Well into the 1990s, family literacy was dominated by models that assumed deficits in the cognitive and social experiences of children and their families. Some researchers (e.g., Klassen-Endrizzi, 2000; Strickland, 1995; Taylor, 1997) argued that programs' emphasis on eradicating the problem of low literacy within poor families was too narrow and misdirected, not focusing enough on how different families use cultural knowledge to promote literacy. Thus, a mismatch often existed between family literacy research that focused on the processes of learning (Bloome and Willett, 1991; Gadsden, 1998; Moll and Greenberg, 1990; Moll, Andrade, and Gonzalez, 1997) and family literacy programs that emphasized the products of learning. Family literacy, unlike most other areas of research and practice, was building on selected evidence and had not begun to explore the options and possibilities for constructing an integrative framework that responded to the issues of culture, race, and difference among children and families as well as the (dis)continuities between home and school.

#### THE SEARCH FOR AN IDENTITY

From the 1990s to present, family literacy's focus on parent-child interactions, home practices, and intergenerational literacy has led to increased ethnographic and other empirical research on children and families shifts—varying in type, nature, and intensity—in programs and the degree to which programs build on research. However, as a field, family literacy still seeks an identity within discourses in the

larger field of literacy (Gadsden, 2004). Particularly interesting and controversial have been the increased governmental demands for rigorous randomized studies that stress learning outcomes without also addressing the pathways to those outcomes. For example, Lonigan (2004), decrying the absence of well-designed experimental research, suggests the need for higher-level assessment of children's early learning in family literacy programs. More recent emphasis on evidence-based approaches reinforces Lonigan's position. While such sentiments are valid, they do not completely or accurately capture the complexities of studying the problems of program aimed at reducing them. As evaluations of Even Start suggest (e.g., St. Pierre and Layzer, 1999), findings on the effectiveness of family literacy programs are mixed, at best, for children and/or parents (most programs do not focus on other family members). Arguments are being made for better measures and measurement, but comparatively less emphasis has been placed on practice constructing conceptual frameworks, epistemologies, and appropriate pedagogies developed around the interactions and intersections between home and school.

A related strand of research examines the intersection between family and culture and the ways in which culture is embedded in the practices of individual family members who are learning literacy in programs. Most of these studies use cultural frames of reference to examine family literacy and acknowledge their importance in accessing and engaging families, as well as determining what learners know, what they want to know, and what they are willing to invest. For example, in her 1995 volume, Purcell-Gates documents parent-child literacy within a low-income, White, Appalachian family. The protagonists in her account, Jenny and her son, Donny, manipulated literacy and personal events in relationship to the cultural markers that were influenced by their social class, geography, family folklore, and families' values around learning, schooling, and societal options. In one of the few studies that focuses specially on culture, Bhola (1996) proposes a model of family literacy in which the family is at the center of the model. The family is located in a network of mutual relationships with multiple institutions such as schools and workplaces.

Gadsden's (1998) concept, family cultures, draws upon life-course family development and intergenerationality in families and provides a framework for thinking about the ways culture is examined within family functioning and literacy learning and for charting the ways in which families develop their own cultures as a subset of larger and complex cultural traditions, beliefs, histories, and folklore. In addition, Rogers' (2003) examines the complexity of family literacy practices within a low-income African-American family, focusing on issues of power and identity, as the mother in the study seeks to negotiate the

school experiences of her daughter, and on the discursive practices and traditions in the family.

To organize assumptions, goals, and practices in the field, Auerbach (1995, 1997) identified three models—intervention/prevention, multiple literacies, and social change—that still hold currency. The intervention/prevention approach is consistent with historical efforts to eradicate low literacy among poor, undereducated parents, through a series of programs and approaches designed to replace home practices with school-like approaches. The approach speaks to the power of school literacies and the poverty of home and community literacies. As she suggests, and I agree, family literacy programs of all types claim to embrace sociocultural approaches to teaching. However, the evidence is limited in the actual practices.

Curricula that reflect familial and community interests and that integrate cultural artifacts would be a first step, and some programs have achieved this entry point. However, curricula that promote interchanges around the uses of knowledge, perceptions of the world, and engagements in critical dialogue around questions of opportunities to learn (real and perceived barriers), social inequities, discrimination, justice, and the role of schooling may be seen as inappropriate for basic instruction in programs, are often uncomfortable topics for practitioners who have not been prepared to examine these issues, or are seen as incompatible as policy and program mandates. In a chapter in Wasik's (2004) *Handbook of Family Literacy*, Gadsden suggests that the understanding of culture, family cultures, and the inextricability of culture and literacy are under-discussed and poorly interpreted in most programmatic efforts and daily instruction.

The multiple literacies approach takes up this sociocultural perspective in a particular way by examining the much-discussed mismatch between the expectations and practices of school-based literacy learning and the home practices of children who are not achieving in school. Supporters of a multiple literacies model “see the solution as investigating and validating students’ multiple literacies and cultural resources in order to inform schooling” (Auerbach, 1997, p. 157), using a range of approaches—from utilizing community resources and cultural artifacts in the classroom (Madigan, 1995; Paratore, Melzi, and Krol-Sinclair, 1999); to engaging parents as co-constructors of the research and inquiry process (Gadsden, 1998; Shockley, Michalove, and Allen, 1995; Voss, 1996); to learning about family histories and experiences as a precursor to teaching (Gadsden, 1998; Weinstein-Shr, 1995); to immersing teachers in the home contexts of parents (Gonzalez, Moll, and Amanti, 2005).

A third approach, social change, is focused on multiple literacies but also highlights the role of power hierarchies in sustaining political and

social structures that alienate rather than engage learners and their cultural histories. Failure to attend to these imbalances of power reinscribes inequity and inequality. For example, in a series of texts during the 1990s (*From the Child's Point of View*; *Learning Denied*; *Toxic Literacies*; and *Many Families, Many Literacies*), Taylor discusses the need for structural change in the social and political hierarchies that govern institutions and work against the inclusion of historically marginalized groups. The responsibility for change is placed back in the arms of the public, while recognizing the role that private spheres (such as families and communities) can play in effecting such change. Other perspectives suggest that parents and other family members should be involved in the planning and strategizing of programs, increasing opportunities for them to identify, grapple with, and respond to pressing social problems affecting them, the education of their children, and the goals of their families and communities.

Auerbach's categories while useful are not discrete, and studies that appear to fit under one model may well have components that fall under others, particularly multiple literacies and social change. Within the past few years, a few studies in progress attempt to build curricula that integrate knowledge from home to influence curricula. This work is emerging and is still inexact in its analyses of appropriate approaches or interpretations of results. Where and how this work will be situated over time is unclear, but it will require a new construction away from intervention to represent the collaborative and partnership focus of many existing and energy efforts work and the integration of a multiple literacies framework, leading to social change.

#### PROBLEMS AND DIFFICULTIES

There are several neglected issues in the study of family literacy programs. The subtle disconnects between socially and grounded theoretical frameworks for family literacy research and the practices of family literacy programs persist. Lee's (2005) analysis of students' use of AAVE provides a useful frame of reference to situate the inherent contradictions and difficulties in family literacy and to connect the problems of research, practice, and policy. She notes that the complex issues involved in understanding how students' discursive practices in their families and communities are taken up to support learning to read and write are still under-studied. Particularly poignant, she argues is that "the problem may not be so much the limitations of language use in the families of children from low-income backgrounds who speak vernacular dialects [but] . . . with the ability of the research community and teachers to recognize what in these language practices may be generative for literacy learning" (p. 251).

## FUTURE DIRECTIONS

The future of family literacy lies largely in its ability to reconceptualize its goals, given societal changes around who constitutes a family, who family members are, the divide of poor and wealthy in schools, and the nature of learning in out-of-school contexts—all necessary contributors to understanding the cultural and social dimensions of learning and the contexts in which it occurs. In addition to the current streams of work, several other areas of inquiry hold promise for the future.

- *A more in-depth focus on and analysis of culture.* Despite regular references to culture, the field still examines it in relatively narrow terms, often categorizing by ethnicity or race. With a grasp of theoretical context and possibilities, programs could engage participants in intellectually inviting discussions about traditions, beliefs, and practices; people who share a common culture; or the complexity of changes that occur among traditions, beliefs, and practices over time. Such classrooms would take an inquiry approach (Cochran-Smith and Lytle, 2001) and would consider culture as being more than national heritage (e.g., Korean or American) they would try to address the ways in culture forms as part of an individual's ethnic, racial, or national identity as well as their other identities (e.g., poor or gay) that are formed out of a shared perspective, life circumstances, or societal response and institutional barriers and that challenge reliance on “one size fits all” instructional packages (see Blackburn, 2005; Osterling, 2001; Quintero, 1999; Whitehouse and Colvin, 2001).
- *Focused attention on gender and the roles ascribed to a gendered identity for girls and boys as well as women and men.* The emergence of women's issues in adult and family literacy has provoked questions about gender more broadly. These questions are informed by other socially significant features of identity, including the large numbers of poor women in programs and the persistence of racial discrimination experienced by adult learners (men and women) who are ethnic minorities (Gowen and Bartlett, 1997; Horsman, 1990; Stromquist, 1999). A similarly growing body of work examines the issues of men, mostly as fathers (Gadsden, 2003; Ortiz, Stile, and Brown, 1999).
- *Examination of different types of learning environments with different forms of participation and linguistic and literacy repertoires* (Gutierrez, 2005). In such cases, the intersections of identity and learning are a part of the classroom discourse. In addition to the traditional home environments, the field might begin to explore uses of technology and digital modalities in building on the knowledge of families and to teach and study families.

- *Deepened efforts to examine immigrant and language minority families.* The recent US governmental responses to immigrants and the public attention to second language makes the present and immediate future important times to examine these critical issues. Work by Suárez-Orozco, Suárez-Orozco, and Qin-Hilliard (2005) and others have initiated discussions that draw upon interdisciplinary knowledge to identify the border crossings of these families.
- *Research that addresses two fundamental questions.* Who are the families, and how do they describe literacy within their own family trajectories? Researchers might ask (or continue to ask in some cases) what learners negotiate in their learning across contexts, how the process of learning and negotiation by the learner can be understood better as an intergenerational activity, and how this process can be utilized effectively as a model or tool for studying intergenerational literacy.

Families in literacy programs differ in race, cultural traditions, ethnic heritage, religion, gender, class, and life experiences. However, they also differ in the literacies that they bring to the program, the ways in which they learn literacy, the purposes and everyday uses they have or will have for literacy, the value they assign to literacy as well as the reasons they assign it, and the family cultures that they bring to the literacy learning experience. Research and practice are still left with the challenge of building upon this knowledge while aiming to create new frameworks that capture the breadth of possibilities in family literacy and allows us to understand the particular ways that diverse families and the learners in them engage in literate acts and are engaged in different social contexts.

## WOMEN, LITERACY AND DEVELOPMENT: OVERVIEW

### INTRODUCTION

The belief that women's literacy is the key to development has informed government and international aid agency policy and programmes around the world. In the poorest countries, the gap between male and female literacy rates has led policy makers to focus on increasing women's as opposed to men's access to literacy, through programmes designed particularly around women's reproductive role. Researchers have been concerned to find statistical evidence that there are the positive connections between female literacy rates and health indicators such as decreased child mortality and fertility rates.

The assumption that illiterate women cannot participate fully in development programmes has led to literacy classes being set up as the entry point to health, nutrition, income generation, community forestry and family planning interventions. This objective has often influenced the curriculum: many women's literacy programmes adopt a functional literacy approach, linking literacy learning with vocational skills training, health education and 'awareness raising' about social issues such as alcoholism. Partly because of the importance of these non-literacy programme elements, there is a tendency to use the term 'literacy' synonymously with 'adult women's basic education'. For instance, evaluation reports on the benefits of women's literacy frequently emphasise the social aspects of confidence building, group solidarity, improved health practices and community action, as compared with reading and writing outcomes.

### EARLY DEVELOPMENTS

The WID (Women In Development) approach of the early 1970s promoted the idea that women needed literacy skills to catch up with men and become equal partners in development. The research agenda was influenced by the 'efficiency' policy approach (Moser, 1993) to women's development at that time, which stressed the economic benefits of educating women and girls. Women's literacy rates were found to be inversely related to fertility rates (Cochrane, 1979) and child mortality rates (Caldwell, 1979). The book of King and Hill's (1993) book,

*Women's Education in Developing Countries: Barriers, Benefits and Policies*, was a major landmark in bringing together these statistical studies on these health linkages, as well as on the links between literacy and income and employment (see Schultz on 'Returns to Women's Education', *ibid.*).

This body of research shared the starting point that literate women had different characteristics and behaved in different ways from illiterate women (LeVine, LeVine, Richman, Uribe, Correa, and Miller, 1991), perpetuating a stereotype of the 'blind' illiterate woman to be found in many policy documents (see Robinson-Pant, 2004). The statistical evidence appeared to support Summer's (foreword in King and Hill, 1993) proposition that the 'vicious cycle' of poverty could be transformed into a 'virtuous' cycle through increasing women's access to education. Although these statistical correlations were often used to justify the need for adult women's education, many studies had failed to disaggregate between those adult women who had learnt to read and write in school, as compared with those who had learnt as adults. As Bown (1990) pointed out, the female adult literacy rates were actually a composite measure of the impact of girls' schooling as well as adult education programmes. Bown's (1990) report *Preparing the Future: Women, Literacy and Development* was one of the first attempts to distinguish between the impact on women of learning in an adult literacy class, as compared to school.

The policy objective of integrating women into development through literacy meant that planners were concerned with overcoming the barriers that prevented women from attending adult literacy programmes. Ballara (1991) and Lind (1990) identified the obstacles to women attending classes as structural (around location, timing and lack of childcare facilities) as well as social barriers, such as male teachers, limited mobility and lack of support from other family members. The factors preventing women's participation in literacy courses could also be seen in similar terms to the reasons for girls not enrolling in schools. These were related to women's low status in society and the lack of priority afforded by communities and families to educating women. Many of the early literacy programmes included an 'awareness' component on the importance of women's education. This was, however, expressed in terms of the value of literacy in making women better wives and mothers, reflecting the fact that the literacy curricula focused almost exclusively on women's reproductive role and that development policy took a 'welfare' approach towards women. Literacy primers often overlooked women's significant productive role outside the home, in agriculture for instance, depicting instead a stereotype of women as primarily active in the kitchen and looking after children (Bhasin, 1984, Dighe, 1995).

The early work in women's literacy was greatly influenced by research that attempted to measure the impact of women's literacy on development. The main aim was to enhance adult women's access to education through tackling the structural and the cultural barriers to participation, rather than to look at the quality and the relevance of literacy programmes to their lives more broadly.

#### MAJOR CONTRIBUTIONS

The shift to the Gender and Development (GAD) approach in the 1980s meant that the impact of literacy programmes was no longer measured only in relation to women. Men were also brought into the picture. In research on the links between women's literacy and fertility rates, Basu (1999) looked at a third variable—marriage—and analysed how educated women's choice of partner influenced the couple's decisions about family planning. This was partly due to the growing understanding that the linkages between girls' schooling (as well as women's literacy) were in fact more complex than those previously believed. Bledsoe et al.'s (1999) *Critical Perspectives on Schooling and Fertility in the Third World* moved the debate on from identifying linkages, to look at the reasons why there might be statistical correlations between education and fertility. Similarly, studies of the impact of adult literacy programmes on health outcomes suggested the need for a more holistic approach to research and evaluation (Robinson-Pant, 2001b).

The feminist debate that informed the GAD approach brought a new critical perspective on literacy. Freire's 'conscientisation' approach to literacy was extended to include not just awareness of class oppression, but also to make women more aware of their subordinate position in relation to men. Stromquist (1997) suggested that Freirean literacy programmes can enable women to develop 'the ability to think critically' about their situations. Using a feminist framework of analysis, researchers began to identify patriarchal structures that prevented women from participating fully in literacy programmes. Rockhill's (1993) research on the gendering of literacy practices in immigrant communities in Los Angeles gave insight into the ways in which women's literacy classes could appear to threaten men's identities. In particular, through 'deconstructing the homogeneous woman' (Mohanty, 1991), feminist writers drew attention to women's multiple identities and the diversity of women attending literacy classes. A 'one size fits all' approach to literacy programming (such as had been promoted through functional literacy and literacy campaigns) failed to respond to the differing needs of young unmarried girls and older married women. Case studies have revealed how literacy programmes can be shaped

by and meet the needs of specific groups of women, such as low caste communities (Khandekar, 2004).

The policy objective for promoting women's literacy is now being discussed in terms of literacy as a human right, influencing the kind of research questions asked. From researching 'How can women's contribution to development be enhanced through literacy?' (the efficiency approach discussed earlier), studies have adopted an empowerment approach, asking 'What does empowerment mean to individual women in this literacy class?' (Robinson-Pant, 2004). The influence of the New Literacy Studies, with its more ethnographic approach to actual uses and meanings of literacy (cf. Papen, 2005; Street, 2001) has meant a move away from the notion of 'literacy' as a technical fix (for instance, as the variable that makes the difference between adopting family planning or not) to a concern with researching what literacy means in the lives of the women participants. The symbolic value of literacy for women has emerged—that a woman may want to learn to read and write to feel 'educated' like her brothers (Flores-Moreno, 2004). Ethnographic studies of literacy programmes have found contradictions between the instrumental objectives of the policy makers and the objectives of women who attend literacy classes (Betts, 2004; Robinson-Pant, 2001a). Case studies of individual women (Egbo, 2000; Kalman, 1999; Kell, 1996) have countered the notion of the 'illiterate woman' being ignorant and needing to be literate before having a voice in the community. This ethnographic body of research has given more insight into the gendered nature of literacy practices in everyday life (see Zubair's (2001) work in Pakistan on women's personal literacy practices such as diary writing) and how literacy programmes can build on these in the classroom.

While adult literacy teaching in many countries is still dominated by the functional literacy approach, many programmes have responded to the reasons why women want to learn to read and write. Legal literacy programmes have become increasingly popular—aiming to provide women with information about their legal rights in relation to issues such as marriage, dowry and land ownership (D'Souza, 2003). Similarly, literacy programmes have recognised that many women wish to learn to read religious texts, rather than development information. Mainstream literacy and development approaches, such as REFLECT, have attempted to address unequal gender relations by facilitating discussion, for instance, about different gender workloads through mixed groups of men and women constructing a PRA seasonal calendar (see Attwood, Castle and Smythe, 2004, p. 148).

On the other hand, many women welcome single-sex literacy classes as an unusual space where they can discuss issues of concern with other women. To overcome the difficulties of attending literacy classes on a

nightly basis, some programmes have established residential literacy camps for women (cf. Nirantar in India). Here the women are able to study more intensively and build up close relationships with the other participants and trainers, without the burden of domestic work that they would have at home. 'Each one teach one' approaches (where women are taught on an individual basis at home) have also proved useful for communities where women have limited mobility to go out and attend a class.

The feminist perspective on women's literacy has raised the question about how far literacy programmes challenge women's traditional roles. Stromquist (1990) suggested that women are encouraged to adapt within the patriarchal education system, rather than transforming those structures. On a micro level, there have been many examples of literacy programmes that aim to counter gender stereotypes. This has involved supporting non-conventional occupations for women—such as the Banda project in India (Nirantar, 1997) where women are trained as hand-pump mechanics and produced a newsletter to share ideas among other women mechanics.

In the context of women's literacy programmes, there is a growing recognition that promoting literacy instruction only in participants' mother tongue could be seen to promote gender inequality. For instance, literacy trainers in the HIL literacy programme in Nepal (Robinson-Pant, 2001a) responded to women's request to learn to read and write in English and Nepali rather than their mother tongue (Newari language). The women saw that their brothers and husbands had learnt to read in a second language at school and wanted to challenge the local assumption that women could only learn to read their mother tongue. Language choices about the medium of instruction within literacy programmes can be related to issues of power and status, rather than seen only in terms of educational effectiveness (see Volume 3). As the recent *EFA Global Monitoring Report* notes: 'the use of mother tongues is pedagogically sound but must offer a smooth transition to learning opportunities in regional and official languages' (UNESCO, 2005, p. 17).

#### WORK IN PROGRESS

Feminist and 'ideological' approaches to literacy, informed by the New Literacy Studies, have continued to influence the kind of research undertaken in the field of women's literacy and development (cf. Kalman, 2005; Kell, 1996; Robinson-Pant, 2004). In particular, researchers have challenged the dominant policy discourse on literacy and development through exploring women's own discourses on literacy. Chopra's work in India (2004) shows how so-called 'illiterate'

women can 'speak back' to the dominant discourse through their narratives. Research like this has contributed a critical dimension to concepts that were treated as unproblematic in the early literature, such as 'motivation', 'drop out', 'empowerment' and even 'literacy'. For instance, women's motivation can be seen in terms of the tension between the dominant and local discourses around literacy and development.

Through her stance that 'literacy is a feminist issue', Horsman (1996, p. 65) expanded the earlier debates about the 'barriers' to women's participation and the reasons for 'drop-out'. Her research in Canada has revealed how women's experience of violence often contributes to early failure in learning and makes it difficult for them to remain in literacy programmes. Horsman (2006) suggests that educators need to 'break the silence' about violence as a barrier to learning.

The research focus on literacy practices in everyday life as well as within the classroom has enabled planners to develop literacy approaches that build on people's existing literacy practices (see *Real Literacies and Community Literacies Approaches*, e.g., Rogers, 2002). In the context of women's literacy, this has encouraged policy makers to make a distinction between education and literacy, rather than using the terms synonymously (see Oxenham, 2003 and World Bank, 2001 on *Adult Basic Education and Literacy*).

Though ethnographic research has revealed how literacy practices are gendered, there is surprisingly little evidence in the policy arena of large-scale literacy programmes adopting a gendered perspective. Many of the key policy documents are concerned with women's literacy, but there is noticeably little attention to the ways in which the literacy curriculum may support or challenge traditional gender relations and gender stereotyped roles. Rogers (2006) and Rao and Robinson-Pant (2006) note the lack of gender awareness and engagement with a gender equality discourse in the fields of lifelong learning and indigenous adult education, respectively. Though literacy programmes for indigenous adult communities have been successful in addressing the oppression of minority indigenous groups, there has been little recognition of the differing experiences and needs of indigenous women as compared with men (see case studies from south and south-east Asia in Rao and Robinson-Pant, 2006). Similarly, though concepts like 'empowerment' have been problematised in the academic research literature, much aid agency-sponsored research has continued to adopt quantitative approaches to measuring the impact of women's literacy programmes on empowerment and health practices (see Burchfield, Hua, Iturry and Rocha, 2002a,b).

The growing recognition of a 'rights perspective' on women's literacy has turned attention to how women's literacy is connected to

citizenship. Stromquist (2006) discusses a more holistic (and less instrumental) approach to citizenship within literacy programmes in which women can learn new forms of leadership to tackle gender discrimination in access to land, credit, capital and legal structures. For literacy to challenge gender relations, she argues that 'women's rights need to be embedded in a visible and conscious political project' (ibid.).

Seeing women's empowerment in terms of gender relations has meant that men too have been brought into the picture. Lind (2006) argues that more attention should be given to encouraging men as well as women to attend adult basic education classes. Taking a wider perspective on 'gender equality' than simply increasing women's access to education, Lind suggests that projects need to deal with issues around male roles and masculinities. This contrasts with the earlier approaches to women's literacy (and Lind's own early seminal work) that focused exclusively on the skills and attributes that women needed to gain through literacy to 'catch up' with men.

The recently published Education for All Global Monitoring Report, *Literacy for Life*, stresses that 'women's literacy is of crucial importance in addressing gender inequality' (UNESCO, 2005, p. 19). Although the report does not take a gendered perspective on literacy in terms of the analysis of policy objectives and programme approaches, it argues strongly that literacy has to be better resourced if the EFA goals are to be achieved. However, by continuing to emphasise the importance of child literacy alongside adult literacy, the report reinforces the tendency to conflate issues around girls' schooling with women's literacy.

#### PROBLEMS AND DIFFICULTIES

A major problem in the area of women, literacy and development is the continued focus on girls' education at the expense of adult women's—particularly in terms of the allocation of resources. In policy-focused research, this is reflected in the continued failure by many education ministries to disaggregate between girls' and women's literacy rates. Given the under-resourcing of adult education (only 1% of the education budget in many countries, UNESCO, 2005, p. 17) and the fact that classes consist overwhelmingly of women, literacy tends to be seen as a second-class educational option as compared with formal education. This reinforces women's subordinate role in society since the better-resourced schooling becomes associated with boys and men. Partly due to the lack of funding, most literacy programmes depend on volunteer part-time facilitators and community contributions for materials and class facilities. Many facilitators are women, and the lack of career

structure within literacy programmes—notably those with a campaign approach that move from district to district—make it difficult for facilitators to develop their teaching skills, particularly women who, compared with men, often lack mobility to teach in another area. Just as the classes are seen as a second-rate education, the career of literacy facilitator is often regarded as suitable for women because it is low-paid and part-time. In many cases, the poor quality of education offered in literacy classes and the lack of linkages with the formal sector contributes to high dropout rates, perpetuating the idea that women are unable to learn effectively.

As noted earlier women-only programmes have been demonstrated to have many advantages, such as providing a safe environment for women to speak freely and develop their confidence. However, the fact that a programme is staffed by women may impose its own constraints: women's limited mobility and lack of access to quality education means that few experienced and well-qualified female facilitators are available. In addition, the local women available to teach often promote gender-stereotyped activities such as sewing and kitchen gardening as part of functional literacy programmes, since they themselves lack experience of non-conventional occupational skills. The question of how to tackle gender bias in materials and primers is also problematic. As Stromquist (1997) observed in her research of women's literacy programmes in Brazil, the women wanted to learn to read women's magazines that promoted images of subordinate women in traditional domestic roles, a point also explored by Rockhill (1993). If programmes are to adopt a participatory approach to curriculum design, there is a tension around how to develop materials that promote an idealised image of gender relations, yet build on women's existing literacy practices.

The potential of women's literacy classes to strengthen group activities, such as social action and income generation activities, has long been recognised. However, research insights into the differences between women as a group (their differing experiences according to age, family situation, language, ethnic and caste group) has also pointed to the importance of recognising diversity within literacy classes. The problem is that 'we [researchers, educators] are concerned about *diversity* in literacies, in women's interests, in locales and methods of literacy learning, while policy makers with costs in mind, are concerned about *uniformity*' (Bown, 2004, p. 248). This issue is not of course unique to women, but has particular relevance, as literacy programmes are targeted mainly at women. There is still a tendency for policy makers and planners to generalise about the needs of the 'homogeneous woman' and to neglect to take their multiple roles into account in planning.

## FUTURE DEVELOPMENTS

The traditional paradigm of women's literacy still dominates policy and planning debates. However, the slow movement towards a rights perspective on literacy and growing popularity of qualitative research approaches within this area suggest that a gendered perspective on literacy and development may be more evident in the future. As Aikman and Unterhalter (2005, p. 5) discuss, the future challenge is how to 'switch the focus of the debate from parity of access to quality, equality and equity'. As literacy has been often been seen in terms of increasing adult women's access to education, there has been less attention to the questions about what kind of education is provided, whether these programmes are as well-resourced and have the same status in society as the educational programmes that men participate in. Advocacy work on girls' education and the stronger role of women's organisations in promoting gender equality within education should lead to a more radical approach to promoting adult women's rights through literacy in future. Similarly, the current focus on improving the quality of formal education may impact on the non-formal sector too, with particular relevance for women.

In future, the 'ideological' approach to researching literacy may raise new questions for policy makers about the assumed linkages between women, literacy and development. For instance, a gendered perspective on debates about language policy (cf. Volume 1, Language Policy and Political Issues in Education) raises the question—what are the implications for women of learning to read in their mother tongue as compared with an official language? In terms of class structures and approaches that promote literacy in the community, we can ask: What do women (as compared with men) lose and gain by no longer meeting as a group to learn literacy? How far does the structure of a literacy class provide a socially acceptable (in the eyes of their husbands) reason for women to meet and talk together? The challenge at the present is for researchers to translate ethnographic findings from in-depth local studies into questions that policy makers can begin to address.

The more holistic approach to adult education in general has drawn attention to the importance of supportive development and employment policies. In the field of women, literacy and development, there has been long recognition of the need for improved access to services such as credit, health-care facilities and agricultural extension, if women are to be able to use the knowledge and skills learnt in literacy courses. As well as the need to explore the links between women's literacy and the economy, there is an increasing interest in how societal discourses shape literacy and development programmes. As Aikman and Unterhalter (2005, p. 4) comment, 'gender equality in education cannot

be separated as a goal from gender equality in society as a whole'. This account of the early and main developments has shown how gender relations in society influence not only the curriculum and the structure of literacy classes, but also the resourcing and the status of women's literacy programmes.

## A COMMUNITY LITERACY PROJECT: NEPAL

### INTRODUCTION

The concept of community literacy is based on the idea that local meanings and uses of literacy should inform the design and implementation of adult literacy programmes and that literacy programmes should respond and be flexible to people's expressed needs. The *Community Literacy Project* in Nepal was informed by the socio-cultural model of literacy developed within the 'New Literacy Studies' (Street, 1995) and was funded by the UK Department for International Development (DFID).<sup>1</sup> The New Literacy Studies is informed by socio-linguistic and ethnographic studies of literacy. Rather than viewing literacy as an autonomous 'skill' these approaches view literacy and literacies as a diverse social practice embedded in local contexts, institutions and practices (Collins and Blot, 2003; Street, 1993). This perspective assumes that literacy programmes can provide a public space for the articulation and debate over local 'situated' meanings of literacy and provide practical mechanisms to help people to learn and use literacy in real life situations. The paper discusses some of the tensions between the articulation of 'local' meanings of literacy within the wider national and international discourses of development and some of the creative responses that emerged.

### GOING LOCAL

*The Community Literacy Project responds to the expressed literacy and numeracy needs of local groups and communities. The approach is flexible, and allows people to learn literacy and numeracy that is directly linked to their daily life and livelihoods* 'Community Literacies' newsletter, Issue 7, July 2002.

---

<sup>1</sup> The Community Literacy Project ran between February 1997 and September 2003. It was initially managed by the Centre for British Teachers (CfBT), and then by World Education Nepal (WEN). Project staff changed during the course of the project. The views expressed in this paper are those of the authors.

One of the strongest claims of the New Literacy Studies has been that there is both a democratic and pragmatic rationale for localising our understandings of how literacy is learned and used (Collins and Blot, 2003). In recognising the existence of ‘literacies’, and the multiple ways in which written media is used and made meaningful, we can avoid imposing dominant models of literacy that are unwanted, or that lack local relevance and utility. Localised perspectives offer the opportunity to engage with dominant literacy practices, or to develop vernacular skills and practices. In the Nepali context this is particularly challenging, not only because of extensive cultural and linguistic diversity, but also because of the ways in which discourses on literacy (and education in general) are framed by nationalist and development concerns (Ahearn, 2001; Robinson-Pant, 2001; Rogers, 1999). In such a context, it is not always clear that local aspirations can be articulated. The ‘gift’ of development aid normally comes wrapped in nationalist and donor-inspired conditionalities and is accessed and expressed through an unyielding and omnipresent developmentalist discourse (Pigg, 1992). In this case, such politics were also complicated by the intellectual agenda of the project, influenced as it was by a radically new perspective on literacy which was often perceived as being alien to Nepal. This presented some significant challenges to the project which had explicitly wanted to localise provision and to ‘empower’ local communities.

### CHANGING LITERACIES

The concept of localised provision was influenced by wider processes of change occurring within Nepal during that time and by broader changes in development discourse and priorities. The national context was in the process of rapid social change, as democratic parties, civil society organisations and left wing Maoist revolutionary forces attempted to replace the elitist, caste-based polity and ideology with a more inclusive and radical politics (Mainali, 2005). These processes involved a radical democratisation of communication media including literacy practices, as silent majorities claimed a voice in these processes of change (Holland, 1995; Maddox, 2001). These changes included more decentralised and democratic access to radio broadcasting and TV and the promotion of language policy and practice in education, media and governance that recognised linguistic diversity within the country (Maddox, 2003).<sup>2</sup>

---

<sup>2</sup> Nepal is one of the most linguistically diverse countries in the world, with 127 spoken languages, and many major language groups.

### Local Literacies: Wall Newspapers

The Community Literacy Project supported local community organisations in Nepal to produce regular community newspapers. The 'wall newspapers' (literally, local newspapers stuck to a notice-board or wall) were hand written by community groups. They discussed a range of community issues, information on resources and politics as well as cultural activities. The wall-newspapers were written in multiple languages and scripts reflecting the high linguistic diversity in Nepal. The newspapers challenged the hierarchical modes of media being produced in and for the local communities. Non-literate community members were able to 'write' for the wall-newspapers with the support of scribes.

Figure 1 Women in an eastern hill village reading a community wall newspaper.

These new forms of communicative politics challenged the discriminatory forms of literacy practice and the lack of transparency often

practiced by government institutions in a country where according to 2001 census data 56% of adults cannot read and write (Ministry Education and Sports, 2002) and where case-based ideologies of social hierarchy remain pervasive.

In addition to these shifting cultural politics, the donor priorities and expectations also changed, from an initial concern with localised community development, to a rhetoric of 'livelihoods' and 'poverty reduction'. These changes in national and international politics and priorities provided an important backdrop for understanding the work of the project and influenced and gave it shape, as it tried to 'localise' and operationalise the concept of community literacy.

This paper describes some of the main activities of the project, the mechanisms and processes it developed for localising literacy activities and the way in which it developed from small-scale pilot activities in a few communities, to a large-scale programme covering ten districts of Nepal, with some 70,000 beneficiaries and 139 partner organisations.

#### LITERACY, COMMUNICATION AND ACCESS TO INFORMATION

The *Community Literacy Project* developed through three distinct stages, which we can retrospectively describe as those of exploration, consolidation and expansion. The first exploratory and experimental stage, involved in-depth participatory and ethnographic research in a few communities in the east of Nepal. Working with local partner organisations, lengthy 'baseline studies' and initial pilot programmes were conducted using a combination of ethnographic research and action-research methodology. Many of the initial activities of the project had a broader remit than many conventional literacy programmes, and many were not considered as 'literacy' at all. This entailed activities to support people in literacy use, communication and access to information in applied in-situ social activities such as in saving and credit groups, health promotion, community broadcasting, community forestry and community newspapers.

In these activities the focus was often on informal literacy support rather than formal literacy instruction. In fact formal instruction was often avoided, as it distracted attention from the applied nature of the activities and people's tasks and goals. As the project consolidated its approach it developed a distinctive ethos and approach. The project literature promoted an approach based on the idea that '*literacy is something that is used and learned in the community, rather than just being the activity of the literacy class, and communication and access to information can be enhanced through oral, visual and literacy based practices*' ('Community Literacies', 2001).

Figure 2 A woman being interviewed during a live broadcast on the community 'audio tower' (Audio broadcast via loud speaker), Dhankuta district.

This approach to literacy was, however, not widely accepted within Nepal, and the project faced significant criticism from a number of areas in early evaluation reports. The criticism centred on the failure of the project to promote and support formal literacy instruction and the limited geographical coverage of the project activities. The unconventional approach adopted by the project clashed with the conventional model of literacy instruction.

#### MANAGING DIVERSITY

Following this criticism the project consolidated its activities, and prepared to deliver them on a wider scale. The second stage of the project can be described as consolidation, and involved learning from the initial phase, and developing and testing the project's approach, methods and products. The project invested heavily in developing its human resources (and those of partner organisations) and the strong and very committed team became the mainstay of the work. The project prioritised three clear areas of activity:

- i. *literacy support (scribing, mentoring, mediation) to help people to access and engage with necessary literacy texts and practices;*
- ii. *tailor-made packages of literacy and numeracy instruction based on specific sets of literacy tasks; and*
- iii. *training packages of 'communication audit' to help institutions to review and modify their communication (and literacy) texts*

*and practices to make them more inclusive and suitable for non-literate groups and those who speak minority languages.*

(Source: 'Community Literacies' newsletter).

The process of project consolidation also involved a shift from lengthy processes of action-research, to more clearly structured and goal driven activities. These activities included training packages of literacy support—for example in legal literacy and scribing for literacy mediators and materials for 'tailor-made' literacy teaching and learning materials based on people's uses of literacy in particular social and economic activities (such as in vegetable production and marketing, saving and credit activities). These activities, which had been developed in the exploratory phase of the project, were developed for delivery on a large-scale, but with mechanisms for adapting them for local variations in content, language and script and for different geographical and cultural locations. Local language and multi-lingual formats were developed. In a radical move, partner organisations were trained in the principles of community literacy and encouraged to innovate and adapt materials kept on CD, to suit the expressed needs of local communities. In that way local variations in language, script and literacy use could be accommodated.

#### SCRIBES AND LEGAL LITERACY

One of the most popular activities of the project involved training local people in legal literacy and in scribing (or literacy mediation). This activity which was developed in a direct response to a community based request, was not focused on 'making people literate' but in helping people to access and manage the many necessary formal literacy tasks involved in encounters with government bureaucracy. These literacy tasks included applications for citizenship, registration of births, deaths and marriage, women's property and inheritance rights, police cases and so on. The governance-related literacy texts that were used for public communication or notification of important official announcement were too complex and virtually inaccessible even to literate people, let alone partially literate and non literate people. It was in such a context that the locals acknowledged the significance of the project trained literacy scribes, not only for literacy support but also to become familiar with the relevant official documents. Many of these local scribes were young women who spoke local languages, and this helped to address the gender and linguistic imbalances and inequalities in many of these official uses of literacy. The training of scribes was complimented by the production of easy-to-read booklets on legal rights describing the associated forms and literacy requirements of the activities. Scribes were also used to help people

Figure 3 Tailor made literacy materials based on literacy and numeracy tasks in vegetable production and marketing.

Figure 4 Learning and using literacy. Women using the 'tailor-made' literacy and numeracy materials on vegetable production and marketing.

to access written information and engage with literacy tasks in community forestry management and public health. Although these activities had a local focus, and were responsive to local languages, the texts and practices that they engaged with had a more national orientation and significance.

#### TAILOR-MADE MATERIALS

The *Community Literacy Project* was initially wary of promoting formal teaching and learning activities and materials, viewing them as insufficiently flexible and lacking a focus on in-situ application of literacy in daily life. It became clear though, that while literacy mediation activities were often sufficient for occasional interaction with formal institutions and access to complex legal or technical texts, other activities were better suited to more conventional literacy instruction. These activities were often the ‘vernacular’ practices that people required in their daily lives.

In response to requests for literacy training related to vegetable production and marketing and credit and saving activities, the project involved several communities in a process of action research where they identified literacy texts and practices and developed dedicated sets of teaching and learning materials. These materials were not generic in nature. Instead they focused specifically on the skills and tasks required for those activities. At the same time, the materials provided a foundation of literacy skills and practices that people could develop. For example, the vocabulary for vegetable production (names of vegetables, numeracy associated with calculation, record-keeping, weighing and measuring) provided applied instruction including familiar vocabulary, the alphabet and basic numeracy. This literacy instruction materials can be viewed as an outcome of the donor’s agenda of ‘literacy and livelihoods’ (Chitrakar, Maddox and Shrestha, 2002; DFID, 2000) and as such, are quite different to the literacy activities in scribing and governance (discussed above).

In the ‘tailor-made’ materials, the focus was on the direct application of literacy learning in daily activities. The materials were developed in local languages and multi-lingual formats in response to the requests of different communities (see [Figure 3](#)). The materials (and visual diagrams and pictures) were stored on personal computer and CD, and so they could easily be modified to suit variations in language and dialect, different types of literacy practice and cultural variation. Teaching and learning activities were conducted in special classes and mentoring and support was provided in the classes and during in-situ application of the learning. These materials provided the opportunity for non-literate people to quickly learn and apply literacy and numeracy in their

daily lives, and different sets of materials were developed to suit levels of ability. The course of instruction was only 3 or 4 months (much shorter than many conventional literacy programmes), as the literacy learning (initial literacy) and application of learning (post-literacy) aspects were fused. Within 3 or 4 months people were able to intensively practice and develop their skills on a daily basis. At the same time, what was very striking about the materials was that they tended to avoid the narrative literary form of conventional materials. The materials focused on the basic literacy and numeracy tasks and vocabulary (with the emphasis on peoples application and sustained use of literacy, e.g., as expressed by the learners themselves,<sup>3</sup> being able to read and/or write minutes of group meetings, constitutions of forest users' groups, legal documents, etc.), rather than jumping rapidly to the narrative text and development messages that are often contained in literacy primers.

### GOING NATIONAL

In the final phase of the project the activities were scaled up to ten districts of Nepal involving some 70,000 beneficiaries. This was achieved through some standardisation of the approach and by training of partner organisations in the principles and practice of community literacy. The project produced sets of training materials on each of its activities, focusing on training of scribes in legal literacy and in the use and production of 'tailor-made' literacy materials. This standardisation of the approach and rapid expansion of the programme came with some risks. To try to ensure continued responsiveness and flexibility the programme developed a participatory monitoring and evaluation system and trained local partners in participatory needs assessment and baseline studies and in how to adjust literacy materials to the expressed needs of different communities.

#### *Promoting Community Literacy Scribes*

The need to promote the development of community literacy scribes was first expressed by an elected Chairman of a rural VDC (Village Development Committee<sup>4</sup>) within a district from east Nepal. The

---

<sup>3</sup> One of the striking examples had been the folksongs that a women's savings group composed in Bardiya district, which included verses of their joyous feeling of being able to fill-up bank vouchers, write and read group minutes and the very songs they composed.

<sup>4</sup> There are almost 4000 Village Development Committees in Nepal, each of which oversees the governance and development activities of the 9 wards. A ward is the smallest political unit comprising of about 300 households.

severity of illiteracy in local communities, even among the elected heads and members of the executive boards at the most local political entity known as ward, posed a serious challenge for the VDC to realise the spirit of local self governance act and decentralisation (Chhetri, 2003). The local administration could not handle the officially required means of communication i.e., in writing while providing services to its people and also to report to the higher authorities. Therefore, the VDC Chairman came up with the idea that the local people with basic ability to read and write could be mobilised as the literacy mediators if they were to be trained in procedures of the local governance and the use of the official documents. The VDC and CLP worked collaboratively to organise such training programme and promote the concept of community literacy scribes. Many local people, mostly women who had left school after completing primary grades, showed interest to be trained scribes. In a period of less than a year, each of the nine wards had four or five community literacy scribes already helping the neighbours not only with their official literacy needs but also to learn to read words from the available documents and forms.

As the project expanded its activities to ten mid and far western districts the local civil society organisations there showed great interest in Community Literacy Scribes. The good practice in this field, which was started at Dhankuta district, was later adapted by local women at Rupandehi district. Two grassroots level women (Amrita Thapa and Krishna Maya Karki), among others, continued with their pursuit to promote community literacy scribing through women who had dropped out of school and who they persistently trained and organised into a local network.

### *Local Literacy Materials*

The production and use of local literacy instruction materials became a favourite activity of the 139 partner organisations from the ten mid and far western districts as the project scaled up its activities. The community interest-groups involved in varieties of group initiatives such as micro finance, honey production, community forestry, health service, combating domestic violence, social discrimination and bonded labour analysed their own literacy contexts with the help of CLP trained resource persons from the local support organisations. Material contents and learning modality were then decided. Unlike in the Tailor-Made Materials (TMM) development process at Dhankuta district during the initial phase, the design and production time was less lengthy, with less fuss made about the quality of paper and printing. Most of the materials were printed or photocopied locally not putting too much of emphasis on

making the content grammatically or linguistically ‘correct’, which otherwise would have delayed the use of the materials. The fundamental consideration remained to link literacy learning and use with the daily lives of people and their group processes.

#### ISSUE OF INSTITUTIONALISATION AND MAINSTREAMING

Some hard lessons were learned with respect to the project institutionalisation process. The project’s effort to mainstream its innovative practices in the national system of literacy and non formal education programme were neither adequate nor entirely successful. There may be lessons here for other projects following the approach in other parts of the world.

Despite a heavy-weight project steering committee headed by senior education ministry personnel (with membership from the National Planning Commission, Ministry of Finance and the donor representative from the UK Department for International Development), the National Non-Formal Education Centre did not mainstream any of the

Figure 5 Women using the ‘tailor-made’ materials.

approaches or methods developed by the project, despite these promising achievements.<sup>5</sup>

At the end of the project, most of the materials, reports and web-site of the project were left with the local management NGO. Although some of the project staff and NGO partners have continued to work in the education field, much of the information and resources developed by the project (including the information and reports stored on the web-site and written in Nepali) are no longer available for public access. Some of the approaches were adopted within a new donor project, but this largely retains the approach within the sphere of ‘donor’ control. The process and the politics of this ‘closure’ raises significant questions about the effectiveness of the project and the role of the donor community in supporting local ownership and sustainability of the approach and its resources.

## CONCLUSIONS

The experience of the *Community Literacy Project* shows, nevertheless, that it is possible to respond to the expressed literacy tasks and needs of local communities while working with large populations. The use of ICT for flexible and responsive production of literacy learning materials enabled such responsiveness on a large scale. The willingness to listen and respond to the expressed literacy and communication needs of local groups and communities was the key principle that informed the approach. The focus on collective practice (of communities, institutions, self-help groups) enabled shared learning, support and mentoring that is noticeably lacking in conventional literacy programmes that focus on individuals. The focus on people’s real life literacy texts and practices helped to make the project responsive to expressed needs and to improve the sustainability and impact of people’s learning. Unlike many conventional literacy programmes, these activities had very low rates of ‘drop-out’ and a high level of application in people’s daily lives.

The process of developing the approach was extremely challenging for a number of reasons. There were few role models on which the project could base the approach, and much of the early activities were conducted on a trial and error basis. The demands of being a ‘development project’ brought with them tremendous pressures—both in terms of delivering ‘goods’ to local communities and in terms of the donor and government’s legitimate desire to have a wide-scale impact. It is

---

<sup>5</sup> The project’s external evaluation report rated highly its performance and potential for scaling up the products it came up with.

questionable whether the government ever fully supported the ideas behind the project, and as a result, resistance from government and lack of buy-in and institutionalisation was an on-going factor that project staff had to deal with. The project staff often had to deal with the uncertainty and self-doubt associated with such a process of innovation, while attempting to protect themselves and the project from sometimes heavy criticism from outside. That was not always the ideal environment to ensure an open and deliberative process. As the project developed, a demarcation began to develop between the more radical politics and risk taking of popular education and attempts to control and manage the more 'risky' activities of the project (e.g., advocacy on language policy in governance, women's legal literacy activities, decentralised production of materials), which were often inherently political and did not conform to the conventional view of adult literacy.

On reflection, much of the resistance reflected the wider politics of education and communication within Nepal. Literacy and language are part of on-going aspects of inequality and social injustice, which the Nepali State and donor community have been either unable, or unwilling to effectively tackle. This became clear as the project became more integrated into civil society organisations and activities. What began as a community-based activity focused on local groups and organisations gained national resonance and as it did, it became clear that national and international politics are central in shaping communication practices and people's access to literacy.

In that sense, the term '*Community Literacy Project*' is both accurate and misleading. We can look at each of those terms, beginning with the concept of *community*. While the project always attempted to respond to the expressed needs of local communities, many of the 'dominant' literacy texts and practices people have to engage with are defined and given shape at the national or international level. As a space for social change the project was inevitably influenced by national and international concerns, development discourse, the concerns of government, overseas managers and donor organisations. As such, it could equally be described as the '*Global Literacy Project, in Nepal*'. At the same time, managing these multiple concerns, discourses and priorities was as much an issue of local organisations and communities as it was for the centrally funded project staff. Rather than a discrete entity, 'local' communities were always shot through with these national and international politics and institutional politics.

The term *literacy* is also only part of the picture. The activities of the project extended to other forms of communication media (numeracy, spoken and visual communication, radio, audio-tower). The literacy and numeracy activities were often embedded in wider social practices and were not always experienced as 'literacy' promotion. Examples

such as the wall newspapers illustrate this point nicely, since there was a heavy literacy and literacy learning content, but the participants did not view the activity as being primarily one of 'literacy' learning.

Finally, the logic of the development *project* presented many difficulties, not least because of the expectations that it created about delivering development goods and the impact of ever changing donor agendas. Despite the agendas of poverty reduction and good governance, the development agenda can become depoliticised, and this created certain tensions within the project as we moved towards closer links with civil society groups more committed to social activism. This was clear as the project attempted to link local and national spheres by contributing to social movements in literacy and language policy. As an innovative project, such tensions were perhaps inevitable, and this itself should perhaps be one of the key learnings. Adult literacy promotion, as Paulo Friere has reminded us, is essentially a political project as one that challenges us to change the social and cultural norms, patterns and relations.

COMMUNITY LITERACY PRACTICES AND EDUCATION:  
AUSTRALIA

INTRODUCTION

Interest in community literacy practices is not new. Its consideration by administrators, schools and teachers has generally been driven by recognition that the literacy experiences of home and community have a significant impact on literacy success at school. But most interest has been in how families and their literacy practices serve school agendas with interest being driven by limited definitions of literacy and at times deficit views of learning (Cairney, 2003). This limited view of the relationship between literacy practices in and out of school has limited many attempts to build stronger relationships between schools and their communities. Prior to the 1980s most interest in non-school literacy was focussed on how parents support children's print literacy learning and to a limited extent how non-school literacy<sup>1</sup> has an impact on school literacy learning. This work paid little attention to variation in literacy practices within the community and appeared to assume that literacy was a unitary skill that needed to be supported in quite specific ways if children were to succeed at school.

However, research by Heath (1983) and others<sup>2</sup> helped researchers and educators to understand better the considerable variation that occurs in literacy across specific groups. Heath considered talk associated with literacy within the home and found that it is related to differences in culture and language. Motivated by this work, other researchers began to examine the literacy practices of home and school more closely and noted increasingly that the way teachers shape classroom discourse can be limited in scope and not reflective of the diversity of student language and culture (Breen, Loudon, Barrat-Pugh, Rivalland, Rohl, Rhydwen, Lloyd and Carr, 1994; Cairney and Ruge, 1998; Cairney,

---

<sup>1</sup> This concern was primarily with how environmental print has an impact on early literacy development. See Cairney (2003) and Hall (1987) for a fuller discussion.

<sup>2</sup> There are numerous researchers whose work has contributed to the growing understanding of literacy diversity and its complex relationship to culture, ethnicity and class. See for example Bernstein (1964), Halliday (1975), Scribner and Cole (1981), Harste, Woodward & Burke (1984), Street (1984), Cook-Gumperz (1986), Cazden (1988) and Lareau (1989).

Lowe and Sproats, 1995; Cairney, Ruge, Buchanan, Lowe and Munsie, 1995; Freebody, Ludwig and Gunn, 1995; Gutierrez, 1993).

In parallel to the above work, two other key and related areas of inquiry began to inform home and community literacy research. One fruitful area has been concern with the variation in literacy practices that reflects the changing nature of communication and growth in multimedia and the need to reject limited definitions of literacy for the richer concept of multiliteracies (Cope and Kalantzis, 2000). This work has led researchers and practitioners to consider whether limited definitions of literacy effectively exclude a vast array of literacies that fall outside the boundaries of traditional school literacy practices.

A second area of related interest has been stimulated by the fields of critical theory, sociolinguistics and cultural studies and has stressed the need to recognise that power relationships are also part of literacy practices (see Freebody, *Critical Literacy Education: On Living with 'Innocent Language'*, Volume 2). This work demonstrates that literacy is not value neutral and disconnected from other human activity, particularly the complex tapestry of relationships that characterise human existence. This theoretical work has highlighted that some families and individuals are disadvantaged (and others advantaged) by power relationships that fail to value the funds of knowledge that they bring to school (see Moll, 1992; Moll, Amanti, Neff and Gonzalez, 1992). This collective work has helped us to identify "the social practices by which schools, families and individuals reproduce, resist and transform hierarchies of social relations and their positions within them" (Solsken, 1993, p. 7). Furthermore, it has enabled research and educational initiatives concerned with family literacy to be critiqued in new ways.

What both these related areas of study indicate is that children from cultural and linguistic minority groups may continue to have difficulty in achieving school success because the dominant pedagogical approaches are based on "narrow understanding of school knowledge and literacy, which are defined and defended as what one needs to know and how one needs to know it in order to be successful in school and society" (Willis, 1995, p. 34).

Collectively these related fields of study demonstrate that while there is a relationship between community literacy and education, that there are many gaps in our understanding and the nature of their relationship to education. This chapter is a review of what research has taught us about this relationship, with a particular interest in Australian research and its relationship to wider research in this area. It is assumed for the purposes of the review that 'community literacy' refers to those social practices outside schools that involve the use of multiple sign systems to create meaning and that involve, in some way, the reading and/or writing of text. While not denying the importance

and impact of informal education, education in this review is taken to mean 'formal' education administered by institutions<sup>3</sup>.

In the review that follows there will be three major considerations. First, early foundational research efforts that explored community literacy practices as well as the relationship of this work to major theoretical traditions. Second, significant recent and current explorations that have acknowledged more complex definitions of literacy and community, with special consideration of work in Australia. Third, the need to problematise the existing research literature in this area and map out possible future directions.

#### A BRIEF LOOK AT EARLY RESEARCH OF RELEVANCE

Early interest in community literacy practices was primarily motivated by a desire to enhance school success by ensuring that families supported school literacy. Some of the most significant early interest in the relationship between education and non-school literacy practices occurred in the United Kingdom. The Plowden report (Department of Education and Science, 1967) was one of a number of stimuli that encouraged schools to become more concerned with the relationship of home to school learning. Plowden argued strongly for partnership between home and school. Such notions of partnership were primarily concerned with what families could do to support schools and lacked the richness of more recent attempts to build partnerships between home, school and community (see Cairney and Munsie, 1992; Cairney and Ruge, 1998 for a fuller discussion of this issue).

The 1970s and 1980s saw a number of high profile program initiatives take place that were judged to be successful at supporting school literacy. Many of these were programs designed to help parents support children at home in relation to school learning, particularly those experiencing reading problems.<sup>4</sup> However, typically, these early projects assumed a deficit view of families and sought to rectify what were seen as barriers to children's educational success (Cairney, 2003). One well-known program, the Haringey Reading Project found that some of the children whose parents were involved in their program made significant gains in reading achievement irrespective of reading ability. This project

---

<sup>3</sup> This review does not attempt to address the significant work done in relation to adult literacy and workplace literacy. While each body of work is significant in understanding broader community literacy practices, a full discussion of each is outside the scope of this chapter that focuses primarily on the literacy worlds of children. For an interesting discussion of 'specialized' literacy populations and institutions see Quigley (2005).

<sup>4</sup> See Cairney (2000) for a more detailed review of this early work.

was to be a stimulus for other initiatives focussing on story reading strategies for parents and the provision of books to families (Tizard, Schofield, and Hewison, 1982).

While not wanting to dismiss these early attempts to address the relationship between school and non-school literacy practices, what is obvious is how such work was limited by the definitions of literacy that framed the work. Developments in other countries tended to parallel the UK experience. In the United States interest in considering the impact of home and community literacy practices on schooling was a little slower to emerge, but by the 1990s it was estimated that there were more than 500 family literacy programs alone in the USA (Nickse, 1993).

In Australia, the early interest in the literacy practices of home and community was again primarily to obtain support for school learning. Curriculum documents during the 70s and 80s stressed the importance of parents and a supportive home environment in children's learning. Common to these early efforts was a desire to encourage parents to become more involved in school and support school agendas, rather than building on the rich literacy practices of home and community.

In a federally funded review of Australian initiatives Cairney, Ruge, Buchanan, Lowe and Munsie (1995) identified 261 major initiatives and over 100 small-scale projects that showed an interest in using the relationship between the literacy of school and community to strengthen the school success of students who were struggling. This study showed that 76.3% of these projects were initiated by schools and were largely designed to fulfil school purposes and transmit information about schooling. The report concluded that more effort needed to be given to understanding the richness of family and community literacy practices and how this could be seen as a rich resource informing and supporting school-based literacy education.

As mentioned in the introduction to this chapter, one of the first researchers to seriously explore the complex relationship between the literacy practices of community and school was Heath (1983). She found that there was variation in the acquisition of oral language, and the manner in which parents introduced children to literacy and its purposes, and was able to document significant differences in community styles of literacy socialisation and the impact that this had on school success.

The work of Heath and others resonated well with earlier theoretical work on early language and literacy development<sup>5</sup> that had already challenged views on the role adults and families play in early literacy learning. The 1960s and 1970s had seen the emergence of important

---

<sup>5</sup> See for example Bernstein (1964), Clay (1966), Halliday (1975) and Vygotsky (1978).

changes in our understanding of oral language development that were eventually to lead to a number of significant literacy studies in the late 1970s and early 1980s. For example, Harste, Woodward and Burke (1984, p. 56) demonstrated that preschool children were actively attempting to understand the nature of the language spoken around them, making predictions and testing hypotheses about how language worked, and demonstrating rich literacy understandings embedded in everyday reading and writing experiences. This work was a serious challenge to maturational theories of child development that had previously confined literacy learning to the school years. Early literacy researchers embraced the term 'emergent' literacy to describe the significant literacy experiences that preschool children were encountering at home and in community settings.<sup>6</sup> These new insights helped researchers to begin to view non-school literacy experiences as relevant and significant to school success.

Almost in parallel to the development of emergent literacy was the emergence of constructivist theories based strongly on the work of Vygotsky (1978) and Bruner (1983). Rich literacy experiences, scaffolded support (Bruner, 1983, 1986; Rogoff, 1990) and encouragement of meaning making and risk taking were increasingly recognised as a vital part of child language learning. What this work again reinforced was the social foundations of literacy.

Sociolinguistic theories of language also contributed a great deal. Scholars like Bahktin (1935/1981), Gumperz (1986), Halliday (1975) and Hymes (1974), built upon the basic understanding that language is made as people act and react to one another. Cook-Gumperz (1986) argued that spoken language and literacy are cultural tools that shape individuals as they grow and transform behaviour as it is internalised. This work informed the view that people learn to be literate primarily in groups as they relate to others and seek to accomplish social and communicative functions. Literacy was seen as purpose driven and context bound, with people acting and reacting to the actions of others as well as to set patterns of group interaction.<sup>7</sup>

This work raised new questions about definitions of literacy and of how these definitions were being applied to community and family literacy. Street (1984) challenged what he called traditional 'autonomous' models that he saw as dominated by 'essay-text' forms of literacy, proposed

---

<sup>6</sup> Hall (1987) provided one of the earliest syntheses of the emergent literacy research and did much to translate this work into a form that could inform early childhood practice. However, this new view of preschool literacy had its roots in the work of many researchers including Clay (1966), Holdaway (1979), Wells (1982; 1986), Harste, Woodward and Burke (1984), Mason and Allen (1986), Teale and Sulzby (1986).

<sup>7</sup> There are many key studies and publications including the critical work of Bloomer (1987); Cazden (1988); Cook-Gumperz (1986); Street (1984); and Wells (1986).

an alternative ‘ideological’ model. This model was concerned with the specific social practices of reading and writing, recognising the ideological and culturally embedded nature of literacy. He argued that the meaning of literacy depends upon the social institution within which it is embedded, and he called for the use of the term ‘literacies’ rather than literacy to recognise the social complexity of the practices. Street was one of a number of researchers seeking definitions that considered literacy as a set of social and cultural practices, not a unitary skill.

One final influence was the emergence of ‘critical literacy’ (Crawford, 1995). This perspective drew heavily on the work of critical theorists, sociolinguistics and cultural studies and attempted to critique and problematise the relationship between literacy and factors as diverse as school success, parental support, self-identity, gender and family life. The work argued that

- differences between the discourses of home and school can make a difference to the success of some children (Gee, 1990);
- an acceptance of cultural differences between home and school can lead to more responsive curricula that offer all children greater chances of success in learning;
- some people are disadvantaged by power relationships that fail to value the funds of knowledge that some children and their families bring to school, while others are advantaged (see Freire and Macedo, 1987; Gee, 1990; Luke, 1988; Moll, 1992; Moll, Amanti, Neff and Gonzalez, 1992; Street, 1995).

The combined and overlapping impact of the above quite disparate scholarly traditions was to bring about a significant shift in the way literacy was defined and studied and an increased understanding of the relationship between the literacy of home and school. In the following section major contributions to this emerging understanding are discussed.

## MAJOR CONTRIBUTIONS

### *Studies that Describe Literacy Practices in the Home*

While a great deal is known about early literacy development, there are few studies that have provided a detailed description of literacy practices within a wide range of families. Denny Taylor has conducted some of the most significant work in the last twenty years. Taylor’s (1983) detailed ethnographic research spawned the term “family literacy”, and provided some of the most detailed insights into the nature of literacy practices within homes. Her series of studies began in 1977 with a detailed description of a single family. By 1979 her ongoing observations had grown to include six white middle class families living in suburban New York City.

Taylor's close involvement in the families contributed a number of critical insights. She argued that literacy is implicated in the lives of family members and found that parents mediated literacy experiences in varied ways across and within families, and that older siblings helped to shape younger siblings' experiences of literacy (see Gregory, *City Literacies*, Volume 2). She also observed "shifts" in parents' approaches to the "transmission of literacy styles and values", coinciding with children beginning to learn to read and write in school (Taylor, 1983, p. 20). Literacy experiences within families she argued were rich and varied; surrounding family members as part of the fabric of life. Finally, she observed that children's growing awareness of literacy involved experiences that are woven into daily activities (Taylor, 1983, p. 56).

Taylor's early work informed a number of later studies, most notably her work with Dorsey-Gaines in conducting an ethnography of black families living in urban poverty (Taylor and Dorsey-Gaines, 1988). The combined work of Taylor and her colleagues challenged notions of what effective parent support of literacy involves, and attempted to move beyond white middle-class definitions of effective parenting. Their work showed that within the poor black families studied there was a richness of literacy experience that previous studies had not been able to recognise. This finding was later given support by the work of Auerbach (1989, 1995).

McNaughton's (1995) work in New Zealand is also relevant to this discussion. Based on case studies of 17 families in New Zealand he concluded that families are a critical determinant of children's early literacy development. His description of the literacy practices of Maori, Samoan and Pakeha families whose income earners were from non-professional occupations provided a picture of resourceful families able to support their children's early literacy learning. McNaughton was able to describe the complex ways in which families use time, space and varied resources to help preschool children to learn literacy. He noted that families used three different ways to support literacy learning: shared joint activities between the children and significant others; personal activities (e.g. scribbling or writing); and ambient activities where literacy was immersed in life.

Arguably the most extensive study conducted in Australia in the last decade was undertaken by Cairney and Ruge (1998) and sought to examine the relationship between home, school and community literacy. In a 2-year study, Cairney and Ruge (1998) conducted school and community-based case studies across four varied settings and subsequently conducted an ethnography of 37 children from 27 families, observing and describing their literacy practices at home and school. The focus children were of primary school age, but within the families there were approximately 20 additional preschool children. The participating

families were asked to collect a range of data including, audio tape literacy events, an audit of home literacy resources, a log of all reading and writing activities, and photographs of significant literacy events in the home (using disposable cameras supplied by the researchers). One member of each family was also asked to act as co-researcher and was trained to help record a range of home literacy events.

Cairney and Ruge (1998) identified four distinct purposes for literacy in the homes and classrooms in their study: literacy for establishing and maintaining relationships; literacy for accessing or displaying information; literacy for pleasure and/or self-expression; and literacy for skills development.

One critical finding from this study was that specific literacy practices may contribute to, and constitute part of, different literacy events in different contexts depending on the understandings and purposes of the participants. For example, the intended purpose of a newsletter from school may be to give parents access to information about school policies or activities. Alternatively, the intended purpose may be to maintain communication between home and school and thereby develop the relationship between families and the school. However, in reading the newsletter at home, families may have very different purposes and 'use' the newsletter in different ways (e.g. one family used it for oral reading practice). This is consistent with the work of Barton (1994) and Street (1993) and their contention that different domains can place quite different demands on participants for literacy.

Cairney and Ruge (1998) also found that the families in their study differed greatly in the extent to which literacy was visible in everyday life. Similarly, families varied greatly in the amount and types of literacy resources available to them.

One of the striking features of literacy practices in the homes of many of the families in the Cairney and Ruge study was the extent to which 'school literacy' appeared to dominate family life. That is, the particular types and uses of literacy usually associated with schooling were prominent in many families. This prominence was manifest primarily in the amount of time spent on homework activities (up to 3 hours per day in some families) and, to a lesser extent, siblings 'playing schools'. As well, there was evidence to suggest that the literacy practices privileged right from the birth of a first child are strongly shaped by the parents' experience of school literacy as well as the desire to prepare the preschool child for later schooling (Cairney and Ruge, 1998).

#### *Studies that Attempted to Bridge Home, School and Community Contexts*

While there have been a significant number of studies that have observed literacy practices within the home, there is less evidence of

research that has been able to tap into children's experiences of literacy outside the family and the school. Putting to one side a few seminal studies that have managed to tap the home, school and community contexts (e.g. Heath, 1983; Hull and Schultz, 2002; Schultz and Hull, *Literacies In and Out of School in the United States, Volume 2*) and studies of 'local' and 'heritage' literacies<sup>8</sup> that are concerned primarily with the maintenance of culturally unique adult literacy practices, what we do have falls into two main categories.

The first group contains cultural ethnographies that have provided insights into the role that written language and other sign systems play within community and family life. This body of work has also helped us to understand the cultural variation that occurs across communities and families. One of the most significant early studies to document cultural variations in literacy acquisition was the work of Scribner and Cole (1981), who found that the Vai people of Liberia used three different writing systems for different purposes. Arabic literacy was learned by rote as part of religious practices, English was learned as part of formal schooling, and finally, the Vai language was learned informally at home and in the community and for personal communication such as letters. Each of these 'literacies' was acquired and used for different social and cultural purposes.

Similarly, in an ethnography within the South Pacific, Duranti and Ochs (1986) found complexity, and that this had an impact on how children coped with literacy at school. They observed that the children of families in a Samoan village needed to cope with different forms of interaction across home and school settings.

However, while anthropology has been a major stimulus for new directions in literacy and culturally sensitive accounts of literacy within communities, Street (1995) argues that such work has often been framed by traditional limited definitions of literacy. He suggests, for example, that early ethnographies like that of Clammer (1976) in Fijian villages assumed 'autonomous' models of literacy in framing the study and failed to question the power relationships of the institution (in this the case the church) in introducing literacy, thus failing to problematise the role that literacy played in the colonisation of these people. However more recently ethnographies of literacy have adopted a broader social practice frame (as many contributions to this volume indicate).

---

<sup>8</sup> The term 'local literacies' has been used by Barton and others (see for example, Barton and Hamilton, 1998) to describe the literacy of everyday life. They observed that in everyday lives, people inhabit a textually mediated social world, bringing reading and writing into most activities. For an interesting discussion of 'heritage' literacies of immigrant families living literate lives in multiple languages see Maguire, Beer, Attarian, Baygin, Curdt-Christiansen and Yoshida (1995).

In Australia, the Federal government has funded a number of significant national studies over a ten year period that have sought to understand the complexity of literacy practices in specific contexts, with a particular concern for the implications of this work for school literacy success. The work by Cairney et al. (1995) and Cairney and Ruge (1998) discussed earlier was part of this broad sweep of projects. However, other studies have explored the literacy practices of children undertaking schooling by distance education (Louden and Rivalland, 1995), the experiences of children and families in the year prior to school as well as the first year of school (Hill, Comber, Louden and Reid, 1998), the literacy practices of urban and remote rural communities, and variations in literacy practices across rural and urban communities (Breen, Louden, Barratt-Pugh, Rivalland, Rohl, Rhydwen, Lloyd and Carr, 1994).

Breen et al. (1994), for example, conducted community-based case studies of 12 urban and 12 rural families and observed that “all children, regardless of specific language background, are very likely to enter school with different repertoires of language knowledge and use which express their initial communicative competence” (Breen et al., 1994, p. 35). They concluded that even when literacy practices across families appeared similar that they could have different meanings and values.

Similarly, Hill and colleagues (1998) found that Australian children come to school with diverse prior-to-school experiences. The 100 children who were studied were growing up in very different communities, families and homes. The researchers suggested that their observations indicated inequalities in contemporary Australia that have an impact on children’s early lives. Schools they argued need to construct a more appropriate curriculum which explicitly builds on children’s existing cultural capital and preferred ways of learning.

### *Studies of Indigenous Literacy*

Australia’s indigenous population has experienced special issues with literacy, with seven out of every ten Indigenous students in Year three performing below the national literacy standard, compared to just three out of ten for other Australians (DEST, 2000). Some of the earliest and most influential attempts to understand issues associated with Indigenous literacy were conducted by Harris (1980, 1984) and described traditional indigenous learning styles amongst communities in the Northern Territory of Australia. He found that learning styles were often context-specific and person-orientated and were dependent on observation and imitation, as well as personal trial and error.

Subsequent studies in this tradition (e.g., Gray, 1985, 1990) have pointed to the failure of existing pedagogy to accommodate Aboriginal learning styles. Malin (1990) was able to demonstrate that conflicts between Aboriginal home socialisation practices and teacher expectations had a significant effect on Indigenous success at school (cf. Susan Phillips' 1983 seminal study of the Warm Springs Indian Reservation in the US).

Other researchers have also highlighted the significant linguistic diversity of Indigenous learners and observed that Indigenous students in both urban and rural areas speak Aboriginal English in informal community contexts and then have to switch to standard English (Mattingley, 1992). Such work has argued for the valuing of the community English that Indigenous learners bring to school and the impact that such actions has on the central relationships between teachers, their students and communities (see e.g. Munns, Simpson, Connelly and Townsend (1999).

### *Understanding the Impact of Culture on School Achievement*

Studies of Indigenous literacy in Australia reflect international research that acknowledges a new valuing of the richness of community and family literacy. Critical to this has been the growing understanding that literacies vary depending on purpose and life 'domains' (Barton, 1994). Researchers have begun to argue that there are many forms of literacy, each with specific purposes and contexts in which they are used. They conclude that to understand literacy fully, we need to understand the groups and institutions through which we are socialised into specific literacy practices (Bruner, 1986; Gee, 1990).

A key focus of research has been to identify why and how people learn through participation in the practices that make up specific groups and communities. How do communities organise their resources, and how does participation in the culture shapes identity? As Moll (1993) has suggested, this has represented a move away from viewing individual learners to viewing learning as participation in funds of knowledge as part of a community of practice. Consequently, a number of American researchers have explored differences in the suitability and impact of curricula and pedagogy on minority groups. For example, Foster (1992, p. 303) concluded that "... many of the difficulties African-American students encounter in becoming literate result in part from the misunderstandings that occur when the speaking and communication styles of their community vary from those expected and valued in the school setting" (p. 303).

Other researchers have investigated the impact of differences between the cultural beliefs and expectations of Native Americans,

and those of mainstream cultures (Deyhle and LeCompte, 1994; Locust, 1988; McCarty, 1987; Phillips, 2002). For example, Locust (1988) examined traditional Native American belief systems, including their holistic approach to life and death, their emphasis on non-verbal communication, and their valuing of visual, motor and memory skills over verbal skills. She investigated the ways in which these beliefs conflict with the education system, and argued that traditional psychological education tests reflect the dominant culture resulting in native American children achieving low scores and being treated as learning disabled.

However, Cummins (1986) has argued that the educational success or failure of minority students is related to more than just curricula mismatches, suggesting that it is “a function of the extent to which schools reflect or counteract the power relations that exist within the broader society” (p. 32). As a result he has argued for the incorporation of minority students’ culture and language in the education of their children (see Cummins, *BICS and CALP: Empirical and Theoretical Status of the Distinction*, Volume 2).

In a related Australian study Cairney and Ruge (1998) conducted case studies of four schools judged effective at acknowledging community language and cultural diversity. They found that within each of these schools five basic premises drove curriculum:

1. staff believed that all children could achieve school success irrespective of language or cultural background;
2. language was used in an integrated way across the curriculum;
3. curricula acknowledged that literacy development benefits from the maintenance of first language competence;
4. success was seen as critical to learning and students were given opportunities to succeed as they learnt new skills;
5. parents were seen as playing an important role in children’s educational success and were actively involved in the activities of the school.

What the above research demonstrates is that an understanding of language and cultural diversity of a school’s students and families is important. It also highlights the need to understand the complexity of community literacies in other than school terms and in ways that transcends ‘autonomous’ models.

In a related research study Street, Baker and Tomlin (2005) have considered how non-school factors affect school achievement. Adopting a sociocultural perspective on learning the Leverhulme Numeracy Research Program was a 5-year longitudinal project that sought to examine the meanings and uses of numeracy in school and community settings. Another focus was the language practices associated with numeracy, namely reading, writing, speaking and listening. A key concern was the influence of home contexts on school achievement. The

Leverhulme Programme attempted to develop ways of measuring pupil progression across a five-year period. The fieldwork involved observation of selected schools and classrooms and of informal situations in and out of school. It drew on interviews with teachers and pupils; analysis of texts from home and school, curriculum school policy documents, school programs and homework, and teacher feedback.

One of the most interesting insights from this research was that numeracy practices were often invisible to the researcher, with observations affected by how both the observers and the observed defined such practices. The question that this raised for the researchers was “what counts as numeracy”? The varied answers to this question impact not just on what is observed and recorded but what is valued and communicated between home and school. Street et al. (2005) found that when questions were asked of parents about numeracy that discussions often turned to school numeracy practices. The researchers were left with the key question “how are the borders between numeracy practices and other social practices constructed by researchers, schools and families?” This led the researchers to ask a related question, “How damaging are any omissions?” Such observations and questions have relevance to the observation already made in this chapter that researchers have noted that school literacy practices dominate home practices. One critical question that obviously needs to be explored is whether observations of school literacy or numeracy practices at home may involve (at least in part) a masking of other practices that researchers or participants simply don’t count or define as literacy or numeracy. This topic requires further research.

### *New Literacies*

One of the obvious gaps in community literacy research has been the failure to adequately tap and understand the richness of non-print literacy available to children outside school. Rarely have studies been able to identify, observe and document use of multiple sign systems, or even the relationship of multiple sign systems to print-based literacy. While early childhood studies have come closest to identifying the richness of children’s early experiences<sup>9</sup>, few studies have adequately tapped the diversity of literacy practices experienced day by day within communities.

The work of Kress and van Leeuwen (2001), Kress, Jewitt, Ogborn, and Tsatsarelis (2001) and Kress (2003) has done most to challenge views on the impact of visual literacy and its different demands for

---

<sup>9</sup> See for example Harste, Woodward and Burke (1984), Clay (1966), Holdaway (1979), Mason and Allen (1986), Teale and Sulzby (1986), and Wells (1982; 1986).

the learner. The New London Group (NLG) (Cope and Kalantzis, 2000) has also sought to re-theorise literacy, and challenge ‘authoritarian’ conceptions of unitary literacy (see Leander and Lewis, *Literacy and Internet Technologies*, Volume 2).

The NLG has proposed a metalanguage of multiliteracies based on the concept of ‘Design’ (Cope and Kalantzis, 2000). Multiliteracies for the New London Group are based on the understanding that “language and other modes of meaning are dynamic representational resources, constantly being remade by their users as they work to achieve their various cultural purposes.” They suggest that meaning is made in ways that are increasingly multimodal, and our world is marked simultaneously by increasing local diversity and increasing global connectedness.

What we do know is that children are being exposed to richer opportunities to encounter written text in diverse digital as well as print forms, and that many of these have a relationship to visual, audio, spatial and behavioural experiences.

What this work promises to deliver is research that will demonstrate the increasingly demanding and diverse literacy practices that are encountered in community settings. The work of researchers like Lemke (2002) suggests that there is much that we need to explore and understand. Having investigated hypertexts, he has concluded that there is great complexity in the processes required to combine words and images giving attention to sounds, music, graphics, hyperlinks, menu bars, hot spots, etc. If children are experiencing the richness of textual and visual forms outside the classroom then one suspects, that previous conceptions of the relationship between the literacy of home, school and community will need to be revised. There may be ever increasing hybridity of literacy practices as popular culture and new media merge with more traditional literary forms.<sup>10</sup>

#### PROBLEMS AND GAPS IN OUR UNDERSTANDING

What the above discussion should have demonstrated is that there is much that we still do not know about community literacy practices. While the studies discussed shed light on the topic there are a number of difficulties in moving forward.

One problem is that in trying to understand community literacy practices, it is difficult to separate out the impact of school literacy practices that have such a strong impact on families and attitudes towards what counts as literacy within the wider community (see Cairney and Ruge, 1998; and Freebody, Ludwig and Gunn, 1995). Alongside this must be

---

<sup>10</sup> The work of Dyson (1997) has much to say about these possibilities and how they are realised.

held the questions raised by Street et al. (2005) about the invisibility of some practices.

A second (and related) problem is the limitation of the methods that have been used to examine community literacy practices. Rarely, have studies of family and community literacy managed to achieve an 'insider' view of literacy practices. This should not surprise us as it is difficult to observe family and community literacy practices and the researcher's presence makes a difference to that which is observed. Rarely have in-depth observations been made of natural settings, and except for a small number of significant ethnographies and case studies, most research has involved limited time with small numbers of families. Getting at the 'invisible' literacy practices of home and community is one of the major challenges of researchers. The impact of multimedia and its prevalence poses special challenges for the researcher. What is counted? How is it observed? How are complex relationships between multiliteracies to be uncovered and understood?

As well as these generic issues, there are many specific issues to explore. We need, for example, more studies that consider how gender, social class and culture interact with issues of literacy practice. Are the experiences of some students at home and school influenced by secondary factors such as language background, social class<sup>11</sup>, gender<sup>12</sup> and so on. We also need considerable attention to be given to the impact of school literacy on home literacy as well as the reverse. Rather than simply examining family and community literacy to gain lessons for school literacy, we need to consider the synergistic relationship between the two contexts and the roles that students play as mediators between them. Some of the early intergenerational literacy work may be a useful starting point for this exploration (see Cairney and Ruge, 1998; Gregory, *City Literacies*, Volume 2).

Finally, we need to remember that literacy is not culturally and ideologically neutral (Street, 1995). Hence we need to examine what this means for literacy acquisition and the relationship of family literacy to life and, in particular, public institutions such as schools. It is important to understand how family literacy practices and their relationship to school literacy are implicated in power relationships that affect life chances.

The research reviewed in this chapter provides an incomplete picture of community literacy practices. While the literature is rich in its findings concerning the importance of the family as the first and perhaps

---

<sup>11</sup> One of the seminal works on this topic is the work of Lareau (1989).

<sup>12</sup> The issue of boy's education and falling literacy standards is a significant issue in its own right. Goldman's (2005) key publication provides an overview of this important issue.

most critical site for literacy acquisition, less is known about the literacy practices that are part of children's lives outside school, and how this relates to learning within school. Children experience a richness of literacy practices at home that is not replicated in school (Cairney and Ruge, 1998). This richness may be even more significant when children's involvement in complex communities outside the home is considered. Finally, we need to know much more about the impact of increased opportunities for multi-modal literacy experiences as we enter an increasingly digital age. Understanding how literacy varies across home, school and community contexts, and how these relate to other factors such as social disadvantage, gender and language diversity, is a significant area of research with implications for schools and communities.

## ACADEMIC LITERACIES IN THEORY AND PRACTICE

### INTRODUCTION

The term ‘academic literacies’ provides a way of understanding student writing, which highlights the relationship between language and learning in higher education. It draws upon applied linguistics and social anthropology for its theoretical framing and its orientation towards the social, cultural and contextualized nature of writing in the university. The work on academic literacies sits broadly within a body of research called New Literacy Studies (NLS), which takes a social and cultural approach to writing, in contrast to more cognitive perspectives. The use of the plural form, ‘literacies’, signals a concern with literacy as a range of social and cultural practices around reading and writing in particular contexts, rather than individual cognitive activity. Research findings suggest that in order to understand more about student writing it is necessary to start from the position that literacy is not a unitary skill that can be transferred with ease from context to context. The research points to the requirement for students to switch between many different types of written text, as they encounter new modules or courses and the writing demands of different disciplinary genres, departments and academic staff. It has unpacked this diversity primarily through ethnographic-type qualitative case study research, looking at students’ and faculty experiences of writing for assessment, and the gaps between their expectations of the requirements of writing. In foregrounding the relationship between writing and learning, writing is conceptualized in terms of epistemology—rather than cognitive skill—and what counts as knowledge in the different contexts of the academy.

### EARLY DEVELOPMENTS

In universities across the world academics publish books, journal articles and conference papers, while their students spend much of their time completing written assignments for assessment purposes. It is within this context that increased attention has been paid to student writing, in terms of how best to teach it and how best to support it. The longest tradition of student writing support in tertiary education has been in USA with the provision of freshman composition courses. According to Davidson and Tomic (1999) the first of these “began in

1806, when Harvard established the first Boylston Professorship of Rhetoric and Oratory” (p. 163). Later, alongside the compulsory freshman writing course, the expansion of US higher education in the 1960s led to the setting up of remedial or basic writing courses, for those students who were not deemed ready for the freshman courses. In tandem with the compulsory requirement for all American university students to follow a freshman writing course came the development of the College Composition movement which was well established from the 1960s in the USA, as practitioners, who were responsible for teaching these courses, also theorized their work in publications concerned with teaching writing (cf. Bartholomae, 1986; Bizzell, 1982). However, in the United Kingdom and other countries with similar educational traditions, there was little systematic attention paid to student writing in higher education before the mid-1980s (Ivanič and Lea, 2006).

Present day orientations towards theorizing academic literacies have their roots, in part, in the work which was carried out by practitioners supporting student writers in USA in the early 1980s. At this time a new direction had begun to emerge in the US literature which raised questions about the nature of academic discourse. This was informed by work in linguistics and literary theory, and contrasted with the more cognitive and psychological models of the individual learner which had come to dominate writing research. Bizzell (1982), for example, critiqued what she termed the ‘inner-directed theorists’, who were primarily concerned with the context-free cognitive workings of the individual mind. She contrasted their approach to writing with the ‘outer-directed theorists’, who, she suggested, were concerned with the social context of writing, and in particular with the influence of discourse communities in the use of language. She argued that the focus for student writers should be on discourse communities and the requirement to address their conventions; the task of freshman composition and basic writing teachers was to introduce students to academic discourse conventions.

Bartholomae (1986) also called for a social view of writing. He, too, was situated in the freshman composition context and concerned with basic writers and the ways in which inexperienced, novice writers wrote themselves into academic discourse and the different disciplinary conventions of the university. Coming from an English and humanities tradition, Bartholomae (op.cit) saw writing as both a social and political act, whereby students had to appropriate a specialized discourse; in Bartholomae’s view this was often a matter of imitation. Both Bizzell (1982) and Bartholomae were concerned to find ways in which the student could be acculturated as smoothly as possible into both the broader discourse of the academy and the specific discourse conventions of particular disciplines.

At the same time that writers in the USA were focusing on the ways in which students could be helped to learn the conventions of academic discourse, similar approaches were also being taken by Ballard and Clanchy (1988), in Australia, and by Hounsell (1988) in the United Kingdom. These authors came from rather different disciplinary traditions and—in contrast to the US writers—they were not directly concerned with ‘basic writers’ or remedial writing classes. Their research was carried out with standard entrant 18-year-old students in traditional universities. Ballard and Clanchy adopted an anthropological approach in considering the issue of literacy in the university; their focus was upon the relationship between language and culture as a way of understanding more about literacy. Although situating their work within a rather different intellectual tradition from Bizzell (1982) or Bartholomae (1985), the arguments they rehearsed were remarkably similar to the US-based authors. That is, students lacked the experience and understanding of the linguistic traditions and conventions of higher education and they needed to be taught how to “read the culture” (Ballard and Clanchy, 1988, p.11). They argued that, if academics made the culture and its implicit ground rules of disciplinary writing explicit and accessible, students could grasp the way a discipline worked, and surface problems in their writing would disappear.

In the United Kingdom, Hounsell (1988) was one of the first to look in depth at the problems students encountered when confronted with the unfamiliar discourses of the university. He identified academic discourse rather than literacy as “a particular kind of written world, with a tacit set of conventions, or ‘code’, of its own.” In common with Ballard and Clanchy (1988) he also conceptualized this code as ‘crackable’. He illustrates how students need to be sensitive to different disciplinary ways of framing in their writing, and highlights the tacit nature of academic discourse calling for the features of academic discourse to be made more explicit to students. Although in many ways this work was the forerunner of ‘academic literacies’ research, it can be critiqued for its lack of attention both to the ways in which language is specifically implicated in the learning process and to deeper epistemological issues concerning the ways in which writing constructs disciplinary bodies of knowledge.

## MAJOR CONTRIBUTIONS

### *New Literacy Studies*

Against this backdrop a new body of work began to emerge. This offered a different explanation of students’ struggles with writing and meaning making, which went further than the problems of acculturation into

disciplinary discourse—as evidenced in the work described earlier—and explored the nature of power and authority in student writing (Ivanič, 1998; Lea, 1994; Lillis, 1997). This particular orientation laid the foundation for the contested approach which has become the hallmark of academic literacies research during the last decade. In 1996 Street published an innovative chapter on academic literacies which both challenged academic convention (by incorporating the original texts of others) and foregrounded questions of ‘academic literacy’. The perspective taken by Street (1996) in this publication sat within a body of work which had become known as the ‘New Literacy Studies’. Street’s seminal contribution to NLS had been made earlier when he distinguished between autonomous and ideological models of literacy (Street, 1984). He had argued that whereas an autonomous model of literacy suggests that literacy is a decontextualized skill, which once learnt can be transferred with ease from one context to another, the ideological model highlights the contextual and social nature of literacy practices, and the relationships of power and authority which are implicit in any literacy event. Literacy, then, is not something which once acquired can be effortlessly applied to any context requiring mastery of the written word. Writing and reading practices are deeply social activities; familiarity with and understanding these practices takes place in specific social contexts, which are overlaid with ideological complexities, for example, with regard to the different values placed on particular kinds of written texts. Following this perspective NLS, with its roots in sociolinguistics and linguistic anthropology, conceptualizes writing and reading as contextualized social practices.

### *Challenge to Deficit Models of Student Writing*

Until the mid-1990s this body of research had been concerned with school-based, community and work-place literacies but had not paid any attention to literacies in the university. Academic researchers had concentrated in exploring other contexts for research purposes, rather than the university context within which they themselves were situated. Although early work by both Lea (1994) and Lillis (1997) had conceptualized writing as contextualized social practice and had explicitly challenged deficit models of writing, neither situated their work explicitly in the NLS tradition nor made reference to ‘academic literacies’, as such. However, Lea (1994) did illustrate the multiplicity of discourses in the academy, an important distinction from the use of the term discourse in the singular. Ivanič also foregrounded the use of different and competing discourses in her study of mature students (Ivanič, 1998). Overall, what characterized this emerging body of work on student writing was its specific focus on writing as social practice

and recognition of the multiplicity of practices, whether these were conceptualized as discourses or literacies. The use of the term 'literacies', rather than 'discourses' (the framing provided by US writers), gradually became more prevalent in the literature. This was not merely because of its association with a theoretical framing provided by NLS, but because the focus of concern was student writing, rather than spoken language; the term discourse being associated more commonly with the use of spoken rather than written language.

Research by Lea and Street (1998) introduced new theoretical frames to a field which was, at the time in the United Kingdom, still predominantly influenced by psychological accounts of student learning. Rather than frame their work in terms of 'good' and 'poor' writing, they suggested that there was a need to focus on understandings of faculty and students without making any judgements about which practices were deemed most appropriate. They examined student writing against a background of institutional practices, power relations and identities, with meanings being contested between faculty and students, and an emphasis on the different understandings and interpretations of the writing task. Findings from their research suggest fundamental gaps between students' and faculty understandings of the requirements of student writing, providing evidence at the level of epistemology, authority and contestation over knowledge, rather than at the level of technical skill, surface linguistic competence and cultural assimilation. Based on their analysis of their research data, they explicate three models of student writing: study skills; socialization; academic literacies. A study skills model is primarily concerned with the surface features of text, and is based on the assumption that mastery of the correct rules of grammar and syntax, coupled with attention to punctuation and spelling, ensure student competence in academic writing. An academic socialization model assumes that, in order to become successful writers, students need to be acculturated into the discourses and genres of particular disciplines. The third model, which is academic literacies, to some extent subsumes features of the other two, and is concerned with issues of meaning making, identity, power and authority in student writing. These three models and, in particular, the privileging of the academic literacies model, have been drawn upon widely in the literature on teaching and learning in higher education, calling for a more in depth understanding of student writing and its relationship to learning across the academy.

### *Methodological Considerations*

Methodologically the research uses a mix of approaches for data collection and analysis although these tend to be dominated by ethnographic

type and qualitative methods. Research in the field generally draws upon data from a number of different textual sources, frequently using interview transcripts alongside samples of students' writing and faculty feedback on that writing. Researchers have been particularly influenced by critical linguistics, which is concerned not only with the more obvious surface features of language but with the ways in which texts embed subtle relationships of power and authority. Researchers have found this approach to analysis particularly pertinent when examining how students make meaning in their writing. As a consequence of a methodological approach which focuses in detail on the relationship between texts and practices, ongoing research in the field has been influential in challenging dominant deficit models of student writing in higher education practice (cf. Jones et al., 1999; Lea and Stierer, 2000).

To date, much of the research in the field has been carried out amongst marginal groups of students. In her early work Lillis (1997) paid particular attention to the implications of the increasing diversity of the student body, exploring the implications of opening up higher education to previously excluded groups, such as mature women and black students. She uses detailed interview and data from students' essays to explore the ways in which such students make meaning through their academic writing. Methodologically similar perspectives are adopted by Ivanič, in her analysis of mature student writers and the distinctions she elaborates between four aspects of writer identity (Ivanič, 1998). Lea (1998) takes a similar stance in exploring how students studying at a distance construct knowledge through the texts they read and write. Despite the wide variety of contexts being studied, the findings concerning students' struggles with writing and the gaps between tutor and students' expectations and understanding remain remarkably constant. What links research in the field is the attention to the nature of situated practices and their associated written texts.

#### WORK IN PROGRESS

Academic literacies research has gone hand in hand with ongoing changes in global higher education, including increased diversity in the student body, the introduction of modular degree programmes, moves from traditional academic disciplines to vocational and professional courses, e-learning and the globalization of the tertiary sector. These are having profound influences on the kinds of texts that students are being asked to produce for assessment, and more recent research reflects the application of the principles of academic literacies to these changing contexts.

Research in the field has both reflected, and illuminated further, the changing nature of the context for today's academic writing. In this respect, authors have begun to address the implications of this research on student writing for educational development in tertiary education more generally (Lea and Stierer, 2000). One particularly significant aspect of this approach is related to the ongoing attention being paid in tertiary education to the use of reflective writing, particularly in professional and vocational courses. A number of researchers are examining the nature of the writing that is required in these contexts, both foregrounding and problematizing the relationship between the supposedly self-evident relationship between reflective practice and reflective writing (Baynham, 2000; Creme, 2000; Rai, 2004; Stierer, 2000).

Academic literacies research is also taking place against a backdrop of attention to the changing nature of texts themselves, a change first highlighted by the New London Group and their attention to multi-literacies. Arguing that increasing linguistic and cultural diversity and the multiplicity of channels of communication required new ways of understanding the literacy landscape in education, they suggested that language-based approaches alone were inadequate for addressing the changing environment. Their work has been taken forward in debates concerned with the nature of multimodal texts (Kress and Leeuwen, 2001). Thesen (2001) relates these more general debates on multimodality to the changing nature of higher education. Drawing on data from her research in a South African university, she provides evidence for the shifts that are taking place in the new contexts of higher education, which privilege multimodal texts over the essay. She suggests that these are likely to lead to intense struggles over what counts as powerful knowledge. Although this is a persuasive argument in some contexts, a tension, between the privileging of print and the increased use of multimodal texts, continues to surface, with ongoing claims being made for technologies bringing forth new kinds of literacies in educational contexts, in the face of the ongoing dominance of the authority of the written text in tertiary education (cf. Lea, 2004b).

In related debates, Street has critiqued approaches which appeared to align mode with particular types of literacy, for example, the use of terms such as computer literacy, visual literacy, arguing that it is the context rather than the mode which needs to be foregrounded in a social view of literacy (Street, 1996). In addressing this relationship further he uses the term 'new communicative order' to describe the complexity of literacy practices which are associated with screen-based technologies, multimodality, the use of hypertext and the web (Street, 1998). Snyder (2002) adds to these debates, arguing that being literate involves using different modalities, and that the challenge is to consider what technologies mean for educational practices in terms of the

broader social, political, cultural and historical contexts. She suggests that texts are always informed by social and cultural practices and that new types of texts, new language practices and new social formations will develop as people find new ways of communicating with each other.

Despite these general developments, most of the work on literacies and technologies focuses upon school-based and informal contexts of learning (Lankshear et al., 2000; Snyder, 2002) and is not concerned with the contexts of higher education. One exception is a developing body of work which has been taking an academic literacies lens to the texts of online learning. Goodfellow et al. (2004) argue that the texts of computer conference discussion in online courses should be approached as academic writing, embedding relationships of power and authority in much the same way as any other writing in the academy. Despite being virtual environments, students still have to 'read off' the ground rules concerning what counts as knowledge, in a context given primarily by the university delivering the course. Goodfellow and Lea foreground the institutional context of virtual learning and the implications for student writing, whether on or off line. This builds upon their earlier research on a global online course, illustrating how students often struggle with, and have little opportunity to challenge, the dominant literacies and discourses embedded in the course design, thus foregrounding the nature of institutional practice (Goodfellow et al., 2001).

The focus on institutional context is particularly significant because the notion of academic literacies as institutional practice has been somewhat lost in the ways in which the literature of the field has been taken up recently, particularly in educational development circles. The importance of institutional context was first raised by Lea and Street (1998), and in separate publications both the authors have, more recently, returned to this as an essential element of an academic literacies framework (Lea, 2004a; Street, 2004). Street argues that we need to reconsider the whole notion of the university and the role of writing within that. He proposes a way of linking ideas from what he terms the new orders: that is the new work order, the new communicative order and the new epistemological order with academic literacies research.

## PROBLEMS AND DIFFICULTIES

Academic literacies research has been highly successful in providing evidence for new approaches to student writing, which challenge more conventional deficit models and highlight the link between student writing and learning. Indeed, Haggis argues that this framing provides an alternative explanation to dominant approaches towards understanding student learning more generally in a mass higher education system (Haggis, 2003). However, the major challenge to the field, now, is to find

ways of making the research findings relevant and central in pedagogic contexts. In this respect, some authors have raised questions about the relevance of this research to pedagogic practice. Lillis (2003) for example, argues that while 'powerful as an oppositional frame, that is as a *critique* of current conceptualizations and practices of student writing, academic literacies has yet to be developed as a design frame' p. 192. She argues that Bakhtin's work on dialogism provides an added dimension, providing a focus on dialogue rather than monologue as central to supporting student writing. Lea (2004a) raises concerns about the whole focus of the field upon student writing. She suggests that the 'tendency of the research in the field to concentrate on the non-traditional entrant and her writing, whether in terms of age, gender, race or language, at best might mask the implications of the research more broadly and at worst recreate a deficit model or study skills model'. She proposes a model of course design which is based on the findings from academic literacies research and takes more account of literacies across the university.

At present, therefore, the central body of research continues to be around issues of student writing and the applications of academic literacies as a research model to practice-based settings. In this respect, Creme and Cowan (2005) report some interesting research findings in a peer assessment project with students. They argue that it is not only academic teaching staff who have implicit models of 'good writing'. By the second semester of their first year of study, students, too, seemed to have internalized a view of 'the essay', and, in the action research project in question, appeared to be using this tacit knowledge in their response to the work of their peers. Creme and Cowan suggest that their students had already become acculturated, or academically socialized, into institutional ways of talking about essays; that is they seemed to implicitly 'know the rules'. This is a particularly interesting finding because it provides an alternative perspective to the dominant finding of academic literacies research concerning students' struggles with writing. Creme and Cowan conclude that their students had fairly fixed notions of other students' writing and suggest that this could form the basis for further exploration about students as both readers and writers. Academic literacies research has focused almost exclusively on writing and has not foregrounded what is to some extent a self-evident relationship between writing and reading. It may be time to redress this balance.

It is noticeable that the majority of publications in the field draw on research carried out in the United Kingdom, or countries with similar tertiary education structures, for example, South Africa and Australia. This reflects a troubling reality of research into academic and student writing; its national rather than international orientation. This might well be because research reflects local concerns which are not always

understood across cultural divides, particularly when different educational priorities are at stake. We are beginning to see some exception in terms of a related area, the implementation of ‘writing in the disciplines’ programmes (Monroe, 2002). These foreground learning the discipline through writing and adopt principles which are closely related to the ‘academic socialization and ‘academic literacies’ models of student writing. The distinctions and similarities between these two bodies of work remain a fruitful area of collaboration and research, with academic literacies researchers able to offer empirical methods of data collection and analysis, which are not generally evident in the literature in writing in the disciplines.

Methodologically, it could also be argued that the field has somewhat neglected social and cultural approaches to learning, which have their roots in disciplinary traditions other than those of social linguistics and anthropology. Lea (2005) has argued that academic literacies researchers should take account of the framing offered by work on communities of practice (Lave and Wenger, 1991), activity theory (Engestrom, 1987), and actor-network theory (Law, 1992). All these approaches can provide academic literacies researchers with additional methodological tools when analysing their research data.

