particular national status (on the grounds that Americans sound American, Australians sound Australian and so on). The crudeness of this assumption is of course a major problem: not all Americans sound American, not all Australians sound Australian and so on—it depends very much on the circumstances of their life, what linguistic influences they have been subjected to, what contact they have had with speakers of other varieties, and so on. Moreover, national and linguistic boundaries do not coincide in many countries, and careful sociolinguistic analysis is required to form a basis for making predictions about the language/nationality link in particular cases, research which is understandably usually entirely lacking in regions with the sort of history of political disturbance associated with refugee flows. Furthermore, the history of the refugees is usually complex in that they have spent time in a number of places along their

route to the country in which they seek asylum, and this will often have an influence on their linguistic behaviour, which may then be held against them. The construct on which the test is based, in other words, is quite problematic. Moreover, the assessment method is crude in the extreme. An interview with an immigration officer with the help of an interpreter is conducted in the language in question, and a tape recording is sent for linguistic analysis. Both the qualifications of those conducting the analysis, their methods and the criteria they use for determining their judgement of the case, frequently give serious grounds for concern. In particular, over-certain judgements are made in cases where the evidence is ambiguous at the very least. A further troubling aspect of the situation is that although the problems outlined earlier have been vigorously pointed out to government authorities by groups of concerned linguists and language testers (Eades, Fraser, Siegel, McNamara and Baker, 2003), no action has been taken to remedy them. The political advantage to governments of appearing to have a hard line on refugee claimants means that challenge on academic grounds may not be taken seriously. Despite this, a group of linguists internationally have developed guidelines for the use of expert linguistic evidence in the determination of the claims of refugees (Language and National Origin Group, 2004), and these have been adopted by relevant national and international organisations.

The use of language tests as part of *immigration* procedures is increasingly common. Nations may require of intending immigrants that they demonstrate proficiency in the national language for a mixture of pragmatic and ideological reasons. Pragmatically, knowledge of the national language is associated with increased chances of employment and successful integration into the host society. Moreover, in contexts where employment involves the use of the national language, the rights of those involved, such as patients, may need to be protected, as language proficiency can be seen as an aspect of professional competence. However, language tests have a potential for exclusion in such contexts. Recently in Europe, there have been obvious tensions involving host and minority communities in a number of countries and the response has sometimes involved language tests. For example, a recent decision of the government of the Netherlands has been to introduce a test in Dutch for all intending immigrants who will come as spouses of Dutch citizens. This is particularly important for the Moroccan community, which has had a tradition of seeking spouses from Morocco. All future intending immigrants who are intended spouses need to pass a test in Dutch which is administered in their country, for example Morocco, and this test is conducted by telephone. Its intention is clearly to exclude. The most notorious historical example of exclusion of immigrants via a language test is the Australian Dictation Test, which

was used in the early twentieth century as the primary method of implementing the racist immigration policy known as the 'White Australia Policy'. In this procedure, undesirable immigrants were given a language test on arrival in a language it had been established they did not know, and were thus bound to fail.

The use of language tests in *citizenship* procedures is also a significant issue worldwide. Many countries (for example the USA) have long had a requirement of some knowledge of the national language for citizenship. But the procedures for establishing competence have been informal, often carried out by untrained government personnel as part of a citizenship procedure. Even where the test was administered in a supportive and kindly fashion, Winn (2005), in an American study, found that approximately 16% of the applicants failed the test.

The failure to gain citizenship on the basis of ignorance of the national language raises the question of on what grounds language should be seen as a requirement for citizenship. There are usually two arguments made: one is that the person concerned needs to be able to understand enough about the politics of the country, and to receive communications from the government about matters to do with the rights and responsibilities of citizenship to participate in the political life of the country. However, it might be argued that this information could be supplied in a language with which the person is familiar (although in extensively multiethnic communities such as London, or where people are not literate, this will involve practical difficulties and possibly considerable expense). A second argument is that knowledge of the language will be an indication of a desire to integrate, or of an existing level of integration, into the host community. This latter argument is becoming more prominent in the context of inflamed inter-group relations in Europe, and elsewhere; for example, in England and Australia, immigrant clerics are required to be proficient in English, given their role in integrating the community into the host community.

It is significant that the level of proficiency required for citizenship differs from country to country. In this the formulation of policy in relation to specific inter-group contexts and inter-group tensions is clear, as obviously the level of functional communicative skill required for social and political participation will be similar across contexts. The reality is different, for example in Europe, where different countries have differing requirements in terms of levels on the Common European Framework of Reference.

#### PROBLEMS AND DIFFICULTIES

The main difficulties impeding progress in this area are a reluctance on the part of the language-testing profession to seriously engage with

language testing as a social and political practice, and the lack of an adequate theory of the social context in which tests find their place even within discussions of the social dimensions of language tests. The reluctance, some might argue, is due to an uncertainty as to what exactly to do about language testing as a social and political practice; it may appear safer to bury one's head in the sand. The theoretical gap is largely due to the relative isolation of language testing from other parts of applied linguistics, and from the humanities in general. Most theories of communication in language testing lack a relevant theory of social context. Social context in the applied linguistics literature on which testing draws is understood in the way that it is understood in Hymes's model of communicative competence, that is, as determining rules for speaking, which form another aspect of proficiency, still understood as a purely cognitive issue. This cognitive orientation is central to Bachman's model of communicative language ability (Bachman, 1990; McNamara, 1997, 2003). The lack of an appropriate model of the broader social context in which to consider the social and political functions of tests is true of work in validity theory in general, even in progressive theories such as Messick and Kane.

It is not that relevant theories are not available. Developments in social theory have great potential for illuminating the social context of tests: for example in the work of Bourdieu, as pointed out by Elana Shohamy (2001) and Pamela Moss (1998). A particularly rich potential source is Foucault's *Discipline and Punish* (Foucault, 1977 [1975]), which deals with the historical emergence of the examination as a key instrument of modernity. In Foucault's view, a fundamental historical transformation took place in the eighteenth century, whereby power was instituted not by brute physical force, but by means of inspection and surveillance. The prototype of this is the model prison, in which prisoners were permanently conscious of potentially being under surveillance, whether they actually were or not. This consciousness was enough to discipline them, because it made them internally aware of the power that kept them under surveillance. This led to an internalisation of consciousness, so that the prisoners in effect disciplined themselves. Foucault argues that the prison is emblematic of the power of examination and classification in general in modern society, in which power is rendered invisible and the subject of that power, the individual, is made visible through inspection and categorisation. The categorisation of individuals is then internalised by them and is the basis for their sense of themselves, their subjectivity. Tests thus play a major role in modern society in constructing social identities.

Unfortunately, the training of language testers does not typically include exposure to such social theory, or the critiques of testing as a social practice that it implies. This is perhaps not surprising given that

such perspectives are still a minority tradition within applied linguistics more generally.

A further problem is who should carry out research on the social and political functions of tests, even given an appropriate theoretical orientation to the question. It is not clear that those who are responsible for the development of the tests should simultaneously be responsible for the critical perspective on them. Bachman (2005) has suggested a procedure for considering test use as part of a larger validity argument, following Kane. While this seems sensible from a practical point of view as far as the test developer is concerned, it should not be understood as encompassing all the possibilities for research on the political and social functions of tests. The field of language testing needs to become more diverse in scope, with research within the context of test development complemented by a different kind of research on the social function of tests.

#### FUTURE DIRECTIONS

Work informed by an understanding of testing as a social practice is needed in a number of domains. In education, assessment frameworks are being used to determine the way in which educational outcomes are reported. This simple expedient effectively gives control over the curriculum. There is thus a need to understand the way in which such assessments in schools, used to implement and evaluate social and educational policy, impact on the teaching and learning process and the role of teachers as mediators of the assessment. The overwhelming bureaucratic character of language assessment in schools threatens to make teachers even more cynical about it and ways of turning it to productive account for teachers and learners is crucial. Work in Britain by Rea-Dickins (2001) and Leung (2005), in Australia by McKay (2000) and in Hong Kong by Davison (2004) has begun to explore this issue. In the USA, where outcomes reporting is associated with drastic penalties for 'failing' schools under the 'No Child Left Behind' policy, the impact of assessment is more directly observable, but there are many indirect effects of this policy as well, for example, its damaging impact on bilingual education. Much ongoing research is addressing these issues (Byrnes, 2005), and more needs to be done.

The use of tests in citizenship is likely to be the subject of much further research and debate, in order to inform public debate on the issue of in what contexts and with what procedures it can work constructively and humanely, and in which contexts it is destructive and goes against the rights of citizens. We also need to evaluate, for example through case studies, the ways in which researchers in language

testing can productively engage with policy makers, to attempt to exert the maximum influence on policy development.

As international education develops, the impact of major international English language tests on the identity of those who take them, both those who pass and those who fail, needs to be explored. Language testing also needs to engage with the issue of the de-authorisation of the native speaker as the norm for assessment. How to assess competence in English as a lingua franca is an urgent priority. The beginnings of such a discussion are present in a recent paper by Elder and Davies (2006), and papers given at a symposium on the subject at the Language Testing Research Colloquium in Melbourne in 2006.

More broadly, there is an urgent need for validity theory to engage with broader social theory, again, a task that has barely begun. This will have implications for the training of researchers in language testing, who need to be introduced to a much broader range of contributing disciplines relevant to their research. The task ahead is very large and very complex, but it has the potential to mark a moment of significant change in language testing as a research field. The social and political functions of language tests can no longer be ignored.

## ETHICS, PROFESSIONALISM, RIGHTS AND CODES

### INTRODUCTION

The chapter considers various definitions of a profession and examines the claims of language testing to professional status. Against the traditional professions of law and medicine, language testing's claims are not strong. However, what it can do is to publish its commitment to ethics by means of a Code of Ethics. This provides for accountability both to members of the profession and to its stakeholders. This drive to accountability, to make its principles and practices explicit, explains the emphasis given in the language testing literature to the role of standards, both as goals and as the criteria for evaluating language testing procedures. It also explains the concern in the profession to uphold individual rights, especially those of test-takers. The chapter accepts that both professionalism and Codes of Ethics can be used improperly for face-saving ends and raises the question of how far issues to do with ethics, professionalism, rights and codes can be subsumed under the overall concepts of reliability and validity.

### EARLY DEVELOPMENT: PROFESSIONS

Max Weber (Gerth and Mills 1948) contrasted professions with bureaucracy, seeing in professions the paradigm form of collegiate activity in which rational power is based on representative democracy and leaders in principle are first among equals. Fullwinder provides the following criteria for a profession:

1. It is a performance for public good
2. It contains special knowledge and training
3. It deals mainly with people who for different reasons are especially vulnerable and dependent in their relationship to the practice of the professional (1996, p. 73)

Such criteria are readily applicable to the traditional professions of law and medicine, which explains Fullwinder's further comment that what distinguishes a profession from, say, a business is its primary concern with public good; this is to say "that doctors and lawyers do

not exploit . . . vulnerability, but help persons overcome serious threats to their health and rights constitutes the great public good of the two professions” (1996, pp. 73, 74). And he suggests that whether or not an activity meets the criteria for a profession may be determined by completing the following schema: “The profession of . . . serves the . . . needs of persons” ( p. 74).

Webster’s Ninth New Collegiate Dictionary of the English Language (1994 edition) defines a profession as a calling. This primary definition ‘a calling’ alerts us to the derivation of profession: “professing, to profess: to commit oneself < profiteri, to declare publicly, to own or confess freely, to give evidence and thus to avow, in particular to declare oneself to be something (a friend, a philosopher, a physician, a teacher) entailing a pledge of capacity to fulfil the undertaking” (Siggins, 1996, p. 56).

Siggins makes much of the early monastic influence:

The profession of religion was the technical term for conversion to the monastic life and its vows . . . when universities appeared in a resurgent Renaissance Europe, it was first of all the teachers of sacred theology who were called ‘professors’ (: 57) . . . the transition from cloister to university, however, laid the groundwork for the emergence of these disciplines (law, medicine) as proud, autonomous and eventually secular orders of society. (pp. 63, 64).

Marshall (1994, p. 419) defines a profession as “a form of work organization, a type of work orientation and a highly effective process of interest group control..” Such an organization requires:

- A central regulatory body to ensure the standards of performance of individual members
- A code of conduct
- Careful management of knowledge in relation to members’ expertise
- Control of entry numbers.

There is a more sceptical view of the professions, querying their concern for the public good and seeing them as interest groups set up so as to exercise control over clients by means of socially constructed problems and thereby exert power. Ivan Illich (1987) saw the professions as totally self-interested and hypocritical. They created new needs among the general population and then made the public totally dependent. This approach treats professional ethics as an ideology rather than as an orientation necessarily adhered to or meaningful in practice. Marshall (1994) contends that, in such a setting, entry and knowledge controls function as a form of status exclusion for privileged and remunerative employment. And, somewhat ironically, while trade unions, that parallel (and very different) form of work sodality, become more professional in practice and orientation through, for example, job-entry

controls, so the professions become more unionate, permitting for example collective bargaining and embracing industrial conflict.

In recent years many work related activities have sought to describe themselves as professional, thus travel agents, (real) estate agents, podiatrists, business consultants, language testers and so on. The reason for what has been called 'the professionalization of everything' is, no doubt, greater public demand for accountability and widespread desire to emulate the status accorded to the law and medicine.

One device which provides for accountability by its apparent openness, thereby permitting the profession to publish its concern for the common good is a Code (of Ethics and/or Practice), discussed more fully below. Such codes set out the principles the profession binds itself to maintaining. Skene (1996) proposes that there are two types of code: the first type is intended to maintain standards of practice within the profession and to protect the community. The provisions of this first type of code may be prescriptive (and duty-oriented) or aspirational (and virtue-related). The second type is intended to protect the interests (especially the financial ones) of the profession and of its members, by including rules new members must accede to: and requiring that only fully qualified people may be admitted to the profession, that members must be loyal to one another, and that they should not compete unfairly with one another.

Language testing has in the last 20 or so years sought to professionalize itself. To that end, it has provided itself with both national and international professional associations such as the International Language Testing Association (ILTA), the Association of Language Testers of Europe (ALTE), the European Association for Language Testing and Assessment (EALTA), the Japan Language Testing Association (JALT), established regular professional conferences (e.g., the Language Testing Research Colloquium (LTRC), supported the publication of two (at least) international academic journals *Language Testing* (LT), *Language Assessment Quarterly* (LAQ), developed sophisticated web-pages, and established a range of academic training and qualifications available in many countries. ILTA has agreed to a Code of Ethics and is now working on a draft Code of Practice; EALTA, ALTE, JALT, among other associations, have produced their own codes.

#### MAJOR CONTRIBUTIONS: ETHICS

The basic concerns of language testing, that its work should be reliable, valid and practical and that it should take responsibility for its impact, fall on different sides of the two explanations for acting ethically. The first explanation is the deontological (following the philosopher, Kant) which takes account of its intrinsic value the second is teleological

(following the philosopher, Hobbes) which takes account only of consequences. Thus we could crudely align validity and practicality with the deontological explanation and reliability and impact with the teleological explanation which means that ethically we cannot choose between the deontological and the teleological because we must take account of both present value and of future effects (Kunnan, 2000; Lynch, 1997).

One of the chief roles for ethics is to maintain a balance between the rights of the individual and the demands of the social. The danger is that in our attempts to be fair to individuals we may end up by destroying the social, making all morality individual and therefore never achieving fairness. We are left, writes Osborne only with ‘personal ethics or the search for small forms of valid knowledge’ (1992, p. 181).

However, there is a way out of such a solipsist trap, as Jackson (1996) shows. Discussing Codes of Practice, she points out that morality is never absolute. For example, codes of health and safety require a clause which limits the protection of employees to ‘within reason’. Such a clause takes a common sense approach recognizing that (i) there are rules and that (ii) how they are interpreted depends on the local context. For ILTA, this has raised the difficult problem of reconciling its global statement of ethical commitment with what may be differently interpreted in local situations. Hence the recourse to a twin approach: the Code of Ethics as the statement of abstract principles and the Code of Practice as the explanation of how these principles are put into local practice.

Codes of Ethics have greater validity for organizations claiming to be professional when there is a single form of activity, one basic qualification, where there is mainly one type of work, and where the activity is already strongly organized and formally registered. The professions of law and medicine are again the obvious canonical examples.

It has been suggested that ethics in language testing is no more than an extended validity. This is the argument of Alderson, Clapham and Wall (1995), that ethics is made up of a combination of validity and washback. Validity, and particularly consequential validity, is defined by Messick (1989) as being concerned with the social consequences of test use and how test interpretations are arrived at. Gipps (1994) considers that consequential validity represents a shift from: “a purely technical perspective to a test-use perspective – which I would characterise as an ethical perspective” (Gipps, 1994, p. 146).

An ethical perspective for a language tester is necessary (Kunnan, 2005). However, in all professional statements of morality a limit needs to be imposed on what is achievable or even perhaps desirable. In my view, therefore, the apparent open-ended offer of consequential validity goes too far. It is just not possible for a tester as a member of a

profession to take account of all possible social consequences (Davies, 1997a). What can be done is the internal (technical) bias analysis and a willingness to be accountable for a test's 'fairness', or in other words, limited and predictable social consequences we can take account of and regard ourselves as responsible for. A language test to select trainees for an organization of torturers is surely unacceptable to the profession. However, if that organization, unknown to me, makes use for selection purposes of a language test I have designed, it is surely unjust that I should be deemed guilty, or that I should blame myself for unethical conduct.

After all, can an architect be blamed if the building he or she designed some years ago is used for ugly racist meetings? In the absence of sanctions for exclusion of members for unethical conduct and of the legal backing to require that those who practice language testing are properly qualified and certified, what the professional associations of language testing can offer is to create an 'ethical milieu' (Homan, 1991) through education: the community of self-governing scholars are inspired deontologically by their ambition to contribute to the public good.

Helping create the ethical milieu is the Code of Ethics (and/or of Practice) which makes the direct link between the members of the profession (test developers in all their manifold activities) and their clients (test users). Professionalism is thus demonstrated and the profession is shown to be accountable by the acceptance of a Code of Ethics, by the publication of the profession's standards and by the recognition of stakeholders' rights.

#### CODES OF ETHICS AND OF PRACTICE

A professional Code of Ethics is a set of principles which draws upon moral philosophy and serves to guide good professional conduct. It is neither a statute nor a regulation and it does not provide guidelines for practice, but it is intended to offer a benchmark of satisfactory ethical behaviour by members of the profession. A Code of Ethics is based on a blend of the principles of beneficence, non-maleficence, justice, a respect for autonomy and for civil society.

Some professions do not publish a separate Code of Practice, assuming that their Code of Ethics covers both ethics and practice. Where there is a separate Code of Practice, its purpose is to instantiate the Code of Ethics. While the Code of Ethics focuses on the morals and ideals of the profession, the Code of Practice identifies the minimum requirements for practice in the profession and focuses on the clarification of professional misconduct and unprofessional conduct. An international association such as ILTA has to take account on the one

hand of universal agreement on principles and on the other of possibly different interpretations of those principles in practice. For that reason, a separate Code of Practice has been mooted and is now under discussion. (Both the Code of Ethics and the draft Code of Practice may be accessed on the ILTA home page: <http://www.iltaonline.com/>).

The ILTA Code of Ethics (see below) identifies 9 fundamental principles, each elaborated by a series of annotations which generally clarify the nature of the principles; they prescribe what ILTA members ought to do or not do, or more generally how they ought to comport themselves or what they, or the profession, ought to aspire to; and they identify the difficulties and exceptions inherent in the application of the principles. The Annotations further elaborate the Code's sanctions, making clear that failure to uphold the Code may have serious penalties, such as withdrawal of ILTA membership on the advice of the ILTA Ethics Committee.

Although this Code derives from other similar ethical codes (stretching back into history), it does endeavour to reflect the ever changing balance of societal and cultural values across the world. Language testers are independent moral agents and sometimes they may have a personal moral stance which conflicts with participation in certain procedures. They are morally entitled to refuse to participate in procedures which would violate personal moral belief. Language testers accepting employment positions where they foresee they may be called on to be involved in situations at variance with their beliefs have a responsibility to acquaint their employer or prospective employer with this fact. Employers and colleagues have a responsibility to ensure that such language testers are not discriminated against in their workplace.

## ILTA CODE OF ETHICS

### *Principle 1*

Language testers shall have respect for the humanity and dignity of each of their test takers. They shall provide them with the best possible professional consideration and shall respect all persons' needs, values and cultures in the provision of their language testing service.

### *Principle 2*

Language testers shall hold all information obtained in their professional capacity about their test takers in confidence and they shall use professional judgement in sharing such information.

*Principle 3*

Language testers should adhere to all relevant ethical principles embodied in national and international guidelines when undertaking any trial, experiment, treatment or other research activity.

*Principle 4*

Language testers shall not allow the misuse of their professional knowledge or skills, in so far as they are able.

*Principle 5*

Language testers shall continue to develop their professional knowledge, sharing this knowledge with colleagues and other language professionals.

*Principle 6*

Language testers shall share the responsibility of upholding the integrity of the language testing profession.

*Principle 7*

Language testers in their societal roles shall strive to improve the quality of language testing, assessment and teaching services, promote the just allocation of those services and contribute to the education of society regarding language learning and language proficiency.

*Principle 8*

Language testers shall be mindful of their obligations to the society where they work, while recognizing that those obligations may on occasion conflict with their responsibilities to their test takers and to other stakeholders.

*Principle 9*

Language testers shall regularly consider the potential effects, both short and long term on all stakeholders of their projects, reserving the right to withhold their professional services on the grounds of conscience.

(The annotations, some quite lengthy, have been omitted here for reasons of space. They may be consulted on the ILTA home page: <http://www.iltaonline.com/>)

The ILTA draft Code of Practice is, as has been mentioned, still under consideration. Here are examples of items in the draft Code. As will be seen, they are very different from the principles forming the Code of Ethics.

B4: The work of the task and item writers needs to be edited before pretesting. If pretesting is not possible, the tasks and items should be analysed after the test has been administered but before the results are reported. Malfunctioning or misfitting tasks and items should not be included in the calculation of individual test takers' reported scores.

B6: Those doing the scoring should be trained for the task and both inter- and intra-rater reliability should be calculated and published.

B7: Test materials should be kept in a safe place and handled in such a way that no test taker is allowed to gain an unfair advantage over the other test takers.

D: Obligations of those preparing and administering publicly available tests. They should:

D5: Refrain from making any false or misleading claims about the test

D6: Publish a test takers' handbook

G: Rights and responsibilities of test takers.

As a test taker you have the right to:

G5: Know in advance of testing when the tests will be administered, if and when test results will be available to you, and if there is a fee for testing services that you are expected to pay.

G6: Have the test administered and your test results interpreted by appropriately trained individuals who follow professional codes of ethics.

Codes of Ethics and/or of Practice are necessary because they indicate a profession's seriousness about its activities and its relation to stakeholders. However, they come with two problems. The first problem is that while strong professions such as medicine and the law have firm entry requirements and agreed sanctions for misbehaving members, weak professions such as language testing do not have such professional rules in place, rules that have legal backing. In their absence, what can be attempted is the building of an 'ethical milieu' (Homan 1991) through a professional association (such as ILTA) that organizes regular conferences and sees to the dissemination of research through dedicated journals (such as *Language Testing* and *Language Assessment Quarterly*). Moreover, only through these published articles can the Codes of Ethics and/or of Practice help establish the professional culture. However, this is where we must acknowledge the second problem, which is once the Codes are published they can act as firewall statements of integrity that protect members from external criticism

even when their practice falls short. In other words, a Code can be a charter for contemptuous hypocrisy (Boyd and Davies, 2002; Davies, 2002, 2004,).

#### WORK IN PROGRESS: STANDARDS

The current drive for accountability may explain the frequent references everywhere to ‘standards’ and therefore suggest to us that the standards concept is new and original. It is not. The search for standards has a long tradition, often under different names, the most common probably being norms, but there are other familiar terms such as rules and conventions. What they all indicate is that there are social goals and that there are agreed ways of reaching towards those goals.

Brindley places standards under the broad heading of outcome statements: these, he considers, can refer to standards themselves and to benchmarks, attainment targets, bandscales, profiles and competencies, all of which are “broadly speaking, standards of performance against which learners’ progress and achievement can be compared” (Brindley, 1998, p. 48). Elder argues that within institutions, standards have more authority since they can be used as non-negotiable goals (Elder, 2000a).

In language assessment, standards have two senses. I note them here and then discuss each in turn:

1. The skills and/or knowledge required to achieve mastery and proficiency levels leading to mastery, along with the measures that operationalize these skills and/or knowledge and the grades indicative of mastery at each level.
2. The procedures followed by test constructors which provide evidence to stakeholders that the test/assessment/examination/evaluation is serious and can be trusted, demonstrating, often through a code of ethics, that the test constructors are operating professionally.

The two senses are also sometimes combined.

In the first sense, standards are the goal, the level of performance required or explained, thus “the standard required for entry to the university is an A in English”; ‘English standards are rising’ (Davies, Brown, Elder, Hill, Lumley, McNamara, 1999, p. 185). Stakeholders, of course, rightly wish to know what is meant by such statements, how they are arrived at and what is the evidence for making them. For this, there are three requirements: description, measurement and reporting.

There needs to be a description of the standard or level, an explicit statement of the measure that will indicate that the level has or has

not been reached and a means of reporting that decision through grades, scores, impressions, profiles and so on.

Description, measure, report, these three stages are essential, although there may be blurring of stages 2 and 3, such that the report is included within the measure. Where classical objective tests such as the Test of English as a Foreign Language (TOEFL), the International English Language Testing System (IELTS) differ from the scale approaches of the Inter-Agency Round Table (IAR), the American Council on the Teaching of Foreign Languages (ACTFL), the International Second Language Proficiency Ratings (ISLPR) is in their unequal implementation of the three stages. The tests offer measures and reports, but may be light on the first stage, description. The scales provide description and reports but may lack a measuring instrument (Davies, 1995).

The move away in recent times from the objective test to the subjective scale is no doubt part of the widespread rejection in the social sciences of positivism, fuelled by the socio-cultural turn and concern for critical language testing (Shohamy, 1997). However, it also has a more practical explanation. In large-scale operations common standards may be more readily acceptable if they are imposed by a scale, which is open to local interpretations. A contemporary example is found in the Council of Europe's Common European Framework of Reference (CEFR) for Languages: Learning, Teaching, Assessment (CEFR, 2003). The CEFR, then, is not a measure. For measuring purposes the CEFR operates as a common reference to which local and national assessment instruments can relate (Taylor, 2004).

Large-scale operations like the CEFR may be manipulated unthinkingly by juggernaut-like centralizing institutions. Mitchell describes the misconceived imposition of the Attainment Targets and Level Descriptors of the UK's National Curriculum for Modern Foreign Languages, asserting that the longer-term impact of these standards "will certainly be to reduce diversity and experimentation [...] we are likely to lose the more ambitious and more experiential interpretations of communicative language teaching, which has [...] historically been found at local level" (Mitchell, 2001, p. 174). Elder reports a similar case of inappropriate standards for LOTE (Languages other than English) in Australia (Elder, 2000b). Bailey and Butler, discussing the No Child Left Behind (NCLB) program in the USA, complain that, because of recent changes to the federal law, no distinction is made between English learners and native speakers. The law now requires "the inclusion of English Learner students in new mandated assessment systems. The NCLB Act of 2001 increases school accountability" (Bailey and Butler, 2004, p. 183). Such mismatches are not unlike the possible CEFR massaging of local measures since in all cases what is in

train is the imposition of one overall set of standards nationally, regionally or even the global macdonaldization of language standards. However, our scepticism may be misjudged and out of place, since by their very nature standards are ambitious for wider and wider acceptance. There really is little point, after all, in establishing standards just for me if they have no meaning or application for you or anyone else; similarly with standards for a class, school, city and so on. What then is wrong about the Mitchell, the Elder and the Bailey and Butler cases is not that they were attempts at expanding the range and distribution of standards but that they were, for the populations discussed, the wrong standards.

In the second sense, standards are a set of principles that can be used as a basis for evaluating what language testers do, such as carrying out the appropriate procedures. When a school principal maintains that his or her school is 'maintaining standards' the implication is that achievement levels over time are constant. When an examination body such as Educational Testing Service (ETS) or the University of Cambridge Local Examinations Syndicate (UCLES) claims that they are 'maintaining standards' what they seem to mean is that they are carrying out the appropriate procedures, such as standard-setting (Griffin, 2001). Standard-setting is a technical exercise, involving, as it does, the determining of cut-scores for a test, either for pass/fail or for each level in a band system. However, it is worth remembering, that standard setting remains a substantially political and ethical issue: "there can be no purely technical solution to the problem of standard setting in this context" (of an English test for ESL health professionals), the decision "remains intrinsically ethical and political; no amount of technical sophistication will remove the necessity for such decisions" (Lumley, Lynch and McNamara, 1994, p. 39).

To an extent, this is where Messick's theorizing (1989) has taken us in his attempt to provide one overall coherent framework for the description, the measurement and the reporting of standards and the systematic effects they have on all stakeholders. The term that has come to be associated with his conceptualization is, as we have seen, that of consequential validity, but it does seem that impact may be an alternative name for it (Hawkey, 2006). Impact studies the effects that a test has when put to use: this is more than the more frequently used term washback precisely because it is concerned not with just how a test works in one situation but with its systemic influences. As such, impact can investigate fundamental issues about standards: are they the right ones for the purposes intended, are they fully and openly described, are they attached to reliable and valid measures, is the reporting clear and precise and does the test produce desirable outcomes in the form of more appropriate and useful teaching? What

impact studies, then, can do is to enable us to re-evaluate and make explicit not just the standards we promote but the very view of language we take for granted.

#### PROBLEMS AND DIFFICULTIES: RIGHTS

Rights are of two kinds, natural or inalienable rights and civil rights. Natural rights are those freedoms that belong to every individual by virtue of being human: they include the right to protect one's life and property. Civil rights include those rights granted to the citizens of a state by its legal institutions and legislative authorities. These imply the right of access to the legal system for protection and claims against others, for defence against charges, for protection of the law and for equality of treatment under the law.

There is no absolute distinction between natural and civil rights. Claims (or needs or aspirations) such as a good education, decent housing, health care, employment, an adequate standard of living, equality of opportunity, freedom of speech, freedom to take part in political processes, are regarded by some as belonging to civil rights and by others to natural rights. Furthermore, since it is governments that protect and maintain (and, pragmatically, grant) all rights, then even inalienable rights may be (and sometimes are) regarded as kinds of civil rights. The argument is that a right that has not been granted by the state is not a real right, thus in a slave-owning society, slaves, it could be argued, have no natural right to freedom or equality because their society does not accord equal rights as citizens to slaves. However, the point of making a distinction between civil and natural rights is to make explicit that some rights (such as political participation, equality under the law) remain rights; they are inalienable even if they are not granted, even if they are removed.

Now rights do not exist on their own. They impose reciprocal obligations, duties to act in certain ways as required by moral or ethical principles, promises, social commitments and the law. My claim to a right requires that I accept that it imposes an obligation. For example, my right to free speech means that I acknowledge that others also have the same right and that I accept that in pursuing my right I do not harm others' rights to, for example, the pursuit of their own happiness or their right to equal treatment under the law.

In other words, I must not, in exercising my right to free speech, tell lies about other people. Further, I must accept that my right to free speech, for example, entails an acceptance on my part that in order to fulfil my obligation to others, I must be prepared to limit my own right.

The universality of human rights requires that everyone act to ensure that others' rights are also observed. However, the new professionalism,

influenced no doubt by the climate of postmodernism, is about giving more power to clients in the context of the professional relationship, even though the focus is still on the professional as the one holding the power (Banks, 1995, p. 105). In the same way, the critical turn in applied linguistics and language testing (Pennycook, 2001; Shohamy, 2001) insists on the ethical importance of recognizing the rights of all stakeholders. And since language testing disempowers test takers in particular, the ILTA draft Code of Practice, as we have seen, highlights test takers' rights.

### FUTURE DIRECTIONS

Being professional, a state to which, as we have observed, many aspire, means making a commitment to ethics, establishing and observing standards and recognizing the rights of all those professionals engage with, including themselves. A profession becomes strong and ethical precisely by being professional (Davies, 1997b). What a code of ethics does is to remind us of what we already know, that language testers are a serious organization, committed to a social purpose, to maintaining standards, to upholding the rights of all stakeholders and to working professionally with colleagues. It is important to spell out in a code of ethics what this means, but there is something to be said for the conclusion that Alderson, Clapham and Wall (1995) came to, that being ethical in language testing could be guaranteed by the traditional precepts of reliability and validity.

LANGUAGE ASSESSMENT IN HISTORICAL AND  
FUTURE PERSPECTIVE

The challenge in the title that I have been assigned is daunting; if only I still had the chutzpa that I had 30 years ago when I happily divided the history of language testing into three periods (Spolsky, 1977)! Since then, having actually spent many months some 20 years later studying the history of the field (Spolsky, 1995b), I am much less confident about my ability to describe its development and quite certain that any predictions that I may make have little chance of being correct: as the Talmud points out, now that prophecy is dead, only fools and babies venture to do it.

What I plan to do in this short paper is to sketch out a number of key events in the history of testing in general and language testing in particular, using them as labels for clusters of approaches to assessing human abilities that continue to show up in one form or another under varying circumstances. Because it is not always clear that a new approach is derived from an older one, I will not argue that these add up to any record of progress in the field (this was the basic flaw in my 1977 paper, where I was attempting to argue that the current approach was the best). There were influences, no doubt, but each is best seen as an adaptation to contemporary concerns and possibilities. Nor will I take the position that so many critics do: *swa lengra, swa wurs*—things go on getting worse, as the bad drives out the good.

In the history of testing, the Chinese Imperial examinations naturally come first, as they were the first state-wide effort to establish a testing system under centralized control. There were times during the 2000 year history of the system that the Emperor himself saw the final papers. The aim of the examination system was to winnow out of a large pool of candidates the very best who would be selected for government office as Mandarins with subsequent major financial reward. The Chinese principle, as Macaulay (1853) called it when arguing in the British Parliament for its adoption as a method of selecting cadets for the Indian Civil Service, involved a long and complex academic examination intended to test and rank a number of well-prepared candidates. It had no interest in evaluating or influencing an educational system, but its only concern was sorting and selecting the very best. While the Imperial examinations faded away even before the last of the Emperors (Franke, 1960), they had a major effect in establishing

a very strong (and potentially unhealthy) respect for testing in China and other countries under Chinese influence, producing continued pressure from examination systems in Japan and Korea as well as China.

This first major examination may well be contrasted with the medieval Treviso test, in which the students of the school were assessed at the end of the year by representatives of the city council, which then paid the schoolmaster according to the success of his students (Ariès, 1962; Madaus, 1990). The important characteristics of this approach were its focus on the educational process, its use of the school curriculum as specification of content, and its interest in ranking pupils only in terms of their mastery of the curriculum. When in the sixteenth century the Jesuits brought the Chinese notion of examinations to Europe, they adapted it to the Treviso purpose of the control of the curriculum: in the classical Christian School of the seventeenth and eighteenth centuries (de La Salle, 1720), pupils were tested at regular intervals on their mastery of the curriculum that had been covered, and their progress through the curriculum was determined by the success of the regular examinations.

During the French Revolution, the religious schools were secularized and their examination system was further modified to suit the needs of strong central government. Napoleon (another Emperor) established academies in each department to be responsible for the administration of the centrally controlled examination, the core of which was the Bac (baccalaureat), which marks the culmination of secondary school study (Théry, 1861). The system continues in effect, its emphasis on government control proving popular in other countries as well.

The oral examination for lieutenants that Samuel Pepys introduced into the British Navy at the end of the seventeenth century (Tomalin, 2003) had features of the Chinese Imperial Examination in that it wished to replace patronage by merit and of the Treviso test in that its concern was not with ranking but with mastery.

In England in the nineteenth century, there were important new approaches. Macaulay (Macaulay, 1853) argued for the examinations that were used initially for the Indian and later for the English Civil Service. They were modelled on the examinations used at Oxford and Cambridge, the goal of which was to rank a comparatively small number of well-prepared candidates; at Oxford, those who did well received first, second, or third class honors; and at Cambridge, the best students in the Tripos was called senior Wrangler. A similar approach was adopted in nineteenth-century Prussia in the selection of magistrates (McClelland, 1980). In England, the popular esteem in which examinations were held made it possible towards the end of the century to develop quite a different approach, the examinations (commonly

conducted by school inspectors) to assess the achievement of pupils in state schools.

In the early years of the twentieth century, there was an effort to extend this school-based testing by the use of the objective techniques being developed by the growing field of psychometrics. In England, the interest was short lived (Burt, 1921) but revived 20 years later, but in the USA, where a number of interested parties trumpeted the mythical success of intelligence testing by the army in the First World War (Reed, 1987; Yerkes, 1921), the 1920's were marked by the proliferation of tests and testing companies ready to sell them to schools. The American or objective test (initially true-false but increasingly later multiple-choice) came to be seen as the ideal instrument for most assessment purposes. Occasionally adopted elsewhere, it met resistance in much of the world until the full forces of globalization after the Second World War led to its rapid proliferation and current virtual universalization.

Language testing grew up against this background. The various tests that have been described often included components intended to assess language competence. Where the emphasis was on literate skills, the method was generally to require composition or translation (and later, as these do not lend themselves to objective testing, comprehension which can be tested with multiple-choice items). When oral skills were considered important (in sixteenth century Cambridge University where students were still expected to know Latin well enough to use it, or in testing spoken language ability when it was valued), there was oral testing, but it proved particularly difficult to adjust to the requirements of large-scale objective testing (Spolsky, 1990). In special cases, however, such as the comparatively small-scale elite testing for the US diplomatic service (Wilds, 1975), there were reasons and resources to develop a comparatively standard method of assessing spoken ability.

This, as they used to say in the old continuous movie houses, is sort of where we came in. For many current language testers, the history of our field seems to start in the 1960s, the beginning of the large-scale industrialization and centralization of language testing that has come to be based in Princeton and Cambridge. My 1977 view of this point in time was a progression from an assumed 'traditional' examination (consisting of written translation, composition, comprehension, and grammar) through a psychometrically driven testing of structural linguistic items that had formed the basis of such tests as the Michigan Lado test of English (Lado, 1951). More recently, we had perceived a new trend that combined John Carroll's argument for integrative testing (Carroll, 1961) with the experience of the FSI oral examination all modified in the light of Cooper's argument for adding sociolinguistic aspects (Cooper, 1968).

Looking back over the half-century during which language assessment has developed into an identifiable academic field as well as a major industry, there are several interesting trends which are worth identifying. One, particularly relevant to the academic field but with strong influence on practical test development, has been the effort to overcome what was recognized a hundred years ago as the unavoidable uncertainty of examinations (Edgeworth, 1888). The field of psychometrics has been struggling ever since to find ways of making tests reliable and valid. Once statistical methods of establishing reliability were found, replacing single individual measures with large numbers of items lending themselves to appropriate statistical treatment, testers could argue that their test was reliable: in other words, that it would have much the same result when repeated on other occasions or other candidates. More difficult has been agreement on the validity, essentially the meaning rather than the stability of the result. In the early days of language testing, tests were considered valid if they correlated well with other tests. The justification for a new test was a fairly high correlation (say 0.8, which meant that two-thirds of the variation had been accounted for) with some existing test it was meant to replace. The last 50 years have seen much more robust and intelligent efforts to establish validity. There have been rare efforts to validate the predictive power of a test: the early versions of the IELTS were validated by asking university tutors whether the results agreed with their own judgement of English knowledge of foreign students who had taken it (Criper and Davies, 1988). For many years, ETS explained that each institution should carry out its own validation study of the TOEFL results of students they admitted; very few did this, however. Another proposal was construct validation, an effort to build a theoretical model of the ability being measured and then to determine that test items could reasonably be assumed to measure the various described aspects of the construct. The notion of validity was greatly broadened by the work of Lyle Bachman (1990, 2000) who applied to language testing the extended definition of validity proposed by Messick (Messick, 1980, 1989). The pursuit of validity continues: Bachman has now found ways to integrate the social implications and the use of language test results into the model, although Bruno seems skeptical.

A second major trend has been the complications involved in what Carroll called integrative testing, the assessment of samples of language (written or spoken) produced by the candidates and only susceptible to objective measurement by requiring human judgement. Language testers in the 1930s and 1940s often wanted to test these performances, but were challenged by the psychometric difficulties

of establishing reliability on the one hand and in determining which factors led to individual judgments on the other. The use of such tests were practically difficult: in the 1940s, the Cambridge testers had to use Post Office engineers to record samples of oral tests to try to train new judges; in 1961, the ETS representative easily dissuaded the TOEFL planners from including a writing sample because of the expense of air mailing examination booklets to the USA; in the mammoth Chinese English Test, oral testing by two examiners was restricted to 100,000 or so of the 6 million candidates who took the test each time it was given.

But there continued to be pressure. During the brief flourishing of the Armed Services Training Program (Iglehard, 1997, Spolsky, 1995a), Kaulfers (1944) planned but never implemented a scale for oral testing soldiers in the program. When later during the Cold War the Assistant Secretary of State insisted that American diplomats be tested for their language proficiency, oral ability could no longer be left out, and the Foreign Service Institute, with advice from John Carroll, developed a scale and began in 1956 a system of interview testing using two or three judges (Sollenberger, 1978). Nearly twenty years later, information about the test was made available to academic language testers (Jones, 1979; Wilds, 1975), and it became the model for oral testing in other government agencies (Clark 1988; Lowe 1988) and (controversially) for foreign language testing in the United States and elsewhere (American Council on the Teaching of Foreign Languages 1982; 1986; Bahcman and Savignon 1986; Henning 1992a).

We thus had two major trends: a pursuit of reliability that provided backing for the development of industrialized objective tests, and a market-driven demand for more or less reliable measurement of productive proficiency. The first of these led to the development of the large-scale industrial test. While most early language tests were the work of individual language teachers and testers, starting in the 1920s in the USA they were quickly taken up by small psychological testing corporations most of which were in due course swallowed by publishers, only to be taken over in due course by large international conglomerates. The exception was Educational Testing Service, born as the testing arm of the College Board and provided with permanence and independence by being set up in New Jersey as a non-profit corporation license by the New York Board of Regents. Their major moneymaker in language testing was TOEFL, the Test of English as a Foreign Language, was set up originally as an independent body but brought under ETS control in a series of brilliant political maneuvers (Spolsky, 1995b). For most of its 40 years at ETS, TOEFL was a prime example of an industrial test, open to market forces rather than to changing theory. Both the Test of Spoken

English and the Test of Written English came from demands of test users rather than independent innovation; and the current new TOEFL, produced 5 years after was promised, remains to be proved in practice.

In England, the process was similar. English language tests were produced by a number of testing centers, generally affiliated with universities, but by the 1970s the University of Cambridge Local Examination Syndicate had clearly taken the lead. The market forces in the period after the Second World War with growing demand for English language teaching and testing persuaded the Syndics to take the field seriously, and they learnt their lesson well from an attempt to compete with TOEFL by claiming to be comparable in reliability and validity (Bachman, Davidson, Ryan and Choi, 1989). In particular, they made sure that their English testing division remained independent and was able to make use of its growing profits to carry out the research needed for constant improvement of their tests (Weir and Milanovic, 2003).

Perhaps the most significant development from the non-industrial oral testing process was the growth of the importance of the scale. For Thorndike in the early days of testing, a scale consisted of a number of pre-judged and carefully ranked examples of the product being scaled: handwriting, or an essay (Thorndike, 1910). For the Foreign Service Institute, a scale was a verbal protocol describing as accurately as possible the particular characteristics of a language performance of product and a defined level or stage of learning (Jones, 1979). Such scales worked as mnemonics for trained judges to remind them of the consensus they had reached in training exercises and in previous experience. They raise all sorts of intriguing theoretical problems: they assume for instance that language proficiency is scalable rather than a set of partially related abilities in performing various language functions. As a result, they need to be accepted by consensus rather than validated in practice or theory. One of the most elaborate developments of the language scale is the Common European Framework (Council of Europe, 2001), which in fact comprises a large number of different scales for various kinds of language knowledge and functional ability. Given the convenience of scales, however, for practical use, the tendency has been to attempt to reduce the Framework to a relatively simple scale equivalent to the US Interagency Roundtable scale.

Besides what may be called the psychometric, the industrial, and the scaling trends, an important development in the late twentieth century language testing was the broadening of the content to include sociolinguistically influenced aspects of language. It was Cooper (1968) who pointed out the need to include social context, and with the development of communicative language teaching and lip service at least to ethnography of speaking (Hymes, 1967, 1974), language testing has broadened from the academic testing of the standard written version

of a language to allow for assessment of control of other varieties in various social and functional situations. One inevitable conclusion has been the realization that tests need to find some way to achieve authenticity, to measure the ability to perform in situations not unlike the real world.