#### FUTURE DIRECTIONS

This chapter has highlighted the varied and changing nature of the texts and practices found in academic contexts and the contribution made to our understanding of this from academic literacies research. However, to date, the focus has been primarily on writing. With the changing nature of textual practice in tertiary education, as explored in this chapter, it may now be an opportunity for researchers to pay more explicit attention to reading as part of writing, in both print based and virtual contexts. This development could be addressed in tandem with another limitation in the field, the lack of longitudinal ethnographic research in specific institutional settings. More research of this kind could provide evidence for comparison and contrast in different disciplinary contexts and take account of the changing status of knowledge, and its associated texts, in today’s global higher education. A substantive body of work of this nature would establish the dominance of the field and its contribution to understanding how the academy of the twenty-first century is constructed through both its texts and practices.

LITERACIES IN AND OUT OF SCHOOL IN THE  
UNITED STATES

INTRODUCTION

Research on literacy practices separates into two strands. School-based research has focused on reading and writing in formal classrooms, often by examining teaching methods, curricula, learning, and assessment, its goal being to improve students' academic performance. Out-of-school research has documented the myriad literacy practices that occur in a range of institutions and social spaces with an interest in expanding conceptions of what counts as literacy. Important theoretical and conceptual advances in literacy studies have come from research within the second strand. Yet, a divide still exists between the engagement claimed for many youth in terms of their out-of-school literacy practices in contrast with their alienation from school-based reading and writing.

In this chapter, we sketch the major theoretical traditions that have shaped research on the relationships and borders of literacy in and out of school—the ethnography of communication, cultural historical activity theory, and the New Literacy Studies (Hull and Schultz, 2002)—and then introduce recent perspectives from cultural geography and semiotics. Research on literacy out of school continues to be an important and necessary corrective to unidimensional understandings of texts, processes, and contexts. However, the persisting challenge in an age of accountability and testing, narrowing conceptions of literacy, and growing socioeconomic disparities, is how to bridge out-of-school and in-school worlds in ways that make discernable, positive differences in youth's present circumstances and social futures.

EARLY DEVELOPMENTS

Arguably the most durable theoretical tradition to influence literacy studies has been the ethnography of communication, which traces its roots to the early work of Hymes (1964). Using this sociolinguistic approach, anthropologists and linguistics looked out of school at homes and communities to understand children's in-school difficulties, especially those from low-income families. Heath's (1983) decade-long study during the 1960s and 1970s of three contiguous communities in the Southern

USA is the best known and most influential of the bountiful empirical work in this tradition. Her research demonstrated how each community—a black working-class, white working-class, and a racially mixed middle class community—socialized its children into distinct language practices. It also explored, as did subsequent work, how teachers could rethink their pedagogies and curricula to use to advantage the fact that children are differentially socialized into patterns of language use.

A second theoretical tradition is built on the work of the Soviet psychologist Vygotsky and centered on investigating the mind in society or culture in the mind. Highlighting the notion of literacy as a socially organized practice, research in this tradition has emphasized the patterned interplay of skills, knowledge, and technologies within larger activity structures. Flagship literacy research from this perspective was carried out by Scribner and Cole (1981) in the early 1970s. They investigated the cognitive consequences of literacy for the Vai people in Liberia, where it was then possible to decouple the effects of literacy from the effects of schooling. Importantly, Scribner and Cole discovered that particular writing systems and literacy activities fostered specialized forms of thinking, which led them to conceptualize literacy as a multiple practice linked to specific contexts of use. This theoretical tradition, which later developed as “cultural historical activity theory,” focused researchers’ attention both inside and outside of schools.

Drawing on the ethnographic practice of documenting literacy in local communities and the characterization of literacy as multiple and situated, the third tradition, New Literacy Studies (NLS), emphasized the interplay between the meanings of local events and an analysis of broader cultural and political institutions and practices. A founder of the NLS, Gee (1996) popularized the construct of “Discourse,” and literacy as usefully analyzed as part of that larger construct. Further, he drew attention away from a solitary focus on learning and language use in school settings and toward identity construction in and out of schools and across the life span. Gee’s discussion of Discourses provided an important starting place for theorizing the connections between literacy, culture, identity, and power.

Brian Street, also a founder of NLS (1995), argued that schooling and pedagogy have narrowed ideas about literacy. Grounding his theoretical conceptions of literacy in his fieldwork in Iran in the early 1970s, Street (1984, 1995) defined literacy as a social practice rather than a set of neutral or technical skills, the customary definition in schools, adult literacy programs, and mass literacy campaigns. For Street literacy was embedded within ideologies and institutions—local belief systems, economic, political, and social and historical conditions—and he argued that research needed to make the varieties of everyday literacy practices visible. His work inspired a flowering

of such studies as subsequent researchers followed his model of detailing literacy practices in different cultures and institutions, especially out of school.

### MAJOR CONTRIBUTIONS

With the intersecting theories and methods associated with the ethnography of communication, cultural historical activity theory, and the NLS as its base, research on the relationships and borders of literacy practices in and out of school has contributed to our understanding of literacy and learning writ large in several important ways. First, through careful documentation of the learning that takes place in community-sponsored programs, we have learned a great deal about the nature of youth participation and engagement. For instance, in her research on community arts-based organizations, Heath (1998) discovered the importance of the collaborative nature of learning and teaching that occurs as youth draw on their own knowledge and skills through participatory projects.

Creating sustainable after-school activity systems for children, Cole (1996) and his colleagues investigated how learning and play can be combined as youth are provided with diverse starting points for learning and multiple paths to progress. In one such program, Gutiérrez, Baquedano-López, Alvarez, and Chiu (1999, p. 92) argued for the importance of creating contexts for learning where “hybridity” can flourish, “particularly in a time when English-only, anti-immigrant, and anti-affirmative action sentiments influence, if not dominate, educational policy and practice.” Such programs can serve a range of important functions including helping us to reimagine classrooms and students. As Gutiérrez and others have shown, children often interact and learn in very competent ways after school, despite poor records and reputations within traditional classrooms (Hull and Schultz, 2002). After-school programs can reorganize learning, shifting typical student–teacher relationships and participant structures. The voluntary nature of these programs, however, can be crucial, and as Cole (1996) points out, these are contexts within which choice is balanced by discipline and learning is infused with play and imagination.

The turn to homes and communities has allowed us to notice and account for the vast, diverse, and often invisible repertoire of resources that youth bring to school. Using the generative term “funds of knowledge,” Moll and Gonzalez (1994) illustrated how the expertise of parents and community members could be used to bridge home and school; they captured children’s interest and investment in the school’s curriculum by seeking out and drawing upon their own and their family’s distinctive bases of knowledge and social practices. With a

focus on language variation across community contexts, Lee (2000) identified community participation structures, for example, in African American hair salons, to draw on culturally relevant styles of speaking and arguing when she orchestrated classroom discussions about literature. Her research illustrates the potential for engaging students in high levels of reasoning about literary texts by putting to use their tacit knowledge about cultural forms found out of school.

Conducting her research within classrooms, but ever aware of the ways that children of necessity bring their home and peer culture to school, Dyson (1997) argued for the permeability of the classroom curriculum; it needed to include the linguistic and symbolic tools that children appropriate from popular culture and through social relations that extend beyond the school walls. More recently the term “third space” (Bhabha, 1994) has been used to demark the intersection of home, community, and school.

Learning in workplaces has been an important site for rethinking literacy and schooling. To be sure, there has long been interest in the USA in preparing particular students for particular kinds of jobs upon graduation from high school, but in economically tenuous times, that pressure redoubles, as has periodically been the case for the USA in recent years. But whereas the bulk of research and writing around these issues has typically focused on ascertaining exactly what skills workers need to keep the country competitive and themselves employed, research on literacy and work has also tended to complicate the picture. A case in point was Gee, Hull, and Lankshear’s (1996) account of the contradictions at the heart of calls for a “new work order” that would elevate both skill requirements and the privileges, responsibilities, and rights of frontline workers. Hull and colleagues’ studies of “high-performance” workplaces (Gee et al., 1996) linked literacy, identity, and power, revealing how opportunities to engage in particular literacy practices were distributed and constrained, as well as how new structures for participation created unexpected spaces for the exercise of new literacies, literate roles, and literate identities.

#### WORK IN PROGRESS

Current research on literacies in and out of school continues to draw generatively on anthropological and sociolinguistic theories and methods. For instance, researchers continue to describe literacy practices that occur in communities in rich ethnographic detail with attention to language use in social contexts. However, in recent years, the explosion of new technologies and the attendant new media have pushed literacy theory and conceptions of literacy practices in new directions with implications for reconceptualizing school practices. As new

technologies and new media proliferate, scholars have turned to fields such as social semiotics (cf. Kress, 2003) and cultural geography (cf. Leander and Sheehy, 2004; Soja, 1996) to theorize these phenomena. New technologies make it possible for literacies to travel across space and time, complicating further the boundaries between school and out-of-school contexts. For instance, youth continue conversations and work on reading and writing with peers outside of school through instant messaging, bringing knowledge learned at school into their after-school pursuits; they bring internet games and communications begun at home into classrooms, drawing on these conversations and figures from games as they write literacy analyses; and they cross local, national, and international borders, communicating digitally with interlocutors at great physical removes through blogs, online interest groups, and assorted web sites.

As a result, rather than viewing literacy practices as socially situated, researchers have documented how discursive practices shape relationships in both time and space (Leander and Sheehy, 2004). Thus, youth are never really either simply in school or out of school: their identities and practices travel across those spaces. Further, the interaction between literacies and the production of identities, especially as students traverse the borders of school and communities and nation-states, has proven to be a critical area of study.

Current researchers have focused on the documentation of literacy practices across the boundaries of school and out-of-school contexts, noting the affordances of these new literacy practices and the implications for teaching and learning (e.g., Gee, 2003; Soep and Chavez, 2005). In her study of the popular genre of anime, Mahar (2003) found that instead of separating in- and out-of-school literacy practices, teachers used in-school tools to read out-of-school texts. She suggests that by learning about adolescents' worlds and popular cultures, teachers can become guides to helping them develop critical strategies for reading and assessing the truth of what they read. Knobel and Lankshear (2006) argue further that the investigation of youth blogs and the practice of blogging provides a window into what we might term "powerful writing," giving teachers access to the words and worlds of youth, shifting what we consider to be "powerful writing" from an individual to collective accomplishment, and from a local to a global practice. Finally, educators have usefully brought youth music (e.g., hiphop, beats) and youth media into classroom, hoping to capture student attention and interest in learning school material by paying respectful attention to youth cultural practices (cf. Morrell, 2004).

Documenting a Chinese immigrant youth's participation in an internet site that included a transnational group of peers led Lam (2000) to raise questions about literacies, transnational identities and "cultural

belonging” (p. 457). Lam explains that the youth used the internet to develop a range of discourse practices and online identities with a “transborder” network of peers. While English spoken in his classroom seemed to contribute to his sense of marginalization, the English he acquired through the internet was the global English of adolescent pop culture and contributed to a sense of belonging. The textual and semiotic tools of the internet contributed simultaneously to the development of literacy practices that could be transferred to school tasks, while affording him new identities. Such work suggests a broader and critical conception of literacies in and out of school that reflect students’ relationships with multiple target languages and communities (Lam, 2000).

Situating their work in the study of youth and media, Soep and Chavez (in press) explain that although much of the research in the past documented the deleterious effects of media on youth, more recently scholars, educators, and activists have investigated how media is conceptualized, produced, and distributed by youth. They conceptualize what they call the “pedagogy of collegiality” (Soep and Chavez, in press) or the shared responsibility youth felt to build community and accomplish media-related projects. In this pedagogy, youth and adults jointly frame and carry out the tasks with both groups accountable to an outside audience.

Hull and James (2007) bring together current work that connects recent research on literacy with theoretical understandings from semiotics and cultural geography in their work in the university–community based organization called Digital Underground Storytelling for Youth (DUSTY). A centerpiece of this work is the creation of what they call “identity texts,” which are constructed through spoken word performances, written narratives, photo collections, storyboards, musical compositions, animations, or digital stories with a focus on fostering agency through a range of semiotic resources. Projects like DUSTY extend school-based definitions of literacy to include the visual and the performative. Drawing on notions of space and place (e.g., Soja, 1996) Hull and colleagues raise questions such as: “How is the construction of identities, both individual and collective, influenced by and enacted through spatiality?” In DUSTY, youth are provided with material tools and supportive social practices to construct new worlds and identities through multimedia and multimodalities. They conclude that learning to communicate with words, images, sound, and movement, and being able to produce artifacts that can traverse geographical, social, and semiotic boundaries brings us close to a new definition of literacy.

In her recent work, Heath (2000) has developed a new conception on schools based on her close study of learning outside of school contexts. Although this might not be an entirely realistic vision of schools given

current constraints on curriculum and pedagogy, it represents a possibility based on what we have learned about youth, literacy, and learning from studies of literacy and learning in out-of-school contexts. Heath's proposal is to envision schools as an integrated system of learning environments explaining that schools should be "central nodes" within a web of learning contexts for children which might include museums, playgrounds, libraries, and the like that are open all day and all year. She writes:

An ecology of learning environments would be the focus, rather than schools alone. In this way, societal members would reconceive young people as learners and resources for the learning of others rather than as passive students (p. 128).

This vision of what is possible suggests what we can—and indeed should-be learning from looking across schools and communities to understand the possibilities for literacy and learning that both suggest.

### PROBLEMS AND DIFFICULTIES

At the same time that there is an explosion of new literacy practices in out-of-school spaces, learning and literacy in school has narrowed. In response to pressures for Adequate Yearly Progress (AYP) imposed by the federal No Child Left Behind (NCLB) legislation in the USA and comparable legislation and state-regulated curriculum in countries around the world, schools and districts have increasingly substituted test preparation for engaged learning, moving the curriculum further away from youth interests and knowledge so vividly displayed in out-of-school spaces. This creates a wide gulf between school pedagogies and what we know and have learned through the documentation of out-of-school literacy practices. As Carmen Luke (2003, p. 398) explains:

When learning is no longer geographically tied to a desk, the school library, the book, or the teacher who demands 'all eyes up front,' then old-style transmission and surveillance pedagogy becomes less stable and less defensible but complementary to the out-of-school pedagogies and practices in households, communities and workplaces.

As a result, although schools and educators might recognize new literacy practices and technologies, this new knowledge has not fundamentally changed the structures of schools. Curriculum and content continue to be delivered in predictable ways and school knowledge and literacy practices tend to be valued over those used in everyday life. Out-of-school practices are used in service of school knowledge, to engage students in learning rather than to transform teaching, learning, and schooling.

Regulatory agencies at the federal, state, and local levels are strengthening the boundaries between school and communities, tightening control over what is taught in school. The demand for academic achievement that is narrowly defined has resulted in the disappearance of spaces for experimentation inside of school, marginalizing the opportunities to build on students' interests and knowledge based on their out-of-school practices. At the same time that researchers have usefully documented out-of-school literacy practices, juxtaposing youth's engagement with them to their alienation from school-based reading and writing, there has been a tendency to valorize such practices uncritically and to attribute to them too much agency (Hull and Schultz, 2002). For instance, we may overestimate how much youth know and learn through their engagement out of school with digital literacies, especially since these technologies are unevenly distributed across communities and there may be a social hierarchy among children in terms of knowledge and use (Moss, 2006). An additional concern is that, on the basis of erroneous assumptions about students' interests and identities, we constrain their opportunities to make choices that differ from perceptions of the norm. Why is it, Noguera (2003) asks, that we automatically assume African American boys are able to rap but not to debate?

Despite the plethora of research and documentation of out-of-school literacies, it seems clear to us that this work has not yet had the necessary impact on the ways schools are structured and the content of the curriculum in most countries and local districts. Instead, the norms associated with schooling have seemed to increase their reach, extending to nonschool learning spaces. For example, after-school programs in the USA and elsewhere have increasingly turned to schools as models, continuing the teaching during the school day after the school bell rings. The pressure for mastering content for tests has led to after-school programs based on test preparation and homework help. In many parts of the world, high-stakes national examinations lead parents and children to after-school programs that drill students in facts to prepare them for tests, which often determine whether or not youth can attend universities. Rather than a useful dialogic exchange between the academic and social content of learning that takes place inside and outside of school spaces, after-school programs, particularly those located in school buildings, are becoming extensions of schools. Teaching and learning is determined by examinations written by adults who are often at a far remove from the literacies and technologies that guide youth's lives.

A further challenge for research on literacies in and out of school is the design of research projects that might capture the movement and flow of literacy practices across boundaries such as those between school and community, but also across digital and print media and

transnational boundaries. Multisited ethnography (Marcus, 1995) has guided researchers to document practices in multiple settings. Questions about methodology as well as ethics arise as researchers attempt to capture the wide range of literacy practices that youth engage in such as online conversations and text messaging. Although youth can inform their interlocutors that they are involved in a study, it becomes easy for outsiders to unknowingly become a part of a research project. At the same time, capturing the rich, complex nature of interactions and circulating literacy practices (Schultz, 2006) invites researchers to reimagine research methods and design.

### FUTURE DIRECTIONS

Eyes focused on the computer screen and oblivious to the surrounding noise in her fifth grade classroom, Saima typed out the following poem that would become a centerpiece of her multimedia story:

I need an answer, for a question from deep inside.

Is life a hard journey, or just an easy ride?

I see this world as a big and open field,

Filled with opportunities and with problems to deal

A few days later Saima spoke these same words into a digital tape recorder to add to the soundtrack for her multimodal story. Once completed, the story was a bold statement about her life and her ambitions. It was an iMovie composed of family photographs, images from the internet, maps, and text. The final product included music from Saima's home country, Bangladesh, and her own soft voice reading two poems and a letter addressed to her teacher. The movie drew readers into the contours of Saima's life with wedding pictures and portraits of two sisters shyly posing for the camera. It also had a large embrace, addressing global issues such as conflict in the Middle East. Contributing more words to the classroom conversation than Saima had added all year, the movie had a loud presence. Its author, a small, shy girl who rarely spoke above a whisper and had only learned to speak English within the past year, seemed as awed by the process as her teachers (Schultz, 2006).

This vignette, drawn from research conducted over the past four years by Schultz and colleagues, illustrates the possibilities for introducing digital technologies into the school day to support a standardized core curriculum. As we look toward the future, we are well aware that it is impossible to imagine the new forms of literacy practices that will become available and the ways in which they will traverse home, community, and school spaces. The worry is that school curricula will continue to tighten, making it nearly impossible to incorporate new modes and media for expression, but the hope is that they will expand, providing the sorts of openings described here.

As these tensions play out, we expect and would encourage research on several fronts. Researchers can helpfully juxtapose the logocentric practices that dominate in schooling with opportunities to communicate in the multiplex combinations of modes and media that currently proliferate, sorting out the affordances and constraints of each. Attention can usefully be paid to ever-changing conceptions of space, place, and borders, rather than in-school and out-of-school dichotomies; after all, digital communication has the potential to bypass customary limitations of location, geography, and identity. In an age in which differences in an interconnected world grow more salient, even as we become increasingly aware of own identities as multiple, we hope for literacy research that enables students to imagine, access, and participate in the realities of others. And like the previous generation of researchers who pioneered the theoretical orientations that have proved so durable for studies of literacy across contexts, we urge the continuation of research that takes as its broadest goal the provision of opportunities to learn and thrive for all students.

We expect, however, that such studies will not proceed from the assumption that detailing differences in linguistic and social practices and celebrating diverse literacies, as helpful as this work has been, will necessarily or easily result in more equitable educational and social futures. Rather, the difficult lesson that researchers of in-school and out-of-school borders and relationships have learned, and their true challenge for the future, is the need now for new theoretical perspectives. These new theories will need to take into account the ways in which schooling and society are strongly bent toward social reproduction (Bourdieu and Passeron, 1977); they will need to assume just as vigorously the existence of intercultural, cross-cultural, and cross-national spaces where agency, resistance, and new identities grow (Appadurai, 1996); and of course, they will need to look expectantly and critically at the role of literacy, and as well as other semiotic systems, in this process.

## LITERACIES IN THE CLASSROOM

### INTRODUCTION

As teachers and children interact among themselves and with each other in classrooms, they use written language and related semiotic systems (such as text messaging and internet technologies) for a broad range of purposes. They acquire academic information and concepts, negotiate social relationships and social identities, engage in imaginary play, control others and themselves, and express their emotions and needs, among other functions. They also use written language to acquire competence in a select set of literacy practices (ways of using written language) labeled school literacy practices (more commonly described as learning to read and write) and academic literacies (ways of using written language in academic disciplines).

As a heuristic, literacy practices in classrooms can be categorized as official or unofficial literacy practices. Official literacy practices are promoted by the school and include learning to read and write literacy practices and academic literacies. Unofficial literacy practices are not sanctioned by the school (but may be tolerated) and occur in the classroom subrosa (e.g., Maybin, forthcoming). These include literacy practices such as passing notes, noninstructional game playing, and graffiti writing, among others. Here, we focus on official literacy practices.

Research on literacy practices in classrooms has been concerned with the nature of classroom literacy practices, the relationship of literacy practices outside of the classroom (in home and community) to literacy practices in classrooms, the use of classroom literacy practices for schooling, academic literacies, critique, and community action (cf. Schultz and Hull, *Literacies In and Out of School in the United States*, Volume 2).

### NATURE OF CLASSROOM LITERACY PRACTICES

The warrant for describing literacies in classrooms derives from a conception of literacy as social practices involving written language (cf. Bloome, Carter, Christian, Otto, and Shuart-Faris, 2005; Heath, 1983; Pahl and Rowsell, 2005; Street, 1995) as opposed to defining literacy as a set of decontextualized, autonomous cognitive and linguistic processes. Literacy is inherently multiple; there are a broad range of

differing literacy practices. Literacy practices are embedded in and influence social situations and social events (e.g., face-to-face interactions) which are themselves embedded in broader cultural and social contexts including institutional contexts such as schooling. Thus, description of literacy practices in classrooms requires description of how those literacy practices are contextualized.

As a context for literacy practices, classrooms can be heuristically described as “cultural” communities. Within each classroom, teachers and students continuously negotiate a set of shared expectations and standards for the organization of events, how people will relate to each other, how meaning and significance are assigned to actions and materials, and how spoken and written language is to be used within and across classroom events, etc. Variation within and across classroom contexts and in the schools and communities in which classrooms are located implicate variation in the literacy practices within those classrooms. As such, key questions in the description of literacy practices in classrooms include:

1. What is (are) the nature(s) of classroom literacy practices given pedagogical contexts?
2. What literacy practices are constructed, and how, within and across classrooms?
3. How do teachers and students take hold of these literacy practices and change, and adapt them to new situations and goals?

Street and Street (1991) label pedagogically contextualized literacy practices as *school literacy practices* and describe their attributes as involving the objectification of language and an emphasis on metalinguistic practices. Thus, a distinction can be made between school literacy practices as described by Street and Street (1991) and literacy practices located in classrooms, per se. That is to say, school literacy practices do not necessarily constitute the entire set of literacy practices within classrooms. Some classrooms may eschew school literacy practices and foreground those that emphasize reading and writing for enjoyment and the expression of emotions and views.

Within the category of school literacy practices, there is variation both within and across classrooms. Borko and Eisenhart (1987) describe differences in reading practices across hierarchically organized instructional reading groups within a classroom. They show how students become socialized to the ways of using language and doing reading specific to their reading group making it difficult for students to move to another reading group. Similarly, uses of language and reading practices vary across classrooms organized by hierarchical tracks. Students acquire the literacy practices of their reading group or track with the accompanying consequence of acquiring a social identity associated with their reading group or track. Their social identity is

both a result of their membership in the reading group or track and a result of using language and engaging in reading in ways consistent with that group's ways of using language and doing reading.

Some schools and classrooms may layer the pedagogical context with cultural ideologies that go beyond individual student achievement. For example, religious schools may emphasize learning to read as a nonhierarchical religious obligation; educational programs derived from political agendas may emphasize school literacy as part of a new nationalism or as revolutionary change, alternative schools may emphasize community pride, noncompetitive social relationships or other agendas as part of how they contextualize learning to read and write, etc. (cf. Cucchiara in Street, 2005). Such layering of cultural ideologies reframes how literacy practices in classrooms are understood and enacted by teachers, students, and others.

A distinction is needed between the surface level form of classroom literacy practices and deeper level functions and structuring of social relationships, knowledge, and ways of acting on the worlds in which teachers and students live. For example, Bloome, Carter, Christian, Otto, and Shuart-Faris (2005) showed how a teacher adapted what appeared on the surface to be traditional school literacy practices to help students engage in a "deeper" social agenda—to learn to use literary oriented literacy practices to question relationships between language and race relations.

#### THE RELATIONSHIP OF LITERACY PRACTICES OUTSIDE OF THE CLASSROOM (IN HOME AND COMMUNITY) TO LITERACY PRACTICES IN CLASSROOMS

The warrant for examining relationships among literacy practices outside of the classroom to those inside of the classroom derives from recognition that students have lives outside of the classroom that may affect how they engage in the literacy practices of the classroom. Students may bring their home and community based cultural models of how to use spoken and written language to classroom literacy practices. (cf. Maybin, forthcoming)

#### *Cross-Cultural Contexts of Literacy Practices in Classrooms*

A long-term ethnography of language and literacy practices by Heath (1983) in three culturally and economically different communities showed that the ways in which children use spoken and written language are derivative of both the communities' specific literacy practices and of broader cultural themes integral to each respective community.

As such, when children approach any social event, including social events in the classroom, the expectations and participatory frames they hold for what constitutes appropriate and effective use of spoken and written language derive from their experiences in analogous social events in their families and communities and in the broader family and community context. When the expectations and participatory frames for classroom events are foreign to the children—as may occur when their expectations and frames are derived from a different set of cultural experiences other than those on which classroom literacy practices are based, the children may not participate appropriately, effectively signal their competence with spoken and written language, or understand what is being expected of them, its import, or the basis for how their actions are being interpreted by the teacher. Such cross-cultural differences are especially likely for students from nondominant cultural and linguistic communities, potentially resulting in misevaluation and misinstruction (Cazden, John, and Hymes, 1972; Cook-Gumperz, 1986; Moss, 1994).

Taking a different view, Ogbu (1974; Ogbu and Simons, 1998) suggested that the historical and economic circumstances of minority groups' relationships with the dominant cultural and economic group fosters differential responses by students to engagement in classroom literacy practices. The existence of job ceilings on minorities influences how students view the efficacy of their participation in classroom instructional practices. In addition, Ogbu argued that there is a differential response to participation in school between those students who come from what Ogbu describes as voluntary minority communities versus those who come from an involuntary minority community. A voluntary minority community had voluntarily chosen to migrate to the target country and students from such communities adopt a stance of cooperation with the literacy practices of the classroom even if there are cross-cultural differences. An involuntary minority community has been forcibly brought to the target country through enslavement. Students from an involuntary minority community may adopt a stance of opposition to participation in the literacy practices of the classroom. The oppositional stance is viewed as fostering social solidarity and social identity of the students from that community and a distancing from the continued domination of the minority community.

### *Culturally Responsive Pedagogies as Context for Classroom Literacy Practices*

Recognition of cross-cultural differences as well as the low-academic achievement of students from many cultural and racial minority groups (when compared to their white, middle-class counterparts), has raised

questions about how classroom literacy practices as part of pedagogical practice might be organized. Shifts in the participatory organization of instructional practices so that they more closely resemble and take advantage of analogous practices with students' home communities have been shown to enhance participation and achievement (e.g., Au, 1980). Taking a broader perspective, Ladson-Billings (1994, 2005), Gay and Banks (2000) and others, have argued for culturally responsive pedagogies that include but go beyond the participatory organization of classroom literacy practices and incorporate broader cultural themes and interpersonal relationships consistent with students' home cultures. As such, classroom literacy practices are embedded in a broader cultural context focusing on interpersonal relationships among teachers, students, parents, and other community members; and this broader cultural context can be viewed as reframing the meaning and significance of participation in classroom literacy practices.

Part of the dynamic addressed by culturally responsive pedagogy involves eschewing *a priori* constructions of students as having a deficit cultural and linguistic backgrounds that make difficult students' effective participation in classroom literacy practices. The concept of funds of knowledge has been used to emphasize that the homes and communities of cultural and linguistic minority students are not deficit in social, linguistic and cultural capital, but rather that teachers need to design curriculum and instruction in ways that provide opportunities for students to bring to their participation in classroom literacy events the funds of knowledge available in their households and communities (Gonzales, Moll, and Amanti, 2005; Moll, Amanti, Neff, and Gonzalez, 1992). Similarly, Lee (1997) and Richardson (2003) argue for pedagogies for literacy learning that incorporate students' language and experiences in bridging to academic learning. Similarly, Willett, Solsken, and Wilson-Keenan (1999) describe how bringing parents into the classroom in ways that foreground the parents' cultural and vocational expertise, histories, and experiences, provides opportunities for students to engage in new forms of literacy practices by incorporating the cultural knowledge from across parents from diverse communities.

Bringing students' home cultures and languages to school literacy practices and academic learning provides opportunities for the students and the teacher to generate new understandings and heuristics. Gutierrez, Rymes, and Larson (1995) has labeled such a learning space, the third space, as it represents neither the dominant culture and language of the school nor those of the students, but one created by the dialectics involved in their juxtaposition. That is, activity in the third space is generative of new literacy practices and new understandings of academic knowledge for both the students and the teacher.

Central to the concepts of culturally responsive pedagogies, funds of knowledge, and teaching/learning in the third space is framing participation in classroom literacy practices and academic learning as not requiring cultural and linguistic minority students to make a choice between assimilation to the dominant culture and loss of cultural identity versus opposition to acquiring the literacy practices of the classroom. By building on the cultural and linguistic resources of students' home and community cultures and language, classroom literacy practices can strengthen students' connections and social identities with their cultural communities while they acquire school literacies and academic literacies.

USES OF CLASSROOM LITERACY PRACTICES  
FOR SCHOOLING, ACADEMIC LITERACIES,  
CRITIQUE, AND COMMUNITY ACTION

The range of opportunities for the writing of extended texts in classrooms are often limited (Applebee, 1984) and the instructional conversational contexts in which writing and reading occur often restrict extended response and opportunity to explore texts, topics and interpretations in depth (Nystrand, 2006). At issue is not merely expanding the range of opportunities for writing and reading nor simply restructuring instructional conversations to provide students with opportunities for topic initiation, extended response, and complex, higher level cognitive tasks. Rather, following Gee's (2004) critique of traditional schooling, shifting classroom literacy practices from an instructional context and from being about doing school (cf. Bloome, Puro, and Theodorou, 1989) to what Gee calls a cultural process. The example Gee (2004) uses below of learning physics applies equally well to learning to read and write.

Besides natural and instructed learning processes, there are also what we can call "cultural processes." There are some things that are so important to a cultural group that the group ensures that everyone who needs to learn them . . . What does it mean to learn physics as a cultural process? Masters (physicists) allow learners to collaborate with them on projects that the learners could not carry out on their own. . . . Learners see learning physics as not just "getting a grade" or "doing school" but as part and parcel of taking on the emerging identity of being a physicist. . . . Children who learn to read successfully do so because, for them learning to read is a cultural and not primarily an instructed process. . . . Children who must learn reading primarily as an instructed process in school are at an acute disadvantage (pp. 12–13).

Yeager, Floriani, and Green (1998) provide examples of teaching/learning the literacy practices of history and science as cultural processes in a middle school classroom by providing opportunities for students to engage in historical study as historians and scientific inquiry as scientists. But where Gee emphasizes work with “Masters,” Yeager, Floriani, and Green engaged students in ethnographic study of what it means to be a historian and scientist and that ethnographic study was used by students to construct literacy practices and learning practices that incorporated the ‘cultural processes’ of those academic disciplines.

### *Academic Literacies*

The literacy practices of academic disciplines and academic communities can be labeled academic literacies. Street (2005), drawing upon Lea and Street (1997) (cf. also Lea, *Academic Literacies in Theory and Practice*, Volume 2) identifies three heuristic models for acquiring the literacy practices of an academic discipline/academic community. The skills model focuses on instructing students in the skills needed to engage in the literacy practices of the academic discipline, often by isolating the skills and sequencing their mastery. The socialization model focuses on having students acquire literacy practices by engaging in those practices with more knowledgeable others (e.g., masters) within the context of the academic discipline/community. As the student becomes more adept at the set of literacy practices of the academic discipline and community, the student increasingly becomes a member of that academic discipline/community. The academic literacies model emphasizes acquisition of the literacy practices of an academic discipline/academic community in a manner similar to that of the socialization model, but also emphasizes critical reflection on those literacy practices and adaptation of those literacy practices based on what students bring to those literacy practices and the need to address new situations that are not necessarily bounded by that academic discipline/academic community. In the academic literacies model, neither the set of literacy practices nor the academic discipline/academic community are fixed and static, but both are continuously evolving and changing.

### *Critique and Social Action*

One direction in classroom literacy practices has involved critical analysis of the worlds in which students live. Often finding roots in the literacy education theories and practices of Friere (2000), critical literacy practices focus attention on the power relations promulgated in and

through texts (Baker and Luke, 1991; Comber and Simpson, 2001; Lankshear, 1997; Lankshear and Knobel, 2003; Morgan, 1997). An underlying assumption is that no text and no act of literacy is ever neutral with regard to cultural ideology and with regard to power relations. Critical literacy practices foreground interrogating texts in order to make visible those power relations. Similarly, attention is paid to the nature of literacy practices and literacy education practices themselves. Questions are asked about how a particular literacy practice or pedagogical practice structures relationships among people and how it privileges particular interpretations and understandings as opposed to others. Of special concern are those interpretations and understandings of texts and literacy practices that appear to naturalize inequitable distribution of privileges and advantage (Macedo, 1996).

Beyond critical analysis, in some classrooms literacy practices are organized to engage students in social and community action. In a series of studies reported in Egan-Robertson and Bloome (1998), students engaged in a series of ethnographic and linguistic studies of their own communities as a way to shift the context of classroom literacy practices from one which foregrounded instruction to one which foregrounded community action and purposeful inquiry. The literacy practices involved in those studies ranged from ethnographic note taking to letter writing to critical reading of community texts to report writing and presenting, among others. However, key to understanding the literacy practices was their orchestration within an ethnographic framework that enabled teachers and students to bring new epistemological understandings to constructing knowledge about their communities, identifying community issues, reporting on them to the community, and taking action. The actions taken often involved literacy practices that made visible people in the community who had made notable contributions to the community or that preserved a history and culture of a community (cf. also Larson, 2005).

#### FUTURE DIRECTIONS

Classroom literacy practices both influence and are influenced by the contexts in which they exist. Thus, as social, cultural, and economic contexts change, both at local levels and at broader levels, classroom literacy practices will both reflect those changes and will contribute to defining those changes. Here, three changes are considered that are likely to influence and be influenced by classroom literacy practices: the increasing integration of digital literacies into daily lives (cf. Leander and Lewis, *Literacy and Internet Technologies*, Volume 2; cf. Kress and van Leeuwen, 2001), increasing racial, cultural, and linguistic heterogeneity, and cultural and economic globalization.

As Lankshear and Knobel (2003) argue, it is not the increasing presence of digital literacies (what they call New Literacies) that constitutes a change in the social context, but rather that large numbers of people outside of schools (including large numbers of young people) have taken up these new literacies, adapted them to their own uses, needs, and interests, and created a series of cultural dynamics that are likely to influence the context of classroom literacies. Lankshear and Knobel note four dimensions of the change provoked by how people have taken up the new literacies:

1. Changes in “the world (objects, phenomena) to be known,” resulting from the impact of digitization.
2. Changes in conceptions of knowledge and processes of “coming to know,” contingent upon deeper incursions of digitization into everyday practices.
3. Changes in the constitution of “knowers,” which reflect the impact of digitization.
4. Changes in the relative significance of, and balance among, different forms and modes of knowing, which are associated with the impact of digitization (p. 158).

How classroom literacy practices will respond to, contribute to, and refract those four dimensions is likely to be varied, depending as much on local contexts as on how the four dimensions above are mediated by various social institutions.

Increasing racial, cultural, and linguistic heterogeneity refers to demographic changes in geographies and social institutions, such as schools, in ways that make racial, cultural, and linguistic homogeneity less prevalent and more challenged (cf. Willis, *Critical Race Theory*, Volume 2). Again, it is not the heterogeneity itself that creates a changing social context of classroom literacy practices, but rather how that heterogeneity is taken up within local and broader contexts. Noting the changing demographics in the USA, Willis, Garcia, Barrera, and Harris (2003) argue for classrooms to adopt a multicultural literacy curriculum. Garcia (2003) explains that such a curriculum would foreground:

A complex understanding of culture and its relation to literacy, a strong commitment to social justice, a transformative mission, and implementation of the emancipatory paradigm (p. 2).

The taking up of a multicultural curriculum involves more than a surface level change in the nature of classroom literacy practices; it involves epistemological and ontological changes, social relationship and identity issues, changes in power relations, etc. (Enciso, 2003). Although, some classrooms have taken up a multicultural literacy curriculum as described by Willis, Garcia, Barrera, and Harris (2003), the degree to which a multicultural literacy curriculum will be taken up and

redefine classroom literacy practices more broadly may depend on how changing demographics are incorporated in schools and how such incorporation is mediated by other social institutions at the local and broader level.

Globalization can be defined as a historical process through which there is increasing interaction among people globally across economic, cultural, and linguistic domains (cf. Luke and Carrington, 2002). Whether globalization involves increasing standardizing of cultural and linguistic practices and increasing centralizing of economic decision making and control is debatable. Regardless, as globalization extends even to remote rural areas, classroom literacy practices are influenced by the economic, cultural, and linguistic dilemmas, opportunities, and problems globalization entails. Within local contexts, people will increasingly have to struggle with how to balance maintenance of their local culture, community and ways of life with preparing their children for a world in which access to economic, intellectual, academic, cultural, and material resources will depend on being able to interact on a global level and address what people are doing elsewhere in the world (cf. Brandt and Clinton, 2002). Communities will variously choose to resist, to adapt themselves, to balance between the local and the global, to incorporate globalization within their own economic, cultural, and linguistic frames, or some combination. Such choices will affect classroom literacy practices as such choices shift the epistemological context and the context of social relationships.

### **Living Literacies – Social and Cultural Experience**

## LITERACIES AND ETHNOLINGUISTIC DIVERSITY: CHICAGO

### INTRODUCTION

Chicago, in many ways an archetypal U.S. city, has become a global city, closely linked to other places in the world economically, culturally, and linguistically. Chicago has always had links to other places in the world through its large immigrant populations, but the rapid pace of recent globalization processes has intensified these connections. Globalization, however, yields pressures that move in two directions that have implications for literacy. Increased transnational communication, especially via mass media like satellite television, facilitates the development of a global monoculture, e.g., among youth worldwide who emulate African American musical and verbal style, thus spreading English literacy in the form of song lyrics. Yet global movements toward sameness are complemented by the marked differentiation of ethnic, class and other identities at local levels. Research in a variety of Chicago communities (Farr, 2004, 2005c), for example, has shown the resilience of such multiple ethnolinguistic identities and their accompanying languages and scripts. Such ethnolinguistic identities encompass verbal styles, both oral and written, that are closely associated with ethnic/racial, gender, class, religious, and other identities.

Identities, in fact, are inseparable from the verbal styles that characterize them: as people speak or write, they construct themselves as particular kinds of people with particular ethnic, racial, class, gender, religious, or other identities. Verbal styles that construct identities are expressed both in speaking and in literacy practices in a wide range of contexts. Across Chicago's neighborhoods, for example, many different languages are spoken, written, and read in both public and private contexts: in stores, businesses, schools, homes, community centers, religious congregations, and workplaces. Signs in these neighborhoods are in English, Spanish, Polish, Arabic, Chinese, Italian, Greek, Hindi, Russian, Korean, Thai, etc., indicating either the residential or the commercial presence of people who speak, read, and write those languages. The notable multiplicity of ethnolinguistic styles reaffirms Chicago's reputation as a vibrant, multicultural and multilingual metropolitan area. Research on this ethnolinguistic diversity is relatively scant and recent, however.

## EARLY DEVELOPMENTS

Historical research has documented that, from its beginnings, Chicago has been multicultural and multilingual (Holli and Jones, 1995). Most historical or current studies of Chicago, however, focus on ethnic populations or neighborhoods, rather than on languages or literacies, although insights can be inferred from such work. Chicago's earliest inhabitants, for example, were primarily Miami and Illinois Native American tribes in villages located along various waterways. In their indigenous languages, they called the area *Checagou*. The coming of the European fur trade between 1760 and 1800 profoundly changed local Indian cultures, resulting in cultural and linguistic loss as tribes merged into a pan-Indian culture. French and English were introduced at this time by French and Anglo-Saxon fur traders, the former notably including Jean Baptiste Point du Sable, a French- and African-descent French speaker from Haiti considered the founder of Chicago who undoubtedly spoke Haitian Creole as well as French, and possibly Potawatomi, the Native American language of his wife, as well (Cameron, 2006). Many European fur traders, especially the French, intermarried with Indian women, resulting in cultural and linguistic mixtures both among Indians and among whites. According to Jacqueline Peterson (1995, p. 24) "Most white traders . . . blended into the pan-Indian culture developing in the Great Lakes region, learning Ojibway, the *lingua franca* of the trade, as their Indian counterparts learned a French *patois*." It is unclear how much of this trade was carried on only with oral language, or whether some literacy, perhaps with the French alphabet, was involved.

Another major change occurred when Yankee entrepreneurs from the east, notably John Jacob Astor and his American Fur Company, monopolized the region between 1811 and 1834. During this period Chicago was comprised entirely of "middlemen traders and their employees—clerks, *voyageurs*, and *engagés* of French, British, American, Indian, and mixed extraction" (Peterson, 1995, p. 25). Yankees, southerners from Virginia, French-Indian *métis* (of mixed race) and Indians shocked newly arrived easterners by socializing together in this frontier space, dancing and drinking to French fiddles. Clearly, if they socialized together, there must have been substantial bilingualism involving French, English, and Native American languages, most probably Ojibway. Moreover, the trading business clearly required not only the use of all these languages, but commercial literacy as well, at least in English, probably in French, and, using the French or English alphabet, possibly in Ojibway. After Chicago became an incorporated city in 1833, easterners continued to arrive, while most French, French-Indian *métis*, and Indians, faced with Anglo-Saxon control and attitudes of

superiority, moved westward, the Indians having been coerced into signing a treaty that gave up their lands in return for acreage beyond the Mississippi. The fact that Indians signed a treaty clearly indicates some literacy, although it is not clear what “signing” meant—a mark indicating agreement, or a full written name.

From the 1830s onward, eastern businessmen promoted the city as a site for self-making and ambition (Spears, 2005, p. 8), and rapid population growth ensued throughout the 19th and early 20th century. In addition to easterners, the city attracted many migrants from the rural and small town Midwest, immigrants from Europe, and southern African Americans. Although the effort to establish Chicago as a cosmopolitan center both of the Midwest and of the nation was led by “the city’s upper- and middle-class elites” (Spears, 2005, p. xv), this vision was crucially supported by the migrants who came to Chicago with hopes of social and economic mobility. Between 1860 and 1890, Chicago grew from 100,000 to 1 million residents, three quarters of whom were foreign-born. All these migrants provided labor for Chicago’s “rapidly expanding industrial sector” (Howenstine, 1996, p. 32). A rare publication about language in early 20th century Chicago describes the city as “an unparalleled Babel of foreign tongues” (Buck, 1903, as quoted in Cameron, 2006, p. 114). German, spoken by 500,000 people, was the most dominant language in the city, followed by Polish, Swedish, Bohemian, Norwegian and Yiddish, Dutch, Italian, Danish, French, Gaelic, Serbo-Croatian, Slovakian, and Lithuanian, all of which had at least 10,000 speakers (Cameron, 2006). Print forms of these languages were extant also, primarily as newspapers, for example in German (Holli, 1995; Kloss, 1998[1977]) and Lithuanian (Markelis, 2004).

Southern African Americans began to settle on Chicago’s near west side as early as the late 1860s, but large numbers, as part of the Great Migration to northern cities, only occurred around World War I, and even more rapidly after World War II, settling primarily on the south side of the city in an area called Bronzeville (Seligman, 2005), the end of the “blues trail” that began in New Orleans and Mississippi, and it fostered not only the Chicago Blues but many other musical innovations. Thus African American verbal, including musical, styles became an important part of Chicago, and much of the south side of the city, including both middle class (Braden, 1995) and working class neighborhoods, remains the cultural heart of this repertoire of ethnolinguistic styles and literacies.

African Americans, along with Mexicans and Appalachian whites, were recruited to work in Chicago’s industries after World War I restricted the supply of European immigrants to the city, the previous source of labor. Thus, in addition to African American English, Appalachian

English (Wolfram, 1980; Wolfram and Christian, 1976) was added to the city's ethnolinguistic profile. The Mexicans brought Spanish, which in recent decades has emerged as a strong second language to English in Chicago, both in speech and print, with multiple Spanish-language newspapers, radio stations, and television channels.

After being recruited as labor around World War I, Mexicans began to arrive in larger numbers during the 1920s, settling in three neighborhoods on the south and southwest side (Kerr, 1977), and in dramatically larger numbers after the immigration law of 1965 abandoned national origin quotas and provided for family reunification. Puerto Ricans became a noticeable presence during the 1950s and continued to build in numbers through the 1960s, settling on the near Northwest side of the city (Padilla, 1987; Pérez, 2004). Although American citizens, they are the poorest Latino group in the U.S. and in Chicago. Chicago's Cubans, in contrast, are largely middle class, having fled Cuba after Castro's victory in 1957, leaving behind property and businesses. In the decades after 1965 a wider variety of Latin American populations (notably Dominicans and Guatemalans) and many other Asian populations filled the city's (and Cook County's) neighborhoods. Among the Spanish-speaking, Mexicans are by far the most numerous (Casuso and Camacho, 1995, p. 369). Thus Mexican Spanish, though not the only Spanish variety in Chicago, is the dominant variety. Over one quarter of the population speaks one or another of these varieties, and the younger generations speak a Latino variety of English that is as yet unstudied.

Chinese immigrants first migrated to Chicago from California in the wake of the Chinese Exclusion Act of 1882, but significant numbers of Chinese did not arrive until after the Communist victory in China in the late 1940s, leading to the development of Chicago's first "Chinatown" on the near south side of the city in the 1950s. These early immigrants were fairly homogeneous culturally and linguistically, having been primarily Cantonese-speaking peasants from southern China. After the end of the Vietnam war in 1975, however, another group of Chinese immigrants came to Chicago, this time largely entrepreneurial ethnic Chinese from Vietnam who spoke Cantonese and Mandarin, as well as Fukien, the Chinese province from which most of them originated. This group established a second "Chinatown" on the north side of the city.

Currently, the Chinese population in Chicago is quite heterogeneous, comprising Cantonese, Indo-Chinese, Taiwanese, mainland immigrants, American-born Chinese (referred to as ABCs), and racially-mixed Chinese (Moy, 1995, p. 408). The languages they speak are equally varied, and even the writing systems they use are differentiated. Earlier Chinese immigrants maintain the traditional Chinese writing system,

with its thousands of complex characters, whereas more recent immigrants from the mainland use the modern simplified system of Chinese characters developed by the Chinese Communist government. Each group is quite attached to its writing system for reasons of familiarity, but also, importantly, for reasons of identity and politics (Rohsenow, 2004).

Like the Chinese, Japanese immigrants were primarily peasant farmers who first migrated to California, but they arrived there later, during the 1880s, replacing the excluded Chinese. By the early 1900s, however, they too experienced discrimination of increasing intensity, peaking with their internment in camps during World War II. After leaving the camps, many relocated in cities to the east like Chicago, although many of them returned to the West Coast before 1960 (Osako, 1995, p. 423). In contrast to stark anti-Japanese sentiments in California, Chicago was more open to Asian immigrants. Ultimately, many of this population became middle class and moved to the suburbs. A high percentage of the second generation intermarried with European Americans, perhaps “the first nonwhites to merge biologically into the dominant American society” (Osako, 1995, p. 432). Such intermarriage initially must involve some bilingualism and complex biliteracy, since Japanese writing involves three different scripts. It is unclear, however, to what extent the Japanese language and writing system have been maintained by Chicago-born or mixed-heritage Japanese. The demographics would suggest a shift to English among Japanese Americans, but Japanese literacy is maintained in Chicago by overseas Japanese who intend to return to Japan (Miller, 2004).

#### CURRENT DEMOGRAPHICS: ETHNICITY, LANGUAGE, AND LITERACY

As with the historical research literature, more information is available on current ethnic and linguistic diversity in Chicago than on diversity in literacy practices, although many of the newer immigrant groups bring distinct writing systems with them.

The 2003 American Community Survey by the U.S. Census Bureau indicated the city to be about 42% white, 37% African American, 26% Hispanic, and 4% Asian. Although the percentage of Asians is low, as a group they increased from 1980 to 1990 in the city by 50% and in the suburbs by 104%. The largest group in these percentages is Indian (who also showed the largest increase), followed by Filipino, then Chinese and Korean, then Japanese, Vietnamese, Cambodian, and Thai (Ahne, 1995, p. 483). These groups bring many different languages to Chicago, including at least one distinct variety of global English, Indian English. Moreover, many of these languages come with writing

systems different from the alphabet used with English, Spanish, and many other European languages. For example, Chinese languages, grouped into seven major dialects, are written with Chinese characters that are part ideographic and part phonetic, being based on syllables and morphemes (Rogers, 2005). Two of these languages, Cantonese and Mandarin (the national standard taught in schools) are the primary Chinese languages in Chicago, and written Mandarin is used in newspapers, books (in bookstores and libraries), a Chinese Yellow Pages, and other media. Both languages are used on global television and radio and are taught in heritage language schools (Rohsenow, 2004). Korean and Japanese, genetically related to each other, but not to Chinese, adapted Chinese characters for their own writing systems. Today, written Japanese uses three sets of symbols and Korean uses an alphabet, Hankul, devised in the 15th century, although other forms of writing were already in use (Rogers, 2005). Both of these written languages, along with written Thai and other literacies, appear in signs and in printed material in several neighborhoods in Chicago and its suburbs.

The 2004 American Community Survey of the U.S. Census Bureau for the city of Chicago shows that slightly over a third of the population 5 years of age and older (34.3%) speak a language other than English. This number includes those who also speak English, but students entering Chicago Public Schools who do not speak English are entitled to 3 years of bilingual education at the level at which they enter school. Of non-English languages, which span all the continents of the world, the numerically important ones are Spanish (71%), Polish (6.3%), Chinese languages (3.8%), other Asian languages (3.1%), Tagalog (2.3%), languages of India—primarily Gujarati and Hindi—(2.1%), French (including creoles) (1.7%), and Arabic (1.5%). Although these figures show a wide range of languages and writing systems, clearly the predominant non-English language is Spanish, followed distantly, but significantly, by Polish, due to continuing immigration from Poland.

Spanish speakers, however, dominate these statistics, and roughly two-thirds of the Spanish speakers are of Mexican origin. Mexicans now move not only into traditional Mexican neighborhoods, but also into Puerto Rican and other Latino neighborhoods, and into “white ethnic” and some African American neighborhoods. The map, Latino Population by Community Area (see [Figure 1](#)), shows that Latinos can be found in almost all neighborhoods of the city, and they are a significant presence as well in the counties surrounding the city, north to the Wisconsin border, southeast to the Indiana border (and in northwest Indiana), and to the west of the city. Although numerically remarkable, the current preponderance of Spanish speakers is similar to that of German speakers over a century ago throughout

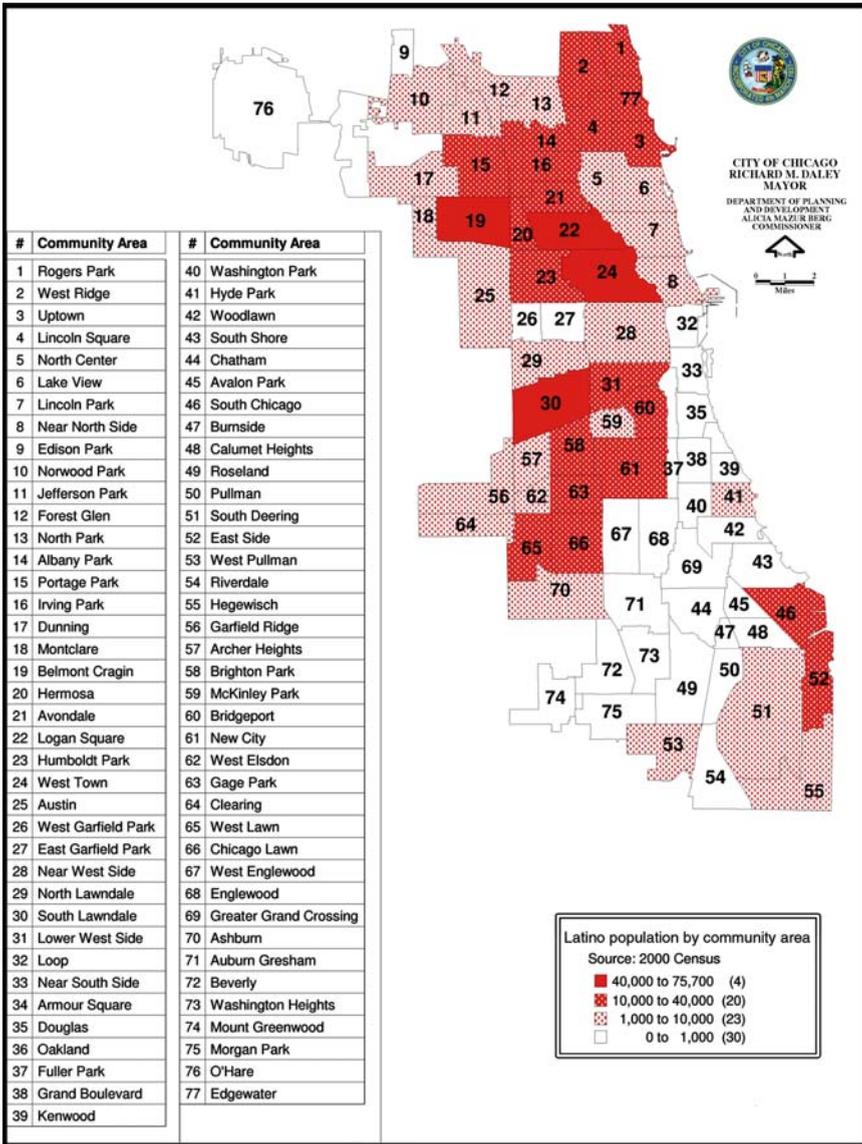

Figure 1 Latino population by community area. Source: 2000 census.

the Great Lakes states of Ohio, Indiana, Illinois, and Wisconsin. Massive migrations of German speakers throughout the 19th century vastly outnumbered the speakers of other languages, including English in some places (Kamhoefer, Helbich, and Sommer, 1991; Trommler and McVeigh, 1985).

Currently, Spanish speakers in Chicago comprise (in order of population size) Mexicans, Puerto Ricans, Guatemalans, Ecuadorians, Cubans, Colombians, Spaniards, Salvadorans, Hondurans, Peruvian, Dominicans, Argentineans, Nicaraguans, Chileans, Panamanians, Costa Ricans, Venezuelans, Bolivians, Uruguayans, and Paraguayans (Farr and Domínguez, 2005). These groups speak different varieties of Spanish, and some of them may speak indigenous languages such as Quechua or Zapotec as well. In many Caribbean varieties of Spanish, for example Cuban or Puerto Rican, speakers tend to aspirate *s*, as in *e'ta'* for *estas* (you are). No research has yet clarified if these varieties are blending in Chicago, or if speakers of other varieties adopt features of the dominant Mexican Spanish.

Even within national varieties of Spanish, vernacular and regional dialects differ from standard popular Spanish; for example, the group of rural Mexicans known as *rancheros* use archaic features in their speech and writing (Farr, 2005b, 2006), although this dialect is denigrated by educated Mexicans, and Spanish teachers in Chicago, as *español ranchereado* (ranch Spanish). For example, a woman who participates in a Catholic Charismatic prayer circle writes letters to God with some *ranchero* dialect features:

|                                       |                                  |
|---------------------------------------|----------------------------------|
| <i>Padre Yavé</i>                     | <i>Father Yahweh</i>             |
| <i>te pido que redames [derrames]</i> | <i>I ask that you pour</i>       |
| <i>tus gracias el día del</i>         | <i>your grace the day of the</i> |
| <i>vautismo en el Espíritu</i>        | <i>baptism in the Holy</i>       |
| <i>Santo en tus hijos</i>             | <i>Spirit over your children</i> |
| <i>que estamos en las</i>             | <i>who are in the</i>            |
| <i>clases de Evangelización</i>       | <i>classes of Evangelization</i> |

The above excerpt of a letter shows the use of the rural vernacular *redames* instead of the standard *derrames* (pour out), as well as non-standard spelling based on speech, as in *v* for *b* in *vautismo* (baptism) for *bautismo* (Guerra and Farr, 2002). Two years of primary school in rural Mexico did not “correct” these features of her oral language, but they did allow her to develop fluent religious literacy.

In fact, standard languages have rarely been used by immigrants to Chicago; Lithuanian (Markelis, 2004) and Swedish (Isaacson, 2004) immigrants, among others, spoke vernacular dialects of their respective languages, then learned standard varieties of these languages in Chicago in order to communicate with each other and to read ethnic newspapers. Moreover, as often happens with languages in contact (Winford, 2003), language mixing occurs naturally. English words appear in both oral and written Spanish; one sign above a *cantina* (bar) in a Mexican neighborhood boasts, *Tenemos Via Satellite* (We have satellite TV).

Code-switching between Spanish and English is common among Texas-origin Mexican Americans in Chicago (*tejanos*), and it is more frequent among Puerto Ricans than Mexicans. Although such “Spanglish” is often as denigrated as vernacular dialects are, in fact this is a common occurrence in all immigrant populations. In Chicago, for example, Greeks (Koliussi, 2004) and Swedes (Isaacson, 2004) used “Greeklish” and “Swinglish;” in a common pattern of code-mixing, Swedes borrowed English words into Swedish and used them with Swedish conjunctions, articles, and suffixes, as in *storet* (the store) rather than the standard Swedish *handel* or *affär* (Isaacson, 2004, p. 224). Such mixing of languages can be seen in both oral and written uses of language, as is evident in a Spanish conversation (for English translation, see [Table 1](#) for transcript) in which Mexican women insert Polish and English words and in a photo of signs (see [Figure 2](#)) in Spanish and English in a Mexican neighborhood.

Today there is a rich variety of dialects in all languages used in Chicago, including a regional English in which whites, but not African Americans, pronounce The White Sox as “the white sacks” (Cameron, 2006). Morgan (2004), moving beyond pronunciation to discourse, describes how African American vernacular is used aesthetically to construct gender identities in south side neighborhoods of Chicago. Lindquist (2004) and Cho and Miller (2004), illustrate dialect diversity in the differing rhetorical styles used by Chicago’s working and middle class white population. Thus language varieties differ both in terms of structural features such as pronunciation and syntax, and in their stylistic dimensions, what Hymes (1974) called “ways of speaking.” Like ways of speaking, literacy practices also construct important aspects of identity, whether linked to class, race/ethnicity, gender, or other identities (such as religious or political). The next section reviews studies of such identity construction in both speaking and literacy practices across a range of ethnic populations.

#### MAJOR CONTRIBUTIONS AND WORK IN PROGRESS

Because most ethnolinguistic research in Chicago is so recent, and much of it is still ongoing, this section will combine these two sections, showing how people construct different aspects of their identities via a range of speech genres and literacy practices. Domínguez (2005, p. 77) shows how the use of proverbs constructs people in a Mexican transnational social network as having “sharp wit, facility of expression, and adherence to traditional values.” The use of traditional Mexican proverbs affirms the solidarity of the network and approved social values, but it also distinguishes the individuals who use them as wise and

| 36 | L: Ay, como son tremendas.  | B: Oh, how audacious you all are.   |

knowledgeable. Farr (2005a) shows how Mexicans from a *ranchero* background construct themselves as independent individuals with a frank speech style that is direct, candid, and down-to-earth. Inasmuch as this speech style constructs the *ranchero* ideology of liberal individualism, it contrasts sharply with the communal identities attributed to non-*ranchero* Indian Mexicans. Both studies of transnational families, then, show Mexicans constructing identities of personhood via sanctioned ways of speaking. Domínguez (2002) develops the implications for literacy by showing how the complex cognitive processes required to correctly interpret a proverb used in context can be utilized in the teaching of writing. The link between proverbs and literacy goes back centuries, since, as Pérez (1988) points out, proverbs are quite likely the oldest surviving texts of Western and other civilizations.

Lindquist (2001, 2004) also links oral rhetoric to literacy; she shows how class identities can conflict when working class students learn to write at the university, arguing that “the domain of argument itself is a site of class struggle” (Lindquist, 2001, p. 262). The verbal style of academic argument is culturally and historically specific (Farr, 1993),

Figure 2 Chicago bilingual and biliterate street scene.

and using it as “real work” strikes those from working class cultures as oddly privileged, especially since work for them is action-oriented and productive, and verbal argument a matter of play, not work. Cho and Miller (2004) similarly distinguish white working class and middle class verbal styles, showing how “working class families privilege personal storytelling in a way that middle class families do not” (Cho and Miller, 2004, p. 99). They also note that working class mothers co-narrating young children’s experiences are more direct and forthright than middle class mothers. This linking of a direct verbal style with working class speakers evokes the *franqueza* of the rural Mexicans in Farr’s study (Farr, 2005a, 2006). Herrick’s (2005) study of workplace communication at a factory in Chicago also shows how class differences can emerge in literacy practices. While translating a brochure into Spanish to initiate new workers, Mexican workers of different class backgrounds (rural *ranchero* vs. urban educated) argue vehemently about whether to use “correct” Spanish or the language of the “people on the [factory] floor” (Herrick, 2005, p. 372).

Moss (2003, 2004) shows how the verbal style of African American sermons (for example, using the pronoun *we* rather than *you* and personal testimonials) constructs the minister as a humble member of the community, rather than one who is superior to it. The genre of sermons is particularly interesting, in that it seems to be both a speech and a

literacy event: delivered orally, sermons are sometimes prepared in writing, and they are often based on religious text (cf. Besnier, 1995). Reynolds (2004) also focuses on a religious genre: prayers at Ibo association meetings that coalesce the physical distance between Chicago and Nigeria. Here prayers are used both to build transnational solidarity and to distinguish the individual creating the prayer as verbally astute, like the user of proverbs in Dominguez's (2005) Mexican families. Finally, as discussed above, literacy practices that construct a religious identity are found in Guerra and Farr (2002) and Farr (2005b), which discuss how a Mexican woman constructs herself as authoritative both in her oral religious discourse and in the letters she writes to God as part of her Charismatic prayer circle. As she builds an ideology of personhood with her frank *ranchero* dialect of Mexican Spanish, she simultaneously creates a gendered, religious, and political identity.

Nardini (1999, 2004) analyzes Italian women's use of *bella figura* (literally, beautiful figure, or good impression) in their discourse at a social club. Here women use verbal art to perform in ways that are consonant with the Italian cultural construction of verbal and visual beauty, but that also construct gender identities that are not submissive. Cohen (2005) also focuses on gender identities, but with literacy practices. She shows how second-generation Mexican high school girls experiment with both gender and ethnic identities on the internet by participating in chat rooms and developing relationships online. Computer and internet literacy allows these girls to try out possible selves from the safety of their homes: they "get out of the house" without disobeying parental restrictions that keep them, but not their brothers, at home.

Del Valle (2005) contrasts the verbal practices of two families, one of which experiences more social and economic success than the other. The family that uses literacy regularly for religious and political purposes (much of it in Spanish) and emphasizes Puerto Rican oral traditions, e.g., *rosarios cantados* (sung rosaries), also achieves some upward mobility that involves specific work literacies. The other family, using primarily English and leisure time literacy (e.g., reading magazines), seems unable to move out of their precarious economic position. Interestingly, although both families appear demographically similar, one of them illustrates "the behaviors, values, and literacy practices" of more mainstream populations (Heath, 1983). This cautions against making facile generalizations about entire demographic groups and indicates that literacy practices that construct religious, political, and cultural identities can have positive effects in life trajectories.

Many of these studies of ethnolinguistic diversity in Chicago bring transnational relations into sharp relief. Cohen (2003), for example, describes

how high school girls in Chicago who pretend to be *chilangos* (residents of Mexico City) in Internet chat rooms have their true identities discovered through the “lexical and morphologic variations” (Cohen, 2005, p. 196) in the Spanish that they write. Thus people online recreate national, gender, and other identities solely through the available clues in literacy. This is yet another example of how literacy practices construct identity, although on this occasion inadvertently. Similarly, Hurtig (2005) shows how adult women construct gendered Mexican identities and thus resist assimilation through the pieces they write and publish in a locally-produced magazine.

Both Rohsenow (2004) and Markelis (2004) discuss political identities as constructed by literacy practices. Rohsenow (2004) shows transnational influences on literacy practices among Chicago’s Chinese populations: earlier immigrants read and write the traditional Chinese writing system, refusing to use the simplified characters devised during the 1950s by the People’s Republic of China, arguing that this move on the part of the then-new Communist government was a “deliberate attempt to cut off China’s people from thousands of years of traditional Chinese culture and values” (Rohsenow, 2004, p. 338). Markelis (2004) describes the considerable efforts by Lithuanians in Chicago to maintain their language, both oral and written, through Lithuanian parochial schools, mass media, and ethnic churches. Migrating in large numbers from 1881 to 1920, the Lithuanian press only ceased operating in Chicago in the late 1970s. Markelis attributes this to the fact that “Concerns about the possibility of linguistic annihilation were widespread among Lithuanian immigrants, who had experienced suppression of their language during the 42 years of the czarist press ban” (Markelis, 2004, p. 282). Having been forced to use (and go to school in) Russian instead, and having secretly fought to use Lithuanian, Lithuanians in the diaspora refused to give it up when they had the freedom to speak and publish it freely. Lithuanian newspapers published both in Chicago and in Lithuania especially served to connect people in this transnational ethnic community by reporting on events and circulating in both places.

Thus both historically and currently, ethnolinguistic practices in Chicago are inextricably linked to events, people, and institutions in their places of origin. Politics, educational practices, local linguistic characteristics, religious traditions, class relations, gender orders, and cultural values in the “homeland” do not determine, though they do influence, what happens in Chicago, and these, as well as other dimensions of life “back home,” are necessary to understand transnational (and internal migrant) communities in Chicago. From its beginnings, ethnic diversity in Chicago implies linguistic diversity in both oral and written forms. The world’s languages and dialects, used alone and mixed with each other or English, create vibrant communities with a range of oral and written genres.

## PROBLEMS AND DIFFICULTIES

As is typical of new research directions, studies of ethnolinguistic diversity in Chicago explore the subject with a variety of approaches and findings. Unlike the early historical research on ethnic diversity in Chicago, which traced the historical trajectories of various populations in similar ways, language-focused research has yielded understandings as diverse as the populations and languages or dialects under study. Although united under the general framework of the ethnography of communication (Hymes, 1974; Saville-Troike, 2003), some studies focus on oral genres such as sermons, prayers, proverbs, arguments, and personal narratives; others focus on written genres such as letters, newspapers and magazines, books, workplace brochures and reports, and journal narratives; and yet others focus on how language, oral or written, constructs various aspects of identity. Eventually, a more theoretically-focused set of studies across populations would be useful.

## FUTURE RESEARCH DIRECTIONS

In addition to developing a more shared theoretical and content focus, future research could expand the range of populations studied. Although research has begun to describe the myriad ways in which people in Chicago use various languages in speaking, reading, and writing, this research is quite recent and does not include, for example, Polish, Indian, Korean, and Native American language and literacy practices, even though these populations have a notable presence in Chicago. Such studies could explore not only Chicago-based varieties of languages and their accompanying literacies, but also the varieties of English that have evolved among various groups in Chicago (e.g., Latino English, Indian English, etc). Finally, studies of groups that are limited to Chicago could be extended globally to include comparative sites: Does the *bella figura* of Italians in Chicago differ from that expressed in Italy? Does the English used by Ibos in Chicago differ in significant ways from the African English used in Nigeria? This final example suggests yet another direction for future research: how much interaction is there among the various ethnolinguistic groups in Chicago, and does interaction lead to yet newer varieties of language and/or new, hybrid literacy practices?

## LANGUAGE DIVERSITY AND INDIGENOUS LITERACY IN THE ANDES

### INTRODUCTION

The Andes mountains extend across the entire length of the South American continent. Traditionally in the social sciences and in pre-colonial studies in particular, the Andean space refers to the Inca Empire's sphere of influence (Cerrón-Palomino, 1985). Following that usage, this chapter focuses on the entire region spreading from the south of Colombia to the north of Argentina and Chile, encompassing coastal areas, mountain ranges and the high plateaus or *altiplano*.

This review of indigenous literacy in the Andes centres on Andean languages that have managed to survive Spanish language rule and maintain certain functional spaces in national societies. It is commonly accepted that indigenous languages had some sort of graphic or notational, non-alphabetical, system. From this, the tendency is to call the indigenous societies illiterate; yet this deficit terminology hinders acknowledgment of different literacies such as textile writing or 'other forms of textual expression and graphic representation' (López, 2001).

In recent decades, speakers of Andean languages increasingly raise them up as symbols of ethnic and political vindication in their efforts to secure prestigious and public spheres for these languages (King, 1997; López, 2001; Sichra, 2005). From this perspective, literacy acquires a driving role in the social participation of sectors traditionally marginalized by their societies, i.e. it could be an empowerment mechanism for the individual, the community and the group (Hornberger, 1997). This chapter focuses on the literacy of languages characterized by their orality and adheres to the ideological model in which literacy comprises concrete social practices whose purposes depend on underlying political and ideological factors (Street, 1984). Literacy events, that is, activities in which literacy plays a social role, can help us observe said practices (Barton and Hamilton, 1998).

### EARLY DEVELOPMENTS

Early chroniclers, like the Jesuit Acosta in 1588, expressed their admiration for the 'veritable language jungle' found by Spanish invaders

upon their arrival in 1532 to the current Peruvian territory. Cieza de León in 1550 gave an account of a process of ‘Quechuification’ (*quechuización*) established by Inca Huaina Capac at the beginning of the fifteenth century as a unifying policy for the Inca Empire which nevertheless also upheld and fostered pluridialectism and plurilingualism. Chroniclers thus record Quechua as a general language superimposed on so-called ‘natural languages’ like Aymara, Puquina and ‘other languages they understand and speak, and call hahuasimi, which means language apart from the general one’ (Monzón, 1586/1965, p. 221). A century later, late chroniclers like Cobo would still register a profusion of languages within any particular town or valley (Cerrón-Palomino, 1988).

The linguistic diversity was partly a consequence of the archipelago system, in which each community established settlements on several ecological niches, thereby dispersing languages and dialects across non-contiguous territories (Mannheim, 1991). This linguistic diversity can likewise be attributed to the Inca policy of *mitmas*, whereby Quechua speakers were forced to migrate in order to secure newly conquered peoples and territories. There were, during the Inca Empire, six linguistic families in the current Peruvian territory (Cerrón, 1988); Moya (1997) reports various languages, without mentioning their specific linguistic affiliation, in what is today Ecuador.

Another surprising observation extensively commented on by Spanish chroniclers of the late sixteenth century, such as the Jesuit José de Acosta or the monk Fray Martín de Morúa, were the records, or *kipus*, that the vast empire’s administration kept. According to Blas de Valera in 1578, the system of knots in multi-coloured wool was read in the manner of a poetic text. Despite the abundance of studies on this topic, it has yet to be confirmed if *kipus* were in effect text documents, or rather accounting and mnemonic instruments (Ascher and Ascher, 1997). In any case, even though alphabetical decoding has not yet been proven, the readers of this register, the *kipukamayúq*, narrated historical facts and mythical stories that legitimized Inca power. New studies of this system of communication are incorporating the contexts in which *kipus* were used and the intervention of the *kipukamayúq* as producer and interpreter (Platt, 1992a). Salomon (2004a) also provides evidence for the use of *kipus* until the latter part of the twentieth century in the Province of Huarochirí, Department of Lima in Peru, and for the coexistence of *kipus* and writing as complementary records for at least four centuries.

On the other hand, it was initially written text in the form of a book that came to epitomize the historical confrontation between Spaniards and indigenous people. Several chronicles of the encounter between

Europeans and the last Inca, in Cajamarca in 1534, highlight the Inca Atahualpa's amazement at the object that bore God's word, the Bible. The Inca's anger and frustration with an object 'that said nothing to him' have defined a scene that would later be mythologized and incorporated into Andean imagery as a trauma borne from the conquest: a symbol of subordination to the invader, of the Inca's death and the empire's defeat (MacCormack, 1988). As instruments of death and punishment, writing and its bearers—paper, letters, memorials and edicts—fascinated and astounded for their unexplainable magic power and foretelling effects (Mignolo, 1995). Platt (1992b) asserts that indigenous people attested to the shamanic powers of European alphabetic writing, finding it analogous to their own experience of representing visual patterns, generated by hallucinogenic visions, in graphic designs for shamans to interpret.

At the outset of the conquest, with the First Council of Lima in 1552, Quechua saw a new period of expansion when it was declared, along with Aymara and to a lesser degree Puquina, the means for evangelization and colonial administration. The Third Council of Lima in 1583 established evangelization in these languages, and for that purpose undertook to print—inaugurating the use of the press in Peru and South America—the *Doctrina cristiana* and *Confessionario* in 1584 and the *Tercero Cathecismo* a year later in a Quechua variety constructed for a broad audience as a written lingua franca. The first pieces of descriptive and interpretative linguistic work followed soon thereafter; monumental lexical-grammatical studies of Quechua by Spanish missionaries like Domingo de Santo Tomás in 1560 and González Holguín in 1608; and of Aymara by Ludovico Bertonio in 1612. In this period of Quechua and Aymara studies, Quechua professorships were created at the Lima Cathedral in 1551 and at San Marcos University in 1579, where writing received particular attention.

Beginning in 1770 with the Bourbon reforms, specifically those of Charles III, a decisive policy of *castellanización* was established 'to achieve once and for all the extinction of the different languages used (. . .) so that only Spanish be spoken' (Rivarola, 1990, p. 108). Thirteen years later, the Quechua professorship at San Marcos University closed down. Constant indigenous uprisings between 1780 and 1782 were decisive in the rigorous enforcement of this change in language policy. In the nineteenth century, languages like Mochica, Culli and Cholón on the Peruvian coast also disappeared. This led to linguistic displacement in the Peruvian coastal area and northern sierra, and equally to an unstoppable process of social and political marginalization and progressive neglect of the major indigenous languages, Quechua and Aymara, in the newly formed Republics.

## MAJOR CONTRIBUTIONS

At the beginning of the seventeenth century, an indigenous assistant of the mestizo priest Francisco de Avila wrote the Huarochirí Quechua Manuscript, the first compilation of Andean literature transcribed into a vernacular language (Taylor, 1988). Forced evangelization and cult banning, the so-called extirpation of idolatries, as well as the rupture of the territorial organization that safeguarded indigenous cultural and religious practices, prompted the need to use writing in order to preserve memory (ibid). De Avila advocated educating local rulers' children 'so they would not conceal or protect native rites' (Glave, 1990, p. 460). To educate these youngsters in Spanish language and culture and make of them intermediaries between the indigenous and the Spanish worlds, the Jesuits founded Schools for Caciques (local rulers) in Cusco, Lima and Quito. The physical extermination of the indigenous intellectual class in power centres at the end of the eighteenth century brought about the cultural and linguistic decline of Quechua and Aymara. The very same indigenous aristocracy, that is, the local rulers and principals who began the process of independence from the Spanish crown, themselves used only Spanish to summon anti-colonial rebellion (Godenzzi, 1995).

The only extant written sources date from the earlier mid sixteenth to the mid seventeenth century period, 'the golden era of written Quechua' (Durston, 2003, p. 210). In addition to the aforementioned Quechua writings, there are other Quechua texts appearing in Spanish books, written by indigenous chroniclers such as Felipe Guamán Poma de Ayala (*El Primer Nueva Corónica y Buen Gobierno* in 1615) and Joan de Santa Cruz Pachacuti Yamqui Salcamaygua (*Relación de antigüedades deste reyno del Perú* in 1613); mestizo chroniclers like Inca Garcilaso de la Vega (*Comentarios Reales de los Incas* in 1609 and 1617); and mestizo monks like the Jesuit Blas de Valera (*Historia de los Incas* in 1596) and Cristóbal de Molina 'El Cuzqueño' (*Ritos y Fábulas de los Incas* in 1574). Poma de Ayala's work is specially worth mentioning. Written as correspondence to the King, it included Quechua and Aymara texts that combined alphabetic writing with illustrations of festive and daily scenes. This exemplary piece of multiple literacies allowed the writer to express veiled meanings of resistance and denunciation before the Spanish authority (Dedenbach-Salazar, 2004).

Fragments pertaining to widely circulating lyric genres, important during the Inca period for their ceremonial and ritual purposes permeating everyday activities, are today studied for their historical and literary meanings and reproduced for circulation among contemporary readers (Murra and Adorno, 1980; Sichtra and Cáceres, 1990). Historical sources that include these oral traditions as songs do not on the other

hand record any prose texts, with the exception of two epic fragments in Fray Martín de Murúa's *History of the Origin and Royal Genealogy of the Peruvian Inca Kings* (1590), collected from khipukamayúq who had survived the Spanish invasion.

The above-mentioned educated native literature (Beyersdorff, 1986), written by descendants of the indigenous nobility commissioned by the Crown or the Church, contrasts with another area of Quechua literature which has come to light only in the last two decades (Adelaar and Trigoso, 1998; Durston, 2003; Itier, 1991; Taylor, 1985). These are documents from the era when Quechua flourished, between the sixteenth and seventeenth centuries, consisting of judicial complaints written by notaries and letters or petitions of indigenous authorship, in several cases by indigenous elite women. The documents were written in the Quechua variety promoted by the aforementioned Third Council of Lima. After several centuries, it is extremely difficult to find this type of daily, spontaneous writings in neglected and isolated parish or archbishopric archives. Nevertheless, these documents are precious evidence of how much social validity Quechua writing must have had among the indigenous population, reaching beyond legal and administrative realms, and becoming a means of communication among speakers. According to Itier (1991), this is proof that Quechua had the status of a written language.

Gradually, literary Quechua began to be cultivated and its importance increased with the use of the Cusco variety in which the colonizing minority of Spaniards and creoles produced religious and secular literature in a European style, and even came to consider it as their own (Itier, 1987). This literature includes theatrical works with which the landholding elites, usurpers of indigenous lands, attempted to establish a Quechua literature that would legitimize them politically. Mannheim (1990) calls the revival of Spanish literary styles in Andean languages during the eighteenth century 'the golden century of literary Quechua'. Nonetheless, it generated an adverse process for Quechua as a means of communication in that the creole and mestizo elite cultivated the language for its importance in the glorious Inca empire rather than its significance as a language of the contemporary majority (Itier, 1995). These plays, targeted to an erudite creole audience, continued to flourish until the Republican period in the nineteenth century. One exception is the Quechua poetry of Juan Wallparimachi of Potosí, Bolivia who wrote at the beginning of the nineteenth century and whose poems have survived in part in popular culture as anonymous writings (Sichra and Cáceres, 1990). Over the course of two centuries (mid-eighteenth to mid-twentieth), Andean languages ceased to be written means of communication for indigenous users, with literary creation being maintained solely through oral tradition in stories and

songs regarded as folklore while in a parallel process languages were gradually being confined to low-prestige social roles and functions.

Although the work of the Summer Institute of Linguistics beginning in the first half of the twentieth century in the Amazonian and the Andean regions sought to assimilate indigenous populations through evangelization (Stoll, 1984), SIL linguists initiated truly pioneering work in systematizing indigenous languages and establishing them in writing. They also contributed to speakers' awareness of the feasibility of writing in their languages (Landaburu, 1998). The last third of the twentieth century reveals a profusion of linguistic descriptions and studies of languages and varieties of Quechua and Aymara, accompanied by protracted debates about their respective alphabets, debates which generate recurring confrontations despite the languages having achieved official status in Bolivia, Peru and Ecuador in the 1980s.

#### WORK IN PROGRESS

The diversity of Andean languages began to be acknowledged and promoted as anti-authoritarian political currents swept the continent from Ecuador to Argentina, and also as a result of the accelerating phenomenon of globalization. Confronting the authoritarian regimes that had been established during the 1960s to the 1980s, movements with social and later ethnic demands questioned the state's homogenizing and unifying character and challenged nation-building aims that adopt a 'one language, one culture' ideology.

A remarkable fact is that the efforts to spread Quechua during the Inca regime and during the first century of Spanish rule, displacing regional and local languages including even a major language such as Aymara, nevertheless failed to impose a supra-regional Quechua variety. Despite the Republican language policy of forced imposition of Spanish, languages and varieties of the Quechua family have been maintained to a great degree in the entire Andean region—although with a tendency towards shift—with the exception of the now extinct languages of the central coast of Peru. Aymara, the most preserved language of the Aru family, is confined to the Peruvian–Bolivian high plateau. López (2001) estimates there are 12 million Quechua speakers and 2.5 million Aymara speakers, mostly Spanish bilinguals. In the Bolivian high plateau, there are still some few Chipaya speakers of the Arawak family. In all Andean countries, migration from the countryside to cities and capitals is transforming urban areas into spaces of increasingly greater reproduction of Andean cultures and languages (Sichta, 2005).

Another revelation, in these times when indigenous organizations and peoples are rising up as active interlocutors with the state in their

struggle for legal recognition and territorial rights, is the re-emergence of multi-ethnicity among peoples traditionally subsumed under the term Quechuas (in Peru and Bolivia) or Quichuas (in Ecuador), and to a lesser degree Aymaras. Oral traditions such as myths, stories and songs, common law (*usos y costumbres*), records and maps in chronicles or judicial writings, community demarcation and land titles and other oral and written documents are brought forward by indigenous communities (*originarios* or ‘aborigines’ in Bolivia, peoples or ‘nationalities’ in Ecuador) as historical evidence of their collective identity and rights. In the 1990s, all of the Andean constitutions were modified or created to incorporate adjectives like ‘pluriethnic’, ‘multilingual’, formulations like ‘ethnic and cultural diversity’, and terms like ‘ethnic groups’, ‘nationalities’, ‘indigenous peoples’ and ‘native peoples’. Amidst this constellation, asserting one’s belonging to indigenous peoples has ceased to necessarily be a stigma, as can be seen for example in Bolivia, where the proportion of the population claiming indigenous identity increased between the census of 1992 and that of 2001.

Among the most notable effects of the constitutional realignments are educational reforms in the Andean region that seek to include indigenous languages in primary education in order to develop decoding skills and literacy through them (López, 2001), under the rubric of intercultural bilingual education, indigenous education or ethno-education (see López and Sichra, *Intercultural Bilingual Education Among Indigenous Peoples in Latin America*, Volume 5). This is an arduous and paradoxical process, given the difficulty of erasing a long, painful history of discrimination towards everything indigenous; something that characterized—and still does—public schools in charge of ‘civilizing’ through Spanish literacy (Hornberger, 2000; Oliart, 2004). Nowadays, sustained by the diglossic relation between Spanish and indigenous languages prevalent in Andean societies despite constitutional and political changes, ‘writing and literacy are closely associated with the hegemonic language’ (López, 2001, p. 211).

The Freirean (1970) pedagogical current in Latin America of the 1970s and 1980s established the idea that writing can be an instrument of political participation, permitting processes of self-affirmation through reading the reality of the world. Raising awareness of a subordinate condition (in those times, of the popular sectors) went in tandem with introducing literacy. This was originally conceived of as Spanish literacy targeting the working population and the urban proletariat. From various scenarios and with the contribution of several actors—NGOs, indigenous intellectuals, rural union organizations, universities—a rich vein of literacy in Andean languages has been developing along the lines of ‘reading reality to write history’ (Pereson, Cendales and Cendales, 1983, p. 152). The fact that oral history and

life testimonies became crucial in this process of establishing literacy during the decades of de facto governments, political oppression and social exclusion is not coincidental. Raising silenced voices in order to narrate history through testimony not only updates historical awareness but 'can also have a political role in the sense of wanting to influence the present, transform the order of things, and project towards a different future' (Howard-Malverde, 1999, p. 341).

In La Paz, Aymara-Spanish bilingual transcriptions of community history, indigenous and union struggles, indigenous leaders and schools and oral tradition and life stories, all of indigenous authorship, were sought out using ethnographic methods and published by the *Taller de Historia Oral Andina* (THOA), the *Instituto de Historia Social de Bolivia* (HISBOL) and the History Department of the Universidad Mayor de San Andrés. Participants included Aymara intellectuals and descendants of local rulers' representatives or *caciques apoderados*, who had launched a movement in Bolivia at the end of the nineteenth century to recover and secure original community lands from state plundering by obtaining old titles signed by the Spanish Crown. Focusing on action-research in Cochabamba, the *Centro de Comunicación y Desarrollo Andino* (CENDA) generated bilingual publications in Quechua and Spanish, collecting oral history and literature on peasant survival strategies in health, agricultural wisdom, community leadership and union struggles. In all these cases, publications were targeted as much to indigenous activists and authors, adults and children in rural areas, as to urban mestizo readers.

For 20 consecutive years now, CENDA has been editing the rural bilingual magazine CONOSUR *Ñawpaqman* (Southern Cone *Forward*). Its contents, relevant to peasant life and political and social movements in Cochabamba, Bolivia, are collected periodically from its own rural readers and returned to them as registered oral discourse (Garcés, 2005). This work is therefore engaged in 'generating new styles and new usages, (with) the grand art of letting people feel that this is their language, that there is nothing artificial in it' (Albó, 2001, p. 9). Stories collected for two decades and regularly appearing in the newspaper have been republished as full-colour editions, along with other material in indigenous language, for school libraries established by the Bolivian Educational Reform at the end of the nineties.

In Peru, the Andean Centre for Education and Promotion (*Centro Andino de Educación y Promoción*, CADEP) publishes traditions and narratives in bilingual editions that recuperate contents related to myths, to the era of the *hacienda*, and aspects of culture; they also preserve some of this material as audio-recorded oral testimony. The Bartolomé de las Casas Andean Regional Studies Centre in Cusco has published several bilingual texts of oral history and oral literature.

In this line of literacy aimed at political empowerment, there is also considerable documentation in Ecuador of community and individual histories of participation in struggles of the 1960s and 1970s to recover lands occupied by hacienda owners and large landowners. Cayambe in the north of Quito, Chimborazo in the central sierra, and Cañar in the south were centres of peasant indigenous movements that stood out in their struggle to advance recognition of their rights to their own education, territory, organization and political participation. These issues came to light in bilingual texts collected and published by the Catholic University of Quito and the undergraduate course in Andean Linguistics and Bilingual Education at the University of Cuenca.

In all three of these countries, between the 1980s and 1990s, scholars, writers, and academics, Andean and foreign alike, compiled oral tradition, stories, legends, riddles, and songs in a wide range of texts for diffusion, cultural affirmation and study, but principally in order to recover and preserve them in writing so they would not disappear as oral patrimony. The Experimental Project for Bilingual Education in Puno, Peru, sponsored by the German Technical Cooperation, also produced texts in Quechua and Aymara. In all these cases, indigenous authorship, although situated in a local or regional context, is anonymous (commonly known as popular cultural wealth).

#### PROBLEMS AND DIFFICULTIES

Ironically, problems in indigenous literacy do not spring from a failure to recognize Andean languages and cultures, but from ideological notions embedded in Andean governments' lack of political will to face the promotion of writing and literacy in indigenous languages as instruments of power in the broadest sense. It is crucial to keep in mind the almost absolute weight granted everything related to Spanish literacy, writing and decoding skills, promoted by the globalizing and development-oriented current that underlies current state policies. National societies voluntarily assume this sort of dogma, with hegemonic sectors transmitting it to indigenous communities and individuals. Principles sustaining all types of international and national policies are therein crystallized and can be summarized as follows: Spanish decoding skills have intrinsic instrumental value in overcoming poverty and Spanish literacy is an inalienable right to participate as a citizen and a requisite for democracy. This strongly internalized faith, materialized in development through written Spanish and the consequential hierarchical differentiation between those who know how to write and those who do not, has been well documented in several Quechua speaking communities (Hornberger and King, 1996; Salomon, 2004b; Zavala, 2002). Contradictory as it may seem, this ideological current is

spreading among the indigenous organizations themselves, and is being fostered as state policy by the new Bolivian government (January 2006) that has an indigenous and popular orientation.

Linguists, education specialists and indigenous organizations continue to place enormous importance on problems concerning alphabets and orthography for indigenous languages, yet invest very little consideration to writing and literacy issues. Establishing written indigenous language was probably important per se to exemplify its equality and its potential equivalence with the dominant language. On the other hand, the policy and practice of public bilingual education has promoted a normative notion of writing that hinders and distances written practice of a daily nature (King, 2001). In the same vein, literacy in Andean languages in rural areas may actually undermine the very languages meant to be preserved and reaffirmed (Arnold and Yapita, 2000). With regard to this 'technical' vision of writing that, far from approaching literacy remains at the level of decoding, the vicious circle is closed by evidence that 'alphabetic non-literacy remains widespread and is a common focus of governmental and non-governmental development projects in Bolivia, Peru and Ecuador' (Arnold and Yapita, 2000).

Even where there are attempts to transcend the orthographic issue in order to promote writing as a useful tool in daily life, efforts in adult education and in primary school education tend to present literacy as the only medium to create and transmit cultural knowledge, ignoring or nullifying other Andean linguistic and cultural media (Howard-Malverde, 1998). Indigenous cultures are cultures of orality and of argumentation that grant central value to spoken words, a crucial characteristic that cannot be denied or ignored by failing to articulate a connection between orality and writing. If indigenous peoples have not appropriated writing, it is because it has been introduced without taking into account its relation to existing social practices in the community. Writing must cease to be a form of acculturation and rather be incorporated into indigenous social practices, without implying a loss of value for the spoken word or their own writings. It is a matter of recognizing writing's social value and ceasing to understand it as a merely educational or technical skill.

At the same time, this means recognizing the wealth Andean cultures exhibit in their diverse textual expressions. For example, Franquemont (1994, p. 362) wonders, 'How is it that textiles could represent information and ideas so effectively that the sophisticated Andean civilizations never felt the need to develop writing?' From this perspective, our failure to understand the textile system condemns us to perpetual illiteracy in Andean thought. Close inquiry into what

was and is present in the textile arts, pottery and music would further our understanding of the cultural, social and political meanings of the various textual practices. As Desrosiers (1994, p. 361) specifies, 'textile techniques have probably constituted a means of resistance to acculturation, which would explain both their preservation in numerous communities and their sudden abandonment by those seeking to partake of a new system of social relations pertaining to urban life.'

#### FUTURE DIRECTIONS

Considering the above in the light of the ideological model that 'concentrates on the overlap and interaction of oral and literate modes rather than stressing a 'great divide'' (Street, 1984, p. 3), a couple of promising viewpoints emerge for the future. On the one hand, understanding and promoting indigenous literacy must take as point of departure the indigenous languages themselves and their characteristic orality. On the other hand, multiple, complementary modes of literacy (alphabetic, graphic, textile) must be taken into account.

Within formal education, this integrated perspective of literacy would build on the mutual influences among cultural, discursive and writing practices, in order to develop local, not universal, teaching and learning methods (Arnold and Yapita, 2000). Childhood literacy within the community realm is undoubtedly the most promising path, entailing the fostering of diverse writings, beyond imposition of a standardized norm or of school contents and topics. Existing experiences along these lines display great creative, stylistic and graphic wealth, where social meanings compete with those of identity, affect and self-esteem.

As for the development of indigenous language practice and functionality in academic spaces, the challenge implies overcoming the traditional narrative genres of stories, myths and legends, and penetrating into informative, descriptive, argumentative and other genres. For this, however, the starting point would not be Spanish discourse models, but rather the discourse forms and resources of the oral languages, such as metaphor, rhetoric, textual inference and ambiguity, and non-linear argument structure. In order to advance this task of respecting the structural particularity of orality, Calvo (1993) proposes a pragmatic grammar that responds to the specificities of orality, in which, for example, the circular organization of narrative text might be described. Sichra (2001) refers to the recognition of oral language discursive resources to stimulate indigenous students' creativity in formal scholarly events, such as the production of academic texts in the Masters program in Bilingual Intercultural Education at PROEIB Andes in

Cochabamba, Bolivia. In this way, the pedagogic practice of writing texts in indigenous languages according to Spanish molds, a consequence of an imposed literacy, could begin to be overcome (Ivanic and Moss, 1991). Paraphrasing these authors, the proposal is to go beyond a literacy where the permitted style and content range are set by external social institutions *of the Spanish learned culture*, and promote a self-generated literacy stemming from peoples' own interests, needs and purposes, where there is freedom to adopt the very content and styles of *oral indigenous cultures*. Elaborating, among others, academic, technical and pedagogical texts *in* Quechua and Aymara, and not only *on* Quechua and Aymara languages and cultures would further this line (Von Gleich, 2004).

The fact that Andean cities and capitals are becoming indigenous, and that formal spaces like higher education or the written mass media are being conquered for the use of indigenous languages, will no doubt encourage biliteracy in accordance with the interculturality evident in Latin American societies (Hornberger, 1997). Literacy events in which two languages intervene will probably exceed monolingual events in indigenous languages, given the advance of bilingualism in cities and the expansion of Spanish to rural areas.

As for multimodal writing, textiles have until recently been studied mostly as historical or modern products from three perspectives: firstly, to understand the cognitive and cultural meaning of their structure and techniques; secondly, to discover their semiotic meaning and related visual and cognitive grammar; and thirdly, to explore their use as clothing, for ritual purposes, and as means to transmit collective memory. Currently, attention is being drawn to the ability and practice of weaving as a process of acquiring socially relevant knowledge (Crickmay, 2002). There is evidence that, during their primary socialization stage, indigenous children learn through the language of textiles the repertoire of textual practices cherished by the community, such as narratives, songs and music (Arnold and Yapita, 2000). A very promising vein is for indigenous professionals to study these indigenous literacies from the perspective of the users themselves (Castillo, 2005). This perspective on indigenous pedagogy reclaims indigenous peoples' sociocultural childrearing and socialization processes for producing, systematizing and spreading their own knowledges and literacies.

## LITERACIES IN THE LIVES OF URBAN YOUTH

### INTRODUCTION

A period of approximately 30 years from the late 1970s through 2006 frames the discussion in this chapter of out-of-school literacy practices. Young people born during this period can be seen as “natives” of the digital age. A key feature of this age is that “new media” enabled by digital computer technologies greatly increased the mobility, interchangeability, and accessibility of texts and signs while magnifying and simplifying processes for their production and dissemination. Video games, instant or text messages, blogs, zines, email, ipods, ichtat, and Internet sites like myspace are digitized places that many young people inhabit. Importantly, these new media have enabled “new literacies” (see also Leander and Lewis, *Literacy and Internet Technologies*; Street, *New Literacies, New Times: Developments in Literacy Studies*; Schultz and Hull, *Literacies In and Out of School in the United States, Volume 2*). Another consideration for this period is its overlap and reciprocal influences with the hip-hop generation—youth around the world who utilize particular styles of music, language, dress, and other practices linked to hip-hop culture for core representations of meaning and identity. During the early part of this period, ways that youth were framed in public discourse contrasted with ways young people have begun to use new media to enact alternative frames. Finally, this period reflected fundamental changes in how literacy itself was conceptualized, moving from traditional literacy models that focused on writing and speech as the central forms of representation to new literacy and new media models that explore multimodal and multi-textual representational practices and forms “situated” in specific social contexts.

### EARLY DEVELOPMENTS

Earlier theories of literacy as static skills that had pervasive cognitive consequences by scholars like Jack Goody and Ian Watt, David Olsen, and Walter Ong began to encounter challenges in the late 1970s and early 1980s from a number of scholars like Ruth Finnegan, Sylvia Scribner, Michael Cole, Denny Taylor, and Marcia Farr who reported ethnographic research on actual literacy practices in various social contexts. Heath (1983) was a classic example of these studies that described

the range of literacy events and practices of different participants acting together in social situations. She explored the language socialization of children in two communities she called Trackton and Roadville and compared these processes in conjunction with a third community of townspeople. Among other things, she found very different literacy events occurring.

Storytelling, for example, varied considerably from community to community. The black residents of Trackton saw the facts of a story very differently from the white residents of Roadville. Although Trackton storytellers may have based their stories on actual events, they liberally fictionalized the details such that the outcome of the story might bear no resemblance to what really happened. These highly elaborated tales were greatly valued. However, parents in this community almost never read stories to their children. In Roadville, on the other hand, stories were read to children and stories would also stick to the facts. There residents usually waited to be invited to tell their stories where in Trackton stories were self-initiated in order to reveal personal status and power. These literacy events had different functions and different social meanings in the different communities. This work by Heath and others during the late 70s and early 80s made early contributions to re-conceptualizing non-school literacy practices by delineating distinct and culturally specific ways of making and receiving meaning in a variety of textual mediums.

Extending the re-conceptions of literacy that were emerging from various ethnographic studies, Street (1984) argued that earlier theories claiming that literacy was a universal and decontextualized set of skills that did not change significantly from one social setting to another reflected an “autonomous model” that was severely limited for understanding actual literacy practices. He put forth an “ideological model” as an alternative framework for understanding literacy in terms of concrete social practices embedded in and given meaning through different ideologies. He chose the term “ideological” to denote that these practices were aspects of power structures as well as of cultures. In further developing this framework, Street (1993) began to outline a “new literacy studies” approach to focus more comprehensively on how literacy is linked to social and cultural contexts. In this edited volume, Street brought together research from a variety of world cultures to investigate and demonstrate the different meanings and uses of literacy in different cultures and societies. This work globalized what Heath (1983) had done with local communities and families in one geographical region.

One early revision of the autonomous model of literacy was a “continuum model” that challenged the notion of a great divide between orality and written texts. Yet, this model also tended to reify “literacy in itself at the expense of recognition of its location in structures of power and ideology” (Street, 1993, p. 4). Street co-founded a group

of international scholars (see Gee, 1990; Barton and Hamilton, 1998; Barton, Hamilton and Ivanic, 1999; Pahl and Rowsell, 2006; etc.) called the New Literacy Studies Group who took the view that literacies were multiple rather than a monolithic concept, and that they should be studied as variably and historically “situated” practices within social, cultural, economic, and political contexts. The contributions reviewed in the following section reflect this new literacy perspective.

### MAJOR CONTRIBUTIONS

A wave of qualitative research and critique influenced by the early developments in studying and theorizing non-school literacy practices began to explore sociocultural contexts like transnational communities (Guerra, 1998, 2004; Gutierrez, 1997; Lam, 2004), families (Cushman, 1998), churches (Moss, 1994), sports (Mahiri, 1994), youth social and peer groups (Finders, 1996; Smith and Wilhelm, 2002; Willis, 1990) youth organizations (Heath and McLaughlin, 1993; Maira and Soep, 2005), gangs (Cowan, 2004), rap music and spoken word venues (Miller, 2004; Rose, 1994), and digital mediated spaces like the Internet (Alvermann, 2002), video games (Gee, 2004), and other electronic media (Johnson, 2005). This work documented and analyzed literacy practices and built additional, grounded theories about learning and literacy in non-school settings.

For example, Guerra’s (1998) transnational fieldwork with a Mexicano social network of several hundred people residing both in Chicago and in a rural *rancho* in Mexico further problematized notions of dichotomies between orality and literacy. His research indicated that both were highly overlapping linguistic (rhetorical) practices that resisted any clear characterization of fixed boundaries between them. Furthering this analysis, he used the literacy practices of one young woman in this social network to demonstrate her use of overlapping, situated literacies and a “nomadic consciousness” (shaped by continual physical and linguistic border crossings) to enact what he termed “transcultural repositioning” – a rhetorical ability to productively move back and forth between different languages, literacies, dialects, social settings, and ways of seeing and thinking (Guerra, 2004). Transcultural repositioning elides the simplicity of dichotomous models of literacy and can be connected to Gutierrez (1997) and her collaborators’ notion of a “third space” for language and literacy learning. Moving beyond discourses that position literacies as oppositional and hierarchical, these researchers posited a third space in which less distinction is placed on formal versus informal learning and more emphasis is placed on normalizing multiple pathways and literacies as learning resources. Lam (2004) utilized a slightly different third space metaphor in her

research on the transnational discourse of Chinese youth to illuminate the nature of their reading and discussion of international comic books as a fundamental social practice linked to literacy learning and the transformation of their cultural identity. Here the third space was the site of new or emerging frames of reference and processes of signification afforded between cultures of transnational youth.

A number of significant contributions followed leads from Heath (1983) to look further at community literacy practices revealed in families, churches, youth social groups, and neighborhood based organizations serving youth. Cushman (1998) showed the rich repertoire of literacy practices that poor black women exhibit as they interact with societal institutions from which they need to get resources. Moss's (1994) work on black sermons delivered from full, partial, or no texts continued the complication of intersections between oral and written language. Mahiri (1994) described and assessed an array of spontaneous and adaptive literacy practices of preadolescent African American males linked to their involvement in a community sports program. Smith and Wilhelm (2002) looked at boys and young men from a variety of backgrounds to investigate why males disproportionately underperform in literacy and found wide-ranging practices of literacy that usually do not get valued in schools. Cowan (2004) researched the low-rider car culture of some Latino males (who are often assumed to be gang members) and found unique literacy practices associated with constructing reading cars as symbolic texts and powerful identity markers. By contrast, Willis (1990) noted that traditional conceptions of symbolic creativity "have no real connection with most young people or their lives" (p. 1). Focusing on adolescent girls, Finders (1996) captured both visible and "hidden" literacies that girls use to construct personal identity and to maintain friendship groups. All of these studies or critiques acknowledged the contrast of their copious findings of complex and expansive practices of literacy to how little is known or utilized from these practices in schools and other societal institutions.

Other more recent contributions have explored the workings and implications of novel literacy practices connected to and often enabled by digital technologies. Manovich (2001) described how earlier visual media eventually converged with (or was consumed by) digital computer technologies through the expanding capability of computers to translate all existing media into numerical data. The result was a "new media" that incorporated graphics, moving images, sounds, shapes, and other forms of texts into data that was computable and thereby interchangeable. These qualities allowed for new forms of authorial assemblage through re-mixing, sampling, and cutting-and-pasting of highly mutable and (through the Internet) highly accessible texts. It created what Miller (2004) termed a "gift economy" that supplies abundant textual

raw materials that allow consumers of all kinds of literacy texts to easily become producers of them. Johnson (2005) argued that as these kinds transformations in meaning making are taking place, “the culture is getting more intellectually demanding, not less” (p. 9). Gee (2003), in his analysis of how these transformations play out specifically in the domain of video games noted that the theory of learning reflected in these digital environments actually “fits better with the modern, high-tech, global world today’s children and teenagers live in than do the theories (and practices) of learning that they see in school” (p. 7).

A number of studies have attempted to understand how and what intellectual demands and literacy practices are engaged by youth in digital environments. For the studies in her edited volume Alvermann (2002) broadened “the term *literacies* to include the performative, visual, aural, and semiotic understandings necessary for constructing and reconstructing print-and-nonprint-based texts” (p. viii). Chapters in this volume describe the new “attention” economy that is becoming increasingly pervasive; they portray literacies in the lives of people defined as “millennial” adolescents or “Shape-Shifting Portfolio People”; and, they argue that youth participation in digital technologies offers dramatically new ways of constructing meanings and identities.

An illuminating example of the some of these considerations was provided in a study by Fleetwood (2005). Her description and analysis of the production process for a narrative video about youth life in San Francisco’s Mission District that was to be shot from the youth’s perspective revealed provocative issues connected to practices of literacy and the creation and representation of identity through digital visual media. The question this study raised was could this visual media be utilized by youth for “authentic” projections, or did the larger community and organizational context surrounding the use of this media inherently work to mainly racialize and contrive youth identity? It was a question of could practices of literacy associated with visual media production work to transform rather than merely conform perceptions of youth. Fleetwood concludes that youth media production does provide possibilities for alternative representations of youth, but it does not resolve the complicated problems of youth being represented authentically.

#### WORK IN PROGRESS

In attempting to apprehend more authentic youth practices and representations, recent research has worked to counter characterizations of youth in mainstream media and political discourse as a “transitional” category and often marked as violent, or dangerous, or weird: “the devious computer hacker, the fast-talking rapper, the ultra-fashionable Japanese teenager teetering on platform heels. Youth in these incarnations

personify a given society's deepest anxieties" (Maira and Soep, 2005, p. xv). The on-going work of these researchers attempts to capture and critique "the transnational imaginaries of youth culture" facilitated by the global reach of technology, but "always in dialectical tension with both national ideologies and local affiliations" (p. xxvi).

Other on-going research on learning and literacy of youth outside of schools attempts to capture their authentic textual productions and symbolic representations at the intersection of new or alternative digital media and the local and global manifestations of hip-hop culture. Miller (2004) continues to demonstrate the cross-fertilizing connections between hip-hop and technology noting, for example, that rap artists were quickest to exploit digital samplers and sequencers when these and other technologies suited their cultural purposes. A decade earlier Rose (1994) had argued that "hip hop transforms stray technological parts intended for cultural and industrial trash heaps into sources of pleasure and power. These transformations have become a basis of digital imagination all over the world" (p. 22). Now, contemporary youth in the U.S and globally are utilizing technological resources to sample, cut and paste, and re-mix multimedia and multimodal texts for replay in new configurations, just as hip hop DJs reconfigure images, words, and sounds to play anew (see Richardson, *African American Literacies*, Volume 2).

Work by Mahiri and a group of collaborators (2007) is one example of research at the intersection of digital media and hip-hop culture. One of the originators of hip-hop, DJ Herc, claimed that it "has given young people a way to understand their world" (Quoted in Chang, 2005, p. xi). It is widely considered to be a salient voice of contemporary youth – a voice that is electrified, digitized, and spoken through rappers' mikes, DJ music mixes, dance styles, and graffiti. The mic of the music DJ or the rap and spoken word MC is a potent symbol at the intersection of power and pleasure on hand inside this dynamic and comprehensive aspect of youth culture. The mic also marks the intersection and interaction of production and consumption of hip-hop texts and styles. Mahiri and his collaborators are documenting and analyzing the wide-ranging practices of literacy inside hip-hop culture focused on how these practices are manifested on both sides of the mic by producers and consumers who are writing and reading the world through vibrant, provocative, music-centric lenses.

Other work in progress by a group of distinguished literacy researchers under the direction of Banks (2007) is focused on understanding and theorizing the nature of learning that is "life-long, life-wide, and life-deep." This research is comprehensively addressing the nature of learning in the multiple contexts and valued practices of everyday life across the life span and attempting to connect the different and

continuously changing “whats” of learning to the different and continually changing “whos” of learners. One strand of this research contends that for youth particularly, the complexity of rapidly changing repertoires of practice might be best understood as “semiotic domains” that Gee (2003) noted as “any set of practices that recruit one or more modalities (e.g., oral or written language, images, equations, symbols, sounds, gestures, graphs, artifacts, etc.) [to create] and communicate distinctive types of meaning” (p. 18). This research on learning for youth that is life-long, life-wide, and life-deep is attempting to understand semiotic domains that are increasingly linked to interactive, web compatible, digital technologies like cell phones, ipods, video games, audio and video recording and playback devices, as well as computers.

### PROBLEMS AND DIFFICULTIES

Traditional conceptions of print-based literacy do not account for the richness and complexity of actual literacy practices in young people’s lives enabled by new technologies that magnify and simplify access to and creation of multimodal texts. Similarly, traditional research processes (that intimately link to traditional conceptions of print-based literacy) are not well suited to capture these widely variable, highly changeable, temporal, and local acts of meaning making and identity construction. The novel, diverse, and transient text production and utilization we attempt to document, analyze, and publish are only realized long “after the fact” and thereby increase the possibility that the fact has significantly changed.

How do we bridge the generational divide between researchers and researched? If our informants are digital natives, we are more like digital tourists who are recognized immediately as if we were wearing fanny packs and white running shoes. I have tried to circumvent this problem by working with young graduate student researchers, but even they are quickly reminded that they are “old school.” More importantly, how do we bridge conceptual divides that distort our views of youth practices as they are filtered through our more static cultural models? Particularly the primacy of modes of meaning making and representation for youth seem to have shifted from written texts to more dynamic and interactive visual, tactile, and sonic texts, yet the primacy of modes for attempting to report these shifts seems not to be affected at all by these changes.

### FUTURE DIRECTIONS

A key challenge for the future seems to be to imagine and implement new ways to more fully and more accurately capture and reflect the

significance of everyday practices of youth in part through their textual productions. Willis (1990) noted, “that there is a vibrant symbolic life and symbolic creativity in everyday life, everyday activity and expression—even if it is sometimes invisible, looked down on or spurned. We don’t want to invent it or propose it. We want to recognize it—literally re-cognize it” (p. 1).

One of thing that needs to be “re-cognized” in research on the literacy and learning of youth is the centrality of practices of meaning making and representation through musical texts the selection of which enact narratives—sonic significations—that are increasingly enabled by digital technologies. “Sound,” Miller (2004) claimed, “has become a digital signifier whose form adjusts its shape in front of us like an amorphous cloud made of zeros and ones” (p. 5). His point and intent (that more literacy researchers may also need to engage) is to create a “rhythm science”—“a forensic investigation of sound as a vector of coded language that goes from the physical to the informational and back again” (pp. 4–5).

LITERACIES IN AND OUT OF SCHOOL  
IN SOUTH AFRICA

INTRODUCTION

I imagine another universe, not beyond our reach, in which [we] can jointly affirm our common identities (even as the warring singularists howl at the gate). We have to make sure, above all, that our mind is not halved by a horizon. Amartya Sen (2006) *Identity and Violence*

Literacy learning in South Africa has never been value-free. Since print-based literacy was introduced in mission schools in the nineteenth century, through the apartheid era of Bantu Education (1948–1994), the idea of literacy has been constructed by social groups and governments as a marker of power and control, of exclusion and inclusion: between ‘literate’ and ‘illiterate’, ‘Christians’ and ‘heathens’, between the ‘civilised’ and the ‘barbaric’, between ‘traditionalists’ and ‘modernists’, between ‘English’ and ‘indigenous languages’. The advent of democracy in South Africa in 1994 brought with it a new dispensation based on human rights, social justice, equality and multilingualism. Since then, attention has turned to what a more inclusive, culturally responsive literacy curriculum might look like: what does it mean, in practice, to design a curriculum which works towards integrated understandings of South African identities, despite the diversity of races, cultures, languages, religions and histories? There is a progressive, learner-centred curriculum in place, but paradoxically, the autonomous model of literacy still prevails in most South African classrooms (Chisholm, 2004; Kell, 2001), where multilingual children are learning through the medium of English, their second or third language. Although there are pockets of good literacy instruction in some schools, not enough children are attaining the necessary literacy levels required for success in school. What counts as literacy is, in the main, constructed within very narrow bands: ‘in school’ literacy learning in the early stages is often the meaningless performance of phonic drills and practice, whether children are learning literacy in their home languages, or in English. At higher levels, literacy is taught as a set of decontextualised, technical skills, with a focus on written language in its standardised forms. There is little attention to literacy as a technology for the

interpreting and designing of meaning for diverse purposes, discourses and audiences. As a result, there is evidence of low literacy achievement and high dropout rates in the majority of schools.

This chapter presents a selected overview of research projects in South Africa, which investigate alternative ways of conceptualising literacy learning: here, literacy is constructed as a multiple semiotic practice, used, inserted and transformed by agentive human beings across local and global sites, contexts and spaces, discourses, languages and genres. In these multiple forms of crossings (Street, 2005), the relationship between learning in everyday lives and school learning, and what might be an effective relationship between them, is explored (Hull and Schultz, 2002). In doing so, it attempts to reconfigure taken for granted assumptions about what constitutes rich locations for literacy and learning.

### EARLY DEVELOPMENTS

The study of literacy is an under-developed but emerging field of enquiry in South African scholarship. An important body of work in post-colonial, cultural and historical studies (Comaroff and Comaroff, 1993; Harries, 2001; Hofmeyr, 1993) explores the relations between indigenous cultural and linguistic forms in Southern Africa, which were predominantly oral and performative in nature, and their interaction with western cultural forms and epistemologies, including literacy. The orientation of much of this work views literacy as a socially situated practice which African people appropriated for their own visions of modernity and embedded in multiple symbolic systems. This interactive relationship between African and western forms of knowledge positions African intellectual agency as central to these processes.

In her study of oral historical narrative in a Transvaal chieftdom that was radically transformed by colonialism and capitalism, Hofmeyr (1993) explores the dynamic relationship between orality and literacy in the history of this community. She traces the impact of mission school literacy, through its production of primary basal readers, on out-of-school indigenous oral storytelling practices, and vice versa. She argues that the overall impact of the agencies of colonialism on oral performance was ambiguous. It was not literacy per se which transformed oral forms: rather it was the political intervention of literate institutions like the church, state or school, which shaped and asserted how literacy was to be used and understood. Drawing on a classic study of Xhosa oral storytelling practices by Scheub (1975), Hofmeyr reveals the gendered nature of oral storytelling practices in African households and challenges the idea of indigenous or 'traditional' oral genres as fixed and stable: rather, she demonstrates

how they shift and transform in response to social and political dynamics and pressures. The instability and hybridity of cross-cultural forms, modes and practices is an important idea which underpins this chapter.

In the field of educational scholarship, the political struggle against apartheid injustices provides the backdrop against which the major critical debates in educational theory and practice have taken place (Christie, 1992). There has been little attention, until more recently, to focusing on literacy education and pedagogy per se, except in the field of adult basic literacy education. Kallaway's (1984) edited volume of essays, *Apartheid and Education*, explores the origins and evolution of black educational policy, including education beyond schools in the radical adult education night school movement during the first-half of the twentieth century. Most of the investigation into school-based literacy has taken place within the context of wider debates on language-in-education policies within the context of the relative status and positions of English, Afrikaans and the indigenous African languages (Heugh, Siegruhn and Pludderhann, 1995). This is particularly the case in relation to the debates around the language of choice for early literacy, in essence, the impact of mother-tongue literacy instruction and English literacy instruction on children's initial literacy learning. Hartshorne (1992) points out that during the apartheid era, decisions about language-in-education policy were intended to divide African communities and limit their social mobility and access to higher education. Since 1994, in spite of the political will to promote multilingualism, and declare all South African languages equal, official languages, English is rapidly monopolising powerful domains like government, the media, schools and business. The dominance of English needs to be seen in relation to the struggle to establish a body of literature in African languages, the absence of which has a direct impact on the range and availability of written materials for early literacy learning.

#### MAJOR CONTRIBUTIONS AND WORK IN PROGRESS

In 1994, the ANC government, under the leadership of Nelson Mandela, initiated a new era in South African education. Nineteen departments of education, previously divided along racial lines, were combined into one national department of education. Faced with the challenges of producing educational policies which would address the inequities of the past and enable young people to enter the globalised world of the twenty-first century, the government introduced curriculum reform in 1998 through a national curriculum, Curriculum 2005, an outcomes-based model of education. This was later revised as the Revised

National Curriculum Statement in 2002. The South African model of outcomes-based education (OBE) differs from its international counterparts in its explicit emphasis on constitutionally enshrined values of redress, equity, the development of a democratic culture based on social and environmental justice, fundamental human rights and inclusivity, multilingualism and multiculturalism. The curriculum is 'learner-centred' and promotes participatory, interactive models of learning, emphasising the important role of the learner's interests, prior knowledge, history and identity in the learning process.

It was in this context of political and social transformation that a number of important initiatives in the area of literacy research took place. The government set out to redesign the assessment framework for education and training and a concern for literacy and Adult Basic Education was included. A major contribution to re-thinking literacy education within a social practice perspective in South Africa and influencing research traditions, was the path-breaking *Social Uses of Literacy* (Prinsloo and Breier, 1996), a collection of ethnographic case studies on the reading and writing practices of ordinary people in the Western Cape, who had little or no schooling. This volume formed part of the first wave of ethnographic research into local literacies research in the tradition of the New Literacy Studies (Barton, 1994; Heath, 1983; Street, 1984, 1993). This research aimed to make an intervention in adult basic education policy discussions, and challenge the universalism of most policy research by providing detailed accounts of the social uses and meanings attached to literacy in a range of contexts, from informal urban settlements to family farms, from townships to the taxi industry. Whilst the planners of the 1994 parliamentary elections considered 'illiteracy' to be a major barrier to knowing about the election and voting, only 1% of the votes cast were spoilt ballots, despite the fact that the ballot form was complex and lengthy. The work challenges the rhetorical 'literate'/'illiterate' divide operating in many educational and policy circles, that without schooling, adults are a homogenous mass of socially disabled people. The research demonstrates how people are able to draw effectively on local forms of knowledge, literacy mediators and forms of apprenticeship learning, in order to participate in processes and actions which affect their everyday lives.

There is a growing awareness in South Africa of the need for more ecological models of literacy education (cf. Barton, 1994) in which teaching young children to read and write has to be linked into much broader chains of sustainability. In a project focused on early childhood literacy learning, Tshidi Mamabolo an early literacy educator working with children from impoverished communities on the outskirts of Johannesburg, changed her 'autonomous' model of literacy pedagogy through reconfiguring the boundaries between home and school (Stein

and Mamabolo, 2005). She set 'in school' activities which built on children's indigenous knowledges, identities and multilingual practices outside of school. However, she discovered that 'pedagogy was not enough': the effects of hunger, poverty and HIV/AIDS on her children's lives forced her to cross the boundary between school and home backgrounds, to try to 'get everyone on board'—households, families and communities—in order to sustain early literacy development across multiple sites and contexts. In remaking the conditions for reading, Mamabolo recognised that 'home background' rather than being in 'deficit', needs to be positively referenced as a matrix of social relations, social conditions and potentials for social action.

In a different version of an ecological model, Janks (2003) describes a whole school environmental educational development project in a poor school on the outskirts of Pretoria, in which critical literacy was nested within other projects, and contributed to the changes produced in the school. One of these classroom projects involved the children in collecting, explaining and illustrating their everyday games for children in Australia. This project drew on their out-of-school literacies and used their multilingualism as a pedagogic resource (see Freebody, *Critical Literacy Education: On Living with 'Innocent Language'*, Volume 2).

It has been argued that the separation of early childhood development and Adult Basic Education and Training in different sites of delivery and curricula can undermine the potential of learning within the household or family. Culturally sensitive, organic models of family literacy in which meaningful partnerships are formed with family members, have much to offer in enhancing literacy in households. Pioneering work in this field was carried out in the early 1990s by Letta Mashishi (2003), who worked with parents and children in Soweto in the Parents and Schools Learning Clubs Programme (PASLC). These programmes were initially developed on the basis of requests from different communities of parents, who did not possess the requisite literacy skills to providing support to their children in school. The aim of these clubs was twofold: to encourage family members to share their experiences, knowledge of languages and cultural knowledge with their children and other members of the family; and to involve families in the effort to entrench reading, writing and learning as part of the culture of African homes. The PASLC curriculum which evolved over 10 years was based on a model of collaborative action research, allowing for high levels of democratic participation and resulted in synergies which directly impacted on parents' and children's engagement with literacy practices. A central focus of this work was discussion and research into African identities and traditional ways of life, including aspects of genealogy and kinship, musical and oral traditions such as

praise poetry, family totems, family and community histories, which then became the content around which different genres of written texts were produced, in extended family chains of collaboration. Building on the fact that the majority of parents indicated that they had not considered that cultural factors such as family trees and praise poems could be relevant to their children's education, this programme was highly political and challenging in its assertion of the importance of African cultural issues and indigenous knowledges within the realm of family literacy. In this organic, contextualised model of family literacy, parents and children, together, forged an alternative set of texts and concerns to those operating in mainstream schooling.

Another example of a successful intergenerational family literacy programme is the Family Literacy Project, which works with groups of women from remote rural areas in Kwazulu-Natal (Desmond, 2004). This model explores ways in which mothers can support the development of their children's early literacy learning. Through the process of broadening the women's horizons through developing a culture of reading, the women come to understand the importance of their own role in relation to their children's healthy development. In 2003, a home-visiting scheme was launched where group members visited other families, took out books and read to children, and at the same time discussed child development with the parents.

The Children's Early Literacy Learning Project (CELL) is an ethnographic research project in the tradition of the New Literacy Studies, investigating the literacy practices of children across homes, schools, streets and communities. This project is trying to understand the key shaping influences which enable some children, and not others, to read and write in South African schools. This research observes children from a range of socio-economic backgrounds in their home and school environments. In a study of children in their everyday play in the Western Cape, Prinsloo (2004) describes how, in contexts where children's resources for representation are not strictly regulated by adults, the children drew in imaginative and creative ways on multiple semiotic resources from their official school world, peer social world, the world of the media and the home. Their games are characterised by a mix of languages, hybrid narrative resources, images and artefacts from local popular culture, including 'traditional' Xhosa and Christian church influences, from the mass media (TV and radio) and from schooling (see Leander and Lewis, *Literacy and Internet Technologies*, Volume 2). In their home language, isiXhosa, they used rich sources of image, metaphor and music. These practices were in direct contrast to the kinds of literacy pedagogy they encountered in school, which was mainly in the form of highly directed skill and drill teaching. Prinsloo argues that in the absence of meaning making activities in school which

are connected to their social worlds, the children's chances of developing careers as successful readers and writers were limited by the narrowness of their school experience, rather than by their home experiences.

Stein and Slonimsky (2006) present data from the CELL project in their ethnographic study of multimodal literacies involving adult family members and girl children, all of whom are high achievers in school literacy, and who come from a range of socio-economic backgrounds. They investigate the microcultures in each family in relation to its ideological nature (Street, 1984): what kinds of textual practices count, by whom and for what ends, in relation to how different roles and identities for the child both as reader and as subject are constituted and projected. Through an analysis of particular family literacy events in each household, Stein and Slonimsky show how what counts as 'good reading practices' are not the same in each family. At the same time, they demonstrate how each adult family member uses the practice of literacy to project and orientate the child towards certain forms of worldliness. Each adult uses the practice of literacy to develop each girl's capacities to self-regulate, to map pathways of access in relation to aspirations and possible futures. These pathways include how to get access to various forms of linguistic, educational, cultural and economic resources. These pathways are both real and imaginary—the dusty roads which lead out of the 'shacks' and the 'townships' to the city of Johannesburg and beyond. The authors argue that the different ways in which adult family members shape and reshape the 'stuff' of literacy (Kress, 2003) with and for their children has deep effects on children's orientations to the future both as readers and as subjects.

In multilingual South Africa, a culturally responsive literacy curriculum has to include bilingual/multilingual literacy. In spite of new language-in-education policies which actively promote functional multilingualism, most parents want their children to have access to English as the language of power and internationalism (Granville, Janks, Mphahlele, Reed and Watson, 1998). The work of Project for the Study of Alternative Education in South Africa (PRAESA) (Bloch and Alexander, 2003) is committed to promoting African languages and developing African literature in African languages in the face of what they call 'the self-defeating language attitudes of the majority of people'. They argue that full functional use of indigenous languages at all levels of education is central to economic development and the development of democracy in South Africa. They propose that all South African schools should become dual-medium institutions in which the home language is sustained as a language of teaching and learning for as long as possible, alongside a second language of teaching and learning, and in which additional languages are offered as

subjects. An important part of PRAESA's work is enabling and supporting teachers to carry out an additive approach to bilingualism and biliteracy in early childhood classrooms. In order to do this meaningfully and effectively, the project develops multilingual learning materials and story readers for teachers and parents to use in children's initial literacy development.

In an attempt to understand the relationship between school learning and students' learning in their everyday lives, the Wits Multiliteracies Project (Stein and Newfield, 2004) has developed classroom-based pedagogies which are multimodal, multilingual and involve different kinds of 'crossings'—across languages, discourses, popular youth cultural forms, indigenous knowledges and performance arts. The work is based on an application of the New London Group's Pedagogy of Multiliteracies (Cope and Kalantzis, 2000) to a South African context (see also Leander and Lewis, *Literacy and Internet Technologies*, Volume 2). These pedagogies attempt to move beyond literacy in the form of written language only. Members of the project argue that school literacies exclude the life worlds of those who participate in them and they work with indigenous knowledge systems, cultural practices and languages within a critical framework that takes account also of school and global literacies. Brenner and Andrew (2004), working in a university context, explore the relationship between visual literacy, identity and knowledge, in their class assignments which focus on local craft forms, such as the *minceka*, a traditional cloth inscribed with narrative forms, worn by women in Limpopo Province. Mamabolo's Grade 1 children at Olifantsvlei Primary School made dolls based on traditional South African fertility figures, as part of a project exploring history, culture and neighbourhood.

Similar work which explores the contribution of multimodality to designing culturally responsive curricula at the tertiary level is Archer's (2006) research which demonstrates how pedagogies which incorporate multimodality and indigenous knowledges can yield successful results for students from diverse language and cultural backgrounds, who are studying academic literacy in an engineering foundation course at university.

In an attempt to engage 'at risk' students in a Soweto secondary school, an English teacher, Robert Maungedzo consciously worked with multimodal pedagogies to stimulate his disaffected Grade 11 students into creative production, hoping that this might stimulate them to returning to poetry, which they had abandoned in the school because it was 'too difficult' (Newfield and Maungedzo, 2006). In this project, the students collectively made a cultural identity text, a large cloth stitched with maps of South Africa, ethnic dolls, praise poems and contemporary poems. They made this cloth to send to teenagers in

China in an international exchange project. The mixed media, multi-modal cloth they called TEBUWA, which means ‘to speak’. Since this time, they have returned to poetry and written a collection of their poems which have been published. Their poems experiment in playful and original ways with forms of rap, text messaging and different South African languages, including township idiom, youth slang and the rhythms of kwaito, a genre of local popular music (see Richardson, *African American Literacies*, Volume 2).

#### PROBLEMS AND DIFFICULTIES

South Africa is engaged in a sustained process of recovery and reconstruction after centuries of racism, violence and oppression. The extremely damaging effects of generations of appalling apartheid education and poverty live on in people’s psyches, senses of identity and selfhood. They also continue to affect people in very material ways, in terms of grossly unequal access in the society to quality education, and therefore to successful literacy learning. This is especially the case for the rural poor (Nelson Mandela Foundation, 2005). Whilst major gains have been made in overhauling apartheid education, with compulsory, improved access to schooling, free schooling for the poor, accelerated provision of school infrastructures, more equitable distribution of resources, school-feeding programmes, better teacher–learner ratios, and better quality textbooks in all schools, the fact remains that the majority of South African children are struggling to become successful readers and writers in school, *in any language*. There are many structural, social and educational reasons for this, some of which have been outlined earlier. A key area of concern is literacy pedagogy: the new national curriculum allows for a range of meaningful literacy activities, which incorporate and build on learner’s knowledges, semiotic resources and multilingualism. However, teachers find this difficult to implement, for historical, cultural and pedagogical reasons (Adler and Reed, 2002). Educators have only recently begun to note the differences in the long-standing international debate between phonics and whole language literacy pedagogies. Teacher education programmes, both pre-service and in-service, which focus on literacy as a social practice can work with teachers on how to sustain and develop learners’ literacies in ways which make sense to learners and which draw on their everyday worlds. Part of such programmes involve the development of teachers’ own multiple literacies, as most teachers were educated in the impoverished apartheid model. This seems to me an important way forward to improving literacy pedagogies. Another area of concern is resources: learners all over the country need access to literacy materials in different South African languages, in print-based

and electronic forms. These materials are more readily available in urban areas: hopefully, more sustained attention will be given by the government to adults and children in remote, rural areas, who live in conditions of extreme deprivation and hardship.

#### FUTURE DIRECTIONS

As researchers in the New Literacy Studies have powerfully demonstrated, literacy learning is part of much broader chains of sustainability and social development. In a developing country like South Africa, which straddles first and third world economies simultaneously, it is important to 'get everyone on board' to raise public awareness around the value and importance of literacy in sustaining democracy and human rights. Families, households, communities, the business sector and the government need to support the development of literacy as one of the enabling conditions for the practice of freedom, at all levels and in all sectors of the society. Culturally responsive models of family literacy can have positive benefits to all participants. At the same time, rigorous, ongoing academic research into literacy practices across educational contexts needs to continue and be part of education programs at tertiary levels. Whilst this chapter has mainly concentrated on research investigating out-of-school literacies, it is fair to say that very little research has actually been conducted into 'in' school literacies: it is time to look in much deeper ways into children's actual experience of literacy learning across the curriculum. This involves getting a better sense of children's engagement with literacy at different grades and levels, across discourses, genres and technologies.

## LITERACIES IN LATIN AMERICA

### INTRODUCTION

Latin America is a heterogeneous region with deep cultural, social, economic and linguistic differences. International agencies such as UNESCO, World Bank, and the Economic Commission for Latin America (CEPAL) refer to the region as Latin America and the Caribbean in order to include not only the land mass stretching from Mexico to Argentina but also the small English, Spanish, and French-speaking islands as well. Disparities in class, race, language, and ethnicity shape literacy in Latin America. In 2000, 20% of the region's income was earned by 5% of the population and 46% of all families were identified as living below the poverty line. Countries such as Brazil, Dominican Republic, El Salvador, Guatemala, Honduras, and Haiti still have illiteracy rates above 10% and this figure tends to increase among indigenous peoples. As a region, Latin America has high educational gender equality. Male and female enrollment is nearly equal and the difference between genders in adult literacy statistics is just 4%. However, indigenous peoples are more likely to be illiterate than other groups. Indigenous women are more likely to be illiterate than indigenous men and although illiteracy in urban centers tends to be 6%, it is twice that in rural areas. Any discussion of literacy in Latin America needs to contemplate this socioeconomic reality as well as the history of literacy in the region, the role of schooling in the dissemination of reading and writing, and education policies promoted by international agencies (La Belle, 2000; Prins, 2001; Rivero, 2000; Seda Santana, 2000).

### EARLY DEVELOPMENTS

School is the social institution traditionally responsible for the education of readers and writers. Starting as early as the 1950s, Latin American countries made universal literacy a national goal and began expanding their school systems in order to guarantee all children a place in a classroom. As a result, literacy rates climbed to 70% in the 1970s, reaching 89% region wide in 2005 (La Belle, 2000; Socialwatch.org, 2005). While most children enroll in school, many fail the early grades and/or drop out before finishing their primary education, creating a potential population for adult education and literacy programs (Ferreiro and

Schmelkes, 1999). However, the role of formal schooling of children should not be underestimated. Latapi and Ulloa (1993) studied the relationship between schooling and the dissemination of literacy. After considering the expansion of the Mexican public school system and adult literacy programs and policies, they concluded that declined illiteracy rates were due more to the growth of formal education, rather than programs designed to teach adults to read and write given the steady increase in school attendance and terminal efficiency and the disappointing outcomes of adult literacy programs.

By the late 1960s, official programs linked literacy to economic development and employment. Seda Santana (2000, p. 41) notes that "the general premise was that industrialized countries have high levels of literacy and therefore reading and writing were necessary conditions for national development." Adult literacy curricula tended to emphasize *alfabetización* or the learning of letters and sounds and then *postalfabetización*, the development of so-called complex skills and abilities considered necessary for the job market. However, many organizers of nonformal education programs associated literacy with Paulo Freire's theories of consciousness raising and oriented their efforts towards building a more socially and politically aware population. Perhaps the best-known endeavor of this type was the literacy campaign in Nicaragua. Before the revolution of 1979, clandestine educational activity persisted for many years. Following the fall of Somoza, the National Literacy campaign, involving 150,000 student volunteers was launched. Employing Freire's methodology, the campaign used short narratives based on the nation's recent struggle as the basis for their program. The organizers claim to have reduced illiteracy in 3 months from 50.3 to 12.98, although there is not a clear picture of the types or depth of literacy achieved (Freeland, 1995; Hornberger, 1997; La Belle, 2000; Lankshear, 1988; Miller, 1985).

The dominant language in continental Latin America is Spanish, except for Brazil where Portuguese is spoken. Over 400 indigenous languages exist in the region, some of them with fewer than 10,000 speakers. In countries such as Bolivia, Paraguay, Ecuador, Guatemala, Mexico, and Peru, the rate of illiteracy among the indigenous population is much higher than the nonindigenous population. One clear example of this phenomenon is Guatemala, a multilingual country with 15 languages having 10,000 or more speakers each. Data from 1993 put illiteracy among the indigenous population at 79%, as compared to 40% among the nonindigenous population (Psacharopoulos and Patrinos, 1993). Most of the literature on illiteracy and indigenous languages centers on bilingualism and national identity, the importance of literacy for development, the right to education in the mother tongue, and educational programs and policies. Shirley Brice Heath's 1972

publication of *La Política del lenguaje en México: De la colonia a la nación* is one of the earliest in-depth studies of the issues from a socio-linguistic perspective (Heath, 1972).

It is important to note that not all prehispanic languages were unwritten. While Quechua, the lingua franca of the Inca empire was agraphic, several Mesoamerican languages were not. In Mexico, writing developed around 600 B.C. and was passed on from one culture to another. At the time of the Spanish conquest, for example, the Mayans engraved stone and wrote glyphs on folded sheets of *amate*, a paper made from the bark of a local tree. Scribes and priests used writing to record historical events, sacred texts, almanacs, astronomical calculations, and mathematics. The Spanish destroyed the *amate* codices and prehispanic literacy as part of their policy to impose social and cultural dominion in the New World (King, 1994). While local literacy was shattered, the conquerors introduced their writing system and uses of written language as an instrument of authority, still associated by many with colonial power and domination (Zavala, 2005).

Education programs developed for speakers of indigenous languages have historically been based on transition models and cultural assimilation policies aimed at building a homogeneous national identity. Schooling for indigenous children and education for adults has involved either teaching the colonial language and then reading and writing or creating a written representation of local languages and using it to teach reading and writing as an intermediate step towards literacy in the dominant language (Freeland, 2003). Programs designed for adults have had different outcomes but most have been unsuccessful. Adults often do not register for programs, and if they do, they tend to drop out before completing them. Cutz and Chandler (2001) have noted that ethnic identity requires adults to adhere to standards of behavior that identify them with their communities. This may include working in the fields or the forests, dressing in typical clothing, and speaking their language. Literacy and/or the learning of Spanish may be seen as a sign of disrespect.

Research during the 1970s and the 1980s was mostly instrumental in nature, oriented towards material development and program design and description. However, there are some notable exceptions. The most prominent literacy theorist in Latin America is Paulo Freire (Freire, 1970), well known for his book *Pedagogy of the Oppressed*, ideas about banking education and his advocacy for *conscientização*—conscious raising learning processes. His work is still widely referenced by adult literacy program designers, informal education programs, and grassroots organizations and is used as a theoretical basis for the development of pedagogical actions in Latin America and beyond. Another early contribution was made by Ferreiro and Teberosky with the publication of their book (Ferreiro and Teberosky, 1979). Using a Piagetian framework, these

two researchers from Argentina unearthed the process of conceptualization involved in understanding the alphabetic principle. This work has been the basis for rethinking emergent literacy throughout the region.

### MAJOR CONTRIBUTIONS

During the 1970s and 1980s, various countries in Latin America were ruled by military dictatorships and authoritative regimes or engaged in civil war. The impact of these extreme circumstances on human rights, combined with the general decline in living standards, fostered social movements during these years. According to La Belle (2000), women were protagonists of these social movements. Their momentum was assisted in 1980 by the United Nations declaration of the Decade for Women. Many of the activities that women engaged in combined various forms of social action with literacy efforts (Prins, 2001). Recent publications explore women's literacy learning and experiences within community-based organizations, official programs, and religious organizations (Aikman and Untehalter, 2005; King, 1998; Medel-Añonuevo, 1997; Prins, 2001; Purcell-Gates and Waterman, 2000). A recurring theme in this literature is the role literacy classes play as spaces for socialization (Kalman, 2005; Stromquist, 1997). Women tend to be confined to their households and hindered by domestic responsibilities and oppressive family structures with few opportunities to interact with other women. Stromquist observes that "the literacy classes constitute very desirable social spaces. The classroom emerges as a setting that is socially approved for women and can offer services that are not available elsewhere" (p. 90). These services function as a site for social distractions, a self-help group and an informal social club.

There is consensus in the literature that the majority of current literacy research continues to be instrumental, what Arnove and Torres (1995) call "under-funded and under-theorized." Jáuregui, Jeria and Retama (2003) note that a great wealth of work has been done on curriculum design and evaluations of performance and quality. Seda Santana (2000, p. 49) points out that "in the midst of multiple demands, research has not been a major priority for Latin American countries." The applied nature of literacy research is due, at least in part, to its close ties to education programs and the sense of urgency to understand and solve what are conceived to be obstacles to obtaining the long-standing goal of universal literacy. Furthermore, adult literacy tends to be divorced from other areas of educational research and perceived basically as a problem of remediation (Kalman, 2005).

In the late 1990's, UNESCO supported research on the characteristics of functional literacy. The study, published under the title *Functional Illiteracy in Seven Countries in Latin America* (Infante, 2000), was

carried out in Argentina, Brasil, Colombia, Chile, Mexico, Paraguay, and Venezuela. Using standardized tests for reading and mathematics, the study aimed to measure adults' abilities to comprehend texts with various degrees of difficulty, to do arithmetic calculations, read graphs, and understand numeric information. One of the most important conclusions was that all those tested showed some knowledge about reading and writing, leading the author to question the widespread belief in a literacy–illiteracy dichotomy. Adults classified in the lower levels of literacy had approximately 6 years of schooling while those with higher reading levels had at least 11 years. This led the researchers to conclude that functional literacy is correlated with at least 6 years of schooling. It should be noted that this finding did not consider more qualitative factors such as opportunities to read and write in everyday contexts or the availability of print materials.

Several studies have recently contributed a more qualitative perspective to a small but growing body of research on literacy, schooling, and social practice in Latin America. A study from Mexico documenting the dissemination of literacy in a semiurban township recently won the UNESCO International Literacy Research Award (Kalman, 2004). In this analysis, the author makes a conceptual distinction between availability (the material conditions for reading and writing) and access (the social conditions for appropriating written culture). She first draws on historical and interview data to portray the development of the town over the last 50 years as a context for using written language. Then she describes in detail a literacy class for some of the townswomen where the local history and culture were backdrops for learning to read and write. She notes that for those whose lives are basically confined to their town, their opportunities for accessing literacy are limited to the reading and writing contexts they encounter there. She concludes that opportunities to interact with other readers and writers are intrinsic in becoming literate.

Rockwell (2001) has also made important contributions to the study of literacy as cultural practice in classroom settings. She draws on Chartier's notion of written culture based on shared practices, artifacts, meanings, and attitudes. Her study centers on reading in a rural school in Mexico analyzing how the layout of the textbook and the ways in which reading was accomplished influenced the outcome of the lesson. She then discusses how students construct changing relationships to the written language through schooling. Zavala (2002) published an ethnographic study of Umaca, a small Quechua community of 70 families in the Andes. There she studied the different ways the townspeople perceive written language, how they associate different meanings to reading and writing and struggle with literacy in both their relationship with their traditional culture and with their efforts to relate to the dominant

culture. Because written culture has been associated with Spanish and perceived as foreign to Umaca life, people there have never considered literacy as necessary or found its' integration into their lives particularly desirable. Not only did the participants not use literacy in Spanish, they found reading and writing in Quechua cumbersome and pointless.

All of these studies offer a different perspective on the study of literacy. Their goal is to further the understanding of the factors and processes that contribute to the dissemination of written culture, explain why literacy is not always rapidly embraced and recognize the complexity of literacy practices. Overall, this line of research contributes to a growing body of knowledge about literacies in Latin America and beyond. The value of these studies is not the potential for their immediate application in a given program, but the specificity of the cases that they examine.

#### WORK IN PROGRESS

One of the ongoing discussions in Latin America and the Caribbean is around the meanings of the term literacy and its representation in different languages. In Spanish, *alfabetización* (*alfabetização* in Portuguese) refers to both the process of learning to read and write and the presence of written language in a given society. Until the 1990s, the notion of literacy as divided into two phases prevailed. This concept claimed that an initial phase involved learning the most rudimentary aspects related to encoding and decoding written language, followed by a second phase of learning how to use written language known as *postalfabetización*. The majority of programs for unschooled and under-schooled youths and adults were built on this principle directing their efforts toward the acquisition of an isolated set of mechanical skills. Those unable to recognize the alphabet, name letters, read and write their names, or read and write simple messages were referred to as *analfabetos absolutos*. Those deemed as lacking in the abilities related to reading, writing, oral expression, and basic arithmetic thought necessary for employment were considered to be *analfabetos funcionales*. It should be noted that during the last decade these definitions have come under scrutiny. Broader notions of literacy and what it means to be literate have become subjects of dispute. These concepts have been debated in international meetings, academic publications, and among educators and policy makers in the region linking their arguments with similar debates in the international context (cf. Rogers, 2006; Street, 2006; UNESCO, 2005).

Researchers and educators have expressed concerns about the narrowness of the term *alfabetización* and its tendency to conceal the use of written language as social practice. In Brazil, for example, the term *letramento* has been used to analyze literacy as social practice and examine

its pedagogical implications (Kleinman and Moraes, 1999; Masagao Ribeiro, 2003) whereas in Mexico *cultura escrita* is currently in use to broaden the concept of *alfabetización* to include both culture of reading and writing and the culture found in written text. The definition of literacy as social practice (cf. Section 1 of this volume; cf. Street, 2001) now has widespread acceptance, as shown by its recent inclusion in the curriculum for language arts in countries such as Argentina, Mexico, and Chile. However, this does not imply that it has been easily integrated into teaching practices.

In the 1990s, the term “youth” was officially introduced to region-wide adult education and literacy and education efforts to explicitly refer to the large number of young people who leave school before finishing their basic education. During this period, Latin America has witnessed the proliferation of education programs aimed at reincorporating learners of 15–30 years of age (or more) back into the education system. These programs tend to be more flexible, focusing on the social, economic, and cultural issues young adults face (Jaureguí, Jeria and Retama, 2003). An example of this type of *approach* is the recent program developed by the Instituto Nacional de Educación para Adultos (INEA) in Mexico. The accelerated basic education program based on academic subjects such as mathematics, science, language arts, and social studies also includes courses based on health, family, domestic violence, child rearing, and employment issues.

The *Centro de Cooperación Regional para la Educación de Adultos en América Latina* (CREFAL) published in 2003, a theme issue of its journal *Decisio* on the topic of written culture and Adult Education. This collection of papers, written for literacy practitioners and program designers, emphasized the relationship between written and oral language, the notion of multiple literacies (Robinson-Pant, Women, Literacy and Development: Overview, Volume 2; Rogers, Informal Learning and Literacy, Volume 2), the use of writing as a vehicle for learning and self-expression, and the complex relationship between those who read and write well and those who want to read and write well. All of these notions extend the traditional boundaries of the concept of *alfabetización*.

In this discussion of the significance and accomplishment of literacy, the exchange of ideas among researchers, policy makers, and practitioners has become crucial. An ongoing host for this kind of dialogue is the *Comunidad E-ducativa*, run by Rosa María Torres of the organization Fronesis. This group serves as a permanent forum for exchanging articles, announcing events, proposing measures and region-wide declarations. Along with the Fronesis web page <http://www.fronesis.org/>, it has become one of the principal resources for keeping up with current literacy and education-related events.

International agencies continue to play a major role in shaping literacy policies and related programs. As part of the policy aimed at achieving universal primary education (UPE) for all children, UNESCO currently promotes the development of libraries, the publication and distribution of books, and access to information, themes partly articulated through the shift of focus from individuals to 'literate environments' signaled in the Global Monitoring Report (Street, 2006; UNESCO, 2005). In Latin America, this has been translated to a series of programs referred to as *fomento del hábito de la lectura* (promoting reading habits). Currently 19 Latin American countries have national reading plans with similar objectives and schemes of action. *The Centro Regional para el Fomento del Libro en América Latina y el Caribe* (CERLALC), an offspring of UNESCO, provides countries technical support for running their programs, organizing events, training teachers, librarians and other literacy personnel, and circulating information. It is not coincidental that these programs have developed simultaneously: the region is currently facing what has been called an education crisis, provoked at least in part, by the recent concern caused by the low achievement scores that students are obtaining on standardized tests and their poor rating in comparison with students in other countries, even after most Latin American nations have given priority to expanding their school systems over the last 45 years (Peña and Isaza, 2005).

The national reading programs are very similar in approach. They are based on the premise that reading is necessary for the development of democracy, the fight against poverty, the advancement of science and technology and, in general, a higher standard of living (Peña and Isaza, 2005). The idea that reading is essential for personal development, instills morals and values, and contributes to democracy by strengthening national identity and social economic development, is ideologically reminiscent of the 1960s literacy campaigns. The various ministries of public education seek to promote reading beyond the usual language arts curriculum, through book distribution programs for neighborhood groups, schools and public libraries; publishing programs to support the production of reading materials for young people; and working closely with teachers and school.

However, the programs do not exist without critics. Both Hernández (2005) and Zavala (2005) note that they operate from a single notion of reading and do not contemplate realities of people in Latin America struggling to get by. Kalman (2006) questions the idea that becoming a reader is a matter of habit and argues that written language use is deeply embedded in other communicative processes. Citing Rodríguez (1995) Seda Santana (2000) noted that legislating literacy often comes up against the conditions and variations of cultures. Becoming

“a region of readers” will only be possible when the social world of diverse groups and cultures are taken into account. All authors agree that the distribution of books alone will not turn people into readers. The appropriation of literacy requires opportunities to interact with other readers and writers and participate in social situations where written language is key to communication (Kalman, 2004; Robinson-Pant, *Women, Literacy and Development: Overview, Volume 2*; Rogers, *Informal Learning and Literacy, Volume 2*).

### PROBLEMS AND DIFFICULTIES

One problematic situation for countries in this region is the heavy influence that international agencies have in shaping policies and programs. From 1981 to 2000, UNESCO organized and directed its education policies for the region through the Principal Education Project for Latin America and the Caribbean (PPE). From 1981 onward, the main thrust was to promote primary education for children (Ames, 2003; Torres, 2004). Despite the importance official policies gave to literacy and basic educations for adults, few resources were channeled toward these areas. In countries where two-third of the rural population were illiterate, only 1% or 2% of their education budgets are/were directed to adult education (Arnove and Torres, 1995; Jauregui et al., 2003). This is partially due to the emphasis in international policy directives on UPE and the following reluctance of national governments to fund to adult literacy and basic education (cf. Rogers, *Informal Learning and Literacy, Volume 2*). The World Bank has also promoted the idea that investing in education programs for children brings a higher rate of return investing in adults (UNESCO, 2006; World Bank, 2003), although the Global Monitoring Report has scope for reintroducing emphasis on youth and adults (Street, 2006; UNESCO, 2005).

This policy has had several impacts on the direction of literacy work with communities and target populations. It has led educators in the region to separate literacy for children and adults, based on the premise that they could not learn together or from each other. As a result, many opportunities for intergenerational learning may have been missed despite the important findings on parent-child interactions around literacy from research in other contexts (cf. Ames, 2003; Rogers, *Informal Learning and Literacy, Volume 2*). It has also contributed to adult programs being second rate, depending on untrained volunteers, improvised spaces, and low social prestige. The poor funding and status of adult literacy and basic education has led to the dismantling of important state-funded organizations previously responsible for designing and coordinating learning opportunities. While many adult literacy initiatives have

often been criticized for their irrelevancy, inefficiency, and compensatory nature, these policies have been a major obstacle to professionalizing literacy teachers, systematically documenting programs, and improving practice (Rivero, 1999). The current tendency in Latin America is to think of literacy policy as a two pronged agenda: preventive measures to provide high-quality education for children and keeping them in school, and the development of programs for marginalized youth and adults (Torres, 1998). In order for this approach to be translated into action, international agencies and lenders will have to reconsider their policies and create mechanisms for more local participation.

Although countries in the region are making efforts to provide education opportunities, both oral and written, to indigenous populations in their own language, literacy in indigenous communities continues to be problematic and insufficiently understood. Today, even with the development of some alphabetic representations, most of these languages are unwritten. The issue of literacy and illiteracy among speakers of indigenous languages poses important questions for the conceptualization of what it means to be literate (King, 1998; Freeland, 2003; Jones and Martin-Jones, 2000). In the strictest sense, one would have to conceive these cultures and peoples as agraphical, without writing, rather than illiterate, unknowledgeable of writing. In school contexts, indigenous languages continue to be used mostly as a bridge to the dominant language. What is needed is that the local languages be used as a means of communication and reflexion as well as the language of instruction. For writing to thrive, literacy policies will need new strategies that promote the use of writing and the development of indigenous writers who can create written texts from and for their cultures (Ferreiro, 1993). Currently, countries such as Mexico, Nicaragua, Colombia, Bolivia, Ecuador, and Peru are developing programs that emphasize the need to develop a strong sense of identity among learners in addition to learning to speak, read, and write both the dominant and indigenous languages. If the context allows it, this would also include teaching indigenous languages to nonindigenous speakers (Schmelkes, 2006).

Research in literacy has been characterized as dispersed and weak: it is permeated by a sense of immediacy that overrides other agendas. In general, universities and other institutions of higher education lack the infrastructure, the funding, and qualified personnel in this field. For this reason, much of what is available in local publications is centered on immediate program applications, program evaluations, material development, and policy analysis. There is an urgent need for a broader research agenda, graduate programs for training of new researchers, and increased collaboration and academic exchanges among researchers.

## FUTURE DIRECTIONS

Globalization has caused important changes in national economic policies. One of the results of the incursion of Latin American countries into international markets has been economic growth during the 1990s, in some cases as high as 6.9%. Despite this statistic, the impact for local employment has been devastating (Hernández, 2005). Formal jobs are scarce and increasingly replaced by the rapid expansion of the informal economy: jobs located outside the formal social structures of work that do not adhere to labor laws, wage conditions, or social security and benefit regulations. They often include exchange mechanisms involving bartering, and activities such as household-based domestic work, day laborers, street vendors, and social services based on self-help. It is currently estimated that 40% of the work force in Latin America is informally employed, and the number is rising (La Belle, 2000).

Young adults in contexts of poverty are likely to end up in the informal sector. Often unschooled or under-schooled, they are ill-prepared for other types of employment. Recent research has reiterated that for survival in this job market, workers need to know how to read and write, make decisions in situations of great uncertainty, negotiate with customers, and calculate costs. For education programs to be relevant for young people and adults working in this environment, planners will have to contemplate the types of literacies and knowledges workers mobilize in this rapid expanding sector. Some activists would also argue that what we should really be doing is working to change this economic structure but that is beyond the scope of literacy programs alone and of this paper. The recent election of more governments with a stronger social agenda such as Michel Bachelet in Chile and Evo Morales in Bolivia is a reflection of these concerns.

Over the last four decades, urban spaces have been decorated with slogans and graffiti sprayed on walls, facades, or under bridges. Even the most unreachable spaces are turned into public displays of youngsters' loyalties and group affiliations. Murals exhibit common cultural icons that have been resignified to account for globalized urban identities (Valenzuela Arce, 1997). These and other types of representations are currently all but absent from research or considerations for literacy planning. Knowledge about people's meaning-making processes is important for thinking about their inclusion in written culture. Everyday literacy practices, alternative sources of text, popular literature, and symbolic representations form a fertile ground for both research and development.

New directions in literacy research should also include the use of Information and Communication Technologies (ICTs) (see Leander

and Lewis, *Literacy and Internet Technologies*, Volume 2). Present efforts are concerned with the distribution of equipment and “technological readiness” while the ways in which ICTs shape literacy use (how people learn to use these technologies, the place they play in everyday communication, or how new formats and connectivity are inserted into the language life of communities) are still unexplored. The impact of handheld devices and the types of transformations in reading and writing messages has not been investigated. While there have been some experiences in using computers in classrooms in Mexico, Chile, Brazil, and other parts of the region, there is an assumption that their mere presence in schools will improve learning. It is often assumed that past curricular contents of literacy will continue to be essential for the future. As a result, computers have been installed in classrooms without much thought given to how teachers and learners will use them.

In the last decades, literacy in Latin America has been contextualized by tensions for educators, policy makers, and researchers. Literacy has been seen as a step towards the labor market and at the same time as part of the road to liberation. It has been promoted as a means of cultural assimilation as well as the means for preserving local cultures. It has been prioritized for children yet almost abandoned for adults; and efforts to understand literacy have been so instrumental in nature that many questions remain unanswered. A deeper view of literacy in everyday life, the emergence of ICTs, the role of symbolic representations in identity building among youth, indigenous people, women and other historically marginalized groups will contribute to the development of a broader notion of literacy in Latin America. In turn, this understanding can help frame new courses of action for shaping literacy in this part of the world.

## AFRICAN AMERICAN LITERACIES

### INTRODUCTION

African American literacies refers to the concept that African American cultural identities, social locations, and social practices influence ways that members of this discourse group make meaning and assert themselves sociopolitically in subordinate as well as official contexts. This definition includes but goes beyond making meaning out of and producing print and language in their strict and broadly defined senses, to include the contemporary context rooted in technological dominance which promotes multimodal meaning making. The term African American literacies encapsulates the sociocultural approaches to African American literacy education advanced by the various sub-fields: including sociolinguistics, rhetoric and composition, and New Literacies Studies. As Americans of African descent had been enslaved and marginalized within American society, the early scholarly thinking about Black language and culture reflected the common prejudices of the time: Blacks were culturally and intellectually inferior. Since the 1940s, scholars presented the systematicity, the West African background, the history and development of what is currently referred to by linguists as “African American Vernacular English,” with many language educators advocating inclusion of African American language histories, structures, and discourse practices alongside those of the dominant culture’s to make literacy education socially just by repositioning students as knowledge-making language resources. Other societal domains should have an awareness of African American literacies.

### EARLY DEVELOPMENTS

One of the basic goals of the Civil Rights and Black Liberation Movements of the 1950s and 1960s was for African Americans to gain access to institutions and begin the project of a more multicultural America. The 1954 *Brown versus Board of Education of Topeka*, Kansas Supreme Court case won by the NAACP’s Legal Defense Team symbolized America’s granting of completely equal societal status to African Americans. This victory brought about the entrance of Black students into America’s previously segregated public schools, which

were not prepared to change their pedagogies or their ideas about the inferiority of African American language and culture. Early work in linguistic anthropology (Herskovits, 1941; Turner, 1949) and (socio) linguistics (Bailey, 1965; Labov, 1972; Smitherman, 1977) focused on the origins and development of Black English Vernacular (BEV) or “Negro Dialect” and its relation to other languages that have their origin in similar contact situations such as Gullah and Jamaican Creole. These experts uncovered significant West African language and cultural commonalities. The work of Labov (1969; 1972), Dillard (1972), and Smitherman (1977) urged educators to apply linguistic knowledge to improve Black literacy education. Smitherman emphasized the importance of Black language to Black culture, identity, and history along with knowledge of discourse modes, rhetoric, and linguistic surface features.

Labov’s (1972) work investigated whether or not “dialect differences” had anything to do with reading failure: and if so, could educator knowledge of the differences between the two systems be useful in curricula design and delivery of services to speakers of BEV. Labov concluded that the conflicts between BEV and standardized American English were symbolic of the cultural conflict and racism that is inherent in the society at large, and played out in the classroom. Such work discredited the idea that African American students were culturally deficient and lacked verbal stimulation in the home (Bereiter and Engleman, 1966). Subsequent scholars focused on factors associated with the trend of literacy underachievement among African American students. They noted mismatch between schools’ and students’ language and culture, (Heath, 1983, in linguistic anthropology; Shaughnessy, 1977, in composition studies), teachers’ negative attitudes toward Black students, (Goodman and Buck, 1973, in reading) Black communities’ mistrust of schools, Blacks as involuntary minorities and their opposition to imposed ways of being (Ogbu, 1979, 1983, in educational anthropology).

Researchers have sought to develop literacy curricula using well-documented research on African American language and culture as the basis of instruction. (See Rickford, Sweetland, and Rickford, 2004 for a fuller listing.) For example, Baxter and Reed (1973) developed composition curricula. Simpkins C., Simpkins G., and Holt (1977) developed reading materials or “dialect” readers. In 1974, The College Conference on College Composition and Communication (CCCC) developed the “Students’ Right to Their Own Language” policy, promoting the development of theories and practices for linguistic diversity in education. In 1979, a Michigan judge ruled that AAVE was a legitimate system of speech and that teachers needed to have knowledge of it to facilitate their students’ literacy achievement in

the “Ann Arbor King School ‘Black English’ Case.” Yet, as a general rule, American literacy education operates on sanctioned autonomous models of language and literacy, whereby subordinated peoples are made to submit to the dominant official language (variety) along with its received ways of using language and reading the world.

The ideas of vernacular literacy (UNESCO, 1953), later expanded to vernacular literacies (Camitta, 1993) converge with African American literacies, where it is understood that the subordinated culture has literacy practices and values that may conflict with the dominant culture’s and that the subordinate culture should define its own empowering literacy agenda.

### MAJOR CONTRIBUTIONS

Ethnographers of literacy have uncovered African American literacies that are not acknowledged or built upon by educational institutions as they are evaluated negatively. For example, Gilmore (1983) observed Black adolescent girls on school grounds “doin’ steps,” involving rhyming and spelling of words while doing rhythmic body movements. Because of their participation in these routines, school officials denied them access to full participation in school sanctioned literacy activities. School officials as well as some Black middle-class parents interpreted these performances as oppositional to school culture. As such, school officials labeled these girls as bad girls and they tracked them as lower ability. Officials never considered the value in the girls’ rhymes, for example, their employment of homonyms, their spelling abilities, and their display of embodied social knowledge. In the college context, researchers have identified such culturally biased educational experiences and note the development of adverse literacy practices within some Black students such as employing White supremacist discourse in their compositions or classroom talk (the use of “fronting,” for example) because they think they will be rewarded [and oftentimes are]. (See, e.g., Canagarajah, 1997; Fine, 1995 [in Gadsden and Wagner] among others)

From historical, intellectual, sociolinguistic as well as social justice perspectives, the literacy experiences of African Americans must be taken into account in literacy education. Documented history attests to Blacks’ struggle for literacy and education as a means of upliftment and liberation. (See Engs, 1987; Beavers and Anderson, in Gadsden and Wagner, 1995; Harris, 1992; Royster, 2000; among others) Gates’ (1988) study traced an intertextual chain of distinct tropes, themes, and oral-written patterns in the African American canon of imaginative literature, wherein Black authors repeat and revise themes to point to their shared experience and cultural identity. Among these are the

“freedom through literacy” and the “Talking Book” trope in which writers speak their voices into the Western text through their use of Black discourse patterns. Lee’s (1993) work on the application of the Black discourse genre of signifying to literary interpretation is instructive. Lee drew on students’ knowledge of the African American Language practice of signifying, which is based on indirection and shared knowledge to teach them how to interpret literature. Ball’s (1995) work showed that some high achieving urban African American high school students preferred certain Black culturally based design patterns in their writing. This finding corresponds to the National Assessment of Educational Progress (NAEP) essays that Smitherman (1994, reprinted in 2000) studied where she found that raters highly evaluated Black students’ writing as powerful and fluent when it evinced higher use of a Black discourse style. Both Ball and Smitherman recommended that educators build on these cultural strengths to enhance students’ literacy education (see also Gilyard, 1991).

Such research within the milieu of African American literacies has substantiated that written literacy cannot exist without orality, literacy is informed by an array of socially constituted practices, understandings, and ways of being in the world, literacy is not a set of isolated skills that can be taught, acquisition of language, and literacy is socialization into particular discourses and worldviews. An important work by Gee (1989) surveys key studies with regard to literacy that inform scholars’ theorization of African American literacies. Crucial ideas in these studies are the “the great divide” between literate and oral cultures [that literacy itself (without schooling) restructures thought and societies]; that oral practices are necessarily more bound up in group identity than “objective” written practices (Ong, following Havelock, Goody). One problem as Gee shows is how the literate/nonliterate debate evolved from the civilized/noncivilized conceptions of orally based cultures. Gee’s (1989, p. 45) observation of this is an important one: “In modern technological societies like the United States, something akin to the oral/literate distinction may apply to groups (usually of lower socioeconomic status) with “residual orality” or “restricted literacy” and groups (usually middle and upper class) with full access to literacy taught in the schools. Levi-Strauss’ recasting of the primitive/civilized distinction in terms of a contrast between concrete and abstract thought, now explained by literacy, comes then to roost in our’modern’ society.” Gee rejects this line of thought, and along with scholars now identified with the New Literacies Studies hold that literacy is a social construction and what counts as literacy varies with context and is bound up in relations of power (for an overview see Street, 1999).

The decades-long literacy underachievement of African American students as documented in periodic reports such as the NAEP and other US Department of Education publications is not the result of massive cognitive deficiency among Black students. Research has presented evidence which suggests that a host of factors contribute to the so-called achievement gap. Among them are: low parent educational level, low social economic status, poor school resources, to name a few. One response to counteract the problem of parents' educational level is the institution of community and family literacy programs to promote higher levels of literacy and to help "at risk" students of color to excel academically. The theory behind this movement and others (e.g. vouchers, charter schools, school choice) is that access to well-funded schools, with lower teacher-pupil ratios and highly skilled teachers, will provide teachers with adequate resources to help students. This is a start but avoids the politics of language and literacy education for Black and poor people. One of the major roots of African American literacy underachievement is the ideology of White supremacist and capitalistic-based literacy practices that undergird curriculum construction and reproduce stratified education and a stratified society, which reproduce the trend of African American literacy underachievement. White supremacist ideology is insidious because it is entangled with the discourse of American meritocracy, which says that individuals are responsible for their own success, which is not entirely false. However, the value of individualism is consonant with White supremacy when large groups of students of color fail to achieve under its account. White supremacy in this usage refers to practices that confer privileges to white-skinned Anglo Americans and their norms, values, and ways of being at the expense of disprivileging people not of white skin, a form of racism. The percentage of students suffering under this paradigm is far beyond that of a smattering of lazy and cognitively deficient individuals who cannot measure up. The failure is not individual, but ethnic and cultural groups are underachieving under the present (decades-long) practices. This indicates that the problem is structural.

Characteristics of the ideology of White supremacist and capitalistic-based literacy include consumption, consent, obedience, fragmentation, singularity (as opposed to multiplicity), and positivism. The educational practices associated with this autonomous conception of literacy (Street, 1993) are naturalized in the system and taught to students as a set of isolated skills divorced from social context, politics, culture, and power. Teaching standardized English, a narrowly conceived academic discourse, and the "academic essay," are examples of the "neutral skills" needed to succeed in the corporate educational system and the market driven capitalistic society (Berlin, 1996).

Works such as that of Hoover (1982) and Ladson-Billings (1995) argue convincingly for culturally appropriate and culturally relevant literacy education, at the college and pre K-12 levels, respectively. Culturally appropriate and relevant approaches focus on integrating African American perspectives, along with those from the dominant culture, in a way that empowers students. Such teachers employ diverse teaching methods and become partners with the community.

Lanehart's (2001) state-of-the-art collection of essays by scholars entitled *Sociocultural and Historical Contexts of African American English* contains chapters by Wyatt, Foster, Baugh, Labov, and Spears which address the role of African American English (AAE) in education. In that work, Wyatt discusses the wide diversity of language use among African Americans even within the same socioeconomic class and how this is not usually factored into theories of language acquisition and literacy education. Foster's research explores the instructional uses of call-response to engage students in higher order thinking, whereas Labov addresses AAVE with regard to reading development. He reports on research with the Oakland Unified School District and holds that reading difficulty can be overcome if the profession and educators apply what we know. Baugh's work details what it is that the profession knows and how all concerned can apply this knowledge, whereas Spears contributes new understandings of directness in African American speech practices and how this should be dealt with in educational settings. Spears makes the point that the terms set for African American Language are "rooted in non-black discursive practices" (p. 243). Many social interactions which would be judged negatively in White-mainstream-culture dominant classrooms would not be judged as such in spaces where all Black norms prevail. Black teachers and administrators in schools in which Black values predominate can use direct speech in ways that build educational achievement and community among the students and the families of the school.

Drawing on sociolinguistics, African American studies, rhetoric and composition, literacy research and critical race theory, Richardson (2003) constructed a theory and pedagogy of African American literacies, attending to discourse forms and functions as well as what it means to teach and learn within these discourse practices. This approach locates African American literacies in a tradition of negotiation of vernacular and standard epistemologies and ontologies. Literacy for people of African descent is the ability to accurately read their experiences of being in the world with others and to act on this knowledge in a manner beneficial for self-preservation, economic, spiritual, and cultural uplift. In the work, *African American Literacies Unleashed: Vernacular English and the Composition Classroom*, Ball and Lardner (2005) cover significant issues which teachers of

AAVE-speaking students must confront. Teachers must face their subjective knowledge about AAVE and become willing to go against the grain as many have internalized unconscious negative racial beliefs and attitudes and educational institutions have set us in motion to gate-keep. Ball and Lardner approach the problem through building teachers' sense of efficacy and reflective optimism. Ball and Lardner define this important approach to literacy education as such:

Efficacy acknowledges affect as an essential element in teacher's constructs of knowledge. Efficacy therefore pushes us to theorize unspoken dimensions of teaching practices, for example, its felt reality, and to trace them to their sources. Efficacy refers not just to what teachers know about linguistically and culturally diverse students but what teachers believe about their ability to teach students from various cultural and linguistic backgrounds. Reflective optimism as the correlate perception of those students' ability to achieve is reflected in the expectations teachers hold for their students' achievement. (p. 65)

Ball & Lardner work with teachers to help them develop culturally relevant pedagogy and to transform their identities as teachers who can teach all students.

An important review article by Alim (2005) revisits many of the issues and theoretical orientations outlined earlier, coupled with the current defacto segregation or resegregation of many urban cities and schools. Alim argues that critical language awareness pedagogies are desperately needed. In this view, it is not enough to teach unequal power relations and standardized English. Language and literacy educators use students' own discourse practices, their Hip-hop literacies, for example, to critically engage them in research and action, to confront and change racist discourse practices and institutions that promote them (see Mahiri, *Literacies in the Lives of Urban Youth*, Volume 2).

#### WORK IN PROGRESS: NEW THOUGHT IN AFRICAN AMERICAN LITERACIES—POPULAR CULTURE AND GLOBAL LITERACIES

Morgan's (2002) work helps scholars to understand how Black youth inscribe their identities through urban, working class and Black language use, how they mark public space therewith, the worldviews they bring to bear on their gendered, sexed, classed, racialized, and otherwise embodied readings of the world. As Black youth culture provides grist for the mill of popular culture in digital media and a wide array of industries, scholars have taken up these understandings of Black youth

language and applied them to their documentation of the development of global literacies.

Pennycook (2003) and Androutsopolous (2004) show that certain Black discourse and literacy practices have been incorporated into Japanese and German youth Hiphop, for example, language in offline and online contexts, respectively. Following this line of inquiry, Richardson (2006) explores Hiphop literacies of Black youth, the ways in which those who participate in Hiphop cultural practices manipulate as well as read and produce language, gestures, images, material possessions, and people, to position and protect themselves advantageously. Richardson attempts to locate strands of Hiphop discourse within global, dominant and vernacular contexts and relate these to the lived experiences of Black people, emanating from their quest for self-realization, their engagement in a discursive dialectic between various vernacular and dominant discourses and semiotic systems. Such lines of study underscore motivation for language acquisition, language change, identity negotiation, globalization and the conflicting evaluations of Black representations, how Black symbols are representative of power and powerlessness, the resilience, identification, and commodification of the global youth village. Such issues provide a complex view of African American Language and its potential in the larger scheme of things. Several scholars have advocated Hiphop or popular culture pedagogies at lower and higher levels of schooling, enlisting the rich knowledge that youth have about the world they live in and how these can be enlisted in literacy education (e.g., Alim, 2006; Haas Dyson, 2003; Jackson, Michel, Sheridan, and Stumpf, 2001; Morrell and Duncan Andrade, 2002; Yasin, 2003).

#### PROBLEMS, DIFFICULTIES, AND FUTURE DIRECTIONS

Though there has been significant support for application of knowledge of African American language and literacy in educational institutions, there are a range of problems of which institutions and instructors must be aware. A question that often arises is how will educational institutions become a site where no single historic group dominates the core experience in a dominating society? Further, as cultural practices and identities are always in flux so are literacies. This situation requires that educational institutions become more open to helping students adapt their literacies to an ever changing world, while simultaneously recognizing the role of identity, history, and context in literacy. This should not be understood as using students' home discourse to indoctrinate them into "traditional literacy." Recent work geared toward the gendered aspects of literacy for Black males and females (as well as to

other groups) demonstrates this sensitivity (Lanehart, 2002; Richardson, 2003, Tatum, 2005, See the chapters of Slaughter-Defoe and Richards; and Fine in Gadsden and Wagner, 1995, for example).

Culturally centered approaches to literacy education emphasize a holistic view. In other words, comparative/contrastive measures should not be understood to mean emphasis on only the grammatical surface level, but rather on the totality of different discourses as different ways of being in the world, the conflicts, coincidences, possibilities for change. Another factor that must be considered in improving literacy education is the role of institutional language policies and philosophies. Blake and Cutler (2003) report on a study of five (5) New York City public schools and their teachers' attitudes toward "African American English" (AAE) and language policies or lack thereof for AAE-speaking students. This work suggests that schools' philosophies influenced teachers' disposition toward AAE-speaking students. For example, the school with the large bilingual population had a philosophy that promoted linguistic diversity and its teachers had greater sensitivity to issues of AAE-speaking students. Baugh (1995) underscores significant problems that need to be addressed to reform delivery of educational services to African American students. Teachers along with the larger society harbor misinformed and racist beliefs about African American English though linguists have proved otherwise. In theory, all languages and varieties are equal, but in practice, they are not. Societal beliefs influence institutions, especially the law, which does not recognize African American English-speaking students as language minorities. This predicament denies AAE-speaking students funding which could be used to improve education. Another problem is that speech pathology is used to refer African American English-speaking students to special education, though AAE is not pathological. Further, sometimes schools place AAE-speaking students in classes with students for whom English is not their "native" language, which presents a different set of problems, though both groups experience barriers to an equitable education. Baugh argues that there is a need for policies and programs that address the literacy needs of linguistically diverse students.

#### FUTURE RESEARCH DIRECTIONS

Heightening awareness of the politics of literacy education of African American students cannot be overstated. The most recent Ebonics Controversy of 1996 revealed not only the continued devaluation of Black culture and racist positions held by the general public but by the U.S. government as well. Research has continued to plumb the language and literacy acquisition of African American students, much of it providing fodder for comparative studies of literacy in various contexts

and how the various strengths of Black students, their families, and their teachers can be built on for successful delivery of literacy education. Investigation of school policies and attitudes toward Black students is another important area that deserves continued study. In the current era of high stakes testing and national standards, critical research on teaching, reading, and writing as well as assessment will continue to be invaluable. Though we must pay attention to the ever evolving condition of globalization, emigration, and continued cultural contact and shift as these affect the literacy development of our students, I agree with Auerbach (2005): It is abundantly clear that major global forces, not individual competence, shape life possibilities, and that to promote new multimodal literacies as the key to participation in the globalized world risks becoming a new version of the literacy myth. (p. 369)

There is a continued need for research that strives to contribute to more democratic literacy education and a better world.

## CITY LITERACIES

### INTRODUCTION

*'Until then, I had thought each book spoke of the things . . . that lie outside books. Now I realised that, not infrequently, books speak of books; it is as if they spoke amongst themselves. It (the library) was, then, the place of a long . . . murmuring, an imperceptible dialogue between one parchment and another, a living thing, a receptacle of powers not to be ruled by human mind, a treasure of secrets emanated by many minds, surviving the death of those who produced them or their conveyors . . .'* (Eco 1980: p. 286)

Cities, the home of many of the world's great libraries, have traditionally been recognised as a hub of both literacy and illiteracy; proudly boasting literacy excellence in their wealth and variety of resources and practices and sadly acknowledging high levels of literacy failure in their inner-city schools. Below is a review of existing literature documenting the history and development of 'city literacies', translated into 'literacies in cities'. This is followed by a more detailed account of recent major contributions to the field and trends in research in progress with special reference to individuals growing up and becoming literate at the beginning and the end of the twentieth century in London, one of the largest and most ethnically diverse cities in the world.

### EARLY DEVELOPMENTS

A number of historical studies include literacy in cities as part of a more general history of literacy. A comprehensive account of the history of literacy by Levine (1986) stresses the importance of Athens as the first city with widespread institutionalisation of literacy around 500 BC. However, although literacy made possible the wide diffusion of Greek ideals throughout the Mediterranean world, there was still a strong preference for oral dialectic (Havelock, 1976). Throughout history, however, it is clear that city life gradually facilitated and fostered the written mode and that literacy competences were generally more developed in cities (Clanchy, 1979). London was particularly advanced in this respect. Thus, wills were officially listed in London from 1258 and records kept by royalty of personnel in the state chancery etc. from the early Middle Ages (Levine, 1986). Papal documentation in Rome

reveals 300 writs in 1130 (Clanchy, 1979), a similar concentration of literacy to the city of Rome.

From the Renaissance on, cities were regularly populated by a higher proportion of literates and attracted more literate immigrants. They also held more formal and informal opportunities for learning and literacy education. Among other studies, Cressy (1980) documents impressively high rates of literacy amongst the merchant classes of late medieval London where literacy had a practical value for most professions and crafts. Cressy stresses that sixteenth century London women were precocious readers—something unknown in the rest of England—and highlights the fact that seventeenth century Londoners were unique in Britain whereby only 22% made marks as opposed to 70% who were unable to sign outside the capital. Studies of similar cities, for example Florence, show rates of literacy far exceeding more rural parts of Italy. As Graff (1987) stresses, not only were people in cities more likely to be in trades and professions needing literacy, they were also more likely to understand national vernaculars than rural folk, giving them not only an additional stimulus for acquiring literacy but also access to more materials. According to Graff, cities across Europe were hosting groups of readers, whereby books would be read out loud to both literates and illiterates.

Social historians focus on the importance of literacy as a means for galvanising workers, often in cities, into rebellion against oppression. In 'The History of the Working Class' (1963), Thompson stresses the uniqueness of 'Radical London' for 200 years (from the seventeenth to the nineteenth centuries), which was always more heterogeneous and fluid in its social and occupational definition than the Midlands or northern towns which were clustered into two or three staple industries. The population of London read more widely and was more sophisticated in its agitations. However, as the city grew, not all were able to be so literate. Altick (1957) stresses the contrasts between the literate artisans of London's West End who were 'almost to a man red-hot politicians' (p. 267) and the unskilled labourers of East London who remained 'a different class of people' who, through their lack of literacy 'have no political opinions at all' (p. 51).

The nineteenth century, indeed, saw a huge expansion of industrialisation in cities in Europe and USA leading to two very separate developments which would later influence late twentieth century and early twenty-first century research into literacy and illiteracy. Both took place within the context of the burgeoning of industry leading to the necessity for a literate workforce and both reveal opposite sides of the coin of literacy and illiteracy resulting from this. In Britain, for example, although basic literacy was offered to all children through the 1870 Education Reform Act which paved the way for free elementary

schooling in 1891, it was clear that the government aim was for workers only to be literate enough to be able to follow instructions rather than being literate enough to begin to question the conditions in which they were forced to work (Inwood, 1998). This tension between the growing demands of industry and the low standard of literacy delivered to and achieved by workers was to be the subject of a number of more recent large-scale studies on illiteracy in cities. On the other hand, literacy for poorer urban workers was generally improving. In smaller as well as larger cities, people were rapidly developing their literacy skills by turning to the radical press to further their case for more humane working conditions. Thompson (1963) documents working-class radical papers, such as 'The Gauntlet', 'The Poor Man's Advocate' and 'The Working Man's Friend' highlighting the spurt in working-class urban literacy as well as noting that Cobbett's *Second Register* sold between 40 and 60,000 copies in 1817.

Historical studies, therefore, leave us with contrasting views of literacies in cities; of both a lively and radical reading public encompassing not only the wealthy and artisans but also the newly urban working-class, as opposed to a large group of illiterates from the unskilled or unemployed labouring urban populace.

#### MAJOR RECENT CONTRIBUTIONS

During the last decades of the twentieth century, considerable concern was growing over the poor literacy skills of inner-city children as well as the 'functional illiteracy' (Vélis, 1990) of adults in urban European contexts. In a short document published by UNESCO, Vélis argues passionately for a greater understanding of the complexity of what he terms 'functional illiteracy' in Europe. He cites the 1986/7 study carried out at the University of Lancaster in the UK on behalf of ALBSU (adult literacy and basic skills agency) based on the data gathered from the National Child Development Study of 10,000 children born from 3rd to 9th March 1958 who were monitored until reaching the age of 23, which indicated that 13% of the group encountered difficulties with reading and writing. Extrapolating, this would put the number of functional illiterates in the UK at about 6 million, a figure allowing *The Guardian* (27/11/1987) to announce 'Illiterate Six Million: Only Tip of the Iceberg'. Parallel to government action in setting up more comprehensive adult literacy and family literacy programmes, a Literacy Research Group was formed at Lancaster University who were also founder members of a national network linking practitioners and researchers in Adult Basic Literacy, known as RAPAL (research and practice in adult literacy).

During the 1990s, members of RAPAL set out to put the insights and perspectives of literacy learners and users themselves at the centre of

research about literacy. The resulting 'Worlds of Literacy' (1994) edited by Hamilton, Barton and Ivanic, opened readers' eyes to the literacy lives of a number of urban readers setting out to improve their own literacy skills. These studies set out to question the notion, hitherto accepted, of literacy as an autonomous cognitive skill. Instead, they drew upon an 'ideological model' of literacy as outlined by Street (1984), whereby literacy is culturally and socially embedded in peoples' lives. Thus, instead of referring to 'literacy' it becomes more appropriate to refer to 'literacies' or 'literacy practices' (Scribner and Cole, 1981) in which people engage and of which they become 'members', using the materials, methods, participation structures and mediators that are appropriate. Within the framework of 'literacy practices' or habitual usage of certain types of literacy (e.g. Bible reading, shopping, playing monopoly, choirs, etc.) that include specific 'literacy events' or one-off occurrences of literacy, ethnographers were able to detail a particular cultural or learning practice and its importance in the individual's life.

Two in-depth studies of urban literacies written at the end of the twentieth and the turn of the twenty-first centuries were 'Local Literacies: Reading and writing in one community' by Barton and Hamilton (1998) and 'City Literacies: Learning to read across generations and cultures' by Gregory and Williams (2000). 'Local Literacies' provides an in-depth study of literacies in the lives of ordinary people in Lancaster, a city in north-west England. Data were collected from over 100 participants in the study in the form of interviews, case studies and a survey and these are embedded in a social history of the city, photographs, original literacy documents and information on the scope and variety of literacy resources in the community. The theory of literacy put forward is 'an ecological approach where literacy is integral to its context' (p. 4), whereby different chapters provide first the context (past and present) of literacy in the city before offering in-depth case studies of four different participants. These are followed by chapters analysing (i) the range of practices (ii) the patterning of practices (iii) the web of literacies in local organisations (iv) literacy and sense-making and (v) vernacular literacies. The whole study is designed within an ethnographic framework, where the authors explain the purpose of their work in empowering the literacies of ordinary people. Integral to the study is the aim to provide an emic perspective (literacy as viewed by the participants themselves) and part of this is the use of photographs of original documents, for example notes on horses for information at the betting shop as well as a residents' committee newsletter composed by one participant. Overall, the study provides an intimate yet broad picture of literacy lives in one city, revealing a wide range of practices, spanning the predictable,

such as library visits, reading newspapers, bills, working on the computer etc. to the less predictable, such as those tied up with the 25 local groups listed, as diverse as the Quiz League, Machine Knitting Club and People Opposed to Noxious Gases (PONG)!

'Local Literacies' is focussed on home and community literacy practices and on adults rather than children or the role of the school as part of the community it serves. In contrast, 'City Literacies' uses as its focus two Primary schools, one set within the square mile boundary of the City of London and the other, just to its east, in the area of Spitalfields, Tower Hamlets. Using a similar ethnographic approach to 'Local Literacies', this study presents a tableau of literacy in the lives of different generations of pupils attending or with children attending the two schools. Similar to 'Local Literacies', 'City Literacies' aims to 'make visible the lives of people whose lives are not normally told' (p. 16). In this case, those lives represent a heritage that is ethnically much more diverse than the Lancaster participants. The authors of 'City Literacies' interviewed over 50 people, aged between 3 and 93, whose origins could be traced back to the French Huguenots, East European Jewish, Bangladeshi British or Anglo London backgrounds. Again, set within the context of the area, past and present, participants relate their memories of learning to read in one of the two focus Primary schools, at home and in their community language or religious classes. The last section of the book presents classroom-reading experiences for children at the end of the twentieth century and contrasts these with their very different literacies in Qur'anic and Bengali classes. Throughout, the argument is made that 'contrasting literacies' (hitherto regarded as a cultural clash leading to school failure), instead are a strength and that emergent bilingualism and biliteracy equips children with advantages rather than problems.

#### WORK IN PROGRESS

'City Literacies', written on the cusp of the twenty-first century, was beginning to reveal a major new development and area for research on literacies in cities: that of multilingual literacies. The end of the twentieth and the early years of the twenty-first centuries have witnessed a massive exodus of people from both economically and politically unstable countries to live in cities across Europe, Australia and USA. It is now clear that many children in urban contexts across the world enter school speaking a different language from that in which tuition will take place. Detailed demographic documentation on the scope of this in Europe and USA is given in *Urban Multilingualism in Europe: Immigrant Minority Languages at Home and School* edited by Extra and Yağmar in 2004. This collection draws together findings

from the Multilingual Cities Project, a project based at Tilburg University, The Netherlands, that investigated the scope and breadth of multilingual literacies as well as language choice in Göteborg, Hamburg, The Hague, Brussels, Lyon and Madrid at the beginning of the twenty-first century. The collection of papers highlights ways in which migrants are often, although not always, highly literate in their mother tongue and take with them numerous literacy practices from their country of origin. These practices or 'unofficial literacies' (Gregory and Williams, 2000) may remain separate from the 'official literacies' in school in their new country. With time, however, and for younger children, both heritage and adopted literacies may syncretise, forming a new and dynamic whole.

A number of ethnographic studies falling into the former category, showing dual or parallel literacy practices in the lives of migrants, can be found in Martin-Jones and Jones' (2000) edited volume 'Multilingual Literacies. Reading and Writing different Worlds'. This book provides a collection of largely ethnographic studies of multilingual literacy practices, largely in cities in Britain. Thus we learn of the different heritage literacies of, amongst others, Sylheti/Bengali speakers both in Spitalfields, East London and Birmingham; Gujarati speaking women in Leicester and children in London; Punjabi speakers in Southall, London; Mandarin speakers in Reading; Arabic speakers in Sheffield and Punjabi and Urdu speakers in Manchester. Most of these studies signal on-going work on a new and fascinating phenomenon taking place in cities, where people are operating in different languages and using different literacies according to the group within which they find themselves.

Studies falling into the latter category, showing very young children who are able to 'syncretise' or blend practices into a new form, can be found in 'Many Pathways to Literacy: Young Children learning with Siblings, Peers, Grandparents and Communities', edited by Gregory, Long and Volk (2004). Different studies in this volume show the cognitive and linguistic flexibility of young children in different cities across UK and USA as they go about making meaning from print in different languages and using different scripts. The authors argue that these children do not live in parallel but in simultaneous worlds (Kenner, 2004). The studies include 6-year old Puerto-Rican children in a Midwestern city in USA; a 3-year old Punjabi/Pahari child in Watford, near London, as well as Samoan-American children, Pueblo children in USA and Chinese children in London.

Studies on urban literacies in school settings during the first decade of the twenty-first century tend to focus on the classroom as an active site for negotiating cultures, including definitions of teacher/student knowledge and values, etc. A variety of examples showing ways in

which this is happening across the globe are presented in 'Portraits of Literacy across Families, Communities and Schools' edited by Anderson Smythe and Shapiro (2005). Authors in this volume explore the intersections and tensions between 'unofficial' and 'official' literacies in multilingual cities such as Johannesburg and Cape Town, South Africa; Vancouver, Canada; London, UK; Australia; Quebec, Canada and USA. In every case, literacies are multilingual and, as in Gregory, Long and Volk (2004), children show themselves as able to live in simultaneous worlds. The subtitle of this volume 'Intersections and Tensions' highlights the very contrasting experiences faced and managed by children as they confront different practices, styles and interpersonal relationships as well as languages from those of their parents. In some cases, children manage these very positively, practising with their siblings or other cultural and language mediators (Gregory, 2005; Maguire et al., 2005). In others, particularly for example where indigenous groups have been ostracised within their native country, shown by the example of First Nation children in Canada (Anderson, Kendrick, Rogers and Smythe, 2005) and aboriginal families in Australia (Cairney, 2005), the task is more complex and by no means resolved.

One major group of urban literacy practices in which early twenty-first century multilingual children are engaged, can be grouped under the umbrella of 'community classes'. These are the subject of interest by a number of linguists and educationalists and may involve both religious and secular literacy classes. Community classes have, of course, long existed in cities, usually entailing both religious and heritage language classes. However, research studies now reveal a shifted interest from simply the factual and historical to the ways in which community classes might enhance both cognitive and literacy skills as well as the effect they might have on children's identities. A number of studies in this field at the beginning of the twenty-first century are focusing on the multiple identities of children participating in community classes as well as the notion of identity choice (Creese and Martin, 2006; Chao-Jung, 2006; Robertson, 2006).

#### PROBLEMS AND DIFFICULTIES AND FUTURE DIRECTIONS

There are a number of problems and difficulties for future research on literacies in cities. Some of these are listed here, together with some possible directions for future studies in order to tackle these:

- There have always been (and still are) contradictions concerning the extent of illiteracy existing in cities. Different research approaches produce different data. In UK, for example, on the one hand surveys conducted among employers as well as Universities

appear to reveal considerable cause for concern at the standard of literacy. Most of this concern centres on the standard of children in urban contexts. On the other hand, however, national examination results improve year by year. Immense problems have always existed in measuring standards of literacy and illiteracy, and this is most apparent in city contexts;

- What is found tends to reflect the research methodology employed. Performance in national tests may well fail to reveal the breadth of urban children's 'unofficial literacies'. Ethnography has begun to open up insights into these but we still lack knowledge of the literacy practices of many multilingual and/or urban groups. For this knowledge to improve, we shall, at the very least, need:
- Life histories of those who have migrated so that the role and scope of different literacies in life as well as the way in which these link with changing and/or multiple identities are uncovered. We also need life-histories of those becoming literate for the first time later in life;
- Longitudinal studies showing how peoples' membership of different literacy practices changes over the years and the effect of these changes (particularly where the language in which the literacy takes place also changes) on the identities of individuals;
- A greater range of ethnographic studies on different local literacies, showing particularly what people are actually reading, the materials they use and the purpose for which they are used;
- Studies that trace the influence and importance of religious literacies in children's lives;
- The huge effect of computer and text messaging literacies—not only found in cities but having a major impact on urban youth cultures.

The quotation opening this chapter linked literacy with libraries and libraries with cities. It is clear that libraries are no longer the sole or even the major repository of reading materials. Even the most rural environment can often be connected via satellite or internet to a wealth of literacies, both oral and written, in numerous languages. Nevertheless, cities still remain a hub of literacy. Through facilitating face-to-face interaction for people of all nations and backgrounds they will always provide a haven for the development of new and dynamic literacies.

## CLASSROOM INTERACTION, SITUATED LEARNING

## INTRODUCTION

In past six decades, researchers in a broad range of disciplines have studied classroom interaction and situated learning, generally emphasizing one or the other. This article explores the developing directions in research on the relationship between classroom interaction and situated learning. As individual areas of study, classroom interaction and situated learning each bring an intellectual history and disciplinary roots to the intersection that lead to different ways of conceptualizing the relationship. Each intellectual history contributes a particular set of questions, theories guiding the research, methodologies, objects of study, and tenets of evidence to the study of this relationship. Therefore, to understand what is currently known about the intersection of classroom interaction and situated learning, it is necessary to explore the history of the different traditions associated with each and how these traditions have led to changes in understandings of this relationship over the past six decades. By contrasting the focus of different perspectives on the study of this relationship, we explore what each contributes to our understanding of the consequential nature of learning in classrooms, at both the individual and collective levels.

## EARLY DEVELOPMENTS

This section begins with a focus on the early developments in the study of *classroom interactions*, the area with the longest history. The purpose of this section is to make visible how studies focusing on classroom interactions are not a unified body of work, but one involving multiple programs of research, each conceptualizing the relationship between teaching–learning interactions in particular ways. Early developments in the USA, UK, and Australia are marked by three foci—one on instructional behaviors of teachers, one on the match between the communicative practices of teachers and students and how those influenced student learning, and one on understanding the work of language of the classroom and its consequence for student learning within and across disciplines. The first focus frames the area often referred to as *interaction analysis in classrooms*; while, the latter two

areas, with their focus on *language in use*, frame a situated perspective on classroom interactions, providing an area of overlap with work on situated learning.

The earliest systematic work on analysis of classroom interactions in the US focused on instructional behaviors of teachers. This work was conducted by researchers from different disciplines (e.g., education, psychology, and sociology), interested in the study of the outcomes of classroom instruction, through observing classroom interactions. Evertson and Green (1986), in their review of the role of observation in research on teaching–learning relationships, date the earliest phase in the USA as beginning in 1939. Researchers in this phase (1939 through the 1960s) entered classrooms to identify pedagogical *behaviors*, primarily realized through *talk*, an approach that continues today. Questions of interest included democratic versus authoritarian teaching practices and direct versus indirect instruction, with little direct focus on what was learned. In most of these studies, language and its influence on learning was opaque. The researchers’ attention was on observed, and at times, predefined behaviors purported to represent teaching, and in a few instances, learning. One notable exception to these approaches was the work of ecological psychologist Roger Barker (1968), who examined how language of instruction varied across phases of the lesson observed. Using an ecologically grounded approach to the study of behavior and boundaries of behaviors, he identified different phases of the lesson and how these changes were consequential for what students could do in subsequent phases. This work is one of the earliest studies exploring the situated nature of learning in the context of teaching, using what has become known as an ecological psychology approach.

The second phase overlapped this early phase (1963–1975). In this phase, language, in teaching–learning relationships, remained opaque in some studies but became important directions for other studies. In the first *Handbook of Research on Teaching*, Gage (1963) argued that there was a dearth of research in classrooms. He called for systematic research that followed a paradigm that began with descriptive studies, moving to correlational studies, and then to experimental studies. He argued that this approach would form a loop, in which research could inform practice in systematic ways. The goal of this research was to identify universal laws of teaching by directly observing classroom interactions.

Three directions grew from Gage’s call, each with a different approach to analysis and a different set of outcomes and recommendations. In the introduction to the 18-volume collection of instruments used to observe classroom interactions, *Mirrors for Behavior*, Simon and Boyer (1970) stated that the purpose of the research was to develop a language of teaching. In this seminal collection, Simon and Boyer

identified 90 instruments, each seeking to explore particular dimensions of teaching by observing classroom interaction. In this body of research, they found no convergence of focus across the instruments, and little evidence of validity or reliability reported by authors, making the development of a common language about classroom interactions or behaviors in classrooms related to teaching and learning problematic. Extending this work, Rosenshine and Furst (1973) identified more than 125 instruments, generally used to observe behaviors during interactions in classrooms. Building on Gage's (1963) descriptive, correlational, experimental loop, they called for a *process x product* approach that linked observed behaviors with learning outcomes, generally identified through correlations with standardized tests and/or predefined outcome measures.

Using a different conceptual approach to reviewing research on classroom interactions and the impact of teaching behaviors, a cross-national team of Michael Dunkin (Australia) and Bruce Biddle (USA) reviewed more than 500 studies that were systematic and observational (Dunkin and Biddle, 1974). Their analysis showed that the same phenomena had different outcomes, given that they were studied in different ways, in different contexts, and with different groups of students. They argued that there was a lack of integrating theories concerning teaching and recommended a series of steps that had a strong epistemological orientation to theory-method relationships. They called for the development of findings that related contexts, presage variables, processes, and products of teaching and that explained related groups of findings, rather than all events of teaching. Dunkin and Biddle included some of the earliest linguistic studies that used technology to record and explore the consequential nature of communication between teachers and students. In their recommendations for close examination of a broad range of variables, they foreshadowed a situated approach to the study of teaching-learning relationships, a direction that differed from the one proposed by Gage (1963) and his colleagues (Rosenshine and Furst, 1973), who sought universal laws of teaching.

Directions that grew out of this early work are visible in a recent conceptual review by Rex, Graciano and Steadman (2006), who identified five theoretical and methodological perspectives that developed since the 1930s: process-product; cognitive; sociocognitive, situated cognition, and activity theory; ethnographic; and sociolinguistic and discourse analysis. Their review systematically examines the logic of inquiry guiding these perspectives and makes visible what each of these perspectives, and their related methodological approaches, brings to the study of the relationship of classroom interactions to learning. Through contrastive analyses of the questions addressed, the research design, data collection methods, and analytic procedures, Rex, Graciano and Steadman demonstrate why a situated perspective to examining

the history of a research field is necessary, if we are to understand what can be known through the different traditions. Further, their review makes visible the growing range of perspectives examining the situated nature of factors that support and/or constrain learning, in and through interactions between teachers and students as well as among students. Their review demonstrates the situated nature of knowledge about the situated nature of learning through classroom interactions.

### MAJOR CONTRIBUTIONS

This section describes two inter-related developments that support the evolution of new understandings about how classroom interactions are central to the study of situated learning. The first is the development of new technologies that permit systematic (re)examination of what is being accomplished in and through classroom interaction. The second is the development of new theoretical perspectives that provide different angles of conceptualization and analysis on learning as a situated process. Innovations in technology since the 1960s (e.g., portable audio and video recording equipment, and computers) constitute an often-invisible contribution. Technological advances made possible, and continue to make possible, approaches that examine the actual talk and chains of communication between and among teachers and students, within events as well as across times and events. Tape recorders, and subsequently portable video recorders (and now digital recorders), made it possible for teachers and other researchers to step out of the moment and revisit the interactions in lessons or recorded events in and out of classroom contexts. The ability to revisit events and interactions multiple times led to new explorations of what teachers and students said to each other and what was accomplished through these interactions. Such studies examined when and where particular information was presented, taken up and used; how events were structured through moment-by-moment interactions; what norms and expectations were constructed for speaking, participating and displaying knowledge; who had access to what was being said and done; and what were the social and academic consequences of particular ways of interacting. Within this body of work, technology became a central actor and catalyst at multiple points in the research process, not just a tool for the study of classroom interactions and situated learning (e.g., Goldman, Pea, Barron, and Derry, 2007).