There has been another important adjustment of language testing to its social context and this has been the attempt to define and even judge the social context of test use and the ethicality of the test. It is not of course that the idea of social and educational effects of tests was new: Latham (1877) had complained that examinations at the end of the nineteenth century were leading to narrower educational goals. British testers like Cyril Burt were conscious of the social influence of tests, assuming they would permit more intelligent children from the lower socioeconomic classes to become upwardly mobile. Similarly Lemann (1999), argues that Chauncey's main motive in developing the SAT was to bring a wider socioeconomic population into top East Coast colleges and universities and so into the national leadership. In language testing, too, we have come to be concerned about social implications. Edelsky et al. (1983) suggested that unwillingness of disadvantaged pupils to play the testing games led to misconceptions about their language proficiency. Spolsky (1981, 1984) argued for the need to take an ethical view of the effects of a language test. Shohamy (1992, 1994, 1997, 2001) took this concern further, detailing the power of language tests for social control. Most recently, McNamara (2005) has described the use of language tests outside the school system to identify people claiming ethnicity or asylum and to filter or block immigrants. The effect has been felt within the profession (Hamp-Lyons, 1997a, 1997b); Hamp-Lyons, 1997, and over the past few years professional language testing associations and groups have been working to develop a code of ethics and of professional practice (see <http://www.iltaonline.com/code.pdf>).

Having almost run out of space, I am spared the task of spending much time on future trends. Were I still a young optimist, I would suggest that everything will continue to get better. Industrial tests will become more human and less powerful; only valid tests will be used (after careful validation) for major career decisions; simple unidimensional scales and scores will be replaced by complex profiles showing the wide range of plurilingual proficiency of anyone tested; tests will not be misused. But from my current perspective, I am much more skeptical. I see the industrial testmakers working industriously to computerize their tests and sell them wherever possible; I read online discussions in which writers painfully and hesitatingly try to rerun debates about cloze tests that were closed decades ago; I see multidimensional profiles being reduced to uniform scales; I see one whole

establishment refusing to recognize that the highly educated native-speaker-like ambassador is not the only top of the language tree; I see countless school and university systems continuing to interpret more or less randomly awarded scores as though they were meaningful. At the same time, I expect to continue to see good research into the nature of language proficiency and the continued demonstration of possible ways to assess its relevance to defined social purposes.

In other words, more of the same. An idea, I notice, for which I am quoted in the introduction to the testing volume of the first edition of this encyclopedia (Clapham, 1997).

## **Language Socialization: Theoretical and Methodological Approaches**

## LANGUAGE SOCIALIZATION: AN HISTORICAL OVERVIEW

### LANGUAGE SOCIALIZATION AND LANGUAGE ACQUISITION

Research in the area of language socialization initially considered the relation between language acquisition and socialization, which had been separated by disciplinary boundaries, psychology on the one hand and anthropology and sociology, on the other. Developmental psycholinguistic research focused (and continues to focus) upon phonological and grammatical competence of young children as individuals who are neurologically and psychologically endowed with the capacity to become linguistically competent speakers of a language along a developmental progression (Bloom, 1970; Brown et al., 1968; Slobin, 1969). Language acquisition research since the late 1960s has debated the source of linguistic competence as located either in innate structures, as the product of verbal input from the child's environment, or some combination of both (Chomsky, 1965; Pinker, 1994; Snow, 1972, 1995). Socialization research posed a set of complementary but independently pursued questions, primarily revolving around the necessity for children to acquire the culturally requisite skills for participating in society, including appropriate ways of acting, feeling, and thinking. In foundational anthropological studies of childhood and adolescence cross-culturally (e.g., LeVine et al., 1994; Mead, 1928; Whiting, Whiting, and Longabaugh, 1975) as well as in pre-1960s sociological theorizations of continuities and discontinuities in social order across generations, verbal resources generally were not investigated as a critical component of socialization processes (Mead, 1934; Parsons, 1951). As a result, the sociocultural nexus of children's communicative development remained largely an uncharted academic territory, and the disciplines that addressed the paths of different types of knowledge acquisition—psycholinguistic and sociocultural—remained isolated from each other.

The first systematic initiative to bridge these academic divisions took place at the University of California Berkeley Language Behavior Research Laboratory, where a team of psychologists, linguists, and anthropologists formulated a comparative research agenda for studying language acquisition, set forth in *A Field Manual for Cross-cultural*

*Study of the Acquisition of Communicative Competence* (Slobin, 1967). This endeavor drew from and was strengthened by Gumperz's (1968) notion of the "speech community" as a unit of analysis and Hymes' formulation of "communicative competence" (1972a), which encompasses the realm of sociocultural knowledge necessary for members of a speech community to use language in socially appropriate ways. Integral to communicative competence is members' ability to participate in "speech events," that is, socially recognized activities that occur in specified situational settings, involving participants performing one or more socially relevant acts using communicative resources in conventionally expected ways to achieve certain outcomes (Duranti, 1985; Hymes, 1972a, b). In linguistic anthropology, the enterprise called Ethnography of Communication (Gumperz and Hymes, 1964, 1972) inspired field investigations of a speech community's repertoire of communicative forms and functions as they complexly interface in communicative events in relation to "facets of the cultural values and beliefs, social institutions and forms, roles and personalities, history and ecology of a community" (Hymes, 1974, p. 4).

From the late 1960s through the 1970s, the cross-cultural study of children's developing communicative competence began to take empirical shape. Ethnographies of communication modeled on the 1967 field manual presented children's communicative development as organized by linguistic, social, and cultural processes (cf. Blount, 1969; Kernan, 1969; Stross, 1969). In addition, children's socioculturally organized ways of becoming literate inside and outside the classroom as well as an interest in the social shaping of classroom communication became a topic of interest (Cazden, John, and Hymes, 1972; Heath, 1978). And paralleling linguists' and psychologists' interest in the pragmatic underpinnings of grammar, the study of children's discourse competence (Ervin-Tripp and Mitchell-Kernan, 1977) as well as the field of "developmental pragmatics" (Ochs and Schieffelin, 1979) became focal areas of study. Developmental pragmatics broadly addresses the interactional and discursive context of and precursors to children's acquisition of syntactic and semantic structures along with the development of children's discursive and conversational competence.

In 1975–1977, Schieffelin conducted a longitudinal study of children's language acquisition among the Kaluli people of Papua New Guinea (Schieffelin, 1985). In 1978–1979, Ochs conducted a longitudinal study of Samoan children's language acquisition (Ochs, 1985). Informed by both psycholinguistic and linguistic anthropological approaches and issues in children's language development, each researcher assumed responsibility for (1) systematically collecting and analyzing a corpus of young children's spontaneous utterances

recorded at periodic intervals and (2) documenting the sociocultural ecology of children, including prevailing and historically rooted beliefs, ideologies, bodies of knowledge, sentiments, institutions, conditions of social order, and practices that organize the lifeworlds of growing children within and across social settings.

Reuniting at the completion of their fieldwork, Ochs and Schieffelin (1984) proposed that the process of acquiring language is embedded in and constitutive of the process of becoming socialized to be a competent member of a social group and that socialization practices and ideologies impact language acquisition in concert with neurodevelopmental influences. The first proposition echoes Hymes' notion that linguistic competence is a component of communicative competence. The second proposition—that local socialization paradigms (together with biological capacities) organize language acquisition—poses a stronger claim. The argument presents linguistic and sociocultural development as intersecting processes and the language-acquirer as a child born into a lifeworld saturated with social and cultural forces, predilections, symbols, ideologies, and practices that structure language production and comprehension over developmental time.

These ideas coalesced in the generation of a research field called *language socialization* (Ochs and Schieffelin, 1984, 1995; Schieffelin and Ochs, 1986a, b), which encompasses socialization *through* language and socialization *into* language. The term draws from Sapir's classic 1933 article on "Language" in the *Encyclopedia of the Social Sciences*, in which he states, "Language is a great force of socialization, probably the greatest that exists" (Mandelbaum, 1949, p. 15). A primary goal of language socialization research is to analyze children's verbal interactions with others not only as a corpus of utterances to be examined for linguistic regularities but also, vitally, as socially and culturally grounded enactments of preferred and expected sentiments, aesthetics, moralities, ideas, orientations to attend to and engage people and objects, activities, roles, and paths to knowledge and maturity as broadly conceived and evaluated by families and other institutions within a community (Heath, 1983).

The spark that fueled the launching of language socialization research was Ochs and Schieffelin's observation that the widespread linguistic simplification and clarification associated with baby talk register did not characterize how Samoan and Kaluli caregivers communicated with young children (Ochs, 1982; Ochs and Schieffelin, 1984). Caregivers in both of these communities scaffolded infants' and young children's language and social development by constantly orienting them to pay attention to people, positioning them as observers and overhearers of recurrent social activities, and prompting them to repeat utterances to those in their environment. Ochs and Schieffelin proposed

a language socialization typology in which communities and/or settings within communities are categorized as predominantly orienting young children to adapt to social situations (situation-centered) or predominantly orienting social situations to adapt to young children (child-centered). In this typology, baby talk register is part of a larger set of child-centered sociocultural dispositions in communities. Alternatively, the Samoan and Kaluli dispreference for simplifying and clarifying in communicating with young children is consonant with local ideologies regarding the limits of knowledge, the paths to knowledge, and the social positioning of children. Kaluli and Samoan caregivers' reluctance to clarify children's unintelligible utterances with an "expansion," for example, was linked to a prevailing reluctance for a person to explicitly assert or guess another person's unexpressed or unclear thoughts or feelings (Ochs, 1988; Schieffelin, 1990). In addition, Samoan caregivers' disinclination to simplify for young children was consistent with their belief that higher status persons do not accommodate down and that displays of attention and respect to older persons is key to children's social development (Ochs, 1988).

Paradoxically, these observations about baby talk register at once support a rigorous biological capacity for children's acquisition of phonology and grammar, flourishing independent of extensive grammatical simplification and clarification in the communicative environment, and an equally rigorous requirement for children's sociocultural attunement to language-mediated acts, activities, genres, stances, meanings, roles, relationships, and ideologies through the process of language socialization. That Kaluli and Samoan infants become competent speakers without being constantly addressed with simplified input indicates that such input is neither universal nor necessary for acquisition of linguistic structures. Indeed, the situation-centric orientation observed in the development of Kaluli and Samoan young children may serve as an alternative form of input that selectively attunes children's attention to linguistic and sociocultural structures and practices. In situation-centered communication, higher comprehension demands are imposed on developing children in that the language they hear is not simplified, but infants and young children are usually positioned as overhearers rather than addressees; their attentional skills are highly scaffolded from birth; and when positioned as speakers, they are often prompted. In child-centered communication involving a simplified register, comparatively low comprehension demands on children are coupled with relatively high demands on their communicative involvement as addressees; and when positioned as speakers, their utterances are often rendered intelligible through the efforts of generous, accommodating interlocutors or are prompted.

Arguing for a language socialization-enriched approach to language acquisition, Ochs and Schieffelin (1995) proposed a *culturally organized means-ends model of grammatical development*. This model suggests that communities differ in the communicative goals they establish in relation to small children and once these goals are established, they consistently organize the linguistic environment of the developing child. For example, in communities where caregivers routinely set the goal of communicating with infants and very young children as full addressees expected to comprehend and respond, they consistently use extensively simplified speech and other accommodations. Alternatively, in communities where caregivers generally wait until children are more mature to communicate intentions, they immerse infants and very young children as overhearers in a linguistic environment of nonsimplified conversations among others.

Recently, Ochs, Solomon, and Sterponi (2005) questioned the efficacy of using Euro-American baby talk and other default sociocultural practices to communicate with children diagnosed with neurodevelopmental disorders such as autism. Certain features of Euro-American child-directed communication—slowed pace, exaggerated intonation, heightened affect, face-to-face interactional alignment, and an insistence on speech as the medium of communication for the child—may be ill attuned to, for example, the needs of autistic children. Severely impacted children are distracted and lose attention in the course of slowed down communication. They easily become overloaded by sensory stimuli such as facial expressions, exaggerated pitch contours, excessive praises, endearments, and other affect displays. And speaking is exceedingly difficult for many of these children. Alternatively, the children appear more communicative, social, and at ease when exposed to a radically different form of language socialization practice, introduced by an educator from Bangalore (Iverson, 2006). In this practice, the caregiver uses rapid, rhythmic speech, frequent prompts, and moderate affect displays, and the autistic child points to a grid of letters or numbers to respond to the caregiver, who sits alongside the child (rather than face-to-face). The lesson here is rather than facilitating the human potential for language, Euro-American baby talk may impede this outcome, with parents, teachers, and clinicians witlessly caught in the inertia of a communicative habitus.

#### LANGUAGE SOCIALIZATION AND LINGUISTIC ANTHROPOLOGY

While one face of language socialization research orients towards language acquisition, the other orients towards linguistic anthropology.

One tenet of the language socialization paradigm is that the social, emotional, and intellectual trajectories of children and other novices are complexly structured by webs of social and economic institutions, public and domestic systems of control, practices, identities, settings, beliefs, meanings, and other forces (Heath, 1983). The inverse is also the case, in that immature members are agentive in the shaping of their development and have the capacity to resist and transform facets of the social order into which they are socialized (Kulick and Schieffelin, 2004). That is, language socialization is inherently bidirectional, despite the obvious asymmetries in power and knowledge, and therein lies the seeds of intergenerational, historical continuity, and change within social groups (Pontecorvo, Fasulo, and Sterponi, 2001). The active role of the child/novice in generating social order is compatible with social theories that promote members' reflexivity, agency, and contingency in the constitution of everyday social life (Bourdieu, 1977, 1990; Garfinkel, 1967; Giddens, 1979, 1984). These approaches favor the study of social actions as at once structured and structuring in time and space, bound by historically durable social orders of power and symbolic systems yet creative, variable, responsive to situational exigencies and capable of producing novel consequences. Even in the maintenance of social regularities, "the familiar is created and recreated through human agency itself" (Giddens, 1979, p. 128).

No principle is more fundamental to linguistic anthropology than the notion that a language is more than a formal code, more than a medium of communication; and more than a repository of meanings. Language is a powerful semiotic tool for evoking social and moral sentiments, collective and personal identities tied to place and situation, and bodies of knowledge and belief (Duranti, 1997, 2003, 2004; Hymes, 1964; Sapir, 1921). When children acquire the languages of their speech communities, the languages come packaged with these evocations. And not just languages: particular dialects, registers, styles, genres, conversational moves and sequences, grammatical and lexical forms, as well as written, spoken, and other communicative modes are saturated with sociocultural contextual significance.

This relation between linguistic structures and sociocultural information is indexical, in the sense that the use of certain structures points to and constitutes certain social contexts and certain cultural frameworks for thinking and feeling (Gumperz, 1982; Hanks, 1999; Ochs, 1990; Peirce, 1955; Silverstein, 1996). A key enterprise of linguistic anthropology is analysis of the indexical relations critical to interpretations of social scenes and events. What transpires in the course of language socialization is that normally developing children become increasingly

adept at constituting and interpreting sociocultural contexts from linguistic cues. In some cases, caregivers and other mature members may make the indexical meanings explicit, as when, for example, a child uses a linguistic form inappropriately and others provide the appropriate form (Fader, 2001; He, 2001, 2004; Howard, 2004; Michaels, 1981; Paugh, 2001; Scollon, 1982) or when someone recounts a narrative centering around a social violation of language expectations (Baquedano-Lopez, 1998, 2001; Goodwin, 1990; Miller, Fung, and Mintz, 1996). In other cases, children may be prompted to perform linguistic acts that attempt to establish particular sociocultural contexts (Demuth, 1986; Moore, 2004; Ochs, 1988; Schieffelin, 1990; Watson-Gegeo and Gegeo, 1986). For example, Kaluli caregivers prompt small children to use a loud voice, distinct intonation, and particular morphemes that define the speech act performed (calling out) and to refer to names, kinship terms, and place names where a shared past experience transpired to establish a special closeness with an addressee (Schieffelin, 2003). Even when the children are prompted, most language socialization of the relation of semiotic forms to context takes place implicitly; children and other novices infer and appropriate indexical meanings through repeated participation in language-mediated practices and events that establish routine associations between certain forms and certain settings, relationships, practices, emotions, and thought-worlds. Speaking of the indexical relation of place names to the establishment of social ties, Schieffelin (*ibid.*, p. 163) concludes “In other words, these mundane socializing activities mattered because they were critical to children’s acquisition of cultural practices and knowledge, namely, building productive sociality in a society where obligation, reciprocity and access were already inscribed onto the space of place.”

Literacy has been a key object of study and contention in anthropology ever since Lévy-Bruhl and Clare (1923) associated “primitive mentality” with “prelinguistic” societies and Goody and Watt (1962) proposed that the historical adoption of literacy in societies led to significant social structural and psychological transformations. Subsequently, linguistic anthropological and language socialization studies established that rather than a monolithic practice, literacy comprises a range of activities, each entailing a set of concomitant intellectual and social skills, which are organized by and constitutive of situations and communities (Ahearn, 2001; Besnier, 1995; Collins, 1995; 1996; Fader, 2001; Heath, 1982, 1983, 1988; Schieffelin and Gilmore, 1986; Scollon and Scollon, 1981). The most influential study of literacy practices is Heath’s (1983) *Ways with Words*, a ground-breaking

language socialization analysis of the sociocultural organization of children's literacy practices across socioeconomically and racially diverse US communities. Heath's ethnographic research delineated the sociocultural universes of literacy expectations, values, and practices for children growing up in white (Roadville) and black (Trackton) working class homes and communities in the Piedmont Carolinas and their consequences for children's success in school settings. As Heath notes, the literacy socialization process is a deep, powerful, and complex factor in organizing how Roadville and Trackton children will fare in the classroom. This analysis lays bare Bourdieu's (1985) claim that the habitus of the home perpetuates the power differential in children's attainment of educational and cultural capital.

In addition to literacy variation, a major contribution of language socialization research has been towards understanding the dynamics of language variation at the register and code level (see Garrett and Baquedano-Lopez, 2002). Ochs' (1985, 1988) study in Western Samoa was the first to point out the centrality of examining systematic register variation with regard to children's acquisition of communicative competence. Many linguistic structures in Samoan are variable and context-sensitive, indexing social distance, formality of setting and gender of speaker. Ochs demonstrated that very small children are sensitive to and acquire knowledge of the socially relevant features of particular phonological, grammatical, and lexical forms that mark salient features of social hierarchy and contextual differentiation. These forms include children's alternation between two phonological registers, affect-marked and neutral first person pronouns, presence/ellipsis of ergative case marking, and the production of deictic verbs as contingent upon addressee and speech act being performed.

Indexicality and socialization into code and register choice are critical to understanding processes of language and culture maintenance and change as illustrated in several lines of inquiry in bilingual or multilingual communities undergoing language shift through processes of globalization on indigenous societies. Language socialization research points out that the coexistence of two or more codes within a particular community, whatever the sociohistorical and political circumstances that have given rise to them or brought them into contact, is rarely neutral in relation to children's developing linguistic and sociocultural competence. A dramatic example is Kulick's (1992) study in Gapun, a small, relatively isolated village on the northern coast of Papua New Guinea, where the vernacular, Taiap, was spoken along side of the lingua franca Tok Pisin. In spite of parents' desire that their children speak the vernacular, children were only acquiring Tok Pisin. Kulick accounted for these processes of language shift and loss by examining

everyday socialization practices and the ideologies that shaped them, finding that ideological transformations since contact with Europeans and their institutions, most prominently Christianity, have profoundly changed how villagers think about personhood, language, children, and modernity, all of which are central to understanding how and why children are no longer speaking their language. The interface of language socialization and language and culture shift has been analyzed in Caribbean (Garrett, 2005; Paugh, 2001, 2005; Snow, 2004), Native North American (Field, 2001, Meek, 2001), African (Moore, 2004), Asian (Howard, 2004), Pacific Island (Riley, in press), and Slavic (Friedman, 2006) communities, among others. Nonaka (2004) addresses the interface of language socialization and emergence, maintenance, and shift of a spontaneous, indigenous sign language community in Thailand, where a disposition towards multilingualism sustains the sign language as a medium of socialization and communication for both hearing and deaf children and adults of the community, even as the language is being encroached by promotional efforts to get deaf children to acquire the national Thai sign language at residential deaf schools.

A related line of language socialization inquiry focuses on language and culture maintenance and shift within diasporic groups in industrialized nations, such as Puerto Rican (Zentella, 1997), Hasidic Jewish (Fader, 2001, 2006), Mexican (Baquedano-Lopez, 2001), and Chinese (He, 2001, 2004) communities in the USA. These studies offer a language socialization perspective on language choice and religious identity, gender, and ways of delimiting or defusing community boundaries and limits (see Garrett and Baquedano-Lopez, 2002). Analyses illuminate how religious and heritage language institutions, along with familial units, support and amplify sociohistorically rooted language and cultural practices, attempting to draw children into an identification with a community of speakers. These studies examine how teachers and other members of the community attempt to socialize diaspora children into affiliating with not only a community-relevant code repertoire but also moral dispositions and social entitlements implicitly indexed through language socialization practices.

The language socialization paradigm offers a socioculturally informed analysis of life course and historical continuity and transformation. This overview has focused on the socialization into and through language in childhood, yet language socialization transpires whenever there is an asymmetry in knowledge and power and characterizes our human interactions throughout adulthood as we become socialized into novel activities, identities, and objects relevant to work, family, recreation, civic, religious, and other environments in increasingly globalized communities.

## ECOLOGICAL PERSPECTIVES ON SECOND LANGUAGE ACQUISITION AND SOCIALIZATION

### DEFINITIONS: WHAT IS LANGUAGE ECOLOGY/ ECOLINGUISTICS?

*Ecolinguistics*, or *Language Ecology*, was originally defined in 1972 by the Norwegian linguist Einar Haugen as “the study of interactions between any given language and its environment” (Haugen, 2001, p. 57). The definition echoes the German biologist Ernst Haeckel’s (1866) definition of ecology within the life sciences as “die gesammte Wissenschaft von den Beziehungen, des Organismus zur umgebenden Aussenwelt, wohin wir im weiteren ‘Sinne alle Existenz-Bedingungen’ rechnen können” (“the total science of the organism’s relations to the surrounding environment, to which we can count in a wider sense all ‘conditions of existence’”) (Haeckel, 1866, p. 286). Haugen understood language ecology as an approach to, or dimension of, linguistics. Today language ecology is still predominantly used within a broad array of linguistic disciplines concerned with multilingual realities, whether psychologically (micro-ecology) or sociologically (macro-ecology) conceived. Language ecology is thus a widespread approach within such fields as second language acquisition (SLA), bi- and multilingualism and language diversity, death, and revitalization (Crystal, 2000).

In the 1990s language ecology, now widely termed *ecolinguistics*, developed into an institutionalized field in its own right, largely triggered by M.A.K. Halliday’s plenary talk at the IXth Congress of the International Association for Applied Linguistics (AILA) in Thessaloniki in 1990 (Halliday, 2001). In 1993 the first ecolinguistics section was held at AILA X (Amsterdam), and in 1996 a scientific commission under AILA was established at AILA XI in Jyväskylä (see the two AILA reports: Alexander, Bang, and Døør, 1993; Bang, Døør, Alexander Fill and Verhagen, 1996). In the AILA context, ecolinguistics comprises:

1. the study of how language reflects, refracts, and distorts our natural and social environment (see part 3 in Fill and Mühlhäusler, 2001)
2. the use of well-known theories, e.g. Critical Discourse Analysis or Systemic Functional Linguistics, in analyzing how ecological crises are expressed in, and constituted by, grammar and

discourse (see part 4 in Fill and Mühlhäusler, 2001; Mühlhäusler, Harré, and Brockmeier, 1999)

3. the development of new ecological theories of language, grammar, and discourse (Finke, 2001; Bang and Døør, 2007).

A keyword in ecology, whether in the life sciences or in linguistics, is holism. A holistic approach to linguistics implies that language is not studied as an isolated, self-contained system, but rather in its natural surroundings, i.e. in relation to the personal, situational, cultural, and societal factors that collectively shape the production and evolution of language, ontogenetically as well as phylogenetically. Linguistic holism leads to a number of methodological considerations, shared by the majority of ecolinguists.

First, the holistic approach makes ecolinguists investigate the contextual properties of language and communication. In ecolinguistics, context refers to both personal-situational and sociocultural phenomena. Thus, an ecolinguistic analysis relates linguistic data to the complex totality of the speakers' situational positioning and the sociocultural and socioeconomic characteristics of the speech communities.

Second, since the holistic approach presupposes a worldview in which everything is part of an undividable whole, ecolinguistics abandons any attempt to reduce complex phenomena to Cartesian dualisms. Rather, the ecolinguist describes linguistic phenomena as interconnected, interdependent, and interactional (Steffensen, 2007). Interconnectedness implies that every part of the whole is regarded as connected to any other part and to the whole. Interdependence implies that a linguistic phenomenon's mode of existence changes if other phenomena change or cease to exist. Interaction implies that no part affects other parts without being affected itself; there is no mono-directionality, only mutuality. This does not, however, necessarily imply symmetry since one part may dominate the other(s).

Third, holism values diversity. Rather than searching for universals—whether in the form of Chomsky's Universal Grammar, Grice's Universal Maxims or Habermas' Universal Pragmatics—ecolinguistics adopts a descriptive frame that accentuates the particular and the specific over the general and universal. This differentiates ecolinguistics from such paradigms as (Labovian) sociolinguistics and conversation analysis.

Fourth, the holistic approach leads many ecolinguists to general systems theory (van Lier, 2003, pp. 213–228)—including its newer developments: chaos/complexity theory—and the notions of open systems, dynamicity and emergence (von Bertalanffy, 1968). These theoretical frames offer a view on language as a mediator between cultural and natural ecosystems (cf. Finke, 1996; Trampe, 1996). The term dynamicity is also used outside of the systems theory frame *per se*, namely to describe changes in the personal, situational and cultural reality.

Fifth, and summing up the four previous points, a holistic starting point leads the ecolinguist to adopt a dialogical point of view on language: (i) It is in dialogue that the personal, the situational, and the cultural merge; (ii) it is in dialogue that interconnectedness, interdependence, and interaction of language unfold; (iii) dialogue provides the breeding ground for the creation and maintenance of sociocultural and linguistic diversity; (iv) dialogue offers a possibility for realizing our potential for changing ourselves and our surroundings<sup>1</sup>.

It follows from the ecolinguistic emphasis on contextuality and open systems that the researcher sees him/herself as participant, i.e. as related to the object system under investigation. This is contrary to the positivist objectivism of the Cartesian–Newtonian era in science, but in accordance with key tenets of quantum physics and systems theory, e.g. as formulated by the Nobel laureate Ilya Prigogine: “The experimental dialogue with nature discovered by modern science involves activity rather than passive observation. [. . .] Description is dialogue, communication, [. . .].” (Prigogine and Stengers, 1984, p. 41, 300). This non-dualist epistemology requires an explicit axiological stance; since the researcher interferes with the object under study, he/she is committed—as meticulously, conscientiously and explicitly as possible—to a praxis that furthers a development which is beneficial. According to Fill (1993), ecolinguistics promotes, *inter alia*, peaceful coexistence of all beings, the preference for the small in opposition to the big, and the preservation of the weaker against the stronger. This axiological stance emphasizes a family resemblance between ecolinguistics and critical applied linguistics. In her review of Fill and Mühlhäusler (2001), Gerbig notes: “[Fill and Mühlhäusler] employ a very broad notion of ecology, which leads to a seemingly irreconcilable diversity between the different contributions and which is one reason why ecolinguistics has been faced with major criticism.” (Gerbig, 2003, p. 91). However, the explicit axiological stance is arguably the one feature that reconciles the many branches of ecolinguistics. Whether an ecolinguist works with bilingualism, language acquisition and language socialization, political discourse or environmental problems, he/she

---

<sup>1</sup> This definition of ecolinguistics is related to an ethnographic, sociocultural view of linguistic phenomena. Qualitative research (e.g., case study, ethnography) too is often described as seeking holism, sociocultural contextualization, multiple perspectives, dialogue etc. However, an ecolinguistic approach includes physical and economic phenomena that are not necessarily accounted for by an ethnographic approach. Moreover, dialogue is understood here in a Bakhtinian sense as a relational principle not only of here-and-now interactions but of human existence per se. In this sense, dialogue is always anchored, not in a multiperspectival external viewpoint, but in the unique subject position of the speaker or the researcher—a subject position for which each one is answerable.

stands up for the minority language and its learners, for the victims of political exploitation and ecological devastation.

### EARLY DEVELOPMENTS

Second language acquisition research has only recently become interested in language ecology. In the 1980s, after an initial focus on the linguistic and cognitive processes at work in the acquisition of L2 forms and rules of usage, SLA researchers started turning their attention to the influence of the social context in the development of language use or communicative competence. The early immersion programs in Canada and the study of immigrant language learners in natural, i.e., noninstructional, environments in the U.S. were the trigger for a host of studies that confirmed the fact that the ability to use language to communicate with others, by contrast with merely learning rules, is acquired through being exposed to comprehensible input as well as in and through interaction with others.

Through the focus on language use rather than just language usage, second language acquisition, one could say, acquired a socialization dimension. Some sociolinguists, such as Leslie Beebe and Elaine Tarone, pushed the field into the study of interlanguage pragmatics. Nonnative speakers (NNSs) were encouraged to “express, interpret and negotiate meanings” in communication with native speakers (NSs), and to become socialized into the host society by approximating the NS. However, what was being approximated was less the diversity and variability of NS social and cultural meanings than a rather standard grammatical, sociolinguistic, discourse and strategic competence. In sum, until the 1990s SLA’s interest in the social context was an extension of its interest in the acquisition of standardized forms and meanings for the purposes of communication as exchange of information.

Since the 1990s, the social has come into its own. Global migrations, the advent of the internet and the global spread of English have raised concerns about the appropriateness of imposing one NS model for all. Social and cultural variability in form and meaning became a source of concern for psycholinguists anxious to have reliable data to analyze and from which to make claims regarding learners’ level of language competence. Sociolinguists pointed out that a language is not just a mode of communication but a symbolic statement of social and cultural identity, especially in the increasingly multilingual environments in which L2 learners found themselves. For example, Rampton’s study of multiethnic and multilingual adolescents in a British high school showed the dazzling linguistic and social abilities of NNSs to temporarily “cross” over into peers’ languages and play with various roles and personae (Rampton, 1995). A renewed interest in the work of Dell

Hymes led proponents of communicative competence in SLA to revisit his understanding of the term and suggest that maybe the computer metaphor in SLA had prevented researchers from doing justice to the complexity of the “ethnography of speaking” (Firth and Wagner, 1997).

The growing influence of cultural psychology (Stigler, Shweder, and Herdt, 1990) and of Soviet theories of language (Vološinov, 1986) and cognition (Vygotsky, 1962) on scholars from anthropology, education, and other disciplines made the full study of the social and the cultural in SLA respectable and legitimate. Sociocognitive and sociocultural theories have become particularly popular to explain the relationship between language acquisition and language socialization. The major contribution made to the social aspects of SLA since the early 1990s has been Vygotsky’s cognitive theory and its reinterpretation through Leontiev’s activity theory, applied to SLA by Jim Lantolf under the name of sociocultural theory (SCT). SCT reverses the notion that language acquisition takes place in the head and that language use merely applies this acquired knowledge to the social world. Cognition, says SCT, occurs first on the social plane and only later gets internalized on the psychological plane in the form of inner speech in interaction with more capable peers. For Vygotsky, socialization is part and parcel of acquisition. In fact, it predates it.

SCT is having a substantial impact on SLA theory, as it responds to the need to account for social and cultural phenomena in a field that was originally mainly psycholinguistic. The notions of symbolic mediation, collaborative learning, participation, and the achievement of common activities around real-world tasks all show a desire to move L2 acquisition in the direction of L2 socialization and thus to adopt a more ecological approach to SLA.

The continued interest in pragmatics and conversation analysis also shows a desire to bridge the gap between acquisition and socialization in SLA. Kasper’s recent review of the current theoretical perspectives on L2 pragmatic development encompasses not only a linguistic (e.g., grammar) and an information-processing perspective (e.g., attention, awareness), but also a Vygotskyian sociocultural perspective (e.g., assisted performance) and a language socialization perspective, which focuses on learners’ participation and apprenticeship in recurring situated activities—a focus she calls “neo-Vygotskyian” (Kasper, 2001, p. 516). In fact, Kasper sees SCT and language socialization theory converge in their close attention to interactional processes in SLA, and she suggests that both theories could benefit from adding conversation analysis to the mix, to form a theoretically “even happier ménage à trois” (p. 524). Conversation analysis, also born in the 1970s from ethnomethodology and the sociology of language, offers a highly elaborate tool to analyze the way conversational partners orient themselves

to the on-going interactional situation and position themselves vis-à-vis the turns-at-talk, the topics, and the cognitive tasks that participants set up for one another. Conversation analysis adds a particularly attractive feature to SCT because conversational transcriptions offer easily observable evidence of cognitive processes at the moment of their deployment in conversation. According to SCT, these processes can be seen as directly related to the learner's inner speech in his/her zone of proximal development.

#### MAJOR CONTRIBUTIONS AND WORKS IN PROGRESS

SLA theories that explain acquisition processes through interactional, collaborative, or socialization processes show the significance of the social and the cultural in SLA. However, they retain the structuralist, dichotomous view of the cognitive and the social as separate realms. Thus, discourse data are considered to be "evidence" of underlying thought processes, not of constructing the very social and cultural reality they purport to reveal. Even though SCT has taken great pains to dissociate itself from earlier input theories and gives precedence to the social and cultural, it still proceeds as if it is possible to infer from individual speech to individual thought. However, to use Vološinov's distinction, speech does not *reflect* thought, it *refracts* thought (Vološinov, 1986). Similarly, even though, according to SCT, individual speech is nothing but internalized collective speech, researchers working within an SCT framework rarely consider the fact that the utterances of L2 learners might express in L2 an inner speech that is mediated by an L1, L3 or L4 because the learner had his/her primary socialization in one of these languages (see research on Bilingual Education, Volume 5).

Some researchers have therefore felt the need to draw on theories that take a more explicitly ecological view of language acquisition as socialization. The publication in 1997 of Diane Larsen-Freeman's article on the application of chaos/complexity theory (C/CT) to SLA was a milestone in the development of this language-acquisition-as-socialization-view: SLA theory was taking a post-structuralist turn (Larsen-Freeman, 1997). Comparing the acquisition of a foreign language to the complex, nonlinear processes of dynamic systems, Larsen-Freeman proposed that we should look for interconnections between scales, e.g., between the microlevel of the individual organism and the macrolevel of society, between past and potential future performance, between organic processes of learning and inorganic materials such as computers, tapes, etc., between local behaviors and global events, between lower level phenomena such as textbooks and classrooms and higher level phenomena such as geopolitics and globalization. C/CT

elides the dualism individual/society, individual cognition/group socialization, and offers a broader lens to view the development of language as one among many semiotic systems through which we make meaning of the life around us (see also Herdina and Jessner, 2002).

Around the same time, ecological theories of language acquisition as socialization were gaining momentum. Three representatives of this trend are Kramsch (2002), Leather and van Dam (2003), and van Lier (2003). They all view SLA as an emergent phenomenon, triggered by the availability of affordances in the environment, heavily dependent on an individual's perception of these affordances and his/her willingness to participate actively in their use. As Jay Lemke (2002) has argued, an ecological perspective on SLA does not circumscribe the individual learner to the limits of his/her skin or to her own experience. The "learner" includes not only the here and now of his/her learning, but memories of previous learnings, projections of future scenarios, subjective appraisals, fantasies, identifications with remembered, relived, and potential selves. We have to distinguish between the biological time of the child, the sociological time of the institution, and the ideological time of society. Teachers teach to multiple timescales, not only to the actual adolescent in the classroom, but to the former child and the future adult; they must judge not only the actual capacity and performance but a set of perceptions, expectations and potentialities. For ecologically oriented researchers, learning takes place not only in educational settings, but also in nurseries, community centers and on the internet, as documented in the collection of papers in Leather and van Dam (2003). As Kramsch (2002) argues, many researchers who work within an ecological framework have adopted a phenomenological stance, ranging from the sociological to the philosophical, which provides them with a sense of educational responsibility and social justice (cf. the axiological stance mentioned in the first section above).

In order to take into account the many other semiotic systems in the environment beside the verbal (e.g., visual, acoustic, electronic), van Lier (2003) explicitly couples an ecological perspective on SLA with C.S. Peirce's semiotic theory and attempts to reconcile an ecological and a semiotic perspective within the activity theoretical framework offered by SCT.

The current interest in SLA as an ecological phenomenon has been accompanied, in language education, by a veritable passion for Bakhtin (1981) and the notion of dialogism that has been associated with his work and that of Vygotsky (Ball and Freedman, 2004). What language educators find attractive in Bakhtin is the collaborative, participatory, dialogic aspect of his stylistic theory that converges with the interactional theories of learning reviewed above and with the holistic conceptions of learning advocated by language ecology. But some scholars

fear that the notion of dialogic pedagogy is becoming trivialized, thus concealing the truly ecological complexity of Bakhtinian thought (e.g., Cazden, 2004).

The emergence of ecology-friendly theories of SLA is accompanied by a renewed interest in linguistic relativism and in the relation of language, thought, and culture in applied linguistics. Gumperz and Levinson's (1999) volume revisits this once controversial issue by publishing together papers in first language acquisition and bilingualism, language socialization, and conceptual development. As a theoretical construct, the notion that a person's thought is channeled or influenced by the language this person has been socialized in is no longer controversial. However, the concept of linguistic relativism is dangerous to educational institutions that pride themselves in delivering knowledge that is universally valid, i.e., that is independent of the language in which it is delivered.

The inroads made by post-structuralism and social constructionism in a traditionally structuralist, objectivist research field like SLA are still tentative but significant. However, it presents problems. Not only is SLA research as a field keen on maintaining its credibility by producing findings that are as reliable and generalizable as those of the natural sciences, but by being tightly linked to the field of language education, it is hostage to the criteria of educational success recognizable and acceptable by a general public that does not necessarily espouse ecological views of education. And yet, ecological theories of learning must prompt us to rethink the relationship of individuals and various learning environments beyond the classroom, e.g., study abroad and distance learning. It is also prompting us to seriously conceptualize the relationship of individuals and their objects or artifacts, in particular computer technology. A growing number of SLA researchers are focusing on computer-mediated communication as a site of learning and socialization and much has yet to be understood in the way language learning technologies and virtual environments mediate learners' acquisition of a second language.

## PROBLEMS AND DIFFICULTIES

The ecolinguistics perspective described in section 1 above enables the researcher to identify the problems with an ecological approach to language education both in theory and in practice. From a theoretical perspective, ecological approaches to second language education present four challenges:

1. *Historical*. Individuals learning a second language in late childhood, adolescence, or adulthood have already been fully socialized

into one language and culture in their families, schools, and workplaces. The memory of this primary and secondary socialization lingers when they attempt to adopt the verbal and nonverbal behaviors of another speech community. Second language education should take all this previous socialization into account.

2. *Cognitive*. According to the linguistic relativity principle, we have to take into account the way language as discourse categorizes and frames our perceptions of reality. Even if NNSs are socialized into adopting the linguistic and pragmatic codes of a L2 speech community, they might retain the discourse categories and the mental patterns of meaning making of their first socialization. Bi- and multilingual individuals (and monolinguals too, of course!) are known to say one thing and mean another, because they can capitalize on the surplus of meaning afforded by the mastery of other symbolic systems.
3. *Methodological*. The historical and cognitive relativity brought about by the ability to navigate several languages and to straddle several speech communities is difficult to document because it is often a matter of subjective appraisal, contingent upon an individual's ecology at the time. Researchers working within an ecological framework (Kramsch, 2002) are very conscious of the need for qualitative, longitudinal data that put the researcher on the line and expects him/her to reveal his/her subject position. An ecological research approach offers more internal validity (appropriately called ecological validity) but less reliability and inordinately less generalizability or external validity.
4. *Ethical*. Applying the paradigm of first language socialization to already socialized individuals raises ethical issues that are currently anguishing many English teachers and researchers of English as a Second Language (ESL) around the world. Many have problematized the use of the NS as model of socialization, especially as the availability of large scale electronic corpora of NS English is making it easy to socialize NNSs into the ways with words of true, genuine, native speakers on the streets of London, New York, or Sydney. But should they be? The resistance of learners to reproduction through ESL is well documented. Socialization researchers talk about negative socialization. Some have suggested the notion of a third place between socialization processes (Kramsch, 1993).

Furthermore, an ecological theory of language education that takes seriously the notions of interdependence, dynamicity, and dialogism is bound to encounter the difficulties that any poststructuralist approach has encountered in the social sciences. A case in point is Bonny

Norton's (2000) pioneering book on *Identity in Language Learning*, which revisits such notions as motivation and learning in a poststructuralist, feminist theoretical light. Inspired by a more ecological view of identity as multiple, changing and the site of conflict, she argues that immigrants to Anglophone countries can capitalize on their various identities as, e.g., immigrant, woman, mother, employee, to stand up to their landlords or employers and redress the power imbalance they encounter in social life. The SLA concept of motivation in language learning has now been supplemented by that of "investment"—a more participatory metaphor than that of motivation. However, Norton has been criticized for holding still too structuralist a view of identity. Instead of seeing one's multiple social identities as given by one's position in the social world, an ecological paradigm would see them as so many subject positions emerging in the interplay between the social world and the discursive situation at hand.

From the perspective of educational practice, language ecology has already had its critics from within applied linguistics. In a recent article on the "ecological turn" in language policy, Alastair Pennycook (2004) is ready to admit that, while the strength of an ecological approach to SLA lies in its poststructuralist relativity, reflexivity, and decenteredness, it risks losing the capacity to take a critical stance toward certain (nefarious) forms of socialization. This insight should function as a reminder to ecologically oriented linguists never to lose sight of the power struggles inherent in cultural ecosystems (as acknowledged in Steffensen, 2007, p. 11). Others, like Shirley Brice Heath, inspired by Bakhtin, prefer to highlight the educationally beneficial role of literary narratives and counternarratives in providing youngsters with alternative models of socialization, which she calls "scenarios of possibility" (Heath, 2000).

Furthermore, an ecological practice of language education should require abandoning the demand for standardization in language education. Like generalizability in educational research, standardization in educational practice expresses the need to eliminate diversity and to exercise control, both notions that are incompatible with language ecology.

#### CRITICAL APPRAISAL AND FUTURE DIRECTIONS FOR RESEARCH

Ecolinguistics has given us a rich holistic framework for studying phenomena of second language acquisition and socialization. It highlights the emergent nature of language and language learning, the crucial role of affordances in the environment, the mediating function of language in the educational enterprise. It brings back into focus the historicity and the subjectivity of the language learning experience, as well as

its inherent conflictuality. The notion that language education operates on multiple timescales, e.g., the timescale of human and personal development, the timescale of the institution, the timescale of the job market should make us pause. Relevance should be researched differently for each of these timescales, and so should the evaluation of knowledge and the control of its use.

The challenge for an ecologically oriented research in language acquisition and socialization is to meet both the institutional demands for public accountability and efficiency and the individual demands for personal relevance and meaning. Rather than generalizability, an ecological approach to educational research strives for dialogicality. The articulation of local and particular experiences, might lead to global changes, not by way of generalizability, but by way of analogy, because dialogue implies the emergence of shared experiences.

LANGUAGE SOCIALIZATION AND THE LINGUISTIC  
ANTHROPOLOGY OF EDUCATION

INTRODUCTION

Language Socialization is generally conceived as the socialization through language to use language in socially appropriate ways (see Ochs and Schieffelin, *Language Socialization: An Historical Overview*, Volume 8). Thus Language Socialization (LS) processes can be seen as a subset of the research purview of linguistic anthropology, characterized more broadly as an investigation of how language “both presupposes and creates anew, social relations in cultural context” (see Wortham, *Linguistic Anthropology of Education*, Volume 3). As individuals are socialized through language to use language, they draw on “presupposed” aspects of language, but also, inevitably, “create anew” aspects of language in order to use it for particular concerns that arise in each individually unique interaction. Despite this point of connection, LS research and more broadly conceived linguistic anthropological research have followed different paths into educational contexts.

Like any productive development within science and social science, the development of LS and its relationship both to the field of linguistic anthropology and to broader issues of education, language, and human development has proceeded through a give and take not unlike that characterized by LS studies themselves: Forays into new territory, creative conceptualizations, and departures from canonical concerns in linguistic anthropology are matched and fueled by a periodic reconvergence of paths, when one or another view of the endeavor runs up against its own limitations. By tracing these points of fissure and rapprochement, this chapter illustrates how LS has not only grown by incorporating and selecting from multiple theoretical and methodological tools within linguistic anthropology and education (and other fields), but also contributed significantly to the educationally focused domain of the Linguistic Anthropology of Education.