Examples of the synergy between technology and theory can be seen in early studies of the *language of the classroom* and *language as evidence of learning* in the UK and USA. In the UK, this work examined communication in classrooms from discourse, communicative, linguistic, and/or sociological traditions. Three of the directions that continue

today explored the situated nature of classroom interactions and their consequences for linguistically, and socially diverse students: the first builds on the work of Douglas Barnes, Harold Rosen and James Britton (Barnes, Britton, and Rosen, 1969), the second on the work of Michael Halliday (Halliday and Hasan, 1976), and the third on the work of Basil Bernstein (1971).

The approach taken by Barnes and his colleagues (Barnes, Britton, and Rosen, 1969) examined ways of involving teachers in exploring their own language and classroom interactions as well as in exploring how the situated nature of classroom communication was consequential for students. The use of technological tools enabled teachers (and researchers) to take a closer look at teacher and student interactions, raising questions about agency of the actors, chains of interaction and shifting patterns of language use across times and events, and how these influenced opportunities for learning. The second tradition focused on linguistic dimensions involved in *learning how to mean* within and across social situations, classrooms contexts and disciplines as well as on language differences between home and school. The third examined how social processes and practices outside the classroom influenced pedagogical practices that supported and/or constrained access to academic knowledge in classrooms. In the latter two traditions, technological resources were also central to close analysis by researchers of the social and academic texts that shaped the opportunities for learning of socially and linguistically diverse students.

In the USA, research on language in use and its relationship to classroom interactions and student learning was grounded in perspectives from education, linguistics (e.g., sociolinguistic and psycholinguistics), anthropology, and sociology. Using these traditions, researchers began to examine systematically the ways in which the linguistic forms and functions used by teachers and students impacted patterns of interaction and the opportunities for learning across times and events (e.g., Cazden, John, and Hymes, 1972; Green, 1983; Mehan, 1979). Central to this work was an ethnographic approach to the study of everyday life in classrooms and other educational settings. One common focus across traditions was the development of an alternative to the view of students as language deficient, which some researchers had equated with intellectual deficits. This work was designed to uncover the ways in which the language teachers and students brought to and used in classrooms shaped the opportunities afforded linguistically and culturally diverse students. This work was expanded in subsequent periods to include work examining the process of communication as the central factor in shaping what counted as meaning construction, social accomplishment of everyday life, and academic knowledge (Rex et al., 2006). For researchers grounded in communicative, linguistic and sociological

perspectives on language in use, the concept of situated perspective captures an ontological claim—that classroom interactions cannot be reduced to decontextualized codes, as in the observation systems presented earlier. Rather, interactions must be examined to understand how learning and academic knowledge and practices are talked, written and acted into being in and through the linguistic processes and practices of participants (e.g., teachers and students) over times and events.

A more recent development in the area of theory, that also uses innovations in technology to study learning in classroom interactions, is a body of work focusing on *situated learning*. This area developed in the past two decades, drawing on a range of disciplinary perspectives, including ecological psychology, human development, sociology (e.g., ethnomethodology, conversation analysis, and symbolic interactionism), anthropology, and most recently the learning sciences (e.g., Brown, Collins, and Duguid, 1989; Goldman et al., in press; Lave and Wenger, 1991; Scribner and Cole, 1981). Researchers from these traditions examine patterns of interaction of members of particular groups, exploring what they need to know and do, and how knowledge is situated in the practices of a community within and across times and events. Central to this work is the understanding that all learning occurs in context, that is, it is situated and realized in and through the interactions of people. Language is often viewed as constitutive of everyday life and knowledge construction. This perspective focuses on social and cultural processes and ways in which members of a community develop cognitive knowledge and practices as they interact within and across times and events. In the UK, this direction was clearly visible in work exploring the construction of knowledge in classroom contexts, leading to what Edwards and Mercer (1987) called *common knowledge*.

These advances in theory supported by advances in technology have led to new areas of research on what is learned, by and with whom, when and where, in what ways, for what purposes, under what conditions, and with what outcomes and/or consequences. These ways of posing questions about learning have led researchers to explore areas of learning from multiple angles of vision not previously considered. Topics being examined include cognitive processes, identity(ies), ideology(ies), literacy(ies), and disciplinary language(s) and knowledge. Currently, researchers are examining how, through the moment-by-moment and over time interactions among teachers and students, a classroom community as well as school and peer cultures are being constructed, raising new questions about how to conceptualize what counts as situated learning, and when and how to bound its study (e.g., Brown et al., 1989; Greeno, 2006) as well as what constitutes a community of practice (e.g., Barton and Tusting, 2005; Lave and Wenger, 1991).

## WORK IN PROGRESS

One area of work in progress focuses on epistemological issues raised by the broad range of traditions and approaches currently available. Over the past two decades, a number of volumes have been created to explore how different research traditions contribute to the study of situated learning and classroom interactions. These volumes enable readers to understand what each research perspective included in the volume contributes, the tenets of evidence within the perspective, the questions that can be addressed, and what is currently known. These volumes and special issues of journals (e.g., Green and Harker, 1988; Koschmann, 1999; Wyatt-Smith and Cumming, 2000) demonstrate how theory–method relationships shape what can be studied and known. The value comes from the fact that the authors of articles in these volumes were given the same data or a common set of data and asked to analyze these data from their research perspective. What is evident across the different studies is that the complexity of classroom interactions and their relationship to teacher actions and student learning in and across lessons and contexts becomes visible when the different analyses are juxtaposed. An examination of the differences among traditions helps readers construct a broader view of this complex relationship than any one perspective permits.

A second area of work in progress is one in which the two traditions, classroom interactions and situated learning are converging in the area of the construction of knowledge across disciplines. Researchers from these perspectives are examining how disciplinary knowledge is socially constructed within and across classroom contexts. Across national boundaries, researchers in mathematics and science education have provided new insights into ways in which knowledge of science and mathematics is constructed within and across events of classroom life (e.g., Baker, Street, and Tomlin, 2003; Forman and Ansell, 2001; Greeno, 2006; Inagaki, Morita, and Hatano, 1999; Kelly and Bazerman, 2003; Warren, Ballenger, Ogonowski, and Rosebery, 2001).

A third area of work on situated learning builds on an ethnographic and sociocultural perspectives on language and literacy learning in and out of schools in national and cross-national contexts (e.g., Barton and Tusting, 2005; Egan-Robertson and Bloome, 1998; Lee and Smagorinsky, 2000; Moll, 1990). These studies provide insights into ways in which knowledge is socially constructed in and through discourse and literate practices inside and outside of classrooms. This work extends and brings new insights into how learning is situated in communities of practice.

These three bodies of research make visible how studies of classroom interaction and situated learning are converging, and how each

represents a complex series of perspectives, each providing a particular lens on the relationship. This work also demonstrates the complexity of perspectives needed to explore the situated nature of learning in and through interactions in classrooms and other educational settings (e.g., homes, community settings, and peer groups). They also provide insights into the need for systematic and theoretically guided studies that make visible how academic and social practices, associated with the construction of disciplinary knowledge, are learned; how language-in-use shapes and is shaped by learning; and how learning is an overtime outcome of interactions in both classrooms and other educational settings. Further, the ethnographic framework used by researchers in many of the new studies makes visible the need for examining intertextual ties within and across times and events to explore the question of when is learning, what counts as learning in and across contexts of everyday life in and out of classrooms, and what learning counts.

#### PROBLEMS AND DIFFICULTIES

Major problems facing those seeking to explore the relationships between classroom interactions and situated learning include the richness and diversity of the theoretical perspectives currently available. Each perspective can be viewed as a lens on a complex process, generally labeled learning. Given that learning requires an object of study, it is not possible to talk about learning without defining what is to be learned, in what ways as well as what counts as learning and what learning counts. Researchers need to pay special attention to formulating the problem of study, selecting theoretical perspectives, and situating or locating their work within the rich and complex range of traditions and perspectives available. This process also applies to those who explore classroom interactions. Researchers need to formulate carefully what constitutes an interaction and what theories will guide their work. Central to these challenges is the idea that epistemology is not enough. Rather ontological—epistemological relationships and practices used in research need to be made transparent. This richness means that researchers need to make visible the logic of inquiry guiding their work so that those who do not share their tradition can examine the basis of claims and the nature of evidence.

#### FUTURE DIRECTIONS

Today, there exists a broad range of theoretical perspectives across disciplines and a wealth of technological advances that make possible systematic analysis of the moment-by-moment work of teachers and

students within and across events and times. These advances enable researchers to examine how interactions shape a particular range of opportunities for learning afforded students in classroom and other educational settings. However, the challenge facing Dunkin and Biddle (1974) in the early phases of this work, the development of integrating theories, is one that is still with us today. How can this breadth of information be systematically and productively brought together to create new theoretical understandings about the complex relationships between interactions and situated learning in and out of school contexts? (Gee, 2003).

The questions that must be explored, if an integrating theory is to be developed, is *what counts as learning, when does learning count?* and *how is learning accomplished?* These questions raise a further question—Is learning a noun or a verb, and what difference does this distinction make? Related to this are questions of what counts as learning within and across events, who has access to opportunities for learning, what types of opportunities are afforded or required of members of particular groups, and how is what is learned at one point in time or in one context related to what people do in other contexts or at other points in time. Central to this research agenda are issues about the nature and role of classroom interactions and ways in which different traditions contribute new understandings of these complex phenomena.

Future work also needs to explore the relationship between micro and macro contexts to identify how actions and decisions at one level of scale support and constrain what can and does occur or is produced through interactions among members at another level of scale. For example, how do policies beyond the classroom or moment of interaction shape what is possible for students to learn and what types of interactions are possible? Without studying multiple levels, the information about situated learning may be too tightly focused on what occurs in the moment and may ignore how moments are historically situated and intertextually related. By examining how decisions at one level influence what is available at subsequent levels (both micro and macro), researchers can expand the concept of situated learning to include an understanding of how interactions and decisions at multiple levels of scale are central to the concept of situation and situated learning in particular.

Central to future work are studies that examine what is being learned by whom and in what ways, for what purposes, when and where, and with what outcomes or consequences. Multiple outcomes of learning are being identified (e.g., academic knowledge, identity, social practices, and literate practices), each requiring a particular angle of vision, analysis, and theorizing. No one tradition, theory–method relationship, or methodological approach will address the full range of the outcomes of the study of what is accomplished at the intersection of classroom

interactions and situated learning. Further, the current world is linguistically and culturally diverse. No longer can we define interactions from the perspective of one kind of English or from one type of learner. Rather, the future requires that researchers make transparent and address the theoretical and methodological traditions and actions they take to study learning in and across situations, including local, national and global contexts. Additionally, with the rapid development of new advanced technologies (e.g., the internet, digital highways, and multimedia contexts), researchers will need to rethink the boundaries of situations, raising questions about what situated means and bringing new challenges to studying interactions, whether in classrooms or not. These advances also raise questions about the boundaries of classrooms and interactions.

Finally, given new understandings of the situated nature of learning on a more abstract and general level, questions about the ways in which researchers are situated or located within their studies need to be addressed (Bloome, Carter, Christian, Otto, and Shuart-Faris, 2005). Today, many research traditions involve the researcher in participating in a context, not just studying a context, making it important for all researchers to make transparent the relationship between the researcher and those studied or participating in the study. For readers of research to understand the nature of the claims and the type and scope of evidence presented, researchers will need to make transparent the angle of vision used and their location(s) and positioning(s) within the context of study.

CONVERSATION ANALYSIS AND  
TALK-IN-INTERACTION IN CLASSROOMS

INTRODUCTION

Conversation analysis (CA) was originally established in sociology during the 1960s, and since then it has found its way into various other disciplines, including applied linguistics and education. Its systematic description and explication of the moment-by-moment, turn-by-turn unfolding of social interactions, accomplished through repeated listening or viewing of audio or video recordings, have aided classroom researchers' understanding of the dynamics of talk-in-interaction in classrooms and the social orders manifested therein. This chapter will first introduce CA's aims and principles as proposed by its founders Harvey Sacks, Emanuel A. Schegloff, Gail Jefferson and their colleagues and apprentices, highlighting what distinguishes this methodology from other methods of microanalysis. Following this brief summary of fundamentals, it will discuss how CA has been applied to the study of classroom interaction by introducing some exemplar studies. The concluding section will refer to ongoing controversies concerning CA's effectiveness as a sole analytical tool for the investigation of classroom interaction. More specifically, it will address whether or not other theoretical or methodological frameworks, such as critical discourse analysis, ethnography, or sociocultural perspectives, among others, should be, or can be, combined with CA to further our understanding of classroom practices.

EARLY DEVELOPMENTS: AIMS AND PRINCIPLES  
OF CONVERSATION ANALYSIS

Talk-in-interaction, the term used in the chapter's title, reflects CA's central concern. Namely, CA considers that any speaker's talk at any moment should be viewed as a demonstration of the speaker's understanding of prior talk by the coparticipants, and simultaneously its delivery and design should be viewed as a reflection of the speaker's orientation and sensitivity toward the particular coparticipants. Furthermore, the recipients' conduct during the current talk or in the next turn is likewise considered to reflect their understanding of the current talk. Thus, CA's aim, which reflects its ethnomethodological origin, has

been to uncover how the participants themselves undertake the analysis of ongoing talk and engage in the sense-making process in interaction. To this end, CA researchers have conducted meticulous observation of numerous hours of audio- or video-recorded daily interactions involving a wide range of speakers and taking place in a wide range of settings. Through this process, they have discovered recurrent patterns and structures, which appear to operate as fundamental, shared resources for the participants to construct and interpret each contribution to the talk-in-interaction. Since the seminal work by Sacks, Schegloff, and Jefferson (1974) on the fundamental organization of turn-taking for conversation, various procedures and expectations underlining ordinary social activities, including sequential organization, repair organization, preference organization, topical organization, among others, have been described and explicated.

The accumulated knowledge of these “context-free” (Sacks, Schegloff, and Jefferson, 1974) generic phenomena and mechanisms, which have been investigated based on a large collection of cases, have served as crucial foundations for investigating details of each action taken in interactions, including those occurring in institutional settings. That is, the aforementioned organizations explicated by CA studies should be understood not as the kind that confines the participants’ behavior, but rather the kind that offers frames of reference that assist the participants’ as well as the analysts’ understanding of what kinds of actions are accomplished and what kinds of stances and identities are displayed. For instance, the participants as well as the analysts can identify at which moment in the interaction a transfer of speakership is expected to (but does not need to) occur, or what kinds of moves can be considered conditionally relevant at the next turn. On each occasion, the participants may or may not conform to the expectations predicted by recurrently observed patterns. Even so, their seemingly deviant behaviors tend to be interpreted (by the co-participants) with reference to the normative patterns and its deviation may be considered to indicate some “context-sensitive” features, including relationships among the participants, social or institutional roles assumed for them, or purposes or goals of the interaction, to which the participants demonstrate their orientation.

To wit, CA starts its investigation with rigorous description and explication of moment-by-moment, turn-by-turn, sequence-by-sequence unfolding of talk captured in audio or video recordings. Rather than asking any specific questions or applying any theoretical assumptions, this strictly data driven approach attempts to describe, in as much detail as possible, at which precise moment each turn at talk is delivered and how it is constructed, and in doing so, uncover how the participants accomplish social actions at hand and display their orientations toward the co-participants. Unlike some other analytical frameworks for

analysis of discourse, CA discourages analysts' interpretation of the participants' intention or other psychological states, but rather encourages technical analysis of observable structures and features of the participants' talk and other conduct, through which the analysts may be able to infer the participants' own understanding of prior talk; CA also avoids making a premature connection between the participants' observed behaviors with their particular characteristics such as gender, age, ethnicity, native versus nonnative status, etc., unless such a category is shown to be relevant through the participants' behaviors. The analysts' intuitive speculation, which can be derived from their membership in the speech community of the participants, may guide their analysis (cf. Hutchby and Wooffitt, 1998; ten Have, 1999), but the systematic presentation of visible evidence is considered necessary for the speculation to turn into an analytical claim. The visible evidence includes not only segmental features of talk, but also prosody and accompanying nonverbal behavior. The participants' gaze directions, postures, gestures, and other types of embodied conduct co-occurring with talk, crucially influence the ways in which they develop their talk-in-interaction and organize their participation (e.g., Goodwin, 2000). Thus, more recent CA studies have attempted to take into consideration any audible and visible features that the participants themselves use for their sense-making process.

CA's primary objective of describing the procedures and expectations through which the participants accomplish orderly and intelligible social interaction is retained when researchers trained in the CA tradition apply the methodology to the study of institutional discourse, including talk-in-interaction in the classroom. Through close examination of the intricacies of interactional practices, researchers can investigate (i) how and to what extent the organization of classroom interaction differs from, or resembles, that of ordinary conversation; (ii) how the participants in classroom interaction design their turns to accomplish specific actions and activities relevant to the specific purposes and conditions of a given classroom; and (iii) how the participants' institutional roles are displayed in the ways in which they interact with each other, or in other words, how the participants accomplish "doing being a teacher" or "doing being a student."

Earlier CA-informed studies of talk-in-interaction in classrooms focused on how instructional talk led by a teacher exhibits organizational features that are different from ordinary conversation. McHoul (1978), for instance, compared the organization of turns in instructional talk in the classroom with the conversational turn-taking mechanisms described by Sacks, Schegloff, and Jefferson (1974). Unlike ordinary conversation, where turn allocation is locally managed among the participants, in what he calls the 'formal' classroom, recurrent patterns

of turn taking indicate that only teachers have access to the use of creative turn allocation techniques. Such differential participation rights and obligations exhibited in turn-taking practices thus reveal how the social identities of teachers and students are realized in and through their conduct.

The outcomes of earlier studies, most notably the identification of the three-part structure consisting of initiation-response-evaluation (IRE) or question-answer-comment (QAC) sequences, where teachers generally take the first and third moves and students the second (e.g., McHoul, 1978; Mehan, 1979; Sinclair and Coulthard, 1975), have been widely recognized and incorporated into classroom research conducted within a variety of methodological and theoretical frameworks. This structure has been viewed negatively by those who examine its pedagogical effectiveness, criticizing it as rigid, controlling, and greatly limiting student participation in learning. However, for CA researchers, the IRE structure, like others described in CA, simply presents a regularity to which the participants may or may not demonstrate their orientation. It should be also noted that while this structure is commonly observed in the classroom, it can also occur in many other places outside of classrooms, where some potentially 'pedagogical' activities may take place. That is, CA considers that it is not only that the physical context of classrooms (or other institutions) may influence the ways in which the participants act the way they do, but also that the very ways in which the participants co-construct their interaction, based on their shared practices, creates the pedagogical context.

#### RECENT DEVELOPMENTS AND MAJOR CONTRIBUTIONS

Subsequent CA studies have investigated further details of the ways in which teachers design their turns at talk by using various resources including syntax, prosody, and nonverbal behaviors, so that they can furnish different types of opportunities for subsequent participation by students (e.g., Hellermann, 2005; Koshik, 2002; Lerner, 1995). These studies demonstrate diverse ways in which the three-part IRE structure can be accomplished and expanded through the teachers' use of incomplete turn-constructive units or prosodic manipulations in feedback moves, among others. It is hoped that the findings of these studies will enhance the appreciation of fine details as to how such a sequence is constructed and prompt the reconsideration of simplistic recommendations against the use of the IRE in classrooms.

Another phenomenon studied extensively in CA-informed classroom research along with the three-part structure is "repair." As discussed by Schegloff, Jefferson, and Sacks (1977), the phenomenon called "repair"

in CA entails any kind of trouble in producing a turn or in hearing or understanding it, and does not always imply the occurrence of an error or mistake as the term “correction” might suggest. With this understanding, Schegloff, Jefferson, and Sacks describe the organizational possibilities of repair with regard to (i) who initiates a repair (self-or-other initiation); (ii) who actually performs the repair (self-or-other repair); and (iii) at which position in reference to the occurrence of a trouble source (same turn, turn transition, next turn, third turn, etc.) initiation and repair take place. Among the possible combinations, the analysis of a large collection of cases found in ordinary conversation yields a substantial skewing toward, or a “preference” for, self-initiated self-repair as contrasted with the rarity of other-repairs.

In a way similar to the approach employed for his comparative study of turn-taking operations, McHoul (1990) takes up these findings by Schegloff, Jefferson, and Sacks (1977) and investigates the organization of repair in the classroom. Indeed, Schegloff, Jefferson, and Sacks note that one exception to the aforementioned robust preference for self-initiation and self-repair is the domain of adult-child interaction, in which other-correction (i.e., adults correcting children), which serves as a vehicle for socialization, appears to be more common than the preferred practices of self-initiation and self-repair. And this note based on anecdotal evidence is what prompts McHoul to conduct his investigation of repair in the classroom, which constitutes one significant site of adult-child interaction. McHoul’s study of Australian classroom talk demonstrates that other-correction did not figure as much as may have been anticipated. While same-turn self-corrections were indeed relatively few, other-initiated self-corrections, that is, teachers’ performing initiations but withholding corrections, were predominant.

More recently, however, Macbeth (2004), who critically examines McHoul’s study, asserts, “conversational repair and classroom correction are better understood as distinctive, even cooperating organization, and thus poor candidates for comparative analysis” (p. 705). Namely, while McHoul’s study focuses on corrections regarding what is expected to be taught and learned in each lesson, which constitutes an identifying task and achievement of classroom interaction in its own right, Macbeth points out that repairs which are similar to those observed in conversational interaction, that aim at establishing common understanding and coherence of discourse, should be also omnipresent in classroom interaction. Thus, while it is important to examine the discursive production of classroom lessons and correct responses within them, conversational repair and classroom correction should not be compared on the same grounds.

This point raised by Macbeth resonates with a spirit of an emerging group of studies that shed light on diverse types of speech exchange

systems and the participants' orientation to them that coexist in a classroom (e.g., Markee, 2004). Namely, while earlier studies, including McHoul's, have tended to focus on the peculiarity of classroom talk represented by the recurrently observed sequential and participation structures that construct the appearance of teacher-fronted pedagogical talk, apparently not all talk-in-interaction taking place in the classroom consists of such participation structures. Furthermore, not all talk occurring in classrooms can be classified as pedagogical, just because of the setting. More recent studies have begun to explore such issues as how different types of classroom activities other than teacher-fronted lessons are accomplished through talk-in-interaction among peers, or how the participants in classroom interaction shift back and forth between pedagogical and non-pedagogical talk, often by adopting an approach that can be characterized as a single case analysis. In other words, rather than focusing on a recurrent phenomenon to describe some generic properties of interaction, these studies undertake a close analysis of a single case, while investigating how a range of phenomena and organizational domains of talk that have been studied and described by past CA studies based on a large data sample, are manifested for the achievement of a particular task or a learning opportunity that takes place in classrooms. The selection of such particular cases may be based on their ubiquity or idiosyncrasy, which depend, to a certain extent, on the researchers' ethnographic knowledge of particular classrooms (as will be discussed further in the concluding section).

Ford (1999), for instance, investigates how three high school students engage in a physics laboratory task through the collaborative coordination of multiple resources such as talk, gesture, gaze, and written materials. The study also examines how occasional teacher intervention can transform the structure of participation in group work sessions. Even if the intervention is not relevant to the ongoing task at hand, the students skillfully defer to the teachers' actions first and subsequently reestablish the group-internal structure by marking off the irrelevant intervention. The microanalysis of the ways in which these three students shift from one participation structure to another in the process of following task procedures illustrates forms of competence that can become visible only through interaction and not through other conventional methods of assessment. Similarly, Mori (2002) examines a case of group work occurring in a Japanese as a foreign language classroom. The analysis of the development of talk occurring in what is supposedly a task designed to have students engage in a discussion with native speakers of Japanese reveals that the learners ended up constructing their talk in a more rigidly structured interview format. This analysis is juxtaposed with the examination of a task sheet describing the procedures and requirements and the analysis of talk occurring during the learners' pre-task

preparation. The study demonstrates how the instructional design affected the ways in which the learners developed their talk, and conversely how their talk demonstrated their orientation to the described procedure and potentially hindered the demonstration of their language proficiency that they might otherwise have displayed. Markee (2005) also analyzes a short segment of small group work undertaken in an English as a second language classroom and provides empirical accounts for how “off-task” talk, such as an invitation to a party, was occasioned during a class in which the reunification of East and West Germany was an official topic of discussion. Thus, these studies based on single case analysis can offer vivid pictures of how exactly the learners participate, or do not participate, in learning as planned by instructors. These findings in turn help educators reconsider instructional designs and re-evaluate competence that these learners can or cannot demonstrate through talk-in-interaction.

Furthermore, the occurrence of non-pedagogical talk within classrooms analogously suggests the occurrence of pedagogical talk outside of classrooms. Thus, for CA researchers (or perhaps for other like-minded educational researchers), classroom talk should not be unquestionably linked to the confined physical space. Such a consideration is particularly important, bearing in mind the bringing into the classroom of more activities that simulate the outside world and at the same time recognizing the efforts to take learners outside of traditional classrooms and have them engage in various learning opportunities that have been made in recent years. Kasper (2004), for instance, studies German conversation-for-learning activities held outside of the classroom but nonetheless validated as a credit-giving assignment for an introductory German class. Kasper’s analysis of dyadic conversation between a learner of German as a foreign language and a native speaker of German concentrates on the situated identities constructed and invoked through their talk-in-interaction. The membership categories of target language “novice” and “expert” were invoked as relevant categories only on particular occasions, while the participants instead oriented to categories such as movie-watchers or female acquaintances, on other occasions. This relates to the fact that the participants evoke and shift their orientations to this interaction either as conversation or as a language-learning event.

Waring’s (2005) study of peer tutoring in a graduate writing center, involving a tutor, an expert in academic writing, and a tutee, a graduate student who has advanced knowledge of the area of her specialty, also explores this theme of locally constituted identities and expertise. By focusing her analysis on sequences of advice giving and resisting, Waring discusses the relationship between the patterns of resisting and the tutee’s identity claim, as well as the competing expertise between the

tutor and the tutee. Benwell and Stokoe's (2002) analysis of task-setting sequences in university tutorial sessions also uncovers complex and contradictory manners in which interactional power was negotiated between a tutor and students. Their study exhibits how the processes of negotiation embody the participants' "face" concerns and their orientation toward an academic identity or the lack thereof.

As the landscape of the classroom has changed over the years and will keep changing in the future, classroom researchers are required to expand their horizons. The wealth of CA studies of other institutional discourse (e.g., Drew and Heritage, 1992), including those that are not specifically labeled as classroom research, are able to inform classroom research, since they often address common issues, such as what kinds of competence or resources come into play for the accomplishment of social actions required of a particular institutional context, how the demonstration of expertise is evaluated in situ by the participants, or how manifestation, ascription, or resistance to various identities are achieved through talk-in-interaction.

#### PROBLEMS, ISSUES, AND FUTURE DIRECTIONS

As illustrated in the previous section, CA studies have uncovered intricate ways in which talk-in-interaction in the classroom is constructed, demonstrating recurrently observed patterns and structures as well as unique features indicating the particularities of each task and activity undertaken. In the meantime, there are ongoing controversies concerning CA's potential for making contributions that appeal to a wider range of researchers and practitioners beyond immediate sympathizers. Many of these controversies stem from CA's exclusive reliance on audio or video recordings as its data source and its affirmative recommendation of "unmotivated" observation. Critics claim that it is critical for researchers to consider the participants' backgrounds, the institution's history, and so on, which may not appear in recordings. They also question what practical or theoretical implications can be drawn from the findings of CA studies of classroom interaction, which, to some, may appear to be purely structural descriptions of minute details. These questions have led both CA and non-CA researchers to reflect on procedures for data collection and analysis promoted by CA and the possibilities of combining them with other methodological or theoretical frameworks such as ethnography, critical discourse analysis, or sociocultural perspectives, for the purpose of educational research. In the remainder of this chapter, we will consider how far CA should or should not be paired with these other frameworks.

First, it is important to note that as much as CA researchers restrict their analyzes to the explication of details found in audio- or video-recorded

data, the analytic process could be informed by their ethnographic knowledge of a chosen research site. The earliest CA studies (e.g., Schegloff and Sacks, 1973), which based their investigation primarily on audio recordings of two-party telephone conversations, did not have to be over concerned about the comprehensiveness of audio-recorded data, because auditory features of talk were the only resources that were available to the participants themselves at the time of their conversation. However, when researchers try to analyze interactions in classrooms, where the participants share a physical space and use nonvocal resources along with their talk to accomplish the sense-making processes, it becomes critical to capture as much visual data as possible to replicate the participants' interactive processes. The more participants there are, and the more movable space they have (as in the case of many classroom interactions), the more challenging it becomes for researchers to videotape the entirety of the participants' experiences.

While technological advancement helps researchers to employ multiple cameras to record an event from different angles and coordinate images for analysis, the quintessential question of the observer paradox still persists. Namely, the more elaborate recording equipment becomes, the more likely it is for the participants to be influenced by its very existence. And, if it is impossible to record everything, the question then is how researchers can capture as much visual information relevant to the participants as possible in the least intrusive manner. As discussed by Mondada (2002), the researchers' (or videographers') familiarity with routine activities occurring at the research site and their development of skilled vision become essential for the selection of particular viewpoints and framings that can account for the setting as fully as possible. It is also important to acknowledge that the limited accessibility of visual or auditory information can influence what analysts can or cannot say about the participants' conduct.

Second, ethnographic information could also aid CA researchers of institutional discourse in their analytic processes. Maynard (2003), for instance, introduces the notion of "limited affinity" to discuss how to integrate ethnography and CA to enable "systematic and rigorous attention to the fullness of participants' spoken sociality and its generic structuring" (p. 77). According to Maynard, descriptions of settings and identities of parties, explications of terms, phrases, or courses of action unfamiliar to researchers, and explanations of unique sequential patterns observed in institutional discourse can all be informed by ethnographic data. At the same time, however, he cautions that proper analytic control of contextual information should be exercised. While ethnographic information can help researchers emulate the ways in which the participants themselves interpret or construct each turn at talk, it is only through the careful explication of the detailed manner

in which each turn is delivered and each sequence of talk is developed that researchers can ground their characterizations of participants or settings. That is, the unveiling of how the participants themselves procedurally display the relevance of such characterizations is what distinguishes CA from other methods.

Indeed, this bottom-up analytical procedure should serve as a powerful tool to reveal vivid evidence of how class, gender, ethnicity, institutional authority, and other critical issues surrounding classrooms are negotiated and reproduced in and through talk-in-interaction. Although a perception that CA is only preoccupied with the analysis of micro-interactional practices and is not concerned with the discussion of any macrolevel political, social and historical contexts has been prevalent among some critical discourse analysts (CDA) (e.g., Billig, 1999), this is not an accurate representation of CA's potential. While CA does argue against premature theorizing, or researchers' top-down ascription of the existing macrolevel discourses upon the interactional data at hand (which CDA is often considered guilty of), it demonstrates how systematic analysis of the complex interactional organization of talk can point to the ways in which political, social, or historical issues are made relevant to, and reconstructed in, daily interaction. While this debate over how to approach the micro-macro link may not be easily resolved, an increasing number of researchers appear to be willing to discuss and explore constructive ways to integrate CA and CDA (e.g., Woofitt, 2005).

Finally, another frequently raised critique of CA studies of classroom interaction claims that these studies do not adequately address the issue of learning, which is considered central to classroom interaction, beyond mere descriptions of locally constituted learning opportunities (e.g., Hall, 2004). In order to address this issue, some researchers have attempted to combine microanalyses of classroom talk aided by CA or CA-informed techniques and some theoretical perspectives accounting for the learning process, including the notions of scaffolding or zone of proximal development (Vygotsky, 1978), language socialization (Schieffelin and Ochs, 1986), and communities of practice (Lave and Wenger, 1991), among others. The issue here again is how to link the careful CA analyzes of the here-and-now shown in the audio- or video-recorded data with preexisting theories of learning. Unmotivated, meticulous explication of interactional practices may result in the discovery of results that resemble what these theories predict. However, if data analysis is guided by (or obscured by) the preconceived theoretical assumptions, then the analysis is no longer considered genuinely CA. For instance, while the examination of longitudinal data has been welcomed in an attempt to document learning taking place in a classroom, from the CA perspective, different practices observed on two different occasions cannot be immediately seen as evidence of

learning. The comparability of the data sets needs to be established through the exhaustive analysis of all possible contextual factors differentiating the two occasions and the participants' potential orientation to these other factors.

Like many other cases of interdisciplinary undertakings that attempt to import a methodology from a different discipline, the application of CA to classroom research can reflect diverse stances taken by researchers. Some aspire to remain purely faithful to CA's methodological origins and attempt to describe structures of interactions, which may or may not be specific to talk-in-interaction taking place in the classroom. Others explore ways to supplement CA with other theoretical or methodological frameworks to address issues particular to this specific institutional context. While the latter approach may yield some fruitful results accessible to a wider audience, caution should be exercised to evaluate whether or not, or to what extent, such CA-informed or CA inspired hybrid approaches retain the true nature and strengths of CA. The amalgamation of different frameworks should be thought of as a means of maximizing their assets rather than risking their compromising of each other. This is a challenge that researchers will continue to face as they incorporate CA into classroom research.

GENRES AND INSTITUTIONS: FUNCTIONAL  
PERSPECTIVES ON EDUCATIONAL DISCOURSE

INTRODUCTION

A genre is itself an institution, for it is a socially sanctioned means of constructing and negotiating meanings, functioning so that it mediates the operation of other social institutions, taking its place in the complex interconnecting series of activities and events that constitute social life. Hence, while it is certainly possible to write of genres *and* institutions, like those of schooling, of the marketplace, or of family life, to mention a few, they are best understood as themselves institutional in character, and part of the fabric of social life. The notion of genres is relatively old, although scholarly interest in it for the purposes of educational linguistics is reasonably recent, dating from the late 1970s and 1980s, while its origins may in turn be dated a little earlier. All traditions of the relevant research acknowledge that genres are found both in speech and writing. However, in practice, it is genres and their role in literacy pedagogy which have generated the greatest body of research, as well as the most heated and lively debates. This paper will briefly review aspects of the development of genre theory, examining in particular these developments as they have had consequences for discussions of educational discourse.

EARLY DEVELOPMENTS

Paltridge (2007) writes that the term ‘genre’ came into use in educational discussions in the 1980s in at least three areas: the systemic functional linguistic (SFL) tradition originally associated with Halliday (1974); English for Specific Purposes (ESP), following Swales (e.g. 1990); and the New Rhetoric studies (e.g. Miller, 1984/1994). While the decade of the 1980s clearly was a productive one, genre-related studies emerged from developments in linguistic theory and research of the 1950s and 1960s. This was a period when linguistic research burgeoned and moved in several directions, not all of them functional or socially driven. Important examples of research with a strong functional and socially driven interest included that of Halliday and his colleagues (Halliday et al., 1967) in the British context and, in the North American context, that of such scholars as Hymes (1967), Gumperz (1968) and Labov (1972). Overall, the interest in genre had its genesis

in the broader scholarly interest in studies of language variety and/or register that enlivened linguistic research from the 1950s on.

For Halliday, like his teacher Firth, the study of language was necessarily social, because language is only comprehensible in terms of its uses and functions in social process, and he was to mount an ambitious account of the nature of language as a social semiotic, powerfully involved in the construction of social experience. Having provided his first discussions of a theory of grammar (e.g. 1961/2002), Halliday turned his attention to the ways language changes according to ‘different situation types’ and he and his colleagues adopted the term ‘register’ (Halliday, McIntosh, and Strevens, 1964): the meanings realized in language were said to be shaped in terms of the context, where the ‘field of activity’ (or topic in writing), the ‘mode’ (or medium and channel of communication) and the ‘style of discourse’ (later called the ‘tenor’, Halliday and Hasan, 1985) were all involved.

While genre in SFL theory was emerging, Swales and others (e.g. Bhatia, 1983) were developing their approaches to genres as part of an interest in ESP, though Swales (1986) also wrote of the relevance of genre-based approaches to language across the curriculum. His interest in genres was primarily in written texts—research articles, academic essays and the like, all of them important especially for the audience of students for whom English was a second language. Like Halliday, Swales has always had a strong sense of social purpose and context in addressing text types, though his account does not adopt an all embracing theory of language and social experience like Halliday’s. Indeed, in his most comprehensive discussion of genres, Swales stated that his approach was eclectic, and informed by a number of traditions of scholarship, not all of them linguistic (Swales, 1990, p. 13).

Genre in the tradition of the ‘New Rhetoric’ arose in the North American context, among scholars who had worked in composition studies, mainly for the audience of mother tongue students, and their priorities and goals were thus different from those of Swales or of Halliday and his colleagues. An early paper by Miller (1984) was very influential, arguing the importance of seeing genre as ‘social action’. She resisted any tendency to classify genres in any definitive way, on the grounds that they are unstable, though she did, like the other genre theorists, note that genres were both spoken and written, both prestigious (like the ‘eulogy’ or ‘the apologia’) and non-prestigious (like the ‘user manual’ or the ‘ransom note’), and that they were all worthy of study for their role in facilitating social action (Miller).

#### MAJOR CONTRIBUTIONS

Initial formulations of register in the SF tradition often conflated the terms ‘register’ and ‘genre’ (e.g. Hasan in Halliday and Hasan, 1985).

However, Martin and his colleagues offered an alternative formulation in which register and genre were said to operate on different planes of experience (Martin, 1985), the former shaping the language choices in a text with respect to the immediate ‘context of situation’, the latter with respect to the broader ‘context of culture’ (terms taken originally from Malinowski, and also used by Halliday). For Martin and his colleagues, a genre was a ‘staged, goal-oriented social process’. For the purposes of educational research and theory, Martin’s model of register and genre has proved the most influential, though Halliday and Hasan have never accepted Martin’s formulation (Hasan, 1995). They have, however, conceded its strengths in educational discussions (Halliday, 1996; Hasan, 1996).

The decision to propose register and genre as functioning on two levels or planes of experience arose from the early work of Martin and his colleagues, including Rothery (Martin and Rothery, 1986) investigating young children’s writing development. Over the ensuing years, the work extended into studies of writing in the secondary school (Macken-Horarik, 2002) and in adult life (Christie and Martin, 1997) as well as into patterns of talk (Christie, 2002a; Eggins and Slade, 1997).

Figure 1 sets out the model of genre, register and language proposed by Martin and others. The model emerged from the observation Martin and others made that children writing might select from the same field of activity (e.g. a class visit to the zoo), select the same mode (written) and the same tenor (that of child to teacher) but nonetheless select different genres (e.g. narrative, recount or observation). The choice for text type, it was argued, came from the broader context of culture, while the particular register choices with respect to field, tenor and mode, related to the immediate context of situation. Hence, a genre and its ‘elements of schematic structure’ were realized through choices

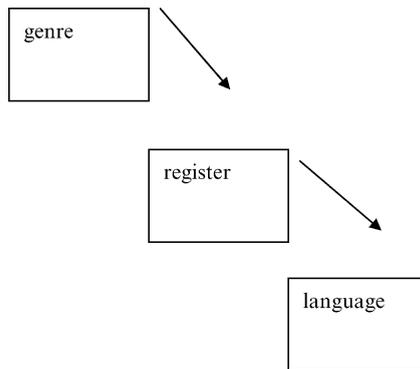

Figure 1 Genre, register and language (Martin, 1985, p. 250).

of register, and these were in turn realized in choices in the language system. Though the model embraces spoken and written genres, it has been most influential in discussions of literacy and literacy pedagogy, leading to many accounts of genres as well as accounts of genre-based curriculum design (e.g. Feez, 1998). Martin and Rose (2006) offer a recent SF account of genre.

Genre-based research methodology after Martin and his colleagues has provoked considerable debate, sometimes because the method of analysis and description of genres has been said to impose unacceptably rigid formulae on texts, and sometimes because the associated pedagogy is said to promote conformity in those who are taught using this approach. Freedman and Medway's edited collections of papers (1994, 1996) offer representative discussions in which SF models of genre are characterized in these ways, while Christie and Unsworth (2005) provide a recent review of SFL language education in which, among other things, genre theory is considered.

Swales' account of genre (1990) was developed round three key concepts: 'discourse community, genre and language-learning task' (ibid, 1), and he proposed that a genre is a 'communicative event', having 'communicative purposes' and being characterized by patterns of 'structure, style, content and intended audience' (ibid, 59). Swales, and others in his general tradition, have examined academic, research and professional writing, such as introductions to research articles, introductions and discussion sections of dissertations and legislative documents (Bhatia, 1993), to name a few (see Paltridge, 1997, for further discussion of the range of research topics). The work in this tradition has tended to focus on the overall text structures of the genres concerned, and while some grammatical features are often selected for close analysis, such studies do not offer the detailed linguistic analyses that have been a constant feature of SF genre work. However, even though Swales, as noted above, has termed his work 'eclectic', the influence of his original training in discourse analysis and applied linguistics is often evident, with a particular focus on the notion of the 'discourse communities' served by the genres involved, as well as their purpose and goals. For Swales, as for others such as Bhatia (1993) a genre has a structure identifiable for its stages, though these are to be flexibly understood. The genre is recognized primarily because of its relevance in social process, and, among other matters, this has the consequence that the genre should be taught with a strong sense of the social relevance and purpose of the genre. In this, Swales and others hold much in common with the SF genre theorists. However, unlike the latter, and in a manner closer to that of Paltridge (1997), who acknowledges a debt to him, Swales does not adopt the detailed accounts of schematic structure associated with

the SF work of Martin and his colleagues. Such accounts, Paltridge suggests (*ibid*, 107), following Biber, tend to assign texts as instances of genres too much ‘on the basis of form’, rather than on ‘the basis of use’.

While the theorists in the tradition of Swales have been termed eclectic, the New Rhetoricians are marked by an even greater eclecticism, as Freedman and Medway (1996, p. 1) made clear in pronouncing the presence of a ‘newly emerging field of scholarship in North America: genre studies’. This field, they said, drew on work as various as that of the rhetorician Burke, notions of ‘social constructionism’ following the philosopher Rorty or the anthropologist Geertz, ‘speech act theory’ following Austin, the work of Bakhtin investigating notions of ‘utterance’ as the fundamental unit analysis, and also the work of Swales and his notion of ‘discourse communities’. What seems most fundamentally to characterize the work of the New Rhetoricians, however, is their primary association with the tradition of composition or rhetoric in North America, conceived as it was originally for the audience of mother tongue students.

Since they write in this context, it is perhaps not surprising that the New Rhetoricians, unlike those in the ESP tradition, have been less inclined to foreground the language learning needs of students: mother tongue students bring to their composition activities a stronger sense of the discourse communities within which they work than do second language students of English, as well as a reasonably well developed grasp of the language, at least for the purposes of talk, though not always for the purposes of writing. Referring in particular to the genre theorists associated with the ‘Sydney School’ of Martin et al., Freedman and Medway (*ibid*, 15) wrote of these theorists that their work was marked by a greater emphasis on ‘explicating textual features’ than that of the New Rhetoricians, while their model of genre was marked by ‘prescriptivism’, and ‘an implicit static vision of genres’. In general, the work of the New Rhetoricians is inclined to celebrate—often in very interesting ways—the diversity of genres, while resisting what are seen as attempts to describe genre types in any definitive or taxonomic way.

#### WORK IN PROGRESS

Research in genres in educational activity continues on several fronts. One would expect this, because, whatever the theoretical framework adopted in addressing genres, it is clear that all contemporary traditions of scholarship see genres as dynamic and hence evolving in new ways, all of them potentially open to further research and teaching. One of the most notable of the new directions has been the recent emergence of interest in multiliteracies (e.g. Cope and Kalantzis, 2000), and the

impact of the Information and Communication Technologies (ICT) generally on the nature of genres, where these are increasingly both verbal and visual. One very influential paper was that of the New London Group (1996), prepared by a group of educators and linguists who met at New London, New Hampshire in 1994 to consider the future of literacy pedagogy, given the rapid developments reshaping literacy in the contemporary world. The various participants at the meeting observed that what might be termed 'mere literacy' had always focussed on language only, often conceived as a 'stable system'. The reality was that modern literacy involves many other meaning systems apart from language, and the New London Group created the term 'multiliteracies', noting that 'a pedagogy of multiliteracies . . . focuses on modes of representation much broader than language alone'. They went on to say that 'multiliteracies . . . creates a different kind of pedagogy: one in which language and other modes of meaning are dynamic representational resources, constantly being remade by their users as they work to achieve their various cultural purposes' (Cope and Kalantzis, 2000, p. 5). Kress (2003), one of the New London Group, has since written on literacy in the new age, noting among other things that while speech will remain our main mode of communication, 'language-as-writing will increasingly be displaced by images in many domains of public communication' (Kress, 2003, p. 1). In so far as the model of multiliteracies adopted by the New London Group has a grammar, it derives from the functional grammar of Halliday, though genre is conceived rather differently from either Halliday or Martin, since one important aim of the multi-literacy endeavour is to revise genre theory.

How genre is to be conceived and described in the multimodal world of multi-literacies is a significant new issue, about which not all writers agree, for not all would use the SF grammar (e.g. Hawisher and Selfe, 2000; Lankshear, Gee, Knobel and Searle, 1997). However, Unsworth (2001; Unsworth, Thomas, Simpson and Asha, 2005) has begun to contribute, exploring the nature of multiliterate genres, as well as pedagogies for teaching them, using the functional grammar while also exploring ways to develop models that do justice to image and design (Kress and van Leeuwen, 1996). Lemke (2002) offers an interesting discussion of the multimedia and genres in science education, for it is clear that science is one important area of the curriculum in which the new media will have a significant impact.

Another area of recent research interest concerns 'subject specific literacies' (e.g. Unsworth, 2000). Where the first discussions of literacy in the SF tradition were devoted to descriptions of these in the primary school, it was in coming to terms with the secondary curriculum and beyond (e.g. Macken-Horarik, 2002) that researchers turned their attention to the 'subject specific' nature of the genres of different bodies

of knowledge (e.g. Coffin, 2006; Schleppegrell, 2004). Related work still ongoing concerns tracing emergent control of the genres that schooling promotes and rewards across the primary to late secondary years, and mapping in particular growing mastery of the complex linguistic resources involved in learning to express abstraction, generalization, explanation and elaboration of ideas that are features of the mature writing of the secondary school and of adult life (Christie, 2002b).

A further important area of research concerns the function and deployment of evaluative language in genres of many kinds (e.g. Hunston and Thompson, 2000; Martin and White, 2005). Here the object is to explore the nature of the authorial stance taken up by writers, and develop possible pedagogies for teaching an understanding of this. For pedagogical purposes there can be a tendency when teaching writing, to concentrate on the content—the ‘field’—and the overall organization of the text—the ‘mode’. But the interpersonal dimensions expressed in mood, modality and lexis, all contribute to what are now referred to as the resources of Appraisal (Martin and White, 2005), and the educational implications are still being developed.

#### SOME ISSUES THAT EMERGE FROM THE REVIEW OF THE GENRE TRADITIONS

This paper began with the observation that a genre is ‘a socially sanctioned means of constructing and negotiating meanings, functioning so that it mediates the operation of other social institutions, taking its place in the complex interconnecting series of activities and events that constitute social life’. Scholars in all the three areas of research identified would broadly agree with such an observation, despite the many issues over which they disagree. I shall identify some of the issues in disagreement, commenting on ways in which they might be addressed and/or resolved.

- ‘Process versus product’: This is a hoary old issue, which has absorbed a great deal of energy in discussions over genre pedagogy, causing some to focus on the ‘processes’ of writing, while generally criticizing the SF theorists who are said to focus too much on ‘products’. The SF theorists dispute this characterization of their work, pointing out that the pedagogy they propose has always had clear phases devoted to the ‘process’ of writing, pursued in consultation between teachers and their students. However, the primary interest in this issue lies in the wider theoretical sense in which genres are understood. If indeed they are recognized as *social institutions*, then they must indeed be understood in both ‘process’ and ‘product’ terms, though this apparent dichotomy is in many ways unfortunate. Any social

institution or practice—especially one realized in the wonderfully plastic resource of language—will be *dynamic*, offering the necessary *stability* and the necessary *flexibility* that social life requires.

- Definitive versus general descriptions: For many theorists—especially the New Rhetoricians—the notions of definitive text structures, and of ‘taxonomic’ accounts of genres are unacceptable. The ESP specialists accept the notion of genre types, and of stages within them, recognizing some similarities between genres. They do not, however, offer the various accounts of genres that have been proposed by SF theorists, where detailed descriptions of text structures are offered, as well as detailed accounts of genres that are said to be ‘agnate’ or related. To some extent this is an argument about the object of the research. For the SF theorist, pursuing an account of the construction of social life, a comprehensive model of genre types is a necessary part of building that account, though the exercise is by its nature always unfinished. In the SF tradition, the exercise will always inform pedagogical practices, providing essential data for teaching and for pedagogy generally. However, its primary motivation is to build a social semiotic account of language, in which genres and their functions have an essential role. For the ESP specialist, the object is to develop useful descriptions of genres, mainly for pedagogical purposes, and the descriptions will be pursued in so far as that object is fulfilled. For the New Rhetoricians, intent as they seem to be on celebration of the diversity of genres, detailed description has little use, especially if it inhibits learners.
- Static versus dynamic descriptions: This is a closely related issue, though often expressed in different terms. It refers to the issues of ‘prescriptivism’, alluded to by Freedman and cited above, and the criticism that genres are conceived as ‘static’, at least in the SF tradition. The difficulty here is that since SF linguists—unlike many New Rhetoricians—seek to provide careful grammatical descriptions of genres, they inevitably make explicit a great deal of their linguistic and educational program, thereby laying themselves open to the charge of ‘prescribing’ what children should write. To offer explicit accounts is not to ‘prescribe’, though the critics often misunderstand this (see Hasan, 1996, for a related discussion).
- Empowerment versus conformity: For SF theorists the argument has always been made that teaching genres is a means to empower students—many of them disadvantaged in the school system. The object is to make the text type and its social purposes available to students, and this will entail explicit teaching both of the text and

its purposes. Hence a genre will be introduced, its elements of structure explained and its social purposes explored. For many critics, this does not empower because the attention paid to the text type and its grammatical realization tends to take over, inducing conformity in students, not independence<sup>1</sup>. The issue here is surely one of how the text type is taught and of the extent to which reflection and critique of the goals and purposes of the genres is encouraged. In principle, an understanding of the text type and its overall structure should enlighten and empower, not least because it draws attention to the socially constructed nature of much of experience. Looking over these broad areas of disagreement it is clear that there is overlap. In my view, the arguments are about the same profoundly important concern: namely, how we explain the nature of social life, recognizing that genres—like other social behaviours—serve to structure and constrain experience, while they also facilitate independent and autonomous action. Much of the debate over genre of the last 25–30 years has sought to come to terms with this, and the debate will continue, so significant is it both for social life, in general, and for educational activity, in particular.

#### FUTURE DIRECTIONS

Research into genre is alive and well, a fact that is easily testified by the range of publications and research activities that continue in its broad name. Some topics for future research have been already touched upon.

- Multiliterate genres in the multimodal world of the future: Here there are many challenges, not only in identifying new text types, but in addressing issues of how to characterize the various modes of meaning making. Early descriptions of mode in the SFL tradition identified language that was ‘constitutive’ of the activity as in a novel, and that which was ‘ancillary’ to activity, as in a football match. The distinction was a valid one, though the contemporary multimodal world will require much more sophisticated tools for analysis to explain the meanings of texts in which verbal, visual, and diagrammatic resources, some of them moving, as in CDROM or video, all operate to build meanings and to construct the overall text.
- ‘Subject specific literacies’: Further work is needed on the ‘subject specific literacies of the various subjects in the school curriculum, though the ‘specific literacies’ of the wider areas of university

---

<sup>1</sup> Ironically, this criticism is only ever made by successful academics and teachers, who are themselves very skilled in use of the academic genres they use to mount their arguments. They do not, apparently, consider themselves ‘conformist’.

research, commerce, the marketplace and so on, should emerge as the linguistic tools for their analysis and discussion are further refined.

- School subject English: For the purposes of teaching school subject English, work needs to be done to build a more coherent model of the knowledge base for teaching and learning English, and, using this, to build the English curriculum. Important work has been undertaken on genres for primary and secondary school teaching and learning, but so far, we lack theoretically well motivated accounts of ways these should be introduced into the overall school curriculum over the years of schooling, allowing for sequence and development in learning. At the moment English is badly in need of a theory of knowledge (Christie and Macken-Horarik, 2006).
- Genre for the TESOL audience: Relatedly, more work needs to be done in developing descriptions of genres and genre pedagogy for the ESL/EFL audience. At the time of writing this paper, for example, Indonesia had recently declared the adoption of a genre-based pedagogy for teaching English. However, the necessary resources for genre-based pedagogy for teaching of English as a modern foreign language have not yet been developed. Insufficient research has been done to determine the most appropriate strategies for teacher education, or for school teaching.

OFFICIAL PEDAGOGIC DISCOURSES AND THE  
CONSTRUCTION OF LEARNERS' IDENTITIES

INTRODUCTION

The term 'official pedagogic discourse' is derived from the work of British sociologist Basil Bernstein (1924–2000), who used it to categorize state discourses on education as revealed in government policy documents and statements, formal state-approved curricula, inspection and examination criteria. Official pedagogic discourse, Bernstein argues, establishes particular social relations between government agencies and those active in the field of education, including educational researchers and teacher trainers as well as teachers and regional administrators, offering each group more or less status and more or less agency in using different forms of pedagogic discourse, knowledge and practice. Through official pedagogic discourse, he argued, the State constructs boundaries between different subject areas; between different types of pedagogic institution; and between different categories of learner, offering each access to selected forms of legitimate knowledge. It thus not only impacts upon curriculum and classroom practices, but also offers different forms of specialized consciousness, and thus helps to construct different identities for different categories of learners.

Of course, in a democracy, government policy is not a single voice, and researchers drawing on the work of Bernstein have drawn attention to the multi-vocal struggle within official discourse itself, as well as the sometimes unpredictable outcomes for practice in the classroom of the convergence with official pedagogic discourse of a range of other (local) pedagogic discourses, themselves drawing on a wide variety of disciplinary fields (such as psychology and sociology), as well as from the 'craft' discourses of practicing teachers.

This chapter considers the role of official pedagogic discourse as the link between macro social structures and micro classroom interactional processes; or the way in which the 'outside' social order is constitutive of the 'inside', or learner identity.

## KEY CONCEPTS AND ANALYTIC FRAMEWORKS

The fundamental question which Bernstein attempted to answer was: 'Given that (a) native wit is not determined by social class, and (b) all children now receive equivalent basic schooling, why are those children who fail to become educated almost all from the lower working class?' (Halliday, 1995, p. 127).

His interests lay in what he called the 'devices of transmission' that is, how knowledge is relayed through symbolic modalities of practice and how these construct different forms of consciousness and thus of identity for different categories of learners (Bernstein, 1996). Essentially, for Bernstein, the construction of particular forms of consciousness has its roots in social relations. From this position, the social, or pedagogical, relationship between teachers and learners is basic to understanding outcomes for learners. The pedagogic discourse which marks the social relationship between teacher and pupil not only constructs knowledge and skills to be acquired, but also the specific social identities and orientations to meaning for learners. Bernstein's early work thus led researchers to focus on interaction between teacher and students in the classroom.

However, teachers are themselves acquirers of particular forms of what Bernstein calls 'official pedagogic discourse', theories of learning and pedagogy usually recontextualized in training courses, government policies, syllabus documents and then embedded in the craft knowledge teachers pass on to one another through their talk and practice. Power relations thus construct what is legitimate or not in classrooms, establishing a particular social order. Thus, through pedagogic discourse and its roots in and relationships to official pedagogic discourse, Bernstein attempts to explain the link between the micro-level of interactions between teachers and learners in the classroom and the macro-level of policy and state control.

*The Production of Pedagogic Discourse: Three Main Fields*

For Bernstein, this complex interaction of official pedagogic discourse with the more specialized pedagogic discourses of educationalists in the field, forms what he calls 'the pedagogic device', a discourse of classroom interaction marking the social relationships between teachers and learners, and not only constructing particular knowledge and skills to be acquired, but also particular social identities and orientations to meaning for learners. In this way, he argues, we are able to explore the question 'how does the outside become the inside and how does the inside reveal itself and shape the outside?' (Bernstein, 1990, p. 94).

For Bernstein, pedagogic discourse is produced through three main fields, which are hierarchically related: the fields of production,

recontextualization and reproduction. New specialized and complex forms of knowledge are produced in certain institutions, such as universities and research institutes (the field of production). Specialized knowledge has to be interpreted and turned into pedagogical knowledge to be accessible and appropriate for the very different institutional context of schooling. This involves selection from existing forms of knowledge, and converting it for use in a very different institutional setting from that in which it was formed. This 'recontextualizing' work has traditionally been carried out by a different group of knowledge workers, found in government departments of education, curriculum bodies, teacher education institutions, education journals, and by media gurus on education (the field of recontextualization). Reproduction, the teaching of these recontextualized forms of knowledge, takes place in yet another social context and community of practice, that found within schools, colleges, universities and groups devising virtual learning environments (the field of reproduction).

Official pedagogic discourse is seen by Bernstein as the work of these recontextualizers, who draw on theory from a range of subject disciplines, including business and management theory as well as theories of child development, psychology, sociology, etc, in order to construct recommendations and prescriptions of different types, either universal (for all learners) or differential (different forms of educational prescriptions for different groups of learners). Current discourses influential in the construction of official pedagogic discourse also include those drawn from business manuals, and management theory. Current key terms, for example, include 'personalization', which is derived from discussions on web publishing. The press, too, are increasingly influential players in forming official pedagogic discourse, along with proliferation of private 'think tanks'. As Bernstein explains: 'Pedagogic discourse is a principle for appropriating other discourses and bringing them into a special relation with each other for the purposes of their selective transmission and acquisition' (Bernstein, 1990, pp. 183–184).

It is through this polyphony of different voices and interpretations that discourses are selected, 'de-located' from their previous position in their original discipline and 'relocated' within the classroom context, where, of course, there is potential for further adaptation in relation to the reactions of students, bringing with them to the classroom discourses from their diverse family and community contexts.

### *Performance and Competence Models of Education*

Bernstein (1996) draws attention to the way official pedagogic discourse constructs two major contemporary models of education. In the first, which he calls a 'performance' model, official pedagogic

discourse sets up a context in which subject areas are clearly and explicitly defined and classified, as are the skills and procedures to be taught to students. Teachers and learners have little control over the selection, sequencing and pacing of the curriculum. The focus is on what teachers need to teach and what learners have yet to learn, rather than on what they know already. There are clear rules on behaviour and presentation. Assessment is explicit. In evaluating students' work, teachers are more likely to comment on what is missing than on what is present; for example, 'You need to put in quotation marks here'. Student performances are likely to be graded, and there is clear stratification between learners. Grading gives rise to 'repair services' and diagnostic practices. Learners are clear about what they have achieved and what they are intended to achieve in the future. However, they are not made aware of how their learning is socially situated and dependent on good teaching as well as the institutional context. Instead, achievements are presented as the result of innate talents and abilities.

In contrast, in a second, 'competence' model of education, official pedagogic discourse sets up a context in which subject areas are more and diffuse, integrated in the form of projects and themes. Learners have more control of the selection, sequencing and pace of the curriculum, facilitated by their teachers who are under less pressure to meet targets. There is more emphasis on what learners already know and the skills they already possess. It is recommended that classroom control is personalized, focused on self-reflection: for example 'Would you like to work with me at the writing table?' Teachers are less likely to explicitly grade work, and more likely to comment on what is present in learners' work rather than on what is missing: for example 'What a lovely piece of writing. I like the way you described the bus journey!' Teacher professionalism lies in an understanding of theories of learning and language development, in facilitating learning rather than in explicit teaching. Though the overt outcome is a focus on shared outcomes, however, this may in fact mask an underlying stratification of outcomes. In such contexts, teacher assessment does indeed take place, but (in contrast to the performance model) here it is covert and not shared with the learner, nor are explicit targets for attainment clarified. Learners therefore may not know how they are perceived as achieving in relation to others in their class or age group until too late, when they may find themselves placed in lower streams, considered of low ability, and later excluded from further education.

However, whether competence or performance based, all pedagogic discourse, Bernstein (1996) argues, is essentially goal directed. Each curriculum is staged and hierarchically sequenced, either strongly in a performance model, or more weakly but with staged evaluative criteria in a competence model. More advanced learning is built on earlier

experiences. Unlike the 'horizontal' discourses of everyday life, pedagogic discourse is a 'vertical' discourse, competence at one level permitting access to the next. A sequenced curriculum is explicitly taught and tested in a performance model; in a competence model development is intensely monitored and recorded, within a carefully organized learning environment.

### *Official Pedagogic Discourse and the Construction of Identities*

At different times and in different national contexts, either the competence model or the performance model can be more dominant in official pedagogic discourse. At the same time, different discourses might be dominant for different categories of learner, for example, those categorized and identified as 'having special educational needs' might be offered a competence model at a time when a performance model was dominant for most learners; or 'English as a second language learners' might be offered a performance model in contrast to a competence model operating for other learners in the same context. In other cases, one might find both discourses in operation in a school system, the one operating for learners categorized as 'high ability', the other for those of 'low ability', whether in different schools or within the same school in parallel 'streams' or 'tracks'.

In this way, official pedagogic discourse operates to distribute specialized forms of discourse and thus different ways of thinking and feeling across different categories of learners. 'Symbolic control translates power relations into discourse and discourse into power relations' (Bernstein, 1990, p. 134). If we do not conceive of identity as a finished and fixed thing, but rather see it as an ongoing process of identification, then we can clearly see how the distribution of different forms of pedagogic discourse and their ways of categorizing and providing for different learners works in the structuring of learner identity. Any educational reform, Bernstein argues, can be regarded as 'the outcome of the struggle to project and institutionalize particular identities' (Bernstein, 1999, p. 148).

Despite apparent differences, Bernstein argues that all forms of pedagogy, whether competence or performance focused, involve the social formation and regulation of individual identities:

'Pedagogy is a sustained process whereby somebody(s) acquires new forms or develops existing forms of conduct, knowledge, practice and criteria, form somebody(s) or something deemed to be an appropriate provider and evaluator' (Bernstein, 1999, p. 259).

Although a performance pedagogy is explicit in taking up a position of authority, in a competence model the authority of the teacher is still

there, but implicit, hidden. Equally, the essentially evaluative nature of the schooling process is also masked. Each form of pedagogy constructs a particular form of 'ideal student', whether as attentive, rule following and obedient, or as risk-taking and problem solving, for example. Against this 'ideal' student, other categories of learners are then distinguished, as slow learners, the 'gifted and talented', those with special needs, the 'underachieving', the second language learner, for example.

Such boundaries are important concepts in Bernstein's work—boundaries socially constructed between different categories of learner, between different social groups; also boundaries produced between different school subject areas, and boundaries between home and school. Bernstein argues that to understand a social system, or the differences between social systems, one needs to examine the way in which such boundaries, or 'classifications' are socially constructed and maintained, and the 'degree of insulation' or strength of the boundary between one socially constructed category and another.

In relation to language in multilingual contexts, a whole raft of learner identities are constructed in official pedagogic discourse in the Western world, each category being subject to a specialized form of pedagogy and specialized forms of evaluation of achievement: these include the identification of certain pupils as 'ESL', 'English as a second language' students; 'EAL', 'English as an additional language' students', 'LEP' or students with 'limited English proficiency', 'LOTE' or students with languages other than English, or 'bilingual' students. Each of these categorizations offer different interpretations of students' existing knowledge and skills, and are used in recommending different forms of educational treatment. Bourne (2001) showed how at different moments in UK education policy, students were strongly classified into 'English mother tongue' and 'English as a second language' speakers, resulting in recommendations for quite different forms of pedagogy. The Bullock Report (DES, 1975) proposed a competence model for English mother tongue speakers, and a quite different, performance model of education for those categorized as ESL. About 10 years later, in the Swann Report (DES, 1985), policy makers drew on a different configuration of discourses in second language research to re-introduce ESL learners into the mainstream competence model of education, in a context in which 'diversity' was proposed as the norm, and the recommended focus was on the training of all teachers for greater awareness of the language demands of the subject curriculum, as important for all learners.

One might ask why contextual issues such as prejudice and racism, so dominant in the literature in relation to African-American or African-Caribbean children, were so rarely the focus of research when

examining causes of underachievement in relation to children of language minorities. Indeed, in focus group interviews with language minority parents and pupils in the UK, reported in Blair and Bourne (1998), issues of low teacher expectations, lack of respect of schools towards minority group parents and pupils, and of unfair treatment were voiced as readily by minority language background parents and students as by those of African-Caribbean origin. Indeed, both parents and students from different linguistic and ethnic minority backgrounds in the different focus groups focused on these issues, rather than raising concerns about provision for English as a second or additional language at all.

In a recent twist, official pedagogic discourse in the UK has brought about the reintroduction of a mainstream performance model of language and literacy pedagogy, through the National Literacy Strategy, but English language pedagogy for learners from other language backgrounds is not similarly addressed, remaining inexplicit and invisible, nor are students' skills in other languages pedagogized. Official pedagogic discourse thus offering a masked competence model for that group of learners within a performance model of pedagogy and attainment for all learners. If ESL pedagogy often appears blind to the effects of racism and the social context of learning on attainment, current pedagogy in the UK for bilingual learners appears 'language blind' in relation to pedagogic treatment of bilingual learners' existing knowledge and skills.

Each form of official pedagogic discourse sets up different categories of learners, different definitions of learner needs, and leads to a different set of prescriptions for practice. Each is based on a different selection and configuration of theories from other fields, such as second language research, sociology, cultural studies, etc, differentially drawn on by the official recontextualizing field to form policy for practice in schools, constructing different categories of learner with different curricula contents, and different forms of pacing and criteria for evaluation of their achievement.

#### BUILDING ON THE FOUNDATIONS LAID BY BERNSTEIN: WORK IN PROGRESS

In his early work, Bernstein focused on the differences in the way children from different social backgrounds 'learn to mean' in the classroom, analysing the social relationship between teachers and students in the classroom and the cultural transmission being relayed there. This work was critiqued as neglecting the wider structuring of the education system in its narrow focus on classroom dialogue, emphasizing the lone teacher as source of cultural transmission (Archer 1995; Karabel and

Halsey, 1977). Nevertheless, it engendered a body of groundbreaking research on local pedagogic discourse in the classroom, as well as comparisons of home-school discourse, most notably the work of Hasan (1988), Cazden (1988), Christie (1995) and Morais (2002), all equally relevant to studies of classroom discourse today. Later research on language education has, however, drawn on Bernstein's later work on the structuring of the education system and the construction of official pedagogic discourse, and as classroom discourse is the subject of a different chapter in this volume, it is to a short review of these studies that we now turn.

Although not specifically focused on language education, important implications can be drawn from the work of sociologists such as Ball (2000) on the structuring of education systems, and Apple (2003) on 'official knowledges', both drawing heavily on the foundational work of Bernstein. Walkerdine (1984) provided a convincing critique of early progressive education as a masked pedagogy which remains worth reading. In some Western nations, official pedagogic discourse has taken up the progressive suggestion of building on children's own interests and home knowledge by introducing home and peer practices into the literacy curriculum. Both Williams (1999) in Australia and Moss (2000) in the UK have explored what actually happens when home literacy practices are recontextualized into school contexts. Moss explores what happens when the horizontal discourses around children's comics and magazines are introduced into the curriculum as 'media studies' and argues that such out of school activities change form and meaning once recontextualized as school practices in the school context, with different outcomes for students from different social groups. Williams (1999) also argues that introducing home practices into schools has differential effects for children from different social backgrounds. However, he claims that school practices have become reflected back into the home practices of middle class ('high autonomy') families in the parental search for success for their offspring, with the result that the middle class home has been turned into an auxiliary pedagogic context of museum visits, web research, and other out of school but school-like activities.

Christie (1999), like Williams, draws on the tools of functional grammar (Halliday, 1994) in her analysis of the pedagogic device in operation, in her case in relation to the impact of national standard language policy on curriculum and consciousness. Analysing a series of secondary school English lessons in Australia, she finds that, unlike other curriculum areas in which technical terms are introduced and put to use in constructing a particular view of the world, English lessons avoid any close examination of how language works, and focus instead on constructing a shared ethical position on issues related to the text. She argues:

‘Surely it can be no accident that the national language—that resource in which so much is constructed that is fundamental to the maintenance and transformation of culture—is often so poorly served pedagogically. The interests of the state are involved in pedagogic practices that leave the national language not well understood, for where people are not aware of how language works to construct the various positions available to them, they are less likely to challenge those positions’ (Christie, 1999, p. 181).

Bourne (2000) and Moss (2002) both examine the formation of a new official pedagogic discourse around literacy in the introduction of a national literacy strategy in the UK. Bourne (2000) notes the switch involved from an invisible, progressive primary pedagogy to a highly visible, performance pedagogy, with the overt aim of raising the attainment of disadvantaged students. She draws attention to the way in which government has marginalized the traditional pedagogic establishment as agents in the formation of the new official pedagogic discourse, setting up new sites for the training of teachers in private agencies and with business interests, so creating a new ‘social geography’ of pedagogic control.

However, simply following a centrally devised strategy without really understanding its logic can mean that teachers are unable to make the strategy work to raise the attainment of disadvantaged children. Moss (2002) examines the way the National Literacy Strategy impacts on teacher autonomy and their sense of professional identity, with the evidence of student achievement in the testing regime coming to be seen as evidence of teachers’ compliance with the policy.

However, the formation of educational policy and its classroom practice is complex and never uncontested. Recognizing the macro structuring effects of classroom discourse does not mean eliminating human agency. Wong and Apple (2002) show the potential for conflict, resistance and inertia between the fields of official pedagogic discourse and school level pedagogic discourse in a diverse school system which allows space for some autonomy. At an individual level, too, Bourne (2003) illustrates how the horizontal discourses of ‘out of school’ knowledge can be skilfully woven by a committed teacher into a regulated performance pedagogy in order to involve and raise the attainment of students from disadvantaged backgrounds.

#### FUTURE DIRECTIONS

Kress, Jewitt and Tsatsarelis (2000) suggest that dramatic changes in contemporary forms of representation and the affordances for communication of new technological media signal important challenges for

official pedagogic discourse. They point to constructions of the learner as 'client' and education as 'consumption', and the dissolving boundaries between work and leisure, between home and school, between age groups and between institutions, asking 'what are the features of an education for instability?' (p. 12). Kress, Jewitt and Tsatsarelis argue this means a shift from 'the centre to the mass, to multidirectional communication from many directions/locations, a shift from the 'passive audience' ... to the interactive audience' (p. 12). They suggest that such dramatic change in representational resources offers space for 'transformative remaking' of pedagogic discourse. Tyler (2001) also begins to develop the way in which Bernstein's theory can be applied to virtual learning environments and new forms of communication such as hypertext. Like Kress, Jewitt and Tsatsarelis, he is aware of the enormous potential of these new forms of representation for remodeling teaching and learning. However, he also warns against utopianism, pointing to management interests in 'exploiting the interdisciplinary and fluid structures of hypertext ... the abolition of academic specialisms and disciplines through managerial or system imperatives rather than for intellectual and pedagogical integration' (p. 357).

Bernstein (2001), in a late paper, identified this new social order, constructed by new technologies, lifelong learning policies and a fluid, adaptable workforce, as a 'totally pedagogised society' (p. 365), requiring 'a new cadre of pedagogues with their research projects, recommendations, new discourses and legitimations' (p. 367). Yet his work always recognized that educational discourse was a site of struggle, and that with struggle, there was potential for transformation, for what he called the 'yet to be voiced' (Bernstein, 1990). There is clearly much work to be done on mapping the impact of such new societal changes on both official and local pedagogic discourse, on all forms of communicative meaning making, and on the construction of social agents in the pedagogic field.

## CRITICAL DISCOURSE ANALYSIS IN EDUCATION

### INTRODUCTION: THE EMERGENCE OF CRITICAL DISCOURSE ANALYSIS IN EDUCATIONAL RESEARCH

Education researchers from around the globe have turned to critical discourse analysis (CDA) as a way to describe, interpret, and explain important educational problems. CDA is an interdisciplinary set of theoretical and analytic tools applied to the study of the relationships between texts (spoken, written, multimodal, and digital), discourse practices (communicative events), and social practices (society-wide processes) (Blommaert and Bulcaen, 2000; Collins, 2004; Fairclough, 1993; Luke, 1995/1996). Luke (2002) defines CDA as a “a principled and transparent shunting back and forth between the microanalysis of texts using various tools of linguistic, semiotic, and literary analysis of social formations, institutions, and power relations that these texts index and construct” (p. 100). CDA focuses on how language as a cultural tool mediates relationships of power and privilege in social interactions, institutions, and bodies of knowledge.

### EARLY DEVELOPMENTS: DIFFERENT SCHOOLS OF THOUGHTS

Critical discourse studies stem from overlapping intellectual traditions, each emphasizing the linguistic turn in the social sciences. CDA is a particular strand of Critical Discourse Studies. It is a problem oriented and trans-disciplinary theory and method that draws from different schools of thought. Fairclough (1992) has referred to CDA as a textually-oriented form of discourse analysis (TODA). To develop this textual analysis, Fairclough brought together the linguistic theory of Systemic Functional Linguistics (Halliday and Hasan, 1989; Halliday, 1985) with the social theory of discourse as it evolved in the work of Foucault (1969/1972, 1979, 1981).

Systemic functional linguistics (SFL) offered a meaning based alternative to autonomous models of syntax and a means to build a theory of language as a social semiotic. From these developments in language theory sprang Critical Linguistics, (CDA) and later Critical

language awareness<sup>1</sup> (Fairclough, 2003; Luke, 1995/1996; Pennycook, 2001). A number of books draw on SFL within a CDA framework; *Discourse and Social Change* (Fairclough, 1993); *Classroom Discourse Analysis* (Christie, 2002); *Systemic Functional Linguistics and Critical Discourse Analysis: Studies in Social Change* (Young and Harrison, 2004), and *The Language of Schooling: A Functional Linguistics Perspective* (Schleppegrell, 2004).

In the early 1990s a group of European scholars (Fairclough, Kress, van Dijk, van Leeuwen, and Wodak) spent two days at a symposium in Amsterdam discussing theories and methods specific to CDA. These scholars came from somewhat diverse academic backgrounds, and CDA reflects their interdisciplinary approach (van Dijk, 1993).

There are a number of landmark volumes that reflect the developing European tradition of CDA: *Discourse & Social Change* (Fairclough, 1993), *Discourse as Social Interaction* (van Dijk, 1997); *Discourse and Discrimination* (Smitherman and van Dijk, 1988); *The Discursive Construction of National Identity* (Wodak, Cillia, Reisigl, and Liebhart, 1999), *Reading Images: The Grammar of Visual Design* (Kress and van Leeuwen, 1995), *Speech, Music, and Sound* (van Leeuwen, 1999), *Discourse in Late Modernity* (Chouliaraki and Fairclough, 1999), and *Multimodal Discourse* (Kress and van Leeuwen, 2001).

The recent trend in the USA, embedding CDA within educational contexts, is predated by the work of Natural Histories of Discourse scholars—scholars who combine anthropology and discourse analysis, often asking questions about power and knowledge (Silverstein and Urban, 1996). In educational research in the USA, perhaps no one scholar is cited more for his approach to Critical Discourse Analysis than James Gee. In his 1999 book, *An Introduction to Discourse Analysis*, he introduced analytic and theoretical links between linguistic processes, situated identities, cultural models, and situated meanings. Books such as *Natural Histories of Discourse* (Silverstein and Urban, 1996), *Literacy and Literacies: Texts, Power, and Identity* (Collins and Blot, 2003), *A Critical Discourse Analysis to Family Literacy Practices* (Rogers, 2003), *An Introduction to Discourse Analysis* (Gee, 1999), *An Introduction to Critical Discourse Analysis in Education* (Rogers, 2004), *Discourse in Place: Language in the Material World* (Scollon and Scollon, 2003) represent the diversity of the CDA tradition as it has evolved in the USA.

CDA has now been adopted in different settings across the globe: in Europe, Australia, and North America, as we have seen, and in Africa (e.g., Ensor, 2004; Janks, 1999; Kapp, 2004), Asia (e.g., Tong, 2005;

---

<sup>1</sup> Critical Language Awareness is the social action dimension of CDA. CLA is the ultimate aim of socially committed CDA.

Yiemkutipavorn, 2005), and South America (e.g., Heberle, 2000; Coulthard and Coulthard, 1996; Magalhaes, 2005). Differences in schools of thought are not the product of geographic differences alone. There are different degrees of eclecticism in different strands of CDA and different scholars draw on different social semiotic traditions: for example, Barker and Galasinski (2001) link Cultural Studies with CDA. Gee (2004) makes a distinction between the capitalized term “Critical Discourse Analysis” (which the abbreviation CDA represents) and “critical discourse analysis” in lowercase letters. He argues that CDA refers to the brand of analysis that has been informed by the work of Fairclough, Hodge, Kress, Wodak, van Dijk, van Leeuwen, and others. Lowercase “critical discourse analysis” includes a “wider array of approaches” (p. 20)—Gee’s own form of analysis (1992, 1996, 1999), falls into this category. It grows out of a rich vein of US-based work in linguistic anthropology, including the work of scholars such as Gumperz (1982), Hymes (1972), and Michaels (1981). Such scholars have conducted critically oriented forms of sociolinguistics, ethnography and discourse analysis, but do not specifically call their work CDA. Gee (2004) points out that what critical approaches to language have in common is that they “treat social practices in terms of their implications for things like status, solidarity, distribution of social goods, and power” (p. 33). Because language is a social practice and because not all social practices are created and treated equally, all those who accept this premise will be committed to analyses that are inherently critical.

Each of these schools of thought share commonalities in terms of a situated theory of power and discourse, but differ according to their analytic procedures and the degree to which they emphasize context. Despite these differences, there are a number of shared characteristics of researchers engaging with CDA. First, all approaches are buttressed by some form of critical theory. Critical theory is not a unified set of perspectives. Rather, it includes critical race theory, poststructuralism, postmodernism, neocolonial studies, queer theory, and so on. Critical theories are generally concerned with issues of power and justice and the ways that the political economy and ideologies about race, class, gender, religion, education, and sexual orientation construct, reproduce, or transform social systems. Critical researchers are intent on discovering the specifics of domination through power, in all of its various forms. Critical theorists generally agree that language is central in the formation of subjectivities and subjugation.

A second shared assumption within the CDA tradition is that discourse is defined as language use as a form of social practice. Moreover, discourse moves back and forth between reflecting and constructing the social world. Seen in this way, language cannot be considered neutral,

because it is caught up in political, social, racial, economic, religious, and cultural formations (see Blommaert, 2004; Fairclough and Wodak, 1997 for the common tenets of discourse).

A third shared assumption is that CDA is a socially committed scientific paradigm that addresses social problems through a range of methodological approaches with the ultimate aim of raising awareness of the ways in which language mediates asymmetrical relations of power, hence the notion of Critical Language Awareness (see the collection of papers, edited by Norman Fairclough, 1992, for further details). Generally speaking, analyses aim to describe, interpret, and explain the relationships between texts, social practices, and society-wide processes. However, each discourse analyst approaches research in different ways, some foregrounding microlevel issues, foregrounding macrolevel issues. Some analysts draw on extensive fieldwork, others stay close to the texts themselves.

#### THE RANGE OF CONTRIBUTIONS TO EMPIRICAL WORK AND THEORY BUILDING: A RECENT REVIEW

During the past decade, education researchers have increasingly turned to CDA as an approach to answering questions about the relationships between language and society. Rogers, Berkes, Mosley, Hui, and O-Garro, (2005) conducted a review of CDA in education drawing from five databases in the social sciences from the years 1980 to 2003. The search term was “critical discourse analysis.” The review included studies that were conducted in formal classrooms or informal educational sites (e.g., museums, families, and after-school programs) and studies that pertained to the production, interpretation and use of different kinds of texts (e.g., policy documents, textbooks). Forty articles were identified that used CDA in the context of education, with an additional six references being collected through bibliographic branching. This review was limited to referred journal articles that specifically called their theory and analysis critical discourse analysis. Books and dissertations were not included in the review.

The findings of the 2005 review suggested that a significant amount of empirical work was conducted in education using CDA, to inquire into a wide range of problems. Of the 46 articles reviewed, 39 of the studies were empirical and 7 theoretical. The focus of this research ranged from the study of ideologies embedded in textbooks (Heberle, 2000), to the construction of gender in learning (Young, 2000), to how consent is achieved in committee on special education meetings (Rogers, 2003). The theoretical articles presented conceptual pieces (e.g., Beach, 1997; Rampton, 2001), critiques (Price, 1999; Widdowson, 1998), and

directions in specific fields, such as literacy research (Burns and Morrell, 2005).

A set of discussions in the journal *Discourse & Society* focused on the relationship between conversation analysis and CDA (Billig, 1999; Schegloff, 1999). The question raised was how much of the context—beyond the here and now of the interaction—is necessary to understand the interaction. CDA attends to the macro and microlevel contexts and, as the 2005 review revealed, analyses were typically embedded in ethnographic contexts. Indeed, all of the empirical studies reviewed used some form of ethnographic method—including participant observation recorded in fieldnotes, document collection, debriefing (Chouliaraki, 1998; Comber, 1997; Egan-Robertson, 1998; Hinchman and Young, 2001; Hughes, 2001; Rogers, 2002; Rogers, Tyson and Marshall, 2000; Young, 2000), focus groups or interviews (Brown and Kelly, 2001; Collins, 2001; Johnson and Avery, 1999; Nichols, 2002; Peace, 2003; Young, 2000). Of course, the studies varied in the depth and description provided about the fieldwork, the data collection, and the participants.

The context in which the studies were set was diverse. The review found the studies covered a wide range of contexts, including science classes (Moje, 1997; Myers, 1996), a social studies class (Brown and Kelly, 2001); literature classes (Hinchman and Young, 2001), after-school programs (Egan-Robertson, 1998; Rogers, 2002), home schooling experiences (e.g., Young, 2000), interviews (e.g., Collins, 2001; Nichols, 2002), special education meetings (Rogers, 2002), administrative school meetings (e.g., Corson, 2000; Orellana, 1996), or written documents (e.g., Ailwood and Lingard, 2001; Anderson, 2001; Davis, 1997).

About 66% of the empirical studies reviewed drew on interactional data (e.g., analysis of spoken language and/or an analysis of spoken and written language), whereas much of CDA research conducted outside of the field of education has focused on written texts (e.g., Rampton, 2001; Teo, 2000). Interestingly, 85% of the studies took place in middle school, high school, or higher education. Only 15% of the studies (4/26) took place in elementary school or with children under the age of ten.

Finally, the 2005 review also pointed out that 20% of the articles (8/39) did not address the specifics of their analytic procedures. This is a problem because some CDA work has been critiqued for reading ideology onto data and creating a disproportionate balance between social and linguistic theory (Flowerdew, 1999; Price, 1999; Widdowson, 1998). A related critique is the lack of attention to analytic procedures amounts to assuming a political stance rather than doing research. Lewis (2006) similarly cautions educational researchers from turning to CDA

because they are attracted to the explicitly ideological agenda and avoid the situation where “CDA becomes the purpose and product of the research rather than a method to use in the service of significant research questions and aims” (p. 356).

#### WORK IN PROGRESS AND NEW DIRECTIONS

Recent research in education, drawing on CDA, is being conducted in areas such as critical race theory and policy studies. Some of this research incorporates a significant social action/critical language component and some teacher researchers have carried our studies in their own classrooms. Recent studies also include research conducted in primary grade classrooms (Heffernan and Lewison, 2005; Martinez-Roldan, 2005; Rogers and Mosley, 2006; Webb, 2005).

#### *CDA and Social Action*

A number of studies combining CDA with critical literacy (e.g., Armitage, 2005; Comber, 1997; Heffernan and Lewison, 2005; van Sluys, Lewison, and Flint, 2006; Young, 2000) have shifted their focus toward social action. The concerns of these researchers is not only with the ways in which power is reproduced but also how it must be challenged, subverted or resisted. The move toward CDA research amongst teachers is to be welcomed, since as Comber and Thompson (2001) write, “teachers need to be engaged in analyzing their own discursive practices . . . and considering the effects on different students” (p. 25). Collins (2004) writes that linking knowledge and action is also increasingly an ethical obligation; “as both social analysts and social actors feel the need to grapple with greater complexity under conditions of greater uncertainty, they do so with an increasing state of ethical commitments” (p. xxii).

Drawing on a range of texts and contexts, Armitage (2005) used CDA in a practitioner-led study to examine the effects of a policy of higher standards on children and families in Ontario, Canada. Armitage explores the discursive and material consequences of testing and higher standards through an analysis of interviews, policy documents, and curriculum documents as well as a critical examination of her own practice. Her analysis, one that foregrounds the impacts of testing from the point of view of parents, reveals how the language arts curriculum continues to maintain a unitary view of literacy, one that often disenfranchises historically marginalized groups of students.

Webb (2005) situated her CDA within Third Space theory (Lefebvre, 1974). She conducted a study of book club discussions in her primary grade classroom in California, which included students who were first

and second language users of English. Webb had the following to say about CDA: “CDA helped me to better understand Discourses and situated identities enacted in positioning, the cultural models negotiated and shaped locally and the larger institutional and societal influences perpetuating the production and reproduction of Discourses and cultural models” (p. 3). Webb analyzes how the children in her class constructed meaning around their reading of the book *Esperanza Rising*. This is a book that focuses on Esperanza, a young girl, who escapes political and personal conflicts in Mexico to live in a migrant farm camp in California. As a teacher researcher, Webb focused on one episode during the book club discussion because it contained contradictions and complexities and as she put it, “it nagged her.” This episode departed from the normative routines of classroom discourses and was more aptly described as a hybrid, or third space. Webb describes through a careful discourse analysis, the ways in which first language users of English dichotomized identity—one was either a Mexican *or* an American. Webb then analyzed her own participation in the book club discussion and on the way in which she redirected focus and encouraged the English as a second language students to draw on their personal experiences of immigration to show the complexity of identity. Webb concludes with implications for her own practice and for bringing together Third Space theory with critical discourse analysis.

### *CDA, Texts, and the Representation of Identities*

A number of researchers and teacher-researchers have begun to use texts to explore with their students the ways in which identities are constructed and the ways in which particular social groups are represented (e.g., Lewis, 2005; Martinez-Roldan, 2005; Young, 2001). Young (2001), for example, used critical discourse analysis to analyze a document designed by and for African Americans in the mid-1800s called *The Freedman's Torchlight (TFT)* (p. 685). Young presents a multimodal analysis of the *TFT* focusing on the genres, framings, omissions and backgrounding, foregrounding, and the visual representations embedded within this text. A major facet of Young's argument is the use of the concept of design—a concept since popularized by the New Literacy Studies. Young draws attention to the racialized construction, production, consumption, and circulation of texts and the ways in which they were designed and redesigned. Young argues that a “community of designers” produced *TFT*, a community who “chose to support Black people and Black progress” (p. 686). Young concludes that *TFT* constituted an example of empowering text written by and for African Americans. Young's study points to the need for

further critical discourse analyses of relevant texts along with pedagogy and instructional technologies produced by and for African Americans.

Martinez-Roldan (2005) uses Critical Latino/a Theory in combination with sociocultural theory and CDA to interpret the ways in which a group of second grade Hispanic children in the US Southwest “work at understanding, marking, and resisting gender boundaries” during literature discussion groups (p. 157). Martinez-Roldan’s study marks an important contribution to CDA in education because she fills three lacunas in existing research. First, Martinez-Roldan pairs the theoretical and methodological tools of CDA with critical race theory (CRT), a combination that has been missing in the literature thus far. Second, she employs CDA and CRT within the ethnographic contexts of a primary grade bilingual classroom, another underdeveloped area of research in CDA in education. Third, this study also attends to the role of cognition and learning in relation to CDA.

Like Young (2001), Martinez-Roldan embeds the CDA within sociocultural frameworks, paying particular attention to the ways in which children acquire, learn, resist, and transform gender identities in texts and talk. Martinez-Roldan uses Gee’s (1999) six building tasks as the methodological foundation of her research. She combines this with a close linguistic analysis of each of the tasks and interprets the way in which the children’s understanding of gender changes over the course of a 50-min discussion about the book *Oliver Button is a Sissy*. Martinez-Roldan is a researcher, a teacher, and a participant in the study and acknowledges all of these roles—including her insider-outsider status in the classroom and how she brought “adult ideological beliefs” to bear on the discussions (p. 165). Her close analysis of this discussion with the children, accompanied by her year-long ethnographic observation in the same classroom, enabled her to demonstrate that the children’s talk reveals sophisticated understanding of gender ideologies—understandings that sometimes reproduce polarities and other times, challenge gender dichotomies.

Arguing that critical analyses of “race” should extend to work with white children, Rogers and Mosley (2006) use CDA in combination with critical race theory and whiteness studies to analyze the ways in which white, working class second graders construct understandings of “race” during Guided Reading groups. They illustrate that young white children can and do talk about race, racism, and antiracism within the context of the literacy curriculum. Using a particular framework for analyzing “white talk,” one that incorporates the insights of whiteness studies, critical race theory and draws on critical discourse analytic frameworks, they show how talk around “race” unfolds among white, second grade students and their teachers. The study illustrates the instability of racial identity formation and outlines the implications

of this for teachers and students when “race” is addressed in primary classrooms.

### *CDA and Written Texts*

Educational researchers have long used CDA to investigate the construction of ideologies in written texts (e.g., Ailwood and Lingard, 2001; Bloome and Carter, 2001; Myers, 1996). Such scholarship continues to deepen and widen as CDA is put to work within written texts as diverse as children’s book order forms, Chinese language textbooks to texts circulated on college campuses. For example, McNair (2005) combines CRT with CDA as she conducts an analysis of Scholastic book order forms, a catalog designed to advertise and sell children’s books, for their multicultural content. Her textual and semiotic analysis indicated a lack of inclusion of books written by and about people of color. Further, only books written by white people were labeled as “classics” in the catalog. When multicultural books *were* included in the order forms, they were often relegated to marginal places on the order form or were touted as part of a special celebration (e.g., Black History Month). In the spirit of praxis, McNair presented her analysis to her teacher education class. Several of the students in the class, with the support of McNair, wrote a letter to Scholastic incorporating the findings of the analysis and urging Scholastic to be more inclusive in their representation of children’s literature in their catalog.

Liu (2005), for example, examines the discourses, cultural values, and beliefs constructed in Chinese language textbooks currently used for primary school students nationwide in China. Powell (2004) argues that CDA can complement and extend existing critical and radical writing pedagogies. Powell uses CDA to analyze texts that circulated on the campus of Miami University, Ohio, surrounding a conflict that exacerbated ongoing disputes about diversity, access, and standards, and discusses how CDA might inform composition pedagogy.

An important, and perhaps under-researched area of CDA in written texts, is in the domain of policy studies. There have been some new directions in this area. Comber (under review) investigates how the literacy curriculum in a socioeconomically disadvantaged school in South Australia was informed by policy, media, and teachers’ ongoing curricular decisions. At the macro level, Comber focused on the historical, political, and economic impetus behind literacy agendas by the Australia government between the years of 1983–1993. Drawing on newspaper texts and policy documents, Comber documented the emergence of the testing regime, a regime constructed by corporations in the service of economic interests, and the consequences on schools, teachers, and children. At the microlevel, Comber draws on texts

produced about the school (e.g., advertisements to boost enrollment), observations in teachers' classrooms, interviews, and local assessment documents. She demonstrates the connections between the macro and micro, using CDA as a way of interrogating normative discourses of schooling constructed and represented in these forms of talk and text—and also the ways in which oppositional and resistant discourses were produced.

Collins (2001), in a study of how teachers take up (or resist) the discourses of educational standards and the ways in which the standards echo larger sociopolitical educational reforms, presents himself as a text analyst or researcher and also as a member of the educational community within the district that he is writing about and a parent of a child in the same district. Stevens (2003) conducted a critical policy analysis of her observations and written artifacts from the Reading Leadership Academy held in 2002. Stevens analyzes the texts for the situated meanings of the texts and the ways in which these meanings are connected to local, institutional, and societal discourses. Similarly, Woodside-Jiron (2004) uses CDA as a tool in the critical analysis of public policy. Woodside-Jiron provides a close analysis of changes in reading policies in California between 1995 and 1997, and the more recent US-federal policy—No Child Left Behind. She combines Bernstein's (1996) social theory with a discursive analysis—specifically linking linguistic devices of cohesion and intertextuality with the construction of hegemony through policies. Woodside-Jiron demonstrates the ways that policy texts were constructed to ensure particular interpretations. She concludes with implications for policy development, policy communication, and policy implementation.

### *CDA and Multimodal Texts*

An area where we have not seen much CDA activity has been in globalized knowledge flows—including digital texts. CDA can also be put to work in new literacy studies—where the focus on the “new” is both new ways of looking at literacy as well as inquiring into new types of literacies (Lankshear and Knobel, 2004). Nichols (2006) provides an exemplar for using CDA to ask and answer questions about the flow of knowledge using Internet texts. Nichols (2006) combines the frameworks of New Literacy Studies and Activity Theory in her CDA of internet texts across time and space. She traces the use of “thinking literacies,” in this case new educational software called “Six Thinking Hats,” across the social space of a primary classroom in Australia and the digital space of the internet. “Six Thinking Hats” has been designed to produce creatively thinking knowledge workers through cyber and social spaces. Nichols analyzes the ways in which

a teacher in a grade 1–2 classroom in Australia is connected to globalized knowledge flows and the ways in which the knowledge is similar and different in cyber space and in the social space of her classroom. She also examines the internet texts looking for what she calls “network effects”—on and offline. She compares this approach to the three levels of analysis (text, interaction, and discourse) of critical discourse analysis (Fairclough, 1993, 2003). Nichols study is one of the few studies that engages with both critical discourse analysis and multimodal examination of hypertexts and digital literacies.

### FUTURE DIRECTIONS

As a result of transdisciplinary analyses such as those described earlier, CDA work in educational contexts is contributing to the shaping of the boundaries of the general field of CDA. In his 2004 keynote address to the first International CDA Conference, Teun Van Dijk (2004) invited us to reframe CDA as Critical Discourse Studies, emphasizing both theory and method. The need to dually emphasize theory as well as method can be seen in recent work in education that combines CDA with theoretical frameworks such as critical race theory (McNair, 2005; Rogers and Mosley, 2006; Martinez-Roldan, 2005; Young, 2001); activity theory (Keating, 2005); Third Space theory (Webb, 2005). More attention might be paid to the issues that surface at the interface between frameworks. For example, the research in CRT and CDA leave us with questions such as: How does the researcher prioritize the narratives of people of color (a central tenet of CRT) while at the same time using CDA as a way of understanding the multiplicity of the form and function of the narratives?

More research is needed in the areas of digital and multimodal literacies, especially as they relate to localized networks of knowledge. More effort could be devoted to the use of CDA in inquiring into the global trend of privatization as it relates to curriculum, teachers, and schools. As Luke (2004) suggests, analyses might focus on the ways in which power is subverted, resisted, or challenged as well as places where power is reproduced. What are the relationships between texts, discourse practices, and social processes in the case of a teacher who continues to teach for justice in the midst of scripted reading programs and a test driven curriculum? What does learning look and sound like for high school students who are immersed in a critical literacy curriculum? Further, more studies are needed that attend to the emotional aspects of power. Emotions such as sadness, love, guilt, anger, and surprise are often the stronghold of ideology and yet we know very little about how people negotiate the emotional terrain of learning.

In short, CDA conducted within educational contexts has led to new and exciting insights both in terms of the shape of text, talk, and social practices that comprise learning environments as well as continuing to contribute to the shaping of the boundaries of CDS.

## POST-STRUCTURALIST ANALYSIS OF CLASSROOM DISCOURSE

### INTRODUCTION

Within the last two decades, Poststructuralist Discourse Analysis (PDA) has emerged in classroom research as a valuable and original methodology with which to investigate and evaluate ‘real’ samples of text and talk in context. Associated in the past with esoteric, abstract theorising, it is increasingly being taken up by educational researchers as a flexible yet systematic tool to make sense of the complexities and ambiguities of classroom discourse.

PDA is both a theoretically coherent paradigm in its own right, and an effective methodology for explaining ‘what is happening right now, on the ground, in this very conversation’. As Wetherell (1998) has argued, there are too many past critical and poststructuralist studies that pronounce on the nature of discourses without getting down to the business of what is actually uttered or written. This chapter will seek to review how educational researchers variously use PDA to describe, analyse and interpret a highly salient feature of classroom discourse: the ways in which speakers (teachers, learners, non-teaching assistants) constantly shift between positions of powerfulness or powerlessness within competing cultural and educational discourses (Baxter, 2003; Creese, 2005). The chapter will also show how PDA is *not* concerned with the modernist quest of seeking closure or resolutions in its analysis of what discourse *means*, but rather with highlighting the diverse subject positions, viewpoints, voices and fragmented messages that classroom research data often represents.

### EARLY DEVELOPMENTS

Poststructuralist discourse analysis was developed by social scientists from the theories of leading poststructuralist thinkers such as Althusser (1971), Bakhtin (1981), Derrida (1987), Foucault (1980), and feminist post-structuralists such as Butler (1990) and Weedon (1997).

The history of PDA is a relatively short one, so I shall consider early developments in the field by reviewing two areas of influence: Applied linguists and sociolinguists interested in second language learning and

social identity, and research in first language classrooms as illustrated by Walkerdine's (1990) seminal exploration of identity construction.