To understand how the field of LS has developed with respect to the Linguistic Anthropology of Education, this entry traces the connections between these categorizations of research from their current coinage to their roots in linguistic anthropology as a whole. The taxonomy below represents the intellectual arena within which LS is situated relative to

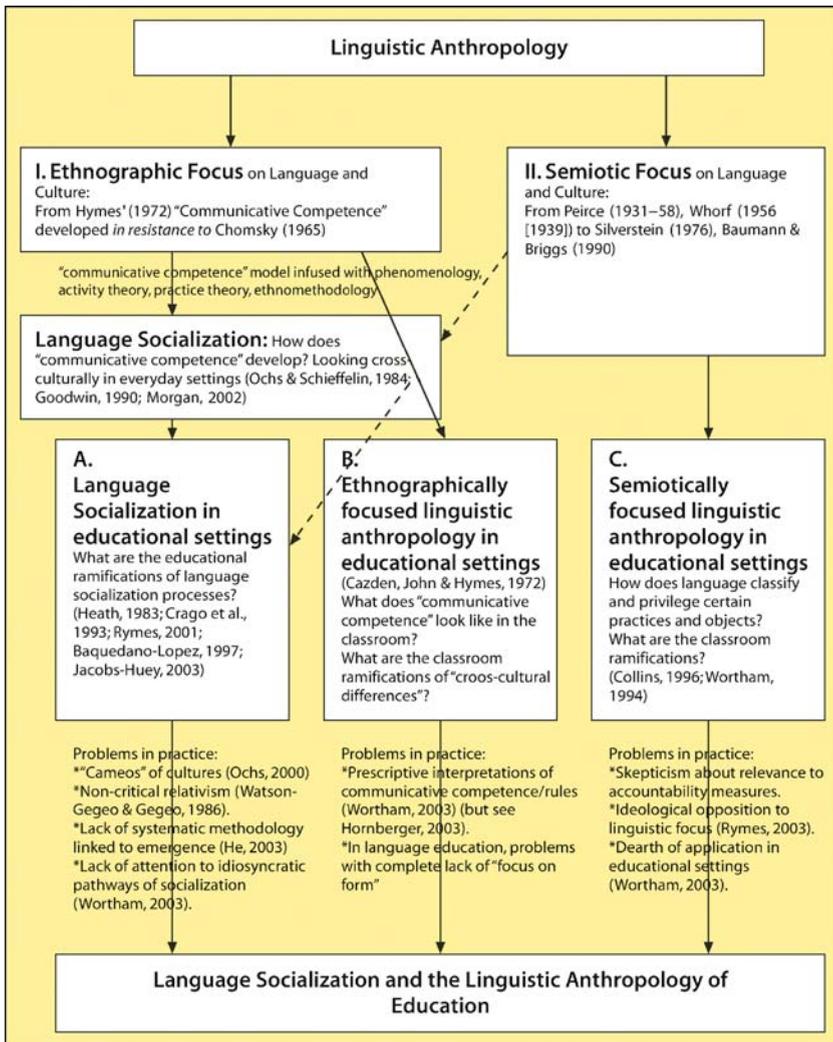

Figure 1 Language Socialization's Relationship to the Linguistic Anthropology of Education.

the linguistic anthropology of education and will be the foundation for the review that follows (see Figure 1).

### EARLY DEVELOPMENTS

The pathways delineated in Figure 1 articulate two initial strands of linguistic anthropology that have developed relatively distinctly (though not necessarily in opposition to each other) since the 1960s: One strand

(Roman Numeral I in [Figure 1](#)), while attuned to language and communication, developed a relatively greater emphasis on the ethnographic aspects of language use, and another strand (Roman Numeral II in [Figure 1](#)) has focused on semiotic processes and their effects both historically and in single instances of language use. While each of these strands theoretically recognizes the mutual influence of ethnographic context and semiotic (including linguistic) processes on events of speaking, work within these sub-fields differs distinctly in their relative emphasis on ethnographic characterizations versus semiotic processes.

On the ethnographic side, Dell Hymes (1972) used a linguistic anthropological approach to articulate problems with Noam Chomsky's (1965) decontextualized concept of "ideal speaker" which was based solely on "grammatical competence." In pointed contrast to Chomsky's phrase, Hymes coined the term "communicative competence" to emphasize the socially situated elements integral to each event of communication that a more culturally nuanced "ideal speaker" must master in addition to grammar to become competent within a community. Perhaps in part because Hymes' theory of "communicative competence" had its genesis in opposition to Chomsky's privileging of "grammar," studies in this tradition do not have a systematically articulated or unified set of methods for studying signs and linguistic form, but do document in detail, and often over the course of multiple years of experience within a community, ethnographic elements of communicative practice, focusing their analysis on recurring speech events like recurrent caretaker-child events (Ochs, 1988; Ochs and Schieffelin, 1984), story-telling (Goodwin, 1990), or literacy events (Duranti and Ochs, 1988). These analyses are concerned with broad event structures primarily, and secondarily, with how these events and the way language functions within them are linked to the role of grammatical categories or other linguistic features.

In contrast to Hymes' (1972) focused opposition to Chomsky's (1965) accounts of "grammatical competence," semiotically focused linguistic anthropology since the 1970s largely ignored Chomsky's claims, and instead developed semiotic accounts of context and language use by building on a tradition of Western philosophy of language and, in large part, on the work of the American pragmatist and semiotician Charles Sanders Peirce (1931-1958) and the linguistic anthropology of Benjamin Lee Whorf (1956). Whereas studies of LS emerge from a background rooted in communicative competence and the cross-cultural comparison of norms of communication, semiotic anthropology and analysis in this tradition centers on how sign systems, including grammar, classify human experience as culturally relevant and how such forms are deployed flexibly in interaction to create new forms of culturally relevant action (Baumann and Briggs, 1990; Silverstein, 1976).

Instead of moving from an ethnography of communicative events to explanations about how language functions in those events, a semiotically motivated linguistic anthropology builds on the ways that the indexical—or context-dependent—features of language point to certain presupposed meanings, but also have the potential for creative use that can reconstitute normative expectations (Silverstein, 1976).

For example, third person pronouns in English (e.g., he or she) normatively pick out (or index) parties who are not present in an ongoing interaction. As such, the use of “he” *indexes* a person not present, presupposing a participation framework that excludes the person indexed by “he.” However, the indexical value of words can also be used non-normatively to achieve highly creative and infinitely variable effects. Imagine, for example a speaker turning to a third participant and saying about the second participant, “He’s such a charmer isn’t he?” In this case, by referring to a present participant in the third person, the first speaker might intentionally exclude that person by indexically performing his absence from the participation framework—by talking *about* him in his presence. (Morgan (2002) identifies this practice as an emergent norm in some African American communities and calls it “pointed indirectness”).

This foundational concern for investigating both normative features of language use and their creative deployment, while rooted in the semiotic tradition, has also permeated later LS work (see the dashed line in Figure 1), and this is a point of connection that has fruitfully been carried forward into recent research on LS in educational settings (e.g., Wortham, 2005).

## MAJOR CONTRIBUTIONS

These early differences have ramifications for research in educational settings. Ethnographically focused approaches to linguistic anthropology that built on Hymes’ early work have moved into educational realms along (at least) two broad, but distinct pathways—one (Box A in Figure 1), taken via LS, and another (Box B) in which Hymes’ work was directly brought to bear on educational contexts. The work that builds directly on Hymes’ model for “communicative competence” (Box B) has fallen primarily under the category of “Ethnography of Communication” and the early contributions to this field are compiled in Cazden, John, and Hymes’ (1972) anthology, *Functions of Language in the Classroom*. (See Hornberger (2003) for a further distillation of the distinct forms Hymes’ work has taken in educational contexts.)

In contrast to ethnography of communication studies in classrooms, which more or less directly applied Hymes’ model to classroom contexts, LS research initially developed largely outside of formal

educational contexts, instead studying human development in multiple societies to counter universal claims about processes of language acquisition (Kulick and Schieffelin, 2004). Just as Hymes coined the term “communicative competence” to counter Chomsky’s notion of a universal linguistic competence, in a similar critique of posited universals, “Three Developmental Stories” (Schieffelin and Ochs, 1988) countered canonical psycholinguistic research by illustrating that characteristically Western middle class language acquisition routines between caregivers and babies (e.g., “baby talk” or “motherese”) are not developmental universals. Ochs and Schieffelin’s research presented cases in which parental discourse patterns are shown to be culturally specific activities that not only foster language development, but also maintain certain normative dimensions of social life. In many Westernized households, for example, ways of speaking sustain family systems in which a mother is the primary and nearly exclusive caregiver. In contrast, ways of speaking in Western Samoa and Papua New Guinea socialize children into family systems in which care-giving is a distributed responsibility, largely in the hands of older siblings and relatives other than the biological mother (see Ochs and Schieffelin, *Language Socialization: An Historical Overview*, Volume 8).

LS work in the tradition of “three developmental stories” has become increasingly relevant for understanding language within schools in part because it has reformulated what counts as “competence” (Garrett and Baquedano-López, 2002). LS studies have reconceptualized many features of language use within schools that have been considered *deficits* as merely *differences* in how students have been socialized into using language in their homes or distinct communities (Crago, Annahatak, Ninguiuruvik, 1993; Heath, 1983; Watson-Gegeo and Gegeo, 1986). Because this perspective has guided research in linguistically diverse communities, it has been able to illuminate kinds of expertise that normative institutions like schools may not recognize, for example, forms of bilingualism and code-switching that maintain community ties (Zentella, 1997; Paugh, 2002) or discourse patterns that sustain particular communities of practice (Jacobs-Huey, 2003).

Educational researchers have used this kind of LS research to understand the mechanisms that produce mass-scale educational phenomena like the “achievement gap” between ethnic groups. Heath’s, (1983) *Ways with Words*, for example, illustrated that patterns of interaction at home in rural Appalachia had ramifications for how children’s participation is interpreted in classroom settings. Thus, the LS perspective has developed a form of research in education that seeks to understand communicative competence “from the native’s perspective” and how those small scale forms of competence connect to large scale social regularities like the educational performance of particular social groups (Wortham, 2003).

This work, while perhaps initially informed by Hymes, is also enriched by an attention to phenomenology of language, activity theory, practice theory, communities of practice, and ethnomethodology (see Garrett and Baquedano-López (2002) for a detailed account of these influences in the trajectory of LS in anthropology). These philosophical and ethnomethodological influences have fueled LS research that accounts not only for static local accounts of “communicative competence” and norms for behavior, but also brings a closely attuned attention to the flexibility of language use across speech events and individuals. Thus, while LS studies have not offered a systematic set of methods for studying long term developmental trajectories, they have provided empirical examples that delineate the presupposing and creative aspects of language that contribute to socialization processes over time. LS in and out of educational settings (see Rymes, 2003 and Ochs, 1992, respectively) has also been permeated with an attention to indexicality, though not to the degree of explicit specification indexical processes have received in the semiotic tradition of linguistic anthropology (e.g., Hanks, 1990).

These roots in phenomenology and ethnomethodology also infuse LS studies with a foundational question that turns the quest for linguistic universals to a question about the variation of human subjectivity: “How do different kinds of culturally specific subjectivities come into being?” (Kulick and Schieffelin, 2004, p. 351). How is it that people experience being in the world in culturally distinct ways? Because of LS’s concern with this broad question of human subjectivity, LS research in educational settings has been able to account for lived experience of students in ways that other approaches have not. Baquedano-López’s (2000) study of the social role of narrative within religious education, Gutiérrez et al.’s (1999) investigation of hybrid language practices in the classroom, and He’s (2003) and Lo’s (2004) respective explorations of moralizing practices in Chinese and Korean heritage language classrooms all illustrate complex and unique processes of LS in educational settings.

In contrast to the proliferation of work in education that grew out of (if only initially) Hymes’ model, semiotically focused linguistic anthropology has been less directly concerned with educational contexts until recently. Whereas LS studies within schools tend to document forms of cultural expertise and their internal organization, studies rooted in contemporary semiotic anthropology document emergent practices within school settings and analyze both those features of interaction which become sedimented over time and those which may be creatively reconstructed. For example, by tracing semiotic patterns and their transmission through speech chains across a series of classroom interactions spanning months, Wortham (2005) has illustrated a trajectory of socialization unique to a particular individual’s classroom experience and not necessarily to a generalizable characteristic “school discourse

pattern.” This semiotic approach is able to document how students are socialized not into one unitary set of practices (e.g., “Western schooling” discourses), but many evolving ways of speaking. In this way, linguistic anthropological perspectives on education are able to recognize not only pre-existent forms of expertise, and children’s socialization into those, but also the increasingly fast-paced parade of cultural formations that characterize the lives and interactions of students in schools.

The potential within the semiotic tradition to create detailed and systematic accounts of those aspects of interaction within educational contexts which presuppose certain norms and those which create those norms anew remains largely untapped. However, the few studies in educational contexts which draw on this framework illustrate its promise. The volume *Natural Histories of Discourse* (Silverstein and Urban, 1996) contains two examples of how linguistic anthropology in educational contexts might be carried out and the kinds of findings it generates. In this volume, Jim Collins’ (1996) chapter on reading groups illustrates how *distinctive prosody* of a “low” reading group is both maintained by and reproduces the practices that go into making a “low” reader. While teachers and students are all “experts” at maintaining this norm, Collins does not describe this as a form of “expertise,” but instead, as a serious educational problem. Mehan (1996), likewise, exposes the natural history of discourse forms that render a mother voiceless when her child is being considered for “learning disabled” designation at school. By characterizing both what certain forms of talk index about people and how those forms motivate and/or transform sedimented ways of participating in schools, this research applies the semiotic insights of linguistic anthropology to educational settings.

Wortham (1994) offers the first and most systematic application of a semiotic anthropological perspective to an educational setting by developing a methodology for analyzing participant examples in classrooms over time. His work hinges on the distinction initially put forth by Roman Jakobson (1960) between the event of speaking and the narrated event and indexical values occasioned by these two layers of interpretation. This work has provided an essential bridge between the fields of LS and semiotic anthropology more broadly conceived.

#### PROBLEMS AND DIFFICULTIES

Accounts of LS in the classroom and applications of semiotic anthropology to educational settings have not been without problems. (I will not continue here to discuss the problems and promises of “ethnography of communication,” the center strand in [Figure 1](#) (Box B). At least four

critiques of LS center on the overly normative characterizations that may emerge from this tradition: the tendency to over-generalize; the lack of a critical perspective on such characterizations; the circular characterization of cultural events and the language that is normative within them; and the lack of a systematic methodology to characterize an individual's unique trajectory of socialization across events, longitudinally. These critiques are detailed below.

Regarding the first critique, Ochs (2000) has noted that many studies claiming to follow a LS tradition do not adequately account for the contingent and layered indexical nature of communication and as such, lead to stereotypical "cameos" of cultures—arbitrary and overly essentialized characterizations of what counts as competence within a certain community. Accompanying this critique about cameos is a related critique about how such generalizations are made sense of in LS research. Simply highlighting multiple forms of "competence" can lead to non-critical relativism (Watson-Gegeo and Gegeo, 1986) in which (to state an extreme, hypothetical example) a practice such as "sounding out" like that identified by Collins (1996) among low reading groups, is just seen as another form of competence—not a disturbing pattern that leads to educational failure in the US context.

The third critique of LS studies is methodological: the initial strategy of identifying focal cultural events like "dinner," "bedtime story," "prayer," or "storytelling," has tended to foster a lack of attention to the emergent quality of speech events within face-to-face interaction. (How, for example, does a certain act of speaking become a "prayer" even when not within a canonical prayer context?). This has led to the critique that LS-based characterizations of certain events and the language that constructs them is circular (He, 2003): According to this critique, LS research methods might lead us to initially identify a "prayer" through the language that is used, then call the language within that event, normatively "prayer-like" language.

The fourth critique, also of methodology, arises from LS researchers' initial and primary concern with documenting alternative cultural norms. Today it is generally accepted that LS research has successfully illustrated that many posited universals are untrue—and that alternative culturally specific subjectivities exist. However, the field has not, as yet, specified a methodology that could account for an individual's unique trajectory of socialization across multiple events of speaking within a normative social milieu (Wortham, 2005). In other words, no social actor uses language in ways that perfectly match normative characterizations; but the study of LS lacks a methodology for investigating how an individual's unique, yet systematic, variation from the norm is developed and sustained over time. This critique is related to the concern that

LS studies need to be imbued with more substantial ethnographic understandings that can account for such nuanced forms of participation and their development over time (Cameron and Kulick, 2004).

These critiques are problematic for LS studies in schools, because, taken together, the logical conclusion of this line of research is a proliferation of studies that identify multiple forms of communicative competence that support the notion of “LS” as a dialectical process of give and take between community norms and individual action, but which have no way of identifying the processes through which norms are taken up or contested. For researchers in education, this is a significant problem. If LS research is to be illuminating, a methodology will need to be specified to (1) avoid essentializing static cultural types and the uncritical relativism that can attend such generalizations; (2) track the emergence of new forms of participation; and (3) document how individuals negotiate or are positioned and repositioned in processes of socialization over time, possibly, in part, through more sustained and detailed ethnographic study.

Critiques of semiotically focused linguistic anthropology of education have not developed this canonical quality, in part because these studies have not had a chance to permeate educational research circles to such an extent. Often, due to a prevailing concern with standardized educational accountability, close attention to the analysis of language and interaction in educational settings (rather than testable educational outcomes) meets with skepticism. Even in circles in which qualitative and ethnographic approaches to educational research are relevant, attention to “linguistics” is perceived as too “micro.” At worst, the close attention to language is characterized as an epistemologically inappropriate “reading into” the words of others and giving them selfishly advantageous interpretations (Rymes, 2003). All of these critiques are rooted in a larger problem with the application of semiotic anthropological methods to educational settings: Unlike the tradition of Hymesian ethnography of speaking or LS, there simply is not a long history of semiotic anthropology within educational settings (Wortham, 2003).

#### WORKS IN PROGRESS

Fortunately, many of the methodological, theoretical, and practical problems encountered with linguistic anthropological work in educational settings have been increasingly addressed as scholars across these sub-fields draw on insights from one another, and as educational researchers become more familiar with these approaches. Recently, work that combines a LS perspective with an attention to semiotic and emergent

aspects of discourse was collected in a volume entitled *Linguistic Anthropology of Education* (Wortham and Rymes, 2003) in an attempt to discuss and provide empirical work that counters problems in the field like those discussed above.

The issue of language “cameos” that emerge from a LS perspective was addressed in the 2003 volume and elsewhere through research that combines a more rigorous attention to emergence and indexicality that comes from the semiotic tradition in linguistic anthropology (He, 2003; Rymes, 2003). In addition, a recent focus on language hybridity and intertextuality has illustrated how LS research in educational settings can account for multiple normative practices that co-exist in classrooms and among social categories of people (Duff, 2004; Gutiérrez et al., 2001).

In direct response to the second critique of “circularity” in some accounts of language, He (2003) has described an “enriched language socialization” infused with concepts of presupposing and entailing indexicality developed by Silverstein (1976). By tracking how utterances like a teacher’s, “when you are finished writing, you may erase it,” come to count as “moralizing” directives within Chinese heritage language classrooms, she refrains from pre-identifying certain speech events or behaviors as characteristically “Chinese” but instead illustrates how such an utterance can only count as moralizing when interlocutors recognize and treat it as such. In this example, He (2003) illustrates how “may” becomes the equivalent of “must” over time, and acquiescing to these “may” directives becomes definitional for being a “good” student.

The third critique—that LS is unable to account for trajectories of idiosyncratic individual socialization across multiple events—has also been addressed by merging insights from LS and traditional semiotic anthropology. Wortham (2005) illustrates how LS’s capacity to address the development of culturally specific subjectivities can be systematically studied with an attention to patterns of semiosis (such as the changes in participation engendered by indexical pronoun use) that develop across multiple events.

The primary concern with semiotic anthropology and its role in educational research has simply been that people haven’t been doing much of it. In response to this problem, the 2003 volume, *Linguistic Anthropology of Education*, has smoothed the way for more semiotically motivated educational research by articulating the differences and points of convergence between the fields of LS and the foundational concepts of semiotic anthropology (Wortham, 2003; Hornberger, 2003). On the heels of this volume, more recent work has continued the project of fusing a semiotic approach with LS. In a forthcoming

volume on *Narrative Analysis for Teacher Education* (Rex, in preparation) for example, contributors explicitly use the combined insights of LS (Capps and Ochs, 1995) and semiotic anthropological accounts (Wortham, 2001) to investigate how novice teachers and their students develop reflexive understanding of themselves and others.

Perhaps the most theoretically promising and recent new direction for LS and the Linguistic Anthropology of Education comes from this turn to reflexive operations—that is, the processes through which people grasp the norms within which they function (Agha, 2007). Both studies in LS and semiotically centered studies of language use and participation have been founded on at least an implicit recognition of reflexive operations in language development and use. However, the import and centrality of these processes in developing models of conduct is only now being fully and systematically articulated. In *Language and Social Relations*, Agha (2007) details the reflexive operations through which social actors variably recognize, produce, and transform models of conduct. By describing how social actors orient toward infinitely diverse models of conduct, this methodology offers a merger of the best of LS approaches—namely its ability to attend to the development of culturally specific subjectivities through ethnographic study—and the best of semiotic approaches—namely their ability to systematically identify the linguistic component of semiosis and its relationship to ethnographic contexts.

Understanding how people grasp the norms within which they function is neither simply a matter of ascertaining broad social norms related to language use nor simply a process of delineating the possible linguistic forms available to social actors. Instead, understanding reflexive processes necessitates both (1) a linguistically informed understanding of the semiotic processes that contribute to normative behavior; and (2) an ethnographically informed understanding of the social positions generated by choosing or avoiding certain kinds of normative behavior. Becoming competent as a social actor means becoming competent not in pre-existing social norms about what an “appropriate” use of, say, an address term like “Dr. Rymes” is, but in understanding the multiple signs, including forms of participation and likely social actors, that come together around activities in which “Dr. Rymes” is invoked.

By following a trajectory of semiotic signs, we can investigate which models of conduct students and teachers are invoking, producing, aligning with, or rejecting. Students and teachers are not constructed as docile recipients of macro level norms, but social actors with the capacity to choose words carefully, subvert (or conform to) the norms with which they are associated, and to develop reflexive facility with this process.

## FUTURE DIRECTIONS

Up to this point, this entry has characterized two broad strands within linguistic anthropology as distinct primarily in the degree to which they focus more on ethnographic context, or the semiotic processes that imbue such contexts with human relevance. Recent conceptualizations of cross-cultural comparisons have begun to articulate more fully the points of connection between semiotic activity and ethnographic context by focusing on reflexive operations (Agha, 2007).

This focus on reflexive grasp may be a useful new point of departure for educational linguistics more broadly. Language Socialization with an infusion of Semiotic Anthropology can lead to fertile investigation of classroom discourse and curricular effects. This fusion of anthropological approaches presents us with a way to study how language and other semiotic activity provides a medium we use to create and live within new models of conduct—even in the most seemingly rigid institutional contexts (like schools) and even while following rigid curricular mandates.

THE CRITICAL MOMENT: LANGUAGE  
SOCIALIZATION AND THE (RE)VISIONING OF FIRST  
AND SECOND LANGUAGE LEARNING

INTRODUCTION

A Japanese graduate student studying at an American university, Keiko struggled with the details of English grammar in writing academic papers. Despite 12 years of formal study in English and a Master's degree in the UK, Keiko continued routinely to write phrases such as "...political shifts of the international aid towards ..." (Bronson, 2005). In fact, her most persistent problem was use of "the," which seemed to randomly appear or be omitted in her sentences. She received volumes of teacher feedback on all drafts. Her professors tried nearly every strategy in the ESL repertoire to help Keiko achieve a more native-like proficiency in academic English. Improvement in her awareness of the problem and her ability to appropriately self-edit her drafts finally occurred when interventions based on Language Socialization (LS) assumptions were enacted.

The older Second Language Acquisition (SLA) approach might have identified Keiko's problem as "fossilization"—a term still current among ESL practitioners—and performed an intervention based on error analysis. Fossilization, however, is an unhelpful cover term for disparate phenomena that add up to nonlearning in even advanced students (see extensive review in Han, 2004). In contrast, discourse-based analyses reveal the complexity of the given/new distinction that underlies native English competence in article usage (Chafe, 1994). But can fossilization, functionality, or discourse-based interlanguage error analysis in and of itself explain what was really going on with Keiko? Is there something missing in grammatically oriented SLA assumptions that we need to consider in order to help a student like Keiko who, in all other respects, is extremely bright and successful?

Keiko's case suggests the need for a wider and deeper sociocultural/political perspective on how human beings learn, experience, and use language and culture. The evolving criticalist (defined below) approach to LS theory not only situates all languaculture (the intersection of language and culture; Agar, 1994) in the holistic contexts of everyday life, but focuses on the roles of gender, race, ethnicity, and power in local

(immediate) and remote (societal) structural levels of influence on language attitudes, rights, learning, and performance. We highlight the importance of critically oriented LS theory for SLA, while distinguishing among the diverse research programs and perspectives that claim a space under the LS umbrella.

We will return to article usage by Keiko to demonstrate that LS research can vary in how fully it embodies the emergent LS paradigm—for example, in the level of detail at which language-learning and associated contexts are represented in the primary record and associated timeframe. We maintain that practitioners and critical readers should attend to the integrity of the design and actual methods employed when assessing any study that claims to be “language socialization.” The explanatory power of LS research for rethinking even the most entrenched issues in SLA is enhanced where best practices in data collection and analysis are brought to bear, and where researchers ground the power of their claims in the rigor of their methods.

#### EARLY WORK

We use *criticalist* as a cover term for all critical perspectives from the left concerned with identifying and analyzing issues of race, ethnicity, class, gender, and power, and pursuing research towards social justice and transformation of knowledge and action. A criticalist sensibility, in the widest, nondogmatic sense of the term, has been seminal in LS research, and should be foundational for future work in this area.

LS research began in the 1970s (e.g., Philips, 1972), but the term was not applied nor a theoretical approach articulated until anthropologists Schieffelin and Ochs’ (1986a,b) classic formulations in their ground-breaking edited collection and major analytic review of the field. Originally a response to the narrowness of mainstream first language acquisition (FLA) and child development research models of the 1960s–1970s, LS recognized that language learning and enculturation are part of the same process. Early LS researchers were students of John Gumperz (e.g., 1982), Susan Ervin-Tripp, or Dell Hymes (1974, 1980), and were influenced by William Labov. These scholars, whose graduate seminars and research on classrooms and other social institutions examined how discrimination by language variety and discourse styles associated with race, ethnicity, class, and gender disadvantaged certain populations, did not explicitly situate their work in critical theory(ies). However, expert testimony by such sociolinguists before the US Supreme Court helped bring about the Lau Remedies that mandated bilingual, bi-cultural education following the court’s decision in favor of the plaintiffs in *Lau versus Nichols*, 1974.

At that time most LS researchers were focused on proving the “scientific” value of their ethnographic work to psycholinguists and child development researchers whose preoccupation was FLA, and this concern took precedence over framing LS work critically beyond a “culture difference” perspective. Early researchers focused on children’s FL learning in usually small (seemingly) monolingual societies, and although gender was typically addressed, power, oppression, multilingualism, and macro-sociopolitical issues of a globalizing world were bracketed. Researchers emphasized all participants’ agency in interactions with multiple (rather than dyadic) others in the dialectic of structure and agency (Giddens, 1979), laying the groundwork for a turn toward an overtly critical perspective. For the past two decades, linguistic anthropologists have argued that everyday linguistic and discursive practices both mirror and help to create broader social structures and systems of cultural meaning. Children play an important role in changing the culture that they are learning as they learn.

LS research projects from the beginning were based on a combination of longitudinal ethnographic methods and discourse analysis. Final research reports presented language development and “acquisition” of particular features or discourse routines in the context of an evolving sociocultural competence negotiated by the learner in use and constrained by social structure. Keiko’s struggle with the definite article in English documented over three years is typical of the use of fine-grained data to exemplify larger patterns and issues at stake in language socialization.

#### MAJOR CONTRIBUTIONS

The seemingly pristine, largely isolated community in which language and culture are learned without other languacultural hybridity or influence is rare if not nonexistent today. Other than studies of privileged middle- and upper-middle class families essentially cordoned off from the struggles of multiethnic communities that surround them, most of the populations all LS researchers encounter face formidable barriers to their livelihood and “success” that are regulated by access to specific language varieties and other sociopolitical resources. If LS theory was to evolve into a paradigm for the complex processes of languaculture socialization, it needed to expand the sociocultural and situational settings in which it was applied, and incorporate theoretical advances in applied linguistics, sociohistorical and cognitive theories, and identity theory.

In the past two decades, LS studies have been undertaken in bi-/multicultural and second language (SL) classroom and community settings, and in postcolonial, hybridized, heterogeneous situations.

Most of this research has been undertaken by SL researchers (e.g., Bayley and Schecter, 2003; Duff, 1995; Sidnell, 1997; but see Garrett, 2004), even as the paradigm itself continues to be developed theoretically and methodologically by these researchers (e.g., Garrett and Baquedano-López, 2002; Watson-Gegeo, 1992, 2004). Criticalist approaches to LS in SLA examine language learning through postcolonial and post-modern theoretical lenses where issues of power, privilege, and socio-political history are central rather than incidental to the analysis, and where the research is positioned to serve subaltern communities in crisis as well as to advance scholarly discourse.

#### WORK IN PROGRESS

Three analytic reviews of LS and related theory that help to advance LS in a criticalist direction have been published in the past five years: Garrett and Baquedano-López (2002), Watson-Gegeo (2004), and Watson-Gegeo and Nielsen (2003). Garrett and Baquedano-López (2002), who are among the current generation (second wave) of LS theorists, show how LS work today is taking place in a wide variety of heterogeneous settings, including institutional contexts, where speakers' lives are impacted by rapidly changing linguistic and social processes. Watson-Gegeo (2004) and Watson-Gegeo and Nielsen (2003) argue for LS as a sociohistorical, sociopolitical paradigm for languacultural learning, and set out minimum standards for a study to be grounded in LS theory as well as robust enough to explain diverse situations researchers and the people they study encounter. The three reviews also examine and critique specific LS studies.

As Garrett and Baquedano-López (2002, p. 1) argue, LS has "proven coherent and flexible enough not merely to endure, but to adapt, to rise to . . . new theoretical and methodological challenges, and to grow." Critical LS theory may embrace a variety of criticalist positionings—radical feminist, poststructuralist, postmodernist, postcolonialist, et al. Recent empirical studies in *linguistic relativity* (e.g., Silverstein, 2000) demonstrate that differences in languages do have a significant impact on differences in thinking. This work resonates with research on *cultural models* for thinking and behaving by cognitive anthropologists using schema and prototype theory (Holland and Quinn, 1987), and psychologist Katharine Nelson (1996) on *Mental Event Representations* (MER), an advance on Vygotskian theory for how children develop ways of representing the world. At the heart of the matter are the *indigenous/local and societal ontologies and epistemologies* that shape thinking, including perception itself, exciting work on which is being done now by indigenous scholars from a variety of third world

settings—bringing a criticalist “insider’s” emic perspective into the academy (e.g., Gegeo and Watson-Gegeo, 2001; Sinha, 1997). *Standpoint epistemology* developed by feminists (Alcoff and Potter, 1993) lays the groundwork for recognizing a range of positionings and ways of knowing different from Western white male orientations. This also includes the realization that children’s epistemologies differ from those of adults. *Culture* is recognized as variable, an ongoing conversation embodying conflict and change, shaped by the dialectic of structure and agency, inherently ideological, and prone to manipulation and distortion by powerful interests (e.g., Habermas, 1979). Culture and *identity* are inextricably linked, but highly complex.

Bhabha’s (1994) concept of the “third space,” that cultural forms in the continuous process of hybridity can allow the possibility for one to create new cultural positionings, does not take away from people’s own interior sense of a “deep culture” (Watson-Gegeo and Gegeo, 2004) on which they draw for a sense of continuing and “authentic” (a concept we must problematize) identity. As Hall (1991, p. 223) argues, cultural identity and knowledge(s) involve two senses of the self: of “one shared culture, a sort of collective ‘one true self,’ hiding inside the many other, more superficial or artificially imposed ‘selves’ which people with a shared history and ancestry hold in common” (e.g., Anzaldúa, 1990), and secondly, of identity and knowledges produced by “the ruptures and discontinuities” that result in “critical points of deep and significant *difference*.” Hybridity is associated with diaspora(s), colonialism, postcolonial history, and globalization, yet the complexity it evokes occurs also in dominant first-world societies where mainstream interests try to suppress difference.

LS theory incorporates new perspectives on learning, as well. Drawing on Soviet activity theory, Lave (1993, pp. 5–6) defines learning as “changing participation [and understanding] in the culturally designed settings of everyday life.” Learning involves *situated cognition*, that “every cognitive act must be viewed as a specific response to a specific set of circumstances” (Resnick, 1991, p. 4), and *situated learning*, involving the “relational character of knowledge and learning,” the “negotiated character of meaning,” and “concerned (engaged, dilemma-driven) nature of the learning activity for the people involved in it”; thus do “agent, activity, and the world mutually constitute each other” (Lave and Wenger, 1991, p. 33). All activities and relationships are inherently political. Bourdieu’s (1980, 1993) work on field, habitus, and cultural capital informs a deeper analysis of the “dispositions” of behavior in everyday life and the contexts in which learning occurs. Learning in contexts takes place through *legitimate peripheral participation*, i.e., learners begin at the periphery and gradually move to the

center as their skills grow (Lave and Wenger, 1991). The concept of legitimate peripheral participation has entered the LS canon—virtually every major LS study includes the source in its bibliography as foundational.

### PROBLEMS AND DIFFICULTIES

LS research in its most robust implementations is very difficult and time-consuming, and only a few will ever have the access to resources required and the requisite motivation—on par with an extensive Ph.D. dissertation—to do it fully. The researchers, theorists and practitioners who seek to interpret and make use of findings from self-described LS studies can benefit from a more mindful and transparent characterization of the actual methods by which knowledge was constructed, and the background philosophical assumptions that guided that construction in each instance.

LS has increasingly become an umbrella under which many kinds of work are undertaken, sometimes evoking sharp critique that these forms of work are not genuinely LS. It is therefore useful to consider the varying ways that research on language learning articulates with the LS paradigm in relatively current research programs: LS as *topic*, *approach*, *method*, and *intervention*. This taxonomy is an informal, suggestive framework for thinking about the range of studies termed LS, provocatively offering a guideline for assessing the strength and credibility of studies via their underlying philosophical assumptions and adherence to standards of LS research. The taxonomy is intended neither as a set of mutually exclusive categories, nor an attempt to definitively pigeonhole every study representing itself as LS.

#### *LS as Topic*

“LS as topic” refers to studies that touch on aspects of the LS process without necessarily embodying an LS approach or methods in the way the inquiry is actually conceived and conducted. Such researchers may examine the intersection of social life, language use, and language development. In this sense, LS has been applied as a rubric for studies of, for instance, the lexical and discursive indices of language shift and English-Spanish bilingual identity in the US (Pease-Alvarez, 2003), the multi-media-based interpretations of identity among immigrant students in the US (Harklau, 2003), sexual orientation in Egypt (Khayatt, 2003), and Aymara-Spanish codemixing among bilinguals in Bolivia (Luykx, 2003). Such research is often based on relatively thin data sets, perhaps interviews and a few examples without intensive analysis of primary discourse data in a longitudinal frame (e.g., Lamarre, 2003 examines language attitudes and bilingualism in Montréal based

entirely on interviews with bilinguals; and Pease-Alvarez's, 2003 study includes no discourse data at all to empirically examine use). These studies may include methods that are based neither on a genuinely socio-cultural nor criticalist perspective, such as those associated with Systemic Functional Linguistics (SFL) (see Chouliaraki and Fairclough, 2001, and Sullivan, 1995 for a critique of SFL's asocial and crypto-positivist roots). Critical readers should ascribe more validity to studies that are longitudinal, genuinely ethnographic, and that are both "thickly" documented and explained—i.e., that include multiple perspectives and rich data sets—than to those that focus on a single incident.

Nevertheless, studies treating LS as a topic can contribute to a collective understanding of aspects of the languaculture complex, despite using disparate modes of research within diverse contexts and communities of practice. Notable collected volumes using LS as a topic have appeared (Bayley and Schecter, 2003; Kramsch, 2002) and are important contributions. The opportunity for a more substantive dialogue among researchers with differing approaches and methods should be one goal of such volumes. The value of refining and advancing the discussion is that it will lead to a more common understanding of appropriate standards for the next generation of LS research, inspiring researchers to a higher degree of transparency and accountability, articulating more explicitly how they have approached research design, data collection and analysis. This move is advocated here as a way of amplifying a "critical moment" in SLA, that will require researchers to assess what they have left out as well as what they have included in their data sets and procedures. They must grapple with questions of accountability and responsibility to the communities they are studying as well as to their own communities-of-practice when they assess the explanatory power and impact of their final interpretations.

### *LS as Approach*

"LS as approach" includes studies that embody LS ontology and epistemology, i.e., studies that take into account the lived realities of learners and the social conditions in which their learning is occurring, but does not necessarily follow a longitudinal design. Returning to Keiko's use of "the," her problem could be approached from many different theoretical perspectives that are not aligned with LS. Much non-LS inspired research and certainly many ESL teachers in the field evoke a uni-directional image of acquisition and one-dimensional understanding of a learner as a "language acquisition device" (as critiqued by McGroarty, 1998 in her discussion of the Chomsky-inspired generative paradigm in SLA). The context- and task-dependent nature of performance and the complex interplay of cognitive, psychological

and even political factors in learning and social life may be obscured by this image.

LS as an approach to Keiko's problem raises a different set of questions and a different ontology, one that is at once particularized, social and cognitive. The LS approach can serve as a lens that brings into focus the lived experiences and challenges of learners. It embraces the subjective, phenomenological dimension of the process of socialization through language. When viewed through the lens of LS, transfer problems such as those experienced by Keiko are always already nested within multiple systems and levels. New questions occur to the researcher, lines of inquiry open up to augment the contrastive analysis and learner language strand. The LS approach thus provides an opening for SLA research and theory to catch up with developments in cognitive science (Watson-Gegeo, 2004).

### *LS as Method*

"LS as method" characterizes studies that adhere to the highest standards, including full-blown longitudinal ethnographic research and discourse analyses of relevant data. Well-designed language socialization research must embody design and methods that are congruent with the theoretical and philosophical underpinnings of the tradition in order to count as genuine contributions. A high degree of transparency about the nature of the context, participants, setting, data, and analysis is essential. Methods may be eclectic in a good LS study. To achieve what we might call a "gold standard" for design and methodological rigor in LS research from a criticalist perspective, however, certain characteristics and strategies are essential (see also Watson-Gegeo, 2004, pp. 341–342).

The study must encompass a combination of ethnographic, sociolinguistic and discourse analytic methods at a minimum, drawing on criticalist work in these areas (e.g., Fairclough, 2005; van Dijk, 1993). Ecologically valid qualitative and quantitative data may both be usefully combined, and usually are for in-depth studies. The scope of the research must include all relevant macro- and micro-dimensions of context, and incorporate whole events and behavior rather than short strips of time that have been coded into pre-set categories; most categories must be generated from and grounded in data. LS studies involve fine-grained longitudinal studies of language and culture learning in community and/or classroom settings that have been systematically documented through audiotape, videotape and careful field notes of interaction. In-depth ethnographic interviews with learners and others involved are an essential part of an LS study. LS methods bring some a priori theory to the study, but depend greatly on evolving

theory and research questions “grounded theory” style in the field site and through accumulating data and continuing analysis.

Several recent examples of such work include Aminy (2004), who reports on a longitudinal (two-and-a-half year) study of literacy socialization (learning to recite the Qu’ran) that spans three sites, exhaustive analysis of textual and contextual data, and a fully developed ethnography of the target community by an insider. Yang (2004) studies a process of school reform in an urban high-school district in Oakland, California in which participants helped to socialize each other into their varied social identities through conversations and formal and informal meetings. The study includes close analysis of meetings through video and audiotapes as well as intense textual analysis of the documents exchanged in the school reform process. Yang (2004, p. iii) uses an LS framework to investigate how members of a grassroots school reform movement “progressed from creating small schools toward recreating the urban school district itself.” Participants in his study confronted the challenge of building a common understanding of policy at a school undergoing state-mandated reform using a process that was heavily mediated by the exchange of texts. The idea of “challenge” evokes the purposes and intentions of those who are being researched and their lived struggle to make the most of available choices as they respond to dynamic contexts.

A return to the case of Keiko illustrates the value of the robust data sets and grounded analysis required by best practices in LS methods. The study included reflective journals written by Keiko wherein she engaged questions related to her language learning process, and many writing conferences and interviews, as well as samples of Keiko’s drafts. Bronson found that the placement of “the” was emblematic of the deepest issues of identity and ideology in language learning and use for Keiko. She had discovered by reading multiple authors from different countries that there were many “Englishes.” She decided to align herself with British English for most spelling forms in her writing.

However, Keiko decided to also take the liberty of experimenting with her own variety of English, including even the idiosyncratic way she used “the.” As she wrote in her journal, “I have found that I can subvert and create a sort of “my English” and style with following certain genres so that my articles can be read and understood.” This led her to a “critical incident” of realization as she worked on revisions of her writing with Bronson, her writing coach. Their counterpoint negotiations led Keiko to write about her own variety of English (Bronson, 2005, pp. 333–334); “I leant (sic) that subversion is not a whatever-goes practice and it is a continuous negotiation with genres and dominant styles of academic writing.”

The significance of Keiko's critical incident was that it induced her to come up with a reason for learning to produce grammatically well-formed English, a reason that did not represent an automatic, corresponding submersion of her Japanese identity. Moreover, it helped her to activate a strategy for breaking the daunting task of mastering sentence-level grammar down into a series of discrete and executable steps. The LS methods of this study, encompassing field notes, learner journals, discourse and textual analysis of her writing, allowed the researcher to describe not only the substance of Keiko's struggle with English form, but what that struggle meant to her and to her teachers. This "thick record" of longitudinal data meant that the differences, conflicts and points of resistance between participants were available in the research record as well as the alignments in their motivations and actions. "Critical incidents" serve as inflection points in the trajectory of LS narratives where those being studied make an important shift in understanding or perspective.

#### FUTURE DIRECTIONS

"LS as intervention" foregrounds the possibilities of LS research to make a difference in SLA teaching and sociopolitical language-related issues. Foundational LS studies of inequities in educational outcome (e.g., Heath, 1983) challenged an established "fact" hitherto attributed to such factors as low I.Q.s of minority students, and generated the languacultural "mismatch hypothesis" for minority children's failure at school and schools' failure to serve minority children. This hypothesis was the realization that the perceived deficit in achievement was a social construction, not a reflection of inherent capacities of children from diverse backgrounds caught at the crossroads between home and school. Similarly, LS theory when rigorously applied leads to a radical, criticalist empiricism, requiring researchers to grapple with the full complexity of languaculture as it manifests in dynamic, evolving contexts. This in turn questions the roots of rationality itself and problematizes the "common sense" that normalizes practices of oppression and distorts equitable discourse. LS theory then can become LS as intervention.

In Keiko's case, Bronson enrolled her as a co-researcher who participated in the creation of the official record of events—a classic example of legitimate peripheral participation. She co-presented with him at a research conference, reporting on the results of the study. She found her inclusion in the study to be instrumental in her learning. The LS research design helped her to empower herself to speak her mind about difficult issues of power and identity. The criticalist orientation of LS invited her to name something otherwise unnamable and to frame it

in valid academic terms: her own resistance to the colonization of her imagination by U.S. standard English, her desire to retain her “Japaneseness” as one pole in a complex and evolving dialectic (Bronson, 2004, p. 318). LS research can become a criticalist intervention when it does not automatically embrace an unproblematic rush to assimilation and the erasing of indigenous identity and history. LS research serves as an intervention to the extent that it is alert to the “third space” where voices and spaces of resistance necessarily accompany the overwhelming and legitimate desire of English-learners to “succeed” in mainstream terms (Candela, 2005).

LS emerged as a kind of intervention in its origins, a move to focus the study of FLA and later SLA on learners as active meaning-making agents who were struggling to construct their roles in society and to master the accompanying repertoire of communicative strategies that index and realize those roles in everyday life. Researchers who seek to bridge theory and practice and who spend extended periods of time in settings where SL socialization is occurring tend to develop high degrees of empathy for the subaltern people who are typically the focus of their studies. LS serves as an intervention inasmuch as it inspires greater attention to the unexpressed and silenced voices of those who labor under the burdens of a generally unjust social order, one that, by default, tends to stack the game of language learning and academic socialization against them.

Beyond its impact upon the researcher and, by extension, the larger communities-of-practice in which they operate, critical LS holds significance as a site for restoring otherwise silenced voices into discourse about opportunity and access to society’s resources. It emphasizes the humanity and human rights of those whom it represents, and depends on the cultivation of a long-term rapport between researcher and researched. Critical LS comes into full flower when the researched are themselves enlisted as co-researchers in the spirit of “collaborative inquiry.” When students and learners are taught to read the world even as they read the word (Freire, 1970), they must also learn to critically read the officially constructed accounts in which they themselves are inscribed.

LANGUAGE SOCIALIZATION: A SYSTEMIC  
FUNCTIONAL PERSPECTIVE

INTRODUCTION

The point-of-departure for a systemic functional linguistic (SFL) account of language socialization must necessarily be its claim to be a theory of language as social semiotic (Halliday, 1978; Hasan, 1996), broadly the theory that language is ‘a resource for meaning’ in the complex socially constituted contexts within cultures. In Halliday’s words:

A ‘sociosemiotic’ perspective implies an interpretation of the shifts, the irregularities, the disharmonies and the tensions that characterize human interaction and social processes. It attempts to explain the semiotic of the social structure, in its aspects of both persistence and change, including the semantics of social class, of the power system, of hierarchy and of social conflict. It attempts also to explain the linguistic processes whereby the members construct the social semiotic, whereby social reality is shaped, constrained and modified – processes which, far from tending towards an ideal construction, admit and even institutionalize myopia, prejudice and misunderstanding . . . (Halliday, 1978, p. 127).

From this claim it follows that accounts of linguistic phenomena—meaning, lexicogrammar, ontogenesis, literacy and so on—all are viewed as a result of the ‘social’, in various senses of that term. Another way of representing this position is to say that it is a logical impossibility in the model for language to originate asocially, so language socialization *is*, in a sense, the process of language development (Williams and Lukin, 2004). However, this orientation also entails a complex set of claims about relations between social context, language development, and the nature of language itself. In developing an account of language socialization SFL, as a theory of language, does not attempt to describe social structure directly but engages in ‘meta-dialogue’ with sociological theory that accords language a significant role in its account of social transmission and reproduction (Hasan, 1999).

To explore an SFL perspective together with aspects of its relations with sociological theory, I will focus on two specific topics: relations

between a child's meaning-making prior to language and children's 'socialization' into language use per se, and intra-cultural variation in meaning-making in everyday language use. The two questions have been chosen to illustrate the status of the concepts of language *function* and language *system* in SFL accounts of language socialization. 'Function' is crucial to the theory, but does it mean anything more than 'use' in this framework? Similarly, does 'system' mean anything more than just a general sense of a language? The selection has also been made to address a question raised by scholars interested in both acquisition and socialization, a question about ways in which it might be possible to 'bridge the gap between linguistic structure and social structure in language acquisition and use' (Kramsch, 2002, p. 2). Kramsch comments that 'a functional description of language does not eliminate the distinction between the individual language user and the social environment; it only attempts to show how each co-constructs the other', and, further, that '... the terms used by Halliday and Vygotsky, *plurifunctionality* and *internalization*, risk keeping intact the very dichotomy they strive to cancel' (Kramsch, 2002, p. 3). My purpose is not so much to eliminate the distinction between language user and social environment, but to illustrate how *function* and *system* might enable us to re-imagine the relation.

This selection has also meant setting aside a general account of work on language socialization from an SFL perspective—for example, I do not discuss differential learner access to genres as a result of differential language socialization, and the pedagogic strategies that have been developed to address this problem. 'Genre-based pedagogy', as this work has come to be called, was developed initially by James R. Martin, Joan Rothery, Frances Christie and their colleagues to provide learners with explicit accounts of the various key genres required in school writing. The accounts were based on extensive surveys and linguistic analyses of writing samples, and they were initially written to assist students from a wide variety of linguistic and social backgrounds to understand the often-implicit requirements for writing successful texts in school. (See, for examples of early work, Martin (1985) and Christie (1985)). Genre-based pedagogy is, though, by far the best-known aspect of SFL educational linguistic work, and in any case has recently been outlined and reviewed extensively (Christie and Martin, 2005; Christie and Unsworth, 2005; Schleppegrell, 2004. For earlier discussion, see also Hasan and Williams, 1996).

#### EARLY DEVELOPMENTS

In building an account of language use early in a child's life, SFL scholars have explored relations between the first systematic uses of

sound and gesture to make meaning, in Halliday's term, protolanguage, and entry into language itself. This work has subsequently proved to be important to SFL descriptions of the functional nature of the language system per se, and to processes of language socialization. Work on protolanguage is perhaps better known for its portrayal of a child's meaning-making achievements prior to language than as presenting a key theoretical proposition about relations between language development and social context.

Halliday first introduced the concept protolanguage in the early 1970s (Halliday, 1975) to describe phenomena he had been observing in a case study of his son Nigel's meaning-making during the first two years of life. For this purpose, there were two key elements in Halliday's proposal. The first was the suggestion that there was an evolutionary relationship between 'functions' of protolanguage and 'functions' in the language itself, in contrast with the idea that protolanguage is a pre-language form of communication that disappears as language proper is 'acquired', or a reduced language form which would eventually be assimilated into the first language. (In this sense his work on protolanguage both precedes, and is qualitatively different from, Derek Bickerton's proposal which also uses the term protolanguage (Bickerton, 1990; for extended discussion of this point see Painter (2005)). The second was that, even in protolanguage there are important interpersonal, and hence social, functions enacted and it is these, rather than representational functions, which provide the basis for entry into the first language.

In protolanguage, a child means through simple content-expression pairs, typically an expression such as an idiosyncratic sound and/or gesture that is interpreted over time by both child and caregiver to mean some specific content. While a child obviously develops many meaningful, generalized sounds—crying, gurgling and the like—the sounds (signifiers) to which Halliday drew attention signify much more specific meaning. These sounds, typically combined with gestures, work in the restricted context of the family to enact a range of functions, now called microfunctions, such as to enact interpersonal relations, regulate the behavior of those around, make demands to get specific things done, find out new information, and so on. They are identifiable as categorically different from generalized sounds because whenever the child means the specific meaning she uses the specific sound-gesture signifier, and whenever she uses that signifier she means that content.

The origin of these signs is social since they arise through interaction with the local interpersonal context, but their meaning is idiosyncratic to the child, interpretable only by those in closest relation to her. Halliday further argues that it is (social) contextual pressure that eventually results in a move from protolanguage to language since, as the child's

interpersonal range widens from the immediate family, she experiences the need to use ways of meaning that function in new contexts; and increasingly, over time. The introduction of lexis achieves that goal to some extent, but it is actually grammar that makes the crucial, qualitative change in meaning-making (Halliday, 2004). However, as I will attempt to show in the next section, this does not mean that there are two processes, the acquisition of grammar and socialization. Since in the SFL account grammar is itself defined as functional, originating historically from meaning-making in social interaction, it is the relation between functionality in protolanguage and the functionality of the language system that enables the child to learn 'how to mean' through language. In this sense 'language socialization' is the pathway to knowledge of language itself, in contrast with the proposal that language pre-exists social practice and is formed by it.

In parallel with Halliday's early work on the first phases of individual ontogenesis, a different perspective relevant to SFL was being developed by the British sociologist Basil Bernstein (1971). He and his colleagues had begun exploring the question of variation in the ontogenesis of language use intra-culturally. Significantly, in the initial phases of this work there was no well-theorized sense of language as system and this was to create major impediments to an account of language socialization until it was resolved. Unfortunately, the developments that have helped to resolve it are much less widely known than the early impediments.

In this work the defining question again was, 'how do people use language in the living of life?', but the perspective was here from the social context towards the individual once the individual has begun to use language. From this orientation the question becomes 'how do people use language in the living of life in different social positions within a culture?' In asking this question Bernstein was directly influenced by Vygotsky's (1978, 1986) and Luria's (1976) research on the social origins of forms of consciousness, but to their theoretical work on semiotic mediation he added the question of effects of social structure on the nature of that semiotic mediation. He notes that 'from Vygotsky and Luria, I absorbed the notion of speech as an orientating and regulative system' (Bernstein, 1971, p. 6. For further discussion of this historical relation, see Hasan, 1996; Williams, 2005).

In one sense the answer to this question is obvious, if complex to describe: in SFL terms, people use varieties of social dialect, and they use different registers that enable them to get things done, more or less successfully, in the various contexts of situation of their culture. However, Bernstein's theoretical and descriptive work raised another possibility: that language might function in systematically different ways to result in different 'codes' or orientations to meaning practices *across*

both dialects and registers. Codes are tacit principles regulating social interaction in contexts through three crucial aspects of meaning-making: recognition of contexts; relevance of meanings in contexts; and appropriate forms of the realization of meanings in those contexts. Different coding orientations, he argued, would be likely to result in implicit, invidious effects on children's access to the privileged and privileging texts used in school since they would not be equally selected into educational discourse, resulting in misunderstanding of the nature of pedagogic contexts and the relevance of meanings to those contexts.

... if we look at education (school), the positioning of the child as pupil, the crucial control on such positioning, with respect to 'privileging text', is essentially a matter of class, race, gender, and age ... It is the *local* pedagogic practice within the family, peer group and community which initially positions the child or the parents with respect to the 'privileging text'. (Bernstein, 1990, p. 176, original emphasis)

Those practices, he argued, are crucially mediated by language, though his discussion has also always included other types of semiotic modality (Bernstein, 1971). His work was soon rejected as deriving from a deficit model of language development, most famously by Labov in 'The logic of non-standard English' (Labov, 1969). These claims were examined in some detail and rebutted by Bernstein (1990), but regrettably they are still frequently repeated in pedagogic handbooks and, even, research citations.

In fact, Bernstein's first attempts to theorize the problem and to describe "language correlates" were flawed, as he himself acknowledged (Bernstein, 1971, p. 42, 55; 1990). Initially the linguistic correlates of code were couched in terms of the concepts of competence and performance, so the account was more or less located in syntax. However, in the latter part of the 1960s he abandoned that approach and instead began to think in terms of meanings being selected variably in general types of context of use. For example, his work in the Sociological Research Unit at the University of London explored different meanings people selected to control children's behavior through expressions such as "Don't do that!", "If you do that you could hurt yourself", "Stop doing that because it makes me really upset", and so on. The point is not that speakers select these meanings variably over time and across contexts—that is highly likely—but that there might be a systematic variation in the probabilities of meanings being selected within some socially defined categories<sup>1</sup> of families. The specific

<sup>1</sup> The social categories were defined in terms of relative position in the social division of labor, not by level of family income or socio-economic status, both of which Bernstein regarded as too crude and indirect as measures of social positioning.

linguistic problem, which I will take up in the second part of the next section, is to develop an account of the linguistic system at the semantic stratum to describe semantic features in ways that would allow the proposition about different coding orientations to be tested.

The two sets of work apparently suggest a theoretical dilemma: on the one hand, a generalized view of a child's entry to language, including lexicogrammar, through meaning-making in social interaction, to which she or he is oriented from birth; and on the other, a particularized view of children forming differentiated orientations to meaning-making in relation to family social positioning. The process of language socialization is crucial to both views.

### MAJOR CONTRIBUTIONS

The key moves that allowed an SFL account of socialization to address this apparent dilemma came through development of the concept of *function* alongside an account of *system*. 'System' is defined multistratally to include semantics, lexicogrammar and phonology/graphology, and the general metaphor through which the description of the system is developed is that of 'resource' for meaning. The key claim in SFL is that the system itself is functionally organized to address the highly complex social need to make and exchange meaning. That is, in this perspective, the linguistic system realizes culture because it is a social semiotic modality that functions in and through social processes to enable socially constituted subjects to exchange meanings.

What SFL studies of protolanguage have been able to demonstrate is that a child moves into use of the language system precisely because its functional qualities enable her to mean in ways that become significant as her range of social contexts and experiences expands over time and with increasing physical maturity. There is thus no sense of language developing and then being acted on by socializing processes, but rather of language itself evolving into greater functional complexity for the individual through her engagement in shared social processes.

During the protolinguistic phase, each content-meaning pair means one thing only. There can be quite elaborate development of meanings for a particular microfunction—lots of specific greetings for members of a large family, for example—but nevertheless each sign means just the one meaning. But as a child's experience broadens she typically uncouples two meaning-making resources in protolinguistic sounds—prosody from articulation, for example—and begins to extend the range of simultaneous meanings each utterance can realize. In Nigel's case this uncoupling allowed him to 'say' personal names (glossing, these were, 'mother', 'father' and 'Anna') and, at the same time, either 'ask' for information ("where are you?") or 'declare' someone's

presence (“There you are!”) (Halliday, 2004, pp. 30–31). At this early stage there are just two simple functions (‘interact’ and ‘representation’) in each instance of use, but this change represents a qualitatively different level of semiotic practice since, now, two generalized functions are deployed in each instance of use. In Halliday’s own study, and those subsequently conducted by Painter (1984) and Torr (1997), some such uncoupling has been observed to lead to initial generalization of microfunctions into two broad, temporary, functional resources, or macrofunctions, that, on the one hand, allow children to act on the world (‘pragmatic’ functions in Halliday’s terms) and resources to find out about the world (‘mathetic’ functions).

Crucially, Halliday was able to develop a detailed account of how these temporary macrofunctions eventually evolve into the functionally defined, abstract resources of the language system itself, resources he describes in terms of three generalized functions of language: to represent experience, to enable interpersonal interaction, and to organize coherent text (Halliday, 1978, 2002). His term for the idea of ‘function’ generalized in this way is ‘metafunction’. Halliday makes the distinctive claim that the qualities of these metafunctionally organized resources are as they are because of the social needs and processes that a language must address. It is these qualities that enable a child to learn how to mean through language with such facility from such a simple meaning-resource as comprised by a protolanguage. The claim about interaction between social processes and the metafunctional ‘nature’ of language systems is, in turn, the basis on which SFL scholars argue that language ‘socialization’ is, in an important sense, the key process for the evolution of language in both ontogenesis and phylogenesis. (For extended discussion, see especially Halliday, 1973; Matthiessen, 2004.) A detailed case study by Painter (1999) of the dialectic process between emerging knowledge of the language system and social context has considerably extended evidence available from the earlier studies of protolanguage.

Interestingly, more recent work has begun to explore a stronger claim for the significance of social interaction in language development. The claim, again originally from Halliday, is that interpersonal meanings develop first, and typically provide the basis for the development of representational ones. This claim contrasts sharply with a more typical idea that a child learns representational meanings first, then learns the grammar that allows her to interact about them. Painter, for example, claims:

... the first semiotic system of the individual emerges to enable the infant to share reactions to experience with the other, and it is upon this personal and interpersonal foundation that language proper is built ... the impetus to share

emotional experience that appears to underlie the development of protolanguage is similarly responsible for the transition into language itself (2004, p. 139.).

Painter provides examples of her son Stephen's development of generalizations to illustrate:

Stephens's first occasions for using generic categories were only in relation to aspects of experience that were emotionally highly charged. In his case it was almost exclusively the domain of age, since he was very conscious of being the 'little boy' in the household, always wishing to achieve the status of his older brother, but he also attended a preschool where there were babies and younger 'little' children. It would seem that reflection on this affectively salient domain provided Stephen with the way 'in' to this new linguistic development, after which, in his fourth year, it became routine to talk about generic categories and their relationships (op. cit.: p. 143)

This, then, is a broad sketch of the way language socialization is described in very early ontogenesis from the perspective of individual development, and of how individual development is understood in terms of the functionality of various stages of linguistic semiosis in relation to the functional qualities of the system itself. However, as discussed in the preceding section, there is a complementary interest in ontogenesis from the perspective of social structure, and this too has relied on an elaborated description of function and system to explore language socialization processes.

As I noted in the initial discussion above, Bernstein's first sociological attempts to describe differences in coding orientation in terms of syntax were flawed, and he abandoned that approach in favor of meaning-oriented descriptions. Interested by the significance Bernstein attributed to language in social transmission and reproduction, SFL researchers began working to develop systematic semantic descriptions which would allow mapping of the selections people made in everyday contexts, and hence examination of possible systematic variation in these selections in relation to social positioning. As Halliday (see, for example, 1978) was quick to point out, from a linguistic viewpoint there can be no question of linguistic 'deficit'—language develops ontogenetically because of its functional relevance to the living of life, so almost all language users develop a 'functional' knowledge of language as a system, unless there is some radical impairment to brain function, for example. And this knowledge is always partial, for all users. No-one can know a whole language. However, it might be possible that people will typically and habitually select some meanings rather than others across contexts of use and over time because

of some general features of social structure—gender, age and class, for example—and that these typical meaning selections form what Bernstein called the ‘linguistic correlates’ of coding orientations. The SFL way of framing this claim to make it linguistically researchable is to say that different coding orientations, should they exist, would be realized systematically through the selection of different configurations of semantic features.

It was a development in description of the semantic system that provided the required breakthrough to understanding ‘linguistic correlates’ and why they might be functionally differentiated in different social class contexts. Halliday suggested that it might be possible to map specific fractions of the semantic potential of a language, and illustrated by writing a small, intricate map, or semantic network, of all the possible meanings people make in controlling the behavior of young children. (He was responding to Bernstein’s interest in the significance of this context, along with others as ‘critical socializing contexts’ for the development of coding orientations (Bernstein, 1971)). It was then possible to closely analyze what people habitually did in control contexts by plotting their linguistic ‘doings’ against the potential of the system, as described by the semantic map, and then to examine the selections statistically to determine whether there might be consistently different patterns of choice from the system associated with speakers in different social positions. A further crucial feature of Halliday’s proposal was that each semantic option was specified in terms of the lexicogrammatical features through which it was realized. This distinguished the system description from either impressionistic interpretations or from content-based descriptions, which would necessarily have been tied just to representational meanings.

However, while the general concept proved to be fruitful for empirical research in language socialization, its range of application was limited since it mapped only one general type of context, control of children’s behavior. For this research initiative to be extended, a more general mapping of the system potential was required, most importantly across a range of everyday contexts of casual conversation in families, given Bernstein’s argument about the significance of *local* pedagogic practices.

Such a map was developed by Hasan, initially in 1983, and became available in an expanded form in 2007 (Hasan, 2007). To illustrate this approach very briefly, interaction between caregivers and children is analyzed through multiple (metafunctional) perspectives on linguistic messages. The perspectives are organized as a general, integrated map of the meanings typically exchanged at the level of message in everyday contexts in families. A message is formally defined as ‘the smallest semantic unit that is *capable of realizing an element in*

*the structure of texts* (Hasan, 1995, p. 227) and is typically realized through clauses. This orientation to the study of semantics is rather different from more typical lexically-oriented semantic research, though it does not at all preclude such parallel study. Message semantics has been developed, though, to support the study of features of language use in context, including particularly the negotiation of meanings interactively, hence the orientation of message semantics to studying elements of texts. In all, about 70 variables are available for the description of each message, described as systems and sub-systems of the semantic network. To illustrate, here is a brief excerpt of interaction between a mother and her three-year-old daughter while they were reading a storybook together, with each semantic message numbered:

Emily: (1) What happens (2) if you don't have a umbrella at the beach? (3) You get burnt.

Mh: (4) Yes, well, you've got to have lots of suntan cream and hats on.

Emily: (5) Yeah. (6) And you have to keep your hat on (7) even when you're swimming.

Taking Message 1 as the first example, it would be described in terms of its function as an initiating move in this stretch of dialogue, as a particular type of demand for information (asking about an 'event' rather than a 'reason' or an 'actant' of some kind, as representing experience as a 'happening' rather than a 'doing', and so on). In turn, Message 2 would be described in terms of its function as a supplementation to Message 1 (by stating a condition for the event), as a representation of a possessive relation, negated, with a generalized participant 'you' and a particularized possession 'a umbrella', and so on. Analysis through contextually 'expansive' semantic networks enables researchers to explore relative frequencies of selection of related sets of semantic features: for example, the extent to which a child interlocutor is represented in the discourse and in what participant roles ('agent', 'patient', etc); by whom she is represented; in what kinds of speech functions; and in what interactive roles. To underscore the last point, the system mapping supports analysis of the dynamic development of dialogue rather than just individual utterances. In this case, the fact that the mother selects a rejoinder to Emily's answer rather than raising a further question, and that Emily selects a further rejoinder, illustrates this point. The mapping also supports analysis of the options *not* habitually selected. Emily might have said, as her mother often did, (1a) "What do you think happens . . .". Research can then test whether, across contrasted categories of some population, there is a systematic difference in the options *not* taken up in comparison with those that are.

System mapping also enables, to some degree, comparisons of meaning selections across institutional contexts. Both Hasan (e.g.

1989, 2007) and Williams (1999, 2001) have found it possible to use the one semantic network to describe interaction both between caregivers and children, and between teachers and children in the first year of primary school. The limiting condition is, of course, the degree of variation in the meanings at stake in these contexts. However, the fact that the same semantic network could be used inter-institutionally has meant that these researchers were able to explore relations between semantic variants used by speakers in different social positions and the variants used in school meaning-making practices.

Hasan and her colleagues have found strong evidence of semantic variation associated with speakers' social class positioning, and interpret this as evidence of differences in coding orientation. The data for these studies have been audio recordings of naturally occurring conversations in families, made by caregivers, and similar recordings in kindergarten classrooms. As is perhaps obvious from the preceding illustration, the advantage of a system-based description is that it enables researchers to describe sets of features from different metafunctions that contribute to the principal components accounting for variance. However, it is not really possible to briefly illustrate details from these findings without creating a reductive account of the nature of the variation. And great caution is required since partial accounts lead directly to the appearance of linguistic deficit. Coding orientation is not realized either by single semantic features, or by simple aggregations of them, but rather by configurations that are intricately inter-related, resulting in delicate habitual meaning differences. Hasan (1989, 1992), Cloran (1994) and Williams (1999, 2001) present sets of these findings, and the first book-length presentation of them is found in Hasan (2007).

#### PROBLEMS, DIFFICULTIES AND FUTURE DEVELOPMENTS

Though there have been significant advances in the development of theoretical understanding and research frameworks, there are some considerable practical difficulties to be addressed in conducting such studies. Perhaps surprisingly, the least of these has been to obtain natural data. It seems that the ordinary living of life in family contexts soon displaces awareness of recording, so recording interaction between caregivers and children over long, uninterrupted stretches of time does provide authentic data. Children do very occasionally comment on the presence of the recorder but don't sustain attention to it and soon become re-immersed in interaction around shared activities with caregivers.

A major constraint on these studies of language socialization is cost. The detail of SFL analyses, which is obviously essential to their descriptive value, makes research expensive to conduct. While the detail of analyses counters the possibility of reductive accounts of semantic variation it does require a lot of investment by researchers. For this reason there have so far only been two substantial data sets analyzed through semantic networks, one of approximately 100 h of recording, the other of approximately 20 h. Producing more data sets and making these available as a part of an integrated corpus has to be a priority for SFL researchers.

Perhaps the most significant constraint, however, has been to locate statistical analyses of patterns of semantic features that will tolerate the dramatic variation in frequencies of semantic features in naturally occurring interaction. While both qualitative and quantitative methodologies have been used in this field for different purposes (see, for example, Williams, 2001), statistical analyses of patterns of interaction have been important for analyzing variation in general meaning-making tendencies across groups of participants in the contrasted social locations. Hasan's research used a principal components approach fruitfully, but to enable statistical comparisons she was obliged to compare fairly general semantic features across metafunctions. In contrast, Williams's (1999, 2001) research used comparisons of median frequencies of much more specific features, but had to cede the possibility of a statistically-based comparison of a large range of multiple features. Interrelations between features had to be explored on the basis of indicative findings from Hasan's parallel study. Given the cost of data-gathering and analysis SFL researchers are beginning to explore new statistical approaches that will tolerate radically different frequencies to overcome this dilemma.

A further difficulty to be overcome in SFL's dialogue with sociology is the modeling and sampling of social class positioning of families. So far, studies have concentrated on intra-cultural semantic variation with monolingual English-speaking children in relation to social class, primarily because variation would obviously be predicted in inter-cultural contexts and between languages. The first task from an SFL perspective was to demonstrate that language might vary systematically at the semantic stratum specifically in relation to social class positioning. However, it would now be very useful to develop a much more multifaceted study of social class positioning in the variety of multicultural, multilingual contexts that comprise urban societies. Writing semantic maps or networks to describe interaction between caregivers and children for these social environments is a huge challenge, but if met, would likely contribute very useful insights into the dynamics of language socialization.

## PRAGMATIC SOCIALIZATION

## INTRODUCTION

As linguistic anthropologists have long recognized, cultural values, beliefs, ideologies, expectations, and preferences are indexed in everyday discourse and social interactions. A powerful contribution that the language socialization paradigm makes to an understanding of language development is its close attention to the linguistic forms that are used to socialize children and other novices into expected roles and behaviors in particular cultural contexts. The difference between language socialization and developmental pragmatics as approaches to the acquisition of communicative competence, according to Schieffelin and Ochs (1986), is only one of scope and perspective, not the object of research itself. As Ochs (1996) explains, language socialization entails “socialization to use language *meaningfully, appropriately, and effectively*” (p. 408, italics added). In this sense, most language socialization research will implicitly, if not explicitly, deal with the acquisition or development of pragmatic competence, something it is deemed “eminently capable of” examining (Kasper, 2001).

*Pragmatic socialization* is defined by Blum-Kulka (1997) as “the ways in which children are socialized to use language in context in socially and culturally appropriate ways” (p. 3). Most studies cited in this chapter pay special attention to the domain of pragmatic development. They reveal the acquisition of language and sociocultural competence as developmentally intertwined processes within daily routine activities in which children (or novices) learn to interpret, negotiate, and index meaning while (co-)constructing different types of social/cultural identities. Research done within the framework of pragmatic socialization reflects a more social and contextual orientation than the “cognitive/mentalistic” orientation of earlier pragmatics studies.

Researchers have explored both first language (L1) pragmatic socialization and the pragmatic (re)socialization of learners in various learning contexts in bilingual and multilingual societies (e.g., Becker, 1982; Clancy, 1986; Dufon, 1999; Gleason, Perlman, and Greif, 1984; Li, 1998, 2000; Schieffelin and Ochs, 1986; Ohta, 1994, 1999). In this chapter, I review literature in both L1 and additional language domains.

## EARLY DEVELOPMENTS

The majority of early pragmatic socialization research was carried out by L1 researchers who built upon the work of child developmental pragmatics in the late 1970s and early 1980s (see Ochs and Schieffelin, *Language Socialization: An Historical Overview*, Volume 8) and extended the traditional microanalysis of interactions between children and their parents/caregivers by linking these processes to more general ethnographic accounts of cultural values and beliefs. The pragmatic behaviors of children, their peers, and caregivers were compared with interactional patterns within the wider community. For instance, the Samoan children's speech act of clarification was tied to comparable routines in legal, school, and work settings (Ochs, 1988). Rhetorical questions by and to Kaluli children were compared with cultural preferences for indirect speech style or "turned over" language (Schieffelin, 1986). The speech act performance of teasing and asserting by white American working class children was linked to the value of such language competence in the community (Miller, 1986). The structure of Kwara'ae children's disagreement and conflict resolution was, similarly, guided by norms governing these activities in Kwara'ae adults' communication (Watson-Gegeo and Gegeo, 1986). The main focus of these studies was children's acquisition of a complex set of culturally specific rules such as the effective performance of interactional routines (events and acts), appropriate conversational strategies, and expressions of politeness, which are part of the pragmatic competence required to successfully participate in social communication. In addition, they examined the kind of metapragmatic input parents provide to socialize their children into and through such routines (Becker, 1994; Gleason, Perlman, and Greif, 1984; Goldfield and Snow, 1992; Ochs, 1988; Schieffelin, 1990; Schieffelin and Ochs, 1986).

Pragmatic socialization processes may be either explicit or implicit (Ochs, 1986, 1990). Explicit socialization is the process used when caregivers clearly teach social norms shared by members of society. In Ochs' (1990) terms, this is "socialization to *use* language" (p. 291). Eliciting politeness routines (e.g., "Say 'Thanks!'" or "What's the magic word?"), or offering conversational rules (e.g., "It's your brother's turn!") are examples of how language is used explicitly as a medium and object of socialization. However, even though explicit socialization is the most salient to observe, "the greatest part of sociocultural information is keyed implicitly," a case of socialization *through* the use of language (Ochs, 1990, p. 291). By observing and interacting with more expert members in language practices, novices develop an understanding of sociocultural phenomena and become competent members of a community. For example, Gleason, Perlman, and Greif (1984) found

that young children learn how boys and girls (like men and women) are supposed to speak and behave by hearing gender-differentiated language at home or in other contexts.

One domain that has received considerable attention in pragmatic studies is the notion of politeness. Indeed, “politeness is embedded in all aspects of human social interaction and as such is central to pragmatic socialization,” according to Blum-Kulka (1997, p. 142). Researchers in North America have described how middle-class mothers devote great efforts to socializing children into expected, polite behavior, such as the routines and expressions *please*, *excuse me*, *thank you*, and turn-taking rules, in various contexts, including “trick or treat” visits on Halloween, dinner table conversations, and other daily occurring interactions (Becker, 1994; Gleason, Perlman, and Greif, 1984).

Researchers have noted, however, that even though children are often labeled as “novices” in the pragmatic socialization process, they are not merely passive receivers but are active participants in constructing metapragmatic knowledge, and also have the potential to socialize their caregivers (Becker, 1994; Gleason, Perlman, and Greif, 1984; Schieffelin and Ochs, 1986).

#### MAJOR CONTRIBUTIONS

In the two decades since the earliest formulation of what has become a language socialization paradigm, Ochs’ (1988) groundbreaking research in Western Samoa remains the most often cited work in recent pragmatic socialization studies of “socialization through the use of language” and “socialization to use language.” Particular attention is given to the socializing role of indexicals, that is, linguistic resources that derive their meaning from conventional associations with the socio-cultural dimensions of context. Ochs (1996) states that “a basic tenet of language socialization research is that *socialization is in part a process of assigning situational, i.e. indexical meanings* (e.g., temporal, spatial, social identity, social act, social activity, affective or epistemic meaning) to particular forms (e.g., interrogative forms, diminutive affixes, raised pitch, and the like)” (p. 411, italics in original). Indexical knowledge is seen as “the core of linguistic and cultural competence and is the locus where language acquisition and socialization interface” (Ochs, 1996, p. 414).

One important element of social competence investigated in Ochs’ (1996) study is the linguistic indexing of affective stance – culturally appropriate ways to express feelings and to recognize the moods and emotions displayed by others. Caregiver-child verbal interactions have been recorded and analyzed to demonstrate how Samoan children

acquire affective expressions of love, fear, sympathy, and shame through adults' and older siblings' use of affectively loaded linguistic forms (e.g., particles such as affective specifiers and affective intensifiers) in speech acts such as teasing, shaming, challenging, and asserting. For example, the particle "e" in Samoan can index anger, disappointment, displeasure, or irritation. Children learn at a very early age that adding this particle to an imperative sentence can signal a threat or a warning. In addition, before children acquire the neutral (unmarked) personal pronoun, they have already mastered the special first personal pronoun indexing sympathy to make their imperatives sound like "pleading" or "begging," which is a culturally preferred way of requesting in Samoan society.

The indexing of social identities (including status, roles, and relationships) is another component of language socialization. In hierarchical Western Samoan society, not only a linguistic form (e.g., a certain verb) can index a higher social rank of the speaker, but the structure and organization of discourse routines themselves can also encode social status and relationship. For example, adults may involve children in triadic or other multiparty turn-taking directives to socialize them into understandings of complex and diverse social relationships. When young Samoan children request assistance, the higher ranking caregiver directs a lower ranking caregiver who may either pass the directive on to an even lower ranking (e.g., younger) caregiver or satisfy the child's expressed need. Crucial information concerning the organization of the society is thus conveyed to Samoan children who come to understand the multiple hierarchical social relationships through such routines (Schieffelin and Ochs, 1986).

Similar work done by Schieffelin (1985) examines how mothers in the Kaluli community of Papua New Guinea socialize their young children to understand and eventually respond to two routine speech acts in social communication—teasing and shaming. These routines are pervasive in everyday social interactions of Kaluli culture, taken as important means of persuasion and crucial skills in the public management of others. Kaluli mothers try to socialize their children (from as young as 6 months old) with verbal manipulation of teasing and shaming to demonstrate the necessary linguistic and pragmatic knowledge of the conventionalized strategies. In Kaluli society, only when people acquire these culturally specific routines and affective displays can they participate appropriately in social interactions and achieve social control in the community.

Observations of children growing up in Japan also offer rich data about how children are shaped in particular, culturally constrained ways through the language of their caregivers (e.g., Clancy, 1986; Cook, 1999). In Japanese, appropriate speech is indexed by specific

linguistic features such as honorific terms and affective sentence particles, as well as appropriate social interaction routines which are indexed by interactional styles of conformity, attentive listening, and indirectness. Clancy (1986) investigated how Japanese mothers teach their children to “read the minds” of other people so as to be sensitive to their needs because people may not express themselves directly. For example, children are taught to offer food again after a refusal, or to stop making requests of a visitor even if the requests are complied with willingly.

Researchers have also documented how Japanese teachers socialize children to display appropriate interactional behavior as attentive listeners in classroom routines. Participation in these routines provides a novice with linguistic input and a normative way of interacting, given one’s social status, role, and identity, with the guidance of the teacher. In comparison to the dyadic participation structure which is often seen in schools in the United States, Cook (1999) investigated the specific multiparty interactional routines in Japanese elementary school classrooms where students are required to provide initial reaction to and comments on their classmates’ discourse. Cook proposes that such a participation structure helps socialize Japanese children to the culturally important skill of *attentive listening*, and contributes to shaping children to be other-oriented. In a group-oriented society such as Japan, attentive listening skills certainly help children acquire the culturally valued competence of communicating as a good, cooperative group member.

It is argued that people experience their primary pragmatic socialization not only during childhood, but that they also continue to experience pragmatic socialization throughout their lives as they enter new sociocultural contexts and take up new roles in society (Duff, 2003; Li, 1998, 2000; Schieffelin and Ochs, 1986). The language socialization paradigm, with its strong ethnographic orientation and its close attention to contextual dynamics of language behavior and human dilemmas and agency, has provided researchers of second language (L2) pragmatics a rigorous approach that is very different from and complementary to traditional L2 pragmatics research (also called “interlanguage pragmatics”). The latter has relied on data primarily drawn from experimental or otherwise controlled situations to look for nonnative speakers’ “deviation” from native speakers’ norms (Kasper, 2001).

Blum-Kulka (1997) is a forerunner in adopting a pragmatic socialization approach in L2 cross-cultural pragmatic research of dinner table conversations recorded in Jewish American, American Israeli, and Israeli families. Family meals, as an “intergenerationally shared social conversational event” (Blum-Kulka, 1997, p. 9), have been reported

to represent culture-specific ways of talking and therefore allow studies of pragmatic socialization into those ways (Blum-Kulka, 1997; De Geer, Tulvisteb, Mizerab, and Tryggvasona, 2002). Parents use “metapragmatic comments” (Becker, 1994; Blum-Kulka, 1997) as a linguistic tool either to point out lack of adherence to a norm or to encourage proper or desired behavior. During family dinner conversations, metapragmatic comments play a significant role in the process of language acquisition and the development of pragmatic skills, such as the choice of topics, rules of turn-taking, modes of storytelling, rules of politeness, and, in a pluralistic society, bilingual or multilingual practices (particularly for immigrant families). While all parents in Blum-Kulka’s study were observed to devote considerable time and effort to metapragmatic discourse, there were marked cross-cultural differences which reflected specific styles of the three (ethnically related) cultural groups. For example, Jewish American mothers at the dinner table paid considerably more attention to following conversational norms and turn-taking than did mothers from Israel. The latter, however, made more comments about language—metalinguistic comments—and about behavior. As Blum-Kulka (1997) points out, “Fair turn allocation and the censure of untimely interruptions seem to represent the discourse corollary of American ideals of individual rights and equal opportunity for all” (p. 184). As a result, such different styles of pragmatic socialization led to bidirectional transfer between the first and second language in bilingual Hebrew–English children, thus creating a unique intercultural interactional style.

#### RECENT DEVELOPMENTS

The last few decades have seen a dramatic increase in the amount, quality, and intensity of communication globally among individuals of different cultural backgrounds. As a result, more people from different ethnolinguistic backgrounds and traditions are interacting with one another to accomplish their personal and professional goals. Preferences for interactional style in such contexts are deeply rooted in people’s ideological origins and cultural identities associated with their primary socialization (Gumperz, 1992; Li, 1998; Schieffelin and Ochs, 1986). More recent and currently ongoing studies uphold the major areas of concern identified in the first generation of pragmatic socialization research while also directing attention to the particularities of pragmatic socialization processes as they unfold within sociolinguistically and culturally heterogeneous settings characterized by bilingualism and multilingualism.

For example, De Geer, Tulvisteb, Mizerab, and Tryggvasona (2002), following Blum-Kulka (1997), conducted a large-scale cross-cultural

study on mealtime conversation in 100 families, including Estonian, Finnish, Swedish, as well as Estonian and Finnish immigrant families living in Sweden, in order to investigate the function of metapragmatic comments as a linguistic tool of pragmatic socialization. They found that all families produced a greater proportion of comments on behavior than on language. However, the results showed variation in the content, the amount, and the way that metapragmatic comments were used by these closely related cultures, which illustrated “how much the peculiarities of language and culture affect verbal socialization” (De Geer, Tulviste, Mizerab, and Tryggvasona, 2002, p. 1759).

Quite a few recently published studies have focused on the pragmatic L2 socialization of adult novices (e.g., Dufon, 1999; Li, 2000; Ohta, 1999; Poole, 1992). These studies show that speakers’ pragmatic competence may continue to develop well into the later years in the life cycle, when adults become socialized into new roles, statuses, and identities associated with professional and social life. The contexts of research have been extended from family and native-language schools, originally, to foreign/second/heritage language classrooms, immersion schools, overseas language study programs, job training programs, work places, and even cyberspace, as other chapters in this volume illustrate.

Second/foreign language classrooms can operate as a socializing space in which the target-language culture is made available to learners. The nature of discourse in the classroom, despite its special characteristics, reflects wider societal norms, values and beliefs. For example, one practice in Japanese classroom interaction that has been identified in the L1 socialization context, and was referred to earlier, is attentive listening (Cook, 1999). Ohta (1999) demonstrated how adult L2 learners of Japanese are similarly socialized to display attentive listening through modeling by the teacher, peripheral and guided participation, direct instruction, and peer interaction.

In a comparative language socialization study of teachers’ directives in three contexts—elementary school classes in Japan, Japanese-medium classes in a Japanese immersion program in America, and English-medium classes in the same program—Falsgraf and Majors (1995) identified different directive styles and politeness features in Japanese and American teachers’ interaction with the students, which revealed the teachers’ implicit or explicit socialization efforts. They demonstrated how the teachers’ interaction practices were influenced by social and pragmatic norms of the target culture. Teacher directives in Japanese (L2) immersion classes were significantly more direct, which accentuated status differences between the teacher and students, whereas in English-medium classes teachers tended to minimize status markers in their speech to downplay the status differential between

students and teacher. Poole (1992) also reported that American teachers in post-secondary ESL classes tried to avoid overt displays of asymmetry of power and downplay the status differential between the teacher and learners. The interactional style could reflect the white middle-class American caregivers' perspective of egalitarianism, which was implicitly conveyed to these learners. As Poole (1992) concluded, classroom discourse can be understood as largely societal in origin, and the teacher's interactional style represents "the voice of a social role" (p. 611).

The study-abroad context has been investigated by researchers to explore the advantage of sociocultural environments for pragmatic socialization which complement classroom foreign language learning. For example, in a 4-month study-abroad program, DuFon (1999) investigated the pragmatic socialization of linguistic politeness for six adult learners of Indonesian. Ethnographic data focusing on address terms, greetings, and questions about their experiences during the learners' interaction with native speakers illustrated both explicit socialization (e.g., metapragmatic instruction on how to *pamit*, or ask for permission, every time the learners wanted to leave their host family's house) and implicit socialization, through learners' participation in activities with members of the target community.

The workplace is gaining researchers' attention as a significant sociocultural context where novices, like immigrants, are socialized into new discourse systems and cultures. Li (1998, 2000) makes a unique contribution to this L2 pragmatics research by using an ethnographic approach to examine the pragmatic socialization of 20 Chinese immigrant women in an inner-city job-training center and later their workplaces. Focusing on requesting behavior, the 18-month longitudinal study dealt with the important issue of pragmatics in high-stakes social communications. The purpose of the research was not to detect the nonnative speakers' apparent deviation from native speakers' norms (as most interlanguage pragmatics studies have done), but rather to examine the interactive nature and the social function of requests that are deeply embedded within particular historical, social, and cultural contexts. The contextualized examples illustrate how these immigrant women, as novices within the L2 culture, developed their communicative competence by interacting with their peers and other more competent members in the community. As experts in their own culture and language (Chinese), they also contributed to the socialization of their American (English L1) conversational partners' communication skills and styles, when the latter seemed too impolite, for example. Linking the microanalysis of the requesting behavior and development to a more macroscopic understanding of the social structures, ideologies, and conventions in the workplace, the research vividly depicted the L2 socialization of a new generation of immigrant women: the process

of discovery (e.g., of L2 conventions) and self-discovery, and the struggle of negotiating and (re)constructing new social, cultural, and linguistic identities as they adjusted to life and language use in North America and sought professional development and social integration at the same time.

In the contemporary period of globalization, everyday communication and the construction of identity and social relations is increasingly taking place in virtual environments. The worldwide use of computer technology has created a new contact zone in language learning and practice. Belz and Kinginger (2002) attest that “telecollaborative” language learning using global computer networks helps socialize foreign language learners into the development of pragmatic competence, specifically, the social status indexed “T/V” distinction in pronouns of address (*tu* vs. *vous* in French and *du* vs. *Sie* in German). They believe that the disappearance of physical boundaries in cyberspace broadens the discourse options and thereby expands the available learning opportunities of the traditional L2 classroom, providing learners easy access to communication with a variety of speakers, often native speakers, for the purpose of developing or being socialized into more target-like pragmatic competence (Belz and Kinginger, 2002).

## ISSUES AND PROBLEMS

### *Learner Agency/Subjectivity*

Earlier pragmatic socialization researchers acknowledged the agency of novices. As Schieffelin and Ochs (1986) advised, “Individuals (including young children) are viewed not as automatically internalizing others’ views, but as selective and active participants in the process of constructing social worlds” (p. 165). However, many L1 research studies have tended to view the child–caregiver (novice–expert) relationship as essentially unidirectional, from expert to novice.

The extension of pragmatic socialization research to L2 and minority language speakers has helped researchers to re-conceptualize the process: from static, status-oriented social roles and identities to a more dynamic process—unpredictable, nonlinear, and affected by the agency of participants (Duff, 2003; Norton, 2000; Ochs, 1996). The expert–novice relationship has been adapted and expanded to emphasize to a greater extent the notions of bi-directionality, shifting expertise, and a recognition of learner subjectivity/agency in the process of pragmatic socialization, especially with adult learners who have had deep-rooted primary socialization in their first language(s) and culture(s).

Furthermore, research has indicated that not all language learners wish to behave pragmatically just like native speakers of the target language

(e.g., Li, 1998; Siegal, 1996). As mentioned in the previous section, Chinese immigrant women sometimes resisted more “expert” peers’ pragmatic socialization based on their personal values and cultural beliefs (e.g., when it was considered inappropriate). They were also observed to have counter-socialized native speakers’ (rude) pragmatic behavior in workplaces to render it more polite and collegial (Li, 1998). In Siegal (1996), the white female learner of Japanese constantly exercised agency during interactions with her male Japanese language instructor. The learner controlled the topic initiation and management, used status-incongruent linguistic choices in interaction (inappropriate pragmatic behaviors with a professor in Japanese), seemingly not because of her linguistic deficiency but due to a desire to position herself as a peer in the academic world. Some implications of these studies include a reconsideration and sensitivity toward issues of learner agency among second/foreign language educators. It is recommended that learners be informed of the various options offered by the pragmatic system of the target language—and also the consequences of these options (e.g., not sounding adequately “feminine” or “deferential” in Japanese in Siegal’s study)—without being coerced into making particular choices regarding those options.

### *Criteria for Pragmatic Socialization Research*

A language socialization perspective has been employed by more and more researchers in an attempt to bring social factors into the field of L2 pragmatics. At the same time, researchers are trying to develop the theoretical framework of language socialization by incorporating new aspects and to extend it into new directions. Caution has been issued that the term *language socialization* is sometimes used too broadly as a “catch-all” term for any research that deals with language in relation to society or identity. Kulick and Schieffelin (2004) listed three criteria for standard language socialization studies: that they should be ethnographic in design, longitudinal in perspective, and deal with linguistic and cultural practices over time and across contexts. They make the strong claim that “any study of socialization that does not document the role of language in the acquisition of cultural practices is not only incomplete, it is fundamentally flawed” (p. 12). However, some researchers are challenging these methodological principles. For example, Matsumura (2001) used a *quantitative* approach to investigate the development of pragmatic competence among university-level Japanese learners of English in study-abroad programs in Canada. Using multiple-choice written questionnaires for perceptions of social status in advice-offering situations, he found that living and studying in the target language community facilitated pragmatic

competence (or perception) development due to pragmatic socialization. The study stressed the importance of “incorporating a diachronic and comparative perspective into language socialization research” (p. 670). However, it provided little insight into actual language use in the community.

*Practical Problems: The “Observer’s Paradox”*

Pragmatic socialization research normally takes a longitudinal approach, documenting natural communicative processes over the course of developmental time and relates these individual developmental processes to the sociocultural contexts in which they are embedded. The conflict between the necessity to observe and collect natural data and the impossibility of collecting *real* natural data with observers’ intrusive presence was well captured by Labov’s (1972) famous term, the “observer’s paradox.” There are serious methodological problems to be dealt with, such as privacy issues, ethical issues, and the asymmetry of the researcher’s perceived power in relation to research participants.

#### FUTURE DIRECTIONS

Kasper (2001) suggests that “language socialization theory has a particularly rich potential for [second language acquisition] because it is inherently developmental and requires (rather than just allows) establishing links between culture, cognition, and language, between the macro-levels of sociocultural and institutional contexts and the micro-level of discourse” (p. 311).