First, applied linguists have brought poststructuralist insights to the analysis of multilingual contexts, based upon the sociological approach of Bourdieu (e.g. 1991), the sociolinguistic ethnography developed by Heller (e.g. 1999) and 'positioning theory' advocated by Davies and Harré (1990), among others. In this tradition, Thesen (1997) argues that second language learners must often negotiate multiple and changing identities for themselves within classroom discourses which may 'position' them as variously powerful and/or powerless. They may be powerfully positioned as multi-skilled language users but simultaneously, powerlessly located as 'deficient', 'disadvantaged', and 'under-prepared'. This is supported by Norton (1997), who demonstrates the poststructuralist principle of *resistance*. She recounts the story of how Mai, a young woman from Vietnam and an adult immigrant to Canada, resists the way she is positioned as a listener rather than as a speaker on her ESL course. Mai votes with her feet, refusing to return to a class that appears to privilege the speech of articulate, European male students over the contributions of reticent, Asian female students. Yet, this is no simple oppressor–oppressed dichotomy (as might be depicted by a critical discourse analysis; see Rogers, *Critical Discourse Analysis in Education*, Volume 3)—the teacher was potentially *empowering* students with the chance to share their 'life histories' with the class, a chance Mai ultimately resisted. Norton's act of providing Mai with a 'space' within her research study to express this sense of entrapment by classroom discourses, serves the poststructuralist principle of 'heteroglossia' (Bakhtin, 1981): that is, releasing 'silenced' voices so that they can be more clearly heard. More recent work by Pavlenko and Blackledge (2004) investigates how the identities of second language learners constantly shift, dissolve and reform in relation to different power variables such as gender, ethnicity, class and language status.

In contrast, Walkerdine (1990) helped to develop PDA as a field by analysing samples of classroom talk. She conducted a renowned study of spoken interaction involving a British female nursery school teacher and two four-year-old boys. In her analysis, she shows how the teacher is constituted simultaneously as a powerful authority figure, and as a powerless woman/sex object, within just a few moments of conversation:

SEAN: Miss Baxter, knickers, show your knickers.

TERRY: Miss Baxter, show your bum off.

(They giggle.)

MISS BAXTER: I think you are both being very silly.

As a former teacher myself, I can empathise with Miss Baxter here, but I am not related to her! In this data, Walkerdine argues from a

feminist stance that the teacher has been ‘made to signify as the powerless object of male sexual discourse’ (1990, p. 4–5). Yet, from the greater complexity of a poststructuralist stance, she suggests that the two boys cannot ‘simply’ be conceptualised as powerless children oppressed by the authority of the teacher, who in turn represents ‘the bourgeois educational institution. Nor can they simply be understood as the perpetrators of patriarchal social relations’. In short, these boys have the potential to be produced as subjects in *both* discourses—as simultaneously powerful and powerless. This multi-faceted notion of subjectivity means that, if students are positioned as powerful within one particular discourse (e.g. male students ‘doing power’ over female teachers), they may well be positioned as powerless within an alternative discourse (e.g. children oppressed/controlled by the power of the teacher).

### MAJOR CONTRIBUTIONS

I will now consider the work of three highly influential role models who have each drawn upon PDA in principle and practice: Davies (1989/2003, 1995), Wetherell (1998), and Bergvall (1998), alongside my own work in this field (e.g. Baxter, 2002, 2003). To a greater or lesser extent, all these theorists have a special interest in the construction of gendered identities in the classroom.

Our first major contributor, Davies with her colleague, Banks (1992), conducted a longitudinal study of a group of preschool children (aged four) and later, the same primary school children (aged eight) in Australia. Drawing on the work of the poststructuralist theorist Althusser (1971), Davies explores the ways in which this group of boys/girls ‘take up’ differently gendered subject positions in relation to two types of fairytale—conventional and feminist. As a feminist herself, Davies argues that the majority of children tend to assume fairly rigid, conventionalised subject positions, which construct their identities as stereotypically masculine or feminine. If a child identifies herself as stereotypically feminine at age four, this is still likely to be the case at age eight. For Davies and Banks (1992, p. 3), the value of the poststructuralist approach is that it views the ‘current gender order as problematic and locate(s) the problem in its dualistic and hierarchical nature’. She considers that PDA provides teachers with the educational rationale to enable children to deconstruct their ‘lived experience’, and to see the danger of binary, gendered relations that are essentially ‘entrapping’. Davies’ major contribution to PDA is therefore her insistence that post-structuralism is not simply a tool of discourse analysis for researchers, but also a potential teaching and learning method which can lead to transformative action in the classroom.

Our second major contributor, the social psychologist Wetherell (1998, p. 395), has effectively argued that a combination of poststructuralist and Conversation Analyst (CA) approaches is a powerful means of analysing the fine-grained detail of 'talk-in-interaction'. She makes the case for a 'synthetic approach' to discourse analysis, which draws upon the combined strengths of CA's interest in the 'highly situated and occasioned nature of participants' psychological orientations within spoken interaction', and poststructuralism's more 'socio-political' concerns with the assignment of subject positioning through discourse. Wetherell's detailed analyses of small-group discussions between 17- and 18-year-old male students in a UK-based, single-sex independent school, which she has also conducted with the discursive psychologist, Edley, tends to highlight gender issues and specifically the construction of adolescent masculinities (e.g., Edley and Wetherell, 1997). But, unlike Davies (1995), Wetherell (1998, p. 395) does not select a feminist focus for specific analysis. Rather, she fulfils the poststructuralist quest to track:

the emergence of different and often contradictory or inconsistent versions of people, their characters, motives, states of mind and events in the world—and asking why this (different) formulation at this point in the strip of talk?

For Wetherell, subjects have a 'portfolio of positions' at their disposal, which 'remain available to be carried forward to the other contexts and conversations making up the 'long conversation'. These positions may be variously 'troubled' or 'untroubled' by the flow of routine interaction. In strictly poststructuralist terms, Wetherell's view of subject positions as akin to 'social learning' or 'sex role' theory might be regarded as somewhat modernist (Baxter, 2003). Nevertheless, her perspective makes a hugely significant contribution to PDA in its pioneering combination of 'top-down' and 'bottom-up' approaches to the analysis of spoken discourse.

Our third major contributor, Bergvall (1998), demonstrates (again through close examination of spoken classroom discourse) the complexities and ambiguities of experience for female engineering students, in a traditionally masculine domain. She argues that women in this community of practice (an Engineering Department in a US, mid-western university) must shift between competing subject positions: their minority role as women and their position as engineering students. They must struggle continuously between these different subject positions in order to gain recognition and acceptance from their male colleagues. The analysis takes the form of detailed attention to the ways in which female speakers co-construct varying identities for themselves according to classroom context. Her methodology resembles a PDA approach, but does not demonstrate how subjects constantly *shift* between different

positions of power, or different forms of identity, within a given moment or context. In her concluding comments, Bergvall (1998, p. 194) argues for the importance of a form of analysis that is ‘neither binary nor polarising, but situated and flexible, grounded in research that is based not only on the careful examination of discrete linguistic structures, but also on the social settings in which such structures are embedded’.

Finally, my own approach to PDA (e.g. 2002, 2003) has specifically built on the role models above by aiming to produce more fully explored and systematic analyses of classroom data. My work is now better known as FPDA (Feminist Poststructuralist Discourse Analysis; Baxter, 2003), but for the purposes of this chapter, I will be referring to it under the generic label of PDA. My decision to use PDA emerged quite naturally from the ethnographic process of observing a class of Year 10 students (aged 14–15 years) in a British, co-educational, secondary school, who were being assessed for their ability to speak publicly for the General Certificate of Secondary English (GCSE) examination. Over a three-month period, I noted numerous examples of how students’ ‘public’ speech appears to be constituted, not by a simple list of examination criteria, but by a complex interplay of social and educational discourses. It was the significance of *three* of these discourses (‘teacher and peer approval’; ‘collaborative talk’; ‘gender differentiation’) on students’ talk that led me to take up PDA as both a theoretical framework and a methodological tool. From my use of long-term, *diachronic* methods (observation; interview) and moment-specific, *synchronic* methods (micro-analysis of spoken discourse), I noticed that individual students might be positioned as powerful within certain discourses, and powerless within others. Students were most likely to be constituted as ‘effective’ public speakers by their teachers, classmates and examination criteria—and therefore to receive a higher exam grade—if they could take up powerful subject positions within and across all *three* discourses. Most powerfully located in this classroom were a couple of vocal, non-conformist, ‘popular’ boys; least powerfully located were a number of quiet, conformist, less peer- and teacher-approved girls.

A number of new researchers around the world have begun to explore the use of PDA in classroom contexts. In the next section, I shall introduce the work of three such scholars who are currently working in the field of classroom discourse.

#### WORK IN PROGRESS

In different ways, the following scholars have subjected the PDA approach to test, and have adapted and extended its methodology to suit their own purposes.

Firstly, Castaneda (2007) is currently analysing the social construction of gender identities through an ethnographic study of Colombian preschoolers learning English as a foreign language (EFL). He selected a feminist version of PDA (FPDA; see Baxter, 2003) as a focused micro-analytical tool to locate the ways in which a number of gendered discourses, arising from teaching materials used to develop language skills, operate intertextually to situate the preschoolers' voices within the classroom interaction. He notes how the preschoolers, both male and female, are never uniformly powerful or powerless, but constantly shift between different subject positions in relation to the different discourses, sometimes between one conversational turn and the next. He suggests that teachers should examine the type of instructional materials used during EFL lessons since they may prompt preschoolers to negotiate subject positions in gendered discourses that 'do not treat peers as equals'. He argues that PDA 'seems to open a new self-reflexive theoretical framework to the study of the interface of gender, EFL learning and early childhood education', which he considers to be a highly under-researched area. Castaneda's development of a sequential, turn-by-turn denotative analysis, building on CA methods (op. cit), focuses on how conversations can be co-constructed between participants.

Secondly, Warhol (2005) is developing methods of PDA to investigate how students at an American, non-denominational, divinity school learn 'exegesis': the interpretation of biblical texts. Drawing on insights from Bakhtin (1981), Warhol argues that all utterances are dialogical in nature: they cannot be read or heard in isolation. Instead, they respond to utterances that precede them and anticipate utterances that will respond to them. Therefore, meaning is not found in one text alone, but amidst a dialogue of interacting voices. Any original text, such as a version of the Bible, will be re-accentuated by new voices. Through a micro-analysis of spoken transcripts, Warhol shows that in one seminar, the exegesis of Galatians 1:11–24 by a group of students and their teacher presents multiple voices: the characters *within* the biblical text; the voices of theological scholars *outside* the text; and the voices of the seminar participants themselves. Warhol (2005, p. 19) adds her own voice to this mix, and then suggests that the reader of her papers will add their supplementary voices to the exegesis process. Thus, 'an infinite number of voices echo through the interpretation of the biblical text'. Warhol therefore uses PDA to challenge the modernist quest of much current theological teaching which seeks closure by deriving a single, correct meaning from a text, presumed to be that of the author. Warhol advances the PDA approach by showing how it can be used to analyse multi-voiced, heteroglossic, written texts such as the Bible, and more importantly to analyse how students make sense of these competing accounts in their seminar discussions.

Thirdly, Gabriele Budach (2005) is exploring the connections between language, gender and local community by means of an ethnographic study of three French literacy centres in Ontario, Canada. Such literacy centres are part of a francophone institutional network designed to sustain the francophone community by providing privileged access to cultural and linguistic capital for Francophones. As such, literacy centres represent an important site where meaning and control over these kinds of resources are debated. To understand the complexity of the issues at stake, Budach finds PDA a useful approach as it offers theoretical and methodological tools to reveal competing and contradictory subject positionings. Being run by women and mainly attended by female course participants, literacy centres are discursively constructed as a homogeneous gendered space, representing female power and excluding men. Applying PDA to interview transcripts and written documents, Budach interrogates this idea of a gendered homogenous space in two ways: first, by looking at the individual life trajectories of female participants, she demonstrates the diversity of subject positionings, needs and investments of individuals, taking account of their backgrounds and life experience. Some of the competing and contradictory accounts foreground social categories other than gender and centre on language ideological issues related to French monolingualism and French/English bilingualism. Second, by linking the literacy centre to broader social relations and grounding it historically in the local context, yet another reading of the homogenous gendered space is offered. Looking through the lens of local history, Budach shows that gender is associated with the opposition between the literacy centre and a male dominated Francophone Cultural Centre. Both institutions are negotiating leadership in the local francophone community. According to Budach, both axes of analysis are in line with a guiding principle of poststructuralism, that is, that there are no fixed and enduring meanings, but contestations and redefinitions revealed by different readings within different contexts.

#### PROBLEMS AND DIFFICULTIES

The number of role models of poststructuralist analysis using transcripts of classroom talk is insufficient. While many classroom studies purport to offer a poststructuralist perspective, they tend to base their observations upon interview data—interaction between the research subjects and the interviewer—rather than upon classroom discourse. More work demonstrating the PDA approach to analysing actual classroom talk would help to establish its epistemological identity and its specific value to the research community.

PDA currently struggles for recognition in the field of discourse analysis; its future is far from certain, and indeed, it might eventually

be assimilated by Critical Discourse Analysis, which it arguably most resembles. Herein lies the paradox of PDA. The poststructuralist quest is to *contest* the authority of more established theoretical and methodological approaches such as CA and CDA, which currently dominate the field of discourse analysis. This is a vital function of the poststructuralist approach to theory and methodology. Lesser known methodologies like PDA serve a *resistant* value in challenging fashionable or entrenched approaches that inevitably transform themselves into 'grand narratives . . . grounding truth and meaning in the presumption of a universal subject and a predetermined goal of emancipation' (Elliott, 1996, p. 19). PDA should ideally be an evolving, ever-changing methodology, receptive to new ways of thinking, to divergent methods of study, and to approaches that question and contest received wisdoms or established methods. Ironically, if it were to become more established, better known, more routinely used by educational researchers and discourse analysts, it might be destroyed by its own success.

One practical problem with PDA—and one that will need more discussion and clarification—lies in its *warrant* for identifying, naming and analysing significant discourses within classroom and other contexts. There are times when it seems that both CDA and PDA are capable of randomly generating new discourses to suit their ideological (CDA) or epistemological (PDA) purposes. But the fact that new discourses have been identified in research data does not mean that they *exist*, except in the mind of the analyst who coins them. CA, in contrast, bases its own warrants on a systematic methodology: any larger patterns it claims to detect in its micro-analysis of 'talk-in-interaction' can always be located, turn by turn, within specific speech exchanges. This is not an approach that Critical Discourse analysts have traditionally deployed. There has been a tendency to consider that a discourse is simply 'out there' waiting to be 'bird-spotted' through a combination of an analyst's finely honed intuition, some supporting textual analysis, and the consensus of like-minded colleagues. Once spotted and tagged, that discourse is taken 'on trust' and then applied as a research category to the critique of other texts. For example, it is fairly routine for analysts of both PDA and CDA to refer to 'discourses of gender' in the classroom, but not to explain upon what warrant these discourses have been identified. Such a discourse may well be widely recognised by communities of analysts, but it is not always clear that it has been identified and named through the application of rigorous research methods such as those developed by CA.

In my own work (see above), I have suggested the need to devise more rigorous and reliable methods based on a combination of 'diachronic' ethnographic methods and 'synchronic' micro-analysis of discourse. However, the development of a systematic methodology to provide a

warrant for identifying and analysing significant classroom discourses remains a continuing challenge for PDA.

### FUTURE DIRECTIONS

Although PDA certainly does embrace complex and abstract poststructuralist principles such as deconstruction and supplementarity (Derrida, 1987), I have aimed to show how recent research studies have got down to the business of analysing how talk is uttered. PDA's 'unique selling point', so to speak, is its facility to create a multi-faceted interpretation of spoken interactions in educational and classroom contexts that reveals, rather than suppresses, the discursive struggles to fix meaning according to different and competing interests.

PDA offers educational researchers a clear, coherent and systematic means to explore the complexities and ambiguities of classroom discourse. Indeed, there are several other areas of educational experience that might benefit from the polyphonic and pragmatic perspective PDA brings. First, PDA could be of particular value to action research within education. Many of the principles that constitute poststructuralist projects—collaboration, participation, practicality, focus, self-reflection, a commitment to informed, directed and flexible action—can also play a part in classroom action research. Both PDA and action research perceive their work to be historical, localised and context-bound; their work is rarely transferable to other settings and periods. Both approaches aim to increase understanding of participants' own practices and the situations in which these practices are carried out. The value of bringing PDA to action research in classroom contexts is that it seeks to promote a greater plurality, openness and richness of perspectives as the basis for insightful action by the participants of the study. It will not close off or disguise the potential for competing viewpoints, or conflicting points of interest; instead, these provide the basis for more informed decisions, more multi-layered actions and developments.

Secondly, now that PDA is relatively well developed, it would be fruitful for researchers working in this vein to engage in dialogue with those working in related sub-fields who have also embraced a broadly poststructuralist approach. This dialogue could centre on future directions for research in classroom contexts where the negotiation of multiple and competing identities, viewpoints, teaching strategies and textual materials is a routine yet often problematic occurrence. We have seen, for example, how applied linguists and sociolinguists have identified 'social identity theory' (Macnamara, 1997) and more latterly, a feminist, poststructuralist perspective to identity (Norton, 1997) as helpful in their analyses of multilingual teaching contexts, where the negotiation of multiple subject positions is a daily yet formidable

challenge for bilingual, second language learners. One particularly productive area of dialogue might be with those conducting research of a sociolinguistic ethnographic nature in bilingual classroom contexts (e.g. Heller, 1999; Heller and Martin-Jones, 2001). Within this particular strand of poststructuralist research, there has now been a decade-long tradition of close analysis of bilingual discourse and code-switching. In such studies, the aim has been to link insights into the local interactional order in different educational sites, with the analysis of the changing social and symbolic order. Through dialogue across these two fields of poststructuralist research on language in education, PDA and critical sociolinguistic ethnography in multilingual settings, areas of common concern with regard to both theory and method, could be identified.

Finally, a PDA approach might usefully be applied, not only to spoken discourse within classroom interactions, but also to other types of classroom text. CDA has traditionally focused on the ways in which institutional texts, printed and multi-modal, often represent the world in hegemonic ways, and by implication, their audiences. PDA would question the binary view that such assumptions are necessarily fixed and static, or that they tend to support dominant over minority interests. PDA would invite analysts to consider the ways in which texts often embed *competing* assumptions about the content they represent and/or the identities and needs of their audience. A PDA methodology would ask analysts to use textual micro-analysis to deconstruct the plural voices and diverging accounts contained within many teaching materials, and to suggest ways of opening up spaces for alternative or 'silenced' viewpoints.

In summary, PDA is an instrument particularly suited to the classroom context, where multiple voices, shifting identities, and different versions of reality compete for recognition and attention. It also enriches the range of theoretical and methodological approaches available to researchers and practitioners. Let us make more use of it in our future research!

## REVOICING ACROSS LEARNING SPACES

### INTRODUCTION

In the context of a considerable amount of language research applying Bakhtinian ideas about voice and dialogue, I shall focus here on studies that look specifically at revoicing, sometimes referred to as discourse representation or ventriloquation.

Our language, as Bakhtin puts it, is full of other people's voices (Bakhtin, 1981, 1984). We quote other people as authorities or call into question what they have said, fill our anecdotes and stories with recreated dialogue (Tannen, 1989), and reproduce the voices of teachers, friends, newspapers and politicians. Voices may be framed grammatically or prosodically as reported speech, or signalled as 'imported' in a range of other more subtle ways, or they may appear to merge with the speaker's own voice (Bakhtin 1984, 1986), traceable only through a knowledge of the speaker's previous language experience. In addition to reporting and reconfiguring actual utterances, or features of specific voices, we may also take on and reproduce the voice of a genre or discourse, for example the genre of online chat, or the discourse of advertising, or imitate the voice of a particular social group, for instance by putting on a different accent. While the language of people of all ages is filled with the features of other voices, which may or may not be identifiable, the ways in which students take on, reproduce and represent the voices of significant people, texts and genres in their lives are particularly interesting because of the implications of this revoicing for learning and meaning-making. Researchers have examined what the multi-voiced nature of children and young people's language can reveal about how they draw on, are positioned by and interrogate the resources of their cultural worlds, and language educationalists have begun to look at how insights about revoicing can inform and drive pedagogy.

### THEORETICAL FOUNDATIONS

In this section I briefly introduce how 'voice' is linked to 'genre' and 'social language' in Bakhtin's work, and note some ways in which the notion of revoicing has been used by psychologists and linguists. I then go on, in the subsequent section, to discuss how these ideas have been applied in educational research on language and learning.

Bakhtin (1981, 1986) argues that we cannot communicate other than through speech genres, i.e. the patterns of language form and use, content themes and evaluative perspectives that emerge in a specific sphere of human activity. Children learn these genres at the same time as they learn language itself. They also learn how different ways of using language (e.g. accent, grammar and style) are associated with what Bakhtin calls the 'social languages' of different social classes, ethnic groups, age groups, generations and so on. When speakers or writers reproduce voices, whether by quoting or appropriating them, these voices bring with them a generic 'taste' of their previous use, and also an association with particular social languages. In fact, it is these very connotations, together with the way in which they are reconfigured by the new speaker/writer, which provide the potential for meaning-making in the new context (Volosinov, 1973). Bakhtin (1984) suggests that there is a range of ways in which reproduced discourse can be strategically framed or reconfigured, or blended with the new speaker/writer's own voice. His preliminary categorization includes direct and indirect quotation, imitation, stylization (where a speaker or writer tries on some aspect of the style of another voice but it is still recognisable as separate from their own) and hidden polemic (arguing against an unspoken alternative position). The use of these dynamic and overlapping strategies by a speaker/writer depends on how far they want to align themselves with the semantic nuances and evaluative perspective the voice brings with it, and how far express varying degrees of distance. In the very manner in which they reproduce a voice and its generic and social connotations, therefore, speakers or writers are in a sense answering it, and saying something about themselves in the process.

The American psychologist James Wertsch (1991) uses Bakhtin's concepts of voicing and genre to develop Vygotsky's argument about the mediating role of language in children's socialization, and the transition from intermental to intramental functioning. Wertsch suggests that children are guided, through dialogue with more experienced others, to learn which kinds of speech genres and social languages are appropriate in particular settings. From their experience of dialogue, for instance with parents and teachers, children internalize the voices of more experienced others and then reproduce these voices themselves. In this way, they take on what Wertsch terms the 'privileged' ways of using language in the genres associated with different spheres of human activity, so that children learn to voice or 'ventriloquate' themselves through the different genres of their social world. For instance, the genre of school science involves using a register of scientific concepts to construct knowledge organized in explicit, standardized taxonomies and schemas. Children learn that this is the approved way of talking about science, and that in appropriating the scientific

genre they are also appropriating power. Thus, children are inducted through their engagement within an increasingly finely differentiated range of genres, into particular ways of reading and representing experience and knowledge. In this sense, Wertsch argues, speech genres provide a crucial link between the psychological processes of individuals and their cultural historical and institutional settings.

While Bakhtinian notions of voicing and revoicing have been applied by psychologists within a sociocultural model of socialization and learning, they have also been taken up by linguists interested in how language reflects and creates the social world, and the speaker's position within it. The British linguist Norman Fairclough (1992), in discussing how all language users borrow from, and orient towards, other voices, distinguishes between what he calls 'manifest intertextuality' where the words from another speaker or text are reproduced or inferred, and 'constitutive intertextuality', or 'interdiscursivity', where broader aspects of style, genre and ideological positioning from another's discourse are reproduced. He suggests that 'manifest intertextuality' may involve clear boundaries between voices (marking direct or indirect quotation grammatically and through punctuation), or unclear boundaries, where other voices may be signalled through presupposition, negation, metadiscourse and irony. Particular genres (e.g. a news report, a chat, a scientific article) are associated with particular modes of discourse representation and writers' use of linguistic strategies for revoicing is constrained and conditioned by relations of power realized through institutional practices. The question of how writers grammatically indicate their position in relation to the voices they are representing is also explored in an influential study of the stylistics of fiction. Leech and Short (1981) use a cline to represent grammatical forms ranging from where the author's voice is most dominant in 'narrator's representation of a speech act', through 'indirect speech', 'free indirect speech' and 'direct speech' to 'free, direct speech', where the character's voice and perspective are more prominent in the meaning being conveyed.

The issue of revoicing is also addressed by the American sociologist Erving Goffman, who began to deconstruct the traditional linguistic model of speaker-listener roles by showing how speakers may assume any combination of three roles in relation to what is being said within a conversational frame: the *animator* who produces the utterance, the *author* who is responsible for its wording or the *principal* who is ultimately responsible for the views expressed. On their side, listeners may be either an *addressed recipient*, the rest of an *official audience* or *unofficial bystanders* including overhearers and eavesdroppers (Goffman 1974, 1981). Goffman's work has been productive for researchers focusing on local interactions, sometimes in combination with Bakhtinian ideas

about polyvocality and revoicing which suggest ways of linking local language interactions with broader social, cultural and historical contexts, and provide a greater theorizing of dialogicality.

#### MAJOR CONTRIBUTIONS/WORK IN PROGRESS

Applications of Bakhtinian ideas about revoicing within recent and continuing educational research draw both on sociocultural theory about learning and socialisation, and on the analysis of the linguistic features of reproduced discourse and their relationship to wider social patterns. Researchers have focused on different aspects of 'voice' and 'revoicing', depending on their research and disciplinary interests.

Educationalist Anne Haas Dyson (e.g. Dyson, 1997, 1999, 2002), for instance, suggests that children in multiethnic urban 1st–3rd grade classrooms in California draw on a 'landscape of interrelated voices' in their writing practices, appropriating content, text forms and features, graphics, voiced utterances and ideologies of gender and power from popular texts outside school. Arguing that popular culture has been neglected in literacy theory and undervalued as a resource in school, Dyson provides a number of closely observed studies showing how children borrow and revoice fragments of text from songs, movies, cartoons and the sports media, both in informal talk among themselves and in classroom tasks. Dyson is interested both in *how* children appropriate, translate across and reframe voices and other features from popular texts into school activities, and also in *the effects* of this on their knowledge construction in school, and on their own personal development. Through their recontextualizations, she argues, children are 'answering' the voices they reproduce, for instance in the way they juxtapose and blend them with voices from stories encountered in school (Dyson, 1997). Dyson suggests that these recontextualizations often bring to the surface a struggle between peer and school worlds, which can be skilfully managed by teachers to encourage discussion and reflection on representations of good and evil, strength and weakness, gender and ethnicity in both popular and school texts. Through borrowing and revoicing, Dyson argues, children can reorganise and rearticulate their own resources, and in the process, expand their knowledge about social practices, symbolic systems and their ideological world.

The reproduction of the features, style, rhetorical patterns and ideological perspectives of voices from family, friends, teachers, TV, film and song in children's writing is also highlighted in Kamberelis and Scott's analysis of 9–10-year-old Detroit students' writing assignments. Kamberelis and Scott (1992) show how students' skill in orchestrating and framing voices in their writing involves using direct quotation,

merging their own voice with another, stylization (e.g. parody), hidden polemic and idealisation (i.e. the taking on of a utopian discourse, for example assuming that hard work leads to success, or that different races live in harmony together). They found that less successful writing may reflect inconsistent and conflicting voices within a students' social world, and the student's unsuccessful efforts to work out a coherent personal position for themselves in relation to these. The development of literacy skills and the ability to present an argument, Kamberelis and Scott suggest, involves the marshalling and grammatical framing of a range of voices, and the child's response to them, within a school writing genre. This process is then part of a child's forging of his or her own social and political identity.

In my own research (e.g. Maybin 1999, 2006) I have focused on the different ways in which specific utterances are revoiced in 10–12-year-old children's informal talk. I examine what patterns of voice repetition, appropriation, stylization and reporting can reveal about children's exploration of new kinds of knowledge, relationships and gendered identities as they make the transition from childhood into adolescence. I suggest that children's reproduction of voices from teachers and textbooks, other children and themselves on previous occasions shows them playing an active role in their induction into school practices and discourses. More generally, I found that reproduced speech was frequently used to invoke past events and bring them to bear on what was happening in the present, and it seemed to provide a powerful way of commenting on experience and drawing the listener in. Children tried out and conveyed personal judgments about people, relationships and events through the ways in which they rephrased and reframed reported speech and through their orchestration of dialogues in anecdotes and longer narratives. Focusing on talk rather than writing highlights the dynamic dialogical processes involved in meaning-making and I found that personal judgments conveyed through revoicing were often reconfigured in ongoing dialogue with other children so that individual impressions and reactions became socially forged. I suggest that 'evaluation' (Volosinov, 1973), that is, the way in which we can never talk about anything without making some kind of judgement reflecting an assumed evaluative framework and signalling our own position in relation to it, is central both to children's continuing socialisation, and to their ongoing identification as individuals. Children's evaluative activity in reproducing and orchestrating voices reflects their social background and values, but also reveals how they are acting on their environment, becoming conscious of their positioning in the world and developing a sense of themselves as a particular kind of person.

While my research looks at revoicing in the context of socialization and learning (in a broad sense), Ben Rampton's sociolinguistic research

on voice stylization in teenagers' talk reveals how general ideological categories of ethnicity and social class are highlighted and recreated by young people, within interactions at a local level. Rampton (1995) found that what he terms 'language crossing' (when speakers use language which doesn't seem to belong to them) was closely woven into the everyday talk and social activity of teenagers of Indian, Pakistani, African Caribbean and Anglo descent in schools and youth clubs in an English Midland town. For instance, teenagers of Indian, Pakistani and Anglo descent reproduced words, phrases and pronunciation from African Caribbean English/Creole, which seemed to carry with them the 'taste' of an exciting youth culture which they aspired to be part of. African Caribbean and Anglo teenagers used Panjabi words in ritual teasing, and Indian and Pakistani students used a stylized Asian English pronunciation to parody limited linguistic and cultural competence. The form and meaning of language crossing varied in different contexts. Like the other examples of voice reproduction discussed above, this stylization is 'double-voiced', that is, both the semantic intention of the speaker and the semantic intention of the voice they are taking on, are evident (Bakhtin, 1984, p. 189). Rampton suggests that the taking on of Creole was usually what Bakhtin terms unidirectional double-voicing, where the semantic intentions of both voices are consistent: teenagers crossed into Creole to emphasize desired identities, and in some cases this use of Creole merged into a local multi-racial vernacular. In contrast, crossing into stylized Asian English seemed to be vari-directional double-voicing, where the speaker was expressing their difference from the voice they were taking on, through an ironic code-switching. This language crossing was used, often playfully (see Lytra, *Playful Talk, Learners' Play Frames and the Construction of Identities*, Volume 3), by young people at moments when ordinary social constraints were relaxed. Rampton suggests that it constituted a challenge to dominant notions of ethnicity, partially deconstructing these at a metaphoric level.

Rampton (2006) extends his analysis to students' stylization of Cockney and 'posh' accents, and the revoicing of German words, in their talk in a multi-ethnic inner London classroom. He found teenagers using exaggerated posh and Cockney accents in greetings, taunts, and in talk about teachers, physical prowess and misdemeanors. Cockney and posh were associated with particular kinds of cultural imagery: Cockney with solidarity, vigour and passion and posh with social distance, superiority and constraint. Teenagers strategically manipulated the imagery invoked through their stylization of accents, in order to, for example, negotiate the reception of a personal story, keep down powerful girls and juggle between school and peer values. Rampton suggests that a temporary fad of playful revoicing of German words

in interactional rituals between students was similarly strategic, signalling both an academically prestigious language, and subversion of the formality of German lessons (see also Hirst, 2003, on Australian students' resistant stylization of Indonesian words in a second language classroom).

Within Higher Education, researchers have found that the reproduction of voices from various sources in students' writing reveals important insights about the writing process, and about the writers' positioning in relation to broader discourses. Ivanic (1997) analyses traces of different discourses within students' essays at a Northern English University and explored, with the students, the reasons behind their choices of voices to reproduce. She found they had taken up particular words, syntax, argumentation strategies and other structuring devices from their reading, lectures, tutorials and discussion with other students and from sources outside the university altogether. Some pieces of language were appropriated because the student had been interested and excited by an idea or a writer and some because the student felt they were appropriate for discourse within their discipline and would be positively valued by staff marking the essay. It was sometimes difficult to knit language from these different heterogeneous sources together, and to negotiate the tricky boundaries between quotation, paraphrase and plagiarism in becoming an academic writer. As Ivanic puts it: 'Complex negotiations of identity lie beneath the surface of what may appear at first glance to be 'inadequate' academic writing' (Ivanic, 1997, p. 343). She argues that teachers need to give more attention to the ways in which students are struggling with different discourses and different kinds of selves within their writing, as they draw on intermental experience to develop their own intramental resources. She suggests that while student writers are constrained by the actual voices they have encountered through interactions with people and texts, and by the conventional genres of higher education, their (often unconscious) acts of selection from the available alternatives constitute a personal response to the patterns of privileging within these genres, and an important component in the discursive construction of their own identity.

Ivanic's suggestion that it may be productive to approach problems of quotation and citation in students' academic writing as part of larger questions about polyvocality and discourse representation, rather than purely as surface features, is also developed in research by Scollon, Tsang, Li, Yung and Jones (1998) in their study of discourse representation in writing by bilingual university students in Hong Kong. Scollon, Tsang, Li, Yung and Jones modelled their work on research by Wertsch and colleagues, who found that Russian and American students appropriated existing historical discourses (of official Soviet history, or civil liberties and individual freedoms, respectively) in their writing about

significant world events, even when constructing oppositional narratives (e.g. Wertsch, 1997). Using Fairclough's categories of linguistic features signalling intertextuality, Scollon Tsang, Li, Yung and Jones analyse how the Hong Kong students appropriated, adapted and contested other voices, in a letter-writing assignment. They found considerable manifest intertextuality in students' writing, expressed through quotation, presupposition, negation, hedging, paraphrase and irony. It was more difficult to trace the appropriation of discursive frames, styles, formats and packages of wordings which would signal interdiscursivity, but they found some students reproducing a public discourse about Hong Kong's success and prosperity. They also point out that the letter-writing assignment (in contrast to such a letter in 'real life') was ventriloquated through the language of English, appropriated from the context of a university lecture and the parameters of an assignment.

### PROBLEMS AND DIFFICULTIES

Researchers have produced a range of analytic frameworks, and a variety of ways for identifying and conceptualizing 'voice', 'revoicing' and 'genre'. While on the one hand this reflects the richness and suggestibility of the Bakhtinian concepts, on the other there is also the potential for confusion about what counts as a 'voice' or a 'genre', and how these can be identified and analysed. In Bakhtin's own account the distinction between intertextuality and interdiscursivity is somewhat blurred, as specific recontextualized voices also index genres and social languages.

Early linguistic analysis of polyvocality tended to focus on written texts (e.g. Fairclough, 1992; Leech and Short, 1981). Researchers identified linguistic grammatical features that signalled the reproduction of a specific voice (manifest intertextuality) or a particular discourse (interdiscursivity), and the writer's own position in relation to these. Researchers of oral language have found that they needed to develop new analytic frameworks to capture the more fluid, dynamic, dialogic negotiation of revoicing and its meaning and significance, in ongoing interaction (see Bloome and Egan-Robertson, 1993, on negotiations of local entitlement to make particular intertextual references in classroom talk, see also Bloome, *Literacies in the Classroom*, Volume 2). Meanings and evaluations are more fluid in talk, and researchers have had to combine textual analysis with conceptual frameworks drawn from psychology, anthropology and cultural studies. Some researchers have identified revoicing using specific linguistic features e.g. language choice, grammar, accent, prosody and analysed how these features are strategically used and interpreted, in the context of ongoing conversational interaction and the wider cultural setting. Other researchers have conceptualized voice primarily as a situated utterance, and tracked

the effects of the strategic reconfiguration and reuse of utterances, in combination with other voices in a new conversational context. Still others track intertextuality and interdiscursivity through writers' accounts of the resources they have drawn on, and through researchers' own perception of the significant discourses within students' environments. These different analytic approaches involve various combinations of linguistics, discourse analysis, sociocultural analysis, interactional sociolinguistics and ethnography. Moreover, they conceptualize the relationships between revoicing and the invoking and instantiation of broader social practices and discourses, in a variety of ways. The most useful research defines voice and revoicing fairly precisely in ways which can be systematically investigated, leading to specific insights about students' language and learning.

Bakhtin's conception of genre, as the pattern of language form and use, content themes and evaluative perspectives which emerge in a specific sphere of human activity, encompasses both the internal, as it were, aspects of a written or spoken text, i.e. its formal features, and also its external significance: the ways in which it is recognized, ventriloquated, responded to and valued. Defining genres as communicative patterns emerging in a specific sphere of human activity, however, begs the question of how large or small a sphere of activity the term 'genre' can usefully be connected with. Bakhtin's list of speech genres includes a wide range of communicative events, from everyday informal conversation to political speeches to literary genres. He talks of simple primary genres (for example everyday chat, an informal written note) being absorbed and reconfigured in more complex secondary genres (e.g. a novel, a speech). However, everyday chat itself could be also argued to include genres of family mealtime conversations, pub conversations, small talk with neighbours and so on, so there is a danger that the level of analysis, and the boundaries between genres, may seem unclear. Within the current context of new technologies and globalised communication, generic transformation and hybridity is happening increasingly rapidly, and this is difficult to document and represent within more formal analyses. While the notion of speech genre seems potentially productive in capturing the mutually constitutive relationship between language and the social world, its very scope and dynamic potential make it difficult to use with precision as an analytic category, which can be deduced from empirical language data, without an accompanying cultural analysis. Researchers drawing on Bakhtin have tended to interpret 'genre' in a fairly general sociocultural sense as associated with particular ways of using language, for instance the genre of science lessons, or the genre of children's informal chat.

In studies of revoicing and interdiscursivity, there are similar difficulties with the empirical warrants for identifying specific discourses, which

are usually conceptualized at a relatively abstract level. Researchers have tended to use the term 'discourse', in the Foucauldian sense as a macro-level complex of language, knowledge and power (Foucault, 1981). For instance, a voice may be seen as invoking a popular culture discourse incorporating particular ideologies of gender. The analytic steps from identifying an instance of revoicing to claiming it invokes a genre, or a discourse, and then to further claims about the nature of these and their implications for students' positioning and learning often involve considerable amounts of interpretation, which also needs to be carefully grounded.

#### FUTURE DIRECTIONS

Researchers are beginning to suggest possible applications of work on revoicing to pedagogy, and raise questions for further research in this area. Dyson (1999) argues for a more 'permeable' curriculum, which will allow students to apply a wider range of voices from their experience outside school, within classroom learning. Similarly, Kamberelis (2001) suggests revoicing can produce hybrid practices where teachers and students can fuse authoritative and inwardly persuasive discourses. Duff (2003) however, shows how students' differential access to popular culture may adversely affect their potential engagement in hybrid teaching and learning practices. In addition to this work suggesting the need for further refinement of research on revoicings of popular culture in school, research on revoicing in older students' writing suggests they can usefully reflect on the polyvocalic nature of their texts, and be helped to find ways of effectively orchestrating the various voices within the appropriate genres (see Bazerman, 2004, on ways of analysing intertextuality in academic texts to help students with their own academic writing).

Research on revoicing reveals classrooms as much more hybrid environments, in terms of language practices, than traditional studies of teacher-student dialogue would suggest. There is a rich range of revoicing practices both in talk related, and tangential, to classroom tasks. Revoicing can be seen as contributing to students' induction into particular social practices and discourses, their curricular and other learning, and their negotiations of personal positioning and identity (e.g. see Haworth, 2001, who suggests that full participation in small group discussion in a class of 7-year-olds involved learning how to revoice appropriated and stylized voices from classroom and community genres). There are potentially rich links between the ways of conceptualizing the revoicing strategies and effects illustrated in the research discussed earlier, and current ongoing research on students' use of multimodal discourses (see Jewitt, *Multimodal Discourses across*

the Curriculum, Volume 3), diverse funds of knowledge (see Moje, *Everyday Funds of Knowledge and School Discourses*, Volume 3) and ways of using hybrid language contexts as a resource for enhancing joint activity and productive learning (Gutierrez, Baquedano-Lopez, Alvarez and Chiu, 1999). Further research on revoicing practices in multilingual and multiethnic student communities, and in relation to multimodal texts in a range of emerging new media, should provide additional important insights into students' strategic uses of language for learning, and into the dynamic relationship between local language acts and broader changing social, cultural and historical practices and discourses.

## LINGUISTIC ANTHROPOLOGY OF EDUCATION

## INTRODUCTION

Linguistic anthropologists investigate how language use both presupposes and creates social relations in cultural context (Agha, 2006; Duranti, 1997; Silverstein, 1985). Theories and methods from linguistic anthropology have been productively applied to educational research for the past four decades. This chapter describes key aspects of a linguistic anthropological approach and reviews research in which these have been used to study educational phenomena. Readers should also consult the chapter by Betsy Rymes on Language Socialization and Linguistic Anthropology of Education, in Volume 8 of the *Encyclopedia*, for a review of linguistic anthropological research in the language socialization tradition.

Almost all education is mediated by language use. The linguistic and paralinguistic signs that compose educational language use have both referential and relational meanings. When educators and learners speak and write, they signal things, not only about the subject matter they are learning, but also about their affiliations with social groups, both inside and outside the speech event. These affiliations, some of which are created in educational events and institutions, can shape students' life trajectories and influence how they learn subject matter. For both theoretical and practical reasons, then, educational researchers need to understand how language use both creates and presupposes social relations during educational activity.

Linguistic anthropology provides a useful set of tools for studying how educational language use creates social relations (Wortham and Rymes, 2003). As implied by its name, linguistic anthropology is an interdisciplinary field—a recognized subdiscipline within American anthropology that also draws on linguistics (e.g., Eckert, 2000), qualitative sociology (e.g., Goffman, 1981; Mehan, Villanueva, Hubbard and Lintz, 1996), cultural anthropology (e.g., Street, 2005) and European “linguistic ethnography” (e.g., Blommaert, 1999; Rampton, 2005). Linguistic anthropologists study how signs come to have referential and relational meaning as they are used in social and cultural contexts. In doing so, they draw on four key concepts, comprising what Silverstein (1985) has called the “total linguistic fact”—that is, four aspects of language use that must be analyzed to understand how linguistic signs have meaning in practice—*form, use, ideology and domain*.

Linguistic anthropologists use linguists' accounts of phonological, grammatical, and other systematically distributed categories of language *form*. Unlike formal linguists, however, linguistic anthropologists are not primarily interested in how forms have meaning apart from contexts of use. Instead, they study how linguistic signs come to have both referential and relational meaning in social and cultural context (Duranti, 1997; Hymes, 1964). The meaning of any linguistic sign in *use* cannot be determined by decontextualized rules, whether linguistic or social. No matter how robust the relevant regularities, speakers and hearers can use signs in unexpected yet meaningful ways (Goffman, 1981; Silverstein, 1992). Linguistic anthropologists study how speech comes to have sometimes-unexpected meanings in local contexts. As important as local context is, however, the meaning of any linguistic sign cannot be understood without also attending to more widely circulating models of the social world. Linguistic anthropologists often construe these models as *ideologies* of language—models of linguistic features and the speakers who characteristically use them, which people use to understand the social relations signaled through language use (Schieffelin, Woolard, and Kroskrity, 1998; Silverstein, 1985). These ideologies are not evenly distributed across social space, but have a *domain*—the set of people who recognize the indexical link between a type of sign and the relevant ideology (Agha, 2006). Linguistic anthropologists study how models of language and social relations move from event to event, across time and across social space, and how such movement contributes to local and historical change.

#### FORM AND USE

The earliest linguistic anthropologists of education moved away from a linguistic emphasis on referential meaning to a more ethnographic emphasis on appropriate communication in cultural context (Gumperz, 1982; Hymes, 1964). They described how students from non-mainstream language communities employed norms of appropriate communication from their home communities and how mainstream educators often misinterpreted their language use as uneducated (Cazden, John, and Hymes, 1972). This research attended systematically to linguistic *form*, but it did so to understand how linguistic patterns interconnect with other aspects of communicative events—with nonverbal signs, the layout of a setting, physical objects, presupposed models of social relationships and appropriate demeanor, and the emergent organization of the speech event. Contemporary linguistic anthropology of education continues to offer systematic analyses of various linguistic patterns, ranging from studies of phonological variation across groups (e.g., Bucholtz, 2001; Eckert, 2000; Stocker, 2003) to studies of

grammatical and lexical patterns that distinguish dialects and registers (e.g., Jaffe, 1999; Kiesling, 2001).

From the beginning, linguistic anthropology of education has also emphasized the study of language in *use*. Hymes (1972) argues that speech can have multiple functions and that educational researchers must examine how utterances come to serve particular functions in context. Instead of presenting speakers as following decontextualized linguistic and pragmatic rules, Gumperz (1982) and Hymes (1972) describe speakers as drawing on diverse resources and creating novel responses in context. Erickson and Schultz (1982) provide an extended study of creative language use, in which they explore the “socially and culturally organized improvisation” that occurs in conversations between academic counselors and students from non-mainstream backgrounds. Erickson and Shultz do not argue simply that non-mainstream students and mainstream counselors experience a “mismatch” of discursive styles, resulting in counselors’ misjudgments about students. They show how counselors and students use various resources to create, override, resist, and defuse such mismatches. Non-mainstream students are often disadvantaged by their nonstandard habits of speaking and by mainstream counselors’ assumptions about these “deficits,” but such disadvantage does not happen simply through a clash of monolithic styles. Erickson and Shultz find that “situationally emergent identity” explains more about the outcome of a “gatekeeping” encounter than demographically fixed identity, and they urge attention to how speakers use social and cultural resources in context both to reproduce and to overcome disadvantage.

The general point here, as described systematically by Silverstein (1992), is that signs indicate social relations only in context. When a speaker uses a less formal term, for instance—say, “lawyer” or “ambulance-chaser” instead of “attorney”—this can indicate that the speaker is poorly educated or unrefined, but it can also signal solidarity or humor. Tokens of such a sign only come to have determinate social meaning when hearers understand them against the background of relevant context. “Context,” however, potentially includes an enormous number of sometimes contradictory pieces of information. When I said “ambulance-chaser” just now, were you aware of the fact that I had recently been victimized by an unscrupulous lawyer, or the fact that I am organizing a grass roots movement to rescue our government from the legal-lobbyist complex, or the fact that I know you are married to one? Any or all of these aspects of the context could have been made salient by earlier interaction, or they could be established things that we know about each other. Depending on which features of the context are in fact, salient at the moment of utterance, participants will interpret the sign differently. This is what Silverstein calls “contextualization,”

the fact that signs come to have meaning only as they and co-occurring signs index aspects of the context. Cultural knowledge is crucial to interpreting the relational meaning of utterances, but we can only interpret that meaning by examining how utterances get contextualized in use—not simply by establishing a list of decontextualized beliefs, styles, or rules that allegedly suffice to determine meaning.

Contemporary work in the linguistic anthropology of education has shown how attention to language in use illuminates educational processes. Rampton (2005), for instance, describes language “crossing” in urban, multiethnic groups of adolescents. Crossing is the use of words or other linguistic features from one or more other languages in the course of an utterance. Rampton studies the use of Panjabi, Caribbean Creole, and Stylized Asian English by white, South Asian and Caribbean youth in the UK. He does not argue simply that minority languages are devalued and used to stigmatize non-mainstream youth, nor that such youth use their home languages to resist such discrimination. Both of these processes, among others, do occur, but Rampton studies how various social effects are achieved in practice. Crossing is a “discursive strategy” in which diverse youth contest and create relations around race, ethnicity and youth culture. The use of terms from a minority language does not have one or two fixed meanings—like stigma or resistance—because particular uses involve contestation, teasing, resistance, irony, and other stances with respect to the larger social issues surrounding minority identities in Britain. Like Erickson and Shultz (1982), Rampton is deeply concerned about how the cultural politics of difference can disadvantage minority youth, and he describes the larger social and political forces regimenting language, identity, and politics in the UK. But, he does not reduce disadvantage to predictable forms of identity politics, in which certain signs of identity routinely signal negative stereotypes. He shows instead how youth use language to navigate among the conflicting forms of solidarity and identity available to them in multiethnic Britain.

He (2003) and Rymes (2001) also attend closely to creativity and indeterminacy in speech events. Like Rampton, they also describe habitual patterns of language use as well. He (2003) shows how Chinese heritage language teachers often use predictable three-part “moralized directives” to control disruptive behavior. Rymes (2001) describes typical “dropping out” and “dropping in” autobiographical stories, through which academically marginal students construct senses of self and reject or embrace formal education. But He and Rymes do not describe speakers as passively invoking these habitual patterns. Such familiar patterns are resources that educators and learners use and sometimes transform as they construct particular stances in context. He shows how the Chinese heritage language teacher’s authority waxes and wanes during a lesson,

as she uses moralized directives in various ways and as students variously react to these uses. Rymes shows how youth in an “alternative” school for “at-risk” students reproduce, contest, ridicule, and otherwise reposition typical dropping out and dropping in stories. Sometimes they even contest the distinction between students who have embraced and rejected school, thereby positioning themselves in unpredictable ways with respect to linguistic, ethnic, and economic stereotypes. This work shows that creative uses of language take shape only against a background of habitual patterns. In order to study the social relations established through education, we must attend to the sometimes-unexpected ways that both marginalized and mainstream speakers use habitual patterns to position and reposition themselves with respect to larger identities.

#### POWER AND IDEOLOGY

Erickson and Shultz (1982), He (2003), Rampton (2005), and Rymes (2001) all attend both to the unpredictable character of local interactions and to the larger social patterns that provide resources for such interactions. Other linguistic anthropologists of education attend less to the creative potential of language in use, focusing instead on the power relations bound up with language and education. Before moving on to the concept of language *ideology*, I will review several studies that show how linguistic anthropologists have attended to questions of *power* at the same time as they acknowledge the importance of creative language use.

Heller (1999) and Blommaert (1999) both describe language planning and education within multilingual nation states. They acknowledge the unexpected meanings that can emerge in particular events, but they do not focus on creativity within discursive interactions. Instead, they provide more detailed accounts of how state and institutional language policies can differentially position diverse populations. Heller studies how French Canadians’ arguments for ethnic and linguistic legitimacy have shifted over the past few decades. Before globalization, French Canadians proclaimed the authenticity of their culture and asserted their rights as a minority group in Canada. In recent years, however, they emphasize the benefit of French as an international language spoken in a multicultural and multilingual Canada. This shift in models of “Frenchness” has changed the value of various French Canadians. Now bilinguals are valued more than monolinguals and Standard French is valued more than vernaculars. Heller explores how this shift plays out in a French language high school in Anglophone Ontario, exploring how the school handles the tensions between standard and vernacular French and between French and English. Blommaert

(1999) describes how the Tanzanian state has used language planning for nation building. He traces the attempt to make a common nation out of a multilingual society by establishing Swahili as the index of a homogeneous Tanzania and as the primary language of education. In the process, language planners sometimes deliberately and sometimes inadvertently create “symbolic hierarchies” between languages and language varieties. Blommaert shows how institutions like schools (and the media, science, etc.) organize language use and language hierarchies, so as to make some types of speakers sound more authoritative.

Other linguistic anthropological work on language and power has addressed literacy. Street (2005) distinguishes between an “autonomous” model of literacy—which casts literacy as a cognitive skill independent of cultural contexts—and models that emphasize the diverse cultural activities in which writing is used. He shows how governments and institutions like school favor the autonomous model and how this model disadvantages “less literate” people and students with non-mainstream literacy practices. The contributors to Street (2005) describe how schools might instead use diverse home literacy practices as educational resources. Collins and Blot (2003) follow Street in exploring literacy practices, but they also describe how local practices are embedded in global processes (like colonialism and neoliberalism) and institutionally anchored power relations. They analyze interdependencies between local uses of literacy and larger sociohistorical movements, describing, for instance, the hegemony of the literate standard and how this has provided cultural capital to some groups and disadvantaged others. They argue against the common assumption that schooled literacy always provides intellectual and economic salvation for less literate peoples, showing instead how this assumption devalues nonstandard literacies and has been used to justify exploitation.

Like Collins and Blot, Eckert (2000) argues for a “practice” theory approach to language and power. Using arguments similar to those offered by Rampton (2005), Silverstein (1992) and others who work on language in use, Eckert denies that tokens of a given linguistic form have determinate social meanings. Furthermore, she argues that apparently stable and homogeneous macrosocial categories are more variable than most theories of “power” assume—“masculinity,” “heterosexuality,” “sluttiness,” and other social categories are constructed in practice instead of being stable and prior to instances of language use. Eckert does not abandon macrosociological variables, but she explores how they are deployed in unexpected ways. Using ethnographic and sociolinguistic methods, she describes the relations among and the divergent phonological patterns of peer groups at a suburban high school. Her study reveals complex relations among students’

social positions and their habitual phonology, with important patterns organized by gender, social class, and orientation toward mainstream institutions like school.

As linguistic anthropologists have moved toward practice-based accounts that attend both to language in use and to power relations, many have used the concept of language *ideology* (Schieffelin, Woolard, and Kroskrity, 1998). Silverstein (1985, 1992) defines an ideology as a “metapragmatic” model of language and social relations that regiments particular uses. Because of indeterminacy about what a sign might mean in context, speakers and hearers must draw on models that link types of linguistic forms with the types of speakers who stereotypically use them. When one such model becomes salient, from among the many that might be relevant to explaining the meaning of a given utterance, it “regiments” the values of indexical signs in the utterance and the context. When I called lawyers “ambulance-chasers,” for instance—and you were unsure whether I was upset about a recent legal experience, crusading to overhaul the legal-lobbyist system, or insulting you and your spouse—you needed to know more about the relevant context to know what my utterance meant. Each of these models (aggrieved victim of legal misconduct seeking sympathy, political crusader seeking a convert, aggressive interlocutor) might frame the event we were engaged in, and in doing so stabilize the indexical value of “ambulance-chaser” (and neighboring signs) in a certain way. As Silverstein (1992) argues, any account of the social meanings of language use must describe such models and explain how they become salient in practice.

Many linguistic anthropologists have noted that such models or language ideologies often systematically associate types of speech with socially located types of speakers, across a range of events. This has become an important concept, allowing linguistic anthropologists to explore relations between the emergent meaning of signs in use, socially circulating ideologies and broader social structures. Language ideology has also been important for the linguistic anthropology of education, because schools are important sites for learning (and legitimating) associations between types of speakers (“educated,” “authoritative,” “at-risk,” etc.) and types of (“refined,” “educated,” “intelligent,” etc.) language use.

Jaffe (1999) uses the concept of language ideology to trace the policies and practices involved in the recent revitalization of Corsican. She describes the essentialist ideology that values French as the language of logic and civilization, the countervailing ideology that values Corsican as the language of nationalism and pride, as well as a less essentialist ideology that embraces multiple languages and multiple identities. Her analyses show how schools are a central site for the struggle among these ideologies—with some trying to maintain the centrality of French in the curriculum, some favoring Corsican language revitalization and

the displacement of French, and others wanting some Corsican in the schools but resisting a new “standard” Corsican as the official language of schooling. Jaffe explores both predictable sociohistorical patterns, like the struggle of a colonized people to value their own language in diglossic situations, and contradictions—like celebrations of “authentic” Corsican by “natives” who cannot speak the language well.

Bucholtz (2001) and Kiesling (2001) use the concept of language ideology to explore peer relations and ethnic stereotypes among white Americans. In her work with high school students, Bucholtz shows how many white adolescents adopt “deracialized” aspects of Black English Vernacular and thereby mark themselves as “cool.” She describes how “nerds” reject coolness and mark this rejection by refusing to adopt any features of BEV. Nerds even go so far as to use what Bucholtz calls “superstandard” English, which includes careful attention to articulation, grammar, and lexis (saying “have to” instead of “hafta,” for instance). The relevant ideologies here associate types of language use—superstandard, borrowing a few features of BEV, speaking mostly BEV—with types of people—nerds who reject coolness, white students trying to be cool, and white students who go too far toward a racialized other. Kiesling studies the speech of middle class, white fraternity brothers, exploring how racially linked features of their speech both serve local interactional functions and reproduce larger social hierarchies. He describes fraternity brothers asserting their intellectual or economic superiority over each other by marking interlocutors as metaphorically “black.” On the other hand, he shows how they assert physical prowess over each other by themselves speaking like black men, thus inhabiting a stereotype of physical masculinity. The fraternity brothers use and reinforce ideologies of BEV speakers as less rational, economically distressed, and physically imposing, as they jockey among themselves for position in everyday interactions.

Stocker (2003), Bokhorst-Heng (1999), and Berkley (2001) apply the concept of language ideology to educational situations outside Europe and North America. Stocker describes a monolingual Spanish-speaking group in Costa Rica that is believed to speak a stigmatized dialect—despite the fact that their language is not linguistically distinguishable from their neighbors’—because they live on an artificially bounded “reservation” and are perceived as “indigenous.” She shows how high school language instruction reinforces this ideology. Bokhorst-Heng describes how Singapore used schools to make Mandarin the “mother tongue” of ethnically Chinese Singaporeans. In 1957, less than 0.1% of ethnically Chinese Singaporeans spoke Mandarin as their home dialect, but in the 1970s the government selected Malay, Tamil, and Mandarin as the “mother tongues” of all Singaporeans.

The government created an image of Singapore, as a multicultural state composed of three homogeneous subgroups, and tied this image to the three standard “home” languages that students were to learn in school. Berkely describes Mayan speakers going to school to learn how to write “authentic” local stories in their language. He shows how this brought two ideologies into conflict—a literate ideology that valued the authority of the (young, female) teacher and treated literacy as an “autonomous” skill, and a local ideology that presented older men as empowered to tell stories on behalf of others. Berkely shows how the teacher and the elders creatively navigated this conflict, with older men telling stories that younger people learned to write down.

#### DOMAIN

Work on language ideology shows how language in use both shapes and is shaped by larger power relations. We must follow some of these authors and be careful, however, not to cast this as a simple two-part model—sometimes called the “micro–macro dialectic”—in which events create structures and structures are created in events (cf. Wortham, 2006). In fact, there are many scales of social organization relevant to understanding language in use. In their study of “untracking” as an educational reform, Mehan, Villanueva, Hubbard, and Lintz (1996), for instance, move beyond a simple combination of local events and larger social patterns. They explore various realms that influence “at-risk” students’ school success—ranging from the student him or herself, to parents, family, the classroom, the school, peer groups, the community, as well as national educational policy and broader socioeconomic constraints. Instead of describing “micro” and “macro,” Mehan and his colleagues describe how resources from many different spatial and temporal scales facilitate or impede students’ academic success. They give a more complex account of how “intelligence,” “educational success,” and other properties are constructed in practice, describing how resources from various layers of social context come together to facilitate a given student’s path.

One important type of resource for the linguistic construction of social relations, are “metapragmatic” or “metasemiotic” models that associate linguistic features with a socially located type of speaker (Agha, 2006; Silverstein, 1992). Agha (2006) and Agha and Wortham, (2005) argue that all such models have a *domain*. Models that link linguistic features with types of social identity are used and recognized by only a subset of any linguistic community, and this subset changes as the model moves across space and time. There is no one “macro” set of models or ideologies, universal to a group. Instead, there are models that circulate densely in communities ranging from pairs, to local

groups, to groups at various spatial and temporal scales all the way up to global language communities. In analyzing language and social relations, then, we need to do more than relate micro to macro. We must instead describe various relevant resources—like models drawn from different spatial and temporal scales—that facilitate a phenomenon of interest, and we must describe the “intertextual” links across events through which models move (Agha and Wortham, 2005; Wortham, 2006).

Wortham (2006) applies this approach to the emergence of social identities in one ninth grade classroom in an urban American school. He traces the development of local models that specify different types of “student” one might be in this classroom, showing the distinctive gendered models that emerge across several months. These local models both draw on and transform more widely circulating models, and they are used in sometimes-unexpected ways in particular classroom events. The analysis follows two students across the academic year, showing how their identities emerge as speakers transform widely circulating models of race and gender into local models of appropriate and inappropriate studenthood, and as they contest these identities in particular interactions. Rogers (2003) also follows an individual student’s trajectory across two years, as the student and her family negotiate with authorities about whether she is “disabled.” Rogers shows how both institutionalized and local models and practices facilitate the transformation of this student from “low achieving” to “disabled,” and she follows the intertextual links among official texts, conferences, tests, family conversations, and other events that helped constitute this student’s trajectory.

Linguistic anthropologists of education study language form, in use, as organized by ideologies, as those ideologies move across social space and come to identify individuals. Educational research done from this perspective shows the utility of these concepts for illuminating important aspects of educational processes and institutions.

### **Educational Discourses, Situated Practices and Identities**

## LANGUAGE SOCIALIZATION, PARTICIPATION AND IDENTITY: ETHNOGRAPHIC APPROACHES

### INTRODUCTION

Ethnographic research examining educational discourse has for several decades focused on how students are inducted or socialized into new subject matter at schools and other learning sites and how language and literacy practices mediate their learning and are themselves a goal and outcome of learning. There has thus been considerable emphasis on how students learn to engage in the sanctioned oral and written discourse practices of different disciplines and social groups, how they negotiate the routine questions, responses, and feedback behaviors of their teachers and peers, as well as other forms of accepted (or sometimes subversive) interaction, and how, in the process, they become more sociolinguistically competent participants in, or members of, these local cultures or learning communities.

With minority students or students experiencing linguistic/literate schooling practices different from those found in their homes and communities, research has also examined the nature of those differences, how they affect performance at school, and also how they might best be bridged to enhance students' academic achievement. Participants' identities, desires, and goals, on the one hand, and their appropriation and demonstration of new knowledge and practices, on the other hand, are closely interconnected. Therefore, research has sought to uncover learners' subjectivities, agency, and intentionality to a greater extent rather than simply describe and interpret their observable behaviors and cultures.

This chapter provides an overview of ethnographic research examining language socialization (LS), participation, and identity, particularly in the North American (i.e., US and Canadian) LS tradition, by considering the methods for conducting the research, the extension of early work to include older learners, and new activities and contexts, and some of the key findings.

### EARLY DEVELOPMENTS

Some of the earliest ethnographic studies of language socialization were conducted in the 1970s and early 1980s by American researchers,

such as Heath (1983), Philips (1983), and contributors to an important volume by Schieffelin and Ochs (1986) documenting first language socialization in the USA and elsewhere (e.g., Pacific island communities, Japan). The researchers emphasized that language learning is highly social and cultural and that culture itself is instantiated and reproduced in linguistic interactions. The general focus was predictable, formulaic *interactional routines* (Peters and Boggs, 1986) between caregivers and children or between peers or siblings within and across cultures; for example, affectively charged speech acts such as teasing, shaming, threatening, or insulting, or the less charged acts of narrating a story, and prompting or telling youngsters how to speak or to imitate and repeat others. On the basis of these sociolinguistic interactions, children or newcomers to a group learn, explicitly or implicitly, how that culture and language encode thoughts and feelings, and how they are expected to speak (or read, write) in various settings. The end result, it is assumed, is communicatively competent members who have appropriated the culture's core values, beliefs, and dispositions (e.g., social control, self-assertion, egalitarianism or hierarchical status, reciprocity, empathy, verbal play, expression of anger) plus other kinds of knowledge (e.g., oratory, narrative structure).

The research methods used in these early studies, guided largely by linguistic anthropology and thus ethnography, typically involved extensive longitudinal fieldwork, including participant observation, the recording and analysis of speech by focal participants (families, caregivers, children) over time, the selection of key activities or routines for analysis (e.g., teasing, bedtime story-telling), interviews with family members, and then an analysis of target linguistic forms, such as morphemes, sentence-final particles, words, phrases, adjacency pairs, pitch and intonation contours, or politeness markers (see Duff, 2002; Ochs and Schieffelin, *Language Socialization: An Historical Overview*, Volume 8). The size of the entire corpus of similar episodes was often described and then features of these episodes or routines were explained and exemplified from transcribed data excerpts, with core features outlined. Variations as well as regularities in practice or form were noted. Changes over time were described, especially in young children's development, and often captured quantitatively as well.

Most of the studies in Schieffelin and Ochs (1986) did not examine institutional or educational discourse per se, but rather examined the informal socialization and instruction of infants, toddlers, and preschool-aged children in and around their homes. Yet, preschool question-answer sequences, prompting, correction, and repetition—plus a variety of literacy activities that may be introduced in the home—figure prominently in schooling as well. Thus, children's earlier

socialization becomes the foundation for later experiences with educational discourse, both successful and unsuccessful. For example, students must learn to speak at appropriate times using the register and routines called for, by taking part in Initiation-Response-Evaluation sequences (Mehan, 1979). They must also learn to be silent and to work independently at certain times. As Peters and Boggs (1986) wrote: "interactional routines facilitate the child's perception, analysis, and practice of utterances" (p. 80), which are central to social/cultural and linguistic learning across a variety of settings and speech events, particularly in early schooling. Language input and behavioral coaching of children by caregivers or by older siblings and peers are followed by teachers' coaching or scaffolding in classrooms.

The early focus on socialization into and through the interactional routines of a community or culture also acknowledged the key *participation structures* (Peters and Boggs, 1986; Philips, 1983) or sociolinguistic roles that interlocutors should assume. Philips' research in schools with Native American (Indian) children in Oregon, USA especially highlighted differences in home and school socialization for that population. Silence or reticence to speak (especially for all the class to hear) had a very different status and meaning to the mainstream Oregon population (and teachers) compared with the Warm Springs Indian students, but such differences were not always well understood or appreciated by the entirely non-Indian staff. As Heath (1982) points out in her seminal article "What No Bedtime Story Means," educators cannot assume that children raised in less "school-oriented," non-mainstream homes or communities come to school well prepared to engage in ("take from" and "talk about" or exhibit) the linguistic, literary, and interactional behaviors or routines of the dominant society. They need to be socialized into these behaviors or risk academic underachievement in mainstream institutions. However, institutions must also find ways to accommodate diverse learners to a greater extent, by building on students' prior socialization practices as well, for example, through the use of oral story-telling (e.g., the use of "talk story" and small-group work, in Hawaii; Gallimore, Boggs, and Jordan, 1974). Yet such well-intentioned adjustments must not, in turn, deprive them of opportunities to gain access to the mainstream discourse practices they require for higher education or professional careers.

#### MAJOR CONTRIBUTIONS

The methods, operationalization of language socialization, and findings reported in the above-cited studies remain influential in current research on educational discourse and have inspired many other significant

studies in the intervening decades (see reviews by Duff, 2002, 2003; Garrett and Baquedano-Lopez, 2002; Kulick and Schieffelin, 2004; Watson-Gegeo, 2004; Zuengler and Cole, 2005). Much more LS research has now also been contextualized in formal educational settings than in the past, as well as in other settings, such as workplaces and community programs. Here I focus on some of the major contributions of this more recent work and how it has enriched and expanded LS theory and the range of research populations, activities, and sites that the theorizing has sought to account for.

### *Language Socialization Theory*

Recent reviews and ethnographic studies have contributed to the original theorizing of LS, with insights from contemporary understandings of human agency, subjectivity/identity, intentionality, and change processes. Some of the new perspectives derive from sociology and post-structuralism but are also grounded in careful empirical research (Watson-Gegeo, 2004). They underscore the dynamic, bi- or multidirectional, political, and highly contingent nature of LS, especially in multilingual settings. Furthermore, they demonstrate the mutually constitutive nature of specific linguistic interactions and local contexts as well as more macro-contextual forces, such as globalization, (post-)colonialism, and institutional power (Duff, 2003; Kulick and Schieffelin, 2004).

Instead of viewing LS processes and outcomes as purely reproductive, behavioristic, and predictable, by assuming that learners are passive, willing subjects who will necessarily appropriate and reproduce the various (socio)linguistic forms, practices, and values of their teachers or other co-participants, scholars increasingly acknowledge other possibilities: resistance, the transgression of norms, incomplete reproduction or attainment of demonstrated norms, or the development of hybridized (syncretic) or multiple codes/practices, subject positions, and cultures. My own work has illustrated how in school or workplace settings (e.g., Duff, 2002; Duff, Wong and Early, 2002), especially in those undergoing social and cultural change, the processes and outcomes of LS can be rather unpredictable. Children, adolescents, and adults, have histories, desires, fears, identities, and (some) choices with respect to the discourses they negotiate, the affective stances they perform, and the power structures they encounter, appropriate, or defy. One of the choices, for example, may be to orient themselves to other less sanctioned sociolinguistic models and codes (e.g., vernacular counter-discourses), rather than those that are most licensed or prized within mainstream society and institutions like schools (e.g.,

Rampton, 1995). Another choice is to adapt very selectively to new cultural norms and thereby also influence emerging new norms to some extent.

### *Expanding Research Populations and Sites*

An increasing number of LS studies investigate discourse and education with previously unexamined populations, age groups, activities, and socio-educational contexts. Research with school-aged school students analyzes not only home and school discontinuities but also the mechanisms and processes of ongoing, advanced language/literacy socialization across the curriculum. The intersection of work on LS and academic literacies or academic discourse(s) (often referred to as *discourse socialization*) is also more pronounced than before. Research on international graduate students being socialized to give in-class oral presentations using various texts and media and to engage in seminar discussions reveals the challenges and learning experienced by many learners and not just newly arrived nonnative speakers of the language of instruction (e.g., Morita, 2000, 2004). Among other things, students need to learn how to display an appropriate epistemic stance discursively, one that projects them as credible and compelling knowers of the subject, without being overly authoritarian. The discursive positioning of self and other (e.g., as knower, insider, outsider, legitimate, or ethnic minority) and its consequences has itself become a focus of LS research (Duff, 2002; Toohey, 2000).

Postsecondary language or discourse socialization research is also examining how new technologies and practices (e.g., electronic bulletin board postings) mediate learning, in contrast with traditional face-to-face instruction, and how learners' identities are constructed through these interactions. Students, peers, and instructors are now socializing one another into emerging and evolving new forms of participation and discourse (e.g., pragmatics, register, citation; e.g., Yim, 2005). Research with older learners, such as immigrant women seeking education and employment in clerical or long-term resident-care fields, illustrates issues in lifelong, multilingual, multimodal learning (e.g., Duff and Labrie, 2000).

Second-wave LS research on discourse socialization in non-Western educational settings and in diasporic communities has also contributed greatly to our understanding of multilingual or heteroglossic socialization and language shift, particularly in small-scale societies and post-colonial contexts in which children encounter colonial languages and discourse traditions at school (e.g., see also Garrett and Baquedano-Lopez, 2002; Moore, 1999).

## WORK IN PROGRESS

*Identity, Participation, and Communities of Practice*

*Identity* (e.g., social roles, membership status, and stances connected with those), *participation*, and *practice* or *activity* have always been important constructs in LS research. However, they have been taken up somewhat differently in recent related poststructural and critical work incorporating the notions of *communities of practice* (Lave and Wenger, 1991; Wenger, 1998), *habitus*, and *practice theory* (Bourdieu, 1977). This trend is seen in ethnographic research by Miller (2003) and Toohey (2000), and in Norton's (2000) multiple-case study of immigrant women's socialization in Canada. All examined immigrant children's and adults' identities, participation (or nonparticipation), and practices as they sought integration into educational discourse(s), and wider communities, although none of them framed their studies as LS. Examining the ability to *participate* fully, as legitimate members, in new communities, including e-mediated or transnational communities, and in new practices such as virtual Bulletin-Board discussions and chat rooms, and to take up or inhabit new subject positions within those communities contrasts markedly with the earlier emphasis on the less contextualized *acquisition* of linguistic skills and knowledge. However, *overt* participation cannot be the only measure of language and culture learning because competent people may opt *not* to participate like their peers or mentors—or may be unable to—for a variety of reasons (Duff, 2002; Morita, 2004). They may be denied access to the key practices and to their ostensibly more capable co-participants, may not value them, or may prefer to participate mentally and emotionally but not in observable linguistic ways in deference to co-participants; they may be afraid of being singled out or mocked, or may be ambivalent. They may opt for other modes of participation more in keeping with their prior socialization and identities as well. They may also participate very differently in one classroom context than in another or at different points in time (Morita, 2004).

Furthermore, people might be considered competent, “legitimate” participants at one point in time but not later, because of migration, displacement, membership in other communities, subsequent language/literacy learning, interrupted learning, and so on. Thus, identity and participation, like cultural knowledge and practices, are co-constructed by participants within particular sociohistorical contexts. Yet, many of these twenty-first century sociolinguistic and educational contexts—whether in Europe, Africa, Asia, or the Americas—are changing dramatically and should be examined more closely. Observation alone may not reveal participants' reasons for their behaviors or

transformations, which is why triangulated emic and etic perspectives become crucial.

*Ethnography and LS: Methodological Considerations*

Suitable research methods for LS is a topic of current discussion and contention. Although some researchers argue that all LS research must be ethnographic, with extended observations and the triangulated analysis of the acquisition of particular linguistic and cultural forms/practices over time and contexts (e.g., Kulick and Schieffelin, 2004), not all published “LS” studies—and not even some in Schieffelin and Ochs’ (1986) own volume—are truly ethnographic. Some studies that claim to investigate LS processes do not necessarily document observed (socio) linguistic behaviors or developments by producing language excerpts, detailed discourse analyses, or systematic developmental accounts nor do they use systematic ethnographic methods (e.g., Bayley and Schecter, 2003). Conversely, not all ethnographic studies that examine the ways in which learners are apprenticed into new cultural, linguistic, or literary practices (e.g., interactional routines) describe themselves centrally as studies of “LS,” even though they may provide important insights on LS processes (e.g., Harklau, 1994; Santa Barbara Discourse Group, 1993; Toohey, 2000). Different levels of analysis and context may be foregrounded or backgrounded in publications, and different articles written by the same researcher may be more synthetic versus more microanalytic. Furthermore, the perspectives and methods may be framed to different degrees by the source disciplines of sociology, education, (cultural) psychology, linguistics, or anthropology.

Methodological and theoretical pluralism should be welcomed in “LS research” because it allows us to view common phenomena from distinct but complementary perspectives, and not just according to the conventions or prescriptions of first-generation American linguistic anthropology. However, LS risks becoming a very vague and diffuse construct and subfield if the term can apply to any research or any type of analysis in which language is used between more capable members of a cultural group and less capable ones, with any social interaction, or with any unit of analysis, theoretical foundation or method. Yet, the basic principle that a longitudinal, contextualized, sociocultural “perspective” should be present, even if the research design itself is not longitudinal, has merit. The investigation of how newcomers become culturally and discursively competent in a social group certainly implies a longer range view or trajectory. A cross-sectional research design or one more limited in duration, although it may illuminate the intricacies of the socio/linguistic practices

themselves, does not capture change over time, end-state (or later stage) knowledge/participation, or nonlinear developmental patterns and contextual changes.

## PROBLEMS AND DIFFICULTIES

### *Focus in LS*

LS research on language/literacy practices for newcomers to learning communities has gained steady momentum over the past three decades and has entered new theoretical, methodological, and pedagogical realms. The earlier emphasis on rituals and particular kinds of affectively charged speech acts (teasing and shaming in particular) and interactions related to “calling out” or repeating others’ utterances has widened to include broader forms of language and literacy practices, cross-generational language shift, even more diverse populations and contexts (e.g., in religious schooling settings), with more of a “life-span” perspective (Garrett and Baquedano-Lopez, 2002; Kulick and Schieffelin, 2004). In addition, many first-wave LS researchers were not “indigenous” members of the communities, though they may have spent considerable periods of time in the field. Now significant numbers of researchers are turning their attention to everyday sites of language/literacy socialization within their own local communities—in schools, colleges, and workplaces (e.g., Bayley and Schecter, 2003; Duff, 2003).

Yet there are issues to be addressed in LS work on language, participation, and identity, and in ethnographic research in particular. With respect to LS itself as a theoretical construct, earlier American conceptualizations, with some exceptions (e.g., Heath, 1983), mainly aimed to account for children’s oral pragmatic or grammatical development resulting from their participation in everyday speech events. The observations that not all parents interact with their children linguistically and around literacy artifacts and practices in the way that many White middle-class American parents were reported to do was theoretically significant (Kulick and Schieffelin, 2004; Schieffelin and Ochs, 1986). However, as LS’s domain has spread to include more types of language/literacy events, discursive forms, and sociocultural knowledge that newcomers gain through LS (e.g., content knowledge), the kind of speech act or event analyzed or scale/scope of studies (i.e., the unit of analysis) has changed too. The *socialization to use language and socialization through language* to gain other kinds of cultural knowledge that defined Schieffelin and Ochs’ (1986) seminal work now can, in principle, include any topic in which language and social interaction are present: the linguistic or discursive socialization of

identities, affect, mathematics ability, intertextuality, respect, narrativity, disability, political ideologies, gestures, taste, and so on. This is at once an exciting, potentially interdisciplinary aspect of LS, offering a world of possibilities to explore, and an issue because the object of study risks becoming too vast and amorphous.

### *“Expert-Novice” Discourse*

Also sometimes problematic is the dichotomous discourse of “expert” and “novice” commonly found in LS and related work. Unfortunately, some of the apprenticeship literature and language leads people to assume that the mature “native” members of the culture are invariably experts in all aspects of their work who, in turn, inevitably socialize their students or advisees into such expert knowledge. Even acknowledging that LS is bidirectional (Jacoby and Gonzales, 1991), not all so-called experts are consistently good socializing agents, and newcomers have their own valuable prior experiences. There is a common misconception that “native speakers” of a language can write or produce oral academic discourse (i.e., serve as models as well as socializers) better than nonnative speakers purely on the basis of their linguistic roots and prior experience. But native speakers vary considerably in their discursive/communicative competence and thus in their ability to write well, to present well, to teach well, or to relate to others in socially acceptable ways (Li, 2000). Thus, there are limitations in the dichotomies and metaphors commonly used.

### *Critical Perspectives*

Much LS work has been surprisingly uncritical of the cultural and linguistic practices studied within (often) very hierarchical societies or groups in which novices have little power. Verbal and physical threatening, teasing, shaming, public humiliation, and the like, were simply considered normal and generally benign in the cultures. They were ways of teaching children to fend for themselves, to toughen up, to be socially accountable, and so on. A more critical theoretical perspective might question the assumptions of benevolence or benign neglect in some cases and the relativist assumption that as long as members of the culture continue to tolerate or enact such practices, they have sociocultural legitimacy, and that outsiders, in particular, should not cast aspersions on them. Or that because certain traditions have a long history, they are in the best interests of newcomers’ enculturation and well-being. While it is important to see the richness, complexity, and value in certain interactional socializing routines, we should consider

their negative consequences as well for subsequent learning, for their participation in a just society, and for their identities.

### *Research Ethics*

Another ongoing challenge, especially for research on discourse socialization within institutions, is formal research ethics procedures. Gaining access and informed consent to study important LS-related interactions in context is becoming much more complicated and protracted—even to visually observe, let alone to audio-record or videotape them. Potentially vulnerable populations, such as new immigrants with limited second-language proficiency, undocumented workers, elderly people, or populations uneasy with or unused to the legalistic written language and conventions of university research ethics boards may elect to withhold their consent for a variety of reasons. Asking to observe and interview people and follow them ethnographically over long periods of time, with recording devices at home, school, work, community meetings, and so on, and sign formal documents to that effect, only increases the sense of suspicion, imposition, or intrusion. Participants' concerns may be completely justified, of course. But the denial of permission from even one potential participant (or guardian) for observation purposes may eliminate the research site or activity setting (e.g., classroom), compromising the analysis of oral discourse and interaction or making it undoable (e.g., Duff, 2002). Some participants may simply be too busy for the kind of in-depth, sustained research that LS has come to represent, particularly in frenzied urban environments. And if permissions *are* obtained, it may be difficult to obtain crucial “emic” insights from participants themselves about their understandings, experiences, and identities for a variety of linguistic, cultural, cognitive, personal, and practical reasons. Lastly, as on-site university workplace demands and expectations increase, particularly in the field of education, carrying out extensive offsite ethnographic fieldwork becomes particularly difficult logistically.

### FUTURE DIRECTIONS

Despite the foregoing challenges, LS research holds much promise for the future. Socio/linguistic norms, language/literacy practices, participants, and political conditions, like the identities and roles of speakers, normally change over time. Therefore, new sites for LS should include societies or communities or workplaces experiencing rapid changes in the norms of language use, especially with new, globalizing multilingual and multimodal discourses. How, for example, is English

language education in non-English-dominant societies socializing language learners into new kinds of cultural understanding, knowledge, and practice (for better or worse)? How is the current spread of Chinese language education around the world socializing and positioning learners of that language, whether in Pakistan, Australia, or Turkey? How is the quickly changing demographic composition of many major European and African cities receiving new waves of immigrants and asylum seekers affecting language and literacy socialization in public and private educational spheres there? How and when do language learners resist the very practices they are being apprenticed into or instructed to emulate, as in Siegal's (1994, 1996) study of English-speaking women learning Japanese in Japan who chose not to align themselves with certain gendered and honorific sociolinguistic norms and practices? What compromises are made and what are the consequences of the acts of resistance (or ambivalence) and compliance, in terms of these speakers' identities and participation and their acceptance (rejection) in Japanese society? How do these new practices in turn influence their own first-language discourse?

Much of our LS research to date has examined relatively introductory language forms, though the interactional routines might be quite elaborate, and we need to explore the advanced end of the language learning/performativity spectrum more. How does discourse socialization proceed in highly sophisticated professional or academic settings, such as physicists' laboratory discussions and conference presentation rehearsals (Jacoby and Gonzales, 1991)?

In addition, follow-up research with communities and participants studied years before would shed more light on the evolution and ecology of language practices over time and space, and across generations, social groups, and sociopolitical contexts (e.g., Heath, 1991; Kulick and Schieffelin, 2004). Such research would also reveal the degree to which earlier LS practices have been effective for participants' integration into and achievement in desired communities of practice (e.g., academic, vocational, social)—and how, and why, the norms in those new communities have also changed. Duff, Wong and Early (2002), for example, documented how the new urban Canadian workplace has changed in some sectors (e.g., inner-city hospitals vs. suburban nursing homes). Immigrant workers being trained in English and healthcare to take care of elderly long-term residents and their interlocutors must be socialized into new ways of communicating verbally and nonverbally because the elderly clients often don't speak English or another shared language or have various degenerative conditions affecting communication (e.g., blindness, deafness, dementia, aphasia).

Additional research could, moreover, extend LS theory/research to other communities, such as populations with mental health disorders,

socially marginalized cultural groups into which newcomers seek refuge or membership, older learners in the new age of “lifelong education,” and highly skilled professionals negotiating complex speech events and tasks through an array of international and virtual networks in postindustrial society. Alternatively, research might explore, to a greater extent, LS in informal education settings.

Investigations such as these will shed more light on the discourse(s) learned, adapted, and used in a variety of contemporary activities—within their larger sociopolitical, economic, and cultural contexts—and the relationship between socialization into these new discourses and the transformation of participants’ identities, practices, and possibilities.

## CLASSROOM DISCOURSE AND THE CONSTRUCTION OF LEARNER AND TEACHER IDENTITIES

### INTRODUCTION

Classroom discourse refers to contextualized or situated language use in classrooms, as specific interactional contexts, that reflects cultural and social practices. Interest in classroom discourse analysis grows with an enhanced understanding of the mediating role of talk in learning as a high-level mental activity (see review by Green and Dixon, *Classroom Interaction, Situated Learning*, Volume 3). From a socio-cultural point of view, a person's speech is a marker of identity. The interweaving relationship between identity and contextualized use of language in the classroom has been brought to our attention by post-structuralist and social constructivist researchers, who view classrooms as a social and cultural space where power politics and ideological conflicts are in constant interplay (e.g. Kumaravadivelu, 1999). An understanding of how such politics and conflicts come into being requires an understanding of teachers' and students' identities as a dynamic, (re) negotiable, and powerful factor in the process of interaction, which, in turn, affects ways of teaching and learning. In this review, I shall identify major developments and themes in classroom discourse analysis pertaining to teachers' and students' identity construction, and show how these contribute to our understanding of teaching and learning.

### EARLY DEVELOPMENTS

In its most basic form, identity refers to our sense of self, or who we are. Since birth, every person is subject to a set of 'ascribed' identities usually associated with biological referents. For example, on our identity cards and passports, there is information about our nationality and/or ethnic origin, age generation and gender. All these forms of identities are given to us, and enable us, as we move along different social planes, to perceive how we are the same, or different, from 'others'. In the field of applied linguistics, different disciplines proffer different ways of talking about identity, often without agreement about their distinctive features. Some terms which are commonly used to express different aspects of the concept of identity include 'self', 'role', 'positioning', 'subject position', 'subjectivity'. Basically, 'self' is associated

with an individual's feeling, whereas 'role' highlights the more static, formal and ritualistic aspect of identity. Subject positions/subjectivity, on the other hand, imply agency, conscious action and authorship (see related review on Freeman Field, Identity, Community and Power in Bilingual Education, Volume 5). In the following paragraphs, I will discuss how the concept of teachers' and students' identity was presented in some of the early developments of classroom discourse analysis.

Despite its weaknesses, Flanders' (1970) interaction coding scheme offers the first, most widely known, systematic method of analyzing classroom speech data. His scheme employs a finite set of pre-selected and pre-determined categories to identify and code the on-going speech acts of the teachers, and attempts to establish a link between teacher behaviour (e.g. praising, questioning, responding) and student academic achievement outcomes. In Flanders' coding scheme, terms such as 'teacher' and 'pupil' appear in the coding categories as fundamental, given, referential labels denoting literally the two types of participants inside the classroom.

Another line of research, in the spirit of Flanders' coding taxonomies in the mainstream second language acquisition research, focuses on features of discourse management (e.g. comprehension checks, self-repetition) and discourse repairs (e.g. requests for clarification, requests for confirmation) that result in input and interaction modifications when miscommunication arises. These studies originated from social interaction discourse that draws an analogy between 'foreigner talk' and 'teacher talk' (see Ellis, 1994). Findings from these studies seemed to suggest a connection between teachers' discourse features and how they perceive their relations with the interlocutors (e.g. native versus non-native speakers; experts versus novices). *Who* we are seems to be determining or affecting *how* we talk. However, the psycholinguistic perspectives of these studies tend to characteristic identities such as foreigners, native speakers, learners, as more or less universal labels rather than socially and contextually situated and constructed self-representations.

A coding-scheme analysis of classroom discourse has been criticized by various classroom researchers as inconsistent, limiting, unreliable and failing to account for how classroom interactions take place in a specific context, and *why* certain verbal acts dominate. As a consequence, a more *qualitative* discourse analysis approach to classroom interaction studies has been developed. In this perspective, emphasis is placed on the *sequential structures* of teachers' and students' turns of talk, the contextual features of the interactions, and ethnography as a method of data collection. A representative outcome of this approach is the three-part I(nitiation)—R(esponse)—E(valuation) or F(eedback) sequential discourse format with a dyadic participant structure identified by Mehan (1979) through his ethnomethodological work in a mainstream, mixed-ethnic third-grade classroom in America. A similar

classroom interaction pattern was proposed by Sinclair and Coulthard in 1975. Their system of analysis was developed on the basis of linguistic descriptions of teacher–pupil interactions and the functions of the linguistic structures identified.

The basic IRE/IRF classroom interaction sequence identified by Sinclair and Coulthard and by Mehan has been widely used for other classroom analyses, and found to contribute more to the *interpretation of meanings* in the interactions than the frequency count approach. It enables readers to see what has actually happened, how it happened and possibly, why it happened that way. Researchers can also tease out the norms of interaction from the turn-taking and organizational patterns. Even though identity did not feature as a key concern for these researchers, there were clear indications of the importance of acknowledging the role implications of the labels ‘teachers’ and ‘students’, and the corresponding institutional rights and obligations associated with these. Sinclair and Coulthard (1975), for example, highlight the need to address questions such as ‘who controls the discourse?’, ‘how do other participants take control?’, ‘how do the roles of speaker and listener pass from one participant to another?’.

Mehan (1979) alerts us to the importance of developing students’ interactional competence through socialization so that they may participate effectively in interaction in a manner that is acceptable to others, thus implying the developmental nature of identities. Heap’s (1992) article best illustrates this point. By looking at the sequential arrangement of the turn taking in a series of classroom episodes, Heap was able to explain how and why a student’s attempt to act in a turn was rebuffed by the teacher. The student was considered a *rule violator* (an identity constructed through the interaction) because s/he mistook the teacher’s informative in the preceding turn as a directive and acted accordingly. Heap (1992) draws the conclusion that in revealing how and speculating why something is done, the speakers’ roles/identities within the context often have a role to play. For example, the teacher has the right to ignore students, or even snub them by not allocating a turn to talk. This is part of the teacher’s institutional identity. From Heap’s micro-analysis, we see an emerging concern and awareness of the impacts of institutionalized power relations on the enactment of roles and obligations attached to social classifications, such as teachers and students.

#### MAJOR CONTRIBUTIONS

Subsequent developments in classroom discourse analysis tend to take identity as a more dynamic and less deterministic and predictable factor, as a result of a correspondingly more dynamic and constructivist view of identity.

*Changing Perspectives on the Notion of Identity*

The practice of viewing identity as bearing a set of ascribed attributes with biological referents has been called into question by many post-modernist researchers. There has been a fundamental shift away from a unified, stable, pre-linguistic and essentialist notion of identity towards identity being conceptualized as socially constructed, undergoing a process of continual emerging and becoming. Identity concerns not just 'who we are', but 'what we might become'. The case is felt to be particularly strong with changing discourse patterns due to the acquisition of a new form of literacy, or to the learning of a new language, or when a different language is used as the medium of learning (Gee, 1996). New forms of personal and cultural identities are constructed and performed, as the person tries to come to terms with new sets of ideologies and worldviews and establish social membership in a new community (Norton, 2000). Thus, a person's identity can be achieved, transformed, subverted and negotiated across time and space. Bernstein (2000) proposed an elaborate model that shows the multi-perspectives and multi-layeredness of a person's identities. A person may construct their identities by drawing on resources from past grand cultural narratives retrospectively or prospectively by responding to cultural, economic and technological change.

A person's identity is also discursively constructed. That people create their linguistic systems so as to resemble those of the groups with which they wish to identify from time to time is a seminal theory of speech and identity developed by Le Page (1986). Le Page found that children from Belize developed various forms of Creole English after independence from British rule as a way of displaying a sense of Belizean identity. The work of Le Page (1986) has effectively drawn people's attention to the fact that language achieves more than communicative functions. It is a major vehicle through which we make acts of identity that bear social meanings. Through linguistic adjustments or appropriation, members of the community may become more like one another in their linguistic behaviour.

Le Page's view of discourse as acts of identity is further advanced by other critical social theorists. For example, Butler (1990) argues that gender-related social categories, such as females, are indeed socially constructed and performed through repeated participation in social interactions. We perform who we are by (amongst other things) using varieties of language. Although these studies were not specifically situated in classroom contexts, discourse features pertaining to the construction and performing of identities, such as adolescents and males and females, are highly relevant to classrooms as a form of social context.

Though not always explicit, a growing number of studies on classroom discourse in the last two decades have taken into account the dynamic and interpenetrating relationship between discourse and identity construction. Such relationship is usually revealed through an analysis of the *code-switching* and *code-mixing* practices, and *participation structures* (e.g. turn-taking and turn-allocating practices) within a basic IRF/IRE framework.

### *Code-Switching and Code-Mixing*

In classrooms with speakers from diverse ethnic and linguistic backgrounds, early work suggested that teachers' and students' switching between, and/or mixing of, codes in their interactions produce social and political meanings, apart from addressing linguistic concerns. One line of thinking posits that code switching may be a participant-oriented practice (Auer, 1984). For example, in a second language classroom, the teacher may switch to the students' L1 to enhance comprehension, and to establish solidarity and foster affective relationship with the students by adopting the 'we code' (the shared L1), versus the 'they code' which is the target language (Guthrie, 1984).

However, as pointed out by Martin-Jones (1995), it may be oversimplistic to claim that a bilingual teacher switching into the learners' L1 is invariably expressing solidarity with the learners. When the two codes are of asymmetrical social status (e.g. one being a socially dominant language such as English, and the other, an indigenous language), the codeswitching often produces highly socio-political meanings. Often, the teachers switch between the codes to fulfil, on one hand, their institutional role by exposing students to English as a highly valued social commodity, and on the other hand, their professional role by ensuring that students' comprehension of the lesson content is not impaired by the use of an unfamiliar and alienating language (see Arthur, 1996). Such code-switching practices, as observed by Arthur (1996) in Botswana, reveal subtle processes of identity construction at work. By enabling students' 'on-stage' performance in English (the L2) through ritualized and routine recitation of question and answer, while reserving the shared L1 for clarification, explanation and correction as the 'backstage' code, the teachers and students in Botswana primary classrooms colluded in keeping up the appearance of effective activity and fulfilment of their respective roles for mutual face-saving.

This kind of highly controlled and mechanical talk is labelled as 'safe talk' by Hornberger and Chick (2001), and seen as a coping strategy used to deal with learning difficulties arising from the need to use the former colonial language to learn in post-colonial settings. Similar work carried out by Lin (2000) in Hong Kong shows that

L1-Cantonese-speaking Hong Kong students employed hybridized discourses (L1 mixed with English words, or L1 spoken with an Anglicized tone) apart from their L1 to respond to the teacher's formal initiation in English, probably to assert a 'local Cantonese-based Chinese cultural identity' in the face of the socio-politically dominant but alienating English. Findings of these studies show that a microanalysis of classroom interaction data may not be complete without making reference to the macro-social contexts of which the school is a part.

### *Participation Structures*

Studies on participation structures are concerned with how students' learning outcomes or performance in class may be a result of their participation mode and/or opportunities to participate (see Philips, 1983). In some teaching contexts, teachers' institutional authority in assigning roles and validating comments from students may facilitate student participation, but in other cases, teachers consciously or unconsciously position students in awkward ways and deprive them of some of their learning opportunities. Hall (1998) reports how different opportunities for learning, and/or of displaying knowledge in sanctioned ways were created in the IRF structure through the teacher's differential attention to student initiations in a classroom where Spanish was learnt as a L2. Such differences in attention resulted in the formation of two different status groups: a primary group (which received more attention from the teacher) and a secondary group (which received less), each with different participating roles and rights to the floor. Hall's (1998) study reveals the highly asymmetrical role relationships between teachers and students in shaping the direction and consequences of participation in classroom discourse.

Some recent studies, however, illustrate that there are times when the students may exercise considerable *agency* as to whether and how they take up the talking turns assigned by the teacher. The study by Duff (2002) in a multilingual and multicultural classroom context found that some students might refrain from taking up a turn directed to them by the teacher to avoid publicly identifying themselves with the tradition or practices of their home culture with which they feel uncomfortable. Duff concludes that such contradictions and tensions in classroom discourse can be most effectively revealed through 'ethnography of communication' as a context- and culture-sensitive method for conducting research in classroom discourse.

### WORK IN PROGRESS

Recent work on classroom discourse and identities continues to reveal the social constructedness and multilayeredness of identities as

discursively constructed notions. Three interrelated themes prevail in most of these recent studies.

### *Contesting Discourse Frames*

The concomitant existence of multiple voices and multiple identities requires that classroom discourse analyses respond to multiple perspectives emerging from the heteroglossic discourse in multiple dimensions.

The plurality of discourses in the classroom was captured by Bernstein's (2000) distinction between an official 'vertical discourse' and a local 'horizontal discourse'. While 'vertical discourse' takes the form of a coherent, explicit and systematically principled structure, 'horizontal discourse' 'entails a set of strategies which are local, segmentally organized, context specific and dependent' (p.157), which represents the users' everyday lived experiences. These two forms of discourse resemble Gee's (1996) primary (or home) and secondary (or institutional) discourses, as well as Bakhtin's (1986) 'authoritative discourse' and 'internally persuasive discourse'. Authoritative discourse is the discourse of the teachers and the father, people who wield power. This type of discourse, infused with the stamp of authority, requires our acknowledgment and appropriation. However, we can transform the authoritative discourse of others into our own words, reconsider it in the light of other ideas, and in Bakhtin's term, 'reaccentuate' it so that it may start to lose its authority and become more open (see Cazden, 2001).

To counteract the alienating effects of the authoritative discourse, students are sometimes found to have inserted horizontal and often surreptitious layers of talk of their own initiation within a vertical sequential participation structures of the IRF/IRE, which are more or less controlled by the teacher. Pennington (1999) was among the first to employ a frames approach, to reveal the co-existing but often conflicting layers of talk in a typical Hong Kong EFL classroom. She showed how students contested authority by articulating different voices to achieve a balance between structure (which exercises control and constraint over talk) and agency (which emphasizes freedom of choice and consciousness). Apart from official *lesson frame* and *lesson-support frame*, Pennington discovered the existence of a *commentary frame* as the outer layer that featured students' L1-dominated discourse. The students' commentary talk showed that they were trying to employ the L1 to move away from the set classroom roles, assert their comments and opinions on issues they found interesting and reproduce the culture from *outside* the institution *within* the classroom. Pennington (1999) suggests that opportunities for students' spontaneous commentary talk in their mother tongue could be strategically planned

and structured within the lesson frame and transformed into English so as to increase students' participation in the lesson. Whether students' interactive practices can be manipulated structurally needs further investigation, but Pennington's (1999) findings reveal that researchers may lose a lot of insights into discourse and identity construction, if they only focus on the official IRF interactional patterns.