Pragmatic socialization research represents a radical departure from the methods previously used in (interlanguage) pragmatics studies, where data were primarily drawn from experimental and controlled situations, and usually with single-sentence production, mostly in written form. A pragmatic socialization approach can offer researchers opportunities to look at the *interactive* nature and the social *function* of pragmatic behavior that is deeply embedded within particular social and cultural *contexts*. By examining pragmatic behaviors in authentic contexts of use—with their own historical antecedents, interpersonal negotiations, and personal and societal significance, researchers can contextualize the study of pragmatics in a changing, multilingual world in illuminating new ways.

### **Language Socialization at Home and in the Community**

## LANGUAGE SOCIALIZATION AND FAMILY DINNERTIME DISCOURSE

### INTRODUCTION: DINNERTIME AND SOCIALIZATION

From the outset, Language Socialization (LS, including first and second language) has been concerned with the ways in which social and cultural contexts provide opportunity spaces for the sociocultural learning of language and in how such contexts vary from culture to culture. *The* basic tenet of language socialization theory is that children learn language and culture through active engagement in meaningful social interactions with adults and peers. Language learning and enculturation form part of the same process; language is always learned in social and cultural contexts that provide cues for the social and cultural meanings of the forms used, and learners are active agents in their own socialization. Differing from psychological studies of language acquisition, with their focus on dyadic, adult–child interaction in both laboratory and natural settings, LS, being grounded in anthropological and sociolinguistic theories, eschews structured or nonnatural contexts for ethnographic observations of natural, both dyadic and multiparty, interactions. The anthropological approach is exemplified in the work of researchers such as Shirley Brice Heath, Bambi Schieffelin, Elinor Ochs, and others, who have collected ethnographic data in naturalistic settings, focusing as much on the participation structures into which children can enter as ratified participants as on the exact nature of the language used when talking to children.

Family dinners may vary across culture and social group—for some, mealtime is an activity dominated by focused talk; for others, talk is dispersed and mingled with television watching; in still others, it is conducted in silence. Yet at least in most Western societies, dinners are speech events bounded in time and space, delimited by their participants and governed by local rules of interaction. As a unique case of face-to-face encounter, they carry certain replicable organizational features which set them apart from other activities. Talk at dinner is affected by the nature of the activity: the business of having dinner (food brought to the table and accessed by the participants) generates minimally the instrumental food focused talk, which in turn may or may not be superimposed by other, more open-ended conversation.

Family discourse is the most natural of settings for following the interaction between children and adults and its effects on socialization. Family discourse offers unique opportunities to learn about the ways in which children's participation in familial multiparty interactions enhances their chances of achieving linguistically competent cultural membership in their society. Viewing language as a cultural practice invites attention to issues such as who may talk to whom, what language performances are highly valued and how children acquire rights of membership in a group through language use. The goal of this chapter is to discuss these and other issues representing some of the major facets of the rich repertoire of discursive opportunities offered to children through participation in family discourse.

### EARLY DEVELOPMENTS

The beginning of interest in dinner table talk can be traced to the mid-seventies of the twentieth century, when psychologists interested in language acquisition began to include mealtime conversations in their language corpora. For example, in Berko Gleason's (1975) project on the Acquisition of Communicative Competence, children were observed systematically in dyadic contexts with mother and father and then at a family mealtime with both parents. In this project the transcripts of middle class mealtime recordings served as an additional source of information for the study of gender differences in parental input to children, with a focus on socialization for politeness (Berko Gleason, Perlman, and Greif, 1984). Subsequently Perlman (1984) analyzed the Berko Gleason corpus from the perspective of the content of dinner-table conversations, showing a wide range of individual variability in the degree to which parents talked about abstract matters with their children, and Snow, Perlman, and Gleason (1990), using additional corpora, looked at the use of politeness forms in the speech of fathers and mothers in middle-class families, working class families, and families with Down syndrome children. They found that the speech addressed to children with Down syndrome was more conventionally polite, but did not find social class or gender differences. Another large-scale longitudinal study in which yearly collected dinner-table conversations were included as a major source of information is the Home-School Study of Language and Literacy Development focusing initially on 81 working class families (Snow, 1991). Analyses of the Home-School Study dinner-table conversations, motivated by an interest in exposure to extended discourse as a predictor of later language and literacy development, focused on issues such as the incidence and nature of narrative and explanatory talk (Beals, 1993)

and the use of rare vocabulary at mealtimes and other adult-child interactive occasions (Weizman and Snow, 1998). Many of the transcripts of dinner table conversations based on data collected in this tradition are now part of the CHILDES archives (see Pan, Perlman, and Snow, 2000, for a review).

A distinct, micro-discourse-analytical approach to the analysis of dinner-table conversations is represented by Erickson's (1982) early study of the social co-construction of coherence at the dinner of an Italian family as a multiparty and multigenerational speech event.

The study of dinner conversations specifically motivated by language-socialization theory was initiated by the work of Ochs and her colleagues on 12 American families across a range of social backgrounds (Ochs and Shohet, 2006; Ochs, Smith, and Taylor, 1989; Ochs and Taylor, 1992; Ochs, Taylor, Rudolph, and Smith, 1992) and subsequently extended to cross-cultural comparisons of American versus Italian families (Ochs, Pontecorvo, and Fasulo, 1996).

#### MAJOR CONTRIBUTIONS

Family dinners are familial "we" events shared with children; as such, they may carry various overt and covert socialization functions, ranging from table manners to cultural ways of narration (Blum-Kulka, 1997), the shaping of political views (Gordon, 2004), learning about work norms in the adult world (Paugh, 2005), the socialization of taste (Ochs, Pontecorvo, and Fasulo, 1996; Pontecorvo and Fasulo, 1999), the cultivation of a prayerful attitude (Capps and Ochs, 2002), and the development of scientific ways of thinking and theories about the world (Ochs, Taylor, Rudolph, and Smith, 1992). For example, Ochs et al.'s comparative study of Italian and American families revealed differences in the way food is approached and talked about, showing that socialization for taste (food as pleasure for Italians, food as reward for Americans) is intimately related to social positioning and construction of childhood identity (Ochs, Pontecorvo, and Fasulo, 1996). Dinner-time may offer unique affordances for socialization through language and for the appropriate use of language; yet for language socialization to emerge, dinnertime needs to be jointly constructed by adults and children as shared talking time, one in which children are accepted as ratified participants (Blum-Kulka, 1997; Ochs, Smith, and Taylor, 1989).

Revealing cross-cultural differences in patterns of language socialization and ways of speaking at large is one of the major achievements of this field. The cultural range of family dinners studied from a language socialization perspective includes American families of varied social backgrounds (Becker, 1990; Ely, Berko Gleason, Narasimhan,

and McCabe, 1995; Ochs and Taylor, 1992; Paugh, 2005; Perlman, 1984; Tannen, 2004), Jewish American versus Israeli families (Blum-Kulka, 1997), American versus Norwegian (Aukrust and Snow, 1998), American versus Japanese American in Hawaii (Martini, 1996), Americans versus Italians (Ochs, Pontecorvo, and Fasulo, 1996); Cypriot-Australian (Petraiki, 2001), Estonian versus Finnish and Swedish (De Geer, Tulviste, Mizera, and Tryggvason, 2002), German (Keppler and Luckman, 1991), Greek (Georgakopoulou, 2002), Italian (Erickson, 1982; Pontecorvo and Fasulo, 1997, 1999; Pontecorvo, Fasulo, and Sterponi, 2001), and Japanese (Kasuya, 2002). The number of families studied in each case ranges from 5 (Becker, 1990) to 60 (De Geer, Tulviste, Mizera, and Tryggvason, 2002). In all cases, the verbal data were collected through direct observation and carefully transcribed later; studies vary in type of recording used (audio vs. video or some combination of both), number of meals recorded for each family, attention paid to nonverbal aspects of the activity, system of transcription used, and presence or absence of an observer and the degree of his or her involvement in family interaction. Thus procedures used include asking families to record themselves (Vuchinich, 1990), setting up the recording equipment and then leaving the scene (Ochs, Smith, and Taylor, 1989), and active participant observation plus recording (Blum-Kulka, 1997). Since recording by itself can be considered a type of intrusion, the issue raised by these different procedures is whether the ways people deal with being observed by a camera (or tape recorder) are essentially different from the ways in which they deal with being observed by a co-participant observer.

As elaborated below, dinnertime emerges from these studies as a major site for the negotiation of linguistic, cognitive, cultural, social, political, and emotive concerns; in reviewing the research in this area, the focus here will be on the discursive aspects of socialization unique to dinner talk, namely, on the role of dinners, as multiparty and intergenerational occasions, in providing children an apprenticeship in cultural ways of speaking and seeing, thereby paving their way to becoming full-fledged members of their culture.

### *Participation Roles and Social Roles*

The joint engagement of adults and children in verbal interaction during dinner is a necessary condition for language socialization; children need to be considered ratified participants to have access to the talk, yet their mode of participation may still vary immensely culturally, allowing for different socialization gains. For instance, Jewish-American

children talk more at dinner (relative to other members of the family) than do Israeli children, often around “today rituals” of telling their day (Blum-Kulka, 1997). Occupying the stage for extended time allows for gaining experience in conversational skills, including help received for constructing coherent discourse; on the other hand, acting as active audience to the talk of adults, as do Israeli children, provides opportunities for overhearing discussions on a wide range of concrete and abstract topics and issues. Variation in the amount and type of talk by different members in the family may index gender asymmetries, such as the practice of setting up the father as the all-knowing figure in White middle-class families in the USA (Ochs and Taylor, 1992). Narrative events in the family are particularly rich sites for enhancing children’s rights and responsibilities as storytellers, creating alliances, socializing children into adult culturally unique notions of tellability, and reinforcing familial roles (Aukrust and Snow, 1998; Blum-Kulka, 1997; Georgakoupoulou, 2002).

A more subtle facet of participation is expressed through family members’ entitlements for and shifts in various speaker and listener roles. By definition, participation in multiparty talk requires juggling between a host of speaker and listener role possibilities; speakers can shift for instance between the role of author (responsible for the wording) and animator (voicing others) as in all talk, but with more than one listener in the audience, possibilities open up for framing others (notably children) alternatively as addressees, just side-participants or even as eavesdroppers. Dinner talk provides children with ample opportunities for gaining practice in the full diversity of roles available, yet concurrently the practices used can be implicative of power asymmetries. In middle-class dinner table conversations in the USA and Israel (Blum-Kulka, 1997), and Greece (Georgakoupoulou, 2002) children act as co-authors to stories about their own experience, as animators of the words of others, as addressees in direct conversational engagement with adults and siblings, as side-participants for all family talk acknowledging their presence as ratified participants, and occasionally also have the less pleasant experience of being positioned by the adults as eavesdroppers. Fatigante, Fasulo, and Pontecorvo (1998) show, for example, in Italian dinner conversations, how in some exchanges at dinner children are marginalized from participation, both linguistically and pragmatically, while they are the topic of the ongoing talk. Thus shifts of participation roles and frameworks offer rich apprenticeship opportunities for children learning to engage conversationally with others, affecting their understanding of what it means to be a member of a given cultural environment.

*Cultural Ways of Speaking: Modes of Arguing, Politeness, Irony, and Humor*

Though, on the face of it, talk concerned with the business of having dinner does not seem to invite much attention to politeness, close inspection of dinner talk reveals a rich array of overt and covert ways of socializing for politeness. Though direct instruction of politeness forms, at least in American families, is quite rare, children receive at dinner ample information about the rules governing the use of both negative and positive politeness in their culture (Snow, Perlman, Gleason, and Hooshyar, 1990). One of the resources drawn on by parents is metapragmatic comments—critical comments concerning behavior, language, and discourse (Becker, 1990), which index cultural norms by drawing attention to their infringement. Preferences for types of comments may be culture specific. For example, Swedish parents comment more on moral and ethical behavior than do Estonian and Finnish parents (De Geer, Tulviste, Mizera, and Tryggvason, 2002), and Israelis are foremost occupied with correct language use (metalinguistic comments) while Americans pay more attention to discourse management (turn-taking) (Blum-Kulka, 1997). In some rare cases, a direct link can be shown between parental discourse practices and children's behavior—thus Ely, Berko Gleason, MacGibbon, and Zaretsky (2001) found a positive correlation between mothers' and children's use of language focused terms. The culturally different styles of politeness children engage in with their families at dinner carry messages at two levels—as situated practice, they “teach” culturally appropriate modes of verbal and nonverbal behavior; concurrently, they also carry value-laden messages, which provide the deeper cultural motivation for the same practice. Thus, for example, the contrast between the frequent use of conventional indirectness (such as “can you . . .?”) in American families, against the salience of mitigated directness for making requests in Israeli families can be interpreted as indicative of the values of respect for individual space in American culture, versus the importance of showing affective involvement in the family in Israeli culture (Blum-Kulka, 1997).

Dinner time creates occasions not only for learning culturally appropriate levels of (in)directness for directive and expressive speech acting, but also for learning to interpret cues (meta-communicative markers) for subtle shifts in keying redefining the situation. Keying devices—such as sound modification and figurative language—act as local rules of interpretation, suggesting alternative readings of an utterance, as in pretend play, humor, sarcasm, and irony. Fasulo, Liberati, and Pontecorvo's (2002) careful analysis of keying shifts in the family discourse of Italian families shows how socialization to keying is

achieved through children's active participation in speech play and poetic language at dinner, as well as through hearing keyed talk (sometimes even when not well understood) not directly addressed to them. From a different perspective, Nevat-Gal (2002) stresses the creativity associated with humor, and argues that the use of humorous phrases, as well as cognitive expressions at dinner (in her case, in Israeli families), act as reflectors and cultivators of cognition, socializing for distant and sophisticated thinking.

*The Social Construction of Knowledge and Morality*

The use of language rich in stance markers (like cognitive expressions) is one facet of socialization for thinking; another facet is revealed through problem-solving talk at dinner. Problem solving may concern a joint future activity in the real world (like planning a family trip) or reflections on different interpretations of a past event. Ochs and her colleagues demonstrate in depth how such multiple perspectives offered at story-telling in families enhance theory building, promoting the types of critical thinking necessary in the modern world (Ochs, Smith, and Taylor, 1989; Ochs, Taylor, Rudolph, and Smith, 1992). The social construction of knowledge at family gatherings may also take the form of teaching-sequences, where one knowledgeable party is self-appointed or called upon to provide explanations of social and natural phenomena (Blum-Kulka, 2002; Keppler and Luckman, 1991). Explanatory talk at dinner provides children with exposure to rational ways of thinking, represents an elaborated orientation to meaning, and provides practice in juggling perspectives on truth, all potential contributions to children's school success (Blum-Kulka, 2002). The multiplicity of perspectives offered for any given topic or issue in multigenerational talk does not necessarily need to be adult generated or represent only adult points of view; during story-telling for instance, children can and do collaborate with adults in the negotiation of the point of the story. Children's contributions to what Varenne (1992) aptly calls "the making of a familial dance" (p. 99) is not only the result of their being active participants talked to and talking to adults, but mainly by virtue of being party to the joint production of the social scene called "family." Similarly, though from a somewhat different perspective, Pontecorvo, Fasulo, and Sterponi (2001) argue that socialization at dinner should be viewed as a bidirectional process of mutual apprenticeship—one in which parents affect children, but are simultaneously affected by the children. Pontecorvo et al.'s analysis illustrates in detail such bidirectionality for moral discourse; they show how the active participation of Italian children in conversations about moral behavior (supplying or inviting accounts from others that attempt to

justify transgressions) affects the structure and content of parental talk that ensues and socializes children to the language of transgression. Sterponi's (2003) sequential analysis of account episodes in Italian families shows that requests for accounts (instead of immediate correction or reproach) promote moral reasoning and the negotiation of norms by virtue of allowing for an inquisitory (rather than condemnatory) perspective on problematic events, and hence serve as a medium for the joint reconstruction of the moral order. Gossip at dinnertime serves as a further source promoting moral reasoning and the negotiation of the moral norms—choice of protagonist (who can be talked about derogatively at dinner—for example, are teachers a legitimate topic for family gossip or not?), subject material (are there taboo topics?), and modes of gossipy discourse all serve to socialize children to cultural ways of judging and talking about the range of acceptable social behavior (Blum-Kulka, 2000).

*Language Varieties, Genres, Extended Discourse, Bilingualism, and Minority Language Maintenance*

Dinner time can socialize children to a wide range of genres in oral and literate forms as well as into culturally molded modes in the performance in these genres. The dinnertime conversations of families from a number of cultures and social backgrounds reveal a rich array of genres in dinner (Aukrust, 2002; Aukrust and Snow, 1998; Blum-Kulka, 1997; Blum-Kulka, 2002). Shifts in genre were observed to be associated with shifts in thematic frame. Thus, the business of having dinner is dealt with through the discourse of directives and compliments, and talk about family members' news of the day enhances narratives. However, talk about topics of nonimmediate concern may require a variety of genres, including explanatory and argumentative talk (Blum-Kulka, 1997; Blum-Kulka, 2002). Children in different cultures may have different discursive genre experiences. For instance, American children take part in more explanatory than narrative talk at dinner, while the reverse is true for Norwegian children (Aukrust and Snow, 1998). The difference is indicative of culturally molded notions of tellability and genre performance. Norwegian families promote retelling of shared events from the children's school experience, whereas in American families the focus is more on the telling of unshared events. Furthermore, the two genres were observed to invite differing modes of performance: multiparty, symmetrical co-construction for stories, versus asymmetrical, dyadic performance for explanations (Aukrust, 2002). Aukrust interprets these findings as indexing the social, egalitarian, collaborative orientation of Norwegian family discourse in contrast with the more individualistic, rational orientation

of the discourse of North American families. Thus participation in these different discourse modes creates different skills and personas for children growing up in the two cultures. Verbal conflict is yet another genre, which varies with culture. Vuchinich (1990) found five recurrent termination formats used by participants in American middle-class families to accomplish consensus regarding the outcome of episodes of verbal conflict. Among these, there was a high frequency of stand-off terminations, a strategy that allows family members to save face and avoid direct conflict, while circumventing the difficulties involved in negotiating a compromise. But whereas in American families children might be socialized into the avoidance of conflict and argumentation, in Italian families they are socialized to discuss and argue, and engage willingly in such activities (Pontecorvo, Fasulo, and Sterponi, 2001).

Another facet of involvement in different genres of talk at dinner relates to the development of discursive skills. Narratives, explanations, and complex arguments require extended turns for their performance and need to be tuned in the information provided to the expected level of shared knowledge with the audience. These genres of extended discourse are all closely tied to the academic, literate language of schooling. Learning to tell a story well (with an active audience) or develop a logical argument in conversation hence forms part of the development of extended discourse skills. Studies of familial story-telling with children from various social backgrounds and cultures have indeed revealed several ways in which participation in such an event socializes children to autonomy in speakership as well as to the construction of (relatively) autonomous texts. The scaffolding provided to children of all ages in their story-telling efforts at dinner can support both the telling and the tale. Co-participants help children gain the conversational floor needed for the telling, encourage them to go on and tell, and enhance the coherence and clarity of the text by asking supportive questions (Blum-Kulla, 1997; Georgopoulou, 2002).

Dinner talk can socialize children not only to different genres but also to different varieties of language, including bilingualism. Different members of a family may speak different varieties—differing in slang, accent, and grammatical acceptability (especially in immigrant countries where the language spoken is not the parents' first language) and register. In the case of bilingualism, the social context will be very different between cases where both parents promote the maintenance of their native language and in cases with a mixed-language scene, where only one of the parents is bilingual. For example, the bilingual practices of American-Israeli families in Israel at dinner present a successful case of mother-tongue maintenance. Though all members of the eight middle class families studied mixed Hebrew and English to some degree, the

children tended to speak English to their parents, cooperating with them in maintaining English (Blum-Kulka, 1997). These families succeed in providing support for dual-language development, despite the pressures of the Hebrew environment (and in contrast to other minority languages in Israel) probably because of the high prestige of English and the cultural and practical benefits associated with English proficiency. On the other hand, when input of the minority language comes from only one parent, promoting active bilingualism becomes a much more challenging task. Kasuya's (2002) case study of two Japanese-American families revealed two very different patterns. Although both families spoke two languages, in one Japanese and English were balanced, whereas in the other English was dominant. Yet even in the family where the mother used Japanese most of the time with the child, the child responded in Japanese only a third of the time. Bilingual practices at dinner may also be conducive to learning how and when to code-switch, thus learning to differentiate ways of speaking according to the social situation and the social identity associated with each language (Lanza, 1997).

#### PROBLEMS AND DIFFICULTIES

Although the study of dinner table conversations yields a rich range of insights into practices of language socialization, observing and analyzing dinner talk poses several challenges. Some are related to the difficult task of observing and documenting family meals, requiring thoughtful decisions about recording equipment and the system of transcription employed. Others have to do with ensuring the ecological validity of the situation for the families observed. How regular are shared family meals for the families studied? Do children always participate? Is the presence of an observer as an adult guest easily acceptable in the given culture? Comparability of dinner table conversations across social class and culture needs to take into account possible cultural variability in participation structures (nuclear or extended family), keyings (levels of formality) in the symbolic meanings of food and eating and in attitudes to child participation in the talk.

#### FUTURE DIRECTIONS

It follows that language socialization at dinnertime, as discussed here, is predicated on a series of underlying assumptions and practices shared by mainstream families in modern Western societies, but certainly not universally true. The perception of dinner (or other meals) as occasions for familial sociability as well as for children's socialization, as a (relatively) democratic space which allows for the mutual

exchange of stories and ideas by adults and children is an essential condition for language socialization to emerge in this context.

Furthermore, the families considered here, regardless of whether they are American, Italian, or Norwegian, all believe in the power of words. Dinner serves as one of the occasions in which children gain apprenticeship in cultural ways of thinking and talking through their involvement in meaningful verbal interactions, rather or at least more than through guided participation in cultural activities. When these conditions prevail, as we saw, the complex multiparty participation structure of family meals in modern literate societies can serve as a developmental trajectory for several aspects of discursive competence. As we have seen, actively listening to the many voices of co-participants at dinner can contribute to perspective taking on truth and knowledge, expose children to multiple varieties of language, to different registers and languages, as well as to different keyings (such as irony and humor), and cultural preferences of politeness and modes of reasoning. Through their own participation in dinner talk, children gain practice in interpreting nonliteral language uses, learn cultural modes of argumentation and giving accounts, acquire cultural notions of tellability and participate in the co-construction of extended texts in various genres.

With all the richness of language socialization at dinner, we should also consider its limitations; dinner time socialization through language and for language in the modern family as considered here represents just one trajectory among the situationally and culturally extremely varied language socialization experiences children go through around the world. A full account needs to consider other important participation structures (like children's peer interaction) as well as the full gamut of cultural variability not only in language socialization, but in human development and socialization at large (e.g., Rogoff, 2003).

## LANGUAGE SOCIALIZATION IN WORKING FAMILIES

### INTRODUCTION

Over the past several decades, there has been a significant rise in dual-career families as women have increasingly entered the paid workforce in the USA, Canada, Europe, and elsewhere (see, e.g., Waite and Nielsen, 2001). Accompanying these trends is a growing body of research in psychology, sociology, and anthropology, among other disciplines, that examines the relations between work and family (for reviews, see Perry-Jenkins, Repetti, and Crouter, 2000; Pitt-Catsouphes, Kossek, and Sweet, 2006). The term “working families” has emerged in this literature as a signifier of research that investigates the interface between work and family. Though broad enough to describe any family in which one or more adults work, it has been used frequently to refer to dual-earner or employed single-parent families with children, in contrast to “traditional” arrangements where one parent is the breadwinner (typically the father) and the other parent the homemaker (typically the mother). This research has focused on the management of time and childcare by working parents, the distribution of family and household chores, working families’ goals and values, child outcomes relative to parental employment, family well-being, and the pressures and challenges that families face in finding a balance between work and family demands. Much of the literature analyzes survey data and self reports, like questionnaires and interviews. While such studies are valuable, few have examined spontaneous everyday social interactions in which parents and children communicate and organize working-family life (though see Kendall’s (2003) study comparing how one woman discursively creates parental authority at home and managerial authority at work). It is in this context that the language socialization paradigm has become a new way of conceptualizing and analyzing the focus on working families. This research takes a distinctly ethnographic approach, revealing what working families actually *do* during their daily lives, and illuminating on the processes of language socialization occurring through everyday family activities and social interaction.

## EARLY DEVELOPMENTS

Language socialization research takes as its focus how children and other novices acquire (or do not acquire) the linguistic and cultural knowledge needed to become competent members of their families and communities. Though the intersection of work and family is a relatively new focus, many early language socialization studies were concerned with topics pertaining to work–family issues, such as the organization of caregiving, the daily round of work and household chores, gendered divisions of labor, and families' economic activities in nonindustrialized societies (Ochs, 1988; Schieffelin, 1990). Even language socialization studies that have focused on other issues shed light on how the goals of working adults can affect all areas of family life. Kulick (1992), for example, illuminated how language shift in the small village of Gapun, Papua New Guinea, was occurring through changes in language socialization practices linked to villagers' changing notions of their place in the world (due to encroaching proletarianization, a growing cash economy, religious influence, and their desire for a more Western life style).

Language socialization studies of family life in the USA have been very influential. One such study was Heath's (1983) examination of how class differences shape language socialization practices, with significant consequences once children enter formal education in the USA. Through detailed examination of socializing practices in working-class Euro- and African-American and middle-class Euro-American households, Heath explored how the early socialization of class-oriented ways of taking meaning can influence children's academic trajectories in formal education. Heath illustrated, for example, that middle-class strategies of reading and engaging in bedtime stories (including encouraging children to elaborate on and associate stories with their daily lives) facilitate the development of a school-based model that allows middle-class children to smoothly transition into and succeed in school, in contrast to the educational struggles faced by children from working-class and ethnic minority families that approach literacy events differently (cf. Lareau's (2003) ethnographic study of child-rearing practices and differential socialization patterns among middle- and working-class American families).

The work of Ochs, Taylor, and colleagues on dinnertime narratives among Euro-American families in Los Angeles contributed significantly to our understandings of middle-class dual-earner working families today (see Blum-Kulka, *Language Socialization and Family Dinnertime Discourse*, Volume 8). Ochs and colleagues found that through social interaction during everyday dinnertime routines, family members share information, aid one another with problematic events in

their lives, and give shape to and socialize family values, solidarity, social organization, gender roles and identities, and relationships (e.g., Ochs and Taylor, 1995). Like Heath, they asserted that storytelling with family members socializes middle-class children to intellectual skills that are valued in mainstream educational settings, such as critical thinking, perspective taking, and metacognition (Ochs, Taylor, Rudolph, and Smith, 1992). In a comparative study of the socialization of “taste” during dinnertime among 20 middle-class families in Italy and the USA, Ochs, Pontecorvo, and Fasulo (1996) found that negotiations over food become a prime site for the socialization not only of culturally specific eating habits, but also notions of morality, individualism, relationships, pleasure, and consumption.

Though not specifically concerned with the consequences of having full-time working parents, these studies offer carefully documented insights into the socialization of Bourdieu’s notion of *habitus* in specific social groups (e.g., Bourdieu, 1977; see Kulick and Schieffelin, 2004). *Habitus* includes learned dispositions to act in particular ways (including how to communicate verbally and nonverbally) as well as taken-for-granted assumptions about the world. These socialized ways of thinking and being provide the individual with the ability to act according to expected norms, but also allow for creativity in social life. Language socialization methodology offers a way to understand how *habitus* is acquired, shaped, and subtly changed through everyday interactions between experts and novices, parents and children. Careful attention to adult–child and child–child social interaction brings to light many otherwise unquestioned assumptions and unspoken rules that organize family and social life. The focus is on *activities* during which novices and experts interact, including those in which children are actively involved as participants *and* observers. Through attentive observation of such activities, language socialization research can shed light on how children learn through everyday interaction how to be a worker—and a particular kind of worker at that—long before they begin working themselves (Paugh, 2005).

#### MAJOR CONTRIBUTIONS

The study of language socialization in working families draws on the above and other language socialization studies. It extends this research in a new direction as it seeks to engage with the growing interdisciplinary research focus on work and family in industrialized nations like the USA. This relatively recent body of literature was significantly shaped by the influence of a philanthropic organization, the Alfred P. Sloan Foundation. Concerned with understanding social and economic changes accompanying the increase in dual-earner

families in the USA, the Sloan Foundation initiated a “Workplace, Workforce, and Working Families Program” to establish a body of research and community of scholars focusing on these changes ([http://www.sloan.org/programs/stndrd\\_dualcareer.shtml](http://www.sloan.org/programs/stndrd_dualcareer.shtml)). Since 1994, the program has funded eight centers (and numerous smaller projects) in major American universities to conduct research on the issues facing middle-class dual-earner families in particular. Each Sloan Center on Working Families has pursued its own detailed approach to the study of the work–family interface.

It was in this context that a new strand of language socialization research focusing on working families—specifically dual-earner middle-class families—began to develop. In 2001, the UCLA Sloan Center on the Everyday Lives of Families (CELf) was established and directed by Elinor Ochs, one of the founders of the language socialization approach. CELf integrated perspectives from anthropology, applied linguistics, education, and clinical psychology into one unified research agenda investigating multiple dimensions of the family life of 32 middle-class dual-earner families in Los Angeles, California. To qualify as “working families” for this research, families had to include two parents working 30 or more hours per week outside the home, and 2–3 children (with one 8–10 years old). The families represented various ethnicities (Euro-American, African-American, Asian-American, Latino) and middle-class incomes, but all were responsible for a monthly home mortgage.

A major goal of this extensive study was to document and analyze the ways in which members of working families actually live their lives and interact with one another on a daily basis, while coping with the demands of work, family, and other activities outside the home. A detailed attention to social interaction was central to CELf’s approach from its conception, and consequently a primary method included ethnographic video recording of naturally occurring family interaction in and outside the home. This was combined with a range of other interdisciplinary methods: ethnoarchaeological tracking of family members’ activities and uses of space, combined with mapping and digital photographing of families’ homes and artifacts; interviews about education, health, daily routines, social networks, and children’s lives; standardized psychological questionnaires and measures; and saliva sampling of Cortisol, a stress hormone (see Pitt-Catsouphes, Kossek, and Sweet, 2006, on the value of multiple methods for understanding the complexities and processes of working-family life).

The CELf methodology has been duplicated on a smaller scale in satellite centers in Italy and Sweden, two countries that, like the USA, have been experiencing a dramatic rise in the number of two-career families. CELf-Italy (or iCELf), directed by Clotilde

Pontecorvo at the Università di Roma La Sapienza, and CELF-Sweden, directed by Karin Aronsson at the University of Linköping, contribute an international and comparative perspective on the daily lives of middle-class working families. Together with the UCLA CELF, the three centers have created an extensive digital video archive of family and household activities, including everyday conversation and language socialization practices of working families. This research illustrates how family life is culturally constituted in particular historical moments through everyday interactions, activities, practices, and discourses. The use of video allows examination of actual familial interaction and engagement in activities, rather than relying only on self-reports or unrecorded observations after the fact.

In all three centers, the language socialization model is a component of the project methodology and is employed theoretically by many of the scholars analyzing the extensive data sets. These studies highlight the importance of everyday interactional routines and activities for creating shared worldviews, socializing competence, and reproducing and transforming knowledge about the family, community, workplace, and the world. Through participation in everyday routines and social interactions as both active participants and observers, children are socialized into culturally specific orientations toward work, education, time, morality, responsibility, individualism, success, well-being, and what it means to be a family. In these middle-class families where parents decide both must work outside the home, CELF researchers analyze the interactional ways in which children are exposed to and acquire a middle-class habitus with particular conceptions of work, achievement, interdependence, and autonomy (Goodwin 2006a; Goodwin, 2006b; Paugh, 2005; Sirota, 2006). All societies deal with these issues, yet they take on particular forms in the industrialized, largely child-centered societies examined thus far in this growing literature. Thus, the exploration of working families' activities, routines, and interactions can illuminate the process of socialization and how children acquire ideologies, values, and ways of being through everyday social interaction with working parents. Due to the relative newness of this area of research (with much of it in various stages of publication or available as "Working Papers" from the Sloan Centers' websites), key studies will be described below as work in progress.

#### WORK IN PROGRESS

One area of investigation is how busy working families manage, organize, and socialize uses and understandings of time, one of the frequently cited concerns of families themselves (Kremer-Sadlik and Paugh, in press). Analyzing iCELF data, Liberati, Arcidiacono,

and Pontecorvo (2004) explore how children in Italian middle-class working families are socialized through language into culturally specific rules of time, including expectations for its use and how not to “waste” it by making profitable use of waiting time and anticipating and planning for future activities and tasks. Similarly, Wingard (2007) analyzes American parent–child interaction in the UCLA CELF data for the use of recurrent linguistic forms (such as “before,” “after,” “first,” and “now”) in planning activities for the day. She suggests that negotiations over how time is to be used socialize children to concepts of time and how to prioritize competing activities in highly scheduled working-family life. These studies show that through everyday social interaction with caregivers, children acquire an awareness of personal time and family time, how to comprehend and manage both, and how time management is linked to ideas about morality, responsibility, and success.

How families make use of the time they have together, including playing games with children (e.g., Fatigante and Liberati, 2005) and engaging in children’s extracurricular activities, offers a valuable window into the socialization of a middle-class habitus that may nurture life advantages for mainstream children. Goodwin (2007) finds that through spontaneous family interactions, American middle-class children in the UCLA CELF study are afforded opportunities for acquiring valued cultural knowledge (such as idioms and theories about the world) as well as ways of exploring and taking such knowledge, in the midst of other everyday tasks and activities (e.g., during mealtime or while parking the car). Kremer-Sadlik and Kim (2007) find that parents’ talk during children’s participation in formal organized sports activities, informal play, and “passive” engagement in sports (i.e., watching sports on TV) serves as an important socializing tool for middle-class American family values, goals, and desires. Parents assess children’s sports performances, socialize ways of dealing with pain and disappointment, and transmit culturally specific ideals about competitiveness, sportsmanship, and loyalty. Exploring this in depth, Goodwin (2006a) investigates one CELF family’s routine socialization of a “competitive spirit” through talk about sports and academic activities. Through explicit coaching of their children to succeed in sports or homework activities (like hockey, bike riding, or spelling), as well as more indirect socialization (such as ranking children’s sports competence or performance relative to other children), the parents in this particular American family teach their children that competition and achievement are highly valued in their culture.

Homework is a particularly pervasive routine, priority, and socializing activity in middle-class dual-earner homes in the USA, Italy, and Sweden. Liberati (2005) finds that among middle-class Italian working

families, children are socialized into valued work ethics through parents' involvement with their homework practices. Homework is constructed as "children's work," with parents striving to socialize work practices and skills, while fostering children's development of responsibility and their own self-initiative. Wingard (2006) examines American parents' inquiries into and directives about children's homework, exploring the tensions between parental control and socialization of child autonomy as working parents seek to plan out the afternoon's activities around and prompt children to do their homework (also see Forsberg, 2004, on homework in Swedish dual-earner families). Homework acts as a routine organizer of family life, despite hectic schedules, indicating its importance in middle-class families (Wingard, 2006).

Dinnertime interaction is another fruitful arena for the study of how ideologies about work and success are socialized. In an interview-based study, Galinsky (1999) found that American children in grades 3–12 know a considerable amount about their parents' work, even though parents generally report that they *do not* talk to their children about their work. Paugh (2005) used a language socialization approach to investigate this through analysis of routine dinnertime conversations among middle-class dual-earner American families in Los Angeles, finding that through overhearing and co-constructing their parents' narratives about work-related experiences, children are socialized into particular understandings about work, expectations regarding work conduct (such as morality, competence, and accountability), and family values and goals, such as about work–family balance. They are simultaneously socialized into preferred class- and culturally specific ways of engaging in narrative discourse. Paugh (2006) is currently examining future-oriented work narratives told collaboratively with or in the presence of children, and how this narrative practice socializes ways of talking about and dealing with uncertainty in American working life.

Cleanliness routines, the distribution and scheduling of chores, and discourses about household work are prime sites for the language socialization of middle-class norms, values, practices, and ways of expressing affect in the working-family context (Aronsson, Simonsen, and Forsberg, 2005; Klein, 2003). Arcidiacono, Pontecorvo, and Liberati (2004) explore how family roles and culturally specific notions of work, family, competence, and responsibility are socialized through household work interactions (including family disputes about household tasks) in their iCELF videotaped corpus of Italian working families. In a comparative study of the USA and Italy CELF data, Fasulo, Loyd, and Padiglione (2007) explore how children's agency may be constructed or limited by how parents focus on and socialize hygiene and household cleaning practices through verbal and

nonverbal interaction. Goodwin (2006b) analyzes interactions involving directive sequences in the UCLA CELF families for how families' interactive styles socialize (or fail to socialize) children to accountability for their actions and responsibilities. Goodwin finds more successful outcomes in interactions where parents and children jointly establish frameworks of mutual orientation and alignment to an activity and parents are persistent in pursuing their directives, in contrast to families where this does not take place and children are successful at bargaining (such as getting out of doing a chore requested by a parent).

Sirota (2006) analyzes children's language socialization into middle-class bedtime routines in the UCLA CELF data, illuminating on how even these routines accomplish much more than the functional goal of getting children to go to sleep. Sirota describes them as collaborative interactions involving extensive negotiation of child autonomy and interdependence, with parents and children using mitigation, politeness, and bargaining strategies in their relational work to both prepare for and delay the bedtime separation. Through these American middle-class bedtime routines, children are socialized into culturally valued aspects of personhood, including acquiring a particular balance of autonomous self-initiative combined with reliance on intimate familial relationships.

#### PROBLEMS AND DIFFICULTIES

One challenge for language socialization studies of working families is to address the diversity of family types that exists, even in one community, socioeconomic class, or social group. In fact, the definition of "family" is an issue that has plagued family and kinship studies for decades. As recent studies have shown, family is culturally and historically constructed, and does not include only biological ties (see, e.g., Carsten, 2000; Franklin and McKinnon, 2001). In the face of a multitude of possible family forms (dual parent, single parent, heterosexual, same-sex, extended, adoptive, blended, etc.) accentuated by the availability of new reproductive technologies, delineating units of study and comparing and contrasting similarities, differences, and patterns across families is a significant challenge to language socialization and other research on working families. In the UCLA CELF study, all families were two-parent and most included heterosexual partnerships; however, there were two same-sex partnerships, and the families included biological, adoptive, and step parents. While this is a step in the right direction, clearly more family types—particularly the increasing number of single-parent working families in the USA

and elsewhere—need to be represented and studied through an ethnographic, language socialization approach.

As previously mentioned, the focus of recent Sloan-funded research in the USA, Sweden, and Italy has been on working families of a *middle-class* socioeconomic background. While this focus has been explained in that middle-class dual-earner families are reportedly understudied in the work–family literature, it raises several questions. What are we excluding or ignoring by focusing only on middle-class families? How do we define “middle-class”? Should researchers impose income limits, or should families self-select according to their own definitions of middle-class (see Darrah’s (2006, pp. 374–375) discussion of this and other recruitment issues in a project on working families in Silicon Valley, California)? As this area of language socialization research grows, it would be beneficial for scholars to examine a range of social groups, and to be specific in how they define “working families.”

As in any study of language socialization, researchers need be careful not to depict working families as homogenous or unchanging. Often portrayed in the work–family literature as “overwhelmed,” “stressed,” and experiencing “time famine,” we should not deny working families an active role in the construction of their own lives. The language socialization approach to working families must deal with the challenges of individual variation and change (including families at different life stages), while still trying to illuminate problems, concerns, and strategies shared across many working families. More longitudinal research, such as following the same group of families over several years, and more comparative work, along the lines of Heath’s (1983) groundbreaking study described above, are needed.

Finally, a significant challenge is coalescing a group of researchers concerned with working families and language socialization that can engage with multiple bodies of literature while still remaining attentive to one another’s work. The interdisciplinary nature of the research that characterizes the Sloan Centers in the USA, Italy, and Sweden brings many advantages and possibilities for collaboration and cross-fertilization, yet it is also challenging in terms of remaining focused on work–family issues. The distinctions between being simply language socialization research that focuses on the family’s role in socialization, and language socialization examining the connections to families’ *working* status, may become blurred, unclear, or lost. Striving to remain attuned to the work–family literature, including research emerging from psychology and sociology, may help bridge language socialization research on working families to the larger body of language socialization literature and anthropology generally.

## FUTURE DIRECTIONS

The three CELFs have amassed an extensive corpus of family life and social interaction, and trained a new generation of language socialization researchers. Currently, there is much analysis being done on this large body of data, including many collaborations across the UCLA, Italy, and Sweden CELFs. This comparative effort may illustrate common patterns as well as differences among working families in these different cultural contexts. It also offers new cross-disciplinary ways of collecting and analyzing language socialization data, such as through the use of ethnoarchaeological methods combined with video taping of everyday interaction to better understand family social interaction patterns at home and the use of material objects and spaces in language socialization (see Ochs, Graesch, Mittmann, Bradbury, and Repetti, 2006, for detailed discussion of these methodologies). These methods may be incorporated into language socialization studies more generally.

As the field of work–family research expands, language socialization has much to offer. Through language socialization methodologies and theories, we can study the moment-to-moment and turn-by-turn ways in which working families are created and maintained through interaction, shedding light on families’ concerns and the meanings of work and family. Some valuable lines of current and future research include:

- A greater focus on language socialization across the lifespan (see, e.g., Garrett and Baquedano-López, 2002, pp. 348–349). Future studies could focus on how adults are socialized into being *working parents* by their children, their partners, their own parents, or their peers, coworkers, and others in their lives. For example, how do working parents socialize one another to be working parents through their everyday social interaction? How do children socialize their working parents?
- More attention to children’s perspectives on and experiences of family life, including focusing on children’s everyday social worlds, peer and sibling interactions, perceptions of parents’ work, and views on child care arrangements (see calls by Perry-Jenkins, Repetti, and Crouter, 2000; Thorne, 2001). For example, Baquedano-López (2002) did some initial exploration of the language socialization practices of predominantly Latina, Spanish-speaking nannies caring for mostly Euro-American, English-speaking children in West Los Angeles, noting implications for children’s acquisition of Spanish, the socialization of affect and morality in the nanny–child relationship, and how children are being socialized as *consumers* of care.
- More attention to language socialization involving paid work-related activities that directly influence the family, such as work-related values

and activities brought into the home or when the family is brought to work-related events, preparation for work, the coordination and performance of work activities through electronic means from home (by computer, cell phones, etc.), narratives and reports about work, and children's engagement in paid and unpaid work, to name a few. As Richardson (2006) points out, family is often invoked as an idiom in the American workplace, but the workplace may also enter into the structuring of the home life. A focus on these activities could illuminate what children learn about work from their parents long before they begin working themselves, and the impact of this learning on their future career goals and trajectories.

- More cross-cultural studies of language socialization in working families, along with more studies in the USA that examine many kinds of families from a variety of class, ethnic, and other backgrounds. For example, Klein and Izquierdo (2006) found that two middle-class immigrant families from India and Mexico to Los Angeles (in the UCLA CELF study) socialize their children into linguistic, educational, and work practices that maintain values from their culture of origin (such as discipline and perseverance) while incorporating and integrating American notions of success. More comparative, cross-cultural studies could bring to light alternative strategies for managing work and family, and link language socialization in working families to larger globalizing processes.
- More attention to agency, change, and resistance in working families, such as ways in which working families resist the pressures and time restrictions put on them, how parents may rework the socialization patterns they grew up with, and how children may come to interpret and resist the working-family frameworks into which they are socialized.

Language socialization research in working families offers much potential for enriching the work–family literature, as well as contributing to the language socialization paradigm with its interdisciplinary methods and attention to work and family in today's growing global economy.

## LANGUAGE SOCIALIZATION AND MULTIMODALITY IN MULTILINGUAL URBAN HOMES

### INTRODUCTION

Language and culture are inextricably intertwined. The home is where cultural practices are first experienced, and within that context, children born into multilingual families experience this identity through language. Children forge relationships with their families and extended families through language. These relationships contribute to the development of identities, which are then sedimented within language, and within texts. As children come to speak and write within households, their linguistic repertoires include home languages as well as languages taught outside the home. Interaction is not just about language, it is about gesture and the tools we use to make meaning, including signs and symbols. Language can be seen to be part of a wider landscape of communication, including images and gesture, which is multimodal. The linguistic experience of multilingual children is found inscribed within multimodal signs. Children see words written in Arabic, Chinese, Urdu, Turkish and experience different script systems at home and at school. As they learn these languages, they begin to experience their written forms. Many children growing up bilingual also attend after school clubs or Saturday schools where their home languages are taught and celebrated. They are immersed in these languages at home, and their meaning making, in multiple modes (gesture, images, talk), draws on these experiences of multilingual identities. An understanding and appreciation of the richness of multimodal, multilingual communicative practices aids understanding of what children bring to school literacy practices. For this reason, children's multimodal, multilingual text making in homes and communities is a particularly valuable resource for researchers and practitioners.

### EARLY DEVELOPMENTS

Initial approaches to language socialisation drew on Vygotsky's insights in *Mind and Society* about the relationship between language and artifacts, or tools (Vygotsky, 1978). Vygotsky noticed how children externalised their thinking through the use of tools and symbols. The work of researchers such as Michael Cole (1996) tracked the way in which

children interacted with tools in order to develop their cognitive activities. Cole's work illuminated the relationship between mind as internalised culture and culture as externalised mind, and crucially, focused on activity and practices as a unit of study. The recognition that the cultural experiences of children could be observed in practice was critical to understandings of children's experience of growing up multilingual. Research which focused on play and role-playing in informal and home situations illuminated this. By focusing on a practice theory of learning, children's observable activities could be extended to include their meaning making at home and in community centres. The work of Barbara Rogoff (1990) was helpful in illuminating how young children learn from taking part in everyday activities with family members. Duranti and Ochs (1996) explored the way in which Californian Samoan families combined practices from their past cultural heritage with new practices. These can be observed within such visible practices as book reading, and the way in which family reading materials were stored. They used the term *syncretic* literacy practices to describe the combining and recombining of different practices into transformed practice.

Much early work on language socialisation saw learning as social, and situated learning within observed social practice. The work of Halliday (1978) recognised that language could be seen as a social process. Research on literacy practices in homes and communities by ethnographers such as Hymes (1996), who studied native American narratives, and Heath (1983), looking at three different communities in the rural Carolinas, developed an understanding of each community's different literacy and language practices. By observing cultural practice, the making of culture could be discerned. The concept of 'culture as a verb', from Street (1993), describes the way in which multilingual children shape and change cultural content as they use language and make texts. Text-making by young children can be understood as drawing on a number of texts from different domains and therefore having an *intertextual* quality. In this context, the work of Bakhtin (1981) has been influential in describing the way in which texts are hybrid. Researchers of children's talk, such as Maybin (2005), who carried out a study of young children's informal talk in the UK, have drawn on Bakhtin's work to describe the way in which children's communicative repertoires are intertextual, and carry others' voices within them.

Initial studies of young children's multimodal and multilingual practices came out of anthropology, where studies like those of Scribner and Cole (1981) of the Vai culture in West Africa informed an understanding of how language and literacy practices were linked to different domains and cultural practices. They were also informed by cultural psychology and theories of mind and culture (Cole, 1996). Early work

by Kress (1997) began to identify the way in which language was embedded in a wider communicational landscape, including visual representation. Kress described how children made signs from a number of different modes, drawing on different representational resources. Kress used the term *multimodality* to draw attention to the variety of modes children used when they made meaning. Children's drawings, gesture and speech were meshed together, and worked to create an ensemble of semiotic resources. Research in multilingual communities, such as that of Gregory (1997) in East London, identified that children drew on these semiotic resources in out-of-school contexts to make meaning. The different cultural worlds that children inhabited were beginning to be mapped out.

#### MAJOR CONTRIBUTIONS

Recent research has focused on studying closely the literacy and language practices of multilingual children growing up in homes and communities. For example, Gregory and Williams (2000) examined the literacy and language learning of Bangladeshi children in East London, and, using ethnographic methods, looked at the ways in which these children learned Arabic in the Mosque school, learned reading and writing in English at school and spoke Urdu or Punjabi within their homes. Kress's work on London children's early writing encouraged researchers to apply a multimodal lens to their studies of young children's acquisition of writing (Kress, 1997). Kenner's (2004) study of young children learning writing at home, situated in Arabic, Chinese and Spanish speaking communities in London, described how young children engaged with multiple learning environments in which to develop their scripts in both their home language and the languages they learned at school. Kenner explored ways in which the children used the *affordances* different linguistic scripts offered them. Different kinds of writing systems could be understood in terms of their semiotic affordances. For example, Arabic and English are presented in very different visual ways. *Affordances* was a term used by Kress and van Leeuwen to describe the possibilities within a particular mode for meaning making, such as the ability of a script to suggest certain images (Kress and van Leeuwen, 2001). By focusing on the *interest* of the sign-maker, and the different representational resources available to children as they make meaning, a richer picture emerged of children growing up in the complex urban multilingual spaces they encountered. Children's representational choices became infused with their cultural identities. A child who wished to represent herself in a drawing, for example, could draw on multi-semiotic resources, and cultural icons from a multitude of global and local influences. Kenner used the

example of a child who used both Chinese symbols together with the English words 'Girl Power' plus a drawing of a girl and hearts, to produce a multi-semiotic, multilingual text (Kenner, 2004).

Research on multilingualism and multimodality focused on what children from multilingual backgrounds brought to the school setting. For example, the work of Gonzalez, Moll and Amanti (Gonzalez, Moll and Amanti, 2005; Moll, Amanti, Neff and Gonzalez, 1992), in which detailed ethnographies were carried out in Hispanic communities in Arizona, in Southwestern USA, found that these homes were full of *funds of knowledge*, which could be seen as resources for children to draw on. These home funds of knowledge could inform pedagogy. Likewise the work of Gutierrez, Baquedano-Lopez and Tejeda (1999), also in the Southwest of the USA, looking at classrooms, examined how home language experience could be mixed with school literacy. They used the concept of a 'third space', to describe the space which children and teachers create by drawing on linguistic practices from home within school settings. Moje, Ciechanowski, Kramer, Ellis, Carrillo, and Collazo (2004), in their research on teenage out-of-school literacy practices in Northern USA, argued that communicative practices which take place within a third space drew on funds of knowledge from home and communities, and could be multimodal, involving gesture (e.g. stunt riding) and oral storytelling (e.g. telling the story of the stunt). Popular cultural texts, including games and television programmes, provided a widely consulted source of information and the Internet was a key information tool. Many of these experiences involved working across modes and across languages in order to develop knowledge that, Moje et al. argued, could usefully be melded with school literacies. Family literacy classrooms are spaces that rely heavily on home experiences. Therefore, family literacy classrooms could be understood as spaces where home literacy practices can merge with school literacy practices in a 'third space', as discussed by Pahl and Kelly (2005) about a family literacy classroom in London.

Researchers using a New Literacy Studies perspective have focused on literacy as a social practice, and developed an understanding of how children's early literacy practices are shaped by culture, a point first described by Heath (1983) in her seminal *Ways with Words* (Barton and Hamilton, 1998; Street, 1993). Rowsell and Pahl (in press) described how patterned practices sediment into texts, and argued that teachers need to understand the complex way in which children shape oral and written texts. Increasingly, families watch satellite television programmes, which are delivered in their own languages, and children draw on these linguistic repertoires as they compose oral and written texts. Kenner (2004) and Pahl (2004) have conducted research in London homes that has examined the intersection of multimodality,

the New Literacy Studies and multilingualism. Children draw on multiple literacies, that is, a range of literacy practices from both digitised media and popular culture. These digitised spaces could be understood as being socially situated spaces for informal learning, drawing on the work of Lave and Wenger (1991). Research such as that by Keating (2005) on Portuguese families on London has used the work of Lave and Wenger very productively to describe how in migrant families literacy practices are recombined and transformed in new communities of practice, and literacy is situated in specific domains of practice.

The concept of *syncretic* literacy practices has been used to describe how children draw on multiple resources to make meaning, including their religion, their culture, languages and school experiences (Volk and de Acosta, 2001). Volk and de Acosta extend the work of Duranti and Ochs (1996) in looking at ways in which children blend practices from different domains in new contexts. They describe how bilingual children's developing literacy and language was supported by a network of people including parents, grandparents and elders in church in the context of Puerto Rican communities in the USA. Children combined experiences from home, school, church and other spaces to make meaning. Volk and de Acosta viewed children's language socialisation as embedded in a socio-cultural process, and used ethnography to trace that process. Research looking at language socialisation has relied mostly on ethnography to develop closer understandings. Researchers, particularly from the traditions of linguistic ethnography (UK) and linguistic anthropology (USA), have used these methods in order to develop an understanding of young children's out-of-school literacy practices (UK Linguistic Ethnography, 2004; Wortham and Rymes, 2003). Linguistic ethnography can uncover 'invisible' literacy and language practices. For example, in the UK, Parke, Drury, Kenner and Helavaara, describe how important it is that both the 'visible' and 'invisible' language practices of young bilinguals are drawn upon in schools (Parke, Drury, Kenner and Helavaara, 2002).

A focus on multimodality emerged as a result of closely observing children's text-making at home and in classrooms. Many researchers observed how children often composed multimodal texts, which consisted of both drawing and writing (Dyson, 1993, 2003). Kendrick and McKay (2004) in Canada, and Lancaster (2001) in the UK, argued that the use of wider symbol-systems than writing was not an add-on but instead was a way of expressing a wide range of experience and emotions. Children depict a wide range of signs to make meaning, and as they make meaning, they transform the materials they use (Kress, 1997). This transformative action can be observed in the meaning making of multilingual children. This crossing of symbolic and

linguistic repertoires reveals the transformative nature of sign making. In a longitudinal ethnographic study of children's communicative practices in homes conducted in London, UK, Pahl studied the experience of Fatih, a Turkish boy, at home. In one text (see [Figure 1](#)), he drew a bird, in a nest, which he called 'gosh' (the phonetic spelling of *kus*, bird, in Turkish). He also wrote beside it the English word 'bird'. He then added the Turkish, word, *kus*.

Fatih drew on a multimodal, multilingual repertoire to create this text: the image of the bird, drawn in pen using a torn out page from his mother's notebook, together with his Turkish, and his written recognition of the Turkish alphabet, which is different from the English alphabet. Detailed ethnographic work unravelled how the concept of

Figure 1 Fatih's Kus drawing.

*kus*, 'bird', meant a number of things to Fatih. His mother called him 'little bird' and when he was a young child, when he returned to his grandparents' home village in Turkey, he used to chase the chickens that lived in the village. He loved to read the story of *The Ugly Duckling*. All these themes, and his Turkish identity in London, were expressed in the *kus* text (Pahl and Rowsell, 2005).

It was observed that in homes there is a strong relationship between narratives and artefacts. An object would tell a story, and children drew images drawing on aspects of that story (Pahl, 2004). Key artefacts in homes often 'held' a family's history and identity. In the case of families who had experienced migration, these objects often had particular resonance. Multilingual homes contain many literacy artefacts in different languages, such as Koranic wall texts, video tapes, dual language texts, letters from other countries and so on. These cultural resources can be used in classrooms where different script systems can be displayed on walls and children's writing competencies can be supported in dual language books. Research by Cummins, Bismilla, Cohen, Giampapa and Leoni (2005) in Toronto has emphasised how home languages can be usefully drawn upon in dual language textbooks, authored by children.

Marsh has described how children's use of popular cultural texts extends and supports their multilingual identities (Marsh, 2006). For example, a child from Wales in the UK, who was being educated in a Welsh-speaking school and only spoke Welsh at home, was able to learn English from watching television (Marsh, 2006). Likewise, Kenner argued that resources such as satellite television allowed children to maintain contact with the cultural and linguistic resources of their home languages (Kenner, 2004). Fatih's bird drawings were combined with an interest in Super Mario, a video game requiring the player to complete a number of tasks, which he played frequently. A long-term family narrative, that of the bird, was combined in one text with an image from popular culture, that of Super Mario (Pahl, 2005). In this kind of image, one text is holding a number of different meanings across modalities and cultural systems, and Fatih's various interests are sedimented within the text, despite being drawn from different domains. Rowsell and Pahl (in press) described this process as one of *sedimented identities in texts*.

#### WORK IN PROGRESS

Many literacy practices these children produce are rendered invisible by monolingual language practices. One advocate of minority children's language practices is Cummins, whose work in Toronto has consistently argued for the valuing of children's home languages in order

to aid linguistic competencies (Cummins, Bismilla, Cohen, Giampapa and Leoni, 2005). In the USA, Zentella (2005) has described communicative practices in Hispanic homes drawing on a wealth model of literacy and recognising that children in Hispanic homes have a rich cultural heritage to bring to school literacies. In the UK, Gregory, Long and Volk (2004) have together collected research that celebrates multilingual literacies in homes with siblings and grandparents.

In South Africa, Bloch, Stein and Prinsloo (2001) have conducted a Children's Early Literacy Learning Project which collected detailed information about the early literacy experiences of 25 children from a diverse range of linguistic, cultural and socio-economic backgrounds. The focus of the project is children whose home languages are African rather than English. The project recognises that many young children are multilingual code switchers, who draw on different languages in different contexts. The findings of the research focused on ways in which multimodal literacies are intergenerational. Stein and Slominsky (2006) have described how children's literacy and language experiences in the home are shaped by parents' and grandparents' conceptions of multimodal literacy and language learning.

In Gent, and London, UK, Blommaert, Collins and Slembrouck (2004) have been analysing the spaces in which children grow up. By focusing on multilingual language in relation to spatiality, multimodal texts can be understood as being the realisation of language practices. They looked at multilingual inscriptions on walls and in Mosque schools to understand language socialisation. For example, children in a Turkish Mosque school in Gent were surrounded by images from Islam, such as inscriptions from the Koran, and also images from Turkey, such as the Turkish flag. There is an urgent need for more research on children's language socialisation in complex multilingual contexts such as those presented in the Asian sub-continent and the continent of Africa.

## PROBLEMS AND DIFFICULTIES

Research studies have emphasised the need for attention to be paid to children's bilingual, biliterate experiences in order for bilingual children to succeed at school (Blackledge, 2000; Booker, 2002; Kenner, 2004). Hornberger's (2003) theoretical contribution on the continua of biliteracy argues for children's multilingual repertoires to be heard in classroom settings but even if this is enshrined in policy, problems and difficulties occur (see Hornberger, *Continua of Biliteracy*, Volume 9). Parents may want their children to experience total immersion in the new language. Policy makers, for example, in the UK, may be hostile to children's use of their home languages in classroom settings. Multimodal

texts and inscriptions drawing on cultural references that classroom teachers may not understand may not carry weight in classroom discourses.

Key questions for practitioners and researchers include: who supports children's language socialisation in languages other than the dominant language? How do children's linguistic repertoires become supported and how do they flourish in a multimodal landscape of communication? What kinds of multilingual and multimodal communicative practices are recognised and what kinds are left unrecognised? What kinds of strategies do multilingual families employ to support their children's heritage languages? The challenges of post-colonialism need to be met with an attention to the voices of multilingual children.

### FUTURE DIRECTIONS

In a post-modern cultural context, Appadurai's (1996) work has highlighted how globalisation has disrupted everyday practices and literacies. The concept of the *mediascapes* of everyday life, which children inhabit, describes the new landscape of communication in which children blend texts and practices from satellite television and digital cultures, local knowledge and practices, and long-term family narratives. These linguistic repertoires can also be symbolic, and bound up with identities and narratives of migration, loss and displacement. Artefacts in homes can 'hold' a story and can be used in families to evoke long-term narratives in homes (Pahl, 2004).

Researchers recognise that siblings are part of children's experiences of multilingual literacies (Gregory, Long and Volk, 2004). Children watch their older siblings, cousins and families engage in a variety of activities, such as playing video games, dancing, composing songs and engaging in role play and performance. Hidden literacies are often those that are least recognised by schooling. They are often realised multimodally, as drawings, performances, gesture (Lankshear and Knobel, 2003). The role of popular music such as hip hop, video games, popular culture and satellite television in shaping and generating children's multimodal, multilingual texts in the home needs to be further researched.

A new area to consider is that of diasporas, identities and migration. As global migration is commonplace today, the question should be what are the communicative practices that are emerging from these new cultural spaces? By focusing on spatiality, multimodality comes to the fore as a way of analysing complex communicative texts.

Digital literacies (Lam, *Language Socialization in Online Communities*, Volume 8) such as web logs are increasingly popular as ways of uniting families across diasporas, as are sites such as Flickr, a web based photo sharing site ([www.flickr.com](http://www.flickr.com)). Different spatial and

temporal concerns permeate this new globalised landscape of signs. Space and place will come to inform studies of language socialisation, for example, an understanding of rural children's multilingual meaning making. Understanding the importance of Islamic concepts of space and time in a post-colonial context, for example, as realised through the Islamic calendar, or Koranic inscriptions as displayed on walls, will produce new insights about the multiple means and modes of literacy socialisation and semiosis in contemporary society. Multilingual children, as they grow up in complex, urban, hybrid neighbourhoods, are the communicative meaning makers of tomorrow and we must focus on what they bring to literacy and language practices.

LANGUAGE SOCIALIZATION IN THE HOME AND  
MINORITY LANGUAGE REVITALIZATION IN EUROPE

INTRODUCTION

Reviewing the research literature on home language socialization in the context of minority language revitalization in Europe is not a straightforward task. The body of language socialization research that has developed over the last 20 years (see Ochs and Schieffelin, *Language Socialization: An Historical Overview*, Volume 8), by North American scholars in particular, is currently very limited in the European context. The issue of minority language reproduction in the home, particularly with regard to inter-generational language practices is, nevertheless, a crucial issue for all the European autochthonous and minority language groups whose vitality is, to a greater or lesser degree, under threat at the turn of the twenty-first century (Table 1). This anxiety over diminishing inter-generational language use has been addressed academically from a number of diverse theoretical perspectives by researchers in Europe. The most common of these are quantitative sociolinguistic surveys based upon census statistics and other language use surveys carried out either at the pan-European level (e.g. Euromosaic study, OPEC 1996) or on a national/regional basis (e.g. Catalonia, Ireland, Wales). Other research has been conducted within a (bilingual) language acquisition framework and many case studies of individual families appear in books giving advice to parents and educators on how to raise children bilingually/multilingually (e.g. Hoffman, 1985; Saunders, 1988). However, very little detailed work in the ‘language socialization’ tradition has been carried out on the language practices of the various minority language groups in Europe which are concerned with their language maintenance and revitalization.

In the absence, hitherto, of much of a European contribution to language socialization research, this chapter describes how such a research perspective could provide valuable insights into the dynamics of inter-generational language practices and so provide useful evidence for European policy makers and practitioners. We begin this chapter, with a review of Joshua Fishman’s contribution to the field of minority language revitalization. Fishman’s contribution has been very influential in guiding language policy and language planning in the European

Table 1 Minority Language Reproduction Within the Family

| Cluster | Language reproduction within the family categories  | Language groups  | Number of language groups |
|---------|---|--|---------------------------|
| A       | Virtually all young families speak their language with offspring as do most minority language speakers in mixed families  | Swedish in Finland, Catalan in Catalonia, German in Belgium, German in Italy, Luxembourgish, and Turkish in Greece   | 6                         |
| B       | Some young families speak their language with offspring, but mainly the older generation; a few minority language speakers in mixed families also use minority language | Welsh in Wales, Basque AC, Catalan in Majorca, Galician in Galicia, Ladin, Slovene in Italy, Slovene in Austria, Basque in Navarre, Danish in Germany, Occitan in Spain, Friulian, Catalan in Aragon, Albanian in Italy, Occitan in Italy, Mirandese | 15                        |
| C       | Only about half of families speak minority language with offspring, mainly the older generation   | German in Denmark, Catalan in Valencia, Irish, Asturian, Gaelic, German in France, Frisian, Croatian in Austria, Basque in France, Catalan in France,  | 18                        |

Table 1 Continued

| Cluster | Language reproduction within the family categories   | Language groups  | Number of language groups |
|---------|--|--|---------------------------|
|         |  | Corsican, Franco Provençal, Slovak in Austria, Catalan in Italy, Slavo Macedonian, Bulgarian, Aroumanian, Albanian in Greece   |                           |
| D       | Only a minority of families speak minority language with offspring, mainly older people; people have heard grandparents speak the language | Sorbian, Saami in Finland, Tornedalen, Hungarian in Austria, Irish in Northern Ireland, Saami in Sweden, Breton, North Frisian, Dutch in France, Occitan in France, Sardinian, East Frisian, Portuguese in Spain | 13                        |
| E       | Virtually no families, except for the very old, use the minority language in the family  | Grico, Cornish   | 2                         |

(Adapted from Table 7.1 Williams, 2005, pp. 194–195)

context. We then present an overview of the vitality of European minority language groups with regard to intergenerational language use in the home as identified by the pan-European survey carried out by the *Euromosaic* project. In many European countries, initiatives which

seek to promote the minority language socialization of young children in the home have been set up with varying degrees of governmental financial support. We outline several of these in order to provide an idea of the kinds of interventionist strategies being undertaken to encourage the use of minority languages between parents and their children. These are also precisely the kinds of initiatives which could benefit from research with a language socialization perspective. As far as we are aware, the only European research on minority language use within the family conducted within a specifically ‘language socialization’ framework is a recent study in Wales by Jones and Morris (2005). We therefore report in some detail upon the findings of this study and refer where possible to similar findings identified in other research which is not ‘language socialization’ oriented per se, in order to begin to identify points of commonality across European minority contexts. We conclude by providing some pointers for future language socialization oriented research in the European context which includes investigating the interplay between the home-school-community in children’s minority language socialization.

#### EARLY DEVELOPMENTS: INTER-GENERATIONAL LANGUAGE REPRODUCTION AND REVERSING LANGUAGE SHIFT

When considering the issue of language socialization in minority language contexts, it is important to recognize the difference between the role played by civil society (namely, the family and the community) in reproducing language, as opposed to the centrality of formal, state-sponsored or state-related institutions (such as education and employment) in generating language production. In many European contexts, the formal education sector has been the primary site of efforts to revitalize minority languages and there is, consequently, a more substantial body of research which investigates minority language education in Europe. The family’s crucial role as a primary socialization agency is, however, well-documented in a wide variety of sociological literature—from a functionalist perspective (e.g. Parsons and Bales, 1955), or the Marxist feminist perspective (e.g. Delphy and Leonard, 1992). As such, it can be argued that the family should be the primary focus of language planners who are concerned with reversing language shift.

Joshua Fishman’s Graded Intergenerational Disruption Scale (GIDS) scale (Fishman, 1990, 1991), which measures the extent to which a minority language is threatened and disrupted, has been extremely influential in theorizing and developing the field of language revitalization and

language shift. Each of the eight stages in Fishman's scale represent key criteria, social activities and language practices which are, in turn, necessary to ensure the revival and/or survival of a minority language. Most crucial of all these is Stage 6, in which the minority language is the 'normal language of informal, spoken interaction between and within all three generations of the family' (1991, p. 94). Fishman emphasizes that the promotion of a minority language within institutions such as education, government legislation, the economy and the national media cannot, of themselves, reverse language shift without also securing the mechanism of intergenerational transmission through 'the normal, daily, repetitive and intensely socializing and identity-forming functioning of home, family and neighbourhood' (1991, p. 162). In the late twentieth century and early twenty-first century, this crucial role played by the home and family is being further undermined by changing parental employment patterns, childcare practices and family lifestyles, each of which diminish the mother's and father's roles as the primary (if not sole) 'transmitters' of the minority language. Fishman argues, therefore, that it is necessary for those family support agencies and networks such as early childcare provision to create the environment that will help socialize young children in their minority language and culture.

Fishman's seminal work on reversing language shift has played a central role in shaping minority language planning and research in the European context. In the surveys which have dominated the early sociolinguistic literature, as well as in the discourses of political institutions and language planning bodies, there has been a tendency, as the terms 'transfer' and 'transmission' imply, to view socialization as 'something done to novices by members' (Wentworth, 1980, p. 64). More recent studies of child language acquisition stress the interactional nature of socialization (e.g. Schieffelin, 1990), demonstrate that infants and small children play a part in socializing other family members (Ochs, 1988), and show how a child's language acquisition is influenced by many factors other than parental decisions and wishes (cf. Kulick, 1992). These more recent approaches, have, hitherto, had little influence upon the discourse of European politics and language planners. In addition to focusing almost exclusively on the role of parents (and often only the mother), the tendency in the early research and government policy has been to treat the family as a unit isolated from its social and historical context. An analysis of the role of the community in supporting or undermining family language practices is particularly important in the case of minority bilingual contexts since individuals' values and practices are intimately shaped by wider power relations and ideology.

MINORITY LANGUAGE GROUP VITALITY AND  
INTERGENERATIONAL LANGUAGE USE IN EUROPE:  
AN OVERVIEW

The Euromosaic study provides the most comprehensive overview of the vitality of minority European language groups with regard to intergenerational language use within the family (Williams, 2005). This large-scale survey indicates that where language group endogamy is high within the geographical territory, a high degree of language socialization occurs in most cases—for example, Welsh in Wales; Catalan in Aragon and Majorca; Galician in Galicia; Slovene and German in Italy; Friulian, Ladin and Franco-Provencal. However, geographical and language group endogamy do not necessarily guarantee a high incidence of family language use, as is evidenced by Breton. Two generations ago, Breton was spoken in virtually all families, but by now this situation is rare (*ibid.*, p. 151). The Euromosaic survey suggests that currently a high degree of family language reproduction occurs in just 11% of the 54 language groups, while a further 28% of the language groups are fairly successfully reproducing the minority language in the home:

The language groups who are reproducing the language within the family tend to be in areas where there is considerable economic activity, and where the minority language group is able to withstand the degree of in-migration associated with economic development, by ensuring labour market segmentation and thus promoting the prestige of the minority language. The support of the state is also a major factor. Within those clusters of language groups where minority language socialization within the family occurs at a medium to low level, a number of steps are being taken by language planners and policy makers to encourage the reproduction of the minority language.

In the Basque Country, for example, *Ahoz Aho, Belaunez Belaun* (*By Word of Mouth, from One Generation to the Next*) is a campaign for raising awareness ‘of the advantages of the continuity and transmission of the Basque language’ (Network of European Language Planning Boards (NELPB), 2005) among young Basque-speakers. The project encourages both future parents and those who already have children to ‘participate in Basque in their every day life through their children’. Language courses are a core activity of the project and include Basque language courses for Spanish-speaking mothers; courses to encourage Basque speaking couples to change their language habits and language use with each other; and a course on tales, songs and games. Language awareness campaigns are also a feature, and parents are granted ‘special subsidies’ to encourage their use of Basque in the home (*ibid.*). Several studies have been carried out to inform the

development of the project, including: Arruti (1995), Jauregi (1996) and Urdangarin (1997).

In Wales, the Welsh Assembly Government (WAG) has recognized its role in language planning by pledging considerable resources to ensure that parents are made aware of the benefits of early bilingualism. The pioneering TWF (*Transfer of Welsh in Families*) project funded by WAG aims to 'ensure that more and more parents decide to raise their children bilingually, especially in households where one or more parents speak Welsh' (NELPB, 2005). This project employs a national development Officer, a Health Officer, support officers and 21 Field Officers responsible for areas throughout almost the whole of Wales. The scheme offers advice directly to parents and also to certain health care and childcare professionals who are involved with mothers and babies, such as midwives and community nurses.

Ireland operates several schemes and incentives to promote parents' use of Irish with their children. In Gaeltacht areas, *Scéim Labhairt na Gaelige (Irish Speaking Scheme)* provides a financial incentive of 260 euros to those households with school-going children where Irish is the predominant spoken language of the household. *Togra Oideachas Ghaeltachta Muintearas Comhluadar* is a non-governmental organization founded in 1993 that operates throughout Ireland to support Irish-speaking families. Five hundred families have registered with the organization which, like the TWF project in Wales, also aims to raise the awareness of prospective parents of the advantages of bilingualism by working in prenatal clinics. In 2004, a language awareness campaign entitled *Ár dTeanga Ná dúrtha Féin (Our Own Natural Language)* and consisting of TV and radio advertisements, information booklet, posters and website, aimed at advising parents in the Gaeltacht of the advantages of choosing Irish as the language of their household. *Scéim Cuairteoirí Baile (Home/Family Visitation Scheme)* is a pilot scheme operating in the Gaeltacht area of Corca Dhuibhne in West Kerry which funds home visits to families with the objective 'of strengthening family based intergenerational transmission of the language' (NELPB, 2005).

In Sweden, campaigns to promote minority language transfer within the home have been aimed at the Saami community. *Čoavdda Guovtti Máilbmái (The Key to Two Worlds)* was a campaign funded in 1993 by the Saami Educational Council which used a video and leaflet to raise awareness of the benefits of bilingualism and encourage parents to use Saami themselves and with their children. Campaigns promoting bilingualism among Finnish speakers in Sweden have also distributed leaflets explaining the advantages of bilingualism via midwives.

MINORITY LANGUAGE SOCIALIZATION WITHIN  
THE FAMILY: WORK IN PROGRESS

Although significant resources are being targeted on these and other similar initiatives to encourage the use of the minority language within families, relatively little is known about the factors that influence language use among family members. Some insights can be gleaned from a number of language use surveys and other studies which are varied in their theoretical and methodological approach. In the absence of any body of ‘minority language socialization’ studies per se in the European context, we therefore summarize the findings of one recent study of the family language socialization of young children in Wales (Jones and Morris, 2005) and indicate those instances where similar factors have been identified in other methodologically and theoretically informed studies.

The study by Jones and Morris (2005) is intended to be the first stage in a longitudinal study of children’s language socialization in Wales. The first stage was an in-depth study of the language socialization practices of 12 mixed-language families with children aged between 0 and 2 years, where one parent was identified as a ‘Welsh speaker’ while the other was a ‘non-Welsh speaker’. The research was developed in response to the Welsh Assembly Government’s prioritizing of ‘family language transfer [as] a key component to maintaining Welsh as a family and community language’ (WAG, 2002, p. 18) and examines in detail the roles of both parents and other siblings in the language socialization process, as well as considering secondary socialization via extended family, friends, neighbours, childcare, nursery and educational provision and the community at large. This study builds upon a small number of survey-based studies of the intergenerational transmission of Welsh that have been carried out in Wales over the past 30 years (Bellin, Hughes, and Thomas, 1996; Harrison, Bellin and Piette, 1981; Lyon, 1996).

Jones and Morris’ study identified five primary factors affecting a child’s Welsh language socialization:

*1. Time Spent and Interactional Practices with Welsh-Speaking Parent*

It was the one-to-one interaction with parents which was crucial in the early language socialization of babies and young children up to two years of age. In the study sample of 12 families, the mother was the principal carer of all but one of the children. The usual practice within the study families was for the Welsh-speaking parent to speak Welsh when alone with their child or when addressing the child directly in the presence of the non-Welsh speaking parent. All the children’s parents used English when talking to each other, and often the Welsh-speaking

partner spoke English with the child when the non-Welsh speaking partner was present. It was, therefore, the amount of time the child spent *alone* with the Welsh-speaking parent that was a significant factor in the early language acquisition of the child. In this study, children were, consequently, more likely to acquire Welsh during their early language socialization if their mother was the Welsh-speaking parent.

Research in several other countries also recognizes the key role of the mother in shaping a child's minority language socialization. In the Basque Country, for example, Larañaga (1986) indicates that the mother's role is far more determining than that of the father's with regard to children's Basque language acquisition. In the absence of minority language socialization research which documents in detail the people and practices that shape and socialize a child's minority language development, then there is a tendency, as Jaffe (1999) has argued in a study of language shift on Corsica, for women to be blamed for language shift.

### *2. Involvement of Welsh-Speaking Grandparents*

Of all the extended family members, grandparents were the most involved in the language acquisition of the child, particularly the maternal grandparents, and especially the maternal grandmother. In two-thirds of the families in the Welsh study, the maternal grandmother was the 'second carer', after the mother. Parental decisions regarding the language of other childcare provision involving non-family members are also crucial in facilitating the early minority language appropriation of children in working families. A study in Catalonia (O'Donell, 2001) shows that the babysitters, *senyores de fer feines*, and nannies employed in the home to care for young children are typically female and non-Catalan speakers.

### *3. The Role of Older Siblings*

The five young children in the Welsh study who had older siblings spent a significant amount of time in their company and it was evident that the siblings' practices of play, watching TV, using the computer, reading, eating, going places and doing various other activities all contributed to the youngest sibling's early language socialization. It was also evident that parental decisions regarding their oldest child's language of education had a direct impact upon the language practices of the home and significantly increased the family's use of Welsh. Data on intergenerational language use in other European contexts tends to focus on parent/child interaction so that information on the part siblings

play in a child's minority language socialization is very limited (see, for example, Barron-Hauwaert, 2004).

#### *4. Language Background, Language Values, and Language Practices of Parents and Their Extended Families*

The Welsh study demonstrates how each family's language practices were intimately shaped by the experiences and values of both parents. The language background and values of the Welsh-speaking parents were, therefore, crucial in shaping their child(ren)'s early language socialization. The study found that the parents' language of interaction with their child closely matched their own childhood language experiences in all cases.

Another important issue was how comfortable the non-Welsh speaking parents felt when Welsh-speakers spoke Welsh in their presence. In some cases, it was found that the resulting family tensions led to the Welsh-speaking partner using English in the presence of their non-Welsh speaking partner out of politeness and in order to include the non-Welsh speaker in the discussion. This tendency to use English out of politeness also extended to parents and other adults speaking English rather than Welsh with the children of the family. A study in Catalonia also reported that Catalan-speaking mothers switched to the common language in the presence of the non-Catalan speaking father in order to ensure 'domestic peace' (O'Donnell, 2001).

Numerous other studies confirm the importance of language values in shaping the dynamics of language use for all minority language groups (e.g. Frisian: Van der Plank, 1987; Arbresch in Italy: Derhemi, 2002; Albanian in Greece: Trudgill and Tzavaras, 1977). Huss (1999) refers to the negative language values which have undermined the public and private use of the 'mother tongue' by the Saami in Norway, Sweden and Finland, Tornedalians in Sweden and Kven in Norway, and the need to address these negative values in order to strengthen the efforts being made to promote children's early minority-language socialization in the home. Ó hIfearnáin (2005) shows how parents value the importance of being bilingual, which is at odds with government incentives to promote the use of Irish only in Gaeltacht homes.

#### *5. Parental Language Values and Power Relations*

In the Welsh socialization study, it was found that the language-related decisions within the families were taken mainly by one partner. In the case of those who were successfully socializing their child in Welsh, the Welsh-speaking partner was the 'language decision-maker'. Which

parent makes the language-related decisions was decided as part of the parents' negotiation of their power relations, roles and responsibilities in the household. Other studies (e.g. Helander, 1984, for Saami and Fishman, 1991, for Frisian) generally indicate that while intergenerational transmission occurs when both parents share the same minority language, this often fails completely in mixed-language partnerships. While various factors will account for this breakdown in the intergenerational use of minority languages, parental language values and their negotiated practices and decision-making roles within the household clearly merit further investigation with regard to their effect upon children's early minority language socialization.

### *Contributing Factors*

In the Welsh study, other factors contributing to minority-language socialization included community language experiences, child-minding practices and local childcare provision. The study focused upon three areas of Wales where Welsh is still at present a viable community language, but where in-migration is eroding, to differing degrees, the ability of the family and community to reproduce the language. In all three study areas, there were opportunities for the families to undertake Welsh-medium pursuits outside the family, should they wish to do so. Similarly, all the families had access to Welsh-speaking caregivers/childcare for their children, if they wished to use this facility, together with access to nursery and primary education provision which could support their efforts to ensure their children learned Welsh or could be raised bilingually.

Those parents who were already socializing their children in Welsh had selected Welsh-medium or bilingual nursery provision and primary schools. Other parents clearly saw Welsh-medium schools as a means of ensuring their child's Welsh language socialization when circumstances meant that their Welsh language socialization within the home was more limited.

The use of TV, video and DVDs was also part of the day-to-day routine of all the families, and in most families, the children watched more English than Welsh programmes. For those children with more limited use of Welsh in the home, watching Welsh TV provided some opportunity to include Welsh in their family practices. Several of the very young children were already being socialized in the use of computers. This generally involved looking at children's interactive TV-related websites in English but also included the Welsh language homework of an older sibling. Almost all the families read stories daily to their children, in both Welsh and English.

## PROBLEMS AND DIFFICULTIES

The findings of the Welsh study add to our understanding of minority language socialization by demonstrating that a child's minority language socialization is a complex process involving, even at a very young age, practices of interaction with a number of other family members, and friends and neighbours/acquaintances in addition to the child's parents. It is also apparent that children's socialization is bound up with their family's interaction with their local community and policy-determined provision regarding childcare, nursery and primary education, again from a very young age.

The role of the media as a socializing agent is also important and should not be underestimated. The Welsh research has started to measure the influence of the media on children's early socialization and it was obvious that it was a pervasive, and mainly English language, influence. This was despite the fact that Welsh language print and broadcasting media are relatively easy to access in Wales. By comparison, most other minority language groups in Europe have more restricted availability of broadcasting and print media in their own language, as identified by the Euromosaic project and summarized in [Table 2](#).

The effect of the media will undoubtedly increase pressure upon family language use in the future as the influence of information technology continues to develop. Minority language television is already becoming increasingly established within the European periphery, and is having a significant economic and cultural impact in Wales, Scotland, Catalonia, Euskadi, Galicia and Ireland (Williams and Morris, 2000). The huge increase in the use of electronic media over recent years poses a challenge for minority language groups, and this has started to be addressed by a number of projects designed to motivate young people in particular to develop and maintain their knowledge of the minority language (e.g. Edwards, Pemberton, Knight and Monaghan, 2002).

Another challenge for minority language areas in Europe is the great social and demographic changes they are experiencing as a result of globalization. Economic restructuring inevitably leads to significant movements of people both into and out of these areas, which in turn affects the rates of language group endogamy (Morris, 1995). Although, as we have previously argued, language group endogamy does not guarantee a high incidence of family-language socialization, nonetheless it sets in place the necessary conditions for language reproduction to occur. [Table 3](#), again from the Euromosaic project, gives an indication of the situation of minority language groups in Europe by reference to endogamy and incidence of family language use.

Table 2 Availability of Minority Language Print and Broadcasting Media According to Language Group

|  | High Availability<br>Broadcasting Media<br>(TV and Radio)  | Low Availability<br>Broadcasting Media<br>(TV and Radio)  |

(Adapted from Table 4.3, Williams, 2005, p. 123)

A related and pertinent factor in family minority language socialization is the family's perception of the prestige and value of the minority language for economic and social mobility (Williams, 2005). The absence of the minority language from economic life leads to many families abandoning the minority language in favour of the dominant language which gives opportunities for higher status employment, and thus upward social mobility.

A study of minority language socialization therefore obviously requires more than merely a study of patterns of socialization practices within families. As the agency of primary socialization, the family is

Table 3 Language Group Endogamy and Family Language Use

|                 | High Language Group Endogamy   | Low Language Group Endogamy   |
|-----------------|--|---|
| High family use | Turkish, Friulian, Ladin, Welsh, Occitan/Italy, Albanese, Galician, Asturian, Aranese, Mirandese, Catalan, Basque, Frisian, Catalan/Valencia, German/Italy, Catalan/Majorca, Luxembourgish German/Belgium, Swedish/Finland | Breton, Occitan, Vlach, Sardinian, Arvanite, Saami/Finland, Saami/Sweden, Tornedalen, Alsatian  |

(Adapted from Table 4.1, Williams, 2005, p. 97)

of course central to any analysis. However, as this brief overview indicates, minority language socialization is a complex process that is firmly embedded within the related social context of the members of that language group. Within the family itself, the adults' negotiation of their power relations, roles and responsibilities in the household is crucial in determining their influence on children's language socialization. However, we also see that a variety of external social factors also come into play, such as the larger community, patterns of education, peer groups, family, friends and neighbours, the media and economic development. The success, or not, of socializing a child into the minority language depends upon a complex interplay of these factors.

#### FUTURE DIRECTIONS

As we have indicated in this chapter, there is, to date, a paucity of research on minority language revitalization that is theoretically and methodologically informed by the language socialization tradition.

The Welsh study referred to in this paper is the only such study the authors are aware of in the European context which specifically investigates early language socialization in the family. As we have indicated, many of the findings of the study by Jones and Morris (2005) corroborate with some of the conclusions of other research projects conducted within different theoretical and methodological frameworks. More specifically ‘language socialization focused’ research carried out among families in other European minority language contexts would strengthen opportunities for identifying commonalities across minority language groups. There is certainly a need for such research and a political agenda within the European context which gives emphasis to ‘family language transfer’ as a key policy area. Family language transfer was, for example, the subject of the first ministerial summit meeting of the British-Irish Council held in Galway in October 2006. Family language transfer has also been one of the key themes of the Network of European Language Planning Boards (NELPB, 2005). At a time when language policy is predominantly informed by large quantitative surveys, there is an important place for the kind of perspective and insights which language socialization research can offer in this field. The agenda for further minority language socialization studies in the European context includes, therefore, the need to explore in detail the complexity of the minority language socialization dynamic, as indeed Fishman (1990, 1991) himself emphasizes in his model for reversing language shift. This would mean conducting more studies on the language socialization practices of minority language group families. There is also a need to investigate the home–school–community dynamic of minority language socialization, since the key to minority language revitalization lies in ensuring that all three support rather than weaken the minority language socialization of children.

LANGUAGE SOCIALIZATION AND GENDERED  
PRACTICES IN CHILDHOOD

INTRODUCTION

Three theories have attempted to explain how children become socialized to speak in ways that are tied to gender in their culture. First, language socialization theory introduced the idea that children learn the values and “ethnotheories” of their culture through participating in its language routines (Ochs, 1986, p. 2). As Ochs (1992) explains, “knowledge of how language relates to gender is not a catalogue of correlations between particular linguistic forms and sex of speakers, referents, addressees and the like. Rather, such knowledge entails tacit understanding of how particular linguistic forms can be used to perform particular linguistic work (such as conveying stance and social action)” in one’s community (p. 342). As novices, children have to learn the particular stances or social actions that are tied to gender in their community. A second theory, the Separate World Hypothesis (SWH), took a more universalist view. The SWH was a peer-based socialization theory that argued that as a result of spending most of their time in gender segregated groupings with peers in childhood, girls and boys grew up in separate communicative sub-cultures, and developed quite different ways of speaking and doing things with words (Maltz and Borker, 1982). This theory stimulated a great deal of research and brought the influence of peers into focus, but was faulted for essentializing gender differences. In the 1980s, a third theory, based on ethnographic studies of children’s peer groups, began to be elaborated, and it viewed “the child as member of a culture that was different from that of the adult world” (Cook-Gumperz and Kyratzis, 2001, p. 591; see Cook-Gumperz and Corsaro, 1986; Corsaro 1985, 1997; Eder, 1995; Ervin-Tripp and Mitchell-Kernan, 1977; Goodwin, 1990, 2006). In peer speech events that children organize themselves, they articulate their own norms and identities of the peer group (e.g., Goodwin, 2006; see Corsaro and Eder, 1990; Goodwin and Kyratzis, 2007; Kyratzis, 2004, for reviews of studies), and these can include ideologies related to gender.

Each of these three theories is reviewed in turn in this chapter. Both language socialization theory, which preceded the other two, and the SWH, an early peer-based theory of gender socialization, are reviewed

in the Early Developments section. Neither theory fully accounted for how children use gender categories in speech among themselves. The difficulties of the SWH in terms of essentializing gender differences are reviewed in the Problems and Difficulties section. The third theory accounted for children's agentive use of gender in talk among themselves in their peer groups, and has generated much current work; it is therefore reviewed in Work in Progress. The early contributions to that approach are reviewed under Major Contributions. Future directions are provided for the language socialization and peer group language socialization (first and third) theories.

## EARLY DEVELOPMENTS

### *Parental Socialization of Children to Gendered Ways of Speaking*

According to theories of language socialization, "children and other novices in society acquire tacit knowledge of principles of social order and systems of belief (ethnotheories) through exposure to and participation in language-mediated interactions" (Ochs, 1986, p. 2). Thus, through observing the ways in which language is used in family routines such as dinnertime interactions, and caregiving and requesting rituals, children can become socialized to their culture's views of gender roles and power relationships between men and women. Ochs, contrasting the caregiving practices of American white middle-class (WMC) mothers and Samoan mothers, suggested that the fact "that mainstream American mothers use a simplified register pervasively has a constitutive impact on the image of women in that this practice socializes young children into an image of women as accommodating and addressee-centered" (Ochs, 1992, p. 351). In family dinnertime interactions of American WMC families, Ochs and Taylor (1995) observed a set of practices surrounding the ways in which family dinnertime narratives about events of the day were told, a "father-knows-best" dynamic that potentially diminished the status of women: "When women directed their narratives to their husbands . . . they disadvantaged themselves by exposing their experiences to male scrutiny and standards of judgment" (Ochs and Taylor, 1995, p. 117). Discussing findings of Kendall (1999), Tannen (2003) concludes that although parents may "espouse an ideology of equal co-parenting and wage-earning" in self-reports (p. 200), the ways in which mothers converse in family care-taking and mealtime routines "position themselves (mothers) as primary childcare providers and their husbands as breadwinners" (p. 200).

Parental speech not only socializes children to particular images of adult men and women in their society, but also socializes them to

images of themselves that can fall along gendered lines. Young males “routinely hear strong prohibitions and jocular names” and girls “from early infancy are spoken to in a more indirect ways” (Gleason, Ely, Perlmann, and Narasimhan, 1996, p. 215). As a result, “the language experiences of girls may thus contribute to the kind of interpersonal sensitivity and vulnerability that are often thought of as feminine traits” (Gleason, Ely, Perlmann, and Narasimhan, 1996, p. 215). Concomitantly, boys are socialized towards toughness. These “images” of males and females projected in language-mediated routines seem to be internalized by children. In formulating requests, American WMC children show more deference to fathers than they do to mothers (Ervin-Tripp, O’Connor, and Rosenberg, 1984). In role-play, preschoolers project fathers as using more direct commands and topic-shifting boundary markers and mothers as using more polite conventional request forms (Andersen, 1990). Similarly, in Aronsson and Thorell’s (1999) study of how fathers and mothers were depicted by Swedish children in role-play, they found that both girls and boys portrayed fathers as having greater rights to judge other family members and make displays of anger:

In our work, the fathers were the judges in a very concrete sense in that they were the ones who put an end to a family conflict about television viewing, by, for instance, turning off the television set, throwing it out of the house, or smashing it (Aronsson and Thorell, 1999, p. 43).