### *Student Resistance*

The existence of horizontal discourse alongside vertical discourse focuses attention on students' agency and power in classroom discourse, which often emerge as forms of resistance to the authoritative and socially valued institutional discourse. Student resistance is a core topic for investigation in the field of critical classroom discourse analysis (CCDA) (see Kumaravadivelu, 1999). Playful and parodic discourses are generally felt to be key features of resistance. These features are believed to be responses to conflicting discourse communities (e.g. Canagarajah, 2004), and/or uninteresting and unimaginative pedagogical discourse (e.g. Lin and Luk, 2005). To counteract alienating authoritative pedagogical discourse, students tend to look for 'safe houses' in the classroom; in other words, hidden spaces for them to assert their preferred identities, often with a view to turning the authoritative discourse to internally more persuasive discourse of a horizontal nature. Classroom ethnographers are encouraged to go beyond surface-level interactions and go deep into the underlife communications to discover evidence of student agency in creating new, alternate and hybrid identities in highly complex ways. In Lin and Luk's (2005) work, which is based in Hong Kong, students' playful discourse may also appear in the official IRF structure and cause disruptions to the lesson agenda. They call for an open-minded attitude on the part of the teachers towards students' desire to assert their home and street identities within the official authoritative discourse. In general, works on student resistance, playful discourse and hybrid identities tend to accentuate the importance of TESOL professionals developing intercultural communicative resources to respond to students' pluralistic discourse and identities (see also the review by Lytra, *Playful Talk, Learners' Play Frames and the Construction of Identities*, Volume 3).

### *Intertextuality, Intercontextuality and Interdiscursivity*

How teachers and students make intertextual, intercontextual and interdiscursive connections during interactions and what these reveal about multiple identities are one of the key issues explored in Bloome, Carter,

Christian, Otto and Shuart-Faris' (2005) book on classroom discourse analysis, which adopts a micro-ethnographic approach. By referring to the concept of intertextuality, in relation to ways in which readers shape meanings of texts through the mediation of 'codes' and meanings acquired by the readers from other texts, Bloome, Carter, Christian, Otto and Shuart-Faris (2005) illustrate how one discourse may penetrate another discourse, or one context within another context, in classroom interaction. This theoretical orientation is closely related to Bakhtin's (1986) concept of dialogicality of voice. According to Bakhtin, our speech, that is, all our utterances, come to us already filled with the words of others, with varying degrees of awareness and detachment. These words of others carry with them their own expression and evaluation tone, which we 'assimilate, rework and reaccentuate' (p. 89). Speakers engaging in talk-in-interaction are at the same time being engaged in a dialogic process with former users and uses of particular language code in the same or similar contexts. An understanding of a person's speech requires a corresponding understanding of other texts and contexts, and sometimes other discourses that are invoked by the speaker.

Bloome, Carter, Christian, Otto and Shuart-Faris (2005) elucidate this theory through a classroom story-telling activity of a young student. It is shown that the young girl shifted between a series of social identities and roles (e.g. a reporter, a gatekeeper, a daughter, a student, a friend and a moral commentator) she created by herself in the story telling and enacted different voices, for herself and for others. For example, by assigning some of the students in the story gendered and sexual social identities (e.g. being easy with the opposite sex) while keeping herself clean from such identities, she created for herself a good daughter and a good student identity. An understanding of the reasons behind the student's construction of such an identity for herself requires an understanding of what counts as taboo issues in the society, at least among young school children. The need to consider intertextual, intercontextual and interdiscursive resources no doubt complicates the work of classroom discourse analysis, but on the other hand, also enriches the findings and insights we could draw from the process.

#### FUTURE DIRECTIONS AND CONCERNS

This review has focused on one distinctive line of inquiry within classroom discourse analysis that gradually moves from investigating structural organization and linguistic categories of teacher-student talk to issues concerning how ways of teaching and investments in learning are closely intertwined with a sense of self, and how these identities are constructed, enacted and transformed through discourse. In this

section, I would like to discuss issues for future considerations along two dimensions: *ideological* concerns and *methodological* concerns.

### *Ideological Concerns*

Bakhtin's authoritative-versus-internally-persuasive discourses, Gee's primary and secondary discourses, and Bernstein's vertical-versus-horizontal discourse, though not exactly referring to the same concepts, reveal the co-existence of forms of talk that are often not congruent with each other. At a time when plurality of identities, differences and alternatives are celebrated, teachers and students representing different forms of discourse have been shown as competing to articulate voices from which tensions and conflicts often arise. Power relations and student resistance have, thus, become two major issues that classroom discourse analysts, particularly those who espouse a critical approach, will need to address. This need is felt to be particularly strong in language learning classrooms where discourse is both the means of mediation as well as the object of study. Kumaravadivelu's (1999, pp. 477–479) *TESOL Quarterly* article on CCDA raises a list of suggestions for further exploration. The following three questions are particularly relevant to the current review:

1. How can we reconcile learners' voices with classroom rules and regulations, and with instructional aims and objectives?
2. How can we make sure students' own forms of cultural capital are recognized, rewarded and enriched?
3. How can we reconcile the relationships between learners' linguistic needs and wants, and their socio-cultural needs and wants?

Basically, the three questions concern how we can accommodate, if not assimilate, students' everyday discourses and identities constructed outside the classroom within the official mainstream classroom discourse, if the two are incompatible (also see Cazden, 2001). While it is generally acknowledged that the discourse and identities students develop in the 'safe places' in the classroom enrich their critical and creative contribution to academic literacies and discourses (Canagarajah, 2004), teachers and researchers must be alerted to the differentiated social value of different discourse and identity resources brought to the classrooms by students from different socio-cultural backgrounds.

Various classroom researchers have used insights from Bakhtin's (1986) theory of dialogicality, addressivity and heteroglossia (see the edited book by Hall, Vitanova and Marchenkova, 2005) to address these questions. Some researchers have called for pedagogical innovations to transform and (re)imagine traditional practices of language and literacy learning to accommodate intercultural innovations in meaning- and identity-making through the learners' hybrid discourses.

Lin and Luk (2005), for example, point to the importance of achieving dialogicality between the teacher, the students in relation to what is taught and what is learnt. They particularly stress the need to avoid reproducing the underprivileged lifeworlds of some lower social class students by reinforcing their restrictive discourses, and assert the importance of helping students master the more valued social languages of English for survival in the globalized economy. Luk and Lin (2007) further proposes a 'pedagogy of connecting' to articulate students' local linguistic and cultural resources and the forms of knowledge and norms of interaction sanctioned by the school institution. The pedagogy of connecting requires teachers to proactively engineer learning activities to enable students to see how their desire to release and assert local or home identities can be capitalized on in the development of socially valued linguistic and cultural resources. While these studies have established the ideological roadmap concerning discourse, identity and learning for further investigations, more classroom-based ethnographic studies are required to show how these pedagogical conceptualizations can be translated into everyday classroom practices, and their effectiveness established.

In general, there is a clear growing interest among researchers from a socio-cultural and socio-political perspective to investigate the situationally constructed nature of identities and the interweaving relationship between social identification and academic learning in schools. Wortham (2006), for example, argues that models of identity are not simply social categories which have emerged from long timescale socio-historical conventions, but rather contingent local categories emerging from event-level social interactions. Such locally constructed models of social identification have been shown to constitute non-academic resources that can be deeply implicated in academic learning.

### *Methodological Concerns*

The first methodological concern relates to increased difficulties with data collection and interpretation due to the multiple layers of talk and the need to attend to intertextual, intercontextual and interdiscursive connections within talk. The concomitant layers of talk between teacher–student and student–student within the classroom create tremendous difficulties in transcription. Not only is it difficult for the transcribers to present these layers of talk on paper, they also have difficulty in deciphering latching utterances, despite the advances in audio-recording technology.

Due to an increasing awareness that teachers' emic, or insider, perspectives and students' everyday lifeworlds and home and street cultures need to be taken into account in interpretation, it seems

that it is no longer sufficient to view meaning as totally situated in the moments of interaction. As Bloome, Carter, Christian, Otto and Shuart-Faris (2005) note, the needed data are sometimes recognized only after data collection has been completed, and/or can only be collected in different contexts that are not easily accessible to the researchers. This sometimes results in analyses conducted with partial contextual information only. To reduce this problem, researchers should seek to conduct classroom research *with* the teachers, rather than *on* them, or *for* them. Teachers should be empowered to become mini-ethnographers, to conduct classroom discourse analysis research collaboratively with researchers, so that the researchers can benefit from the teachers' insiders' knowledge and experiences with the pedagogical setting they are situated in, while the teachers can draw insights from the researchers' etic perspectives often synthetically formed through observations of a wide range of classrooms.

As for the choice of research methodology, although ethnography of communication is felt to be the best methodology to investigate the discursive construction of identities due to its culture- and context-sensitive nature, Bloome, Carter, Christian, Otto and Shuart-Faris (2005) highlight the need for a dialogic approach to the building of relationships among different research perspectives. An ethnographic or micro-ethnographic approach to classroom discourse analysis could draw on strengths from other methodological frameworks, such as conversation analysis, interactional sociolinguistics and systemic functional linguistics (see related reviews in Hornberger and Corson, 1997). Bloome, Carter, Christian, Otto and Shuart-Faris (2005) also point to the importance of locating discourse analysis studies, connecting these studies with other disciplines or lines of inquiry such as New Literacy Studies (see related contributions in Volume 2), and Critical Pedagogy, in which identity construction and negotiation have a key role to play. There is, therefore, a tendency for classroom discourse analysis to be considered as an eclectic pool of resources to be drawn from for a variety of research issues.

## CATEGORIZING LEARNERS BEYOND THE CLASSROOM

## INTRODUCTION

All social activities rely on categorization. In order to understand the world, to discuss it with others, and to participate in social action, we have to *re-present* to ourselves and to others what is happening. Language is the primary mechanism for this, and categorization can be seen as one of the most ‘fundamental organizing principles of human thought and action’ (Edwards, 1991, p. 515). In institutional settings, such as courts of law, hospitals, and schools, categorization is an important element of, and instrument in daily practices. Institutional categories are constitutive of how we construe entitlements and obligations of social actors. In schools, a child who is categorized as ‘learning disabled’, ‘immature’, or as a ‘slow reader’, is met with expectations that are different from those that apply to other children.

Institutions are central to the functioning of a complex society, and they play a decisive role in the production and use of knowledge. Through the use of categories in institutional practices, people are ‘transformed’ into entities that the organization can recognize and process (Lipsky, 1980). In this sense, categories are part of an ‘institutional machinery’ (Mehan et al., 1986, p. 164), and they ‘work as some kind of stabilising standards’ (Douglas, 1986, p. 63) for the activities undertaken. Through categorizing, the institution puts similar ‘things’ together, and entities of ‘dubious standing lose their ambiguity’ (Douglas, 1986, p. 59). In this manner, the institution organizes and encodes information, produces knowledge and co-ordinates its daily practices.

In this chapter, we address issues that relate to categorization in educational settings. We want to emphasize that categorization is to be seen as a very practical activity, as something that people *do* to get their job done. In schools, as elsewhere, categorizations are consequential; as Bowker and Star (2000) put it, the ‘material force of categories appears always and instantly’. The focus of the chapter is on how difficulties children encounter in school are interpreted in the context of pupil welfare meetings, i.e. settings where teachers, heads of schools, and specialists such as school psychologists, social workers and others, discuss children’s problems and decide on how to provide support (Hjörne and Säljö, 2004a).

## EARLY DEVELOPMENTS

The activity of classifying and categorizing children is as old as schools themselves. In fact, the very introduction of schooling some five thousand years ago in Mesopotamia implied a significant transformation of identities; 'children' were turned into 'pupils'. This was a new category and a new social role with specific obligations on how to behave. What has varied during history are the kinds of categories that have been considered informative and justified when organizing school practices and when, for instance, understanding learning difficulties. In the 19th century, when public schooling was introduced in many countries, a religious and moral discursive tradition served as a provider of categories that were used to account for school failure. Pupils were described as vicious, lazy, slow, immoral, or as nailbiters, to mention but a few examples of categories that typically referred to the alleged moral character of children (Trent, 1994; Deschenes et al., 2001). During the early 20th century, the testing of intellectual capacities of children and their maturity was introduced. The testing movement was grounded in medical and psychological accounts of school difficulties. New categories emerged with a fine-grained set of concepts, especially for describing the lower end of the scale. Terms such as mentally dull, feeble-minded, imbecile, idiot, backward, slow, moron and intellectually weak were introduced as relevant accounts (Trent, 1994).

Later during the 20th century, other modes of accounting for school difficulties were introduced. A range of factors that relate to social background and upbringing of children came to be used. In this more sociological understanding of children's adaptation to school, family conditions came to be seen as important determinants that have to be attended to when trying to improve school performance. Categories such as disorderly behaviour, concentration difficulties, aggressiveness, immaturity, shoplifting and truancy now came to play a prominent role. The mental hygiene movement of the 1950's and 1960's in a similar fashion pointed to social background as significant for understanding success in school. When accounting for school problems at this time, the children were for example described as maladjusted, rejected or coming from bad homes.

Understanding categorizing practices in schools is a key to understanding how diversity is dealt with. It is also obvious that categories are ideological in nature. An important function of categories throughout the history of schooling has been 'to control difficult children, divert them away from schools (...) into institutions or regimens of treatment' (Hacking, 1999, p. 111). Furthermore, a very important general observation is that accounting for school failure seems to have been based mainly on categories of individual failure and have left structures in school largely intact (Deschenes et al., 2001)

INSTITUTIONAL REASONING AND  
CATEGORIZING PRACTICES

In recent decades, the topic of categorization, and its consequences for children and their schooling and identity, has emerged as a research interest in its own right. An important line of research has been carried out by Mehan and his colleagues (Mehan, 1986; Mehan et al., 1986). In this work, in-depth studies of the processes and consequences of sorting students into categories such as 'normal', 'special' or 'educationally handicapped' are reported. Mehan and his colleagues have found that in the American context, the school psychologist, and the social language (Bakhtin, 1986) of this profession, plays an important role. Thus, when 'the school psychologist speaks, it is from an institutionally designated position of authority' (Mehan, 1986, p. 160). A consequence of the categorizing practices invoked by psychological categories is that the problems of the child 'are treated as if they are his private and personal possession' (p. 154). This is yet another confirmation of the observation that there is a strong tendency in school to explain difficulties in terms of individual disorders. And, as a consequence, the problems become located '[b]eneath the skin and between the ears' (Mehan, 1993, p. 241) of the child.

When scrutinizing descriptions of 'deviance' in school in the UK, Hester (1991, 1998), using data from Child and Family Guidance Service as a part of the Special Education Services provided, found that certain kinds of activities, attributes, characteristics and school problems of the pupils were, in a sense, expected to be relevant to report. 'Such recognitional "work" is what provides a sense for the participants of their being respondents to an independent or objective set of problems within the school', as Hester (1991, p. 461) puts it. Thus, these categorizing practices contribute to the construction of the facts of 'deviance', and these facts, in turn, become the "grounds for intervention and treatment" (p. 462). Similar categorizing practices have been reported by Verkuyten (2000, 2002) in studies of teachers' talk about pupils' problems in school in the Netherlands. He argues that defining a student as, for example, 'disruptive' implies introducing an explanation for poor educational results that is accepted by the institutional actors. The study also confirmed that the accounts produced emphasized the role of the students, while at the same time hiding the teachers and their activities from view.

In a study of so-called class conferences (a kind of pupil welfare team meeting) in Sweden, reported by Cedersund and Svensson (1993), similar results were found. The discourse employed, though vague, still pointed to children's shortcomings in traditional, individualizing terms as the causes of school problems. Categories such as

weak, slow, immature were frequently used. This is a further indication that there seems to be a prevalence of the psychological discourse in school settings in many different Western countries.

In a practice perspective, categories should not be seen as passively reflecting a pre-given social reality. Rather, they are formative for our understanding of a problem and for our acting in the world. Our “seeing” is “in-formed” by the terms in the dominant discourse of the day’ (Shotter, 1993, p. 102). The categorizing practices create a common understanding of what to ‘see’ and ‘how to go on’ when solving dilemmas as Shotter puts it. Another facet of this constitutive nature of categories is that once an institutional category has been accepted as valid, there is, as Hacking (1986, 1999) points out, a ‘looping effect’ by means of which people ‘spontaneously come to fit their categories’ (Hacking, 1986, p. 223). In other words, there is a tendency to find people who fit into the categories used by institutions, and their identities may be shaped accordingly.

This phenomenon that categories themselves generate people who fit into them is significant in the context of pupil welfare. The study by Thomas and Loxley (2001) is an interesting illustration of this. They refer to the results of the Warnock report by The Department of Education and Science in the UK in 1978. The committee introduced the idea that one in five pupils has special needs in school (earlier, the figure was assumed to be around two percent) with the positive intent of ‘highlighting children with difficulties and directing resources to them’ (Thomas and Loxley, 2001, p. 78). This direct link between categorizing practices and the provision of resources testifies to the centrality of categories in pupil welfare. Since the ‘consensus has always been that such rationing will follow the axiom that resources will be provided in ratio to the need assessed’ (Thomas and Davis, 1997, p. 269), the claim that one of five pupils were in need of special support had as a direct consequence that an increasing proportion of the school population was found to be in need of special support. Expressed differently, this implies that the committee ‘actively generated a ‘reality’, which had to be lived up to’ (Thomas and Loxley, 2001, p. 78). A significant element of this ‘looping effect’ is that to ‘be called “special” is to be given a new identity within the schooling system’ (Thomas and Loxley, 2001, p. 76); a process that can be expected to have far-reaching consequences at the individual and institutional level. This can be seen as a decisive step in a child’s future career in school, and ‘when known by people or by those around them, and put to work in institutions’, categories may well even ‘change the ways in which individuals experience themselves’ (Hacking, 1999, p. 104).

## EXAMPLES FROM WORK IN PROGRESS

In complex societies, children's adaptation to school is central. The significance of schooling for the life careers of individuals has become increasingly important. Prevention of school failure and drop-out is high on the political agenda. Many educational systems are operating in societies which are more diverse in terms of the social, cultural and ethnic backgrounds of their respective populations. Also, many countries now have some kind of comprehensive compulsory school system in which children of different backgrounds and academic orientations are educated in the same classroom. All these factors add to the complexity of teaching and learning practices, and issues of pupil welfare have become increasingly emphasized.

One characteristic feature of the interpretation of school failure during the past few decades is the widespread adoption of neuropsychiatric diagnoses. These diagnoses include conditions such as AD/HD (Attention Deficit Hyperactivity Disorder), MBD (Minimal Brain Dysfunction/Disorder), syndromes such as Aspergers and Tourette, dyslexia, dyscalculi, to mention but a few. To some extent, neuropsychiatric disorders can be seen as yet another set of categories that originate in medical and psychological diagnostic traditions. The problems are located in the individual, and, in most cases, they are considered as biological in nature. The role and consequences of the uses of categories of this kind for the individual as well as for the school system are important to analyse.

In many school systems, pupil welfare has expanded as an activity, and there is an increasing professionalization with special needs teachers, school psychologists, social workers and others taking part in multi-professional team work. Analysing the discursive activities of such multi-professional pupil welfare team meetings in Sweden, we found that the nature of the accounts produced, and the categories used by the staff nevertheless referred more or less exclusively to individual traits of the pupil as causes of the problems observed (Hjörne and Säljö, 2004a, 2004b). Lack of adequate intellectual capacity and immaturity are frequently used. An illustration is when the team in one school is discussing Jonas, 9 years old, (see in Excerpt 1).

Furthermore, the problems are accounted for without considering the role of the teacher's activities, the family or any other contextual elements. In the next excerpt (Excerpt 2), the team elaborate the school problems of a 9 year old girl (Malin) and the members use the category 'weak', implicitly meaning being weak intellectually, as an explanation.

An interesting feature of the work in these multi-professional teams is that many of the categories used are ambiguous and vague, and the

## Excerpt 1

|                        |  |  |
|------------------------|--|--|
| Assistant principal    | it's difficult to get him to concentrate and to get his work sort of finished and then of course.uhm in other words he might not be the most (.) he needs time and private lessons [to]- | han är svår att få å koncentrera sej å få arbete gjorda färdigt å sen har han väl naturligtvis.ehh en liten alltså han e ju inte världens (.) det tar väl tid å han behöver enskild undervisning för [att] - |
| Special needs teacher: | [mmm]  | [mmm]  |
| Assistant principal    | everything is not just easy for him, rather, he has some problems  | allting går ju inte bara lätt för honom, utan han har ju lite problem  |

## Excerpt 2

|                     |   |   |
|---------------------|---|---|
| Assistant principal | Malin . . . I think she hides . . . I think she's got problems in school she has difficulties, it's not easy for her and this she hides . . . | Malin . . . jag tror att hon gömmer . . . jag tror att hon har problem i skolan hon har de svårt hon har de inte lätt å de gömmer hon . . . |
| School nurse        | She's a weak pupil you mean?  | hon e en svag elev menar du?  |
| Assistant principal | yeah she's weak   | ja hon e svag   |

concrete instances of exactly how the problems appeared in the classroom are generally not presented or considered relevant to discuss. Nevertheless, there is a high level of consensus in the team. We have observed very few overt disagreements in these settings, and the representatives of the various professions do not seem to interpret the problems differently. When discussing Philip, 10 years old, (Excerpt 3), several of the experts are involved, and they all follow the same idea of explaining his supposed problems by means of one of the most frequent categories, 'immaturity'.

Another interesting feature of the process of categorizing children is that most of the accounts and categories produced are negative in character, i.e. they focus on weaknesses of the pupils rather than on their strengths. When discussing Maria, 10 years old, (Excerpt 4), the team do not point at any strengths in her behaviours in school.

## Excerpt 3

|                       |   |   |
|-----------------------|---|---|
| Special needs teacher | Well, visually he has a good memory and memory of sequences and so on. So that's not it, it's not that type of problem. But it is entirely possible that he has, in addition, but we, we don't have time to get that far, but on the other hand when he is here then he works and then he reads, he sort of sounds together and then he puts a lot of energy into it and tries, but he sort of gets nowhere, and then he is gone and then he is lost and, well all the time he is somewhere else. Comes in late . . . | jo, han har ju visuellt bra minne och sekvensminne och så där. Så det är inte det, det är inte den typen av problematik. Men det är ju mycket möjligt att han har, dessutom, men man, vi hinner komma så långt, men däremot när han är här så jobbar han och då läser han, han liksom ljudar ihop och då lägger han ner mycket energi och försöker, men han kommer liksom ingenstans, och så är han borta och så är han försvunnen och, ja hela tiden är han någon annan stans. Kommer sent . . . |
| School nurse          | But he is about to start in [fourth]  | Men han skall börja i [fyran]   |
| Special needs teacher | [Mm]  | [Mm]  |
| School nurse          | And the teacher wants, well says that he is on the level of a first grader.   | Och läraren vill, ja säger att han är på en ettas nivå.   |
| Special needs teacher | Mm, first grader during the autumn possibly.  | Mm, etta på hösten möjligtvis.  |

A striking observation when analysing how the team talk about pupil difficulties is that the problems accounted for are rarely contextualized as responses to pedagogical practices, teachers' activities, or other aspects of life in the classroom and in school. There are hardly any discussions of the appropriacy of pedagogical practices for particular pupils, or if they could be modified so as to support pupils with reported difficulties. Rather, the presumed problems are understood as residing within the pupil and determining his/her inability to participate in school practices in the expected way. In the next meeting, the

| School Psychologist   | Difficulties schoolwise, difficult to follow, yes yes, it could be the case that one has hit the ceiling a bit too, his developmental maximum that there sort of begins to be some resistance | skolmässigt svårt, svårt att hänga med, ja ja, det kan ju vara så att man har slagit i taket lite grann också, sitt utvecklingstak att det börjar ta emot |

team again discuss Philip, (Excerpt 5), without introducing any new contextualization of how to understand his school behaviours.

In this manner, our results show that the meetings are not cumulative or systematic. Little attention is paid to previous decisions. There are

almost no discussions concerning the goals of the actions taken, and, consequently, no attempts to evaluate what previous discussions and decisions have resulted in. It is also hard to see that the multi-professional character of the team adds to the nature of solutions produced. There is no obvious sense in which the team members provide different analyses or suggest alternative modes of handling the situation. On the contrary, results such as these show that the team regularly uses a limited number of individualizing categories that are well established. The function of these categories is to match the institutional category 'pupil in need of special support' with the few options that the staff perceive as available: an extra year in school, having an assistant as extra help, etc. It is worth noting that the pupil's own perceptions of life in school, and/or his/her alleged problems, are not visible or attended to in this process.

### PROBLEMS AND DIFFICULTIES

Summarizing the implications of the research such as this, often end up in one of two traditions of argumentation; either schools or pupils are considered to be suffering from 'deficits' and/or as failing to meet expectations. In our opinion, it is necessary to avoid ending up in any of these positions. An important premise to take into account is that pupil welfare teams are coping with very different, and sometimes conflicting, demands. Any normative claims as to how to deal with various dilemmas will have to take this into account. Schooling, very clearly, is an ideological activity where different kinds of dilemmas constantly have to be handled. These dilemmas concern how limited resources are to be used, what ambitions and goals are reasonable to have for teaching and learning in different circumstances, and a range of other issues related to inclusion and exclusion. Decisions on matters of this kind do not follow from laws of abstract logic, but are, and have to be, grounded in values and knowledge.

During the last hundred years we have seen a radical expansion of education. In many, if not most, parts of the world the number of students at various levels of the educational system, and the number of years of schooling *for* each age cohort, have increased dramatically. Secondary and even tertiary education, previously catering to the needs of small elites in society, are now available to large proportions of the population. In contemporary society, where knowledge has come to play an increasingly important role for the future of the individual, there are high expectations that schools will provide students with knowledge and skills that are relevant for active participation in working life and in the practices of a democratic society, and, in general, for the development of a productive and healthy life-style.

This development implies that issues of pupil welfare, and the support of individuals who risk becoming marginalized, have become increasingly important. Yet we see from recent research how learners and learning difficulties are categorized and interpreted by teachers and other members of school staff, and by the general public. This is a problem that has to do with the politics of representation of human abilities and needs, in and through educational discourse. At the same time, discourses about learning difficulties are, increasingly, a site of struggle. One illustration of this is that, during recent decades, many groups who were previously marginalized or even excluded from education, such as people with various kinds of learning disabilities, now are able to successfully participate in learning practices suitably geared to their needs. Innovation and flexibility in the organization of teaching and learning practices have been grounded in attempts to meet the needs of individuals of different backgrounds and with different needs, rather than insisting on maintaining traditional modes of instruction and authority patterns. This change of ideologies, and of school practices, to a large extent is grounded in new modes of categorizing and understanding human capacities and needs.

An important problem in this field of research is to develop knowledge that is relevant for teaching and learning practices. The present trend of relying on neuropsychiatric diagnoses carries an obvious risk of resulting in segregation of increasingly large proportions of children from mainstream schooling. This is a development that, from an educational point of view, is problematic. In many cases, segregation from mainstream, even when carried out with the best of intentions, has questionable consequences for the identities of learners and for the expectations of teachers and others on what can be achieved. Also, there is very little evidence in empirical research that strategies of segregation are beneficial. The role of pupil welfare systems in dealing with these issues clearly requires more research.

#### FUTURE DIRECTIONS

The creation of pupil welfare systems is an important step in the process of instituting arenas where significant events and features in school are publicly and openly analysed by those who have the most intimate knowledge about the daily activities in school. Knowledge is built through such collective practices where the difficulties experienced by learners are attended to, defined and collectively handled. However, the potential of these arenas as contexts in which practices of schooling, and responses by pupils to these, are critically explored does not seem to have been fully exploited. To further our knowledge

about how to analyse and understand problems of this kind, and how to convert such knowledge into viable pedagogical practices that are accepted by teachers, students and parents, must be seen as joint responsibilities for many parties in school as well as those outside, such as university-based researchers analysing these issues. But, to be productive, such knowledge cannot be grounded in research that ends up reinforcing the familiar patterns of pointing to student ‘deficits’ and school ‘deficits’. In our opinion, the reasoning has to be much more complex, innovative and strategic, and it must recognize the dilemmas in pupil welfare. It must include habits of critically scrutinizing the local teaching and learning practices, appreciating the value of dissent between the actors on how to solve problems, sensitivity to the perspectives of pupils on their own schooling, and continuous concern with implementing and evaluating activities that will enhance the possibilities for inclusion into mainstream schooling for large proportions of children.

## CONSTRUCTING ELITES IN KENYA: IMPLICATIONS FOR CLASSROOM LANGUAGE PRACTICES IN AFRICA

### INTRODUCTION

In Kenya, as elsewhere in Africa, the elite are a class of highly educated people, more often than not with university degrees and even post-graduate degrees, who hold well-paid and influential positions in the civil service, in business, politics and other fields. They are the children and grandchildren of the select few who managed to get western type education and the language of the colonial power—English, French, Spanish and Portuguese—during the colonial era. On attainment of independence in the late 1950s and early 1960s, such people were able to send their children to good schools, even sometimes to schools that had been reserved for Whites only during the colonial era, where the colonial language served as the language of instruction. The children were therefore in a position to obtain appropriate higher education academic credentials that put them on an upward social mobility track.

In this chapter, I trace the construction of elites in Kenya (and by extension in other Africa countries) to the introduction of western type education and English by the missionaries and explore how this is currently perpetuated through school and classroom language practices and through the expansion of the private education system. I then discuss some of the language and education problems and difficulties confronting the education of non-elite children and end by making suggestions on what needs to be done to begin to address these problems.

### EARLY DEVELOPMENTS: THE COLONIAL ERA

The construction of elites in Kenya, as in other former British colonies in Africa, dates back to the introduction of western type education and English language by the missionaries (with later British colonial government participation) in mid-eighteenth century. English, the language of the socially and politically powerful white colonial officers, farmers, also known as white settlers in Kenya, businessmen/women and missionaries became available to the Africans as a means of gaining power. Writing about the situation in Nigeria in particular, and British colonial Africa in general, Goke-Pariola (1993) has stated: ‘To speak that language in itself was power . . . the local person who understood the

White man's language increased his own power dramatically: he became a man before whom others stood in awe' (p. 223). At the same time, the Africans who acquired English language skills gained inclusion into colonial power in as far as they gained employment in junior positions of the colonial administration; according to Ngũgĩ, in Kenya, 'English was the official vehicle and the magic formula to colonial elitedom' (Ngũgĩ, 1985, p. 115).

On the other hand, it was only through access to western type education that the Africans could gain access to this inordinately powerful language and, thus, join the class of the elites. However, for various reasons, very few Africans managed to do this. Colonial society in Kenya was based on a three-tier hierarchy, with European farmers, missionaries, civil servants and business people occupying the top, Asian shopkeepers and artisans in the middle and African labourers, on European farms or on their own land, at the bottom. The racially segregated western type education system, with English as its symbol, enhanced this three-tiered, racially based social stratification of colonial society.

The quantity and quality of education provided, reflected these social stratifications. In 1926 government expenditure on education per year per pupil was: \$33.40 for Africans, \$37 for Asians and \$180.50 for Europeans (Sheffield, 1973). The European children received an academic British education in preparation for an English university education; the Asian children received higher forms of vocational training aimed at preparing them to become technicians, technologists and engineers (Kerre, 1991). However, vocational education for the Africans became colonial government policy from 1909 onwards. This curriculum choice for the Africans was based on the racist thinking within which handwork was thought to be suitable for Africans because they had undeveloped reasoning faculties and thus like mentally defective children could only benefit from vocational education (Stabler, 1969).

In the early part of British colonial rule in Kenya, access to English was controlled by language in education policies and practices that severely restricted the number of African children learning English. Education in indigenous languages with a switch to Kiswahili was the norm. Only those few Africans who went beyond the first few years of primary school were introduced to English at a time when educational opportunities for the Africans were very restricted. The 1949 Beecher report for example targeted only 40% of eligible African children for primary education, 10% for intermediate and less than 1% for secondary. Only the less than 1% targeted to enter secondary education so as to become members of the educated and skilled professionals required by the state and by commerce were to be taught English. Further, English was to be offered only where recognized teachers of English were available (Kioko and Muthwii, 2001). Since there were

only British colonial teachers, of whom there were very few could meet this criterion, this was an extremely difficult condition for African schools to satisfy. Hence, very few African children acquired English skills during this period. Consequently, within the African communities western type education and English in Kenya (as elsewhere in the British African colonies) led to the emergence of a two tiered stratification: an elite that spoke English, the language of colonial power and the masses that were illiterate or literate only in their indigenous language (Bamgbose, 1991).

In the later part of British colonial history in Kenya, beginning in the 1940s, there was a change in the colonial government education and language in education policy marked by the two Beecher reports referred to earlier, which saw the expansion of both primary and secondary school levels (Sheffield, 1973) and the liberalization of English (Gorman, 1974). According to Ngũgĩ (1986) the teaching of English was vigorously pursued, culminating in the introduction of English as the medium of instruction right from Standard 1 programme in African schools in 1961 (Mbaabu, 1996). Ngũgĩ (1981) posits that the colonial government realized that its days were numbered and therefore found it necessary to ensure that those who took over power would serve its interests. The colonial government therefore expanded access to English literacy as a way of passing on its values and standards to the incoming African elite. This interpretation is not far fetched. According to Macaulay, quoted in Bamgbose (1991, p. 4), in India, the justification for the elite breeding colonial policy was: 'It is impossible for us with our limited means to attempt to educate the body of the people. We must at present do our best to form a class who may be interpreters between us and the millions we govern—a class of persons Indian in blood and colour, but English in tastes, in opinions, in morals and in intellect'.

The hegemony of English was secured early. Both the African elite and the non-elite were happy with the English as the language of instruction from Standard 1 programme. The elite had been schooled in English and had bought into the value accorded to English and enjoyed financial and social-political gains. The non-elite, on the other hand, interpreted vocational education in indigenous languages as a colonial strategy to keep them and their children under and yearned for an English language academic education for their children, thus also buying into the legitimization of English.

#### MAJOR TRENDS

On attainment of national independence in 1963, the education and English language-based inequities that resulted in the creation of a

small elite class, with western education and English language skills as its distinguishing marks, were enhanced. Ironically, this time round, this was achieved through the expansion of teaching through English. The first post independence education commission report released in 1964 recommended that English be used as the language of instruction in all schools right from Standard 1. The second post independence education commission of 1976 reversed this decision by recommending that indigenous languages be used as languages of instruction in linguistically homogeneous areas and English or Kiswahili in linguistically heterogeneous areas, with those who start by using indigenous languages and Kiswahili switching to English in Standard 4. All the same, this policy is not adhered to strictly in the actual classroom situation and overall the tendency is for schools to opt for English as the language of instruction right from Standard 1, in the mistaken belief that this increases the children's intake of English and thus their chances of acquiring English literacy skills faster (Muthwii, 2002; Merritt, Cleghorn, Abagi and Bunyi, 1992; Obura, 1986 ). Unfortunately, while such practices work well for children of the elite, owing to access to English in their homes and communities, they have a negative impact on the education of non-elite children who lack access to English in their daily lives.

It should be noted that the marginalization of indigenous languages in the education of African children is not unique to Kenya. Virtually all African governments have continued to maintain language in education policies that promote the use of colonial languages—English, French, German, Portuguese and Spanish (Chiatoh, 2005).

### *The Growth of Private Education and the Construction of Elites*

As already indicated, a racially hierarchical ordering of primary schools with schools for European children coming first, those for Asian children second and those for African children last pertained in the colonial era. With independence and the dismantling of racial segregation in schools, elite African parents started enrolling their children in the formerly European and Asian schools as European and Asian parents started withdrawing their children from these public schools and enrolling them in private schools. Gradually, elite African parents also started enrolling their children in expensive private schools.

With the expansion of educational opportunities in the country and especially with the free primary education programme implemented from January 2003, which decreed that no user fees should be charged and that teaching learning materials should be provided free of charge by the government, conditions in the primary schools for the poor have worsened. The class sizes have grown to over 80 students

per class taught by just one teacher, in some cases. Furthermore, the composition of these classes has also changed radically with over-age children and greater variability in abilities, due to the entry of new students who may never have gone to school before and some who might have dropped out earlier but have now re-entered the system. Consequently, the previously small private education system has expanded, as the elite withdraw their children from the public school system. Expensive elite primary schools, referring to themselves as *academies*, some of which offer foreign, especially British curricula, are now fashionable for the elite. Having tasted the fruits of elite education, members of the elite are prepared to pay the very high school fees charged in these institutions to ensure that their children get into the best public secondary schools in Kenya, where they stand a good chance of qualifying for the very limited and thus highly competitive public universities places<sup>1</sup>.

Furthermore, the expansion of private university education and the deterioration of standards in public universities are contributing to the entrenchment of the elite. Previously, only those who failed to get admission into public universities sought admission into private or even universities overseas. However, private universities in Kenya are becoming the universities of choice for a substantial proportion of elite parents<sup>2</sup> who can afford to pay the high fees charged. At the same time, there are already anecdotal observations that employers prefer to hire private instead of public university graduates. These elite students are reportedly more self-confident and have better communication skills in English. Given their class and cultural background and the more liberal learning environment in these universities, it is not surprising that the students have these qualities.

### *Constructing Elites—Ethnographic Evidence*

In a comparative study of social selection processes in two primary schools—Park View, an elite, formerly Whites only, school with adequate teaching-learning resources and Gicagi, a rural non-elite, formerly African only, school with limited teaching-learning resources—Bunyi (2001) showed that the two groups of children received a differential curriculum, with the elite children in Park View receiving a rich and intellectually challenging curriculum that enabled them to

---

<sup>1</sup> For example, in the 2005 Kenya Certificate of Secondary Education examination, of the more than 60,000 students who attained the minimum university requirement, only about 10,000 will find places in the public universities.

<sup>2</sup> Elite parents with even more financial resources send their children to overseas universities such as in Britain, the USA, Canada and Australia.

succeed in school unlike the Gicagi children who received a very restricted curriculum.

The fact that Park View students come to school with a good knowledge of English, which they have learned at home and in English medium nursery schools, contributed to their being positively evaluated by their teachers. The teachers were quick to point out that Park View students were very good children and that they did not have a language problem as they knew English very well. The teachers talked of the children being clever and willing learners. This perception of the students was passed on from one generation of teachers to another. A teacher new to the school reported:

*The teachers told me that the children in this school are very clever and that they don't need much teaching. All they need is for you to show them how to do something and they will do it.*

Reporting on her experience she said

*It is true. These children are clever and they do their work. They learn very quickly and even if you test them on things that they did long ago, they will still pass.*

Because the teachers believed in the students' abilities and study habits, they offered them an academically engaging and challenging curriculum. The students spent considerable amounts of time interacting with text, as they worked on assigned readings and exercises and therefore did well in the tests; this in turn helped to validate the teachers' high expectations.

Classroom ethnographers working in African classrooms for non-elites have reported on the pervasiveness of choral responses and chanting as pupils repeat individual letters, words or sentences after the teacher or even read pieces of texts aloud (Arthur, 1994; Bunyi, 2005; Rubagumya, 1994). Interestingly, this was not observed in Park View. For example, the Standard 1 teacher observed did not usually ask the pupils to repeat anything after her and actively discouraged reading as chanting. Rather than teach reading by asking the children to read bits of text after her, she employed the phonic approach and encouraged the children to sound off the words they could not read.

#### WORK IN PROGRESS: RESEARCH ON CLASSROOM LANGUAGE PRACTICES

For the last three decades or so, Kenyan newspapers have carried articles that decry the poor English skills of primary and even secondary and college students. Articles with titles such as 'the big English problem', 'language experts concern', 'declining standards of English language', 'English standards are falling' are a fairly common feature of

newspaper articles. This is an indication that Kenyans are dissatisfied with the English language learning levels that the schools are achieving. At the same time, there is evidence that Kenyan primary school learners are not achieving the literacy skills necessary for successful learning. The 1998 SACMEQ criterion-referenced English reading test administered to a representative national sample indicated that 77% of Kenyan Standard 6 pupils had not attained the English reading mastery level deemed desirable for successful learning in Standard 7 (UNESCO IIEP, 2001). As a response to these concerns, the English Literacy Norms research team based at Kenyatta University has been trying to determine the appropriate English language literacy proficiency levels (referred to as norms in the project) for Standards 3 and 6 (Groenewegen, forthcoming). It is expected that once completed, these norms will serve as useful guidelines for curriculum developers, text book writers and teachers on the minimum and desirable English language competencies that learners in these classes should have, to be able to learn other school subjects in this language.

Classroom ethnographers have paid attention to language practices in the teaching learning process. Merritt, Cleghorn, Abagi and Bunyi (1992) analyzed the functions of codeswitching between English Kiswahili and indigenous languages in the teaching-learning process. They concluded that codeswitching provided a crucial communication resource that both teachers and students drew on to accomplish important communicative goals. Bunyi (2005) has documented classroom discourse and shown that linguistic routines (such as greetings and prayers, choral responses, strict initiation-response-feedback (IRF) and code-switching) are the predominant language practices in non-elite primary schools. She argues that these language practices translate into boring and intellectually uninspiring classroom processes that lead to little learning of English and/or of the content subjects.

Researchers have also paid attention to the attitudes of parents, teachers and students towards the various languages used in education. In her compilation of ten case studies— five in Uganda and five in Kenya, Muthwii (2002) reports that in all the case studies, more positive attitudes towards English than towards any other language were observed. Even when poor primary school students, their parents and teachers admit that the students have difficulties understanding lessons taught in English, they still say that they prefer English as the language of instruction.

#### PROBLEMS AND DIFFICULTIES

Some of the problems facing language in education have to do with policy and its implementation. On the face of it, Kenya seems to have

a reasonable policy as regards using the indigenous languages as languages of instruction for the first three years of school. The assumption made is that after three years of English language learning, the students will acquire sufficient English proficiency to study other subjects of the curriculum in the language. This is often not the case, as the SACMEQ assessment referred to earlier show. Further, the Ministry of Education statistics show that the highest grade repetition rate of 17.2% is at Standard 1 (Ministry of Education Science and Technology, 2003). The report indicates that most of these children repeat because they fail to acquire literacy. This is probably not surprising. In addition to the indigenous language and English, the Standard 1 child is also taught Kiswahili. Since the syllabus for each of the languages is developed separately, the Standard 1 child is expected to acquire literacy in the three languages simultaneously. It would make better sense for the curriculum to be so designed as to allow children to acquire initial literacy skills first in their indigenous languages, which they already know, and which they would therefore learn to read in more easily. They could then transfer the skills to acquiring literacy in Kiswahili and then English (Cummins, 1981).

Second, there are no content subject textbooks in the indigenous languages, even for the first three years where policy requires teaching-learning is conducted in these languages. This means that teachers have to translate the content. Many of these teachers have attained a 'D' grade in English in their end of secondary school examination and, thus, have less than adequate proficiency in the language. Third, although estimates of the number of Kenyan indigenous languages range from over 30 (Gorman, 1974) to over 40 (Abdulazizz, 1982), the initial literacy materials TLY (Tujifunze Lugha Yetu—let us learn our language) for Standards 1–3 are available in only 22 languages (Mbaabu, 1996). Many of the other languages do not even have orthographies. Interestingly, although there is little government supported orthography development work, a Christian non-governmental organization, the Bible translation and literacy (BTL) is very active in this area, developing orthographies for minority languages spoken by very small often marginalized communities. Fourth, in a highly examination oriented education system; there are no examinations in the indigenous languages. Teachers therefore do not see the value of teaching through these languages even in the first three years as mandated by the language in education policy.

All the same, a major difficulty in the design and implementation of language in education policies through which education could serve as tool for the improvement of the lives of the poor, has to do with the language attitudes of the elite and the non-elite who both accord

English greater value than indigenous languages. For the elite, English constitutes a valued resource that they have access to and control over; a resource that they can use to benefit not only locally but also in the global labour marketplace (Mazrui, 1997 cited in Stroud, 2000). The non-elite, on the other hand, unknowingly buy into the designs of the elite. They see their lack of English as the reason for their marginalization and therefore misguidedly believe that their children should be taught in English as early as possible.

#### FUTURE DIRECTIONS

The foregoing discussion in this article has shown that through the language policies and practices in place in Kenya, the education system continues to reproduce elites, as the majority of Kenyan children fail to derive any social mobility benefits from the system. This is an untenable situation in a country that professes democracy and social equity. The National Goal of Education, Number 4 states, 'Education should promote social equality and foster a sense of social responsibility within an education system which provides equal educational opportunities for all'. Even as researchers and others continue to call for a change in policy, classroom language practices that enhance non-elite children's learning should be sought, disseminated and implemented.

As already indicated, language practices, such as codeswitching, have been shown to be useful tools for helping teachers accomplish a variety of classroom tasks, including making lessons understandable by the students (Brock-Utne, 2005; Merritt, Cleghorn, Abagi and Bunyi, 1992). However, other observers have pointed out that codeswitching does not always enhance student learning of the lessons content and/or English, the target language (Bunyi, 2005). There is therefore need for pre- and in-service teacher education programmes to train teachers in the strategic use of codeswitching.

It is undoubtedly true that English remains the key to education in Kenya. It is therefore critically important that methods of teaching the language to non-elite children within their material, sociolinguistic and cultural context are found. In particular, language practices that empower these children, by validating the indigenous languages they come to school with as they are helped to learn the English they require to learn other subjects in, should be explored and implemented. Further, teacher education programmes should educate the teachers to help them avoid applying a language deficit model in coping with these children's lack of English skills on arrival in school, so that they can help them acquire English as an important, additional language, needed first and foremost to access school-based knowledge.

DISCOURSE AND THE CONSTRUCTION OF GENDERED  
IDENTITIES IN EDUCATION

INTRODUCTION

Children learn to take up gender as an element of their personal and social selves, and they do so, among other things, through learning the discourse practices in which all people are positioned as either male or female. Children develop an emotional commitment to their gender as early as 2 years of age and when they arrive in preschool, many of them already act, speak and behave according to conventional images of gender—though the contents of these images vary considerably according to culture, historical period, social class, ethnicity, age, and individual circumstances. Images of gender also vary in the lifetime of any individual, and as the individual moves from one context to another. Yet classrooms can be sites where a specific gender order is made to seem intractable: a binary and hierarchical order between girls and boys, and a shifting array of hegemonic or marginalized positions within each gender group. Classrooms may also be sites where students discover ways of talking and being that liberate them from more conventional forms of gender, and where they develop a reflexive awareness of the power of discourse to shape identities.

The purpose of this chapter is to examine in which ways classroom talk is implicated in the construction and maintenance of gender. Conventional gender orders have been contested and also to some degree changed during the last decades, but so has the understanding of gender as a theoretical concept. Hence, the shifting images of gender in classroom discourse which are found in research literature from the last decades.

EARLY DEVELOPMENTS

From Rousseau through to the 1950s, gender differentiation was an explicit *goal* of education. This ideal was challenged after the Second World War, with the political ideology of equal rights and the educational ideology of child-centred development and learning gaining dominance. However, even though the language shifts and structural changes taking place suggested that gender was no longer a central

defining feature of students, many of the earlier assumptions and practices constitutive of gender difference remained remarkably intact. 'Boys' and 'girls' had become 'children' or 'students', and mixed schools became the norm in most parts of the Western world. The ideal 'un-gendered' child in the child-centred ideology was implicitly a generic male—and in many classroom studies those observed and referred to as 'students' were actually boys. Until around 1970 the few studies focusing on gender influences in classroom interaction criticized the treatment of boys in primary school and suggested that the teachers, being female, were unable to meet the boys' learning needs effectively (Brophy, 1985). The girls were, apparently, as invisible and uninteresting to the researchers as they were to the teachers. During the 1970s, feminist researchers began to make girls visible in the classroom and to reveal the problematic patterns hidden by the cloak of egalitarian educational discourses. They found that the assumed advantages enjoyed by girls at the primary level were not sustained. This led to important texts such as Spender and Sarah's edited collection *Learning to Lose* (1980) from Australia, Delamont's book *Sex Roles and the School* (1980) from England and Wernersson's *Könsdifferentiering i grundskolan* (Gender Differentiation in Compulsory School, 1977) from Sweden.

#### MAJOR CONTRIBUTIONS

##### *Gender- and Class Structures in the Classroom—Research from the 1970s and 1980s*

The first wave of research showed that the gender neutrality of the modern school was an illusion. Sex/gender had remained a major organising principle of the classroom under the claim and intention of gender neutrality. In the 1970s and 1980s it was found that teachers, on an average, paid less attention to girls than to boys (Brophy, 1985; Kelly 1988). Kelly (1988) in a meta-analysis of 81 quantitative studies of primary and secondary schools showed that in all countries studied, across all ages, school levels, subjects, and socio-economic and ethnic groupings, girls received fewer instructional contacts, fewer high-level questions and academic criticism, less behavioural criticism, and slightly less praise than boys. Kelly's study also showed that, while girls volunteered to answer questions as often as boys, they were less likely to initiate contact. Other studies found that boys initiated more contact with teachers in classroom talk, while girls tended to contact the teacher outside this context (Brophy, 1985). Qualitative studies (for instance, Nielsen and Larsen, 1985) revealed a typical discourse sequence in a primary school classroom: teacher asks a question, a girl raises her hand and is appointed to answer; she does so briefly and her

answer is usually correct; a boy interrupts with an interesting comment on the topic and the teacher leaves the girl and engages in an exchange with the boy; other boys then join the discussion; the girls silently wait for the next question or may use the time to whisper together on other matters.

Good, Sikes and Brophy found that level of academic achievement (often corresponding to socio-economic and ethnic background) differentiated boys more than girls: low achieving boys got more behavioural criticism, while the high achieving boys 'receive the best of everything' (1973, p. 81). In this study, low achieving girls came out as the group in the classroom talk that got the least teacher attention, whereas other studies found this to be the case for high achieving girls (Kelly, 1988; Öhrn, 1991). High performance in girls gained ambivalent responses from the teachers: on the one side it was praised, on the other hand was often dismissed as the product of conformity and instrumentalism. As Adams and Walkerdine (1986) observed, an unruly and quite incompetent boy could be perceived by the teacher as bored, but 'really' more intelligent than a cooperative and high achieving girl. In general, girls' better achievement and more cooperative style meant that they received less attention: 'The overall picture of teachers' relationship to students of both sexes indicates that the girls do get some praise for their obedience and willingness to please the teacher, but that they pay a price for this by being forgotten and taken for granted, they do not exist as individuals in their teacher's minds' (Wernersson, 1977, p. 254, translated from Swedish).

Even though girls were often praised as good pupils in the primary school, performed better, and were reported to be more satisfied with school, several studies indicated a serious decrease in self-esteem of girls in secondary school (Lees, 1986). Although girls continued to get better marks than boys, teachers often perceived girls' classroom participation to change dramatically and for the worse in adolescence (Hjort, 1984; Wernersson, 1977). The girls tended to become less compliant, less self-confident and participated less in classroom discussions. Contradictory explicit and implicit norms for what was valued meant that while girls might meet the explicit demands of obedient behaviour, the more inventive and individualistic behaviour of the boys was what corresponded to the (implicitly male) ideal student of child-centred pedagogy.

*Gender Identities, Age and Peer Group—Research from the 1980s and 1990s*

In the 1980s, the focus shifted from analyses of inequality produced through differential treatment and double standards in the classroom

to a focus on the active role children themselves play in constructing gendered worlds and taking up gendered discourse. In learning to be recognizable members of their social worlds, children actively take up their assigned gender in complex patterns of conformity and resistance. Already from preschool age, children are engaged in 'category maintenance' (Davies, 1989/2003) or 'borderwork' (Thorne, 1993). The expressions and the relative importance of this work vary with age, gender and situational context. It is strongest and most inflexible in the age span from 5 to 12 years, and though boys tend to demarcate themselves more fiercely from girls than the other way round, both genders engage more in borderwork in institutionalised or group contexts, than in more informal and personal contexts.

This new approach situated classroom talk in a broader cultural, linguistic and psychological context, as part of a process of gender identity formation. This was an important interpretive shift in which girls' cooperative style was no longer seen as an expression of inherent obedience and passivity, but as an active taking up of gendered identity in which female identities are relational and responsive to others.

Studies focusing on the formation of gendered identities and life-worlds indicated that girls' cooperative and boys' competitive and individualistic discursive strategies are found and practiced in their respective single sex groups. Girls like collaboration with peers and group work better than boys (Hjort, 1984; Reay, 1991). Girls and boys tend to take an interest in different aspects of the world around them: girls are more active in classroom talk when human and social issues are discussed, and the greatest male dominance is found in science classes and when the discussion concerns politics and history (Hjort, 1984; Kelly, 1988). In classes where girls dominate, the conversation patterns tend to be different, both in regard to form and content and in the way the girls relate to classmates (Öhrn, 1991). The girls' interpersonal interest is also seen in their dyadic friendships where their relational competence is used both as a means of establishing contact and in fighting and betraying each other. The boys' more assertive and aggressive behaviour could be connected to their more hierarchical and competitive social life, where getting public attention and admiration from the group of boys counts more than intimate relations, and where demonstrating their superiority over girls seems to be a central point in establishing a collective male identity (Best, 1983; Hey, 1997; Nielsen and Larsen, 1985; Paley, 1984). The subtle interplay between the priorities and social orientations of girls and boys, the structure and content of classroom discourse and the responses they receive from the teacher is seen as almost inevitably maintaining and reinforcing the traditional gender order.

The focus on cultural meanings and active self-constructions gave more attention to the secondary level where classroom activity displayed a more varied picture than the findings for earlier ages (Brophy, 1985; Lees, 1986; Öhrn, 1991). Some girls tended to adopt a more 'masculine' approach at this age, in line with what they perceived as being valued in school. Others responded to boys' more concerted displays of dominance by becoming silent or oppositional. The explanations given were the gradual changes in the academic demands towards more abstract knowledge, matter-of-factness, more impersonal relations to the teachers, a more competitive atmosphere, and, related to this, the limited area of application in school for the girls' interactive skills (Brophy, 1985; Hjort, 1984). Generally, girls were neither taken seriously in regard to the (implicit male) norms of school curriculum and discourse, nor were they given possibilities to develop their personal and social orientation.

The different social orientations of girls and boys were also seen as gender specific platforms for strategies of resistance towards the power asymmetries in the classroom. These differed according to the class- and ethnicity-related cultures of the students. Studies of youth cultures analysed different gendered identities as positions for gaining power and control both in relation to teachers and in peer groups. Some working class boys, for instance, seemed to oppose the middle class culture of school through macho behaviour, strengthening both their working class male identity and the likelihood of dropping out of school (Kryger, 1988; Willis, 1977). Similarly, girls' docility could sometimes be used to gain facilities or advantages, and they could use their interactive skills to gain influence. Adolescent working class girls appeared to have their own patterns of resistance, using more personal weapons against teachers and school routines (Lees, 1986; Öhrn, 1991).

*Intersectional Identity Constructions—Research from the 1990s and the New Millennium*

While studies from the 1980s mostly saw classroom behaviour and discursive strategies of girls and boys as part of a developmental process in which gendered identity is accomplished, researchers in the social constructionist and post-structuralist traditions from the 1990s onwards have challenged the idea of such coherent and stable identities, and such coherent and stable gender binaries. In this new research it was argued that through ignoring the complexity of gender, the identity formation studies might actually have contributed to the maintenance of the bipolarity of gender, instead of deconstructing and opposing it. Gender should rather be seen as dynamic and processual: 'We *are* and *have* gender; but we can also do gender, avoid

gender, ignore gender and challenge gender' (Gordon, Holland and Lahelma, 2000, p. 3).

In studies informed by post-structuralism, the focus changed to the discursive practices through which culturally available meanings are taken up and lived out. They ask what positions are open for students to identify with in the gendered discourses of learning, and how do students position themselves in relation to such gendered discourses? (Adams and Walkerdine, 1986; Davies 1993/2003; Walkerdine, 1990). To do gender in the classroom is to continuously negotiate, maintain, or oppose these positionings offered in classroom talk. At the same time, because gendered images, metaphors and narratives are part of the everyday, unexamined discursive practices of the classroom, they mostly pass unnoticed by both teachers and students. The binaries that structure Western thought (abstract/concrete, rational/emotional, independent/dependent) are tied into the binary male/female in complex ways (Davies, 1989/2003). Our patterns of language usage contain and shape the positions that are open to boys and girls in the discursive practices of the classroom, and the meanings that are attributed to what they do.

A number of studies have taken a broader social constructionist approach and put more emphasis on the open and ongoing processes of subjectification by which students construct themselves as gendered subjects within specific contexts and organisational framings (Ambjörnsson, 2004; Davies and Kasama, 2004; Gordon, Holland and Lahelma, 2000; Mac an Ghail, 1994; Staunæs, 2004; Thorne, 1993). School ethnographies combining observations, interviews and visual material from the everyday life at school with an analysis of the wider material and political structures outside the specific school have become more prevalent. New emphasis has been put on the relation between gender constructions and the constructions of sexualities (Robinson and Diaz, 2006). The complexity, ambivalence and multiplicity of masculinities and femininities among and within individuals has been emphasised, and also the intersecting character of different social categories: Gender, ethnicity, class and sexuality should not be seen as additive identities, but rather as mutually constituting at every moment in the school setting, resulting in an array of different and fluid, but also hierarchically ordered forms of masculinities and femininities which come into existence by being 'done' in interaction (Alloway, Gilbert, Gilbert and Henderson, 2003). Thus, the result is not fixed identity categories, but an ongoing process where different students are in- and excluded, according to what is seen as appropriate or inappropriate ways of doing gender, ethnicity, class and sexuality in a specific context. As a methodological consequence, the analytic focus is often

on the borderline figures or incidents—on those who do not fit within what is perceived as ‘normal’ in a specific context—and thus on making the naturalized categories visible and potentially transgressable. One study, for instance, (Staunæs, 2004) found the following ‘normative imperatives’ to be at work in two Danish compulsory schools: stay mono-ethnic, preferably Danish, expose an appropriate amount of heterosexuality, and keep your sexual-romantic relations within your own ethnic group. However, the different educational values of the schools—one striving to convey Danish culture to its multi-ethnic group of students, the other trying to create a multicultural environment for learning—had different impacts on how the borders were drawn, and on what identities became visible and problematic. While multi-ethnic boys were seen as the trouble-makers at the first school, the girls with Danish ethnicity who extended their liberated sexual behaviour outside their own ethnic groups were the problematic category in the other. In the ‘Danish’ school, sexism was absorbed in the overwhelming visibility of ethnic borderlines; in the multicultural school, problems arose when students behaved in non-appropriate ways (sexually and otherwise) for the ethnic group to which they belonged. Another study interrupted the long-term association of hegemonic masculinity with an individualism that is disruptive of the teacher’s agenda and of harmonious social relations in the classroom. Davies and Kasama (2004) found that dominant masculinity in Japanese preschools is expressed through co-operation with the teacher. The individuality of boys is not accomplished against relationality and awareness of others’ needs, but in harmony with it.

#### PROBLEMS AND DIFFICULTIES

The unfolding of different research perspectives throughout the last decades make it difficult to say what changes in gendered classroom talk have taken place during that period. Different groups of students have been viewed from different perspectives in different studies and at different times (Öhrn, 2002).

Studies of classroom interaction and gendered identities from the 1990s onwards indicate a situation of both continuity and change. Several studies (including some of the new school ethnographies) have found discourse patterns not radically different from the ones seen in the 1970s, and relative stability in boys’ and girls’ gender stereotypes and peer relations. At the same time, they convey a more nuanced picture of variation related to social class and educational context (Bailey, 1993; Gordon, Holland and Lahelma, 2000; McLeod and Yates, 2006). It is not easy, however, to say whether this variation is due to a change

in ways gender may be expressed in schools today, or to a greater awareness on the part of the researchers relying both on the critique of the gender binary of the 1990s, onwards and on making gender visible in the first place in the 1970s and 1980s. From the early 1990s a new figure in the classroom has become a centre of attention: the 'new' active girl who keeps intact her relational interests and competencies, but does not lose her self-confidence at adolescence. She does better than the boys, not only with regard to marks, but also with regard to coping with new qualification demands in school and society (see for instance Hatchell, 1998; Nielsen 2004). As a mirror to this, the discourse about 'failing boys' has become prevalent in public and educational debate (see for instance, Epstein, 1998). A difficulty is, however, that girls' and boys' situation in school is often analyzed from different perspectives—the 'new' girls in term of agency, and the 'failing' boys in terms of an assumed feminised school context (Öhrn, 2002). Whereas the 1970s and 1980s saw a tendency to analyse boys in terms of class, and girls in terms of gender, the opposite is the case today where the 'new' girl is often explicitly individualised, white and middle-class, and the 'failing' boys are grouped together as the losing gender. The current studies of boys come from a range of political agendas and adopt a range of research perspectives: the 'what about the boys?' studies continue with the approach of the seventies in which female teachers are blamed for boys' failure and unhappiness. The 'multiple masculinities' agenda focuses on the varieties of masculinity and blames the dominant boys for not accepting difference. The more post-structurally oriented studies question the automatic assumption of masculinities of one kind or another being inextricably linked to the male-sexed body.

Another complexity is that even if school today should, to some degree, be characterised by new ways of constructing gender identities among girls and boys, the teachers' interpretation of the students may not have changed to the same extent. Oppositional girls are seen as a bigger nuisance than oppositional boys and are disciplined for less disturbing behaviour than are boys (Gordon, Holland and Lahelma, 2000). Öhrn (1991) found in her study of Swedish classrooms that being outspoken and active does not necessarily give girls individuality in the classroom. Teachers still described girls in groups and boys as individuals, and now referred to active girls collectively as, for instance, the 'girl mafia'. Öhrn also found that teachers overestimated the extent of the girls' oral activity, while the reverse applied for the boys. Boys were only judged to dominate when the gender difference was extremely marked. The discourse about failing boys in the 1990s has aroused much more immediate attention than the discourse of 'silent

and insecure girls' in the 1970s and 1980s. The old gender order may also be seen in the research itself where the attention of even aware researchers is easily drawn towards the boys, while the girls remain marginalised (Gordon, Holland and Lahelma, 2000). And whereas the study of different 'masculinities' in school appears to be an interesting and legitimate subject in contemporary gender studies, the study of different 'femininities' does not.

A last point is that these various theoretical perspectives on gender in education could be seen as supplementary rather than as mutually excluding each other. Without a gender identity and a gender construction perspective, the structural perspective may overlook the attractions of doing gender, the agency of the students in specific contexts, and the ways gender intersects with other categories. Without a gender structure and a gender construction perspective, the identity perspective may overlook existing power relations in the classroom and the flexible, contradictory and processual character of subjectification. Without a gender structural and a gender identity perspective, the construction perspective may overlook the astonishing stability of structural patterns over time, in spite of all the ongoing negotiations, and neglect the motivational and formative dimensions of such constructions and negotiations. Language is both a means for construction of gender, and a means for expressing gender. Studies of 'being' gendered and 'doing' gender could, thus, be seen as functionally related and reveal different aspects of the social process of gendered identity construction. Studies of individuals cannot give any full account of the collective process of doing gender—something new is accomplished/created in this process. But the reverse is also true: the analysis of the collective praxis does not tell us anything about the different motives of the individuals who engage in this meaning making, what positions they choose in it, and what consequences this has for their sense of self over time. Studies of gender in classroom discourse reveal both obvious differences within each gender group and in the array of gender positionings the same girl or boy can take up, and, at the same time, striking similarities within each gender group over a wide array of cultural and situational contexts in the ways girls or boys do and are their gender. A theory of gendered identity should account for both, being aware of the traps both of false similarities and false differences.

#### FUTURE DIRECTIONS

Future research must see how gender structures in classroom discourse, gendered identity formations and gendered positionings and subjectification in school interact—in a period of time where major social and

economic changes, particularly in relation to family—and work patterns have had a pro-found influence on gender images and gender relations. What do schools do with gender compared to what, for instance, families do? (McLeod and Yates, 2006). A growing interest in comparative, longitudinal, and generational studies (see, for instance, Davies and Kasama, 2004; Gordon, Holland and Lahelma, 2000; McLeod and Yates, 2006; Nielsen, 2004;) may indicate an urge to overcome the somewhat fragmented picture in the research and also to locate classroom discourse in a wider perspective. Gender construction also needs to be understood better in relation to intersecting identities like age, class, ethnicity and sexuality, in relation to specific educational contexts and situations, and in relation to ways teachers position students as girls and boys. Little is known about what differences in teachers' own gender, class, sexuality and ethnicity mean for these processes.

Future research must also ask questions such as, in what respect must gender be part of the identity formation process? Can identity be maintained without it—and do we want to maintain it? Post-structuralist theorists imagine a world that goes beyond gendered identities. Might doing away with gender leave us once again with the gender neutral illusion of the child-centred ideology, ignoring the fact that social structures of gender and power hierarchies can work quite effectively even when linguistically disguised?

ETHNICITY AT WORK IN PEER-GROUP INTERACTIONS  
AT SCHOOL

INTRODUCTION

This review focuses on the ways in which ethnicity and allegiance are manifested in peer-group interactions at school. The intimate relationship between social process and everyday life of social actors is central to the review and will be referred to throughout the text. The review includes an outline of some of the early developments and major contributions to research in the field. Some implications from on-going work and suggestions relating to challenges and future directions in the study of youth, language and education are delineated. The author takes as a point of departure research in the Swedish context but the empirical suggestions and theoretical implications outlined ought to be valid also outside of the Nordic context.

CHANGING THEORETICAL PERSPECTIVES AND  
SIGNIFICANT SOCIAL CHANGE: THE  
IMPLICATIONS FOR RESEARCH

Research in the field has been guided by theoretical developments as well as social changes. The development of the theoretical perspective of poststructuralism on the one hand and the increasing complexity of society in this late modern time on the other have influenced both initial and more recent work in the field.

*Poststructuralism: The Power of Language and Discourse*

In the early developments of research on multilingualism with grounding in poststructuralist and critical theory the intimate relation between social actors, their language practices and the contexts in which their social encounters take place has been the main focus (Gal, 1989; Heller, 1988; Mehan, 1987; Rampton, 1995; Woolard, 1985;) (see Heller, *Language Choice and Symbolic Domination*, Volume 3). Applying the poststructuralist perspective to analyses of language practices and narratives shifts the focus away from traditional concerns with linguistic differences towards the ways in which meaning is constructed locally within particular sociocultural and linguistic contexts.

Theorizing around language in this tradition is concerned with the identities inscribed in discourses and how they operate (Gee, 1992). Hence, “[i]nstead of assuming that individuals have an identity as, say, a woman or a black, or assuming that selves are produced by discourses in any simple way, [poststructuralists] see individuals as being inserted into webs of discourses that always position [them] in multiple intersecting ways” (Seidman and Alexander, 2001, p. 7). There is accordingly an attempt in the approach to identify the relationship between everyday practices and the sociohistorical and economic conditions, which shape them.

The initial contributions in the field take as a point of departure that all human action, including language practices, is dialectically related to social structure and social process. Language is part of the social, interacting with other modes of social behavior. Discourse and daily interaction accordingly *mediates* something more than what is observable here and now. The mediating function of language helps draw attention to power dynamics both in the encounters themselves and in other aspects of a particular sociocultural context. Mediation, in view of that, stands for something more than simple reflection or reproduction (Williams, [1973]1991).

*The Nation State in Late Modern Times: Struggles for Uniformity Within Diversity*

The early work in the field, in Sweden and in other Western societies, highlighted the increasing preoccupation with the maintenance of an imagined homogeneous society and a shared mainstream culture and language. This is in response to, on the one hand, continuous and radical social and cultural transformation and change and on the other an ambition to maintain traditional social and cultural practices. Majority members may come to regard themselves as guardians of traditional mainstream values, attitudes and beliefs, mediated through the majority language. The majority in this effort draws on an existing system of dispositions and a particular habitus already shared in the (dominant) communities (Bourdieu, 1991; Bourdieu and Passeron, 1977) (see Heller, *Language Choice and Symbolic Domination*, Volume 3). In this way, the majority members may succeed in sustaining their key positions in the game of power taking place throughout organizations and institutions. Withholding an official policy of uniformity within diversity, the state, governed by this elite, sets out to control the increasing heterogeneity (Sjögren, 2001). Accordingly, what appears to be struggles for pluralism and a profound integration project may be just new masked forms of assimilation. In Sweden, these processes would be scarcely different from the assimilating processes underpinning the

linguistic and educational policies directed to the Sami and the Finnish-speaking minorities in the nineteenth and twentieth centuries (Municio, 2001; Skutnabb-Kangas and Cummins, 1988).

Bourdieu assigns a central role both to education and to language in these processes, pointing to the decisive role of the teacher in the construction, legitimation and imposition of an official language:

[The primary school teacher], by virtue of his function, works daily on the faculty of expression of every idea and every emotion on language. In teaching the same clear, fixed language to children who know it only very vaguely or who even speak various dialects or patois, he is already inclining them quite naturally to see and feel things the same way; and he works to build the common consciousness of the nation. (Bourdieu, 1991, p. 49)

Owing to the hegemonic practices legitimizing nationalism on the basis of a shared language, minority members, including the young multilinguals in focus here, may be prevented from participating in powerful discourses (Heller, 1994). Yet, as representatives of emergent cultures and identifications and given notions of counter or alternative hegemony (Dirks et al., 1994), young people are still in possession of central roles (Cieslik and Pollock, 2002). They are symbols of the changes but also act as participants in the process of implementing them.

#### INVESTIGATING THE LINKS BETWEEN THE INTERACTIONAL ORDER AND THE SOCIAL AND SYMBOLIC ORDER

Recent sociolinguistic studies in the field of language and education include attempts to uncover connections between the interactional order and social and institutional order. The findings of this research have illustrated how structures of domination and discrimination are established and reproduced but also contested on the micro-level of speech (Heller, 1999; Rampton, 1995; see also Heller and Martin-Jones, 2001 and Pavlenko and Blackledge, 2004 for collections of articles on this theme). In the Swedish context, the relationship between language and social context was established when the poststructuralist perspective was first applied to the study of language and education in work among youth in a multiethnic school setting (Haglund, 2005).

The theoretical direction suggesting that there is a potential in social structures for actors, above all young people, to actively respond to and even resist dominant discourses has been established in much cross-disciplinary research over the years. The studies in this direction have illustrated how experiences of social exclusion may direct youth to invest outside of mainstream majority contexts, in the globalized

marketplace where some of them already operate (see e.g., Hall, 1988), or towards the margins of society, where they eventually give up their struggles for legitimacy (see e.g., Cieslik and Pollock, 2002; Heath, 1994; Willis 1977). An additional strategy includes accommodation to mainstream language preferences and corresponding normalized and neutralized language practices (see e.g., Nieto, 1996).

Studies demonstrate how speakers employ their expanding linguistic repertoires to create and modify their social worlds (Hoyle and Adger, 1998; Maybin, 1993, 1999, 2006). Maybin offers insights into pre-adolescents' use of repeated, appropriated and reported speech in order to position themselves in relation to the institutional practices of schooling (1999). Albeit without focusing primarily on ethnicity, Maybin raises questions about the notion of individual voice, individual agency and the boundaries between the voice of the self and the voice of the other.

Given the current transformations and changes of Western societies, above all in relation to ethnicity, culture and language, there is a need in current research to take full account of the sociohistorical and present economic and political conditions. Such a focus in the study of language and education facilitates the appreciation of the background to and consequences of rejections of categorization and of the knowledge valued by the dominant class (or race). In some groundbreaking studies this implication is taken seriously (Heller, 1999; Rampton, 1995). These studies point out linguistically mediated contestations among young minorities of the attempts by the elite to establish this knowledge and the language it produces as legitimate.

Heller (1999) illustrates how choices of specific languages, vernaculars, or certain expressions over others may index ethnicity or a particular political stance between language and ethnicity. In a Franco-phone school in Ontario, Heller observes tensions between the monolingual ideology of the school and the language use and ideologies of some of its students. Heller finds that some of the students find ways of resisting the linguistic ideology of the school through the very language which oppresses them. In the school, the French language is officially manifested in order to resist the general domination of English in the province and in the urban environment. Unofficially, and on the micro-level of interaction among the students, English, thus, becomes the language of resistance.

In a study on language and ethnicity among adolescents in England, in the South Midlands (Rampton, 1995), in a similar way, situates interaction in the larger structures "that both constrain and are reproduced through specific activities, values, norms, roles, purposes and systems of stratification" (p. 348). According to Rampton, to adjust one's linguistic practice is an act of investment, an expression of desire

and a deliberate counter-hegemonic undertaking. Rampton shows how adolescents draw on a repertoire of languages (or language varieties) in an effort to affirm or contest social structure and define community. According to Rampton (1999) languages and dialects are used in order to appropriate, explore, reproduce, or challenge influential images and stereotypes of groups to which the speakers themselves do not belong.

Rampton (1995) accordingly identifies a multilingual repertoire suggesting that linguistic switches “contribute[s] to the definition of multiracial youth community ... an imperfectly shared meaning potential that enabled youngsters to declare positions and comment on social order” (p. 237). Rampton compares the observed “language crossing” to a kind of “liminoid practice,” which contains social critiques of mainstream structures and organization. He argues that crossing warrants close attention to the emergence of “new ethnicities of the margins” (Rampton, 1998, p. 299) (cf. Hall, 1988). The observation that “crossing” is used in efforts to define community corresponds to the assumption that actors, in their daily conduct and communication, undermine taken-for-granted realities and try to establish new conventions and assumptions where old ones no longer seem tenable (Rampton, 1995).

Bailey (2001) observes how different language forms are adopted in order to resist white cultural and linguistic hegemony and the dichotomous black–white racial classification system in the USA where his study among Dominican Americans is conducted. The discursive construction of identity is situationally activated through language. A non-white identification is highlighted among the high school students through avoidance of marked white English forms, mocking use of white English and extensive adoption of African American vernacular English. Bailey argues that the multilingual repertoire “serves to undermine U.S. assumptions of a primordial unity among language, phenotype and identity, particularly in constructions of the category African American” (p. 215).

Giampapa (2001) illustrates how Italian-Canadian youths use language in order to re-position themselves and downplay neutralizations of their ethnicities as well as actually accentuating them or performing a range of ethnicities through participating in creating a “new” code. Language is thus used by youth to locate themselves in relation to expectations but also in terms of their individual preferences in relation to language and culture.

The major contributions in the field accordingly show us that contestation and partial penetration of dominant structures are important components of the power infrastructure and that social actors are most active in bringing about social transformation and change. These findings have guided more recent work.

## WORK IN PROGRESS IN THE SWEDISH CONTEXT

Some insight from on-going work in Sweden will serve here as *one* illustration of everyday life, language and identity among young people in multiethnic school settings. We will see how the experiences of young people can bring about particular interactional patterns and identification processes, which in turn reflect some of the social mechanisms at work at school.

*Institutional Order and Sociocultural Change: Peer-Group Interactions at a Swedish School*

A recent study among young multilinguals in Sweden (Haglund, 2005) has provided insights into how identifications and allegiances get constructed and reconstructed in everyday social interaction in and out of school. The study is based on an ethnographic fieldwork among a group of first- and second-generation minority members in their early to late adolescence (aged 12–17). The fieldwork was conducted in the stratified multiethnic neighborhood of “Durby” and at the junior high school of the community “Durby School.”<sup>1</sup> The fieldwork covered the 3 years of junior high school focusing on the activities of about 50 students during this period. The dominant ethnic backgrounds of the subjects were Turkish and Kurdish. Other nations of origin represented among the young people were Chile, Iraq, Serbia, Bangladesh, Pakistan, Finland, Greece and Russia. The primary ethnographic method employed was participant observation in a number of different situations and contexts both inside and outside of school. Fieldnotes and audio-recordings, in addition to subjects’ diary notes and individual audio-recordings constituted the bulk of data generated. The research revealed the influence on identification processes and language preferences and practices from the youths’ common diasporic experience of living outside of the countries or nations of origin, experiencing marginalization in relation to Swedish majority society and concurrently being part of global, national and local transformations and changes.

The contradictory experience of simultaneous central and marginal positions led to claims regarding the right to be valued, feel a sense of belonging and have access to instruction that is responsive to the needs of diverse learners. Efforts were also made to acquire the legitimate cultural capital and the prestigious majority language, which in some cases resulted in disparagement and a reduced use of the minority language, even though the majority language was not yet completely

---

<sup>1</sup> ‘Durby’ and ‘Durby School’ are pseudonyms given in order to preserve confidentiality.

mastered. In the latter case, the struggle to remove oneself from the margins accordingly seemed to take place at the expense of the young people's multilingual development.

The collective interactional practices among peers in formal classroom interaction, to a large degree, embodied contestation, whereas individual accounts to a larger degree reflected ambivalence and sometimes compliance. Hence, the absence of the peer-group seemed to lead to perspectives and approaches that in some cases stood in glaring contrast to the ones that emerged from these other negotiations among peers or between students and teachers. A hypothesis emerges suggesting that the peer-group and the interaction that took place here or where support was retrieved, offered more space for contestation.

Ethnicity was constructed as part of counter-hegemonic strategies identified in interactions with teachers and in attempts of the young people at positioning themselves as positive as possible in the peer-group, ensuring solidarity was maintained, at the same time as making sure the individual positioning as scapegoat was avoided.

#### *Contestation in Formal Classroom Interaction*

The young people did not simply accept the negative expectations embedded in some of the discourses and practices they were subjected to. Instead, parallel to their attempts to conquer other fields, they objected to the structures of domination (Haglund, 2005, p. 102ff.). They made efforts to challenge teachers' attempts to maintain control of the content of the classroom.

They struggled to manifest the benefits of their backgrounds, their multitude of competencies and transcultural experiences. Accordingly they collectively set out to position themselves in relation to expectations, demands and prescribed statuses and roles and took a collective stand in relation to the agendas of the teachers. A counter-discourse was constructed among them as a part of this effort.

#### *Strategic Positionings in Peer-Group Interactions*

In peer-group interactions the young people negotiated common strategic positionings, which they subsequently drew on collectively in the formal context. But in the peer-group they also exploited stigmas and stereotypes related to specific ethnicities and languages, a strategy which itself was ambiguous. It offered a possibility of escaping workings of the dominant discourses but simultaneously functioned to manifest precisely these ideas. The strategies, with the dual purpose of ensuring commitment to the allegiance established and achieving individual

agendas, include claiming authority, monitoring and mocking. Each of the strategies is discussed subsequently.

*Role Enactments: Authoritative Voices*

The young people objected to the unequal distribution of power at school and in society through attempting to rearrange the institutional order. A salient example of such repositioning includes the efforts made in peer-group interaction to draw on authoritative voices (Haglund, 2005, p. 125ff.). Discussions on politics and power issues both from a local a more general global perspective were frequent among peers. In these interactions, roles were enacted with the general purpose of gaining more influence on the present power structure. The roles available were, for instance, those of presidents and prime ministers from countries all over the world. The young people moved between different “nationalities” in these interactions. In addition to the range of roles available, this elusivity implies that “national identity” was subordinated to the goal of achieving certain purposes in the interaction.

The young people attempted to problematize not merely the ethnic and social segregation characteristic of their neighborhood as they saw it, but also the unequal power distribution of Swedish society more generally. In one episode where this pattern was manifested one of the young people in this study enacted the role of the president of the USA at the time, Bill Clinton: “I’ve come from America, all the way up to Sweden . . . to visit Durby [the multiethnic neighborhood], to visit you.” Referring to the general understanding of Sweden as an egalitarian country the boy asserted: “I’ve heard and I didn’t believe . . . Because in Sweden everything is beautiful,” and thereby scratching the surface of the well kept secret of the social, economic and ethnic segregation of Swedish society. Furthermore, drawing on media discourse, suggesting that he (Bill Clinton) wanted to see what Durby is like through the perspective of the inhabitants he announced: “And now I have given the camera to everyone who lives in Durby,” an approach quite commonly taken by journalists focusing on life in multiethnic neighborhoods in the late 1990s.

This enactment of imaginary roles (see Lytra, *Playful Talk, Learners’ Play Frames and the Construction of Identities*, Volume 3) supported the attempts of the young people to position themselves vis-à-vis social inequalities and the lack of control and influence accompanying their subordination. Claiming the powerful voices also functioned to rearrange the distribution of power in the particular situation. The authoritative voices provided new legitimacy and thereby affiliated individual, as well as collective positionings. Other interactional strategies

employed in order to display this kind of solidarity included talking simultaneously and finishing or repeating each other's utterances.

*Performance Control: Monitoring and Mocking*

In order to manifest solidarity within the peer-group, ensure the shared interest and direction of the community established and further manifest the common agenda and commitment to a mutual allegiance the young people ensured that the degree of deviation among them, for instance in terms of language use and identification, was limited. They monitored one another's performances and quests for identities. The status and value of the variety of Swedish spoken among them was put forward as one of the most powerful symbols of their allegiance (Haglund, 2005, p. 113ff).

The young people also shared fragments of, or merely the intonations and pitches of, each other's languages. The practice of mocking seemed to reinforce and manifest solidarity but was also drawn upon by individuals to escape the stigma and stereotypes they were aware were depicted about some of the additional languages and ethnicities represented among them.

*Popular Culture and the Internet*

The constructions and reconstructions of identities and allegiances in peer-group interaction reflected successful attempts by the young people to make sense of their own position in relation to the diasporic experience. In their quests for identities, they did not draw on the conditions set up by the local community or mainstream society alone, but instead their identifications were constructed in relation to a combination of these conditions and more modern influences from global, trans- and postnational experiences. These experiences derived, for instance, from their virtual communication on the internet or from popular culture, both offering material from which they were relatively free to choose (Haglund, 2005, p. 151ff.). Unique insights were accordingly offered here into the lives of other young people from their countries of origin or from other major European and international cities. Space was accordingly provided in which the young people constructed their own "truths" about, for instance, their life situations and negotiated and critically reflected upon the complexity of the diasporic experience. The identifications of these young people, then, should not be understood as autonomous, but temporally, spatially and situationally contingent.

It is possible to draw out resonances from this empirical work with research in contexts outside of Sweden. For instance, Maybin (1999)

identifies, in a similar way, how appropriated and reported voices are drawn on in order for adolescents to invoke an authoritative voice to pursue their own social goals. Goodwin (1990) also identifies how authoritative voices may be drawn upon in interaction in order to create or maintain hierarchical status. Commitment among youth to peer-group allegiances has also been identified, for instance, by Fordham and Ogbu (1986). They observed how African Americans develop group loyalty by defining some attitudes and behaviors occurring among them as “white” and consequently unacceptable. Furthermore, the strategies of mocking identified in the present study correspond to occurrences of “crossing” (see above) and to mocking of institutional voices and jocular abuse in relation to representatives of the dominant mainstream population more generally (Rampton, 1995). Together, this work in the field illustrates how language use lets aesthetic creativity and identity formation interact with ideological discourses and power relations.

#### PROBLEMS AND DIFFICULTIES

Theoretical as well as methodological challenges apply in the study of ethnicity in peer-group interactions. Studies focusing on subcultures and transgressive identifications rarely account for the situation where the construction of allegiances is linguistically mediated. Similarly, it is not always the case that studies focusing on interaction account for how objections and oppositions are connected to social order, or in which ways language offers space for negotiations of this order. Instead, analyses and interpretations mainly linger at the interactional level. Most studies, for instance in the Swedish context, are accordingly part of a direction in research influenced by conversation analysis theories (see Mori and Zuengler, *Conversation Analysis and Talk-in-interaction in Classrooms*, Volume 3). Identifying the relationship between everyday social practices, including interactional practices, and the sociohistorical and economic conditions which shape them, thus stand out as the primary theoretical challenge in the field.

Methodologically other challenges apply. For instance, there have been calls in educational and sociolinguistic research for accounts of everyday interactions and discourse that do not avoid questions of who gets studied, who gets to study, where the study takes place and on what grounds it is justified (Cameron et al., 1992; Rampton et al., 2002). There are other debates about how researchers are located in the field as cultural outsiders, how they are inserted into the contexts of the field and the specific agendas of the subjects. There is also a concern about the ways in which observers can provide context and space for the voices of others and eschew their own voices and agency (see

Duff, *Language Socialization, Participation and Identity: Ethnographic Approaches*, Volume 3).

Furthermore, it is argued that building arguments and interpretations from accounts of social interaction may sometimes be a precarious activity. This is because large areas of social life and cognition are non-linguistic and cannot be easily "translated" into language (cf. Bourdieu, 1977).

#### FUTURE DIRECTIONS

Drawing on the dominating theoretical directions and most influential empirical findings in the field, it has been argued in this review that the distribution of power, for instance in education, is often acted out on the level of language. It has been illustrated that language is not a neutral medium but mediates power hierarchies, domination and authority. Accordingly, words carry with them a power that goes beyond the description and identification of people, objects, properties and events. By uttering a word, for instance, in a different language, speakers may index another time and place and connotations associated with other situations. Furthermore, theory as well as empirical findings reveal that the identification processes among contemporary youth stretch well beyond predictability, homogeneity and national borders.

Together these developments suggest that the challenge for future research in the field may be, for instance, to investigate further the masked meanings and nuances of utterances, to look closer at the ways in which speakers' interests and intentions are conveyed in talk and to document the ways in which the changing cultural traditions with regard to roles and identities both support and restrain young people in exercising freedom and creativity over how they define their sense of self (cf. Rampton, 1995).

It will be of particular value to investigate the circumstances that allow space for more hybrid and transgressive identifications, thereby increasing our understanding of language as a resource for young multilinguals as they endeavor to assert the legitimacy of their identifications, languages and language practices. The challenge for future studies in the field of language and culture is clearly to uncover previously unseen connections between the micro-level of face-to-face verbal interaction and the macro-level of statuses, roles and identities (cf. Duranti, 1997).

In future ventures in the field, researchers might also want to make more explicit the connections between local instances of social interaction and wider processes, such as globalization, internationalization, transnationalism and postnationalism. Such efforts would increase our awareness of the mechanisms at work in these processes and of the

influence of sociocultural transformation and change on individual attitudes, choices and social practices, particularly with regard to language and identity. The complex and unpredictable nature of contemporary social life and social practice requires understandings that go beyond the categories of social class, gender, ethnicity and religion that are frequently applied in more traditional sociolinguistic studies. Methodologically, ethnography, and more specifically critical ethnography, offers opportunities to uncover the kind of structures and processes under scrutiny. Adopting a dual focus on the macro-level of society and the micro-level of speech and narratives can also offer opportunities to further advance cross-disciplinary approaches.

Last but not least, researchers have a responsibility to share whatever they can of their findings with the young people who participate in their research and to explore ways of collaborating with them in doing such research. The link between research and practice, and in particular educational practice, also needs to be explored in dialogue with teachers and teacher educators.

#### ACKNOWLEDGEMENTS

I am grateful to Marilyn Martin-Jones, Anne-Marie de Mejia and Nancy Hornberger and two anonymous reviewers for comments on an earlier draft of this paper.

PLAYFUL TALK, LEARNERS' PLAY FRAMES  
AND THE CONSTRUCTION OF IDENTITIES

INTRODUCTION

Research into learners' talk in schools and classrooms from educational and sociolinguistic perspectives has explored the intersection of language and identity construction. These research traditions view identity as "an emergent construction, the situated outcome of a rhetorical and interpretative process in which interactants make situationally motivated selections from socially constituted repertoires of identificational and affiliational resources and craft these semiotic resources into identity claims for presentation to others" (Bauman, 2000, p. 1). From this perspective, language (including playful talk) emerges as one of the central semiotic resources available to learners (and teachers) to make identity claims. By focusing on the learners' linguistic and other semiotic resources, we can then explore "when and how identities are interactively invoked by sociocultural actors" (Kroskrity, 1993, p. 222). This understanding of identity is premised on a view of the self as an active participant in the interactively achieved social construction of meaning. Identity construction is, therefore, viewed as an on-going process that is constituted through daily interactions in sites such as schools, classrooms and other social places, rather than a quality that a learner has or does not have. Moreover, in educational contexts, social realities are shaped by the institutional order of the school, rather than a priori taken for granted social fact. Both premises underlie a social constructionist approach to identity.

Playful talk can, therefore, provide a productive locus for the study of the constitution, representation and negotiation of social roles and identities in learners' talk in schools and classrooms (see also Bourne, *Official Pedagogic Discourses and the Construction of Learners' Identities*, Volume 3; Luk Ching Man, *Classroom Discourse and the Construction of Learner and Teacher Identities*, Volume 3). In this chapter, I use the term "playful talk" as a super-ordinate category with the purpose of capturing a wide range of verbal activities and routines, including teasing, joking, humour, verbal play, parody, music making, chanting that can emerge in learners' talk. Some of these activities and routines may be more fleeting and highly unstructured (e.g. private solo singing and humming of popular tunes in circulation) and others more ritualised

(e.g. teasing routines). Moreover, these verbal phenomena may require different understandings of local and global contexts and allow for varying audience roles and participant structures. The notion of playful talk can be fruitfully combined with the concept of performance as linguistic practice that is “situated, interactional, communicatively motivated” (Bauman, 2000, p. 1). Playful talk as performance then can “represent for participants an arena for the display, contemplation, and manipulation of salient elements, practices, and relationships that allow language to serve as a resource for the expression of identity” (ibid., p. 4).

### EARLY DEVELOPMENTS

Bateson in *Steps to an Ecology of the Mind* (1972) was one of the very first scholars to develop a theory of play and communication drawing on a number of disparate disciplines, including anthropology, psychiatry and biology. In his pioneering essay *A Theory of Play and Fantasy* (reprinted in the aforementioned volume), he provides us with two important insights that have influenced the way subsequent scholars working within educational and sociolinguistic paradigms have conceptualised the relationship between play and communication. Observing two young monkeys playing in the San Francisco Zoo in the 1950s, he noted first that the monkeys were engaged in an interactive sequence of actions or signals that were similar to but not entirely the same as those of combat. Second, he noticed that the participant monkeys treated their playing as such. Based on these observations, Bateson deduced that the two monkeys were capable of some degree of meta-communication that involved exchanging signals carrying the message “this is play” (Bateson, 1972, p. 178). Drawing on Bateson’s insights, subsequent scholars have explored the close association between play and combat in human communication and the liable nature of play as well as the significance of meta-communicative awareness in recognising that an interactive sequence should be interpreted as play.

Goffman’s discussion of frames in *Frame Analysis* (1974) can be a useful point of entry into the examination of the unstable nature of play with important implications for the conceptualisation of play frames in general and learners’ play frames in particular. Goffman regards frames as mechanisms through which participants structure their social and personal experiences, thereby providing us with an interpretation of what is going on in a given interaction (Goffman, 1974, pp. 10–11). As indicated in the introduction of this review, playful talk as performance can encompass a wide range of verbal phenomena (e.g. humour, teasing, joking) which in turn set up play frames. Learners can then

employ clusters of contextualisation cues (e.g. laughter, shifts in pitch, rhythm, voice quality, volume, nicknames, repetition) which function as framing devices and signal how their utterances, movements or gestures are to be interpreted by their teachers and fellow classmates. Contextualisation cues as framing devices allow us to glean into the organisation of social interaction and explore how learners strategically exploit playful talk to do identity work in educational settings. By framing talk as play, learners mark-off periods of playful talk devoted to a particular verbal activity (e.g. teasing, music making, verbal play) from talk about other matters (e.g. talk about a school task). Learners need to have a certain degree of meta-communicative awareness in order to distinguish between those signals or cues used for play and those used for combat. Meta-communicative awareness is created and constantly renewed against a backdrop of shared cultural assumptions, associations and background knowledge reflecting the learners' interactional histories and interpersonal ties.

Some of the earliest social interactionist studies on playful talk in urban neighbourhoods in the USA and Turkey explored verbal duelling and ritual insulting routines among African-American young males (Labov, 1972) and Turkish young people respectively (Dundes, Leach and Özkök, 1972). Although not focusing on schools and classrooms, these early studies provided useful insights for the investigation of playful talk, learning and peer socialisation. They highlighted the role and function of ritual and personal insults as contextualisation cues and the unstable and ever-changing boundary between play and non-play. Moreover, they stressed how contestants became competent players by learning to suspend normal conditions of accountability and take what would normally be considered serious business as play. On the other hand, contestants who issued impulsive or defensive protestations or denials lost out and needed to learn how to respond to ritual and personal insults more effectively within the context of the verbal game.

#### MAJOR CONTRIBUTIONS

Educational and sociolinguistic research has tended to focus on learners' official school practices, often ignoring that there is more happening than just learning academic subject matter in schools and classrooms. Indeed, as Maybin (2006) aptly argues, mainstream accounts of schools and classrooms have tended to adopt an "educational gaze". They have tended to concentrate on the learners' curriculum-oriented talk usually with their teachers. As a result, they have often treated instances of "off task" talk in the classroom, for instance, or as learners pass through school corridors, play in school grounds and have lunch together as

marginal. Nevertheless, educational and sociolinguistic studies of schools and classrooms from an ethnographic perspective have repeatedly shown that playful talk is an enduring feature of classroom talk and learning (e.g. Lytra, 2003; Maybin, 2006; Rampton, 2005; see also Garcez, *Microethnography in the Classroom*, Volume 10). These studies have demonstrated that learners' talk is often saturated by the use of nicknames, cross-sex teasing routines and quiet solo singing. They have also illustrated that learners experiment with rhyme and rhythm, differences in intonation contours, pitch, volume and repetition. Moreover, they have shown that learners often refer, allude to, or perform recyclable and recontextualisable fragments of talk from music, TV and film as well as mimic and parody the voices of their teachers and fellow classmates. The shift of focus away from the learners' official school worlds has also been influenced by more recent approaches to classroom talk. These have probed into the heterogeneity of classroom discourses and practices and have highlighted the processes of recontextualisation and dialogicality at play in learners and teachers' talk (e.g. Gutiérrez, Baquedano-López and Tejada, 1999; Haworth, 1999; Kambarelis, 2001; see also Maybin, *Revoicing across Learning Spaces*, Volume 3).

In his seminal study *Crossing: Language and Ethnicity among Adolescents* (1995), Rampton was one of the first scholars to shift our analytical gaze away from curriculum learning and draw our attention to the wide variety of different expressive resources and practices in young people's talk in multiethnic schools and classrooms (see also Haglund, *Ethnicity at Work in Peer-group Interactions at School*, Volume 3). Among other practices, he identified crossing into Punjabi by black and white adolescents in routines of jocular abuse and the impact of popular media culture (in particular music making) on their talk and conduct across different interactional contexts at school. As far as the latter is concerned, he looked into crossing into stylised Asian English in school-sponsored theatrical performances and the spread of bhangra (a form of folk music and dance closely associated with Punjabi culture) among black and white adolescents. One important theme that emerges in this line of research is the different ways in which popular media culture provides young people with rich and complex linguistic and cultural repertoires for play to appropriate, transform and recontextualise in order, for instance, to take part in a sequence of jocular abuse or in singing along snippets of Bhangra and pop songs.

Another key theme is linked to the positioning of such instances of playfulness in daily school activities and classroom routines. Although, as Rampton (2006) argues, such instances of playfulness during instruction were often regarded as undermining teacher authority and

the canonical patterns of classroom talk, they had the potential of opening up new possibilities for teaching and learning. Rather than sanctioning such talk through out, the teacher in his study seemed to tolerate a high degree of playfulness by a group of over-exuberant and keen learners. Indeed, he seemed to regard their contributions as helping to keep the lesson on course. In doing so, the teacher and this group of learners negotiated and co-constructed a particular classroom settlement that appeared to be based on the strategic co-existence and mix of curriculum priorities and popular media culture (notwithstanding along with other influences). For the learners, this classroom settlement, Rampton maintains, seemed to allow them to explore different kinds of sociability, to consolidate existing friendship ties and aid them in their quest for social influence among their peers.

One strand of research that has fruitfully explored the intersection of learners' expressive repertoires (including various forms of playful talk and text production, such as producing and acting out imaginative episodes inspired by contemporary super-heroes and characters from ancient Greek mythology) and popular media culture are childhood literacy development studies (see also Bloome, *Literacies in the Classroom*, Volume 2; Mahiri, *Literacies in the Lives of Urban Youth* Volume 2; Prah, *Language, Literacy and Knowledge Production in Africa*, Volume 2). Dyson's (2003) ethnographic research into primary school literacy highlights the importance of young learners sharing what she called a "common sociocultural landscape" to draw upon in playful talk and text production. She comments on the young learners she worked with:

They had, for example, a favorite radio station and saw many of the same videos; they referenced the same sports teams, and most watched the same televised sports shows; they were all comfortable with a religious discourse and the promise of a heavenly reward (Dyson, 2003, p. 8).

This shared sociocultural landscape provided these young learners with diverse symbolic and textual material and resources to appropriate, recontextualise and reuse in order to fashion both their official and unofficial school worlds. An important theme that emerges is that the young learners' engagement with popular media culture opened up spaces for more polyphonic written and oral playful performances, which in turn, generated new opportunities and challenges for meaning making, social fun and social affiliation.