These studies of children’s role-play, and the forms of deference children themselves use in formulating requests to mothers vs. fathers, provide convincing evidence that the images of men and women that are projected by adults in family interactions are, to an extent, internalized by children. However, the relationship is not a perfect one. As noted by Kendall (2003, p. 603) in her discussion of a study by Cook-Gumperz (1995), young girls “constituted mothers as speaking with power in a make-believe game of “mummies-and-babies.” The images of men and women projected in family routines as reported for WMC families may therefore not be fully reflected in the peer role-play of children. Although WMC American mothers may be positioned as lacking authority in family conversations, WMC British and African-American working class girls do not project mothers in this way in their peer play (e.g., Cook-Gumperz, 1995; Goodwin, 1990). This lack of reflection of adult gender patterns in children’s projections of adults in role-play suggests the need for researchers to study a broader cultural range of parental socialization patterns, and to consider the possibility that children, although utilizing gender “ethnotheories” (Ochs, 1986) modeled in the adult culture, may refine these and create their own gender images and ideologies in their peer interactions.

Although particular images of men and women and girls and boys have been reported to be socialized in the family language routines of WMC American families, researchers need to consider different cultural groups, and different kinds of family circumstances, such as single-parent families, same-sex parent families, families in which both parents work (e.g., Kendall, 2003; see studies in special issues edited by Ochs and Kremer-Sadlik, 2007; Tannen and Goodwin, 2006), and families for which dinnertime is a less formal or patterned routine in which all family members do not sit down to dinner at the same time (Kendall, 2006; Nader, 1996). Family interactions do not always reveal themselves to have a pattern of father-dominance (Nader, 1996). Just as the field of language and gender research has progressed so that “researchers increasingly considered the interaction between gender and other social identities and categories” (Kendall and Tannen, 2001, p. 555), family socialization studies (such as those described in the two collections listed previously) are expanding to examine less traditionally studied family systems in a multiplicity of settings, focusing on “the situated and sequential nature of everyday family negotiations” (Aronsson, 2006, p. 624).

*Peer Socialization of Children to Gendered Speech Styles—The Separate Worlds Hypothesis*

Parents have always been regarded as having a major role in socialization of children to gender roles. However, in the 1980s, a peer-based model of gender socialization rose to prominence, called the SWH (Maltz and Borker, 1982). The hypothesis states that as a result of separated peer play in childhood, with girls playing predominantly with other girls and boys playing predominantly with other boys, and engaging in quite different activities, girls and boys evolve quite different goals for social interactions and quite different communicative styles and sub-cultures. Girls learn that talk serves “to create and maintain relationships of closeness and equality” (Maltz and Borker, 1982, p. 205) and boys learn that talk serves “to assert one’s position of dominance” (p. 207). The SWH was based on Gumperz’ (1982) work on intercultural communication and claimed that girls and boys have different sociolinguistic sub-cultures. It drew its evidence from time-sampled observations of natural peer play interactions of children in six cultures (Whiting and Edwards, 1988), which found systematic gender segregation. It also drew on findings from Goodwin’s ethnographic study of neighborhood peer groups of working-class African-American children in Philadelphia (Goodwin, 1990). Goodwin reported stylistic differences in girls’ and boys’ speech during task activities. However, Maltz and Borker (1982) did not consider the contextual

variation that Goodwin had observed in the children's speech styles in earlier work, and similarities that Goodwin noted between girls' and boys' directives and arguments (Goodwin, 1990; see Goodwin, 2006, pp. 19–20).

Although a great deal of research with WMC children supported the view that in same-sex groups girls interact so as to sustain interaction, minimize confrontation and the direct expression of control, and realize group goals, and boys interact so as to one-up the conversational partner without mitigating conflict (e.g., Sachs, 1987; see Coates, 2004, pp. 160–170 for reviews of this research), several critiques were leveled at the SWH and other dichotomous models of the relationship between gender and language. These criticisms are reviewed in the next section.

### PROBLEMS AND DIFFICULTIES

#### *Feminist Critiques of the Separate Worlds Hypothesis and Dichotomous Models of Gender and Language*

The problems with the SWH (reviewed in Goodwin, 2003; Kyratzis, 2001) come from feminist critiques (e.g., Bing and Bergvall, 1996; Eckert and McConnell-Ginet, 1992), and can be placed in four categories. First, gender segregation between girls and boys was found not to be as great as Whiting and Edwards' (1988) research suggested (see Goodwin, 1990, 2006; Thorne, 1993). Second, studies emphasizing gender differences are essentialist (see Goodwin, 2006) and minimize similarities that do occur between girls and boys, for example, de-emphasizing girls' self-assertion (Sheldon, 1997). A third criticism is that the model fails to consider such factors as race, social class, and culture, which have been overlooked (e.g., Bing and Bergvall, 1996; Ochs, 1992). Fourth, as suggested by Ervin-Tripp (1978, 2001), "some social settings may emphasize gender while others do not" (Ervin-Tripp, 1978, p. 28), so that researchers need to consider the influence of contextual factors on children's use of particular communicative styles, most effectively by conducting ethnographic studies following peer groups of children over different contexts of interaction (Evaldsson, 2004; Goodwin, 2003, 2006; Kyratzis and Guo, 2001). Researchers need to examine gender as locally determined "practices" of specific communities (Bucholtz, 1999; Cameron, 1997; Eckert, 2003; Eckert and McConnell-Ginet, 1992) and peer groups (Goodwin, 2006).

In addition to the critiques that came from feminist writings, another criticism that can be leveled at the SWH is that much of the research that came to support it was based on one-time observations and comparisons of girls' and boys' peer interactions that were arranged by researchers in experimental settings, rather than on ethnographic

research. Recent work on children's peer language socialization from linguistic anthropology, developmental pragmatics, and sociology, using ethnographic methods, has begun to examine how children in their peer groups build their own cultural worlds through language (e.g., Cook-Gumperz and Corsaro, 1986; Corsaro, 1985, 1997; Ervin-Tripp and Mitchell-Kernan, 1977; Goodwin 1990, 2006; Goodwin and Kyratzis, 2007; Kyratzis, 2004). In peer speech events that children organize themselves (gossip talk, conflicts, collaborative stories), they articulate their own norms and identities of the peer group, including gender ideologies (see Kyratzis, 2004, for a recent review), as the studies in the next section will illustrate.

### MAJOR CONTRIBUTIONS

Three classic ethnographic studies, those of Goodwin (1990), Eder (1995), and Thorne (1993), examined gender construction in children's peer groups and did much to dispel the assumptions of the SWH. First, while the studies that supported the SWH had observed WMC American girls to use indirect and less confrontational strategies to manage conflict, Goodwin (1990) found that African-American working class girls in the Maple Street group that she observed used direct commands and bald directives in certain contexts. Goodwin described talk in the Maple Street girls' group as follows: "Whereas boys' directives, especially those issued by leaders, are typically shaped as a command . . . girls' directives are constructed as suggestions for actions in the future" and as such do not show "claims about special rights over the other (as a command does)" (Goodwin, 1990, pp. 110–111). However, when enacting mothers playing house, the girls used bald directives and enacted hierarchical forms of organization, delivering "imperatives loudly with emphatic stress" (Goodwin, 1990, p. 127). The results suggest that "the girls have full competence with bald or aggravated forms of action, and also systematically use them in appropriate circumstances" (Goodwin, 1990, p. 117). The girls embraced conflict. In disputes with boys, they used direct forms of opposition, including insult terms and negative person descriptors, as well as bald directives. They told discrediting stories about non-present girls, which set up future confrontations and made their disputes more complex and extended in time than boys' disputes. As in the boys' peer group, disputes and stories played a central role in the girls' negotiation of the social organization of their peer group.

Thorne (1993) conducted an ethnographic study following the peer interactions of children enrolled in two public US elementary schools. Through fieldnotes and observations, she found girls and boys engaged in practices and games that emphasized gender boundaries. These

included practices such as teasing and labeling (e.g., “sissies”), boys and girls excluding one another or making fun of children who played with opposite-sex peers, and games such as boys chasing girls and vice versa. These “borderwork” activities tended to occur in large public settings. In contrast, the display of girls-against-boys, boundary-marking behavior by both girls and boys, was not in evidence in less public settings, such as neighborhoods, in which groupings of children tended to be mixed-age (Thorne, 1993): “Crowds provide not only many potential companions but also potential witnesses; schools are much more public environments than are neighborhoods” (Thorne, 1993, p. 53). Thorne concluded that analysts should concentrate on contextual specificity in the display of gender, “examining the social relations in which multiple differences are constructed and given meaning” and avoiding “binary abstractions” (pp. 108–109). Furthermore, analysts should pay close attention to the fact that “gender takes shape in complex interaction with other social divisions and grounds of inequality, such as age, class, race, ethnicity, and religion” (p. 109).

Another influential ethnographic study that examined children’s construction of gender inequalities through their language use in peer groups was Eder (1995). In teasing rituals, “labels like *fag*, *wimp*, and *sissy* constrain the types of behaviors in which boys can engage, while other labels, such as *slut*, *whore*, and *dog*, limit girls’ desires and sense of self” (Eder, 1995, p. 150); see also discussion of labeling practices in Eckert (2003, p. 386). All three studies, especially Goodwin’s, which relied heavily on recordings of naturally occurring conversations among children, set the tone for future ethnographic studies examining children’s naturally occurring conversations in their peer group interactions, and the uses children themselves make of gender in their peer groups.

#### WORK IN PROGRESS

Influenced by the ethnographies of Goodwin (1990), Eder (1995), and Thorne (1993) and by the work on children’s peer cultures, recent work on children’s construction of gender has examined gender as a contextually determined phenomenon that children invoke in their peer groups for their own purposes (see Kyratzis, 2004, for a fuller review of these studies). Current studies do not treat gender as a given. Rather, influenced by the field of Conversation Analysis, researchers examine how and whether gender is oriented to by children in their moment-to-moment interactions (Danby and Baker, 2001; Evaldsson, 2007; Goodwin, 2006; see especially Danby and Baker, 2001, p. 193; Goodwin, 2006, pp. 5–10). Current studies also examine gender construction and display in cultural groups other than WMC American children’s peer

interactions. These studies find that assumptions about girls' affiliativeness and use of mitigated conflict strategies do not hold up for working-class Latina girls (Goodwin, 2006), Mainland Chinese girls (Kyratzis and Guo, 2001); Taiwanese girls (Farris, 1991), African-American working-class girls (Corsaro, 1997; Goodwin, 1990, 2003), and Italian middle-class girls (Corsaro, 1997). Nor do they hold up for groups of girls of mixed class and ethnicity (Goodwin, 2006).

Several studies have documented contextual specificity in children's use of practices associated with gender (Coates, 1997; Cook-Gumperz and Szymanski, 2001; Evaldsson, 2004; Goodwin, 1990, 2006; Kyratzis and Guo, 2001; Nakamura, 2001; Tarim and Kyratzis, 2006). For example, girls who are skilled team players have been observed to use mitigated language when instructing less skilled team players in a sports game, but display authoritative stances towards one another (Evaldsson, 2004), and boys who lack expertise in jump rope use language forms that request permission of girls until the time when they achieve more expert status (Goodwin, 2006). Further studies examined gender as locally determined "practices" of specific communities (Bucholtz, 1999; Cameron, 1997; Eckert, 2003; Eckert and McConnell-Ginet, 1992) or peer groups, such as assessments as used by a peer group of 10–12-year-old girls "to construct notions of normative value" (Goodwin, 2006, p. 209), and use of "lexical items associated with the formal register" by members of an adolescent friendship group of adolescent "nerd" girls followed by Bucholtz (1999, p. 212). Other studies have illustrated the use of gendered practices for children's social organization (Adler and Adler, 1998; Berentzen, 1984; Danby and Baker, 2001; Evaldsson, 2002, 2007; Goodwin, 2006; see Kyratzis, 2004, for a review). Still further studies have illustrated children's subversion of gender ideologies of the adult culture in their interaction with other peers (Coates, 1997; Cook-Gumperz, 2001; Eder, 1998). These studies suggest that children provide their own construals of gender images learned from adults and use them for their own peer goals.

#### FUTURE DIRECTIONS

Future research on family socialization will be dedicated to studies of families from different cultures, as well as non-traditional families, and will study them in a multiplicity of settings. Like the studies in the special issues co-edited by Ochs and Kremer-Sadlik (2007) and Tannen and Goodwin (2006), these studies will examine how parenting occurs in a variety of naturalistic family activities, and will focus on how families work out important locally relevant and emergent moralities, identities, and transitions in their identities through the ways in which they manage the local sequential organization of their "mundane

interaction” (C. Goodwin, 2006, p. 458). C. Goodwin (2006), for example, illustrates how “participants faced with working out such issues in mundane interaction... attempt to place each other in consequential positions through detailed operations on the talk” (C. Goodwin, 2006, p. 458). Future studies will examine how identities and moralities are “embedded in and [are] an outcome of everyday family practices” (Ochs and Kremer-Sadlik, 2007, p. 5). With respect to peer interaction, future research should focus on what children themselves make of any images of males and females provided by the adult culture in their peer talk among themselves. This research will continue to rely on ethnographic methods to study children’s naturally occurring peer group talk and interaction, focusing on extended observations of the same groups of children over many contexts (Evaldsson, 2004, 2007; Goodwin, 2003, 2006; Kyratzis and Guo, 2001; Reynolds, 2007), and will focus on cultural groups other than European-American middle-class participants. Future studies will also focus on practices that might constitute gender for the children themselves (Evaldsson, 2007; Goodwin, 2006), as used in their peer and friendship groups, including uses of labels and insults (Eckert, 2003; Eder, 1995; Reynolds, 2007) as well as less explicitly gender-linked practices, such as uses of “accounts and forms of membership categorization work” (Evaldsson, 2007) and assessments (Goodwin, 2006). Another focus will be how moment-to-moment processes such as format-tying allow children to display their alignments towards one another (Danby and Baker, 2001; Evaldsson, 2004, 2007; Goodwin 2006; Goodwin and Kyratzis, 2007; Reynolds, 2007) as well as to “articulate for each other what they are doing, [and] how they expect others to participate in the activity of the moment” (Goodwin, 2006, p. 21; see Goodwin and Kyratzis, 2007, for an overview of several studies along these lines). By following children ethnographically, over many settings of play and interaction, future studies will focus not only on children’s use of gender-consistent images, but also on uses of counter-gender stereotypes, focusing, for example, on girls’ authoritative language strategies and exclusion in peer groups (Evaldsson, 2007; Farris, 1991; Goodwin, 2006; Griswold, 2007) or boys’ uses of gossip in their friendships (Cameron, 1997). In these ways, researchers can examine what children make of gender categories learned from the adult culture for their own purposes.

### **Language Socialization and Schooling**

## LANGUAGE SOCIALIZATION IN SCHOOLS

### INTRODUCTION

In modern Western nation-states, schooling, or institutionalized education, has come to be seen as the normative activity through which knowledge and mores are passed down to the younger generation. Traditionally, in the USA at least, education has been researched from psychological and sociological perspectives. In recent years anthropology has increasingly contributed to schooling research, with language socialization exemplifying a particular attention to the lives of children as they engage in everyday institutionally organized learning activities.

As noted in other chapters in this volume, the language socialization paradigm proposes that participants are socialized *through* language as well as *to* use language (Ochs and Schieffelin, 1984; Schieffelin and Ochs, 1986).<sup>1</sup> As a field primarily concerned with the linguistic and social development of individuals across the lifespan, language socialization has, since its inception, understood schools and other educational institutions as integrated parts within, and thus sites for, these processes of socialization (Heath, 1983; Ochs, 1988; Schieffelin, 1990; Schieffelin and Ochs, 1986). At the core of language socialization studies that look at school contexts is the notion that schools play a role in reproducing the social order.

While continuing to address fundamental questions concerning language development, language socialization studies expand educational concerns by examining the broader dimensions of the socialization process. From studies of student-to-student exchanges, to storytelling practices, classroom recitation, and second/foreign/heritage language learning, language socialization studies illustrate how competencies might be acquired or negotiated in moment-to-moment interactions, and yet project historically contingent dispositions. Language socialization studies thus understand schools, classrooms, and other educational

---

<sup>1</sup> We recognize that the term “language socialization” is used broadly by various scholars to refer to two approaches (cf. Baquedano-López and Kattan, 2007; Kulick and Schieffelin, 2004: (i) as a theoretical and methodological paradigm (cf. Ochs and Schieffelin, 1984; Schieffelin and Ochs, 1986) and (ii) as a theme of study (cf. some of the works in Bayley and Schechter, 2003). The studies reviewed in this chapter generally follow the first approach.

settings such as churches, community centers/after-school programs, and youth groups, not as self-contained and autonomous communities, but rather as interdependent and interrelated parts of a broader process of communicative competence acquisition that spans an individual's lifetime and experiences. Less an idealized process, and more a dynamic and contested one, language socialization is an intersubjective accomplishment that requires the active co-construction and participation by novices and experts around culturally meaningful goals, such as classroom lessons, group work activities, or even individual seat work.

In this chapter, we first present some of the sociological foundations to the study of schooling that have been taken up in language socialization research. We discuss more fully language socialization research in schools and its influences on the study of schooling. We provide as well a critical review of some long-standing and more recent interpretations, tenets, and assumptions of language socialization research in schools. As the field grows and expands, language socialization research must re-examine and test the viability of its theoretical assumptions. Our critical perspective here is undertaken in the spirit of this quest to identify new and productive research trajectories.

#### EARLY DEVELOPMENTS AND CONTRIBUTIONS

When Schieffelin and Ochs (1986) first elaborated on a new paradigm for language socialization, proposing not only the centrality of language in socialization processes, but that language was an end of socialization itself, they drew in large part on the work of social scientists who had examined how people interacted across social groups and situations and how those interactions related to actual and future cultural and social, including educational, opportunity. The concern with understanding everyday participation in social and institutional practices as habitual and structured by sociohistorical antecedents and as having a reproducing force (Bernstein, 1974; Bourdieu, 1979; Giddens, 1979, 1984) was a generative point in the early framing and development of the language socialization paradigm (Ochs, 1988, p. 4; Schieffelin, 1990, p. 15). This commitment has been avidly taken up by language socialization researchers who have provided analytical and methodological focus to theorizations on social reproduction (see Kulick and Schieffelin, 2004). At a time when sociolinguists became increasingly concerned with the properties of language use in the classroom (cf. Cazden, John, and Hymes, 1972; Cook-Gumperz, 1977), Basil Bernstein's (1974) empirical studies of home and school language use in England provided a starting point for understanding the enduring qualities of the socialization process. Indeed, as we discuss later in this chapter, a strand of language socialization research has attended

to this relationship. Bernstein's studies were innovative in that they viewed schools not merely as sites where learning took place, but rather as loci for reproduction of social inequalities along class lines. Bernstein's work challenged notions of compensatory education, a notion which, in his words, was "introduced as a means of changing the status" of children who were at the time considered to be "the culturally deprived, the linguistically deprived, the socially disadvantaged" (Bernstein, 1974, p. 190). A strong version of his perspective on school inequality fueled much educational concern and research trying to understand in what ways the socialization of home language practices failed to align with socialization to school norms and linguistic codes. The impetus of this work, however, was not to democratize society through the school system, but to underscore that those social inequalities existed through and were manifested in linguistic codes.

Perhaps the most well known of Bernstein's findings was his distinction between elaborated and restricted codes, which indicated the degree to which speakers assume common background knowledge and thereby employ linguistic means to represent this shared understanding (see Williams, *Language Socialization: A Systemic Functional Perspective*, Volume 8). Specifically, in the case of restricted codes, speakers, during the recounting of events, assume a great deal of background knowledge and therefore may be more inclined to utilize relative pronouns without making explicit prior reference. In the case of elaborated codes, speakers assume less shared background knowledge and are therefore more explicit in making that context available to their interlocutors. Bernstein and his colleagues found that restricted codes were commonly used among working class families, which made for the argument that there is a reproductive nature to education when children cannot participate fully in the normative, expected use of elaborated codes favored in classrooms. It is important to note that this division between restricted and elaborated codes was derived from empirical studies which carefully matched the use of linguistic code with class. In subsequent studies, these views were challenged on the grounds that the theory did not account for findings reported in other studies on working class communities (cf. Labov, 1972). However, Bernstein did not claim that the code variation was a constant across all societies. Rather, Bernstein pointed to the notion that, in many instances, the linguistic and cultural practices of the school are discontinuous with the linguistic and cultural practices of the students' homes.

The role of institutions and their effects on social actors has also been emphasized by Giddens (1984), whose theory of Structuration continues to inform language socialization research more generally, but particularly across social institutions. Giddens viewed the relationship between the individual (in his words the *social subject*) and the

social structure (in his words the *social object*) as recursive, contending that schools, like other social institutions, are made possible through the continuity of purposeful, agentive human activity. That is, in contrast with structural and phenomenological approaches to the study of structure and human action, Giddens viewed human social activities as the ways that individuals recreate the very structures that define them as social beings and which make those activities possible (1984, p. 2).

Whereas Bernstein examined how school practices did not align with home practices in terms of linguistic code and Giddens viewed schools as extensions of human activity, Bourdieu and Passeron (1977), on the other hand, contended that schools serve to reproduce the very social structures which recognize the school as legitimate. For Bourdieu and Passeron, schools act as venues in which cultural and social norms are reified and reinforced, only to further propagate those norms beyond the school setting. Yet, this relationship is not a deterministic or static one, for it also allows for its own forms of resistance and change:

Every institutionalized education system owes the specific characteristics of its structure and functioning to the fact that, by the means proper to the institution, it has to produce and reproduce the institutional conditions whose existence and persistence (self-reproduction of the system) are necessary both to the exercise of its essential function of inculcation and to the fulfillment of its function of reproducing a cultural arbitrary which it does not produce (cultural reproduction), the reproduction of which contributes to the reproduction of the relations between groups or classes (social reproduction).  
(Bourdieu and Passeron, 1977, p. 54)

This threefold relationship between the institution, the culture which supports and enables it (and which it supports and enables), and the social relations and hierarchies of that culture which are relived and reinforced through the institution, is made manifest, necessarily and accordingly, in the local interactions of actors who through their actions rely on and recreate the system. Early language socialization work provided the empirical basis to examine these notions of codes and reproduction in ways that both drew upon and departed from these terms. We now turn to some of this foundational work.

The sociocultural turn in linguistics and psychology, as witnessed primarily in the works of Hymes (1972), Gumperz (1968, 1982), Labov (1972), Scribner and Cole (1981), and Vygotsky (1978), sparked an interest in the social dimensions of language acquisition. From an educational perspective, Ochs' (1988) study of grammatical and cultural development in Falefaa, Western Samoa, revealed how Western values were taught during literacy activities in the local missionary church. Through the teaching of an alphabet tablet in Samoan, children learned

to identify sounds represented on this tablet as indexical of Western culture. While Ochs did not look at other systems of education, her investigation of the practices of the missionary church provided a language socialization view into the ways that even seemingly new systems reproduce themselves. Schieffelin's (1990) work in Bosavi, Papua New Guinea, documented how the introduction of Western literacy and schooling by missionaries began to change the language and worldview of the Kaluli, illustrating the embeddedness of literacy practices within broader cultural contexts. Schieffelin's work in this area of literacy development has covered a span of over 30 years looking at this dramatic change (Schieffelin, 2000). In both cases, these two studies, through a language socialization perspective, showed how the linguistic practices of formalized education both reflected the processes of colonization and drove those processes forward.

Shirley Brice Heath's (1983, 1986) ten-year ethnographic study of literacy practices across three communities in the Piedmont Carolinas challenged Goody and Watt's (1968) oral-literate dichotomy in claiming that it failed to recognize "the ways other cultural patterns in each community affect the uses of oral and written language" (Heath, 1983, p. 344). Heath concluded that in order to break the cycle of reproduction, "the boundaries between classrooms and communities [must] be broken . . . and the flow of cultural patterns between them encouraged" (p. 369). Heath's work was especially influential in promoting what has come to be known as a cultural mismatch theory of schooling, the notion, similar to Bernstein's earlier work, that the practices of the home do not match the practices of the school.

In these three selected foundational studies we see how theories of socialization and reproduction come to be enacted through everyday practices in ways that provide analytical focus to the social theories that consider habitual ways of participating in social activities as reproductive of the social order. The authors show (in what will become an important concept in later language socialization studies in schools) how actors, in their local interactions, draw on broader global practices which are in turn constituted by these microlevel processes.

#### MAJOR CONTRIBUTIONS: RECENT STUDIES

Recent language socialization studies have built upon the perspectives and insights of these earlier works by contributing to the ways in which we may understand the relationships between social structures, institutional processes, and local practices. Most significantly, we can distinguish three fundamental contributions that both draw on and enhance the theoretical insights of Bernstein, Giddens, and Bourdieu and

Passeron on the one hand, and the anthropological ones of Heath, Ochs, and Schieffelin on the other.

The first set of language socialization studies reviewed below have examined the ways in which *continuities and discontinuities* across culturally organized domains influence and are influenced by daily practices of actors and groups, thus showing how diversity across social settings leads to, or at least affects, actors' successful participation in different contexts. Language socialization studies of schooling in the second set have offered a view into the ways *social institutions both enact and reform wide-ranging social processes*. Thus, whereas in the first set of studies we see group practices being centralized, the second perspective highlights the work of the institution in reflecting and reproducing broader sociological change. Finally, some studies within the language socialization paradigm have made explicit the relationship between groups' *ideologies about their practices and their day-to-day conduct*, and these are reviewed in the third set below.

It is important to note that to use these terms is not to say that one set of studies focuses on sociological practices while another looks at ideological ones. Rather, each term is meant to capture a general perspective rather than a method or disciplinary orientation. These categories are not necessarily those by which researchers frame their studies; rather, they are a means for us to organize the contributions language socialization studies have made to an understanding of the ways schools function in society. While each of the studies discussed here illustrates to one degree or another each of these three contributions, we organize our review of these works in such a way that we believe best highlights or frames the thrust of the perspective under discussion. In the remainder of this chapter we will consider the ways in which these analytical foci have framed the study of social reproduction in schools, at least from a language socialization perspective, and the insights they have provided into the work of schools in society.

### *Continuity and Discontinuity Across Domains*

As intimated in the review of Heath's work, an examination of discontinuities across home and school language and literacy practices has proven to be a productive means by which to examine how schools perpetuate, and are indeed structured by, social inequalities. Much of the recent work in language socialization that has considered questions of discontinuity between home and school contexts has looked at school-going populations who learn the language used in school as their second language (Moore, 1999, 2004; Nielsen, 2002; Willett, 1995). Moore (2004), for example, looked at Fulfulde children who learned French and Koranic Arabic at two different school sites in

Cameroon. Moore compared the socialization practices at home and at the two school sites and found that the practice of *Guided Repetition* in the public French school and in Koranic instruction, and its recent surfacing in first language socialization practices, “is realized in different ways, for the languages, texts, institutional settings and identities involved are rooted in socially, culturally, and historically distinct traditions” (Moore, 2004, pp. 457–458). Moore illustrates that while the settings draw on different traditions, the importation of one literacy practice from one site to another bridges those otherwise separate sites. In other words, Moore’s data illustrate two processes. On the one hand, they show that socialization at different sites draws on different histories. On the other, they show that those sites are permeable and inter-related. Moreover, the participants acting in these different sites draw on practices from each of the sites in ways that make these practices intertextual (Bakhtin, 1986; Briggs and Bauman, 1992; Hanks, 2000).

In a similar vein, in her ethnographic study of one white, working-class boy’s literacy development across home and school contexts, Nielsen (2002) looked at how Josh, the child in her study, was socialized differently across his home and school worlds. While acknowledging that these worlds are historically and socially embedded, Nielsen sees them as distinct and overlapping (2002). Thus, in the same way as Heath (1983), Nielsen concludes that home–school partnerships offer both benefits and problems for the child’s education (Nielsen, 2002). Teachers’ prejudices regarding socioeconomic class and single-parent households, she contends, often painted the ways they perceived Josh’s abilities. Yet, Nielsen, like Heath and Moore, in separating these worlds in the first place, makes any interaction between them necessarily problematic. This separation, it must be emphasized, exists only at the analytical level.

Discontinuity and continuity, however, should not be understood only as occurring across the home and state-sponsored elementary schools. This distinction has been used as well in reference to other educational settings. He’s (2003) study of Chinese heritage language programs for secondary learners focused on novices’ speech roles, contending that an examination of speech roles reveals a particular social and cultural organization in these classrooms that differs from mainstream English-speaking classrooms. She further contends that more research needs to be undertaken which compares socialization of the same group in more than one language. We note that since we see the process of socialization as occurring across the lifespan and across sites and contexts, we do not make a distinction between socialization to first and second languages, nor between primary and secondary socialization (Baquedano-López and Kattan, 2007). While there have been substantial efforts to separate these as distinct processes

both outside and within the language socialization paradigm, we abide by a more inclusive definition of the process of socialization that views sites and linguistic practices as inseparable parts of larger sociohistorical practices. Such a view of the processes of language socialization is reflected in work that has looked at how local interactions in schools draw upon, reflect, and reproduce larger social structures and changes.

*Institutional Structures, Social Reproduction, and Change*

Through the study of classroom routines, language socialization studies have provided insight not only into the socialization of the child to and through language, but also to the structure of the institution (Anderson, 1995; Baquedano-López, 1997, 2000; Cook, 1999; Duff, 1995; Willett, 1995). Duff (1995), for example, examines the ways that recitation routines (*felelés*) for secondary school students both reflected and enacted broader political, economic, social, and moral changes in post-Soviet Hungary. Duff illustrated that as political and social changes took place in the country, the preference for one type of classroom interaction, which was deemed to align with new and preferred democratic and capitalist values, was exhibited while forms of discourse associated with the prior regime were on the wane. This study provides an example of the bidirectional connection between macro-level changes and microlevel practices and serves as an illustration of how social change and transformation influenced cultural, in this case schooling, practices.

Willett (1995) observed the interactions of four university affiliated kindergarten language learners, three girls (Maldivian, Palestinian, and Israeli) and one boy (Mexican-American), revealing that alongside language development there are also intervening variables of social identity, gender, and class which shape the ways students' abilities are perceived by others. As the four designated English language learners in the class, the girls' participation contrasted with that of the boy in that the girls were able to work collaboratively with each other, thus being constructed as competent by the adults in the classroom. The boy, on the other hand, before being able to display academic competencies, had to establish social status among the other boys in the classroom. His efforts at this minimized his opportunities to be perceived as competent in academic tasks. Willett illustrates that in this way, social and class hierarchies, and especially gendered expectations that existed outside of the kindergarten classroom, came to weigh upon interaction in school. While Willett warns that the micropolitics of class and gender should be understood within their local, rather than a universal, context, those very micropolitics must be seen as reflecting broader social processes. That is, Willett assumes that as they participate in classroom

activities, these four English language learners establish divisions based on expected patterns and outcomes.

Baquedano-López (2000) through a comparison of narrative practices in Spanish-language *doctrina* and English-language catechism classes at a Catholic parish in Los Angeles, California, demonstrates how, through story-telling activities, teachers socialize young immigrant children to particular social identities in a transnational context (Mexican, Indian, Mexican Catholic, American). The narratives in the *doctrina* classes, for example, draw both historical and social connections between the students in the classroom and their cultural and religious heritage and experiences outside the classroom and beyond twentieth century Los Angeles. Thus, Baquedano-López illustrates how broader social, historical, and political trajectories, such as immigration, religion, and language policy, come together in the local practices of the parish. As an extension of such studies, some language socialization research has investigated not only the effects of social asymmetries in classroom interactions, but also the ideological components which lead to those asymmetries.

### *Ideological Considerations*

One analytic device used by language socialization researchers who have looked at schools as sites of change and/or reproduction has been the examination of the role of ideologies in structuring school practices (Fader, 2000, 2001; Field, 2001; Jaffe, 2001). Language ideologies are to be understood here as the moral and political dimensions of beliefs individuals and groups hold about their language, how it should be used, and to what ends.<sup>2</sup> Language socialization studies that have examined ideologies of language have often done so in settings in which two languages were in ideological contestation. That is, numerous studies have been carried out in communities that were undergoing processes of language shift, with the concept of language ideologies being used to explain how and why speakers in multilingual situations choose one language over another. Schools, within such a framework, become one of the primary sites in which the legitimacy of one language or another is contested. In an example of the ways schools reproduce social distinctions, Fader (2000, 2001), in her study of Hasidic Jews in New York City, noted that language ideologies and beliefs about gender roles, assimilation, and religious integrity structured literacy practices for girls and boys across languages, as well as the differential use of Yiddish and English among the two gender groups.

---

<sup>2</sup> For reviews, see Irvine (1989), Woolard and Schieffelin (1994), Woolard (1998), and Kroskrity (2004).

Schools, she noted, became arbiters of legitimate linguistic practices especially as related to the borrowing of English words into Yiddish speech and the perception of these borrowing practices by the community at large. Similarly, Jaffe's (2001) study of Corsican language revival looked at how ethno-regionalist discourses authenticated bilingual practices as constitutive of Corsican identity through a call for mandatory bilingual education in public schools in Corsica. In another study of language shift, Field (2001) examined how despite diminishing use of Navajo and increasing use of English in the community she studied, the use of particular interactional routines, specifically the use of triadic directives, in which adults direct one child to tell another child to do something, persisted in a local preschool. All three studies showed how practices across school and community sites reflect ideological positionings that not only derive from and are changed by, but also underlie and alter social structure.

#### PROBLEMS AND DIFFICULTIES

As we mentioned in the introduction to this chapter, the language socialization paradigm has provided a productive and creative means by which to examine the role of schools in the acquisition and reproduction of linguistic and cultural competence. Many of the studies reviewed in this chapter have provided evidence for the role of language in the constitution of society, including its social institutions. As the field grows, it may become necessary to reconsider some assumptions at the core of these studies.

In this chapter, we proposed three analytical insights that can help to organize the contributions made by language socialization studies of schooling practices. However, within these models, similar assumptions can be further problematized. For example, examining continuities and discontinuities across home and school sites assumes that each of those sites is bounded yet porous. Moreover, these delimitations exist in time and space. That is, in order to identify the local, artificial boundaries must first be put into place that may include notions of community, language, geo-political, and even historical configurations. Likewise, insights into the ideological elements of everyday practices presuppose potentially monolithic views of one identity and one ideological point of view. Additionally, it must be considered that while language socialization studies have generally equated demonstrable changes in displays of communicative competence with learning, it may be necessary, as language socialization studies increasingly contribute to education research, to offer a more acutely defined relationship between competence and learning. As language socialization has, since its inception, attempted to account for the ever-changing nature of

social activity and structure, efforts must be made to develop frameworks that allow this complexity to be most readily visible. Additionally, we note that this review has been conceptual rather than exhaustive. That is, while there are indeed other studies on the process of language socialization and schooling that could have been examined, the work reviewed here represents a sample of ethnographic, cross-cultural and analytic work identified as upholding the tenets of the language socialization paradigm.

### FUTURE DIRECTIONS

Building on the perceived shortcomings in language socialization research noted above, we propose a set of trajectories which can further complexify the insights language socialization studies can make to educational research and to the study of language in culture. First, language socialization studies have long been concerned with the way time figures in social and individual development. The paradigm, after all, originates with a concern for showing how developmental change takes place longitudinally over the entire lifespan of both the individual and the community. It is not enough, as we have noted elsewhere, to show socialization practices at one moment in time (Baquedano-López and Kattan, 2007; Garrett and Baquedano-López, 2002). As Schieffelin (2002) recently pointed out, this involves as well considering how different communities conceive of “time” over time. Language socialization studies would do well to consider, then, what role time, both as a theme and as an organizing principle of socialization practices, plays in learning and the developmental trajectories of social subjects (Kattan, forthcoming). Finally, language socialization research should continue to problematize the core of its theoretical assumptions. As a paradigm that draws on a wealth of theoretical insights from sociology, anthropology, and social theory, language socialization is well equipped to reconsider how concepts such as bidirectionality in learning differ from the multidimensional processes of inculcation offered in Bourdieu’s concepts of habitus and field.

LANGUAGE SOCIALIZATION AND SECOND/FOREIGN  
LANGUAGE AND MULTILINGUAL EDUCATION IN  
NON-WESTERN<sup>1</sup> SETTINGS

INTRODUCTION

Language socialization research documents and theorizes the diversity of cultural paths to communicative competence and community membership. From this theoretical perspective, linguistic and social development are viewed as interdependent and inextricably embedded in the contexts in which they occur. Language socialization is a life-long process, and a collaborative one. Through participation in recurrent interactions with more expert members of the community, novices are socialized *through the use of language* and *socialized to use language* (Schieffelin and Ochs, 1986).

Garrett (2006) identifies four core methodological features of language socialization research: (1) a longitudinal research design, (2) field-based collection and analysis of a substantial corpus of audio or video recorded naturalistic discourse, (3) a holistic, theoretically informed ethnographic perspective, and (4) attention to micro- and macrolevels of analysis, and to linkages between them. Taking an ethnographic and interactional discourse analytic approach, researchers identify patterns in novice–veteran interactions and study how they shape individual developmental processes. Furthermore, they seek to understand how these patterns and processes relate to community norms, values, and ideologies, as well as to large-scale social, cultural, and historical processes.

The paradigm was formulated by linguistic anthropologists Elinor Ochs and Bambi Schieffelin, both of whom had conducted extensive fieldwork in small-scale non-Western societies (Ochs in Madagascar and Western Samoa, Schieffelin in Papua New Guinea). They observed in these communities patterns of caregiver–child interactions and child language development that challenged some assumptions about first language acquisition that had emerged from research conducted almost exclusively with white middle-class Europeans and North Americans

---

<sup>1</sup> The term non-Western is used here to refer to regions of the world other than Europe or those areas in which the dominant culture is European.

(such as the universality and necessity of Baby Talk). These discoveries demonstrated the need for a cross-cultural and interdisciplinary perspective on linguistic and social development, one that placed sociocultural context at the center of analysis.

In their seminal 1984 article, Ochs and Schieffelin compared “developmental stories” from Samoan, Kaluli, and Anglo-American white middle class communities. The authors identified differences in how members of these societies organized interactions with children and how they conceptualized the child and its social and linguistic development. They proposed that caregivers’ communicative behaviors were organized by and expressive of values and beliefs held by members of their social group. Thus, interactions between children and caregivers could be understood as cultural phenomena embedded in the larger systems of cultural meaning and social order of the society into which the child is being socialized.

Before long, this perspective was brought to bear on second and foreign language education. It should be noted that the distinction between second language (a nonnative language used in the speaker/learner’s daily life) and foreign language (a language studied by the speaker/learner in a formal instructional setting removed from the target language community) is a problematic one. This may be particularly true in postcolonial, multilingual contexts, where many people rarely use the “official” language outside the classroom and where the boundaries between languages are often not clear. Thus, in the following discussion I use the term Lx to refer to any language other than the learner’s native language (cf. Pavlenko, 2006).

Poole (1992) studied interactions in adult ESL classes in the USA, where she found several discourse features that resembled those of white middle-class American (WMCA) child-caregiver interactions. She argued that these features encoded and communicated cultural messages and norms of expert–novice interaction, including a preference for expert accommodation of novice incompetence and a dispreference for displays of asymmetry. Poole observed that the role of teacher is “culturally constrained and motivated” (p. 611), making efforts to change classroom discourse patterns or scripts difficult because these patterns are tied to cultural norms and the individual’s identity as culture member.

Duff (1993, 1995) examined foreign language classroom interaction in three experimental dual-language (Hungarian–English) secondary schools in Hungary. Focusing her analysis on a traditional genre of oral assessment known as *felelés* (“recitation”), she found that political and social changes in post-communist Hungary were reflected and enacted in the transformation of classroom discourse patterns in the English-medium sections of these innovative schools. Associated with

the authoritarianism of the Soviet era, the socialization practice of *felelés* broke down as new classroom interactional patterns associated with ascendant democratic values became more preferred.

These and the many language socialization studies conducted since have illuminated the social, cultural, and political organization of participants' roles, expectations, and linguistic behaviors in second/foreign language educational settings. But while a number of studies examine Lx education in mainstream, immigrant, and aboriginal minority communities in North America, Europe, and Australia, only a handful of language socialization studies of Lx education have been conducted in non-Western societies.<sup>2</sup> Yet such settings are rich sites for exploring the sociocultural nature of language teaching and learning. Many non-Western (NW) societies have undergone dramatic changes in recent decades as the result of colonialism, missionization, Western schooling, and accelerated integration into the global economy (Watson-Gegeo and Gegeo, 1992). The result is a complex and sometimes conflicting array of linguistic and cultural practices and ideologies. Many people participate in multiple speech communities and/or multiple educational traditions, giving rise to hybrid practices. While few in number, studies of Lx education in NW settings have yielded important insights that expand our understanding of both language socialization and the teaching and learning of nonnative languages. In this chapter, I discuss three core theoretical domains illuminated by this work, and I conclude with reflections on future directions and challenges.

### COMPETENCE

The concept of communicative competence is fundamental to both the language socialization research paradigm and Lx education research and practice in the West. In response to generative linguist Chomsky's (1965) explicit exclusion of sociocultural aspects of language use from his definition of competence, linguistic anthropologist Del Hymes (1972) argued that a speaker must know much more than grammar and lexicon in order to comprehend and produce speech in real situations in ways that are effective and appropriate in relation to the context.

Hymes' idea is at the heart of Communicative Language Teaching (CLT), an approach to Lx education that emerged in the 1980s and dominated for nearly two decades.<sup>3</sup> In an effort to (re)define and refine

---

<sup>2</sup> Several researchers working in bi- or multilingual non-Western settings refer to schools as shapers of community language ideologies but do not provide detailed analysis of language socialization in formal educational contexts (e.g., Kulick, 1993; Obondo, 1996).

<sup>3</sup> In recent years, content-based instruction has become increasingly popular.

the objectives of language instruction and assessment, many researchers have elaborated on the concept of communicative competence. Canale and Swain (1980), for example, specify four components: grammatical, discourse, sociolinguistic, and strategic competence. Bachman's (1990) framework identifies three components—language competence, strategic competence, and psychophysiological mechanisms. Language competence comprises organizational competence and pragmatic competence, competences Bachman further divides into grammatical and textual competences and illocutionary and sociolinguistic competences, respectively.

Language socialization studies of Lx education take an ethnographic and holistic view of communicative competence and the practices through which it is developed. As Garrett and Baquedano-López (2002) state, research in this paradigm is “concerned with all of the knowledge, practices, and orientations that one needs in order to function as—and, crucially, to be regarded by others as—a competent member of (or participant in) a particular community or communities” (p. 345). Language socialization researchers seek to identify community norms, preferences, and expectations with regard to language competence and its development; to examine how they are locally enacted and negotiated; and to understand their cultural meanings and social histories. Studies of Lx education conducted in non-Western settings have proven particularly fruitful for exploring cultural variation in the ways language competence is conceived, constructed, and developed over time.

In her study of language socialization of children in a Northern Thai community into the use of two languages, Howard (2003a, b) found that children were socialized into practices of language hybridity in the classroom. Despite the fact that Standard Thai (ST) is the official school language, kindergarten children did not need to produce only or even mostly Standard Thai to be regarded as using language appropriate for the classroom. Rather, they were instructed to speak politely in their native language Kam Muang (KM) and to use the honorific particles of Standard Thai. Howard observed that this local norm for classroom communicative competence reflected wider “community perceptions about what it means to speak ST versus KM—the perception that the use of a particular honorific particle marks the boundary between languages” (2003a, p. 327).

According to Howard, this classroom norm of code-mixing emerges from two modes of teaching and caregiving that are rooted in two core values of Muang culture. An ethos of accommodation underlies a noninterventionist mode, while an ethos of respect underlies an interventionist mode. Adults are expected to accommodate children, to gauge the readiness of individual children to understand new knowledge,

and to avoid pressuring them to perform beyond their abilities and/or proclivities. On the other hand, children are expected to develop competence in community practices of respect from a very early age. Thus, teachers accepted children's code-mixing behavior, seeing it as an indicator of "readiness" (or lack thereof) to "receive" ST vocabulary, grammar, and pronunciation" (2003a, p. 327). At the same time, teachers explicitly corrected children when they failed to display respect through the use of ST honorific particles.