The importance of the children's shared common knowledge and metalinguistic awareness in participating in playful activities and routines has also been illustrated in studies looking at more linguistically, culturally and ethnically rich pupil populations from an ethnographic sociolinguistics perspective (see also Fenner, *Cultural Awareness in*

the Foreign Language Classroom, Volume 6; Van Essen, *Language Awareness and Knowledge about Language: A Historical Overview*, Volume 6). In my work (Lytra, 2003, 2005), I examine the linguistic and other semiotic resources and practices available to a group of majority Greek and minority Turkish-speaking learners in an Athens primary school. I illustrate how they adapted and refashioned shared references to mainstream Greek popular media culture in their playful talk (e.g. teasing routines and music-making activities) across school contexts. I argue that these resources and practices functioned as a powerful identity kit for the display and co-construction of a shared peer group identity and show how this peer group identity co-articulated with their other social identities and roles at school (e.g. gender, pupil/learner identities). The active participation in such playful routines and activities, I claim, allowed minority children in particular to gain access to and display their knowledge and expertise of valued linguistic and other semiotic resources and practices associated with mainstream Greek popular media culture. At the same time, these processes of boundary leveling based on the sharing of out-of-school recreational practices, experiences and a common sense of humour were fraught with tensions and contradictions. Minority children's claims to knowledge and expertise displayed through their playful talk could be contested by their majority peers, thereby raising boundaries of exclusion and positioning them as peripheral to the group.

Duff (2004) further explores the processes of boundary leveling and boundary raising in relation to inter-textual references to popular media culture (e.g. references to shared jokes, one-liners and set phrases from various media sources) in two linguistically, culturally and ethnically diverse Canadian social science classrooms. Taking an ethnographically informed applied linguistics stand-point, she observes that for the local (Canadian born and raised) pupils and teachers such popular media culture laden talk, saturated by playful banter and repartee, served to affirm their socio-cultural affiliations. For most of the newcomers (ESL learners), however, this on-going playfulness was a source of fun but also bewilderment and ambivalence: more often than not, ESL learners had difficulty following the complex web of inter-textual references which they had no or limited access to at home and through their various community networks. These well-established classroom practices among locals had the effect of restricting the active participation and involvement of ESL learners—or at best allowing them some marginal participation. This resulted to “what was cultural play for some [being] heavy cognitive and identity work for others” (Duff, 2004, p. 253).

One key theme permeating the aforementioned studies is how through playful talk and text production learners take on and reproduce

the “voices” of others by drawing on a diversity of sources (including popular media culture) for meaning making, meaning negotiation and identity work. The notions of inter-textuality (Kristeva, 1980) and contextualisation (Bauman and Briggs, 1990) are central in understanding these processes. Both of these notions are premised on an understanding of talk and text as being “constructed of a mosaic of quotations” (Kristeva, 1980, p. 66). These notions have been fruitfully combined with insights from socio-cultural and social constructivist theories of learning (e.g. neo-Vygotskian approaches), literary theory (e.g. Volosinov and Bakhtin’s work on dialogicality and heteroglossia) and interactional sociolinguistics (e.g. Goffman’s work on *Frame Analysis*). This line of research has looked into learners (and teachers’) various types of playful talk across learning contexts (e.g. in undirected informal talk among peers, small group and whole group instruction). It has highlighted the opportunities for identity work and processes of learning that the heterogeneity of voices in the classroom might be supporting.

For instance, Maybin (2003) explores how, through the introduction of “other voices” (e.g. snippets of songs, parodies of teacher voices, “he-said-she-said” routines and other forms of stylised talk) in informal talk during group work, learners produced rapid frame shifts to play. The frame transformations of instructional interactions into more playful ones allowed learners not only to display and experiment with different institutional roles, identities and classroom practices but also to scaffold their engagement in classroom tasks and learning activities (see also Maybin, 2006). In her comparative study of two groups of learners engaged in the same collaborative writing task, Haworth (1999) reaches similar conclusions. She observes that the group which produced the most collaborative and dialogic talk experimented more with seamlessly shifting between task related and play frames, mixing genres (e.g. task-related talk with playful talk drawing on the playground and the courtroom genres) and adopting a range of different voices. She argues for the importance of such collaborative and dialogic talk for classroom learning and highlights its carry-on potential to support learning across classroom genres.

In Hirst (2003), our analytical gaze shifts to an Indonesian second language classroom in Australia. Hirst explores how through the ventriloquation of diverse voices characterised by the pervasive use of teasing, ironic remarks and parody learners appropriated and resisted aspects of the teacher’s voice. Through the use of these playful resources, they not only had social fun but also engaged in constructing their cultural identities and interpersonal relations by raising boundaries of inclusion and exclusion. Baynham (1996) investigates how the use of humour by both teacher and learners in an adult numeracy class is exploited as an interpersonal resource. He illustrates how it is

strategically manipulated for the management of the interactants' complex and potentially conflicting social roles and identities and to address the power/knowledge imbalance in teacher–learner relations.

#### WORK IN PROGRESS

As mentioned in the previous section, there has been an increasing research interest in the heterogeneity of voices, genres, frames, practices and discourses in schools and classrooms and its implications for meaning making and identity work (e.g. Gutiérrez, Baquedano-López and Tejada, 1999; Kambarelis, 2001). In addition, a number of recent studies have explored the intersection of learners' expressive repertoires (including various forms of playful talk) and popular media culture in probing into learners' strategic shifts and alignments to display their multiple and at times conflicting identities and roles (e.g. Duff, 2004; Dyson, 2003; Maybin, 2006; Rampton, 2006). Although both strands of research seem to offer promising directions for the investigation of learners' playful talk, there is still a dearth of work in progress from sociolinguistic and educational stand-points with an explicit focus on various forms of learners' playful talk and identity construction in schools and classrooms.

The following two ESRC research seminar series (*Children's Literacy and Popular Culture* and *Play, Creativity and Digital Cultures*) focus primarily on popular culture and only indirectly on playful talk in so far as they probe into the different ways popular culture informs various forms of playful talk (e.g. teasing routines, humour, music making) and issues of identity, knowledge, agency and social capital. This work is premised on the ubiquitous presence of popular cultural and media texts and artifacts in the lives of children and young people in out-of-school arenas and seeks to understand its corresponding influence on school literacy and other school-related learning processes and practices. More specifically, the first ESRC Seminar Series on *Children's Literacy and Popular Culture* (2002–2004) looks into the different ways popular media culture has been used and transformed across sites (within homes, communities, peer groups and schools) and the different affordances and constraints it offers for learning and identity work. Following on the first seminar series, the second ESRC Seminar Series on *Play, Creativity and Digital Cultures* (2005–2007) focuses on the role of play (including aspects of playful talk and text production) and creativity in learning with new media technologies both within and outside school.

Two ethnographically informed sociolinguistic ESRC funded projects are looking indirectly into various forms of playful talk focusing specifically on contemporary British urban schools and classrooms

(mainstream comprehensive schools and complementary also known as supplementary or heritage schools). Rampton et al. (2005–2008) are exploring the intersection of ethnolinguistic difference and popular culture with the purpose of investigating young people's ethnic, popular cultural and educational identities in school-based interaction. Creese, et al. (2006–2007) are investigating “new multilingualisms” currently in development by young people and their teachers in complementary schools in four ethnolinguistic communities (Chinese, Turkish, Gujarati and Bangladeshi). The project aims to extend the boundaries of traditional sociolinguistic research by examining not only widely researched discursive phenomena such as code-switching and code-mixing but also more dynamic ones. These include the emergence of new linguistic varieties associated with youth/popular media cultures and the appropriation and transformation of linguistic, cultural and other semiotic resources, practices, genres and strategies in learners' talk inside and outside the classroom. Moreover, it aims to explore how through these discursive practices (including playful talk) learners display their multilingual/multicultural identities and sense of belonging.

Both the research seminar series and projects can provide important insights into what Pennycook (2003) has referred to as “more fluid ways of thinking about language, identity and belonging” (Pennycook, 2003, p. 514). Playful talk can constitute a central resource for learners in understanding such processes of meaning making and identity formation in schools and classrooms.

#### PROBLEMS AND DIFFICULTIES

While the recent turn in the research agenda towards exploring learners (and teachers') hybrid discourses and practices and the heterogeneity of resources, genres, styles, registers, frames available to them across school arenas can not be denied, more research still needs to be done in this direction. The privileging of whole class instruction over, for instance, undirected informal talk among learners and small group instruction and the corresponding focus on unified floors, sequential turn-taking and the conventional IRE structure of classroom discourse have influenced the extent to which learners' playful talk and play frames have been examined as discursive phenomena in their own right. As a result, the focus on particular types of talk, practices and resources has tended to consign playful talk, play frames and their producers to the margins of educational and sociolinguistic research. Indeed, playful talk in the form of music making, humming and chanting during whole class instruction, for instance, has often been associated with noisier, more unruly classrooms and has been seen as

undermining traditional teacher authority and power and disrupting content transmission (cf. Rampton, 2006). The fact that these discursive phenomena remain under-researched may also be linked to broader questions concerning what counts as legitimate knowledge in educational settings and what kind of linguistic and other practices are relevant in supporting it (Heller and Martin-Jones, 2001).

Moreover, while sociolinguistic and educational research into various forms of playful talk and play frames has benefited from insights from childhood literacy development studies and ethnographic sociolinguistics, there is a need to explore further the potential contribution of other research traditions in enhancing our understanding of learners' playful talk and identity construction. For instance, there is a growing interest in learners' playful and creative uses of language within second language acquisition (SLA) research and applied linguistics (see Broner and Tarone, 2001; Cook, 2000; Warner, 2004). In her study of playful talk (language play with form, content and frame) in synchronous computer-mediated communication (CMC) among second language learners of German, Warner (2004) draws the following illuminating conclusions:

Play can no longer be regarded as an anomaly or exceptional form of communication, but must be acknowledged as a legitimate and conventional use of language. In particular, greater attention must be paid to playful elements in language use that are not limited to the linguistic form. Students in the German classes were not simply playing with the language, but playing *within* [italics in the original] the language. In such instances, it is not primarily meaning that is being negotiated, but also the relations between speakers, their interlocutors, the medium and the context. What's more, they are negotiating their relation to a foreign language, which to them feels in some ways inauthentic and, as one student noted, like "just a game" (Warner, 2004, p. 80).

#### FUTURE DIRECTIONS

As learners' lives become saturated by popular media culture and new telecommunications technology, increasingly much of what constitutes learning takes place outside mainstream schools and classrooms. Homes, community-based and other recreational organisations, after-school homework and other clubs, complementary schools, chat rooms, on-line discussion lists and newsgroups, the internet are some of the sites where learning for children and young people also takes place. These changes have important implications for how processes of learning,

meaning making and identity construction are conceptualised and explored. It would, therefore, be fruitful to extend the investigation of learners' playful talk, play frames and identity work beyond mainstream schools and classrooms to look into these other sites for learning. In this context, more work needs to be done: (1) to examine how these sites provide novel opportunities but also perhaps limitations for the use, appropriation and refashioning of the learners' diverse linguistic and other resources and practices for playful talk; (2) to explore playful talk as a productive locus for the co-construction of knowledge and social affiliation but also perhaps as a powerful tool for social/discursive differentiation and exclusion in these sites and (3) to explicitly raise awareness regarding the centrality of playful talk and its various manifestations in learners' lives in general.

Moreover, while fine-grain analysis of learners' playful talk can yield important insights into the regularities of how they manage their linguistic and other semiotic resources, more work needs to be done to explain how playful talk can be linked to broader social, educational and historical contexts, linguistic and institutional ideologies as well as processes associated with consumption, leisure, globalisation and migration (cf. Heller and Martin-Jones, 2001). At the same time, more attention needs to be paid to how different learners are positioned within particular institutions and social networks, ranging from local school-based peer groups to trans-national diasporas and virtual communities and how they engage with particular practices and activities associated, for instance, with popular media culture consumption (cf. Rampton, 2006). Both analytical perspectives can greatly enhance our insights into learners' playful talk, play frames and identity work.

## **Section 3**

### **Discourses about Language and Linguistic Diversity**

## LANGUAGE CHOICE AND SYMBOLIC DOMINATION

## INTRODUCTION

Research on language choice and symbolic domination in schooling can be seen as one approach to one of the major sociological questions regarding education, namely the role of education in social and cultural reproduction. Sociologists and anthropologists of education have long argued that, while schooling often is supposed to be a major means of meritocratic, and hence democratic, access to social success, in fact its evaluation procedures favour the already successful. In other words, schooling simply reproduces existing social hierarchies, whether based on class, ethnicity, race, religion or gender.

Most of this research was based on examination of patterns of school achievement, that is on the statistically skewed outcomes of the educational process. Pioneering work of Bourdieu and Passeron (1970) on this subject focussed attention on the process of social selection through education. Central to their argument is the notion that schools contribute to social and cultural reproduction because the knowledge they value is not, as they claim, universal, but rather is the privileged property of the dominant classes. As a result, students who come to school already possessing that knowledge have a better chance of doing well at school than those who do not. However, to fulfil this function effectively, it is crucial that it be masked; that is, all participants must accept the basic, albeit false, assumption, that schools really are meritocratic. Bourdieu and Passeron term symbolic domination the ability of the dominant classes to convince themselves and others that the existing social hierarchy is thus justified on the basis of inherent properties of people or knowledge (this might include personality characteristics such as talent or drive, or properties of knowledge, such as the relative purity or clarity of languages).

For Bourdieu and Passeron, language is central to the exercise of symbolic domination, for it is through language that reality is socially constructed. Clearly, this implies that there are many ways in which linguistic variation, as it is tied to social differentiation and stratification, is relevant to social and cultural reproduction. However, for the purposes of this review, I limit myself to two of the most evident ways in which language contributes to this process, that is, through preferences for the acquisition and display of knowledge through certain

languages (or language varieties) rather than others, or for the acquisition and display of knowledge of certain languages themselves.

In the rest of this chapter, I show how the notions of Bourdieu and Passeron have met up with an Anglo-American tradition of sociolinguistic interest in linguistic and social difference and school success, and how the resulting cross-fertilization permits an analysis of the local and the global conditions influencing social selection through language choice in multilingual educational settings. This type of analysis opens the door to explorations not only of social reproduction (the only scenario Bourdieu and Passeron discussed), but also of challenges to existing forms of symbolic domination. In the final section, I consider some implications of these areas of research for future trends in research, policy and practice.

#### DEFICIT, DIFFERENCE AND DOMINANCE: SOCIOLINGUISTIC APPROACHES TO SCHOOL ACHIEVEMENT

In the 1960s, among the prominent explanations offered for the skewed representation of certain groups among those doing well, or, conversely, doing poorly, at school, the argument that the problem was due to cognitive, social and linguistic deficit among unsuccessful student populations (Bereiter and Engelmann, 1966; Jensen, 1969) was particularly influential. (Similar arguments are still made today.) In other words, researchers argued that some students did poorly because they were not well-equipped (genetically, or by their environment) before entering school. It was held that the problem was due to lack of knowledge, of cognitive and social stimulation, and of cognitive and linguistic skills among certain segments of the population.

Along with other social scientists, several prominent sociolinguists (notably William Labov and John Gumperz; cf. Gumperz, 1982, 1986; Labov, 1972, 1982) attacked this argument on the grounds that sociolinguistics showed that the problem was not one of degrees of knowledge, but rather one of kind. They demonstrated that educationally unsuccessful groups certainly possessed systematic knowledge (for example, their linguistic production was perfectly grammatical, even if its rules were different from those of the standard). According to them, the problem was that schools did not recognize this knowledge, since it was different from the forms of knowledge valued by educators. This insight inspired over a decade's worth of research focussing first on discovering the nature of linguistic and cultural differences at play in a variety of settings and their consequences for educational evaluation, and second on ways of transforming schooling so as to take these differences into account in ways that might equalize chances of school success for otherwise marginalized groups.

The most influential of these studies focussed on differences between White, Black and Native American students and schools in US. Among these, it is important to cite the early work of Philips (1972), who showed that Native American ways of learning and displaying knowledge were radically at variance with those of classrooms run by White teachers. In particular, Native American students were accustomed to learning by observation, to collective undertakings and to choosing when to display competence once acquired. Teachers' insistence on individual displays of the learning process forced students to violate their cultural norms, resulting in patterns of student resistance. Michaels (1981) showed that Black students' narrative styles differed from those expected by White teachers; as a result, those teachers were actually unable to discern Black students' narrative structures. Hence, from an early age, these students were understood not as having a different competence, but as being incompetent. In addition, as Michaels and others showed (cf. Collins, 1988; Erickson and Schultz, 1982), not only were students of different backgrounds negatively evaluated, they also received differential treatment that effectively closed off for them any hope of educational success. Well-meaning attempts to 'help' (such as remedial reading programs), in fact tended to increase the distance between targeted students and the kinds of knowledge they would need to do well in school.

On the basis of such research, a number of individual and collectively initiated action-research programmes were undertaken with the intention of building into teaching and learning practices not only an awareness of linguistic and cultural differences, but also of modifying curriculum and pedagogy to make it more culturally compatible for minority students. Among the better-known of these is the work of Heath (1983), who examined language socialization patterns among working-class and middle-class Black and White families in the US south. Based on her findings, she worked with teachers and students to increase awareness of linguistic and cultural differences at play in the community and school; her use of ethnographic techniques as learning and teaching practices might stand as one source of the language awareness movement that has been developing since the late 1980s, with the goal of facilitating language learning and school achievement through metalinguistic awareness and socioculturally embedded pedagogy (cf. Bremer, Roberts and Vasseur, 1996; Fairclough, 1992). Other significant works in this domain include the reading programs implemented in the Hawaiian Kamehameha schools for Native Hawaiian students, which build on indigenous collective oral narrative strategies to modify literacy and literacy preparation activities in the classroom (Au and Jordan, 1981; Jordan, 1984); and the culturally compatible programs and practices implemented in a Navajo school (McCarty, Wallace, Lynch and Benally, 1991; Vogt, Jordan and Tharp, 1993).

While language choice (Black English, Hawaiian, Navajo) is clearly one element of cultural compatibility, these efforts incorporate the issue of language choice into the broader context of cultural practices of teaching and learning, that is, of acquiring, constructing and displaying knowledge.

While such research has inspired many people, and many such programs seem to have met with at least a certain degree of success, they have also encountered criticism from a number of quarters (for example, de Castell and Walker, 1991; Delpit, 1988; Ogbu, 1993). What these critiques have in common is that they point out that the cultural-difference model (as it has come to be known) cannot account for some cases because it does not take into account the relationship between cultural difference and social dominance; in other words, it tends to ignore the relations of power obtained in schooling (and in research on schooling), and to neglect contribution of schooling to social and cultural reproduction. Its primary recommendation (culturally compatible programs and pedagogy) does not accord with minority needs to at least understand the language and culture of power (Delpit, 1988), and does not work unless students are convinced that education actually gets them somewhere (Erickson, 1993; Ogbu, 1993, 1999). It also fails to address issues faced in ethnolinguistically heterogeneous settings, whether stable or in flux.

Recent research has tried then to understand the relationship between school and community language and cultural practices as one of power, in which differences are embedded in the exercise of and resistance to the school's power to impose its values and norms on students and their families. Much of this research has in fact focussed on the issue of language choice, as one area where struggles over the value and distribution of linguistic and cultural capital may emerge most clearly. One reason for this is that research on codeswitching since the 1970s demonstrated the prevalence of this practice in (usually officially monolingual) educational institutions in multilingual settings, and established its effectiveness for purposes of social, discourse and conversational organization (Martin-Jones, 1995). However, by the early 1990s, this strand of research had also developed an awareness of the necessity of examining the social, economic and political constraints and processes that not only make language choice an issue in such settings, but also make them meaningful. It became clear, in other words, that language choice practices in educational settings were about, and had to be understood in terms of, social structures and processes beyond the ethnographic present and the local site (Heller, 1995, 2006). Indeed, given the centrality of social selection in educational processes, it became clear that language choice in schools or other

educational settings was, at least in part, about struggles of power, about, quite literally, whose voice would dominate educational discourse, about whom education is really for.

#### LANGUAGE CHOICE AND SYMBOLIC DOMINATION IN EDUCATIONAL SETTINGS

Work in this area focuses both on the relationship between standard and non-standard varieties of the same language, as well as between other kinds of language varieties, more or less linguistically related. The issue of power emerges clearly in the first, since by definition what characterizes standard languages is the authority institutionally invested in them (this of course raises the question of who controls the institutions). In the second, the issue of power is connected to the relations of inequality obtaining between speakers of the languages in contact, whether due to conditions of colonization, immigration, conquest or other processes.

Some of this work emerged from a reflexive movement in applied linguistics, in particular among those engaged in the field of English as a second language, beginning in the early 1990s (see, notably Pennycook, 1994, and Phillipson, 1992, followed later by Pennycook, 2001), have focussed on the importance of moving away from examining language teaching and learning as principally technical, or universalistically cognitive, processes, and of taking into account the relations of power which inform them (this is particularly obvious in the case of English, the new global lingua franca, but has been applied more generally to various aspects of the role of language in globalization, post-colonialism and post-nationalism; cf. e.g. Block and Cameron, 2002; Cronin, 2003; Coupland, 2003; DelValle, in press; Dor, 2004; Heller, 2007; Leap and Boellstorff, 2004; Maurais and Morris, 2003; Wright, 2003).

Major focuses have, however, crystallized around post-colonial settings, questioning the practice of using the former colonial language as the language of instruction and of granting former colonial powers the authority to define legitimate language; around politically mobilized indigenous or long-established minorities fighting for the right to use their language as the language of instruction; and around areas of dynamic immigration, where almost every day new questions are raised about the linguistic dimensions of relations among groups. This trend is usefully captured in Heller and Martin-Jones (2001), a collection of papers from a variety of such settings around the world. The collection explicitly aims to link language choice practices in interaction in educational settings to institutional processes, and to the political

economic foundations of symbolic domination. The central notion is that codes represent institutional authority, or challenges to that authority, and can be drawn on in ways that serve principally to establish or resist the local, interactional order, and through that order, the larger institutional, and social one. It is the mediation through the local interactional order that instantiates symbolic domination, since it is there that relations of power are masked through appeals to legitimizing ideologies.

For example, my own contribution to that collection shows how, in French-language minority schools in Canada, the authority of the teacher is maintained through an interactional order based on a sequential organization of turn-taking, which is institutionally legitimized through the notion of 'respect' ('respect' means listening silently while others talk, and talking when invited to do so). This local interactional order permits teachers to control both the form and the content of talk in ways which, among other things, allow them to reproduce institutional language norms (a preference for standard, monolingual-type French). These norms are in turn legitimized through the notion that they are necessary for the maintenance of French as a minority language, and for the maintenance of the quality of that French. The unintended effect, however, is to privilege students who are speakers of the valued variety of French, members of the new middle class, as against working class speakers of the (often bilingual) vernacular, despite the fact that the schools ostensibly exist to promote the interests of all francophones, and especially those who suffer most from economic, social and political marginalization. Williams (1987), Jaffe (1993, 1999; and her contribution in Heller and Martin-Jones, 2001) and McDonald (1990) have made similar arguments about how the standardization of minority languages (in their cases, Welsh, Corsican and Breton) through education (as well as through related forms of linguistic research and legislation) serves the interests of emerging middle classes who benefit from political mobilization, while constructing new relations of inequality internal to the ostensibly unified minority. These cases, as well as others (see earlier paragraphs), show clearly how language choice helps to reproduce (or, on rare occasions, to challenge) the unequal distribution of resources in the community through symbolic domination.

#### FUTURE DIRECTIONS

I have traced here a developing commitment to understanding language choice in education as a matter of power, as well as a commitment to examining the role of language in educational processes of social reproduction. These orientations have implications for further research, and also for educational policy and practice. Two priorities for research

stand out. The first has to do with internal linkages, the second with cross-setting comparison.

Current work has begun to explore the ways in which language choice as a discursive or conversational strategy is connected to its effects regarding the distribution of linguistic (and hence other cultural, or even material) resources, that is, to social and cultural reproduction. However, we still understand poorly the nature of that link, and in particular of its relationship to legitimating ideologies of language, class, ethnicity, gender and education, and to institutional structures and processes. Nonetheless, some ethnographies have laid the groundwork for how to tie what happens in the here-and-now of life in the classroom to academic achievement (and hence social reproduction) and to the political economy of language and education in particular arenas. Some of these (such as Heller, 1999, 2007, or Jaffe, 1999) focus on the particular problem of linguistic minority education, tying issues of language standardization to nationalism. Others, notably Wortham (2006), examine the local construction of social categories, in this case, gender and class, and their ties to academic achievement. In all these cases, the methodological path involves analysis of interaction, institutional ethnography, and social histories in the form of political economic analyses of language and education. This entails asking why these forms of interaction, there, then? With what consequences, for whom? In addition, we know we must look for institutional and ideological interstices to discover possibilities for resistance and change (Heller, 2007; Heller and Martin-Jones, 2001), but we have only just begun to take on this challenge.

In addition, clearly, generalizations cannot be made without a comparison across close understandings of individual, socially and historically situated cases. We are beginning to build up such a body of ethnographic work, and to explore the general processes of state-building, nationalism, colonialism and globalization which help us understand the role that language has played in the past and plays currently in constructing education as a social institution in the service of reproduction of specific forms of social organization, legitimated and made sense of through specific ideologies, under specific historical conditions (in addition to those mentioned earlier, see Block and Cameron, 2002; Heller and Martin-Jones, 2001; Martin-Jones, 2007).

The results of such research have clear practical implications. This work fundamentally asks whom education is for, who benefits from the way things are, and who is marginalized. That leaves us with the question of whether we are happy with the picture our research portrays, or whether changes are needed. Either way, such research should help us understand what policies and practices actually produce, and

therefore help identify critical points of intervention. Most importantly, it shows that educational language choices are never neutral.

LANGUAGE PLANNING IDEOLOGIES,  
COMMUNICATIVE PRACTICES  
AND THEIR CONSEQUENCES

INTRODUCTION

Languages are far more than just media of communication. They embody more subjective features such as values, ideals and attitudes that imbue them with particular symbolic qualities and functions. They are then seen as emblems of nationhood, cultural identity, progress, modernity, democracy, freedom, equality, pluralism, socialism and many such 'values'. These valuations become central elements in the ascription and achievement of language status (Blommaert, 1999). Such attitudes and beliefs, when linked to other social ideologies, can influence and constrain the development of language planning and policy (LPP). For this reason language planning issues are rarely solely about language.

Ideologies are unconscious beliefs and assumptions that are 'naturalized' and thus contribute to hegemony. They bring into play relationships of power that perpetuate inequality and social injustice. Further, ideologies are reproduced by a variety of institutional and everyday practices, such as those followed in schools, administration, media, advertising, art, literature and so on. These reproduction practices tend to reinforce privilege and grant it legitimacy as a 'natural' condition (Fairclough, 1989). A good example is the notion of a standard language; itself a product of such 'naturalized' thinking (Bex and Watts, 1999; Milroy and Milroy, 1985). Scholars engaged in LPP, therefore, seek to understand and uncover the ideologies inherent in the historical and sociopolitical structures and practices that contribute to the reproduction of such systems of authority and control, and how they may be resisted, for language planning to be beneficial.

EARLY DEVELOPMENTS

Early work in LPP first emerged in the 1960s and 1970s to aid programmes of 'modernization' in 'developing' countries and was seen as having practical value for newly independent, multilingual and multiethnic states facing the problem of national unity and socioeconomic development. Much of this work (Fishman, Ferguson and, Das Gupta, 1968; Haugen, 1966; Kloss, 1966; Rubin and Jernudd, 1971) focused on the

formulation of language planning goals and on constructing frameworks and typologies as tools for determining which languages should be developed for which purposes.

The central question in status planning for many of these 'new nations' was the selection of a national language for the purposes of modernization and nation building. Since language diversity was typically perceived as a problem and, only 'developed' languages were considered appropriate in formal and specialized domains, this role was typically assigned to a major European language (usually English or French), whereas indigenous languages served other, subservient functions. Thus, the European formula for successful nationhood, of one-nation/one-language, became the model which implicitly informed language planning in several decolonized states in Africa, Asia and the Middle East (Ricento, 2000).

The long-standing dominance of 'standard language,' 'native speaker norms' and 'linguistic competence' as icons of communication and pedagogical practices in the periphery, owes its existence to the imposition of this Eurocentric universalistic model, despite their total irrelevance in these multilingual and multicultural contexts. These deeply entrenched practices marginalized the indigenous languages and devalued local forms of knowledge and culture.

#### MAJOR CONTRIBUTIONS

By the 1970s and 1980s, LPP scholars were vigorously critiquing and questioning the descriptive models they had developed. A number of factors led to a reconsideration of the goals and methods of LPP. The fundamental assumptions underlying these models were found to be problematic, e.g. the belief that language as a resource could be planned; that status and corpus planning could be undertaken as separate activities which were ideologically neutral; that languages could be abstracted from their social, historical and political contexts (Ricento, 2000).

The choice of European languages as 'neutral media' to aid national development favoured the economic interests of metropolitan countries, and not those of marginalized minority language speakers. The selection of indigenous languages for low variety functions and European languages for high functions tended to perpetuate socioeconomic asymmetries based on education, and differential access to linguistic, social and cultural capital (Bourdieu, 1991). The newly independent states thus became more dependent on their colonial masters than during the colonial era. At the same time, several studies on multinational LPP cases (e.g. South Africa, India, Thailand, Nepal, and others) challenged the one-language/one-nation ideological tenet of modernization and development theory.

Widespread dissatisfaction with the inherent limitations of early top-down models led to the call for an LPP that would move beyond the descriptive to become more theoretical, predictive, and explanatory. A rich profusion of work emerged in the early 1990s that would inject new theoretical and empirical perspectives into LPP. Whereas early scholars were largely concerned with status planning and issues connected with standardization, graphization and modernization, scholarly interest in the 1990s shifted to examining the social, economic and political effects of language contact and change from a more critical and post-modernist perspective. How do such approaches critique LPP?

A critical approach to language planning (CLP) takes a more complex view of the new world order and acknowledges that power is implicit in the policy-making process, where policies often create and sustain various forms of social inequality. Most policies adopted by the state and other institutions controlled by supra-national dominant groups, are viewed as serving the interests of oppressors. Hence CLP scholars adopt a more probing approach (Canagarajah 1999, 2000; Luke, McHoul, and Mey, 1990; Pennycook, 1994; Phillipson, 1992; Tollefson, 1991) in elucidating the link between language policies and ideologies of power.

A particularly influential notion that has stimulated much discussion is that the global expansion of English as a vehicle of modernity and economic progress is little more than 'linguistic imperialism' (Phillipson, 1992) or 'linguicism' (Skutnabb-Kangas, 2000). This perspective offers a forceful critique of the global spread of English and English language teaching in the periphery as being motivated by the hidden interests of agencies of the centre, while engaged in supposedly altruistic activities. The process of political, economic, social, cultural and educational domination and exploitation with which English was promoted in these countries has had devastating effects on indigenous languages, amounting to 'linguistic genocide'.

In this view, social and economic progress is denied to those who do not learn this language of modernity, thus propagating unequal division of power and resources between groups in former British and American colonies. This leads speakers of the less powerful minority languages to increasingly dispense with their first language(s) in favour of learning English, resulting in language shift or displacement. One consequence of this process is the marginalization, and ultimately the loss, of thousands of indigenous languages. This view of linguistic imperialism has been strongly criticized as being deterministic, because it largely overlooks local cultural politics and tends to cast members of the periphery in the role of helpless and largely unconscious victims of a linguistic hegemony in which they are persuaded to connive. In other

words, this perspective has been criticized for divorcing language from human agency: people are agents and not merely objects in the creation of their own meanings.

Clearly, there exists a tension between English, seen on the one hand, as a neutral, pragmatic language, essential for national development, and on the other, as a language tied to undesirable forms of Western culture, values and knowledge which threaten local cultural identities (Pennycook, 1994). This paradox gives rise to 'conflicting discourses', indicating that the local people still 'desire' English, thus perpetuating its hegemony, as revealed by the post-colonial status of English, especially in countries like Singapore and Malaysia, or urban South Africa, where it is seen to thrive even at a period of intense nationalism.

This suggests that it is not only the power and position of English globally that needs to be considered, 'but also the struggles around English in its local contexts' (Pennycook, 1994, p. 219), characterized by these competing discourses. Using English does not necessarily imply a deterministic imposition of cultural and discursive frameworks, since English can be used and appropriated in different ways, as in 'writing back' from the periphery. In short, English can be taken over and employed by periphery users as a way of asserting cultural and political independence from centrist interests.

Yet other studies illustrate the point that in many local communities and contexts, marginalized subjects are resisting established policies, constructing alternative practices that exist parallel to the dominant policies and even initiating changes that transform unequal relationships (Canagarajah, 1999). Such analysis demonstrates how people from the periphery use different strategies in creative and critical ways in different historical contexts, to achieve their ends. For instance in Sri Lanka, in the period of colonization, English was used to represent the local discourse through a 'strategy of discursive appropriation'. In the decolonization stage, the dominant English discourse was re-worked to reflect the local interests and ideologies through a 'strategy of reinterpretation'. After independence, English was used by the new elite to strengthen their power, via a 'strategy of accommodation.' And in present day Sri Lanka, people have mixed the use of the vernacular with English to form a system of hybrid codes to achieve a variety of symbolic purposes through a 'strategy of appropriation' (Canagarajah, 2000, pp. 125–128). Such realities involve individual agency and point to incipient cases of language planning from the bottom up.

Recent investigations of specific cases of LPP as mechanisms for exclusion bear evidence of exploitative policies in education systems that impose disadvantages on minority students and restrictions on bilinguals among both subordinate and dominant populations. This aspect is discussed in the following section.

## WORK IN PROGRESS: NEW PERSPECTIVES

The turn of the millennium has seen a resurgence of interest in LPP, fueled in large part by the unprecedented spread of English and other global languages, and the alarming loss and endangerment of indigenous and small language communities worldwide. Old themes have been repeated and several new issues have emerged arising mainly from the dilemmas caused by two major historical (and in some ways opposing) movements: decolonization and globalization. Decolonization entails resisting English and other colonial languages in the interest of building an autonomous nation state; globalization, on the other hand, has reinstated the importance of English for all communities through multinational production flows, pop culture, cyber space, and digital technology.

In English-speaking countries, such as Britain and the USA, two dominant ideologies have continued to thrive: the ideology of English monolingualism and the standard language ideology (Ager, 2003; Wiley and Lukes, 1996). The first frames policy issues in an immigrant paradigm in portraying language diversity as an alien and divisive force, identifiable in the rhetoric of the English Only movement in the USA. The second positions speakers of different varieties of the same language within a social hierarchy, with schools functioning as the principal instruments of this stratification, as the chief purveyors of standards.

These linguistic ideologies are, in turn, reinforced by other ideological assumptions that link language with national unity and social mobility.

In the US context, the ideology of monolingualism prompts the assimilationist belief that incoming language minorities should give up their native language in favour of the dominant one: first, because preservation of a minority language is seen as a potentially divisive factor in maintaining national unity, and second, as the key to equal opportunity that allows linguistic minorities to integrate into mainstream socioeconomic systems.

The chief characteristics of a standard ideology is the belief that there is one and only one correct spoken form of the language, modeled on a single correct written form and that access to standard language education is an essential component of social mobility. However, although literacy in the standard is held out to be universally accessible, its control by the elites strengthens its potential to either open or bar doors of access and opportunity. Groups that can impose their language and literacy practices as normative have a strategic advantage over those who cannot. In Britain, from the nineteenth century through to the first decades of the twentieth century, the concept of Standard English was identified as the speech of the ruling class, thus permitting

the ranking and valorizing of certain forms of speech as superior: (see Williams, *Discourses about English: Class, Codes and Identities in Britain*, Volume 3). In the USA, on the other hand, the standard ideology reveals itself in attitudes that can be described as overtly racist or ethnically discriminatory, where speakers of African American Vernacular English, among others, constitute the largest number among 'nonstandard' varieties of English (Modiano, 2001).

These ideologies have not only drastically affected bilingual education policies in the USA, usually based on a 'weak' transitional model rather than on a maintenance model, but have also influenced teaching and testing procedures, wherein the linguistic background and abilities of students in their native languages are either ignored or perceived as deficiencies in ESL classes. Moreover, significant gatekeeping mechanisms, such as college entrance requirements and tracking, bear testimony to the hegemony and centrality of the standard ideology in education. The historical legacy of the ideologies of English Only and Standard English, and their continuing differential impact across racial and ethnic groups, as foregrounded in the Ebonics debates in the USA, has led to a call for more equitable instruction for speakers of non-dominant varieties of English.

In many non-Anglo-American settings, particularly the former colonies in Africa, South Asia and South East Asia, where English continues to play a powerful role, the ideology that prevails is the pre-eminent instrumental value of this language in modernity and economic progress. The power wielded by English as the primary language of globalization is further boosted by its perceived 'neutrality' amidst competing interest groups of diverse ethnic and linguistic affiliations in these multilingual and multicultural contexts and its potential, as lingua franca, for bringing about social and national cohesion among these peoples—a role which frequently hides the fact that, in these contexts, English is far from neutral in terms of social class and has equal potential for dividing people.

Meanwhile, the impact of globalization presents new dilemmas which lead to 'the assimilation of the powerless towards the powerful' as communities and individuals find themselves torn between the desire to enhance their economic prospects and maintain their linguistic/cultural affiliations. For instance, the European Union is officially committed to multilingualism and linguistic diversity, while integrally involved in the processes of globalization that are symbiotically linked to English. It is likely that increasing European integration strengthens the process of globalization, Americanization and Englishization rather than constraining them (Phillipson, 2003). Similarly, faced with the dilemma of accommodating the presence of its indigenous languages and English, having apprehended English in purely instrumental terms,

Singapore, a country where much of current social life is driven by economic demands, finds itself framing its indigenous languages correspondingly in non-instrumental terms, as bearers of ethnic identity and repositories of traditional and cultural values, thus weakening their internal role and status vis-à-vis English (Rappa and Wee, 2006, pp. 129–130).

The growing emphasis on the use of English in education in the peripheries of the World system, articulated in national language and educational policies, is increasingly based on an image of globalization as monocentric, with an English-dominant economic, financial and political centre. The promotion of English in countries as diverse as Congo and Mozambique, where English used to be a marginal commodity, and Thailand and Malaysia, countries that are committed to having their indigenous languages flourish, is motivated by a desire of national governments to align themselves with the USA and international organizations such as the International Monetary Fund and World Bank (Blommaert, 2006, p. 241). The imbalances created by this tendency to construct majority languages as instruments of modernity and economic progress and minority languages as (merely) carriers of ‘tradition’ or ‘cultural identity’ has created an awareness of the need to rethink nation states in more linguistically plural and inclusive ways.

One area that has received particular attention is language shift and loss, particularly among the smaller languages that are dying out due to the spread of a few world languages such as, English, French, Spanish and Arabic (Crystal, 2000; Nettle and Romaine, 2000). Of the estimated 6,800 languages spoken today, 96% of the world’s population speak 100 languages, with 4% speaking the remaining thousands of languages. It is predicted, on present trends that between 20% and 50% will die out by the end of the twenty-first century. Concerns about the plight of many of today’s minority languages have led scholars to advocate their revitalization by reversing the limited instrumentality of these languages and according them at least some of the protections and institutional support that majority languages already enjoy (Freeland and Patrick, 2004; May, 2001, 2006).

Thus, in the midst of a heightened awareness of language endangerment an ‘ecology-of-language’ paradigm has been proposed, most articulately developed in the works of Tove Skutnabb-Kangas and Robert Phillipson (1994; Skutnabb-Kangas, 2000). Its aim is to build linguistic diversity worldwide, promote multilingualism and foreign language learning, and grant linguistic human rights (LHRs) to speakers of all languages. In this view, the cure for linguisticism and linguistic genocide requires a proactive political and moral response, involving the promotion and acceptance of LHRs by states and international bodies as universal principles. LHRs could then be one way of:

- preventing linguistic genocide;
- promoting integration and defending people against forced assimilation;
- promoting positive state policies toward minority languages;
- promoting the maintenance of the world's language diversity;
- promoting conflict prevention and self-determination.

The proponents of LHR believe this can be effected by changing the rules of the game that automatically presume an exclusive relationship between dominant languages, modernity, and mobility. They desire to avoid language displacement and discrimination and allow individuals a choice in the maintenance of their first languages. This view also has been critiqued for being somewhat utopian, for essentializing the linguistic identity of minority communities and treating vernacular rights as non-negotiable.

The debate about the relative status of the vernacular and dominant languages continues to pose serious practical and policy problems in many nation-states, particularly with regard to the choice of medium of instruction (MOI) in education, increasingly seen as playing a crucial role in determining social hierarchies, political power and economic opportunities. Many case studies detailing policies and practices in different countries across the globe (Fishman, Conrad, and Rubal-Lopez, 1996; Rappa and Wee, 2006; Tollefson and Tsui, 2004) have revealed that decisions on MOI policies are guided more by complex extraneous factors than inspired by academic or pedagogical considerations. These factors are often linked to a range of politico-economic issues including globalization, migration, labour problems, competition among elites in the distribution of economic resources and the nuances of political power. This suggests that MOI policies are never politically neutral. Pedagogical arguments for or against mother tongue medium very often serve as an alibi for pushing forward 'hidden agendas' of pressure groups while paying 'lip service' to nebulous ideological goals and are therefore open to a greater possibility of political manipulation and negotiation.

Recent studies (Canagarajah, 2005; Lin and Martin, 2005) have examined the debilitating conflicts and dilemmas involved in planning the relative status of the vernacular or mother tongue and English in society and education. In communities where the vernacular has been upheld in education and social life by way of affirmative action in recompense for colonial disparities, there are subtle resistances in favour of English, as can be seen in Malaysia and Iran. In communities that have accorded primacy to English as a key to economic and educational opportunities there has been a resurgence of localism, for example, in Brazil and India (Ramanathan, 2004). The unresolved tensions arising from the imposition of English in classrooms in such disparate

countries as India, South Africa, Tanzania, Kenya, Brunei and Hong Kong (see Lin and Martin, 2005), to name a few, are revealed in the many subtle ways in which the local language is introduced to negotiate the values, identities and interests of the local people. These ground realities indicate that abstract theoretical debates which pit one ideological position against another may not offer productive solutions to the practical problems confronting these communities.

Analysis of communicative practices in multilingual educational settings show that language use in the classroom often defies policies that are largely monolingual and purist. Code selection and codeswitching become particularly prominent in contesting (or constructing) domination in schools (Heller and Martin-Jones, 2001). While teachers and students use the authorized language for on-task and official sites, they use the unauthorized codes in surreptitious ways in unofficial and off-task contexts. Such practices enable minority students to represent their preferred cultural identities, develop solidarity, and tap into local knowledge both to facilitate their learning and to resist unfavourable policies by employing covert language acquisition and communicative practices that counteract dominant policies.

Given the role played by language in struggles of power and dominance between groups, language planning can often result in conflicts rather than solutions (Wiley and Lukes, 1996) or it can produce unintended outcomes. For instance, attempts at language maintenance in the interest of preserving linguistic ecology can be frustrated by some minority communities that are not committed to preserving their language, and instead prefer to learn the dominant code to overcome their marginalization. At other times, overt policy may belie the ulterior motivations of covert policy, as in the case of the egalitarian, pro-Tamil policy of the Singapore government, whose housing policy, militates against the language policy and covertly works to prevent Tamils from enjoying the numerical strength or cohesiveness to use the language in social life (Schiffman, 2003). These studies foreground the importance of LPP as a site for struggle and contestation as a prerequisite for social change. CLP scholars have an important responsibility to help people see how they can negotiate their own interests in an imperfect world.

Currently, intensification of efforts at the revival, revitalization, renewal, and reversing of language shift in LPP has generated some useful frameworks for addressing the exigencies of LPP practice, such as the graded Intergenerational Disruption Scale framework (Fishman, 2001) for reversing language shift, the model of forces at work in a linguistic ecosystem (Kaplan and Baldauf, 1997), and the continua of biliteracy framework (Hornberger, 2003). LPP remains a complex balancing act, as the revival of one language can lead to the endangerment of others, as in the case of the revival and revitalization of Hebrew (Spolsky, 2004).

Meanwhile a series of contributions have emerged, calling for greater attention to the role of human agency, and in particular bottom-up agency, in LPP (e.g. Canagarajah, 2005; Ricento, 2000, 2006; Tsui and Tollefson, 2006). These combined critical perspectives on ideology, ecology and agency provide a rich resource for moving LPP forward in the new millennium.

#### FUTURE DIRECTIONS

The field of LPP has witnessed significant growth over the past 35 years and continues to broaden and deepen its scope of inquiry. Yet there is no unified theory of LPP that offers a model which can predict and explain the consequences of particular policy decisions, despite the existence of a number of theories and frameworks. It has been suggested that micro-level research on language choice needs to be integrated with macro-level policy investigations to provide a more complete explanation of language behaviour—including language change—than is currently available (Ricento, 2000). Here I present in point form some broad recommendations that may help move in the direction of such a unified theory:

- A conceptual framework needs to be developed, which, in addition to linking the macro- and micro-levels of investigation, permits valid comparisons to be made between language policies of different nation states as lessons to learn from.
- More research is needed, by way of both empirical and ethnographical studies, not only to provide richer descriptions from an insider perspective, but also to provide a more illuminative vantage-point for analysis and critique.
- In rethinking nation-states in more linguistically plural and inclusive ways, the prospect of more representational multinational and multilingual states needs to be fostered (May, 2006). This can be done by exploring mechanisms for directly contesting the historical inequities that have relegated minority language speakers to the social and political margins.
- Broadening the basis for language preferences of the state to better reflect the cultural and linguistic demographics of most present-day multinational and multilingual states to improve people's life chances.
- At a time of increasing domination by supranational structures of decision-making, a key issue is how can more democratic forms of language policy be developed, in which non-dominant ethnolinguistic groups can shape the language policies that affect them. This means seeking ways to alleviate the repression non-dominant groups have experienced and continue to do so by making accessible to them the democratic choices they were previously denied.

- Greater critical awareness and a spirit of skepticism needs to be fostered towards the hidden agendas and interests that underpin the actions of particular nation-states, institutions and communities in promoting or inhibiting certain (or certain kinds of) LPP decisions and activities, so that non-beneficial ones can be resisted or subverted and empowering decisions sustained.
- Better understanding of the factors contributing to successful language maintenance and revitalization programmes must be developed, with particular attention to the role of indigenous communities in shaping policies and programmes that will both promote social equity and foster language diversity.
- Adequate material and institutional support needs to be accorded to allocate more resources (funding for education, provision for teacher education, books, libraries, multi-media, literacy activities, etc.) to communities that seek to cultivate and revitalize their vernacular/indigenous/heritage languages.
- In an era of increased globalization, LPP researchers need to explore what kind of policies will better be able to serve the competing needs and aspirations of individuals, represented by dichotomies such as economic advancement versus cultural authenticity, social mobility versus ethnic group integrity, educational opportunity versus class affiliations and so on, without necessarily pitting them against one another.
- With the rapid loss of languages worldwide, which has understandably provoked resistance, a better understanding needs to be developed as to which forms of individual and collective resistance may be productive and which may not, and under what conditions. More importantly, the role of human agency in this process must be clearly understood.

In a global future, increasingly characterized by plural societies and multi-modal information networks, the field of LPP would do well to realize the risks involved in proposing universalistic formulas or holding out uniform solutions. This means LPP must liberate itself from its old constraining frameworks and revitalize *itself* by seeking new answers to new questions.

## TEACHERS' PRACTICAL KNOWLEDGE, STANDARD LANGUAGE AND MULTICULTURAL CLASSROOMS

### INTRODUCTION

This review deals with the teaching of national standard languages in multicultural contexts in Europe. It discusses ethnographic studies that describe and analyse subject English in England, German in Germany, Dutch in the Netherlands and so forth. Its focus is on teachers' practical knowledge as reflected in the discourses they produce in classrooms and in interviews. The early developments in this field are discussed in the context of the work of the International Mother Tongue Education Network (IMEN), which was set up in 1981. Initially, this network developed and used ethnographic research methodologies to investigate how standard language teaching was nationally and culturally shaped. In the 1990s, the attention shifted towards the challenge of multilingualism and multiculturalism to standard language teaching. A similar focus emerged in European ethnographic research outside the network. The main thrust of the contributions discussed in this area is the attribution and legitimisation of linguistic resources in standard language classrooms in contexts of immigration and multilingualism. Some new avenues for future research are also discussed.

### EARLY DEVELOPMENTS

The story goes that the IMEN research programme on standard language teaching in Europe originated from the experience of one of its members who, as a German professor working at a Dutch university, was intrigued by cross-national differences in the teaching of ostensibly similar subject areas. 'Grammar', for instance, appeared on timetables of both German and Dutch schools, but classroom observations suggested that there were significant differences between the two countries in the teaching of grammar. This impression led IMEN to adopt an ethnographic and international-comparative perspective, using multiple methods of inquiry. Observations were set out to unveil classroom discourses of standard language teaching in various European countries, whereas interviews and document analyses were to unveil 'rhetorics', or discourses of standard language teaching realised outside these classrooms.

The research programme started off with a study on historical developments in the rhetoric on standard language teaching in nine European countries (Herrlitz, Kamer, Kroon, Peterse and Sturm, 1984). Drawing on Bernstein's (1971) notions of classification and framing of educational knowledge, classic educational publications, such as widely used textbooks for teacher training, were analysed. The analyses showed that across the countries, a paradigmatic shift had taken place in the 1970s, from a literary-grammatical paradigm, which valued a literary canon and grammatical correctness, to a social-communicative paradigm, which focused attention on popular forms of literature and communicative adequacy. The study also indicated that this shift was shaped by the local socio-historical and geo-political contexts of the cases.

In a second study, the research focused on classroom realities of standard language teaching as experienced by teachers. The international design of this project implied that case studies were carried out in various countries and that researchers from these countries were brought together to allow for 'international triangulation'. This technique of involving researchers external to a case in its analysis opened up new ways of making familiar rhetoric and practice of standard language teaching 'strange' (Erickson, 1984). In the study, teachers were asked to keep diaries about what they experienced in their classrooms (Holly, 1984). Besides, long, unstructured interviews were conducted with the teachers on their professional development (McCracken, 1988). These systematic and more spontaneous accounts resulted in a series of comparative portraits in standard language teaching. They offered illuminating insights into teachers' developing professional practical knowledge as partly autonomous and partly shaped by their national and cultural context (Delnoy, Herrlitz, Kroon and Sturm, 1988).

In a third study, classroom discourses were investigated. In two international-comparative case studies (Flanders-Italy-Netherlands and England-Hungary), data were collected synchronically and analysed collaboratively. In addition, a number of single case studies were carried out in which external researchers participated for purposes of triangulation. One of the main findings of this study was that the organisation of the field of standard language teaching in different curricular areas and the contents offered in these areas clearly showed culturally specific differences, whereas the conversational structures or communication patterns in the classroom did not greatly differ (see Delnoy, Herrlitz, Kroon and Sturm, 1992). The Hungarian case, for example, showed a curricular division between language and literature, while the Dutch case revealed a division within the subject 'language' between grammar and texts, where reading was a subfield. The French case, on the other hand, showed a curricular structure in which spelling, texts, grammar, writing, and reading all represented clearly separated fields.

In the 1990s, it became imperative to focus on the growing linguistic and cultural diversity represented in the classrooms as this heterogeneity had the potential to challenge, in overt and covert ways, previously relatively stable discourses on national standard language teaching. The common designation as 'mother tongue education', for instance, appeared to have become obsolete; its very defining feature no longer seemed to match the linguistic and cultural realities of students. In a variety of case studies, IMEN sought to investigate how these changing realities actually impacted on rhetorics and practices of standard language teaching. Using its international comparative methodology with key incident analysis as a main technique (Kroon and Sturm, 2000), projects involving case studies were carried out in Flanders, England, Germany, and the Netherlands (Gogolin and Kroon, 2000), and later also in Norway (Bezemer, Kroon, De Wal Pastoor, Ryen and Wold, 2004). This work is reviewed in connection with similar European undertakings outside the network in the following section.

#### MAJOR CONTRIBUTIONS AND WORK IN PROGRESS

Ethnography seeks to understand the rules or norms that individuals within a society, community, school or classroom have to know, produce, predict, interpret and evaluate to participate in socially and culturally appropriate ways (Green and Bloome, 1997). The studies reviewed in this section are described from this standpoint. On the one hand, they attend to the attribution of linguistic resources to students in the national standard language and in immigrant minority languages. On the other hand, they attend to the legitimisation of and valuations attached to these resources and their users. In the final part of the section, some problems and difficulties emerging from the review are explored.

##### *Attribution of Linguistic Resources*

When linguistic tasks are set up in language classes and accompanied by instructions on how to deal with these tasks, teachers' beliefs about the linguistic resources that students have at their disposal are brought into play. Examples of instructions used in multicultural classrooms such as, 'write, as you speak' (Neumann, 2000), 'listen to what it sounds like when you make the word longer' (Kroon and Sturm, 1996), or 'listen to what it sounds like when you invert the word order' (Bezemer, 2003) are often rooted in traditional didactic maxims which are based on the common monolingual assumption that students share particular linguistic resources in the national standard language (Gogolin, 1994).

When students actually draw on wide-ranging commands in a variety of languages and conceptions of phonemes, letters, and grammatical principles, these types of instructions are bound to be misunderstood. In most of these reported cases, students, in fact, requested clarification or contested the monolingual conception of language that underpinned the instruction. In everyday practice, however, such mismatches between the linguistic resources attributed to students and those to which they actually have access may not come to the surface of classroom discourse (Tuveng and Wold, 2005).

The linguistic tasks that students encounter in multicultural classrooms may also explicitly call on cultural knowledge. Sturm (2000) presents a classroom event showing how a teacher's and student's culturally shaped conceptions of swimming clash when completing exercises actually meant for practicing past participles in Dutch. The cultural embeddedness of language is also repeatedly observed to be taken for granted in classes focusing on aspects other than language. De Wal Pastoor (2005) discusses excerpts showing how Christian-Western notions such as 'baptising' and 'godmother' are taken as shared when teaching religious studies or during 'circle time' in a Norwegian classroom. Elbers and De Haan (2005) present an excerpt from a Dutch Maths lesson in which students have to count loaves of rye bread which are only identifiable in the picture in the textbook if one knows that rye bread in the Netherlands usually has a rectangular shape. Gorgorió and Planas (2001) present a Maths lesson in Catalan where the notion of a 'will' becomes a source of misunderstanding. Kroon (1987) discusses the confusion raised when Dutch maritime history is taken for granted when the origins of the French terms 'babord' and 'tribord' are explained.

The attribution of linguistic resources in languages other than the standard language appears to follow a similar pattern. Kroon (2003) presents a Dutch lesson in a mainstream classroom, where students were asked to translate 'cauliflower' and 'peanut butter' into their own language. The students, however, explained that they do not know, as their mother always uses the Dutch words for this food. Bezemer and Kroon (2006) report on special 'language support' lessons for 7-year-old Turkish/Dutch bilingual students. They were asked to translate words from Dutch to Turkish, but occasionally failed to do so. As in the previous case, the 'Turkish' students were taken to be 'native Turkish' and 'non-native Dutch' (cf. Leung, Harris and Rampton, 1997). They were attributed linguistic resources in Turkish, which they did not possess. Being born in the Netherlands, and immersed in Dutch schooling since the age of four, their proficiency in Dutch had developed in domains where they hardly ever used their 'home' language, and these languages in turn, were used in domains where Dutch played no role.

Linguistic resources available to students can thus be misconceived in the classroom. Ongoing immigration and globalisation will only reinforce the blurring of boundaries between students' 'first language' and 'second language' that create the caveats of such misattribution. The 'Turkish' student may not know the Turkish word, and at the same time know perfectly well what standard Dutch word order 'sounds like'. Indeed, when she misspells words in the context of instructions such as 'listen to what it sounds like when you invert the word order' the mistake may well have been the result of other factors unrelated to the lack of particular resources in the target language.

Paradoxically, teachers may react differently when students' linguistic resources are discussed in interviews. The Dutch teacher who encouraged a student to invert the word order 'so that it sounds better' also articulated the belief that 'it doesn't sound weird to foreign children' (Bezemer, 2003). The Turkish teacher, when asking students to translate from Dutch to Turkish, believed that 'there are also children who don't even know the Turkish word' (Bezemer and Kroon, 2006). Such mismatches between classroom practice and articulated beliefs may be indicative of the multi-faceted character of practical knowledge, with rhetoric changing more rapidly than the beliefs which inform the day-to-day classroom routines upon which teachers may have acted for many years (Anderson-Levitt, 1987).

### *Legitimisation of Linguistic Resources*

The second issue focused on in European case studies of standard language teaching in multicultural contexts is the valuation and legitimisation of linguistic resources. Kroon and Sturm (1996) present a Dutch multicultural school where there was a rule generally acknowledged by all teachers that students could not speak any language other than Dutch in the classroom. When students speak languages other than Dutch, it was argued, 'we' are excluded and may believe negative things are being said about one of us, while at the same time, it was seen as a lost opportunity for students to practise Dutch. Indeed, in the classroom, students could be seen to be reprimanded for using Turkish to each other during a group discussion. Only on one occasion was Turkish used legitimately. A student had written, in Turkish, 'happy birthday', under a drawing for a boy whose birthday it was. When the boy, who did not speak any Turkish, attempted to pronounce and translate the Turkish congratulation, he was praised by the teacher. Those students who did speak Turkish corrected his pronunciation and objected that the boy could easily have guessed the meaning of the message from the context. However, they were not given the floor. 'Turkish' was legitimate only when used by a student for whom Turkish

was a 'foreign' language, rather than a 'home' language. Comparable reluctance to allow students to display their knowledge of languages spoken at home—as opposed to knowledge of 'modern foreign languages'—was observed in Flemish (Ramaut, 2000), German (Neumann, 2000) and British multilingual classrooms (Bourne, 2000).

Blommaert et al. (2006) show how a Flemish teacher applies common-sense, ideological and professionally habituated distinctions between some linguistic resources and others in the emergent literacy repertoire of her students. In her classroom, literacy was defined as Dutch-language literacy in the Latin alphabet. Other kinds of literacy were disqualified as lower-value or even value-less linguistic resources. The authors observed two types of disqualification. First, the disqualification of existing writing skills acquired in other linguistic contexts but potentially valuable as an instrument for learning, such as basic, grass-roots literacy skills developed in English in Sierra-Leonese education. Second, the disqualification of 'foreign' accent in speaking or writing. Unlike 'native' non-standard accents, which the teacher sometimes used herself, the foreign accents would be corrected.

If languages other than the national standard language count as legitimate in European school contexts it appears that in most cases their use is limited to special classes, such as language support classes and reception classes, where use of these languages is seen as instrumental to the regular curriculum. In the 'language support class' in a Dutch school (Bezemer and Kroon, 2006) 'Turkish' students and a bilingual teacher were physically separated from the regular class for 1 hour per week to learn Dutch through Turkish. Martin-Jones and Saxena (1996) discuss English reception classes with bilingual support teachers working alongside a class teacher, showing how the legitimate use of multiple languages in one and the same classroom is tightly controlled by the national standard language speaker. The bilingual support teachers were positioned as assistants, with the monolingual class teachers assuming the principal speaking rights, allocating turns to the bilingual assistants and shaping the patterns of code-switching across turns.

Mondana and Gajo (2001) report on reception classes for Portuguese children in French-speaking Switzerland. They discuss key excerpts illustrating uses of bilingual resources ranging from rejection or disqualification of bilingualism to the recognition of bilingualism. They conclude that languages other than French were most often given attention when a more communicative approach to language teaching was adopted. This is also the conclusion that Bezemer et al. (2004) draw from a comparison of Dutch and Norwegian instances of dealing with multilingualism. In the Dutch case, a teacher-centred approach was accompanied by a reluctance to have students display linguistic

resources other than the standard language. In the Norwegian case, a more communicative approach was accompanied by occasional room for the students to use their home language.

From time to time, students have been observed contesting the linguistic norms and valuations operating in the classroom. Jaspert and Ramaut (2000) conclude that those students who openly questioned the linguistic norms in the classroom they studied were the most proficient students in the class. Following Bernstein (1971) and Bourdieu (1977), they argue that those students, in particular, who do not belong to the dominant language community, will increase their chances of symbolic gain and thus improve their position in the class when they accommodate to the norms of the linguistic market (see Heller, *Language Choice and Symbolic Domination*, Volume 3). Frey (2000) noted that it was precisely those children whose contributions had an impact on educational practice, who understood the teacher's linguistic norms. Jaspers (2005), however, reports how students taken to represent a minority group use their awareness of linguistic norms to what they themselves call 'fool around'. Moroccan boys in a secondary school in Antwerp, Belgium, were observed 'playing' with three different varieties of Dutch, that is, Antwerp dialect, 'poor' Dutch and standard Dutch. By simulating hysterical indignation, complete incompetence or extreme cooperation in the mainstream class through creative use of these language varieties, they did not directly contest but 'sabotaged' linguistic norms. In raising confusion and ambiguity, they entertained themselves and others, thus quite literally taking centre stage in tedious lessons. At the same time, this tacitly conveyed their misgivings about linguistic rules, attitudes, stereotypes and asymmetrical social relations inside and outside the school.

The reported practices of legitimisation of the national standard language in European schools show that students who speak a language variety need to become acquainted with situated sets of linguistic norms which are needed to participate in socially and culturally appropriate ways (Green and Bloome, 1997). These include a sense of appropriateness of school-based uses of linguistic resources within varying constellations of location, speaker, and audience. Contestations of these norms were initiated by those students who could be expected to be acquainted with the norm, in most cases but not exclusively, members of the dominant language community. Teachers were observed to allow marginal infringements of the norm when the use of other languages was conducive to the learning objective. In other cases, contestations were unacceptable and sanctioned.

Legitimisation practices echo different socio-political discourses. The national standard language may be statutorily defined as the official language of communication in classrooms. Curricular prescriptions may

facilitate the (instrumental) use of languages other than the national standard language in mainstream or separate classrooms. National or local policies on intercultural education, inclusive education or language-in-education may promote reflection on linguistic and cultural diversity. Besides, there are ongoing debates across European countries as to how to organise a multicultural society, with positions ranging from assimilation to separatism (May, *Language Education, Pluralism and Citizenship*, Volume 1). These discourses form the backdrop to the classroom practices portrayed here.

### PROBLEMS AND DIFFICULTIES

Two difficulties emerge from the documented practices of national standard language teaching in multicultural contexts. As regards the attribution of linguistic resources, it may be observed how misattributions in both the standard language and other languages can result in ineffective instruction. It has been predicted that growing diversity and hybridity will only reinforce the difficulty of making assumptions as to precisely which linguistic resources students have at their disposal. Assumptions of what students already know are nonetheless inevitable in pedagogical contexts where the teacher is in control of sequencing and pacing curriculum content. Weaker framing is less dependent on insight into individual students' language backgrounds.

With respect to legitimisation and valuation, we can see how disqualification of linguistic resources may lead to missed opportunities to learn. Existing speaking and writing skills acquired in other linguistic contexts may be potentially valuable as means of learning to speak and write in the national standard language (Blommaert, Creve and Willaert, 2006). Recognition of such resources as valuable in their own right may also promote self-awareness and identity formation. At the same time, incorporating knowledge and practices which evolve outside school into the curriculum probably always involves some form of overt or covert transformation (Moss, 2001). It is this transformed, schooled knowledge that offers pathways to educational qualifications which teachers and students are pressured to create and pursue.

From a methodological perspective, a number of difficulties emerge from the review. Most of the reviewed case studies are, in fact, about one class, and one teacher. Moreover, most of the analyses appear critical with respect to the practices they describe. The episodes presented in the studies were usually selected as a result of the impact they had on the researcher, thus potentially leaving episodes unattended which might qualify more convincingly as 'good practice'. However, the strength of the accounts offered lies in their power to unveil socially and culturally shaped processes of attribution, legitimisation and valuation

of linguistic resources that have implications for equal opportunities to learn. Some of these mechanisms might be reshaped through growing awareness of multilingualism, others might recede as new generations of teachers embark on their career.

### FUTURE DIRECTIONS

The review has shown some of the ways in which immigration and internationalisation have challenged and occasionally destabilised traditional conceptions of national standard language operating in European classrooms. These challenges will continue to develop. National standard language teaching has played a key role in recent national debates on what citizens should know and do in order to count as a member of the national culture. In 2005, various European governments initiated such debates themselves. In Germany, there was a proposal to make German the compulsory language of communication, not only in classrooms but also in schoolyards in Berlin (Presseerklärung, 2006). In the Netherlands, the minister of immigration and integration suggested that a civil code of conduct should be drawn up in which speaking Dutch in public was to be declared the norm. The minister of education appointed a committee whose brief was to propose a cultural-historical and socio-cultural canon (Opdrachtbrief, 2005). Future research should account not only for the origins of such *reaffirmations* of monolingualism and monoculturalism but also for their ramifications in multicultural classrooms.

This future research would benefit from further integration of the foci on teacher and student. In trying to understand what goes on in language classrooms both the teacher's and the student's 'emic' perspectives are indispensable. Much of the work reviewed here centres on teachers' practical knowledge. The understanding of this perspective may be reinforced when teachers are involved again as researchers in classroom research, as suggested two decades ago in English and American publications (see e.g. Hopkins, 1985). Through participation in classroom research, teachers would also gain a deeper understanding of their own behaviours, which could lead to (more) appropriate ways of dealing with heterogeneity and diversity in their day-to-day practice. At the same time, students' perspectives should be an integrated part of future studies on standard language teaching. In view of popular discourses that problematise multilingual students' competence of the national standard language, it is of paramount importance to describe and understand the creative ways in which these students use their repertoire of linguistic resources inside and outside classrooms.

Achieving understanding of the attribution, legitimisation and valuation of these resources also bears on the construction of teacher and student identities (Luk Ching Man, Classroom Discourse and the Construction

of Learner and Teacher Identities, Volume 3). Where students may be defined as ‘foreign’, ‘different’, ‘disadvantaged’, ‘second-language learner’, ‘Muslim’, ‘non-native’ and so on in discourses inside and outside the classroom, students often have much more complex self-ascribed identities. These intricate relations between language and identity in school deserve further research (Spotti, 2006).

Sociolinguistic and school ethnography remains a fruitful approach to these matters (Green and Bloome, 1997; Jaspers, 2005). It provides detailed accounts of language-in-use in specific settings, taking educational practice as an ensemble of interrelated texts. The methodological challenge that lies ahead involves accounting for the multimodal construction of these texts. Recent classroom studies show that discourses on standard language teaching are indeed realised not only through speech and writing, but also, and often primarily, through image, gesture, wall displays and other modes of representation and communication that have remained largely unattended in the research reviewed here (Jewitt, *Multimodal Discourse across the Curriculum*, Volume 3). A multimodal lens also opens up new ways of understanding the communicative resources that novice students have to acquaint themselves with, which range from, for example, ‘Dutch word order’ in the mainstream classroom to ‘Turkish gaze’ in the ‘language support’ classroom.

DISCOURSES ABOUT ENGLISH: CLASS, CODES AND  
IDENTITIES IN BRITAIN

INTRODUCTION

This chapter focuses on the social and historical processes involved in the creation of a standard language, the discourses which emerge and circulate as a result of those processes and the social and educational consequences of standardisation for speakers of the non-standard, marginalised dialects. In order to provide the historical and contemporary evidence needed to support the arguments in this chapter, I have chosen to focus on one standardised national language, British English. Similar accounts have been written on other languages in their national contexts. We now have a wealth of studies on the development of standard languages and language ideologies in many countries, and especially in Europe where links between language and nation have been widely articulated (Davies and Langer, 2006; Grillo, 1989; Mar-Molinero, 1997; Tosi, 2000). Several interesting studies have also been carried out in Anglophone countries (Collins, 1999; Lippi-Green, 1997). There are themes common to all these accounts, but the process of language standardisation is essentially historically situated, hence the decision to focus, in this chapter, on the details of the social and ideological conditions in Britain and on the processes at work in the rise of Standard British English. As I suggest, in Britain, possibly more than in any other country, the development of the standard has been inextricably linked with class stratification and social prejudice.

DISCOURSES ABOUT ENGLISH IN BRITAIN: MAJOR  
CONTRIBUTIONS TO RESEARCH

*Defining the Standard*

Standard English (SE) is usually defined as the set of grammatical and lexical forms typically used in speech and writing by educated native speakers (Trudgill, 1975). It has undergone the processes of determination, codification and stabilisation and is now the variety used in almost all forms of writing, the media, government, and crucially, in education. However, while it is the official dialect of the school, and commonly referred to as 'the English language', standard English is only one

dialect of English among many and is spoken natively in only a minority, approximately 15%, of homes in UK according to Trudgill (1999). In spite of its wide use in the public domain, the press and education, the term ‘standard English’ is problematic. Most linguists agree that standard English is simply one (albeit the most important) of the many dialects of English which are distinguished from each other by their grammar, phonology and lexis. Unlike regional dialects, however, which now largely exist as spoken varieties only, SE has developed as the fully developed written variety, the ‘historically validated and uniform written form of the language’ (Crowley, 2003, p. 259). Thus ‘to use spoken or written SE is to signal competence in a set of well-established rules, endorsed by a normative education system’ (Milroy, 1999, p. 174). Some argue that there cannot be a true spoken variety of SE since the educated nature of its speakers means that their spoken mode is heavily influenced by written norms, and certainly, twentieth century grammars of standard English (cf. Quirk, Greenbaum, Leech, and Svartvik, 1972) were based on written and spoken corpora provided largely by academics. Milroy suggests, ‘spoken standard English might be described as what is left after we remove from the linguistic bran-tub, Estuary English,<sup>1</sup> Brummie,<sup>2</sup> Scouse,<sup>3</sup> Geordie,<sup>4</sup> various quaint rural dialects, London Jamaican . . . etc.’ (Milroy, 1999, p. 174). Recent research on the grammatical structure of spoken English, based on more varied corpora (Cheshire, 1999; Carter and McCarthy, 2006) suggests that it differs considerably from the written mode. In the public mind however, references to standard English generally evoke ideas about a fixed and unchanging language rather than a dialect, and about ‘good English’ and ‘correct usage’.

### *Authority and Distinction: Historical Perspectives*

Such beliefs are due, in part, to the word ‘standard’ itself which can mean both uniformity<sup>5</sup> and level of excellence.<sup>6</sup> The notion of a standard therefore ‘involves [ideas] about authority, commonality and evaluation’ (Crowley, 2003, p. 78). It is generally accepted that the standardisation of English began in the fourteenth and fifteenth centuries in Britain with the emergence of a variety of English which was

<sup>1</sup> Standard English spoken with an accent that includes regional features localisable in and around London.

<sup>2</sup> Brummie is the dialect spoken in Birmingham.

<sup>3</sup> Scouse is the dialect of Liverpool.

<sup>4</sup> Geordie is the dialect of Newcastle and the northeast.

<sup>5</sup> As in the expression ‘this is the standard issue for soldiers’.

<sup>6</sup> As in the expression ‘her work was of a consistently high standard’.

used in the first printed books, and which developed into the uniform, national literary language we find in written texts today. The process of 'fixing' or codifying the written language, initiated by the prescriptivist writers of the eighteenth century (Dr. Johnson, for example) with the publication of dictionaries and grammars, means that there is little variation in standard written English and change is very slow. Spoken language, in contrast, is in a state of constant change and many linguists would argue that attempts to standardise it are bound to fail, especially in the case of the phonology which is 'particularly resistant to standardisation' (Milroy, 1999, p. 173). The designation of a standard form with its attendant notions of authority and evaluation, however, means that it becomes the primary form against which all others are judged, and other, i.e. 'non-standard' spoken varieties are devalued with social consequences for their speakers.

Judgements about standard and non-standard varieties date back to the eighteenth century when Swift and other writers urged that there should be 'a standard set up for those to repair to who might chuse (sic) to speak and write grammatically and correctly' (Crowley, 2003, p. 79). Their primary aim was to find a commonly accepted, literary language such as that used in the King James translation of the Bible, to serve as a model for writers, but interest was also growing in establishing a spoken standard and 'shops [swarmed] with books whose titles announce a standard for pronunciation' (Walker, 1774 cited in Crowley, 2003, p. 107). The variable nature of speech however, meant that selecting a model was more complicated and many of the books consisted mainly of 'a barbarous orthography and a corrupt pronunciation' (ibid.).

By the mid-nineteenth century however, an association between language and the social hierarchy had become firmly established. This was under-pinned by the ideas about the links between language and nation that were circulating in Europe at the time. Sociolinguistic research in UK has since repeatedly demonstrated clear correlations between the number and variety of non-standard regional features a speaker uses, and social class, with speakers at the lower end of the social scale using the most regional forms. Leith maintains, 'in no other country in the world are pronunciation and social class so closely linked' (Leith, 1997, p. 55). The agreed model for spoken standard English and the corresponding accent, Received Pronunciation (RP) was that of the educated elite whose speech betrayed no trace of their regional origins. Commentators at the time referred to: 'the common standard dialect . . . in which all marks of a particular place of birth and residence are lost and nothing appears to indicate any other habits of intercourse than with the well-bred and well informed' (Smart, 1836 cited in Crowley, 2003, p. 111). By the 1930s, Henry Wyld, Merton professor of English

at Oxford University, had narrowed down the model for spoken SE to a particular profession:

The best speakers do not need to take thought for their utterance: they have no theories as to how their native tongue should be pronounced. . . . Their fathers have told them – that suffices. If I were asked among what class the ‘best’ English is most consistently heard, . . . I should say among officers of the British Regular Army. The utterance of these men is at once clear cut and precise, yet free from affectation: at once downright and manly yet in the highest degree refined and urbane (Wyld, 1934, p. 614).

The ability to speak SE with an RP accent became a matter of birth and accessible to only a small minority of the population. ‘By analysing correct usage in terms that only a tiny minority of educated people could command, the codifiers ensured that correctness remained the preserve of an elite. The usage of most people was wrong, precisely because it was the usage of the majority’ (Leith, 1997, p. 57).

### *Language Values and Social Class*

The confident belief in the intrinsic superiority of SE, expressed by scholars such as Wyld, has ensured that not only are the non-standard dialects spoken by the least powerful groups in society considered ‘wrong’ but they have long been subjected to stigmatisation. In the nineteenth century, Whitney described the speech of the ‘uncultivated’ as containing ‘a host of inaccuracies, offences against the correctness of speech, ungrammatical forms, mispronunciations, burdens of application, slang words, vulgarities’ (Whitney, 1865 cited in Crowley, 2003, p. 128), while H-dropping, a feature of many non-standard varieties, and possibly the most stigmatised feature in British English, was said by Alford (1864) to be ‘common throughout England to persons of low breeding and inferior education’. Urban dialects and accents in particular are still widely stigmatised and articles criticising regional speech and by association, the speakers, commonly occur in the press today. On the subject of adolescents, Dr. Rosalind Miles wrote:

brought up as they are on little more than a mouthful of glottal stops, the garbage of mental gutters awash with the waste of today’s rock and pop ‘yoof talk’ (Dr. Rosalind Miles, *Mail on Sunday*, September 1995).

The following description of the Liverpool dialect was published in *The Times*:

T'me ed laaa' . . . Example of the delightful dialect known as Scouse,<sup>7</sup> derived from lobsouse, a Norwegian name for meat and vegetable stew.

(*The Times*, June, 2004).

Linguists have made repeated attempts to counter linguistic prejudice, and have consistently stressed that all languages and dialects are equally complex, structured and rule-governed systems. In spite of their efforts however, beliefs about non-standard varieties being 'sloppy', 'lazy', 'wrong' or 'ugly', seem to persist, even in the minds of the speakers themselves, who often feel they cannot speak their own language properly.

And yet the characterisation of working class speech as incomprehensible, harsh and ugly has been shown to be based on little more than social prejudice. Trudgill (1983) asked North American and British judges to rate a series of British accents for their inherent aesthetic qualities. Interestingly, there was no agreement at all between the North Americans who did not recognise regional British varieties, but British judges were united in rating the dialects of the big cities—Liverpool, London, Glasgow and Birmingham—as the least attractive, a finding that would suggest that social connotations have a strong influence on aesthetic evaluations. Interestingly, traditional rural dialects are generally evaluated as 'attractive' and their speakers as trustworthy and friendly (Milroy, 1999).

Equally serious for working class speakers is the process of 'symbolic revalorisation' (Woolard and Schieffelin, 1994), whereby negative (or positive) values assigned to a dialect or a language, are transferred to the speakers themselves. This means that while there has long been an association between standard English and RP and good breeding, a good education and other exemplary qualities, the use of non-standard English has a history of being associated not simply with speakers from the lower socio-economic groups, but with low moral standards. Twentieth and twenty-first century politicians and journalists have been voluble on the subject:

If you allow standards to slip to the stage where good English is no better than bad English, where people turn up filthy to school . . . . All those things cause people to have no standards at all and once you lose standards there's no imperative to stay out of crime. (Lord Tebbit MP, *BBC Radio 4*, 1985).

The new dialect emerging in the new town of Milton Keynes was described as:

a hellish, slow-spreading, universal yob-tongue (Peter Tory, *International Express*, August 1994).

---

<sup>7</sup> See footnote 3.

While the publication of the new Cambridge Grammar of English (Carter and McCarthy, 2006) prompted the following comment from a journalist:

Grammar is a question of manners, practically of morals  
(D. Wordsworth, *Daily Telegraph*, March 2006).

The wide coverage given to such prejudicial opinions in national newspapers suggests that whereas racial or sex discrimination is no longer permissible, prejudice and discrimination on linguistic grounds are still considered acceptable in Britain. The educational consequences for children and their parents whose home language is a non-standard variety will be discussed in a later section of this chapter.

### *Standard and Non-Standard: English in Education*

Since the introduction of compulsory state education in the UK in the 1870s, a primary aim has been the teaching of SE. In the period following the First World War, language was seen as a powerful dividing factor in society and fears that a dissatisfied, poorly educated working class might trigger social unrest led educationists to propose that teaching English should be the main focus of all state education. Sir Henry Newbolt, who chaired the Newbolt Committee to report on the teaching of English, stated:

Two causes . . . at present distinguish and divide one class from another in England. The first of these is a marked difference in their modes of speech. If the teaching of the language were properly provided for, the difference between educated and uneducated speech, which at present causes so much prejudice and difficulty of intercourse on both sides, would gradually disappear (Newbolt, 1921, p. 22).

The Committee decided that non-standard dialects had no place in school.

It is emphatically the business of the elementary school to teach all its pupils who either speak a definite dialect or whose speech is disfigured by vulgarisms to speak standard English and to speak it clearly and with expression (Newbolt, 1921, p. 65).

Forty years later, speakers of non-standard dialects from working class backgrounds were still being characterised as inarticulate and unintelligent. In attempts to explain under-achievement by working class pupils, speech pathologists Gerber and Hertel, blamed lack of language skills for children's poor performance in IQ tests:

The language that is spoken in the working class home is typically poor in quality and quantity. It is not used to express subtle feelings or to express ideas and thought. With inadequate

stimulation from people and experiences there is little to talk about. Most of the conversation is by non-verbal means. (Gerber and Hertel, 1969, p. 270).

Such views appeared to be reinforced in the early writings of the eminent educationist, Basil Bernstein (1971), whose labelling of working class and middle class speech<sup>8</sup> as restricted and elaborated codes, respectively, was unfortunate in that it served to confirm the negative attitudes held by some members of the educational establishment towards non-standard dialects. Bernstein's views were strongly opposed by linguists (Labov, 1970; Rosen, 1972; Trudgill, 1975) and from the early 1970s onwards, calls were increasingly being made by linguists and educationists for a change in attitudes toward non-standard dialects.

After a period of intense debate, the wider educational climate began to change, albeit for a brief period. An independent committee, chaired by Sir Arthur Bullock, was set up to report on language teaching in schools. The Bullock Report, *A Language for Life* (1975), articulated some of the most progressive views on language diversity that have ever been published in policy documents. The main recommendation was that every secondary school should develop a policy for language across the curriculum. It acknowledged that children arrive at school speaking a range of dialects and languages and that 'to criticise a person's speech may be an attack on his self-esteem'. 'No child' it stated, 'should be expected to cast off the language and culture of the home as he crosses the school threshold' (Bullock, 1975, p. 143). There followed a period when tolerant attitudes towards many varieties of English prevailed, creative writing using features of local dialects was encouraged and language awareness was taught in many schools.

#### POLITICAL DISCOURSE ON ENGLISH IN EDUCATION

English is far more than merely a school subject however. Language and language ideologies have regularly been the source of conflict, political dissension, and even the cause of 'moral panics' (see Cameron, 1995 for discussion). The introduction of a national curriculum by the Conservative government in 1988 signalled a shift in attitudes towards language in education, and the teaching of English, became 'a crucial focus of tension and debate . . . a site upon which political positions were argued' (Crowley, 2003, p. 258). Debates about an appropriate model of English and about the merits of teaching formal

---

<sup>8</sup> Bernstein was careful to point out that he was not referring to SE and NS dialects as such, but his theories have regularly been interpreted in that way.

grammar raged in the media, with journalists, politicians, educationists and even members of the Royal Family taking part (see Cameron and Bourne, 1989 for discussion). In spite of the recommendations of the Kingman Committee (1988),<sup>9</sup> and its successor the Cox Committee (1989)<sup>10</sup> that SE should be taught in ways that do not denigrate the regional dialects spoken by many pupils' and that 'teachers should encourage an interest in both rural and urban non-standard dialects', politicians took a firm stand: SE was to be the only acceptable variety in school. For the Conservative politicians of the 1980s and 1990s, standard English represented nationhood, a unified electorate and a return to traditional values. Topics such as variation in English, language and gender and language in multicultural settings were removed from the curriculum and the Minister of State for Education, Mr. Tim Eggar, banned the publication of a government-commissioned set of materials<sup>11</sup> for teachers which focused on language in social context. His reasons were that:

They [were] banal and theoretical and failed to give children the basic grammar they needed to speak and write the English that could be understood throughout these islands. It was as though 'the experts' were determined to destroy the concept of correctness in language and literature ... (Editorial *Evening Standard*, 26/6/1991).

A change of government in 1997 brought about further changes in English teaching. The stated aim of the new Labour government was to 'raise standards' in literacy and numeracy. The repeated use in policy documents of expressions such as 'raising standards' or 'high standards' however, appears to have led to a certain slippage in the meaning of the term standard English. Whereas it had previously been used to mean 'a uniform kind of English to be used in formal neutral contexts' in the National Curriculum documents of the 1980s and 1990s, it now took on the meaning associated with 'levels of excellence'. In official documents, therefore, we now find frequent juxtaposition of SE with expressions such as 'correct, accurate, precise'. For example on a Department of Education and Skills (DfES) web site entitled 'The Standards Site', parents are informed:

Pupils should be taught in all subjects to express themselves *correctly and appropriately* and to read *accurately* ... Since SE, spoken and written is the predominant language in which knowledge and skills are learned ... (DfES, April 2006).

<sup>9</sup> Committee appointed to advise on a model of English to be taught in schools.

DISCOURSES IN SCHOOLS AND CLASSROOMS:  
WORK IN PROGRESS*Standard and Non-Standard English in the Classroom*

The insistence on accuracy, correctness and precision in the National Curriculum for English Guidelines can have the effect of persuading teachers that the language spoken by many of their pupils is 'sub-standard' and that children's language should be 'corrected' from a very early age. Education professionals' lack of understanding of the nature of language variation can lead to difficulties in schools for both children and parents as the following section will demonstrate. The data presented here was collected in a wide range of state primary and secondary schools across England.

The following extract was recorded in the course of a research project<sup>12</sup> on family literacy. The Year 1<sup>13</sup> children are having a literacy hour<sup>14</sup> lesson

*Year 1: classroom observation*

It is the Literacy Hour: the children are sitting on the mat and the teacher is showing the children a big book

1. Teacher: Which page is this? (*pointing to a page*)

Child: The one we *was* reading yesterday

T: **Were** reading

2. T: Where did we get to yesterday?

Ch: Houseflies

T: So where will I look?

Ch: We *ain't* done houseflies yet

T: Ain't, ain't!! Is there such a word?

3. T: What are these?

Ch: Bullet points

T: There's a T at the end of bullet.<sup>15</sup> (Williams and Gregory, 2004)

The corrected forms are all common features of non-standard dialects of British English, but no explanation was offered to the children as to why they were corrected. It is unlikely that the teacher's corrections were understood. Rather, they may have had the effect of confusing the

<sup>12</sup> Leverhulme-funded project: 'Literacy practices at home and at school: community contexts and interpretations of literacy', conducted by Eve Gregory, Brian Street, Dave Baker and Ann Williams.

<sup>13</sup> Year 1: pupils aged 5–6.

<sup>14</sup> The Literacy Hour: a daily hour of literacy teaching compulsory in all state primary schools as part of the National Literacy Strategy.

<sup>15</sup> In fact, the 't' is realised as a glottal stop before a following consonant even in RP, so the child was 'right'.

children and leading to hypercorrection as was the case in the following example. The following sentences were taken from the English exercise book of Jade, a 9-year-old girl who lived in Reading, and were written over a period of 6 months:

|  |                           |
|--|---------------------------|
| We down <sup>16</sup> the housework                                |                           |
| We don don done our homework                                       |                           |
| My brother <del>done</del> (i) <del>done</del> <sup>did</sup> (ii) | (i) Jade's correction     |
| a jigsaw   | (ii) Teacher's correction |
| We <del>done</del> did a bit more dancing                          | Jade's correction         |
| When we had <del>done</del> did some housework                     | Jade's correction         |
|  | (Williams, 1994)          |

The above examples suggest that primary school children need time and careful teaching if they are to acquire the grammar of SE. While it is generally accepted that children need to be able to write in standard written English if they are to function as fully competent members of society (see Cox, 1991 for discussion), there is less support for attempting to change children's spoken dialects and in particular, their regional accents.

### *Discourses about English in School*

In spite of linguists' repeated efforts to 'educate' the public and the educational establishment about the complex and rule-governed nature of local dialects, it is not unusual for teaching personnel to evince the same linguistic prejudices shown by the general public. The following texts illustrate some educationists' views on their pupils' language:

1. . . . many children, when they come to school, can scarcely talk at all. Sometimes, a witness told us, they cannot even remember their eyes, ears, toes and so forth.<sup>17</sup>
2. A generation of young teachers has gone into schools recently, convinced that working class parents never talk to their children . . . that the language they do possess is lacking many essential features.<sup>18</sup>
3. Teacher. And in fact in Reception,<sup>19</sup> you notice it there . . . just in the lack of language . . . the number of children that are just not speaking.

AW                      What do you attribute this to then?

Teacher                Nobody talks to them<sup>20</sup>

<sup>16</sup> In the dialect of the town of Reading in Berkshire, the past tense of DO is 'done', e.g. I done, you done, he done, etc.

<sup>17</sup> The Newbolt Report.

<sup>18</sup> Rosen and Rosen (1973, p. 54).

<sup>19</sup> The first year of school in UK. The children are aged between 4 and 5.

<sup>20</sup> See footnote 12.

Depressingly, the quotations span 80 years: the first was written in 1921, the second in the 1970s and the third was recorded in 2001 in an interview with a special needs teacher in an affluent town in the south of England. The view that working class parents do not speak to their children appears to be remarkably persistent. Linguists, however, suggest that context plays an important role in a speech production and that a school setting can be intimidating for some children (Labov, 1970).

Such negative opinions can have serious educational repercussions on children's education. Firstly, there is a danger that such attitudes colour the professional judgement of those whose role it is to assess children's competence, and lead them to the pathologise normal children. For example, in one school in a poor district, special needs staff maintain that 90% of the pupils (all of whom have English as their first language) enter school with a 'serious to moderate language delay'.<sup>21</sup> As a result, otherwise normal children are taught Makaton, a rudimentary sign language, developed for children with autism and other severe learning difficulties.

Second, such views can have an impact on school policy. In some schools where it has been decided that the children are unlikely to achieve the targets set by the National Curriculum, a reduced curriculum has been introduced. Children who are offered a restricted curriculum from age 5 are highly unlikely to catch up in the educational stakes.

Finally, frequent correction and the stigmatisation of the language used by a child's family and friends can erode self-esteem and promote feelings of alienation. There is ample evidence in the UK that children from lower socio-economic groups fare worse than their middle-class colleagues in the education system, and that social mobility has changed little since World War II. A recent OECD<sup>22</sup> survey based on 16,000 respondents showed that the opportunities gap between those from different social backgrounds is no better for those born in 1970 than it was for those born a generation earlier in 1958. It would be injudicious to attribute working class children's poorer performance in national tests to language alone, but it has long been understood that linguistic practices are deeply embedded in one's sense of identity. In a school context where SE is the only legitimate code, the non-standard dialect of a working class child has minimal value and both pupils and their parents are fully aware of this. The following comments made by adolescent girls in a secondary school in the north of England clearly demonstrate the role of language in social class stratification:

---

<sup>21</sup> See footnote 12.

<sup>22</sup> Organisation for Economic Cooperation and Development.

AW: Do the teachers correct you when you speak?

R: Mrs C. corrects all your language. She says, 'You're not on the street now you know'. She takes us for estate kids. Estate kids are meant to be real bad, druggies and everything.

P: The posh teachers think we're all like that. It does my head in.

R: They don't give you a chance do they.

(Kerswill and Williams, 1997).

Working class parents also feel intimidated and, as a result, excluded in the school discourse community. The following extract is taken from field-notes made by the author in a working class area of a town in the UK in 2002<sup>23</sup>:

Mrs P said that her son Justin had started to stutter when he was in the nursery. The play leader told her to ignore it, but the school doctor said that she 'should be picking it up'. When Mrs P enquired how, the doctor ignored her question and said to a teacher who was present, 'Can't she understand anything?'. Mrs P says she felt terrible and too upset to respond. (Williams and Gregory, 2004).

Justin's mother suffered the same feelings of humiliation as the mothers in a study carried out in London schools by Reay, who found that for many parents, 'the primary school constituted a field that was least favourable to their linguistic productions and which condemned them to a more or less desperate attempt to be correct or to silence' (Reay, 1998, p. 166).

#### FUTURE DIRECTIONS

Outside the school context, of course, non-standard varieties continue to flourish. Although the traditional rural dialects are gradually dying out as rural life changes and incomers from towns and cities move into the countryside, other regional and urban dialects are still thriving. There is now a growing body of research on dialect levelling (the reduction of regional differences between dialects), which suggests that features of non-standard dialects such as the replacement of 't' by a glottal stop (a feature of Cockney<sup>24</sup>) are rapidly spreading not only geographically across the country, but also into middle-class speech. The range of local dialects being researched and described by linguists is increasing steadily and it is crucial, that their findings be made available and accessible to non-linguists such as teachers and teacher trainers.

---

<sup>23</sup> See footnote 12.

<sup>24</sup> The dialect of London.

Among the public, there appears to be a growing awareness of and interest in language issues. It is encouraging that the number of pupils choosing to study English Language (which includes topics such as language variation, language and gender, etc.) at Advanced Level<sup>25</sup> increases year on year. Many towns and cities produce booklets on their local dialect and there are now Web sites where regional speech can be accessed.<sup>26</sup> Possibly the most hopeful recent development is that schools in the county of Norfolk have recently received a grant to teach the Norfolk dialect. The organisers said ‘[they] were tired of hearing all the teachers running it down as laziness and not seeing it as a dialect. It’s critically important that youngsters are aware that there’s a wonderful rich dialect that they need to use or lose. It’s not something to be ashamed of’ (*Guardian Newspaper*, 23/03/06). It is to be hoped that the actions of Norwich educationists will be replicated across the UK and in other countries and that the position of standard and non-standard varieties in all schools might finally be re-evaluated.

# **Section 4**

## **Discourse and the Construction of Knowledge**

## THE GUIDED CO-CONSTRUCTION OF KNOWLEDGE

## INTRODUCTION

Enabling students to become more adept at using language is seen as one of the major goals of education: first, so they can express their thoughts and engage with others in joint intellectual activity to develop their communication skills; second, so as to advance their individual capacity for productive, rational and reflective thinking. The guided co-construction of knowledge, in which a teacher talks with students in whole class, group and individual situations to guide their thinking, is, therefore, seen as being central to the educational process. In this theory of learning, teachers and learners are seen as active participants in the construction of knowledge on the basis of ideas and experiences contributed by the students as well as the teacher (Mercer, 1995; Wells, 1999).

## EARLY DEVELOPMENTS

Writing in the 1930s, Vygotsky was one of the first psychologists to acknowledge the role of talk in organising learners' understanding of the world, particularly through his writings on *Thought and Language* first translated into English in 1962. He suggested that using language to communicate helps in the development of new ways of thinking: what children learn from their 'inter-mental' experience (communication between minds through social interaction) shapes their 'intra-mental' activity (the way they think as individuals). More importantly, Vygotsky argued that the greatest influence on the development of thinking would come from the interaction between a learner and a more knowledgeable, supportive member of a community, such as a parent or teacher. In what became known as the zone of proximal development (ZPD), the zone between what a learner can do unaided and what he or she can manage with expert assistance, language was seen as being central to instruction. Classroom language was also seen as mediating and reflecting the wider socio-cultural context in which it operated (Daniels, 2001).

A similar emphasis on the social origins of the individual's language repertoire is found in the work of the Russian philosopher Bakhtin on the dialogic nature of language and literature, originally published in Russian in the 1920s and 1930s but not translated in the West until the 1960s and later (Holquist, 1990). Bakhtin argued that dialogue

pervades all spoken and written discourse and is essential where meanings are not fixed or absolute. It is therefore central to educational discourse and learning because of the need to consider alternative frames of reference.

Out of the work of these early theorists developed the social constructivist view of learning which suggests that classroom discourse is not effective unless students play an active part in their learning (Barnes and Todd, 1995; Wells, 1999). This view of learning suggests that learning does not take place through the addition of discrete facts to an existing store of knowledge, but when new information, experiences and ways of understanding are related to an existing understanding of the matter in hand. One of the most important ways of working on this understanding is through talk, particularly where students are given the opportunity to assume greater control over their own learning by initiating ideas and responses. In this way, they can contribute to the shaping of the verbal agenda and introduce alternative frames of reference which are open to negotiation and where the criteria of relevance are not imposed. The social constructivist theory of learning therefore questions the value of the linguistic and cognitive demands made on students within the traditional teacher-led question–answer recitation format where the students are mainly expected to be passive and to recall, when asked, what they have learned and to report other people’s thinking.

Closely related to Vygotsky’s work is Bruner’s (1985) concept of ‘scaffolding’ developed from his observations of young children interacting with their mothers to highlight the way that an adult can guide a learner through an activity. As a term it has increasingly been used in educational contexts to describe certain kinds of support which learners receive in their interactions with teachers and peers. Through such interactions, students are helped to move towards new skills, concepts and ways of using language, and acquire new frames of reference to interpret observations, information and events (Maybin, Mercer, and Stierer, 1992).

The concept of scaffolding has also led to a series of educational interventions designed to facilitate the guided construction of knowledge. For example, Tharp and Gallimore (1988) developed a mode of pedagogical interaction which they called ‘instructional conversation’ allowing for a range of instructional conversations in small-group and whole class situations in contrast to traditional patterns of question–answer teacher-led recitation. Similarly, Brown and Palincsar (1989) developed a co-operative learning system for the teaching of reading which they termed ‘reciprocal teaching’ where teacher and learners work in group to interrogate a text using questioning, predicting, clarifying and summarising techniques (see also Valencia Giraldo, *Talk, Texts and Meaning-making in Classroom Contexts*, Volume 3).

## MAJOR CONTRIBUTIONS

In the development of a dialogic and constructive view of knowledge building, the notion of teaching as 'transmission', in which knowledge is presented as closed, authoritative and immutable rather than open to discussion and interpretation was challenged. Drawing upon insights from the work of Vygotsky, Barnes, Britton and Rosen (1969) working in the UK developed a critical and cross-curricular analysis of what they saw as teachers' overwhelming use of transmissional forms of teaching. Rather than seeing talk in learning as a linear process, they argued it should be a reciprocal process in which ideas are discussed between students and teacher so as to take thinking forward.

In an attempt to open up classroom discourse and encourage greater student participation, research has focused on the promotion of 'higher-order' questioning techniques to promote reflection, self-examination and enquiry through the use of 'open' questions which invite students to speculate, hypothesise, reason, evaluate and to consider a range of possible answers (Brown and Wragg, 1993). A large amount of research has been carried out into teacher questioning techniques and it has generated controversy about the use of questions as a strategy for guiding the co-construction of knowledge because of teachers' overwhelming reliance on 'closed' questions in which students provide the 'right' answer as defined by the teacher (Wood, 1992).

Dillon (1994) argues that a high level question might be said to express a high level of thinking on the part of the teacher, but it does not necessarily cause it in the respondent. He goes on to suggest that discussion usually begins with a problem in which all participants share some perplexity, giving rise to genuine questions; however, teachers are rarely perplexed about the questions they ask, as they typically know the answers, so there is little opportunity for sharing the question and therefore stimulating either teacher or student thought. Therefore, teachers' questions cannot be held to have a stimulating effect on enquiry, as there is no enquiry in asking them and none in answering them. In order for teachers to be more effective in opening up classroom talk to students, a range of alternatives to teacher questions have been suggested which include the use of provocative, open-ended statements, encouraging students to ask their own questions and maintaining silence so that students have thinking time before they respond (Edwards, 1992). Such alternatives to teacher questions also led, as discussed later, to a shift in emphasis to the way teachers react in their feedback to student responses.

Other research studies have also raised doubts over the effectiveness of teacher questioning techniques in situations where teachers and students from different ethnic groups have different cultural expectations

about how to use language in the classroom (Corson, 1993; Heath, 1983), and where such questioning could impact upon social class and gender differences in the classroom (Drudy and Chathain, 2002; Myhill, 2002).