Communities vary not only in how they conceptualize Lx competence, but also in what they consider to be an appropriate pathway to competence. Among the Fulbe of northern Cameroon, the ability to speak and understand Arabic is highly valued. In her study of Fulbe children's apprenticeship into Arabic at Koranic school, Moore (2004a) found that the developmental trajectory Fulbe children follow in learning Arabic was quite different from those preferred in present-day Lx education in the West. As in many non-Arabophone Islamic societies, Fulbe children learn to recite and write verses of the Koran in Classical Arabic without comprehension of their lexico-semantic content. In learning to reproduce faithfully the sounds and signs of the Koran, a student achieves a first level of understanding of the sacred text that is foundational to any subsequent study of Arabic. Recent efforts to modernize Islamic education include teaching Arabic as an Lx in the way that French is taught in secular schools. However, most Fulbe object to such innovations on the grounds that they desacralize Arabic and fail to provide learners with as deep an understanding as traditional pedagogy does.

### LANGUAGE IDEOLOGIES

Language ideologies—the ideas with which people “frame their understanding of linguistic varieties and the differences among them, and map those understandings onto people, events, and activities that are significant to them” (Irvine and Gal, 2000, p. 35)—are at play in any Lx educational context. Indeed, Lx pedagogies can productively be understood as constellations of ideologies about language and communication, language acquisition, human learning and development, and specific languages and the people who speak them. Language ideologies are highly salient in situations of language contact, wherein local and state ideologies are often in conflict and community members manage competing interests and ideologies. This makes Lx educational contexts in non-Western settings particularly fruitful ones in which to explore the complexity of language ideologies and their relationship with language socialization practices and outcomes.

In her research on the Caribbean island of Dominica, Paugh (2000, 2005) examined schooling as an agent of language socialization and a significant influence on the language ideologies of community members. She found many of the ideologies about the community language (Patwa) and the language of the state and school (English) that have been documented in postcolonial settings around the world. Teachers and parents alike expressed the belief that English was better adapted and necessary for personal and community development, while Patwa was “holding back” the village. Concerned that the use of Patwa would interfere with children’s acquisition of English and lead them to mix the two languages, teachers discouraged the use of Patwa in the classroom. Moreover, they encouraged parents to speak only English with their children, and parents agreed that this was important for their children’s success.

However, Paugh found that community members’ actual language socialization practices often did not match these purist, English-only ideologies. Parents code-switched frequently when speaking to and in the presence of children. While English had replaced Patwa as the primary language of the community, Patwa was believed to be better for emotionally expressive speech functions (e.g., joking, arguing, teasing, and assessing others) and was associated with “the very valuable qualities of boldness, self-sufficiency, and independence” (2005, p. 1817). The two codes had complementary roles in the community, used for different purposes and different roles, and children’s use of English and Patwa reflected their awareness of a community member’s need for both languages to participate fully in village life.

In most states, monolingualism is the preferred norm (usually in the ex-colonial language in postcolonial settings), while multilingualism is regarded as an obstacle to development and national unity. However, a fluid and complex linguistic repertoire is valued in many communities (Woolard and Schieffelin, 1994). In the Mandara Mountains of northern Cameroon, Moore (1999, 2004b) documented communicative and socialization practices that reflected and reinforced a multilingual norm among the montagnard (traditionally mountain dwelling) groups. From birth, children of this community were socialized into the use of multiple languages in complex ways for both Lx learning and interethnic/linguistic communication. At school, however, montagnard children had very little success in learning French. Moore identified several aspects of Lx classroom practice that prevented children from applying to the learning of French the language learning skills they had developed in their multilingual home environment. In particular, the French-only policy of Cameroonian schools failed to make use of—in fact, punished—the Lx learning competencies children brought to school. This study indicates that in multilingual communities, Lx

educational policy and practice rooted in a monolingual norm may have serious implications for children's additional language development and academic success.

The language socialization lens has also been trained on study abroad programs. In her study of dinnertime talk between college student learners of Japanese and their Japanese host families, Cook (2006) found these conversations to be an "opportunity space" (p. 145) for participants to be socialized into, challenge, reexamine, and transform stereotypical folk beliefs about Japanese and Westerners. She observed that the ideology of *nihonjinron* (theories on the Japanese) was reflected in dinner table discussions of topics such as language, social customs, and gender roles, and that "part of being Japanese is constituted by participating in the discourse of *nihonjinron*" (p. 147). However, dinnertime talk provided opportunities not only for the Japanese learners to participate in such discourse and to learn *nihonjinron*, but also for students and hosts to question their cultural assumptions and "to co-construct shared perspectives and emotions" through co-tellings of folk beliefs (p. 147).<sup>4</sup>

#### SOCIALIZING SUBJECTIVITIES

A central concern of most language socialization research is the development of locally intelligible subjectivities, or ways of being in the social world (Garrett, 2006; Kulick and Schieffelin, 2004). Guided by more competent interlocutors as they engage in cultural/linguistic practices, novices come to view particular behaviors, perceptions, and affective stances as appropriate to particular goals, settings, and identities (Ochs, 1988). National, ethnic, and religious identities are constructed and maintained in everyday interactions, and they may also be contested and transformed (Garrett and Baquedano-López, 2002).

This perspective informs recent research on the relationship between identity and Lx learning (e.g., Duff and Uchida, 1997; Norton and Toohey, 2001; Siegal, 1996). In this work, language learning is viewed as "not simply a skill that is acquired through hard work and dedication, but a complex social practice that engages the identities of language learners" (Norton, 2000, p. 132). Language socialization researchers who study Lx education identify patterns in classroom interaction and explore their meanings for participants. Their analyses illuminate the communicative processes through which participants teach and learn ways of feeling, thinking, and behaving that are (or come to be) associated with the target language. Most of the research in non-Western

settings has been explicitly comparative, investigating Lx socialization in two or more cultural contexts and yielding insights into the relationship between language socialization practices and the development of subjectivities.

In her study of language socialization in Koranic and public schools in Maroua, Cameroon, Moore (2004a, forthcoming) found that rote learning dominated in both schooling traditions. Moreover, Koranic recitation lessons and French oral expression lessons had the same overall organizational structure, which she called guided repetition. This language socialization practice was used to teach and learn not only Lx knowledge and skills, but preferred ways of being in the social worlds in which Arabic and French were privileged. Guided repetition was accomplished in different ways in the two contexts in order to achieve different intellectual and moral effects. Koranic schooling was meant to socialize children into reproductive competence in Arabic and traditional Fulbe and Muslim values of self-control, respect for religious authority and hierarchy, and submission to the word of God. The practice of guided repetition in the Koranic context emphasized strict discipline, reverent renderings of the text, and deference to teacher and text. At public school, children memorized and acted out dialogues crafted to teach not only generative competence in French, but also “modern” ways of acting, feeling, and thinking. Guided repetition in the classroom was often playful, and teachers used exuberant praise, liberal manipulation of the text, and rapid expert–novice role shifts to encourage students to emulate the educated, Francophone, and Cameroonian characters in the dialogues.

Meacham (2004) examined English language instruction as a cultural practice in two public high schools in Tokyo, Japan. Comparing two communities of Lx learning—one located in an elite liberal arts high school, one in a technical high school—she found that linguistic practices in the two settings were quite different and that they socialized two very different types of English-speaking Japanese subject. At the technical high school, students were socialized through what Meacham calls empathetic participant frameworks to view English as imposing or intruding. Through word choice and the structure of her elicitations, the teacher positioned students as problematic recipients of English in need of emotional support. Lessons were primarily listening activities, and when participants did produce English, it was frequently filtered through Japanese phonology. In Meacham’s words, the effect of Lx activities in this school was “to construct a kind of Japaneseness out of English incompetence” (p. 233). At the liberal arts high school, students were apprenticed into an affectively neutral

stance toward English through an analytical participant framework. Participants tended to keep Japanese and English separate in class, stressing word for word translations and maintaining English phonology when English words were inserted into Japanese utterances. In texts and activities, English was framed as an expressive tool students needed to master for the purpose of representing Japan to outsiders. Thus the “competent performance of Japanese identity [came] in being able to deftly move back and forth between the two languages” (p. 234).

#### FUTURE DIRECTIONS AND CHALLENGES

Through the creation and comparison of richly contextualized accounts of Lx education in non-Western settings, language socialization researchers have generated new understandings of how language teaching and learning is shaped by the social, cultural, and linguistic systems in which it is embedded. However, many more studies are needed if we hope to document and theorize the full range of ways in which humans are apprenticed into nonnative languages. In some cases, there is a need for studies longer than is typical for language socialization research or the integration of longitudinal and cross-sectional studies. A data set spanning several years or levels of Lx education will be essential to understanding the relationship between interactional patterns and developmental outcomes of traditions like guided repetition or the non-interventionist mode of Muang teachers.

A handful of studies of Lx classroom interaction in non-Western settings have illuminated the organization, function, history, and impact of teacher-centered, rote pedagogies in postcolonial settings (Hornberger and Chick, 2001; Watson-Gegeo and Gegeo, 1992; Wright, 2001). Such practices are the object of reform in many nations. However, reform efforts are rarely grounded in an anthropological understanding of locally, regionally, and globally organized sites of Lx educational practice, based instead on the assumption that Western approaches to language education are superior and universally applicable (Kachru, 1991; Pennycook, 1989). Schieffelin and Ochs (1996) stress that a “defining perspective of language socialization research is the pursuit of cultural underpinnings that give meaning to the communicative interactions between expert and novice within and across contexts of situation” (p. 255). Such a perspective is crucial to the successful development and dissemination of language education policies and practices that will be more inclusive of and effective for underserved populations in non-Western settings and worldwide.

## LANGUAGE SOCIALIZATION AND LANGUAGE SHIFT AMONG SCHOOL-AGED CHILDREN

### INTRODUCTION

Language socialization research examines how novices are socialized into communities of practice across the life course, including how they are socialized to use language appropriately in culturally significant activities, and how they are socialized through language into local values, beliefs, theories, and conceptions of the world. Adopting an ethnographic, discourse analytic approach, this research has illuminated the local, contingent, and contested nature of language socialization as it occurs through language in moment-by-moment interactions between social actors who construct their social worlds together through discursive action. Language socialization research seeks linkages between this local level at which culturally significant activities are constructed by participants, the social structures and institutional settings of a community, and larger political and economic processes of globalization, modernization, and social change. The goals, trajectories, and practices of language socialization vary across cultures as local conceptions and theories of language, childhood, child development, personhood, teaching, and learning vary. Many language socialization studies conducted in multilingual societies have explored the interconnections between the process of language socialization and widespread processes of language change, maintenance, and shift. Focusing on research conducted in multilingual communities outside the USA, this chapter examines the role of language ideologies, schooling, home-school connections, and peer/sibling groups in school-aged children's language socialization, and the impact of this process on language shift.

### EARLY DEVELOPMENTS

Much of the early, pioneering work on language socialization examined small-scale monolingual societies, focusing in particular on caregiver-child interactions in the home (Ochs, 1988; Schieffelin, 1990). These early studies laid the groundwork for later research on more linguistically heterogeneous communities by examining how children come to

master a multiplicity of language practices, language varieties, registers, and genres, as well as the social, political, moral, and aesthetic loading of this linguistic repertoire (Clancy, 1986; Ochs, 1988; Schieffelin, 1996). This emphasis on the socially distributed character of a community's linguistic repertoire and cultural knowledge has provided a useful lens into the dynamic process of cultural and linguistic reproduction and transformation in situations where two or more codes are spoken, as well as the role of various socializing institutions and settings in this process.

A major focus of language socialization research in multilingual settings has been to examine how language ideologies—"shared bodies of commonsense notions about the nature of language in the world" (Rumsey, 1990)—are contested, negotiated, and transformed in conjunction with other processes of social change, including language change and language shift. During the process of language socialization, community members transmit information to novices about cultural norms and expectations regarding how to use language appropriately, what it means to speak a language, what it means to learn a language, and how different codes and varieties construct and index various social identities and roles. Such language ideologies also underlie socialization practices that may impact language shift. While sociolinguistic research has often attributed language shift to macrosociological factors such as migration, industrialization, modernization, and the workings of government institutions (such as the public schools), linguistic anthropologists argue that the analysis of everyday social practices yields a more nuanced understanding (Gal, 1978; Kulick, 1992). As Kulick notes, "to evoke macrosociological changes as a 'cause' of shift is to leave out the step of explaining how such change has come to be interpreted in a way that dramatically affects everyday language use in a community" (Kulick, 1992, p. 9).

In his groundbreaking study of the small and isolated village of Gapun in Papua New Guinea, Don Kulick (1992) explores the mediating role of language ideologies in the process of language socialization, which underlies children's declining use of the local vernacular, Taiap, in favor of Tok Pisin, an important national language of New Guinea. In Gapun, each of these language varieties has become associated with particular images of social persons through larger processes of modernization and globalization (Kulick, 1998). This research illustrates how "positive and highly valued aspects of the self"—including *hed* (a bold, independent side of the self), and *save* (a cooperative, social side of the self)—"come to be bound to expression through a particular language" (1992, p. 262). As children are socialized into these cultural conceptions of personhood, they are also socialized to associate particular discursive practices, including language choice, with different modes of the self. As the display of *hed*

has increasingly become indexically linked to undesirable characteristics, such as stubbornness, backwardness, and selfishness, the use of vernacular speech genres and styles has become more restricted, leading, in turn, to a process of language shift. This growing ambivalence toward the vernacular is reflected in language socialization practices, despite adult discourses that value Taiap and reflect a desire for children to learn it. Local theories regarding the teaching and learning of languages, in which adults blame their children for willfully rejecting the vernacular and downplay the caregivers' role, were also shown to play a role in language shift.

#### MAJOR CONTRIBUTIONS

Following Kulick's findings, many language socialization studies in multilingual societies have explored how school-aged children's use of the local vernacular is impacted by language ideologies that underlie language socialization practices, including the speaking practices of adults to which children are exposed, adult responses to children's use of the community's languages, and restrictions on children's language use in the home. These language ideologies include evaluations of the relative status and prestige accorded to different language varieties, local theories about children's ability to learn various language varieties, the attribution of responsibility for teaching and/or learning these varieties, and how identity and personhood are linked to various codes in the community's linguistic repertoire.

Language ideologies have varied effects and are rooted in particular social positions. Not only are they consciously held ideas that are expressed in explicit discourses, but they are also implicitly embodied in, and constituted by, social practice. Because ideologies render certain practices invisible, the linkage between community evaluations of its language varieties and the process of language shift is not straightforward. A key finding of language socialization research in multilingual settings has been that there is often a gap between explicit discourses valorizing a particular language variety and the implicit evaluation constituted by socialization practices. While adult discourses often stigmatize a particular variety and disfavor its use by and to children, adult interactions with children instantiate competing evaluations of that language variety through practices that forge indexical linkages to desired social positions and affective displays. Kulick (1992) shows that villagers in Gapun express a strong desire for children to learn the vernacular, Taiap; these same caregivers, however, use Tok Pisin, rather than the vernacular, to emphasize a point or to control their children, implicitly socializing a positive evaluation of Tok Pisin as the language of adult authority and control. Caregivers in Gapun also ignore

or criticize their children's use of the vernacular, unintentionally discouraging its use by children. Other studies have found a similar but contrasting dynamic in which explicit discourses reproduce dominant ideologies promoting a standard or national language, while adult socialization practices link the vernacular to adult authority and control, and to particular affective displays. Paugh (2001), for example, found that adults in Dominica maintained a purist English language ideology, while engaging in practices that associated the vernacular (Patwa) with desirable adult domains of authority and interaction. In Loyd's (2005) research, adults in Nicastro, Italy generally expected children to speak and be addressed in Standard Italian, while, in practice, Nicastrese was associated with adult control through scolding, and with positively affect-laden activities such as joking and displaying affection. Similarly, Garrett (1999, 2005) found that although caregivers in St. Lucia expected children to use only English, they socialized children to curse and to assert themselves in the vernacular, Kweyol.

In addition to the mediating role of local ideas about language status, prestige, and social positioning in adult language practices, language socialization studies across cultures have explicated the role of local theories of child development, learning, caregiving, and teaching in children's language socialization (Schieffelin and Ochs, 1986). Studies conducted in multilingual societies have illustrated that cultural conceptions and theories of how languages are learned, in which order, and with what degree of difficulty underlie a range of socialization practices and outcomes. Communities vary in the degree of responsibility that is placed on the learner versus the caregiver in teaching/learning a language, and different languages are associated with different processes of acquisition. Often children, rather than parents or teachers, are believed to be primarily responsible for learning (or failing to learn) the vernacular. Community members in many societies believe that the vernacular is acquired naturally by children and with little effort; children who fail to acquire it are characterized as willfully rejecting it. Such ideologies, in turn, underlie adults' failure to recognize the consequences of socialization practices that disfavor the vernacular (Augsburger, 2004; Garrett, 1999, 2003; Howard, 2003; Paugh, 2001; Sandel, 2003). For example, Augsburger's (2004) research among the Isthmus Zapotec of Oaxaca Mexico showed a dynamic similar to that found by Kulick (1992): in a context in which children's use of Zapotec in the home is suppressed, the responsibility for learning this language is placed squarely on the child, and children who do not acquire it are said to lack the desire to do so.

The belief that the more prestigious language variety in one's community requires more effort to learn leads to a policy, by some families, of restricting or forbidding the use of the vernacular in the home, often

due to a theory that the vernacular will interfere with children's acquisition of the more prestigious language variety. Such suppression of the vernacular at home is often influenced by school language policies (Howard, 2003; Luykx, 2003; Moore, 2004, 2006; Paugh, 2001). Schools are powerful socializing agents in promoting monolingualism and purist language ideologies among parents in their communities (Augsburger, 2004; Jaffe, 1999; Paugh, 2001; Sandel, 2000). Adults who had, in their childhood, been submitted to draconian language policies forbidding their use of the vernacular at school in turn perceive that their own difficulties in school resulted from their family's use of the vernacular at home. These parents believe they can help their children succeed in school and in the larger society by facilitating their early acquisition of the school's language at home. In many communities, the vernacular is believed to interfere with children's acquisition of the language of instruction, and some families consequently adopt the strategy of using only the school's language with children in the home (Augsburger, 2004; Garrett, 1999; Howard, 2003; Jaffe, 1999; Paugh, 2001; Sandel, 2000). Other caregivers may adopt baby talk registers from the more dominant language variety, while maintaining the vernacular for other home uses (Luykx, 2003; Riley, 2001). Sandel (2003) showed that a shift in beliefs about language learning have led to a shift in such family language practices in rural Taiwanese homes. He showed that while parents in this setting had once suppressed the vernacular for similar reasons, they now believe that children's exposure to Mandarin through media and the schools will be sufficient for their acquisition of that language and are increasingly making efforts to speak the vernacular (Tai-gi) with children in the home.

"Family language policies" (Luykx, 2003) suppressing the use of the vernacular can lead to problematic language use and interaction in the home. For example, the language spoken at home may in fact be a nonstandard variety of the language of instruction that is misrecognized as the standard language (Garrett, 1999, 2003), the caregivers may vary widely in their proficiency in the language of home interaction (Augsburger, 2004; Sandel, 2000, 2003), and certain forms of local knowledge may be withheld by caregivers in the interest of avoiding speaking to children in the vernacular (Augsburger, 2004).

Instructional practices at school also transform caregivers' treatment of the vernacular in the home leading, for example, to explicit, school-like instruction of the vernacular in the home. Watson-Gegeo and Gegeo (1992) found, in the Solomon Islands, that "many of the interactional routines parents and other caregivers use with young children are similar in form and function to those used by white middle class, American parents and evaluated by American educators as essential for developing preschool skills" (p. 21). Riley (2001) showed that

adults in the Marquesas believe that children require explicit instruction not only in French, but also in the vernacular, 'Enana. These caregivers use syncretic socialization practices at home, including explicit modeling, prompting, and guided performance to "teach" children the "proper" uses of both languages. Moore (2004, in press) found that school instructional practices have been "diffused" into the home setting among the Fulbe in Cameroon. The practice of "guided repetition," used pervasively both in the Koranic school setting and in public school French language instruction, has filtered into the socialization of traditional folk tales in the home. Whereas children traditionally learned folk tales in the vernacular (Fulfulde) through intent observation of their performance by adults over time, caregivers have recently begun using guided repetition as a means of eliciting performances from children.

#### WORK IN PROGRESS

Language socialization studies in multilingual societies outside of North America have focused their analysis largely on the home and community settings. The close analysis of classroom interaction at school has not been a major focus of most of these studies, although many include some description of a limited number of participant observations in the classroom (see Heller & Martin-Jones, 2001, for classroom studies from a range of perspectives). Discourse analytic research on how children use both the language of instruction and the vernacular in social interactions at school and with their peers would greatly contribute to our understanding of the process of language maintenance and shift in multilingual communities.

Some research has shown, for example, that children's classroom interactions in the language of instruction at school may be problematic. Teachers in these settings may not be fluent or well trained in these languages, especially in rural settings, so their use of the language of instruction in the classroom may be formulaic and decontextualized, and characterized by rote repetition, choral response, formulaic talk with predictable rhythms, intonation, and exaggerated gestures, as well as language that lacks conventional meaning (Augsburger, 2004; Chick, 1996; Hornberger and Chick, 2001; Kulick, 1992; Moore, 1999, 2004; Watson-Gegeo, 1992; Watson-Gegeo and Gegeo, 1992). These interactional styles prevent the children's active participation in the classroom, such as asking questions, creatively using the materials being taught, or using the language for expressive purposes (Kulick, 1992; Watson-Gegeo, 1992; Watson-Gegeo and Gegeo, 1992). Some authors attribute these language practices to a "banking" model of education in which learning by rote memorization dominates. Chick and

Hornberger (Chick, 1996; Hornberger and Chick, 2001), however, note that this style of interaction is a social practice allowing both teachers and students to save face in cases where engaging in more spontaneous and communicative dialog would expose their lack of competence in the language of instruction. These “safe-talk” practices also hinder learning and “contribute to the continuing marginalization of language minorities in social and policy contexts of long-term oppression” (Hornberger and Chick, 2001, p. 52).

Few traditional language socialization studies have examined whether and how the local vernacular, rather than the language of instruction, is used in school and how teachers treat its use by children. Children are often explicitly instructed to use the language of instruction, and they are sometimes corrected, reprimanded, or their speech is repaired by teachers when they use the vernacular (Howard, 2003, 2004; Jaffe, 1999; Moore, 1999; Paugh, 2001). Nonetheless, the vernacular is often used at school in a variety of ways. For example, Howard’s (2004) research in a Northern Thai village school showed that although school policy promotes Standard Thai as the language of instruction, the vernacular (Kam Muang) is used by both teachers and students in a number of hybrid language practices that reflect competing models of conduct, including accommodation, respect, and social hierarchy. Standard Thai is metadiscursively associated with the display of formality and respect, whereas the vernacular is understood to be a language of intimacy or in-group membership.

Children’s social lives include interactions in a wide range of settings in ever-expanding social networks requiring new and creative uses of their linguistic repertoires (Hoyle and Adger, 1998). As part of this expanding social life, children’s peer, sibling, and play interactions constitute a rich site of language socialization. The language varieties and styles that children use in peer and sibling interactions and the particular ways they deploy their linguistic repertoire, strongly impact and may have profound implications for language change, maintenance, and shift.

School-aged children’s language use has a profound impact on interactions in the home setting. As children’s social networks expand, they bring new language practices into their interactions at home, especially for interaction with their siblings. These new sibling language practices in turn have an impact on how caregivers interact with children at home. The findings of language socialization research suggest that this process is mediated by language use in peer groups: It is the language practices of the peer group, rather than those of the school per se, that seem to be adopted by school-aged children. Children whose vernacular is privileged at home may establish the school’s language as a peer code, often teasing and reprimanding their peers for using

the vernacular (Luykx, 2003; Makihara, 2005; Riley, 2001). Riley (2001), for example, found that children in the Marquesas learn the vernacular in early childhood at home, but as French is adopted with their peers at school they increasingly use French in the home with their siblings. Caregivers react by using more French with their children in the home “citing their perception that the children are more competent in that code” (Riley, 2001, p. 566). Makihara (2005) showed that, although many children on Easter Island are already Spanish dominant, those children who are dominant in the vernacular, Rapa Nui, rapidly switch to Spanish when they enter preschool because it is the language of their peers. Even when adults continue to address children in Rapa Nui, the children do not reciprocate and respond instead in Spanish or syncretic Spanish/Rapa Nui. When this happens, adults often accommodate to their children by switching to these same language varieties.

Where the family language policy suppresses the vernacular at home, children in some communities adopt and deploy the vernacular in their peer groups to varying degrees, sometimes as the preferred medium of interaction (Augsburger, 2004; Fader, 2000; Paugh, 2005). Children and adults sometimes position the school language in opposition to the language of peer interaction, constructing a subaltern prestige for the vernacular or another syncretic variety of language. For example, Augsburger (2004) found that, even in Zapotec homes that have aligned to the school-fostered ideology of using only Spanish in the home, children learn the vernacular at school as a language of peer interaction, which in turn leads to increased use of Zapotec to children by adults. Children’s skills in Zapotec genres such as joking and teasing are viewed as “anti-school” so “Zapotec becomes useful as delimiting a play or peer space opposed to the Spanish of teachers and classroom, and may be particularly treasured because of this” (p. 282).

Recent studies point to the importance of carefully analyzing how children use language within their peer groups. Children often use syncretic varieties of language, and multiple code-mixing or code-switching practices, which are differentiated from adult uses of language in other domains with possible implications for language change and language shift (Augsburger, 2004; Garrett, 2005; Howard, 2003; Makihara, 2005; Paugh, 2005; Sidnell, 1998). Children’s social worlds are actively constructed by children themselves, who are managing the contingencies of childhood in moment-by-moment interactions. Paugh (2005) found that, although children in Dominica were more proficient in English than the vernacular (Patwa), they used Patwa among siblings and peers to enact adult roles in play, to intensify their speech, to assert control, and to make moral evaluations of each other. Sidnell (1998) and Luykx (2003) explore how children’s language use in peer and

sibling groups is differentiated by gender. Howard (2003, in press) showed that Northern Thai children, who privilege the vernacular (Kam Muang) in their playgroups, construct and inhabit hierarchical or symmetrical social relationships with their playmates through their use of person reference, and how they deploy formulaic, Standard Thai genres (songs, riddles, jokes, and advertising jingles) in hybrid, code-mixed genre performances. As Muang children grow older, children interact in syncretic language varieties that are lamented by adults as “inauthentic” Kam Muang and strongly associated with urban youth.

### PROBLEMS AND DIFFICULTIES

The body of language socialization research referred to above has provided a wealth of information on how children are socialized and the interconnections between this process of socialization and broader linguistic processes such as language shift in a number of societies. Both language socialization and language shift, however, constitute major areas of investigation in their own right, so researchers face a complex challenge when trying to understand the connection between them. Because scholarly information concerning the process of language shift in a given community can be difficult to obtain, language socialization researchers face the difficulty of conducting research on both of these domains. The challenge, then, is to rigorously engage in research that provides adequate information about both language socialization and language shift, while at the same time drawing connections between these phenomena. The classic language socialization paradigm incorporating microanalysis of language practices into thorough ethnographic research provides an important tool for making such connections.

Another challenge for research on language socialization and language shift is the problem of scale. A typical ethnographic study is conducted over one or two years, while language shift takes place across generations. Although language shift can be studied through cross-sectional methodologies, such a technique contradicts ethnographers' interest in the historicity and situated nature of human experience. Our investigation of language shift should therefore ideally also include longer-term study of a particular generation across the life course in order to examine the process of language shift as it occurs at a particular moment in history, among a particular group of speakers, and the role of human agency in building, resisting, transforming, and transmitting cultural practices and ideologies that underlie language shift over time. All of these challenges require an enormous investment in this research that is not well accommodated by the academic structures and funding cycles in which researchers work.

Language socialization research is ambivalent about the effect of home language policies on children's success in school. In many cases, these studies report that children's school-based achievement does not seem to improve after the implementation of home language policies, fostered by the schools, that suppress the use of the vernacular by and to children at home (Augsburger, 2004; Garrett, 2005). In other cases, however, children's school success does seem to show improvement after the implementation of such policies (Jaffe, 1999; Paugh, 2001). Some possible factors behind this discrepancy are suggested by the research findings, such as variability in adults' proficiency in the language of instruction, both at home (Garrett, 1999; Sandel, 2003), and at school (Hornberger and Chick, 2001; Watson-Gegeo and Gegeo, 1992), the nature of language use in peer groups (Augsburger, 2004), or the treatment of the vernacular at school. Finally, language socialization research highlights the mediating role of language ideologies—local interpretations of language, language use, and language acquisition—in the language practices of a community. Psycholinguistic and educational research on bilingualism would benefit from a language socialization perspective on the culturally rooted nature of language acquisition, language change, and language shift. In order to foster dialogue between these fields, language socialization researchers should more explicitly address questions of school performance and bilingualism.

#### FUTURE DIRECTIONS

The large majority of language socialization studies outside the USA have been conducted in rural villages where the language of instruction is rarely spoken at home or in the community. Some multisite studies have shown that rural settings contrast with urban settings where children are more likely to be exposed to the school's language before entering school (Augsburger, 2004; Sandel, 2003). Future research should explore in more detail how dynamics in rural versus urban settings impact the process of language socialization.

Schools in rural village settings often fail to make education relevant to children's experiences of village life, including traditional knowledge and practices and their linguistic and discursive competence. Modern, public education often ignores, and sometimes explicitly rejects, traditional values, traditional ways of life, the local vernacular, and local *funds of knowledge* that children bring to school (Chick, 1996; Hornberger and Chick, 2001; Kulick, 1992; Moll and Greenberg, 1990; Moore, 1999; Watson-Gegeo and Gegeo, 1992). As a result, community members' views of schooling are often ambivalent: while they may recognize that education is an important means of access to the forms of social

capital that a modern and urban life promises, they also view it as irrelevant to the needs of village life.

Whereas classic language socialization research in multilingual/bidialectal North American settings has focused in large part on home–school discontinuities, research outside of North America has focused mainly on the home setting. In order to better connect these two bodies of research (and thus to enhance our insight into North American processes of education as well as education in international settings), future work should examine the school setting in more detail. A closer examination of schooling within the language socialization paradigm—and in particular, a micro-analytic focus on the language socialization practices and processes therein—would provide much needed insight into the impact of official language policies on language maintenance and shift by demonstrating how policies are actually implemented in teachers’ and students’ everyday practices, and how these practices articulate with local interpretations of social change and reproduction. Further, research on language use among children has also demonstrated the crucial role that children play as agents of social and linguistic reproduction and change, through their active linguistic and discursive production of their social worlds. Language socialization studies in the future should examine these multiple sites in which children participate in the culturally significant activities of their community, through the medium of a complex repertoire of linguistic varieties, and mediated by multiple and competing norms, values, and expectations of how to think, speak, and act in the world.

## HERITAGE LANGUAGE LEARNING AND SOCIALIZATION

### INTRODUCTION

Although research bearing the label “heritage language” has had a relatively short history and consequently has a relatively small body of literature, the notion of “heritage language” has existed for a long time under various names such as “home language,” “mother tongue,” “circumstantial bilingualism,” “language maintenance,” or “language attrition,” depending upon the purpose for which these terms were created, be it sociolinguistic, ethnolinguistic, psycholinguistic, or educational. Despite social and psychological pressures to assimilate to mainstream ways of life in their new countries, minority language communities have been deeply committed to maintaining languages of their native countries by, for example, establishing weekend community-based language schools. The earliest research on heritage language could be dated to about half a century ago, when Fishman (1964) established language maintenance and language shift as a field of inquiry. The significance of Fishman’s proposal was not widely realized until very recently when heritage languages began to be recognized as valuable national and personal resources (Brecht and Ingold, 2002; Brinton and Kagan, in press; Campbell and Rosenthal, 2000; Creese and Martin, 2006; He and Xiao (in press); Kondo-Brown, 2006; Krashen, Tse, and McQuillan, 1998; Peyton, Ranard, and McGinnis, 2001; Roca and Colombi, 2003; Wiley and Valdes, 2000).

In this context, instead of providing an overview of the field in terms of “early developments,” “major contributions,” and “work in progress,” this chapter will first provide a working definition of “heritage language” and locate work on heritage language development within the research tradition of Language Socialization. It will then review major contributions in the following three dimensions:

1. Research on heritage language as a set of language skills—the development of reading, writing, grammar, vocabulary, accent, interactional strategies, literacy, etc.
2. Research on heritage language as a resource for developing specific, multiple, and fluid discourse patterns, cultural values, identities, and communities—the linguistic, interactional, socio-cultural, cognitive characteristics of the heritage learner, the multiple

communicative worlds which s/he inhabits, discourse processes in class and at home, motivation, attitudes, etc.

3. Research that theorizes or models heritage language development—the routes and rates of learning, the variables, the optimal path for acquisition/maintenance, the similarities and differences between heritage language socialization and foreign/second language socialization or mother tongue socialization.

It will conclude by summarizing problems and challenges in heritage language socialization research and suggesting directions for future work.

#### LOCATING HERITAGE LANGUAGES IN A RESEARCH TRADITION

Following Valdes (2001, p. 38), the heritage language (HL) learner in this chapter is defined broadly as a language student in an English-dominant country who is raised in a home where a non-English target language is spoken and who speaks or at least understands the language and is to some degree bilingual in the HL and in English. More specifically, these learners see their HL “with a particular family relevance” (Fishman, 2001, p. 169). Furthermore, the HL learner manifests a set of ambiguities and complications which are perhaps less salient in the second or foreign language learner or mother tongue learner and which can be sources of both challenges and opportunities. The process of how these learners acquire and maintain their heritage languages and the symbiotic social and cultural processes that accompany heritage language learning can be fruitfully enlightened by the analytic framework of language socialization.

Grounded in ethnography, language socialization, as a branch of linguistic anthropology, focuses on the process of becoming a culturally competent member through language use in social activities. As formulated by Ochs and Schieffelin (Ochs, 1990, 1996; Schieffelin and Ochs, 1986, 1996, *Language Socialization: An Historical Overview*, Volume 8), language socialization is concerned with: (1) how novices are socialized to use language, and (2) how novices are socialized to be competent members in the target culture through language use. It tells us that language and culture are reflexively and systematically bound together and mutually constitutive of each other. This approach focuses on the language used by and to novices (e.g., children, language learners) and the relations between this language use and the larger cultural contexts of communication—local theories and epistemologies concerning social order, local ideologies and practices concerning socializing the novices, relationships between the novice and the expert, the specific activities and tasks at hand, and so forth. Work using language socialization as theoretical guidance has focused on analyzing the

organization of communicative practices through which novices acquire sociocultural knowledge and interactional competence and on the open-ended, negotiated, contested character of the interactional routine as a resource for growth and change (Garrett and Baquedano-López, 2002). In this line of work, both the forms of language (e.g., word order, sentence final particles, intonation, modal verbs, turn-taking routines) and the sociocultural contexts of language use become important research objects and sites.

As Watson-Gegeo (2004) argues, a language socialization approach to language development is compatible with the recent synthesis between cognitivist and sociocultural approaches, where cognition is reconsidered to originate in social interaction and is shaped by cultural and social processes. Guided by language socialization, we may conceptualize heritage language development in the following dimensions.

First, what does it mean to know a heritage language? Language socialization considers language acquisition and socialization as an integrated process. Linguistic meanings and meaning makings are therefore necessarily embedded in cultural systems of understanding. An account of linguistic behavior must then draw on accounts of culture. Accordingly, to know a heritage language means not merely to command the lexico-grammatical forms in both speech and writing, but also to understand or embrace a set of norms, preferences, and expectations relating linguistic structures to context.

Second, how does heritage culture relate to heritage language? From a language socialization perspective, heritage language learners' acquisition of linguistic forms requires a developmental process of delineating and organizing contextual dimensions in culturally sensible ways. A language socialization model views learners as tuned into certain indexical meanings of grammatical forms that link those forms to, for example, the social identities of interlocutors and the types of social events. This model relates learners' use and understanding of grammatical forms to complex yet orderly and recurrent dispositions, preferences, beliefs, and bodies of knowledge that organize how information is linguistically packaged and how speech acts are performed within and across socially recognized situations.

Just as foreign or second language learners may have varying degrees of investment across space and time (Norton, 2000), HL learning is often motivated by neither strictly instrumental nor integrative goals; learner motivations are derived not merely from pragmatic or utilitarian concerns but also from the intrinsic cultural, affective, and aesthetic values of the language. Unlike mother tongue acquisition in a monolingual environment, HL is in constant competition with the dominant language in the local community. How do HL learners position themselves vis-à-vis mainstream culture/language? With

language socialization, we can examine how different displays of and reactions to certain acts and stances construct different identities and relationships. It also allows us to examine the construction of multiple yet compatible/congruent identities, blended and blurred identities in multilingual, multicultural, immigrant contexts.

Thirdly, what constitutes evidence of learning? Language socialization research has looked for culturally meaningful practices across settings and situations (Ochs and Schieffelin, 1995). Language socialization views language acquisition as increasing competence in both the formal and functional potential of language. Within this model, HL learners can be viewed as acquiring repertoires of language forms and functions associated with contextual dimensions (e.g., role relationships, identities, acts, events) over developmental time and across space (He, 2006).

The last but not the least important question to consider is the route by which HL is acquired and socialized. The transmission of HL takes place in not merely formal settings (e.g., classrooms) but also, and perhaps more importantly, informally (e.g., across generations at homes and in the communities). Both the propositional content of messages conveyed in the HL and the ways in which HL is used (e.g., how HL instructors or parents communicate with the HL learner) have a direct impact on how HL learners perceive the language and its associated culture. Hence, everyday interaction in the classroom and in households plays a crucial role in heritage language acquisition and heritage cultural development. With language socialization, we may view interaction as language practices, which serve as resources for socializing social and cultural competence. In this view, interactional competence itself embodies both cultural competence and linguistic competence.

In what follows, sample research on HL will be reviewed along the two dimensions of the language socialization model—socialization to use language and socialization through language use. As mentioned previously, since existing research on HL is still scarce, few studies have explicitly adopted a language socialization approach. What is presented below can be seen as an emerging body of work that lays the empirical foundation for a conceptualization of heritage language development from a language socialization perspective and suggests possibilities for language socialization to enrich and expand research on HL from related paradigms.

#### MAJOR CONTRIBUTIONS

##### *Research on the Acquisition of a Heritage Language as a Set of Skills*

Research that focuses on the various linguistic components and language skills—pronunciation, grammar, lexicon, listening, reading, writing, narrative skills, register, literacy, etc.—is just emerging. In

almost all cases, research is carried out in comparison with either monolingual speakers or foreign language learners.

Godson (2004) investigated whether the age at which English becomes dominant for heritage speakers of Western Armenian in the USA affects their vowel production in Western Armenian. Participating in the study were ten Western-Armenian bilinguals who learned English before age 8, ten bilinguals who did not learn English until adulthood, and one Western Armenian monolingual. Vowel production was measured using recordings from oral reading of a list of sentences. Results showed that English affects the Western Armenian vowel system but only for those vowels that are already close to English. This bifurcation of vowel behavior indicates that a single across-the-board principle that governs the influence of a dominant language on a minority language is too general. Other forces such as universal tendencies, normal diachronic change, and sociolinguistic pressures must be considered.

Jia and Bayley (under review) investigate the (re)acquisition of the Mandarin Chinese perfective aspectual marker *-le* by 36 children and adolescents who either initially acquired Mandarin as an L1 or were acquiring it as a heritage language. The results of several different measures indicate that, as expected, participants who were born in China outperformed their U.S. born counterparts, as did participants who reported using primarily Mandarin at home. Results for age show a more complicated picture, with younger speakers outperforming older speakers on a narrative retelling task, but older speakers outperforming younger speakers on cloze and sentence completion tasks. Finally, the results of multivariate analysis of the narratives show that use of perfective verbal suffix *-le* was significantly constrained by its position in the sentence and by whether it is optional or obligatory.

Using both proficiency tests and self-assessment measures, Kondo-Brown (2005) investigated (a) whether Japanese heritage language (JHL) learners would demonstrate language behaviors distinctively different from those of traditional Japanese as a foreign language (JFL) learners, and (b) which domains of language use and skills would specifically exhibit such differentiation. Her findings suggest that there were striking similarities between the JFL learner group and JHL students with at least one Japanese-speaking grandparent but without a Japanese-speaking parent and JHL students of Japanese descent without either a Japanese-speaking parent or grandparent. In contrast, JHL students with at least one Japanese-speaking parent proved to be substantially different from other groups in (a) grammatical knowledge, (b) listening and reading skills, (c) self-assessed use/choice of Japanese, and (d) self-ratings of a number of can-do tasks that represented a wide range of abilities.

Several researchers in Roca and Colombi's (2003) volume address the areas of register and genre in Spanish heritage language use. Their

work indicated that Spanish HL learners need to make adjustments in their speech as they move from informal oral settings to formal settings or to written communication such as oral presentations in academic settings and writing assignments. While the way they speak Spanish among friends and family is completely appropriate for that setting, what they lack is the ability to modify their speech for other settings, audiences, and purposes.

Koda, Zhang, and Yang (in press) address literacy development in Chinese as a heritage language among school-age students. These children typically use Chinese at home, receive primary literacy instruction in English at school, and pursue ancillary literacy in Chinese in a weekend school. As such, their primary literacy tends to build on underdeveloped oral proficiency, and secondary literacy reflects heavily restricted print input and experience. Hence, their literacy learning in both languages lacks sufficient linguistic resources. Despite these inadequacies, however, many children succeed in their primary literacy, and some even in heritage language literacy. Based on theories of cross-language transfer, reading universals, and metalinguistic awareness, their study explores what additional resources—metalinguistic and cognitive—are available to these children, and how such resources might offset the limited linguistic support.

In addition to phonology, grammar, reading, writing, register, genre, and literacy, broader features of narration and interaction of HL learners have also been researched. Kaufman (2005) investigates narratives produced by speakers of Hebrew as a heritage language. Compared to monolingual norms, the HL narrative data showed considerable fragmentation in all aspects of the language. The HL learners are lacking in communicative fluency, grammatical accuracy, and lexical specificity as evidenced in their use of developmental forms characterized by present-tense temporal anchoring, frequent pauses, false starts, repairs, lexical substitution, simplification, redundancy, and circumlocution.

Even though most of the above studies are not directly informed by the theoretical model of language socialization (with the exception of Jia and Bayley, in progress), collectively they document the challenges HL learners face across a spectrum of linguistic components and language skills. The language socialization model will inspire future work to reveal and specify the culturally situated ways in which these and other linguistic forms are learned and taught along different developmental stages.

### *Research on Heritage Language as a Resource*

There is a long tradition of conceptualizing language as an integral part of the development of the self, the mind, and of the society that

complements language socialization. When language is seen not as a metaphysically present, nor a coherent system, but a context-specific tool for achieving our purposes, identity is then structured in the everyday flow of language, and stabilized in the pragmatic narratives of our day-to-day, fluid social life. For heritage language learners, HL acquisition is thus constitutive of identity, which is accomplished in the everyday social conversations. From a language socialization perspective, the indexical relationship between language and sociocultural dimensions of language use (including identity) is achieved through a two-step process. Ochs (1990) argues that *affective and epistemological dispositions* are the two contextual dimensions which are recurrently used to constitute other contextual dimensions. Consistent with this line of thought, many researchers have focused on heritage language as intricately woven with learner identity formation or transformation.

Tse (1997) attempts to explain the relationships among ethnic identity, attitudes and motivation, and HL development. Based on a study of American-born Asian-American adults, Tse concluded that language acquisition is facilitated when an individual has positive attitudes toward the language and feels positively about her ethnic group. In a further study (Tse, 2000), she examined published narratives of Americans of Asian descent to discover whether feelings of ethnic ambivalence/evasion extend to the heritage language, and if so, how they affect language beliefs and behaviors. The results suggest that for many, the HL is closely associated with the ethnic group so that attitudes toward the ethnic group and its language speakers also extend to the narrators' own language ability and their interest (or lack of interest) in maintaining and developing their HL.

Similarly, W. Li (1994) posits that HL proficiency correlates positively with a well-developed sense of ethnic identity and network with their ethnic group, such that group members have a greater understanding and knowledge of their group's cultural values, ethics, and manners. The same is echoed in Beckstead and Toribio (2003), Bernhard, Freire, and Pacini-Ketchabaw (2001), Chinen and Tucker (2006), Cho (2000), Kaufman (2005), Kondo-Brown (2005), and Lee (2002), all of whom suggest that in addition to internal factors such as attitudes, motivation, and social identity, ethnic identity is also a key factor in HL development.

In addition to learner identities, other researchers have examined how heritage language use socializes cultural values and speech roles. Lo (2004) demonstrates how expressions of epistemic stance relate to moral evaluations by looking at cases in which teachers at a Korean heritage language school claim to read their students' mind with a high degree of certainty. Lo argues that Korean HL learners are socialized to portray their access to the thoughts and sensations of other individuals

differently depending upon who these individuals are. If the individuals are perceived as morally worthy, then the access is portrayed as distant; if they are perceived as morally suspect, then the access is presented as self-evident. He (2000) details the discourse processes by which Chinese HL learners are socialized to values of respect for authority and group conformity through teachers' directives in weekend Chinese language schools, where teachers do not merely impart knowledge/facts but also function as moral guides to the students.

### *Modeling/Theorizing HL Development*

Several models, theories, or frameworks have been advanced to explain and predict heritage language development.