The difficulty of managing the turn-taking of a large numbers of students in whole-class talk has also led to the raising of doubts about the effectiveness of teacher questioning and the development of group-based learning. For example, Barnes and Todd (1977) went on to explore the promotion of student talk through the use of collaborative group work as a way of 'decentralizing' classroom communication, so as to encourage more students to participate in, and practise of, academic forms of discourse normally dominated by the teacher, and allow for alternative frames of reference. In discussing the features of group work where students are encouraged to explore meanings collaboratively, Barnes and Todd (1995) pointed out the clear differences in discourse structure between this and whole class question and answer routine. Because the absence of the teacher means there is no authoritative figure to dominate the discourse, there are no clearly marked asymmetrical relationships, and the consequent lack of pre-allocated rights makes it necessary for the students to negotiate the terms of their interaction as they go along.

As Edwards and Westgate (1994) argue, in such group discussion turn-taking is managed locally and interactionally, and it sets up different expectations and patterns of working because speakers potentially have equal rights and joint ownership of the interaction allowing for both the asking as well as answering of questions. The patterns of interaction are therefore, strikingly different from the kinds of discourse associated with the whole-class, transmission model of teaching. In this way, as Mercer (1995) suggests, students can share in and practise forms of academic discourse of the classroom normally inhabited by the teacher: that is, sharing, comparing, contrasting and arguing from different perspectives, providing opportunities for instructional conversation or the shared construction or negotiation of meaning. Therefore, in group or paired work, students are given more opportunities to develop linguistically and cognitively (see also Lyle, *Learners' Collaborative Talk*, Volume 3).

Work on the linguistic patterning of teacher–student interaction was carried by Sinclair and Coulthard in the UK (1975), although they consider its value in the promotion of student learning. In their study of primary English lessons, they revealed the initiation-response-feedback (IRF) exchange as being central to teacher/pupil interaction. In its prototypical form, a teaching exchange consists of three moves: an *initiation*, usually in the form of a teacher question, a *response* in which a pupil attempts to answer the question, and a *follow-up* move, in which

the teacher provides some form of feedback (very often in the form of an evaluation) to the pupil's response. In a similar study in the USA, Mehan (1979) used 'evaluate' to designate the third move because it was found that this move in the exchange was often used to provide an evaluation of a student's answer.

International research into classroom discourse suggests the IRF structure is central to all classroom teaching (Abd-Kadir and Hardman, 2007; Alexander, 2001; Arthur, 2001). It is particularly prevalent in directive forms of teaching and often consists of closed teacher questions, brief student answers which teachers do not build upon, superficial praise rather than diagnostic feedback and an emphasis on recalling information rather than genuine exploration. This has led some researchers to call for the demise of the IRF exchange because of the cognitively limiting role it appears to afford to students where most of the questions asked by teachers are of a low cognitive level designed to funnel responses towards a required answer (Lemke, 1990).

While accepting the pervasiveness of this phenomenon, other researchers have argued IRF can be functionally effective, leading to very different levels of student engagement and participation. Mercer (1995), for example, argues that it can be an effective means of monitoring students' knowledge and understanding, guiding their learning and identifying knowledge and experience which is considered educationally significant, thereby promoting academic forms of discourse. Others suggest that the IRF structure can take on a variety of forms and functions leading to different levels of student participation and engagement, particularly through the use that is made of the feedback move. Nassaji and Wells (2000), for example, suggest that through feedback which goes beyond evaluation of the pupil's answer, the teacher can extend the answer to draw out its significance so as to create a greater equality of participation for the student.

Similarly, Nystrand, Gamoran, Kachur and Prendergast (1997) advocate that teachers pay more attention to the way in which they evaluate student responses so that there is more 'high-level evaluation' whereby teachers incorporate student answers into subsequent questions. In this process, which they term *uptake*, they suggest that teacher's questions should be shaped by what immediately precedes them so that they are genuine questions. When such high level evaluation occurs, the teacher ratifies the importance of a student's response and allows it to modify or affect the course of the discussion in some way, weaving it into the fabric of an unfolding exchange. Such high level evaluation therefore chains together teacher questions and student responses so that the discourse gradually takes on a conversation-like quality, thereby encouraging more student-initiated ideas and responses, and, consequently, promoting higher-order thinking.

## WORK IN PROGRESS

Research has started to explore the connection between patterns of classroom discourse and learning, particularly the link between discourse patterns and teachers' theories of learning, arguing that the use of particular discourse strategies reflects certain pedagogical epistemologies (Cazden, 2001; Barnes and Todd, 1995; Moyles, Hargreaves, Merry, Pateron and Esarte-Sarries, 2003; Wells, 1999). It is argued that the choices teachers make about the kinds of discourse patterns and pedagogical strategies they use in their classrooms are linked to their pedagogical beliefs, and that the most effective teachers are those who can theorise their teaching so as to make confident and professionally informed pedagogic decisions (Askew, Brown, Rhodes, Johnson and Wiliam, 1997).

Through his comparative research into classroom talk in primary school classrooms in five countries (England, France, India, Russia, USA), Alexander (2001) found that although the IRF exchange is ubiquitous, it is used in different ways to organise the communicative process of teaching and learning. While in most of the classrooms he observed teachers spoke for the majority of the time, the contribution of the students varied considerably across the different cultures, leading to different levels of student participation and cognitive engagement. For example, in Russian and French classrooms it was more common for a teacher to probe a student's response, leading to higher levels of student engagement and longer stretches of discourse conducted through a more formal academic discourse, when compared to British and American classrooms. Alexander argues that this reflects a commitment in French and Russian schools to collective/public, rather than individualised, learning.

From this work, Alexander (2004) has developed the concept of 'dialogic talk'. Here the essential features of a dialogic classroom are that it is collective (teachers and students address the learning task together), reciprocal (teachers and students listen to each other to share ideas and consider alternative viewpoints), supportive (students articulate their ideas freely without fear of embarrassment over 'wrong' answers and support each other to reach common understandings), cumulative (teachers and students build on their own and each others' ideas to chain them into coherent lines of thinking and enquiry) and purposeful (teachers plan and facilitate 'dialogic teaching' with educational goals in mind). Alexander (2004) also argues that the term dialogic teaching should replace the organisational restrictiveness of 'whole-class teaching' as teaching can be dialogic when teachers are interacting with individuals, groups or the whole class.

However, in drawing on international findings to inform his concept of dialogic teaching, Alexander (2006) cautions against the assumption that teaching approaches which are effective in one country can be imported into another, because of the cultural differences which shape educational beliefs and practices. Before adopting such practices, he argues that it is important that the cultural assumptions, values and pedagogical principles which shape such approaches are fully understood so as to judge how far the pedagogy can be accommodated in a different cultural context. Out of such an accommodation will come new teaching approaches with a greater chance of them being implemented in the classroom.

Alexander (2006) also argues that recent research into formative assessment, emphasising the power of feedback in enhancing the teaching and learning process, supports the concept of dialogic teaching. Feedback is found to be particularly powerful when it is used by teachers to adapt their teaching to the learning needs of students, and when it focuses on the qualities of student work and offers guidance on what can be done to bring about improvements (Black and Wiliam, 1998). Effective teacher–student and student–student interaction and discourse, in which students are given opportunities to actively participate in their own learning and communicate their evolving understanding in spoken and written forms in group-based and whole class activities, is therefore central to the whole teaching and learning process. Black, Harrison, Lee, Marshall and Wiliam (2003) recognise, however, that such an approach to classroom assessment requires fundamental changes to underlying pedagogic practices to enhance feedback between those taught and the teacher.

#### PROBLEMS AND DIFFICULTIES

While extensive research in the USA by Nystrand, Gamoran, Kachur and Prendergast (1997) and Cazden (2001) found that managing the quality of classroom discourse is the most important factor if there is to be genuine dialogic teaching, leading to significant gains in learning outcomes, both studies found there was a persistence of teacher-led recitation.

Similarly, recent studies of national educational initiatives in England designed to improve the quality of classroom interaction show they are failing to induce fundamental pedagogic change as they have done little to change traditional patterns of whole class interaction. Despite a scenario of considerable change in, for example, curriculum planning, assessment and use of ICT in the UK, studies have found a relative continuity at the deeper levels of pedagogy as measured through classroom

interaction and discourse (Galton, Hargreaves, Comber, Wall and Pell, 1999; Hardman, Smith and Wall, 2003; Moyles, Hargreaves, Merry, Paterson and Esarte-Sarries, 2003; Smith, Hardman, Wall and Mroz, 2004). The research suggests traditional patterns of whole-class teaching have not been dramatically transformed by the strategies, despite official endorsements of 'interactive whole class teaching' (Reynolds and Farrell, 1996). More worrying for advocates of dialogic approaches, compared to earlier studies of the primary phase, the findings suggest an increase in teacher talk and directive forms of teaching and less opportunities for students to explore ideas (Alexander, Willcocks and Nelson, 1996; Galton, Simon and Croll, 1980, Galton, Hargreaves, Comber, Wall and Pell, 1999).

Similarly, in studies of teacher–pupil dialogue in the small-group 'guided' sessions, it was found that teachers exercised tight control over the parameters of relevance and were reluctant to allow student initiation or modification of the topic (Hardman, Smith and Wall, 2005; Skidmore, Perez-Parent and Arnfield, 2003). This resulted in an international pattern of teacher–student talk which afforded little opportunity for students to formulate ideas in their own words. Such findings about the persistence of recitational patterns led a recent evaluation of national literacy and numeracy initiatives in England to argue that there is a need for different approaches to in-service training to change habitual classroom behaviours and traditional discourse patterns, and secure the long-term effectiveness of educational initiatives (Earl et al., 2003).

#### FUTURE DIRECTIONS

The research findings reviewed earlier suggest major challenges have to be overcome if classroom talk is to be transformed from recitation into dialogue so as to promote the co-construction of guided knowledge between teachers and students. They suggest the need for the exploration and researching of alternative teaching and learning strategies to raise the quality of teachers' interactions with their students, and promote broader participation beyond the role of listeners or respondents. The research also, as Alexander (2006) argues, suggests the need for dialogic principles to inform professional learning and school improvement.

If the classroom discourse is to take a variety of forms and functions as suggested by advocates of dialogic talk, leading to different levels of student participation and engagement, the studies reviewed earlier suggest teachers will need to pay close attention to their use of questions and feedback strategies so as to promote the use of alternative discourse strategies (e.g. probing, student questions, uptake of questions, teacher statements). Research into the professional development of teachers suggests monitoring and self-evaluation will need to become a regular part

of in-service training so as to give teachers a degree of ownership of the process of school improvement.

Studies looking at dimensions of teacher development (e.g. Alexander, Willcocks, and Nelson, 1996; Joyce and Showers, 1995) suggest that teachers are slow to change their ways of teaching and new teaching methods or innovations are not readily taken on. Tharp and Gallimore (1988, p. 191) suggest that because innovation and change always cost time, anxiety and uncertainty, it is essential that teachers have supportive interactions with peers through modelling and feedback if the 'recitation script' is to be changed to 'new repertoires of complex social behaviour necessary for responsive teaching' which the co-construction of knowledge requires. Similarly, Dillon (1994) suggests that coaching and talk-analysis feedback may be useful tools for professional development whereby sympathetic discussion by groups of teachers of data derived from their own classrooms could be an effective starting point. In addition to recordings and transcriptions, observation and coaching could prove a very useful means in providing such quality feedback.

Research into the role of coaching in teacher professional development suggests that the instructional behaviours of teachers cannot be influenced until the internal thought processes have been altered (Joyce and Showers, 1995). Reflection on teachers' intentions and beliefs about their practice is seen as a way of enhancing expert thinking and problem solving so as to bridge the gap between theories and actual classroom practice.

In order to facilitate such changes in pedagogic practice, research has started to explore the connection between patterns of classroom discourse and learning, particularly the link between discourse patterns and teachers' theories of learning, arguing that the use of particular discourse strategies reflects certain pedagogical epistemologies (Cazden, 2001; Moyles, Hargreaves, Merry, Paterson and Esarte-Sarries, 2003; Wells, 1999). The research suggests teachers should be encouraged to theorise their teaching so as to make confident and professionally informed decisions about the way they interact with students so as to encourage greater participation and higher levels of cognitive engagement. Moyles, Hargreaves, Merry, Paterson and Esarte-Sarries (2003) found using video clips of lessons selected by the teacher to be a powerful means of promoting critical reflection on professional practice. They found that their video project, entitled video-stimulated reflective dialogue (VSRD), encouraged teachers to articulate and demonstrate their own understanding of their interactive styles and provided opportunities for monitoring and self-evaluation.

In addition to the provision of more powerful professional development programmes, there is the need for more research to provide comprehensive evidence, for both teachers and policy makers, that dialogic styles

of teaching encouraging more active student involvement in the guided co-construction of knowledge can produce significant gains in learning.

TALK, TEXTS AND MEANING-MAKING  
IN CLASSROOM CONTEXTS

INTRODUCTION

There is now a rich body of literature on classroom research and on the talk that takes place in interaction in educational settings. Talk is a fundamental component of interaction in classrooms; however, texts are also an important element. Interaction often takes place around texts of various kinds and in educational settings, pedagogy is ‘made possible’ by the use of texts (Freebody, 2003, p. 179). In this review, I will focus on the development of research on classroom talk and talk around texts in monolingual and multilingual settings, highlighting specific aspects of interaction in classrooms and taking account of the contribution of ethnographic methods of analysis to this area of research.

EARLY DEVELOPMENTS

Initially, educational research focused exclusively on methods of teaching and assessment. Before the 1960s, very little was known about the characteristics of educational discourse and the analysis of transcripts of classroom talk was not considered a major part of research on classroom interaction (Edwards and Westgate, 1987/1994). Early research involving observations of classroom lessons relied on coding schemes. The focus of research was mainly on the ideal traits of teachers and learners, and on teaching styles (see Green and Dixon, *Classroom Interaction, Situated Learning, Volume 3*). Most studies at the time, centered on teacher talk, practically ignoring students’ contributions to the interaction.

One of the most significant contributions to the study of classroom language in the 1970s was that of Sinclair and Coulthard (1975) who developed linguistic methods of analysis. Their concern was not primarily educational. Applying speech act theory, they drew attention to form-function relationships and built their model of classroom discourse around this. In addition, they drew attention to the three part exchange structure of classroom discourse, the Initiation-Response-Feedback structure (IRF), which has, since then, been found to be the most common sequence in teacher-led discussions in classrooms all over the world.

As researchers have carried out analyses of the IRF patterns of classroom talk over the years since the 1970s, there has been increasing concern about the predictability, simplicity and limited nature of such teacher–pupil talk, and also about the way this structure positions students in class (Barnes, 1976; Van Lier, 1996). However, IRF exchanges may present very complex patterns, compared with the relatively ‘simple’ structure originally described by Sinclair and Coulthard. Researchers such as Mehan (1979), Cazden (1988/1996) and Zentella (1981) have shown that it is indeed a complex and variable pattern, especially in bilingual classrooms. Mehan (1979) used the acronym IRE, in his analytic framework, with the E component of the three part structure referring to ‘Evaluation’ since he wanted to foreground this evaluative dimension of classroom discourse.

Barnes’ (1976) research led the way in focusing attention on classroom language and how it relates to learning processes. According to Barnes, genuine exchange of meanings between teacher and pupils provides opportunities for learning, so talk that draws on the prior knowledge and experience of the learners should be encouraged by teachers. Barnes looked at both teachers’ questions and pupil-initiated sequences and found that the latter represented only a small proportion of the classroom talk in his data. Along with this finding, his main contribution to the study of classroom discourse was the formulation of the concept of ‘exploratory talk’ in contrast to ‘presentational’ or ‘final draft talk’. The former occurs when teachers ask open questions and reply to the contributions of learners instead of merely evaluating them. The latter is found when teachers ask questions to test the students’ understanding of topics that have already been explained and evaluate their responses paying particular attention to the form of student’s utterances.

A predominant feature of teacher talk, teacher control of classroom interaction, shows up in many studies of classroom discourse. This kind of talk is usually asymmetrical in nature (Stubbs, 1976). In addition, research by Edwards and Westgate (1987/1994) has shown that talk in classrooms is ‘not conducted normally on a basis of shared knowledge’. Moreover, as Lemke (1989) has noted, participants in classrooms have rights and obligations, which are continually being negotiated, but most of the time teachers succeed in imposing their authority.

#### INCREASING INTERDISCIPLINARITY AND THE WIDENING SCOPE OF RESEARCH: MAJOR CONTRIBUTIONS

In this section, I turn to developments in the 1980s and 1990s. In this period, research on classroom discourse moved beyond linguistic

description and functional code analysis. However, it did continue to be problem-focused, seeking to examine the effects of teaching on learners. The attention of researchers now shifted from a primary focus on communicative functions to a more detailed concern with the sequential structures of classroom discourse and with the ways in which meanings are contextualized through the use of both verbal and non-verbal cues. At the same time, research on classroom interaction widened its focus to include second and foreign language contexts and talk in bilingual classrooms.

### *Increasing Interdisciplinarity*

By the 1980s, research on classroom discourse was beginning to reflect diverse and, often, intersecting influences from the fields of social science research that had been developed and consolidated in the preceding decades. These included fields such as ethnomethodology and conversation analysis (CA) (Garfinkel, 1972; Sacks, Schegloff and Jefferson, 1974); the ethnography of communication (Gumperz and Hymes, 1972; Hymes, 1968); micro-ethnography (Erickson and Schultz, 1981) and interactional sociolinguistics (Gumperz, 1982). Several scholars working in these fields had a particular concern with the educational achievement of children from social groups who found themselves positioned towards the lower echelons of the social hierarchy and they conducted some of their research in educational settings. Their influence was far-reaching. The attention of classroom-based researchers shifted away from the communicative functions of individual utterances towards the detail of the ebb and flow of talk in classrooms, highlighting its situated nature and the recurring sequential structures of classroom routines. The emphasis was now on the joint construction of meanings by teachers and learners. The contexts for teaching and learning were no longer seen as fixed and pre-defined but as being constituted in and through interaction and therefore continually open to negotiation and redefinition.

John Gumperz (1982) made a distinctive contribution to the study of classroom discourse by foregrounding the ways in which meanings are contextualized in ongoing interactions between teachers and learners. He was the first to put forward the notion of 'contextualization cue', referring to choices of verbal and non-verbal signs, which participants in a conversation perceive to be marked. This included, for example, signs such as a change in pitch or intonation, codeswitching or an unexpected gesture. He showed how teachers and learners draw on such cues in negotiating classroom encounters and in making situated inferences about each other's contributions to classroom conversations and about the significance of ongoing activities.

Working along similar lines, Fred Erickson (1986) developed a micro-ethnographic approach to the study of the fine grain of classroom interaction, focusing, in particular, on non-verbal cues and on the manner in which participants in classroom conversations attend to such cues. He was especially interested in the ways in which teachers and learners manage to synchronize their contributions to classroom interaction. He also sought to identify the means they employed to engage in conversational repair and to describe the strategies deployed when synchrony is not achieved. He was also interested in documenting the consequences of cross-cultural miscommunication.

Several researchers working in education in the 1980s and 1990s were specifically interested in applying the principles of ethnomethodology and conversation analysis (CA) to the study of classroom discourse (e.g. Baker and Freebody, 1989; McHoul, 1978, 1982, 1990; MacBeth, 1992; Mehan, 1979, 1981; ). They focused on the sequential structures of classroom interactions, on question and answer routines and on the accomplishment of turn-taking and conversational repair in multi-party classroom interactions. A good deal of this ethnomethodological work focused on the teaching of reading in the early years of schooling, on the construction of what counts as literacy and on the orientation of learners to specific ways of working with texts.

Influences from developments in social psychology were also beginning to be felt in studies of classroom discourse in the 1980s. Two influential concepts were Vygotsky's (1978) concept of 'zone of proximal development' (ZPD), and Bruner's notion of 'scaffolding' (Wood, Bruner and Ross, 1976). These concepts were taken up as interest grew in the role of talk as a means of joint knowledge building. The construction of knowledge came to be seen as a collaborative process. These concepts were taken further in work by Mercer (1995) who developed a Neo-Vygotskian approach to the analysis of classroom talk. Mercer's approach highlights the social nature of interaction and foregrounds the role of talk between learners and between teachers and learners in the construction of knowledge (for further details see Hardman, *The Guided Co-construction of Knowledge*, Volume 3).

The 1990s saw further development and consolidation of research in bilingual classroom discourse. Here too, there were cross-cutting influences from different disciplines. Conversational analysts' work was combined with new analytic frameworks from sociology and from research on bilingual codeswitching (e.g. Auer, 1984). Some of this research was based in language classrooms (e.g. Mejia, 1994, 1998; Lin, 1996, 2001). Other research was developed in contexts where a second or foreign language was employed as medium of instruction (e.g. Arthur, 2001; Bunyi, 2001, 2005; Canagarajah, 1995; Martin,

1999a,b, 2005a,b; Martin-Jones and Saxena, 1996). Research based in countries of the South constituted the greatest portion of this new body of work on classroom discourse and opened up new insights into the ways in which meanings are exchanged by teachers and learners in multilingual classrooms.

As Martin-Jones (2000, p. 2) points out in her review of research on bilingual classroom interaction:

We now have ample examples in the research literature of teachers using code contrast as a resource for demarcating different kinds of discourse: to signal the transition between preparing for a lesson and the start of the lesson; to specify a particular addressee; to distinguish 'doing a lesson' from talk about it; to change footing or make an aside; to distinguish quotations from a written text from talk about them; to bring out the voices of different characters in a narrative; to distinguish classroom management utterances from talk related to the lesson content.

The analysis of codeswitching practices in these different contexts also drew attention to the tensions arising between official language policy and classroom practices. Teachers in many of the contexts under study were falling back on codeswitching in order to accomplish lessons, despite the fact that, in some schools, this was not an approved practice (e.g. Arthur, 2001; Lin, 1996, 2001; Mejia, 1994, 1998; Martin, 1999a,b).

Some studies in post-colonial contexts, where English was the medium of instruction, documented the prevalence of classroom routines such as teacher-led orchestration of classroom interaction where students responded in chorus to teacher prompts (Bunyi, 2001, 2005; Chick, 1996; Hornberger and Chick, 2001; Martin, 1997). Chick (1996) introduced the concept of 'safetalk' to capture this interactional phenomenon. 'Safetalk' was defined as 'talk that creates a space where teacher and students know more or less what to expect and how to behave in class, but where a high price is paid in terms of (a lack of) learning' (Hornberger and Chick, 2001, p. 52). Chorus-style responses serve as a means to avoid loss of face associated with being shown up publicly, in the classroom, as being wrong. Chick (1996) gave particular attention to chorused behavior and the way in which chorusing was orchestrated by teachers through ample use of contextualization cues. This concept was taken up in classroom-based research such as Arthur's (2001) study in Botswana, Bunyi's (2001) research in Kenya, Martin's (1997) research in Brunei and Hornberger and Chick's (2001) comparative study of Peru and South Africa (see also the chapter by Bunyi, *Constructing Elites in Kenya: Implications for Classroom Language Practices in Africa*, Volume 3).

*A New Eclecticism*

As research on talk in face to face classroom interaction developed over time, in different areas of the curriculum, it grew more eclectic, often drawing on different strands of previous work. Thus, for example, by the turn of the century, conversational analytic approaches were increasingly being interwoven with work of an ethnographic nature (details of this way of working are discussed in a discussion paper prepared for the British Linguistic Ethnography Forum—Rampton et al., 2004).

This new eclecticism has, in fact, come to be seen as a positive development and as a welcome move away from the methodological purism of some research in the field of conversational analysis. A special issue of the journal of *Applied Linguistics* was devoted, in 2002, to a comparison of approaches to the micro-analysis of classroom discourse, including ethnography of communication, conversation analysis and a systemic functional approach. One group of researchers, who were invited to respond to the papers in this issue, concluded that all three approaches ‘offer more to the analysis of classroom discourse in combination than they do alone’ (Rampton et al., 2002, p. 387).

*Texts, Talk and Classroom Practices*

Texts do not exist in isolation in educational settings. The talk that takes place around them is what gives them meaning (Maybin and Moss, 1993). The term ‘text’ here does not only refer to printed materials, it may also include electronic text, student notes, lesson plans or school textbooks and many other types of educational material, which are ‘inspected, dissected, and analyzed in various ways’ (Barton, 1994, p. 58). In classroom situations, the text is almost always the object of mediation by teachers. As we will see in the following section, this process of mediating is particularly evident in bilingual classrooms where bilingual talk often unfolds around monolingual texts. Textbooks are also mediators of experience. They represent the social world in particular ways (Barton, 1994).

Research on talk around texts in different types of classrooms has shown us that knowledge is often constructed in classrooms via a cultural artifact or a textbook. As De Castell and Luke (1989) have observed, a textbook constitutes an authorized medium that conveys ‘legitimate knowledge’ to pupils. In language classrooms, such as EFL and ESL classrooms, the textbook is invested with characteristic features that distinguish it from other types of texts. In a detailed analysis of the features of EFL textbooks, Dendrinos (1992) draws attention to the variability in the discourses, to the different type of

genres, to the cultural content of different EFL texts, and especially their underlying ideology. In contexts where English is taught as a foreign language, the 'EFL textbook' is often relied upon to guide classroom-based interactional activities; its authority derives from sources outside the classroom, including curriculum authorities, local and central government departments concerned with education and multinational publishing companies. The relative importance of the EFL textbook depends on the way in which the curriculum is organized: so the tighter the state control over educational content and instructional practice, the stronger the reliance on the textbook (Ibid.). However, in developing contexts, textbooks may not be readily available to learners who lack economic resources, so teachers rely on alternative 'texts', as a recent case study in public secondary schools in Colombia has shown (Valencia Giraldo, 2004; 2006). Teachers often create texts from a range of existing textbooks. So, in schools such as these, textual authority resides in these locally produced worksheets and they largely determine the teaching content.

Teacher mediation of texts takes place in specific observable literacy events in classrooms. The notion of 'literacy event' derives from the influential work of Heath (1983). Heath referred to literacy events as encounters between people 'when talk revolves around a piece of writing' (1983, p. 386). Her particular focus was on children's literacy socialization in different classroom and community contexts, so she studied talk exchanged between adults and children around texts. Heath's ethnographic work paved the way for the development of a sociocultural approach to literacy, an approach which came to be known as the New Literacy Studies (e.g. Barton, 1994; Street, 1984, 2000). In this approach, reading and the use of texts are seen as profoundly social and cultural practices, embedded in particular historical contexts.

For two decades, the focus of much ethnographic work on literacy, was on the local, on particular cultural contexts and on detailed accounts of the ways in which local literacy practices were manifested in particular literacy events. However, there has been recent debate within the New Literacy Studies about the need to take account of global contexts and global, cultural flows in empirical work related to local literacy events and practices (e.g. Brandt and Clinton, 2002; Pahl and Rowsell, 2006). It is argued that close description and analysis of literacy events in which talk is exchanged around texts can provide revealing insights into the ways in which the global pervades the local. As Pahl and Rowsell (2006, p. 11) observe, we can see 'how texts are shaped by practices which themselves are both locally based and globally shaped . . . we see the global and the local in *instances of practices*'.

Thus, in the study briefly mentioned above, carried out by Valencia Giraldo (2004, 2006) in public secondary schools in Colombia both

the local and global dimensions of local teaching/learning events were taken into account. The focus was on particular events when Colombian teachers of English, in two public schools, were talking with the students about texts they had produced themselves from existing textbooks. Detailed analysis of the talk around texts in these events revealed complex patterns that could be linked to the wider policy context and to broader processes of change, such as globalization. Global forces are clearly having an impact on Colombian education and on the day to day classroom routines of public schools. However, the issues raised by globalization are not exclusive to development contexts in South America. There are wider resonances, as I will argue in the [next section](#).

#### GLOBALIZATION AND TEXTS IN AND FOR ENGLISH: WORK IN PROGRESS

There has been increasing interest in classroom interaction in settings where English is a second or foreign language, settings such as the post-colonial contexts of countries of the South: in Africa, Asia, South and Central America. Recent work carried out in these contexts shows a growing concern with socio-cultural issues in the context of the English classroom and a trend towards research which takes account of how the local interactional order in particular classrooms is constructed *and* the ways in which global processes impinge on the local. Attention has been drawn to the rapid spread of English due to globalization. Some studies focus on the increasing dominance of English within the curriculum and the resistance to this linguistic dominance which is manifested in and through interaction in different educational sites. Work by Canagarajah (1999, 2005) shows how teachers and learners deal with the tension between English and Tamil ideologies in classroom interaction. In this context, codeswitching practices constitute a subtle means of resistance to language education policy constraints which is played out in the daily rounds of interactional life in classrooms in Jaffna.

As Pennycook (1994) has pointed out, discourses about the spread of English in different parts of the world, often embody a positive image of English, as a new commodity on the educational market. Language education reforms tend to privilege English at the expense of other languages. Conflicts and tensions generated by the rapid spread of English and the imposition of new policies are most visible in the daily routines of classroom interaction. As noted by Heller and Martin-Jones (2001, p. 422) 'it is through the interactional order . . . that it is possible to act with regard to interests and positioning constrained by institutional and social orders beyond the control of actors'.

The impact of English language policies on classroom interaction and on talk around texts is particularly evident in recent research carried out in Southeast Asia by Peter Martin (2005a,b). A study by Martin (2005a), in Malaysia, highlights key issues related to talk around texts and the construction of knowledge. This study focuses on the language practices in two rural schools in Malaysia where English has come to be seen as a desirable commodity. Recent policy developments have established English as the main medium of instruction in mathematics and science in schools across the country. Martin describes in detail the consequences of this policy. The teachers in these classes have limited English resources so they read through short texts in English from the official textbook, with the students annotating key words and concepts. These are usually key lexical items that are repeated by the students. Interactional exchanges in these lessons take place in both English and Malay, with the teacher's initiations being in Malay and with the students responding with single lexical items in English and in Malay. The teachers and students have become reliant on the textbook, although it is in a language which is remote from the local Malay vernacular. The textbook's pictures and lifestyles have a Malaysian flavor but according to Martin (2005a, p. 90) the cultural contents are 'far removed from the lifeworlds of the students'.

Thus, in these two rural schools, English is the language of the text and Malay is the language of mediation. They are both used in the daily cycles of classroom interaction. While codeswitching is a practice that is permitted in these classes, tensions arise as the local educational policy does not approve of this practice. There is little participation on the part of the students, a situation commonly reported in research in other multilingual contexts. As Martin (2005a) points out, what has emerged in these and other similar classes, where teachers are constrained by the imposition of new language in education policies, are instances of 'safetalk', of the type described previously. Safetalk practices like these provide an interactional resource for coping with the imposition of official policy. In using the term 'safe', Martin notes that it does not necessarily refer to 'pedagogically sound' practices (2005a, p. 94), but rather just a means of coping and getting lessons done. What becomes clear from this study is that the tensions in the interactional order of these classrooms need to be considered with reference to the external context of the classroom, to the local language in education policy and to the ways in which the global is inserted in the local.

Martin (2005b) reports on research conducted in Brunei on the uses of texts and talk around texts and the ways in which textual practices are bound up with the construction of knowledge. This study was conducted in a small rural community in Brunei and focused on how knowledge was talked into being around texts in primary schools. Both

Malay and English are recognized as official languages in this context, as part of a national bilingual education program but English is once again seen as a desirable commodity and it enjoys a privileged status in education from primary education onwards. It is seen as the language of social and educational mobility. A further issue in this context arises from the fact that the children in local schools, such as the one in Martin's study, have home languages other than Malay and have varying degree of proficiency in Malay. The local language of inter-ethnic contact in this remote, multilingual region of Brunei is Iban. The difficulties that stem from the imposition of a bilingual education policy based on two languages that are remote from the children's lived experience surface in the talk around texts in the daily rounds of interaction in the classroom. Further difficulties stem from the use of the school textbook which has cultural content which is not familiar to the children although it was produced in Brunei. Martin (2005b) shows how the teacher in this class struggled to make links between the world of the textbook and the local knowledge of the students. This was partly because of the remoteness of the two officially sanctioned languages of the curriculum and partly because of the remoteness of the cultural content of the textbook from the students' own lived experiences. They had been brought up in a rural community that was located on the political and economic periphery of the nation of Brunei. The textbooks were produced in the Malay-speaking centre of Brunei, by a government agency, in a joint venture with international publishers.

#### PROBLEMS, CHALLENGES AND FUTURE DIRECTIONS

These two studies of classroom practice in primary schools in South-east Asia demonstrate the need to investigate in more detail the ways in which global process impinge on and constrain local educational practices. Further attention is needed, in classroom-based research in the countries of the South, to the spread of English and, specifically, to the trend towards the creation of bilingual education programs involving an official national language and English. How do teachers and students manage the communicative demands of such bilingual education policies? What kind of meaning-making goes on in such classrooms? How are these meanings built up around texts? How do teachers and learners talk knowledge into being in different kinds of policy conditions? What evidence is there of resistance to the implementation of these policies? From my own work in Colombia, it is clear that secondary school students in public schools continually engage in small acts of resistance to the efforts of English teachers to implement a

national policy of bilingual education (Spanish with English) (Valencia Giraldo, 2004). Teachers deploy different strategies, some playful, some quite authoritative, in responding to these challenges from students. What evidence is there and elsewhere of student resistance to the implementation of such bilingual education policies? How common are these practices in other public secondary schools in other countries of the South where similar policies have been imposed?

These questions need to be addressed in research conducted by researchers who speak the local languages. They are best-placed to describe and interpret the intricacies of classroom talk in such settings and the particular meanings generated through that talk. As Canagarajah (2005, p. 19) notes, it is important to maintain an ‘ongoing conversation with local knowledge . . . for our common pursuit of broadening knowledge construction practices. The local will always have a questioning effect on established paradigms’.

In all classroom-based research in the countries of the South and the North, the bulk of research still tends to focus on the voices of teachers. In future research, more importance needs to be given to the role of learners in classroom interaction. Focusing primarily on SLA research, Breen (2001) proposes a research agenda that takes into account not only the value of learners’ contributions to language-learning processes, but also the social relations underpinning classroom interaction.

As I have tried to show in this chapter, research agendas in the future will also need to pay greater attention to the role of texts and talk around texts in the study of classroom discourse. As Smith (1999) and Barton (2001) have pointed out, we need to take greater account of the intensely textually mediated nature of contemporary social life. If we focus primarily on spoken language in face to face encounters, we will risk overlooking significant textual dimensions of human endeavour. Barton (2001) argues as follows for research which incorporates frameworks from the New Literacy Studies with a view to deepening insights into the communicative practices that predominate in today’s world.

Whether it is technological change and internet use, educational change and the nature of learning, the relation of language to poverty and social exclusion, or language in the changing workplace, an analysis which starts from literacies is central to understanding. Studies restricted to spoken language cannot adequately account for these crucial areas for contemporary language use (2001, p. 101).

Lastly, the increasingly complex and multimodal nature of text production and of contemporary communication poses new challenges for researchers engaged in classroom-based research. Our attention has

been drawn to some of these complexities in recent work in science classrooms (Kress et al., 2001) and in English classes in urban schools (Kress et al., 2005) (for further details see Jewitt, *Multimodal Discourses across the Curriculum*, Volume 3). The challenge posed by the rapidly changing nature of contemporary communication in classrooms need to be met with new theory and method. We will need new analytic lenses and new approaches to research design in future studies of talk, texts and meaning-making in classroom contexts.

## LEARNERS' COLLABORATIVE TALK

### INTRODUCTION

Learners' collaborative talk involves students working together to use talk as a meaning-making strategy to achieve common goals. Theoretically, research in the field is mainly located in socio-cultural approaches which suggest that the world is a discursive construction and the mind is embedded in contexts which have unique historical, political, cultural, social and interpersonal determinants. Learning is seen as a social process and knowledge as a jointly constructed phenomenon. Collaborative talk is, therefore, a means by which dialogic engagement between learners can become a tool for meaning making.

Social-cultural research draws extensively from the theories of Vygotsky who emphasized that human beings construct their understanding and knowledge in dialogic ways with others. This led researchers to look closely at classroom discourse and the ways in which pupils use talk to make meaning. Characteristic of recent work has been the emergence of a number of disciplinary hybrids which see human action as the proper focus for research in the human sciences, and language as the key mediator of such action. Three key disciplines, psychology, sociology and linguistics, have each drawn on two Vygotskian-inspired concepts: the centrality of the socio-cultural world, and language as part of a culture's toolkit for mediating and shaping action to produce new fields of study. These fields include cultural psychology (Bruner, 1996); socio-cultural studies (Wertsch et al., 1995); and discursive psychology (Edwards and Potter, 1992). Learners' collaborative talk has emerged as having particular relevance to all three disciplinary hybrids. Findings indicate a growing consensus on its potential contribution to the development of learners' higher mental functioning.

Recent research that has focused on analysis of transcripts from the natural setting of the classroom has increasingly been informed by the ideas of Bakhtin, in particular on the role of dialogicality in the construction of meaning (e.g. see Haworth, 1999). The concept of dialogical meaning-making allows the learner to play an active role in developing a personally constructed understanding of the curriculum through dialogic interchange. It is proving to be an important framework in which to investigate the impact of learners' collaborative talk

because it is the dialogue that occurs between learners in collaborative settings that supports the co-construction of meaning.

### EARLY DEVELOPMENTS

The antecedent of current interest in the processes of collaborative talk, is early research reported in such key works as Barnes and Todd (1977). They saw pupil-to-pupil talk as beneficial to the learning process and an essential part of problem solving. Since then, views on classroom talk have produced considerable consensus that pupils need worthwhile opportunities to work together in small, collaborative groups using talk to facilitate understanding. However, early classroom studies rely on experimental settings; observation of classrooms in their natural setting suggests that the benefits of collaborative talk promised by research did not materialize in school.

Experimental early research into the impact of collaborative talk on learning outcomes focused on conditions which influenced its effectiveness. A large body of research from the USA showed that the structure of the learning context has an effect on the outcomes of group work (e.g. Johnson and Johnson, 1992). This research rarely investigated actual classroom practice: classrooms were simply used as the site in which to implement varying models of group learning. All required reorganization of typical practice in grouping, and often, in curriculum content. The importance of carefully planned, systematic approaches to collaborative talk in small groups was thus established early on. Little is known from the early American studies about what actually goes on in small, cooperative learning groups that stimulates the use of appropriate cognitive processes.

Early observational research from both sides of the Atlantic has produced a consistent picture: schools and classrooms are full of talk, but little collaborative talk between learners. It is generally accepted that the Initiation/Response/Feedback (IRF) (Sinclair and Coulthard, 1975) discourse structure is a fundamental feature of all official talk in classrooms, constituting around 60% of the teaching/learning process. This practice, known as recitation, is understood well by teachers and plays a central part in the direction and control of student learning, allowing little opportunity for collaborative talk among peers. The movement to promote such talk has to compete against this dominant form of classroom interaction. Implementing a change from the traditional classroom to one that values talk is not a simple matter.

It was not until the National Oracy Project (NOP) in the UK that we start to get substantial evidence of the value of speaking and listening to children's development gathered by researchers and teachers

working in classrooms (Norman, 1992). The project led the field in using transcripts from children's talk in small groups as research evidence. Following this, a number of researchers have found that the educational value of any classroom talk between children hinges on how well the teacher has set up activities (Galton and Williamson, 1992).

Collaborative talk is not, however, restricted to a consideration of small group work. There is a considerable body of evidence on the development of collaborative talk through whole class discussion which challenges the established IRF pattern. The claims made for its efficacy in promoting communicative competence, as well as social and cognitive development are many (for a review of such studies see Gall and Gall, 1990); however there was little research or empirical study of classroom practices to back up the claims until more recently (Dillon, 1994).

The early work indicates that the centrality of spoken language in the education process is widely recognized in theory, but until recently, there has been little attempt to ensure its place in the curriculum.

#### MAJOR CONTRIBUTIONS

Any discussion of learners' collaborative talk must acknowledge that in Britain, North America and Australia the focus on a National Curriculum and standardized testing through paper and pencil tests has marginalised speaking and listening. It has mainly been the voices of researchers, rather than government or teachers, that have called for oracy to be embedded in the curriculum and practices of schools. The movement to promote collaborative talk has to compete in a climate dominated by teacher accountability based on narrow measures of pupil attainment.

Major contributions to our understanding of collaborative talk come from researchers in the field. In the UK, the work of Neil Mercer and the team at the UK's Open University is seminal. Barnes' original concept of 'exploratory talk' has been extensively researched by the team, which has proved to be very influential on the work of other researchers and practitioners (Mercer, 2000). (Kelly, *Learning Science: Discursive Practices*, Volume 3). Robust evidence to support the value of collaborative talk to learning and cognitive development has emerged. Members of the team have also considered children's talk around computers and a growing body of literature on this topic is emerging. (Hardman, *The Guided Co-construction of Knowledge*, Volume 3).

#### *Thinking Skills*

A key development has been the emergence of thinking skills as a theme in discussion of learners' talk. Research has identified

collaborative talk as a key component of success in all existing models for teaching thinking skills. Evidence supports earlier work which focused on task design; for learners' collaborative talk to be effective in small group work, the tasks must have a degree of open-endedness and uncertainty to permit learners to impose meaning, to make judgements, or to produce multiple solutions. In addition, the concept of metacognition has emerged as a key to understanding what makes for success in the promotion of high quality thinking. If pupils are to develop metacognition, they need time and opportunity to talk about thinking processes so they can take more responsibility for their learning.

In the USA, Swartz and Parks (1994) designed an infusion approach to embed thinking skills within the given curriculum. Following this, McGuinness (1999) developed the ACTS (activating thinking skills) project in the UK. Activities to promote collaborative talk are at the heart of this approach and the use of graphic organisers is characteristic of this work. Also known as thinking frames, they provide a focus for pupils to keep a record of their thinking during tasks, and help make the steps in the thinking process explicit thus promoting metacognition. They are a valuable tool for teachers wishing to understand learners' thinking processes as they provide a record of what has been jointly developed and understood. This approach enables teachers to find out what has gone on in group work, providing a bridge between teacher control and learner autonomy. The autonomy of learners can be a major stumbling block to the implementation of small group work, with teachers unwilling to suspend their role as authorities on meaning; an infusion approach can help overcome this.

Teaching from a thinking skills perspective is also evident in various curriculum subject areas. CASE (cognitive acceleration through science education) (Adey and Shayer, 1994) and also CAME (cognitive acceleration through Mathematics) are notable examples. Other subject areas have developed curriculum approaches to thinking, for example, in Geography and History. Common to subject-based approaches is the development of disciplinary-based cognitive tools to examine ideas. Tasks within these programmes depend extensively on collaborative talk for their successful completion. Such developments in the practice of collaborative talk led by subject associations constitute significant moves towards embedding such talk in the mainstream classroom.

Development in the work undertaken by small groups is only one aspect of collaborative talk. Other initiatives make use of whole class interaction as well as pair and small group work. Lipman's (1988) Philosophy for Children (P4C) is widely used in over 30 countries and is an approach to collaborative talk which sees development and

understanding best achieved in dialogue between peers, facilitated by their teacher. An increasing body of research evidence suggests the impact of this approach on improved pupil outcomes in a range of assessments is considerable. Success in P4C depends on the quality of teacher questioning to promote higher order contributions from learners including exposition, explanation, justification, speculation and hypothesising.

Other initiatives have sought to adjust the balance between teacher-dominated classrooms and group work. Brown and Campione (1993), for example, recommend classroom procedures that start with small collaborative groups which then build into larger groups until the whole class is involved in what they describe as a 'community of learners'. The resulting whole class discussion draws on Socratic dialogue to allow the teacher greater insight into children's collaborative practices when working in peer groups.

### *Language and Literacy Development*

Collaborative teaching methods and activities to promote collaborative talk has been a particular focus for those working with children for whom English (in Britain, Australasia and the USA) or French (in Canada) is an additional language. There is widespread agreement that such pupils need an environment where they can engage with their peers in activities which are cognitively challenging. Development in English as an additional language (EAL) work has increased our understanding of the role of collaborative talk in language acquisition and development and the promotion of bilingual ways of working to acquire literacy, (e.g. Swain, 2001). Stimulated by these initiatives, there is a growing body of evidence to suggest that collaborative discussion about texts provides *all* pupils with ways to improve their reading comprehension and writing skills as well as improve their attitude towards literacy tasks.

### *The Impact of Collaborative Talk*

Research design impacts on the nature of evidence presented, some larger-scale studies seek to measure the impact of collaborative talk on standardized test scores. A study in Mexico by Rojas-Drummond and group (2003) found that teaching primary age children to use exploratory talk leads to an improvement in their individual test scores on *standardized* test of non-verbal reasoning. Other studies have compared experimental groups with control groups to measure the impact of collaborative group work on pupil outcomes according to a range

of variables. Ethnographic studies evaluate the impact of group work through the analysis of transcripts to draw attention to the quality of the verbal interaction that takes place between learners during collaborative talk. These small-scale studies have identified variables that impact on task design and outcome, which has increased our understanding of the conditions which promote successful learner outcomes, some of which are discussed below.

#### WORK IN PROGRESS

There are a number of influences on current research on children's collaborative talk. A key concept is emerging, that of dialogue and dialogic forms of learner talk. Focusing on whole class interaction, Alexander's (2001) study of classroom practice in five countries identified very different opportunities for structured talk and the associated deep learning. He uses the term 'dialogic teaching' to describe what happens when teachers and pupils work together to build on their own and each others' knowledge and ideas to develop coherent thinking. Reporting on his project to guide dialogic teaching initiatives in England, Alexander (2005) calls for a greater focus on teacher questioning which seeks to prompt and probe pupil thinking, to promote deep learning through skilful scaffolding, while acknowledging that such a shift in practice will require sustained professional development and support for teachers. Work in this field is in its infancy, but early results suggest it will become an important strand for those who wish to promote learners' collaborative talk.

#### *The Emergence of Narrative as a Theme*

Recent research has identified a range of variables that can impact on effective practice in collaborative talk. Gelat's (2003) investigation of pupil inter-subjectivity in a primary setting evaluated the role of collaborative talk in preparing pupils for a writing task. An experimental design, it compared pupil outcomes in collaborative groupings with control groups who completed the same writing tasks following whole class instruction from a teacher. The experimental groups performed significantly better than the controls. Of particular interest was the role narrative played in the pupil discussions. During peer talk, recounting stories helped pupils 'clarify' understanding and was a 'vehicle of meaning making' (Bruner, 1996, p. 39, 129). Other work in a whole class setting also found that narrative understanding was used as a primary meaning-making tool by pupils engaged in collaborative talk through role-play (Lyle, 2002).

Extending this theme, Wegerif (2005) discusses the importance of verbal creativity in collaborative talk. He argues that there are educationally valuable ways of pupils talking together that are characterized more by verbal creativity than by explicit reasoning. He calls on us to expand our understanding of collaborative talk to incorporate creativity and believes that the concept of 'playful talk' may be central to the aim of improving the quality of thinking and learning. (Gardner and Yaacob, *Role Play and Dialogue in Early Childhood Education*, Volume 3).

Such research emphasises that we can no longer consider children's cognitive development without acknowledging its interdependence with the affective and social in children's learning. The role of collaborative talk in promoting analytical and critical ways of thinking is well established, it also seems to play an important role in promoting creative and imaginative thinking, drawing on narrative as a primary meaning-making tool (Bruner, 1996).

### *Role of the Teacher*

The importance of the teacher's role when setting up collaborative work is a common theme in the literature. Yamaguchi (2003), for example, investigated the ways in which groups are instructed in group work by their teachers. Ten groups were engaged in a collaborative mathematics activity; six groups worked under a mastery condition, emphasising learning and improving as the goal of the task, and four groups under a performance condition, emphasising competition and social comparison. The mastery condition produced more positive behaviours and attainment than the performance condition. This suggests that teachers can influence discursive patterns by the way in which they introduce tasks to learners, and that this influence will impact on performance and outcomes. This has implications for how pupils are introduced to collaborative tasks.

The role of the teacher in promoting collaborative talk in the infant school is under-researched. In a rare study Ogden (2000) concludes that young children may not have the strategies or the capacity for understanding others necessary for engagement in extended reciprocal interaction with their peers. In her study it was not until the age of six that pupils were able to engage in meaningful collaborative activity. However, research evidence from the natural setting of the home shows children as young as two engaging in extended reciprocal interactions. This has implications for the creation of learning environments for the early years which offer interactive experiences for peers so children can experience the perspectives of others. Ogden also stresses the

importance of imagination and play if collaborative talk is to flourish in the infant classroom.

Overall research calls for teachers to engage with children as co-collaborators in meaning making. To succeed, teachers need to select topics and plan tasks that generate fruitful discourse between children. During activities teachers must observe the learners and use interventions that are contingently responsive to their needs. When they do this, learners will be engaged in deep-level learning.

### PROBLEMS AND DIFFICULTIES

This overview of current thinking on learners' collaborative talk highlights the gap between mainstream practice and the growing recognition of the power of talk in the process of making meaning. One of the barriers to the implementation of collaborative learning is the dominance of the teacher's voice at the expense of students' own meaning-making voices. The power relationship between teachers and learners is a stumbling block to genuine dialogue in classroom settings. Many teachers lack the skills necessary for planning effective group work and as a result the pedagogic potential of learning through collaborative talk is unrealized. Blatchford and group (2003) argue that research and theory relevant to group work in classrooms is limited and calls for a new approach to training teachers. Even rarer is the presence of dialogic discourse. Nystrand and group (1999), in a study of over 100 middle and high school classes, found that such discourse took up less than 15% of instruction time; when 'lower-track students' were considered there was a virtual absence of structured talk.

Recent trends in the UK, USA and Australia has identified whole class teaching as an important component of successful classroom practice which has detracted from the value of collaborative talk. In England the introduction of Literacy and Numeracy Hours in primary schools means that pupils spend all morning in tasks controlled by teachers. Although this approach includes the grouping of pupils for pedagogical purposes, the emphasis is on 'direct instruction and well-paced interactive oral work' (DfEE, 1997, p. 18) and this style of interactivity imposes discursive patterns and functions which detract from genuine dialogue. This emphasis on whole class interaction constructs pupils as respondents only and limits children's discourse. The privileging of adult voice may displace children's voices and limit their expectations of classroom discourse (Haworth, 1999). The dominance of the literacy and numeracy hours means learners rarely get to work with their peers in pairs or groups independently of the teacher so that the 'shadow of whole class interaction falls heavily across the discourse' of pupils' (Haworth, 1999, p. 114).

The presence of a National Curriculum in many countries means teachers have an overriding practical concern with 'covering' the curriculum. Collaborative group work is time-consuming and many teachers working to strict timetables and content-led curriculum requirements struggle to see how collaborative talk can become a regular feature of classroom practice. Much will depend on how current trends towards the promotion of thinking skills which require collaborative talk are actually embedded in the statutory curriculum.

Much of the research evidence base for the benefits of learner collaborative talk comes from natural classroom and experimental settings using transcript data to illustrate findings. This evidence is inevitably small-scale, often takes the form of a case-study, and attempts to generalize can only be justified in terms of the number of studies with similar findings across a range of contexts. In addition, reported studies take place predominantly in upper primary classrooms; there is a much smaller base of evidence from either the early years, secondary or tertiary phases of education. This reflects the age of participants and the difficulty of carrying out research with very young children, and the nature of the secondary classroom, with its rigid timetabling and focus on a subject-dominated curriculum. Evidence from secondary classrooms is more likely to be based on pre and post-testing using standardized tests and comparing experimental and control groups. The evidence available supports the claim that engagement in collaborative talk will improve performance on standardized tests when compared with control groups who have not. How the evidence base for the impact of collaborative talk on learner outcomes can be increased is an area researchers must continue to address.

#### FUTURE DIRECTIONS

If we accept that the social world is a discursive construction then language is at the heart of cognitive activity and dialogue the key to learning. If classrooms are to become places where learners' collaborative talk is an accepted teaching strategy, where all (including teachers) can learn, change and grow, approaches to learning and teaching must value the affective as an essential element in the learning process as well as cognitive growth. Learners bring with them different cultural meaning systems through which they make sense of the world, knowledge is therefore something to be negotiated as students and teachers create meaning dialogically. Collaborative talk has the potential to allow learners to experience the different ways in which people use language to make meaning out of educational text. Opportunities for dialogic engagement are growing as teachers are expected to focus on processing information,

rather than testing for recall; such dialogue will increasingly take place on a computer screen.

Content must increasingly reflect students' need to understand our complex world and to make sense of global interdependence and its implications for sustainable development and social integrity. Collaborative talk could offer a pedagogical addition with emancipatory potential to current authoritarian models of teaching and learning and better prepare learners for the challenges of tomorrow.

More evidence is needed on how the type and quality of talk during collaborative groupings changes with age and experience. More work is needed on variables such as gender, class and ethnicity, as well as variables in terms of strategies for grouping pupils, task design, and teacher input to better understand what interactions provide the most effective discourse.

Other trends can be seen to support the importance of children's voices in educational settings. There is growing awareness of the importance of teachers listening to learners' talk; by listening to children interacting with each other, teachers learn a great deal about their perspectives on the topics of the curriculum and how this relates to their lives. Such information can play a central role in assessment for learning and ensure that planning is truly learner-centred. As well as listening to pupils in classrooms, Grudeon and colleagues (2005) encourage teachers to review transcripts of children's talk in order to understand what children bring to collaborative learning tasks. It is this growing body of transcript evidence, often produced by teacher-researchers working in an Action Research paradigm, which helps us to understand the processes children engage in as they use talk for making meaning.

How to listen and learn, as well as to teach and lead, is a challenge for today's teachers and schools. Research shows pupils have a lot to say about learning and can advise on peer support and how to improve group work. When pupils are genuinely involved in discussing group work they can contribute to improvement in teaching and learning.

Computer-mediated communication is growing rapidly. Many commentators believe the developed world is on the cusp of a combined pedagogical and technological revolution with profound challenges for learning and teaching in the twenty-first century. A key challenge for the future will be that of developing new pedagogies and new technologies to advance computer-mediated dialogic engagement.

Increasingly the role of the teacher does not just lie in teaching basic skills or the content of curriculum subjects, teachers are expected to engage with new technologies, to be able to teach thinking skills including the ability to compare and contrast, predict, hypothesis, analyse, synthesis and evaluate, and to carry out action research in their

own classrooms. Learners' collaborative talk has a major part to play in all these developments.

## ROLE PLAY AND DIALOGUE IN EARLY CHILDHOOD EDUCATION

### INTRODUCTION

In order to explore how role play and dialogue in early childhood contexts contribute to our understanding of language and education, we focus on, but are not limited to studies of sociodramatic play, where children pretend in verbal interaction with others. The terms *imaginative play*, *fantasy play* and *pretend play* are also used to describe play that is crucial in children's development, particularly around ages 4–6, beyond which more rule-governed games and language play take over (see Lytra, *Playful Talk, Learners' Play Frames and the Construction of Identities*, Volume 3).

Smilansky (1968) characterises sociodramatic play as: (a) imitative role play, (b) make-believe with regard to toys or objects, (c) make-believe with regard to actions and situations, (d) persistence for at least 10 minutes, (e) interaction between at least two players and (f) verbal communication. In our discussion of role play we are not limited to studies of at least 10 minutes, nor indeed to those that involve two actual players, rather we focus on those that include analysis of the language of the role play, or the dialogue.

Assuming roles in dialogue is a complex process:

In role play, children are able to synthesise their 'factual' and 'fictional' experiences, and also transform them for their own purposes. Such transformations involve both children's affective selves and their adopted roles. That is, players do not simply reproduce pre-formed adult roles, but actively recreate playful versions of them. These re-creations do not necessarily adhere to 'expected' norms but may reflect players' own interests and perspectives (Martin and Dombey, 2002, p. 58).

Role play generates dialogue in different ways. Before and during the role play, children negotiate roles, props and plot, sometimes producing written scripts for themselves or puppets to perform. Educators may be involved at various stages, or not. The roles and the play blend stories and lived experiences with children's imagination and developing identities, moving in and out of the play and different social contexts. As

this suggests, role play is an excellent site for the study of dialogue that is creative, social and spontaneous in young children.

### EARLY DEVELOPMENTS

The relationship between sociodramatic play and the language and literacy development of preschool children was well documented in the 1970s (Fein, 1981). Role play can promote increased language performance (Smilansky, 1968); a higher level of thinking skills (Bergen, 2001; Marjanovic-Umek and Musek-Lesnik, 2001) and power of imagination (Kitson, 1994; Martin and Dombey, 2002) in young children. It is a complex process that involves role taking, script knowledge and improvisation (Bergen, 2001).

Play is not only beneficial for children, but also allows adults to learn more about children's needs, perceptions and growth. Teacher action research has long been interested in play. For instance, a project in Canada (Thornley-Hall, 1989) which engaged teachers in analysing the role of spontaneous play in the development of oracy in their classes has echoes in a recent teacher research project supported by the TTA teacher-researcher scheme in the UK called 'using role play to improve nursery children's language' (Aubrey, Godfrey and Thompson, 2000, p. 74).

Play has been studied from a range of disciplinary perspectives and in different research traditions. Reference is made to early work by Piaget on developmental stages of play, or to Vygotsky and the importance of social interaction and adult scaffolding. Smilansky's work on the effects of sociodramatic play on disadvantaged preschool children's language development (1968) is a significant early contribution.

Broadly speaking, research on play has followed general trends in educational research. Two of the preoccupying themes of early childhood educational research in the late 1970s were classroom interaction, and play-tutoring, where teachers might initiate a role play with a child (Aubrey, Godfrey and Thompson, 2000, p. 74). The 1980s saw an increase in clinical studies of play and language whereas the 1990s could be characterised by an increase in interpretive methods to capture naturally occurring situations and complex, social practices.

### MAJOR CONTRIBUTIONS

Research on role play and dialogue is varied and scattered. We have selected contributions to illustrate three recurring themes: experimental research using role play in interventions; ethnographies showing the influence of popular culture on literacy development through role play; and the varied insights gained from children 'playing school'.

*Dialogue as Intervention to Develop Role Play*

The connections between the development of socio-dramatic play, cognition and language have led researchers to experiment with interventions to develop children's dialogue in specific directions. Two such studies are presented here.

McWilliam and Howe (2004) cite their earlier findings that both construction and symbolic play were associated with the production of a greater number of explanatory exchanges, while symbolic play, fantasy and role play have frequently been linked to enhanced reasoning or justificatory skills. In this study, in an urban nursery setting in Scotland, they used role play with 'Alien' puppets to model either 'justificatory' or 'non-justificatory' three-turn exchanges to 4-year-old dyads in 10-minute play sessions, decreasing their support over 5 days. The dialogue with Aliens modelled in the experimental condition was 'claim-why-justification' (e.g. I like this school—why? —because I can talk to all the nice children), whereas in the control group it was 'claim-question-response' (e.g. I like this school—What do you like about it?—I like to talk to the nice children). On day 2, the researcher modelled one part in the exchange. On day 3, the researcher prompted the children in dyads (e.g. Tell Zag to answer the question), on day 4, the role play dialogue with puppets was simply encouraged where necessary and on day 5, the researcher moved away from the dyad after asking the children to talk with the puppets as before. The results show that the experimental groups were able to produce more 'why' questions and justifications at every stage of the intervention than the control group. For example:

Control: I'm playing with that (yellow puppet)—Do you not want to help with this?—yes that's his nose and put his hair on.

Experimental: I've a broken spaceship—Why did the spaceship crash?—Because he wasn't a very good driver.

This research is significant not only in its attribution of justificatory talk to children as young as four, in collaborative play (as opposed to conflictory talk where it had been previously noted), but also in its support for the identification of role play as an ideal site to develop justificatory talk.

Neeley, Neeley, Justen and Tipton-Sumner (2001) describe research on the effectiveness of scripted play as a teaching strategy for children with developmental disabilities. Their literature review suggests improvements in cognition, language development and socialisation may be positively correlated to a child's acquisition of more sophisticated play behaviours, and these behaviours can be facilitated using a scripted play paradigm (2001). Following 20 minutes of individual script training involving what would appear to be a fabricated dialogue of a service encounter

between an employee and visitor to a fast food restaurant, there was a clear shift in the children's overall balance of play activity from solitary and functional play (muscle movements) to group constructive play (e.g. with blocks), games with rules, and dramatic (role) play, with group dramatic play being the most frequent after training. This study highlights both the social aspects of role play and the difficulties some children have in engaging initially, as well as the importance of shared scripts or schema (e.g. about the nature of service encounters) in the development of dialogue.

The issues and findings in these experimental studies resonate with studies from very different research traditions where play occurs naturally, in and out of school.

### *Role Play in Natural Settings*

Spontaneous, naturally occurring role play is open to interpretation from many perspectives. To illustrate this, Danby in her study of pre-school children's speech practices in daily play in Australia contrasts a reading of her data based on 'more traditional' early childhood practices in terms of educational and social learning with one that "constitutes children as persons of gender and power by showing how they are positioned (and position themselves) as teachers, learners and players" (Danby, 1999, p. 151). Further perspectives are now illustrated.

### *Revoicing, Recontextualisation and Popular Culture*

Dyson (2003) reports on an ethnographic study of a group of African-American first graders. Two of her findings are particularly relevant here: she shows how the children recontextualise from popular culture in their dramatic play and how these processes shape their entry into school literacy.

She examines how children appropriate 'the symbolic stuff of media genres', and adapt it in their dramatic play and other practices. This is a process of revoicing or recontextualising (see Maybin, *Revoicing across Learning Spaces*, Volume 3):

A song heard on the car radio . . . might become collaborative dramatic play among peers (as in playing "radio singing stars" on the playground), or particularly appealing bits of film dialogue might be lifted for group language play (ibid., p. 331).

Voices from the movie *Space Jam* which "incorporates the children's three most common sources of symbolic material—sports media, songs and animation" (ibid., p. 329) provide a focus for her study. Here, Dyson traces one child's experience with the movie:

Noah originally experienced *Space Jam* with his real family as a multimodal story, complete with pictures, music score and dialogue. Then, with fake siblings and classroom friends, Noah recontextualized and transformed that original experience into childhood practices of group singing and dramatic play (ibid., p. 342).

She describes the Grade One class watching the movie as a treat. Most had seen it many times before and joined in for group singing and reciting lines. “Noah matched tone, pitch and volume almost exactly. Indeed, he did not like others to say the lines if . . . ‘they don’t say it right’” (ibid., p. 335). Later in composing time, he drew Bugs Bunny and Michael Jordan in cartoon style. When he added a written report to this paper saying that he watched *Space Jam* with his cousins, he had converted it into a personal experience text that fulfilled the school expectations of composing. He later wrote longer texts that reframed the media resources with school expected voices (*I learned that . . . ; I saw . . .*) as encouraged by the literacy teaching.

Dyson argues against narrow conceptions of young children’s literacy and for opening up classrooms to literacies that children engage with outside class. The movie provided the shared script which was imitated, extended and exaggerated in role play, eventually providing a focus for school literacy.

### *Playing School*

Role play not only brings popular culture into school, but also extends school practices into play. Woods, Boyle and Hubbard (1999) observe that girls in their first year of school in particular were fond of playing school. One child would sit in the teacher’s chair, use the teacher’s pens with an old red diary as the register, and play ‘school’. Children with little English could also participate in pupil roles.

Bourne describes a range of school role play practices: “Sometimes they played ‘pretending games’, for example, when Ahmed was the ‘teacher’ telling a group to sit up straight and cross their legs; or when Najma, half in play and half seriously, instructed me in how to write in Bengali, drawing on the practices of her Bengali classes outside school, making me recite the text without telling me what the text meant (‘making sense’ being, in contrast, an essential feature of school reading practices). In the next example, Alea drew on past experiences of using the tape recorder in a previous ESL class to use another kind of discourse, with an intonation and delivery sadly only too familiar to teachers of ESL: . . . Alea: (*In a clearly enunciated, stiff ‘drill’ voice*)

Yes Somiron. What.is.your.name? My.name.is.Alea” (Bourne, 2002, pp. 245–246).

Significant in this area is the work of Gregory and colleagues. In an investigation of the role played by siblings in mediating both home and school literacy practices, they compared ‘playing school’ with what actually happens in school, among monolingual and bilingual learners. Gregory (2004) reports on play between siblings, one aged 9–11, the other 4–8, in Bangladeshi British homes. The children learn from each other, “usually through *playing out* formal classroom experiences” (Gregory, 2004, p. 99; Williams, 2004). The ‘lessons’ at home, one of which lasts almost an hour, show that the older child “could almost be her sister’s real teacher. The curriculum is clearly focused, the discourse shows respect from both teacher and learner, and praise is given where deserved” (2004, p. 104). Direct comparisons of classroom interaction and home role plays illustrate that children’s play exemplifies procedural, cultural and as illustrated in Table 1, academic knowledge.

Table 1 Classroom interaction and playing school

| Classroom interaction   | Siblings playing school at home   |
|---|---|
| <p>81. Teacher: ‘Right’. Can you tell me why that’s a homophone, Sultana? What’s the other word that sounds like it? How would you spell that? Sorry, can’t hear you.<br/>A. can you spell it for me?</p> <p>82. A: ‘w-r-i-g-h-t’</p> <p>83. Teacher: what ‘w-r-i-g-h-t’ Do you agree with him, M?<br/>(Gregory, 2004, pp. 102–103)</p> | <p>42: Now we’re going to do homophones. Who knows what a homophone is? No one? OK. I’ll tell you one and then you’re going to do some by yourselves. Like watch—one watch is your time watch, like what’s the time, watch. And another watch is I’m watching you. OK? So Sayeeda you wrote some in your book, haven’t you? Can you tell me some please. Sayeeda, can you only give me three please.</p> <p>43. Oh I have to give five</p> <p>44. No, Sayeeda, we haven’t got enough time. We’ve only got another five minutes to assembly. And guess who’s going to do assembly—Miss Kudija (<i>Wahida’s friend</i>) . . . .<br/>(Gregory, 2004, p. 103)</p> |

The older children are not only expert imitators of their teacher's talk and pedagogic style, they are also able to adjust the 'lesson' to the learner (making it a meaningful learning experience), and to inject creativity by extending or exaggerating the talk. For example, the 'teacher' gives her sister lines for bad behaviour (not a school practice); others blend (syncretise) literacy classes with styles used in Qur'anic and Bengali classes. (Gregory, 2004).

### *Syncretic Literacy Studies*

The work of Gregory, Long and Volk (2004) under the umbrella of syncretic literacy studies is important in exploring how different languages and cultures blend in talk and literacy practices. It also brings to the study of role play the complex relationships between home and school talk. A study by Kelly (2004) describes a child who lacked confidence in school literacy practices, but then demonstrated use of specialist vocabulary and understanding of space procedures when able to join in sociodramatic play about Buzz Lightyear, a character he was familiar with from home videos. As with Dyson (2003), we see the transfer of popular culture from home, to play, to literacy in school. Role play also provides a window at home on school learning. Drury (2004) portrays 3-year-old Samia using English mixed with Pahari in playing nursery with her younger brother—though Samia's teacher was unaware that she could speak any English at all. In these diverse ways, role play enhances children's confidence, linguistic growth, literacy development and sheer pleasure.

### *Role Play in Qualitative Research*

The work of Gregory and colleagues has promoted the use of role play as a research tool. For instance, Yaacob (2005) in her study of Year One Literacy Hours in Malaysia was able to use role play alongside classroom observation and participant interviews. With suitable props and a dedicated quiet space, she prompted children to pretend they were teaching younger children how to read, just as their teacher did. Recordings of the 'lessons' revealed how children were able to move in and out of the fantasy, as well as between English in the instructional register and several dialects of Malay in the regulative register, and showed their imitative and productive language proficiency and command of the script or dominant literacy practices. The role play technique also helped resolve the observer's paradox (Table 2). For example, the child playing 'teacher' would discipline the 'pupils' with techniques which were sometimes exaggerated, sometimes not:

Table 2 Role play and the observer's paradox

|   |  |
|---|--|
|   | Some students start to play among themselves while the teacher is reading the text. She moves to the group and asks them to stand on the chair   |
| Farra: Diri atas kerusi! <stand on the chair!>        | She holds Sofea's hand to help her stand. The other students stand up too. The teacher asks the students to hold their ears and bend up and down ten times. They count 1 to 10 as they do it and giggle among themselves |
| Farra: Nak sembang lagi? <Do you still want to talk?> |  |
| All: Tak nak dah ! <No!>                              |  |
| Farra: Hah duduk! <Ok sit down!>                      | The teacher still holding the text book walks to the other side of the classroom   |

Source: Yaacob, 2005.

In this instance, Yaacob recognised the punishment, was able to check with the real class teacher and confirm that indeed this was a practice, but one that she intentionally tried to avoid when being observed.

#### WORK IN PROGRESS

The rich variety of contextual variables in studies can make comparison difficult, which points to the value of continuing research on variation in the interactants, the props, the themes and the settings in relation to features of the dialogue in role play. In this section, we point readers to studies that have explored different aspects of the context.

##### *Contextual Variables and Role Play*

Props can prompt increased sociodramatic play. Levy, Wolfgang and Koorland (1992) found that building shared background information and adding time, space and props in play areas (hospital, restaurant) increased amount and complexity of language in sociodramatic play. Their single case repeated measures multiple-baseline design across three subjects found increased language (type, token and Mean Length of Utterance) as well as increased use of imaginative functions per se and in multi-functional units (e.g. from the imaginative *bang!* to the

imaginative and instrumental *I want a pizza*). Marjanovic-Umek and Musek-Lesnik (2001) found that ‘Doctor play’ gave children greater opportunities for personal interaction, verbal communication and make-believe with objects in comparison to ‘lost doggy’ play which was found to be more imitative with its involvement of fewer objects. Siraj-Blatchford and Whitebread (2003) describe children around a computer manipulating items on the screen which become props in their role play (ibid.) illustrating a new form of symbolic play and its interaction with sociodramatic play. The increase of Information and Communications Technology (ICT) in early childhood education, and the fast developing technologies will continue to have an impact on the nature of young children’s Role Play and Dialogue.

Neppyl and Murray (1997) found that interactive, imaginative play tended to occur most where children were grouped in same sex pairs, largely because they opted for different kinds of play activities. Where girls seem to feature in the research on playing school, boys are central in studies on superheroes. For instance, Hicks and Kanevsky (1992) note that Mike’s symbolic play focused on superheroes and flying vehicles in their description of the discourse processes surrounding journal writing.

Kitson (1994) looked at pretend play through collaborative talk and makes a case for adult intervention arguing that

“Structuring the play enables us to extend and enhance children’s learning. Through socio-dramatic play, educators are able to create a situation and generate motivation which will encourage children to behave and function at a cognitive level beyond their norm” (Kitson, 1994, p. 98).

Paradoxically, Gmitrova and Gmitrov (2003) found that child-directed play in small groups resulted in a significant increase cognitively in comparison with teacher-directed play in their Slovak classrooms.

Drummond (1999) extends the focus on the role of adults to the setting. She contrasts a mainstream argument for play based around learning outcomes, achievements and cognitive gains with an approach that allows children to imitate and express their will in play in Steiner schools. “When the children arrive at kindergarten, the adults are doing adults’ work—sewing, preparing snacks, mending a broken toy—which creates the freedom, rhythm and creative space in which children can play” (ibid., p. 53). This means that teachers do not question children to elicit verbal displays of understanding, they do not engage in Initiation-Response-Feedback (IRF)-type exchanges, they do not use the ‘teacher tone of voice’ to call for silence or issue instructions. They talk, laugh and sing, as the children engage in spontaneous, creative, transformative play (1999).

As part of a series of studies on the telephone dialogues of children in pretence play, Gillen and Hall (2001) analyse the dialogue of

3–4 year olds in a nursery setting in spontaneous role play as they make emergency calls, place delivery orders and call their parents on a toy phone in a play hut. They found, for instance, that 71% of calls included an appropriate opening move, 45% included a closing move whereas 51% including turn taking. Whereas the imaginary interlocutor was usually identified, self-identification was rare. One third of the ‘emergency’ calls followed the pattern of a request or imperative followed by justification, such as:

Anna: Doctor come round tomorrow ‘cos someone’s poorly.

It’s teddy bear poorly so come round. *Call ends* (ibid., p. 20).

Gillen’s one-sided telephone dialogues show children’s proficiency in pretence telephone talk exceeding their proficiency in actual dialogues. This is then extended when a second telephone is added to the nursery setting and children are able to communicate by phone as part of their play (Gillen, 2000). With the lack of face-to-face communication usual in role play, these telephone dialogues show children’s developing ability to use less contextualised language.

In a similar way, Janson’s (2001) study of blind and sighted pre-school children’s negotiations in fantasy play are conducted in contexts which require more explicit language. It is not the disability that impedes communication, but the different scripts and experiences blind and sighted children have in familiar contexts. Where background knowledge and scripts differ, there is more need for negotiation. In contrast, Annica (2005) examines the interaction in a Swedish pre-school between two girls playing at holding a funeral ceremony and shows how new knowledge occurs through negotiation. Children also draw on their different cultural backgrounds. For instance, Riojas-Cortez (2001) shows how Mexican American children in their socio-dramatic play draw on funds of knowledge including language, values, beliefs, ways of discipline and the value of education.

#### PROBLEMS AND DIFFICULTIES

As studies have shown, an effective means to capture spontaneous socio-dramatic play is through ethnography. The drawbacks are well rehearsed, but the rewards are rich (see Toohey, *Ethnography and Language Education*, Volume 10). Through ethnographic research, researchers observe the naturalistic development of language, social interaction and negotiation over longer periods of time. They learn to understand the children, and their backgrounds, in context, in ways that inform interpretation of the role play. Although ethnographies are well tested, and developments in Linguistic Ethnography (Creese, *Linguistic Ethnography*, Volume 10) in particular are a current focus of research activity in Britain and North America, many researchers do not have

the luxury of being able to spend many months or years with children. Here the use of strategically placed video cameras, as in Gillen and Hall (2001), can help with studies tied to specific play areas, or attaching microphones to individual children can provide data on individuals, as in Bourne (2002). The use of researcher-initiated role play of teaching practices as in Yaacob (2005) is also possible, although personal communication with some researchers in the UK suggests that their attempts to encourage young bilingual children in England to 'play school' were 'hilarious' but ultimately unsuccessful in yielding useful insights into children's learning or practices. Working with young children is challenging, and careful trial is necessary if techniques are to be developed to record specific types of dialogue or role play in relatively natural settings.

### FUTURE DIRECTIONS

Bergen (2002) in her synthesis of the latest research on the role of play in children's cognitive, social and academic development, which notes the clear links between pretend play and social and linguistic competence, identifies the need for research on the relationship between high-quality pretend play and development of specific academic skills. This is one possible future direction.

A second promising sign comes from the developments in cognitive psychology towards discursive psychology, which aims to use methods of conversational analysis in its pursuit of understanding of psychology. Most studies on the benefits of role play in early childhood education pay little attention to dialogue, or the actual language, and how this is used in context. A more effective analysis of the language or conversation would enhance current findings.

A third area of growth might be in the direction of work on language and identity. Research in this area has been growing, and in early childhood education we see the beginnings of how children, particularly when leaving their homes to enter new communities of practice for the first time, construct their identities through language (e.g. Sawyer, 1996). Role play could well provide an ideal lens for such studies.

In Britain and North America, the early years curriculum is perceived as having moved away from play. Teachers who advocate play as a central part of the curriculum are reported to be under pressure to conform to more traditional educational practices. The message from Bergen (2002) from an American cognitive perspective: "the limited research evidence that does exist suggests that educators should resist policies that reduce time for social pretend play experiences in preschool" is the same as from Gregory (2004) from a British syncretic literacies perspective, and indeed from all the research reviewed for this

paper. This is an area where research would not only inform our limited understanding of how role play and dialogue contribute in education, but would also add weight to the arguments for more socio-dramatic role play in early years educational settings.

## DISCOURSE AND SECOND LANGUAGE LEARNING

### INTRODUCTION

Discourse is both the starting point of second language learning and the result. That is to say, it is through expressing ourselves in language using whole pieces of discourse that we stretch our linguistic abilities in that language; moreover, fluent discourse, whether it is monologic or dialogic, spoken or written, is the culmination of successful learning of a second language (L2). Recent research in second language acquisition (SLA) has begun to glean insights from the various approaches to the analysis of discourse, and these insights lend theoretical illumination and practical applications to L2 learning and pedagogy. By studying how language users employ their language(s) in a variety of contexts, with a variety of types of interlocutors, and on a variety of topical issues, we can create curriculum, materials, and assessment instruments based on something more substantial than the intuitions of mother tongue users. The current state of affairs in the field is that we have a highly developed Discourse Analysis and a highly developed body of research in SLA that have begun to inform each other in important ways.

### EARLY DEVELOPMENTS

In the intersection of discourse and SLA there is a tension between psycholinguistic and sociolinguistic perspectives. While much of what has been studied as “interactional” in SLA has, historically, been psycholinguistically based, there are several early trends that are firmly rooted in sociolinguistics.

Labovian sociolinguistic perspectives on SLA were explored in work on variation and SLA by Tarone (1985, 1988). These studies focused on variability in learner usage along the dimension of attention to speech. A somewhat different approach was taken by studies focusing on accommodation theory perspectives on SLA (e.g., Beebe and Giles, 1984; Beebe and Zuengler, 1983). This research looked specifically at formality/informality of context and interlocutor relationships and their effects on second language production. For example, a formal context of speech might result in transfer of a formal feature of the L1 into the L2 in a similar situation. Moreover, a relationship of rapport

between a nonnative speaker (NNS) and her native speaker (NS) interlocutor was found to foster convergence with some of the characteristics of the NS's speech patterns in the target language, particularly on the phonological level.

Acculturation is another important early discourse perspective on second language learning (e.g., Schumann, 1978, 1986). This theory focused on immigrant group members' language acquisition along the dimensions of social distance and psychological distance. *Social distance* considers the language learner's community in relation to the host community as a critical factor in the success of acquisition. *Psychological distance* factors are more individually based. Acculturation theory has received only limited support, but has served to put forward a more macro-sociolinguistic view of factors involved in successful L2 learning. As such, it is an important early view of the connection between discourse and second language learning.

Also significant are the early contributions of studies focusing on classroom discourse and interaction (e.g., Mehan, 1979; Stubbs, 1983). This body of research examined the discourse features of language and content classrooms with particular attention to teacher and student "moves." An important construct to emerge from this research is the "IRF" (initiation, response, feedback) pattern typical of classroom interaction, which tells us that teacher talk accounts for some 2/3 of all discourse in the typical "chalk and talk" format of formal schooling. Classroom discourse is an important area for analysis that continues in current studies on tutored second language development.

Cross-cultural discourse has been an important focus of work on *Crosstalk* spearheaded by John Gumperz (cf. Twitchen, Gumperz, Jupp, and Roberts, 1979). This perspective focuses on the use of differing contextualization cues by speakers of languages in multilingual settings. It continues to be a significant tool in pointing out the pitfalls of miscommunication potential across different ethnic/cultural groups using a lingua franca. (<http://sunsite.berkeley.edu/Anthro/gumperz/gumtalk.html>).

A psycholinguistically oriented thread of discourse and SLA research has focused on negotiated interaction (e.g., Hatch, 1978; Long, 1983), either between native speakers and learners (NS-NNS) or between two or more learners (NNS-NNS). Negotiated interaction has been thought to encourage language learners to stretch their linguistic abilities in L2 by means of checking their comprehension of the discourse until mutual understanding is achieved. This perspective viewed interaction as the quintessential site of acquisition. Hatch (1978) went so far as to propose that out of discourse comes syntax; that is to say, the ability to use native-like strings of words into sentences emanates from participation in discourse in the target language.

Long (1983) found negotiated interaction to be replete with such moves as comprehension checks, clarification requests, repetitions, and reformulations. These serve the learner by aiding in comprehension of the ongoing discourse and providing necessary feedback of the learner's comprehensibility.

## MAJOR CONTRIBUTIONS

### *Theoretical Frameworks for Discourse and Language Learning*

Recently, a contingent of applied linguists has argued for a broadening of perspectives on SLA to include increased *emic* points of view. At the 1996 International Association of Applied Linguistics (AILA) meetings, Alan Firth and Johannes Wagner opened up a controversial debate in which they called for a reconceptualization addressing what they saw as an imbalance biased toward a cognitive perspective on SLA that neglected social interactional perspectives. Ben Rampton (1997) has been an important voice among this group whose arguments point out that the current state of world globalization necessitates new perspectives on what it means to be a language "learner" and "user." For Rampton, globalization presents an opportunity to take a post-modern view on issues such as "communicative competence" and "speech community." Currently, language learning is no longer seen as a purely cognitive phenomenon by most researchers interested in discourse and SLA. This new perspective is congruent with a view of the world as it presently exists: one of transnationalism and globalization. Indeed, the issue of the "native speaker" is obfuscated in a shrinking planet (cf. Boxer, 2002).

In order to adequately analyze the best processes for applying findings on discourse analysis to SLA, we must assess the usefulness of existing theories, models, and frameworks for the processes involved in the development of language ability in second/additional languages. Three theoretical models offer fairly compatible insights into these processes: (i) Language Identity, (ii) Language Socialization, and (iii) Sociocultural Theory.

### *Language Identity*

In the past several years there has been a developing interest among applied linguists in the relationship between identity and second language development (e.g., Boxer and Cortes-Conde, 2000; McKay and Wong, 1996; Norton, 1997). These scholars have been interested in studying how incorporating an additional language and culture

impacts on one's sense of who one is in the world. For immigrants, the issue of taking on a new and/or changed identity is a hallmark of one's linguistic and cultural development in the context of immigration. Even for those learning an L2 for more instrumental purposes, as the case with ESL/EFL as the world's lingua franca, adding a language to one's verbal repertoire necessarily entails modifying one's self perception in relationship to others in the world.

McKay and Wong (1996) focused on the importance of fluid and changing individual and social identities and their relation to multiple discourses (e.g., immigrant, minority, academic, gender). In this view, the identity of an individual in the process of SLA affects agency, which differs from the traditional view of motivation. Agency enhancement affords learners a sense of power over their environment and thereby their learning.

In a somewhat parallel view, Norton (1997) highlighted the importance of "investment enhancement" in her discussion of identity and language learning. Boxer and Cortes-Conde (2000) put forth the concept of "relational identity" (RID), which is displayed and developed between and among specific interlocutors in their interactions over time and which affords comfort to build on sequential interactions that rest on rapport and solidarity. This relationship built between interlocutors leads naturally to further interaction and, consequently, increased opportunities for language development.

It seems likely that the first and foremost resource of those involved in additional language learning involves face-to-face spoken discourse. Second language users must grapple with fluid and shifting identities—individual, social, and relational—and come to terms with the power relations inherent in them. Whether or not those in the position of taking on new linguistic and cultural identities choose to appropriate or reject the "affordances" of the new language/culture may depend largely on the lived histories of the individuals, the contexts of their interactions, and the power relationships inherent in these contexts.

### *Language Socialization*

The Language Socialization framework of studying linguistic and cultural development derives from Schieffelin and Ochs (1986). This early work views language as the symbolic means by which humans appropriate knowledge of norms of behavior of their speech communities (see Ochs and Schieffelin, *Language Socialization: An Historical Overview*, Volume 8). For L1, the transmission of linguistic and cultural knowledge is largely implicit; however, explicit metalanguage is also used in the socialization process, as it is with L2 learners (e.g., "What do you say?" "Say 'thank you'"... "Say 'I'm sorry'"). Becoming a

competent member of any speech community for children in L1 and for L2 users entails taking on the appropriate behaviors of the community.

The applications of a language socialization model to L2 learning have been most notable in studies focusing on second language classrooms as communities of practice (Lave and Wenger, 1991). Socialization practices of such communities are reflected in the classroom discourse and interaction in which teachers take on the role of socializing agent. The applications of socialization theory to SLA are principally in the realm of discourse and pragmatic development (Duff, *Language Socialization, Participation and Identity: Ethnographic Approaches*, Volume 3).

### *Sociocultural Theory*

A contingent of applied linguists spearheaded most notably by James Lantolf has been actively engaged in adopting the theoretical perspectives of Vygotsky (e.g., 1978) to second language studies. This work views the acquisition of language as a sociocultural phenomenon linking the social/interactional with the cognitive. Unlike the Language Identity and Language Socialization models described above, Sociocultural theory (SCT) sees language as a tool that mediates between social interaction and the development of higher order mental processes

Those who espouse SCT as a lens through which we can view both tutored and untutored second language development call for a careful analysis of the social setting of such development (cf. Lantolf and Appel, 1994). The concept of “scaffolding” is one in which the interlocutor possessing expertise guides the novice through a series of interactions in which the expert gradually cedes and the novice takes on increasing responsibility. Scaffolding occurs through social interaction, and includes modeling and training by the expert and observing and imitating by the novice. Gradually the novice becomes more adept, and that which began as an intermental, socially mediated activity becomes an intramental, cognitive developmental process. Sociocultural theory applies to any learning process, and connects sociolinguistic with psycholinguistic contexts and outcomes.

### WORK IN PROGRESS

Research in progress on the interface of discourse and second language learning has taken up an important methodological debate, as discussed above, and put forth a strand of investigations that are firmly rooted in Conversation Analysis (CA). Firth and Wagner’s call in 1996–97 for a more fully contextualized, *emic* perspective on second language learning has blossomed into a series of research projects using CA as a

methodological tool. Researchers involved in this new thrust claim that CA is the most effective means for studying moment-by-moment second language development. This body of research has by and large focused on classroom discourse and interaction, with a few exceptions (see also Mori and Zuengler, *Conversation Analysis and Talk-in-interaction in Classrooms*, Volume 3). Indeed, the *Modern Language Journal*, in 2004, devoted a special issue (Volume 88, number 4) to a series of articles using CA for L2 research, and included four essays taking a critical perspective on the pros and cons of this line of research endeavor.

The special issue of *MLJ* was edited by applied linguists Numa Markee and Gabriele Kasper. The authors overview the debate begun by Firth and Wagner (1997) and assess how far we have come since then insofar as “how cognitive SLA might be re-specified in sociocultural terms” (p. 481). They go on to discuss if and how CA can be used to demonstrate language learning, and describe to what extent the authors contributing to the volume believe that it can or cannot.

Articles in this special issue include one on task accomplishment in French as a foreign language (Mondada and Pekarek Doehler). These authors characterize their approach as sociointeractionist, and assert that CA as a research tool enables the observation of task (re)organization by teachers and students. A second contribution is on ESL writing conferences (Young and Miller). In this piece, the authors show how a CA analysis of such conferences affords a view of participation frameworks that change over time for the learner. They assert that studying the moment-by-moment unfolding of revision conferences offers a lens into the learner’s evolving central participation in the process. A Japanese language classroom is the site for a study by Junko Mori, in which she highlights learners’ orientation to learning opportunities. Kasper’s own study on a learner of German takes the conversation partner speech event as the research setting. Her CA analysis shows how participant statuses were made relevant through the interactions between the expert and the novice. Markee’s piece puts forth his notion of “Zones of Interactional Transition,” (ZITS), to designate talk that occurs at the boundaries of speech exchange systems. His CA analysis affords an exploration of two ZITS phenomena, which he terms *counter questions sequences*, and *tactical fronting talk*.

Agnes He’s piece uses Chinese heritage language classrooms as the site for her research. As a researcher with a long history of CA research, He is nevertheless hesitant to make sweeping claims for the extent to which CA can be used to demonstrate that language learning has taken place. She proposes that a language socialization perspective may lend increased insights into this process through its propensity to

deal with introspective matters important to SLA. She states, “[the] indexical relationship beyond language form and meaning lies beyond the central concern of CA. In this sense, language socialization may complement CA” (p. 579). Thus, He seems to have a clear view of the limitations as well as the benefits of any one approach.

Of critical importance among the essays in the special edition are the four commentaries by applied linguists Susan Gass, Diane Larsen-Freeman, Joan Kelly Hall, and Johannes Wagner. Each assesses the role played by CA while taking to task some specific claims made by the individual papers in the collection. Gass comes from a psycholinguistic tradition in SLA research, that of negotiated interaction. Thus, as in the 1997 *MLJ* debate, she continues to question how CA can demonstrate *acquisition*. Larsen-Freeman, who espouses a chaos/complexity perspective on SLA, questions the CA conception of *emic* in these studies. Hall’s work is firmly rooted in a Vygotskian sociocultural perspective, and thus while noting the pros of CA, also outlines what SCT can offer to L2 language development; Wagner, the sole CA representative of the group, reasserts his stance that classroom discourse may not be the best site for studying language learning. He states: “the real potential for a social approach to language learning lies outside the classroom in the activities of ordinary bilingual social life.” (p. 615).

So, what research is in progress? A brief glance at the 2005 program of the conference of AILA/AAAL shows us that current research using qualitative methodologies are highlighted. Some interesting ongoing research focuses on interculturality in talk-in-interaction (e.g., Kakava, 2005). Identity issues continue to be a salient focus of current work in the interstices of discourse and language learning (e.g., Caldas-Coulter, 2005; Lemke, 2005). And, of course, CA for SLA still takes a central place in the ongoing new thrusts in the field, as we have seen in the above overview.

The year 2005 celebrated a resuscitation of the conference on Pragmatics and Language Learning (P & LL). The meeting was held at Indiana University and hosted by Kathleen Bardovi-Harlig. Research featured at this biannual conference shed light on the subject of developmental pragmatics and represented many qualitative and quantitative approaches to L2 pragmatics research.

#### PROBLEMS AND DIFFICULTIES

The major problems with applying discourse analysis to second language learning revolve around methodological, theoretical, and epistemological issues. The models and theories discussed above in current major contributions have stemmed from the epistemological question

of what counts as evidence of second language learning. An outgrowth of this problem is that of ascertaining the most effective means of studying discourse to determine how second language learning best takes place. As we have seen in the above discussion of CA for SLA, there has been a strong move toward connecting *emic* perspectives on discourse to the study of SLA.

A major difficulty is the issue of documenting actual L2 learning. Gass and Larsen-Freeman took up this specific argument in their commentaries on the 2004 *MLJ* articles. While CA can trace a learner's participation in the learning process, this is not the same as showing that acquisition has taken place. Some examples of this problem are found in the articles by Mondada and Pekarek Doehler and Young and Miller. In Mondada and Pekarek Doehler's description of a French L2 classroom, they use CA to demonstrate a process of task (re)organization by teachers and students. The assumption is that demonstrating the process is evidence of the product (i.e., language learning). It is a leap to claiming language learning has taken place. A similar problem exists with Young and Miller's study on a novice and teacher involved in writing conferences. While their CA analysis shows increased central participation on the part of the learner, we cannot assume that this increased participation is evidence of language learning.

Thus, the existing problem with this current research thread using CA to investigate SLA is that the studies fall short of demonstrating language acquisition. Moreover, as Larsen-Freeman points out, the authors' conception of CA as *emic* is not the same as what is considered *emic* in other qualitative approaches (e.g., ethnography of speaking or interactional sociolinguistic perspectives). Wagner's suggestion that we explore contexts of lingua franca use as rich sites for study is a good one. Limiting the *emic* analyses to classroom discourse provides us with limited views of language use, let alone language learning.

The growing body of research deriving from contextually rich methodological approaches has lent important insights into language *use* by NS for decades. However, their applications to language *learning* contexts are more problematic. Ethnography of speaking (ES) and Interactional Sociolinguistics (IS) offer alternative qualitative approaches to the study of language learning. ES, for example, takes into account a variety of contexts as well as insider knowledge. The meaning of speech for particular speakers in specific social activities is a central concern for ES; thus, it is particularly suitable for the study of spoken language and its application to second language learning. ES is concerned with community members' perceptions and representations of their own culture; therefore, it describes everyday, ordinary functions of language. For this very reason it is a potentially very powerful methodological approach to language learning data.

ES and CA diverge specifically in their distinct notions of context. While for ES the sociolinguistic variables of gender, social distance, status and power, age, and social class are taken as indexical to the analysis, for CA what is in the transcription of the interaction is what counts as important. In CA the participant perspective is not considered useful. Thus, CA and ES differ in what are construed as relevant contributing factors to the realization of speech behavior.

Work in the tradition of Interactional Sociolinguistics takes as its focus developmental bilingualism and cross-cultural miscommunication between and among different linguistic/ethnic groups. IS unites some of the tenets of ES and CA, but typically employs triangulation techniques in order to tap into the participants' own perspectives on the interaction under analysis. This sort of *emic* consideration can lend critical insights into miscommunication and misperceptions between interlocutors of different cultural and linguistic backgrounds. Participants in the interaction are invited to reflect on the interaction as it naturally occurred to lend insights into what they meant by what they said, what they were trying to achieve, and how they felt about their own language use and that of the other participant(s) in the moment-to-moment unfolding of the exchange. As such, IS offers rich analyses of talk in interaction that have important potential implications for the application of the study of discourse to SLA contexts.

ES and IS are highly contextualized *emic* methodologies for studying language use. The fact that CA is all the rage in current studies of SLA begs the question of why ES and IS should not be further exploited. Indeed, their usefulness for studying second language development has long been overlooked.

#### FUTURE DIRECTIONS

While there is now a considerable body of rich, highly contextualized research on how speakers carry out their daily communicative practices, few scholars have applied what we know about norms of spoken discourse in communities around the world as a *baseline* to SLA. The little that has been applied to language learning contexts has been by and large applied to the English language and to ESL/EFL contexts. Nessa Wolfson (1989), an early protégée of Dell Hymes regarding application of his theories of communicative competence to educational linguistics (1972), was one of the first to propose that before we can study what language learners do in spoken L2, we need to know, from empirical evidence, how languages are actually used in face-to-face interaction by members of communities. While much of this knowledge is intuitive, we have no way of really knowing what

we do in conversation as community members until we systematically study these speaking practices.

The world has begun to be transformed into one in which language users, employing languages from their linguistic repertoires other than their L1s, quite frequently interact in these languages with other speakers who are also *not* mother tongue users of those languages. Firth and Wagner (1997) made this case strongly, and Rampton (1997) eloquently elaborated on it. No one would deny that English is a lingua franca around the world. Here we move beyond the social domain and enter domains of language use that are transactional as well as interactional. Thus, the issue of comprehensibility in such cross-cultural interactions is more critical now than at any other time in history. Even if we eschew the concepts of “native-speaker,” “learner,” and “interlanguage,” we are still left with the nagging question of whose burden it is to make a message comprehensible in any linguistic interaction (see Boxer, 2002 for a more complete discussion of this issue). Having said this, it is important to take into account norms and rules of any community of practice in order to be able to guide and train novice language users into increased expertise.

Once we have knowledge of what members of discourse communities successfully do in spontaneous spoken discourse, we can then apply these findings to situations in which novice language users are acquiring and employing an L2 in any domain and in variously configured communities and interactions. Such varied contexts include: bilingual language practices, such as code alternation and switching; sensitivity to the constraints of the sociolinguistic variables (e.g., gender, social distance, and social status) in the L2; sensitivity to domains of usage (e.g., workplace, education, and social interaction); and understanding how to carry out transactional and interactional discourse (cf. Brown and Yule, 1983), to take some examples.

Highly contextualized, *emic* approaches to applied linguistics research are increasingly critical in current analyses of spoken discourse, now not necessarily only within native speech communities, but in multilingual contexts of interaction as well. Critical discourse analysis is and will continue to be an important thrust in such analyses, since issues of power and dominance necessarily come into play (see also Rogers, *Critical Discourse Analysis in Education*, Volume 3).<sup>1</sup> Yet we are still left with nagging questions of how best to view language acquisition as well as use, and ethnographic, conversational analytic, and interactional sociolinguistic perspectives have only recently begun to lend insights into these questions.

## DISCOURSE, MATHEMATICS AND MATHEMATICS EDUCATION

### INTRODUCTION

Mathematics has long had a curious relationship with language. For some, mathematics *is* a language; for others mathematics is beyond language, a mode of thinking that escapes the ambiguities of human beings or the languages they use. The *teaching and learning* of mathematics is, however, a process that, perhaps more than any other subject, depends on language. Abstract mathematical ideas are brought into being through classroom talk or writing. It is perhaps for this reason that mathematics teachers and educators have always been interested in the language of mathematics and the role of language in the teaching and learning of mathematics.

In this chapter, I give an overview of some of the key issues, ideas and findings of research in this area. I discuss, in particular, research on mathematical discourse or mathematics classroom discourse, by which I mean research that focuses on language in use in social context in mathematics or mathematics classrooms. Much of the work I refer to draws explicitly on theories of discourse. Some of these theories merge with theories of learning or cognition, however, so the boundaries are not clearly defined. In general, then, I will refer to research that has a central concern with the social, ideological or political nature and use of language as part of the process of doing, teaching and learning mathematics.

### EARLY DEVELOPMENTS

Research on discourse in mathematics and mathematics education dates back little more than 25 years. Austin and Howson's (1979) survey of research on 'Language and mathematical education', for example, contains little that could be said to concern discourse in the sense I have indicated earlier. There was a recognition, however, that mathematics involves a distinctive form of language use. Halliday (1978), for example, defined the *mathematics register* as:

the meanings that belong to the language of mathematics (the mathematical use of natural language, that is: not mathematics itself), and that a language must express if it is being used for mathematical purposes (p. 195).

This definition maintains a separation between language and mathematics, or rather, between linguistic meaning and mathematical meaning. Halliday makes a number of important observations about mathematics registers. First, all languages are equally capable of developing mathematics registers, although there is variation in the extent to which this has happened. Second, different languages, through their semantic structure, stress some meanings more than others. The mathematics registers of different languages, therefore, stress different mathematical meanings. This may mean that students of mathematics in different languages develop differing awareness of a given aspect of mathematics. Third, mathematics is a social activity and is therefore suffused with the values and patterns of natural language. It is not possible to eliminate language from mathematics.

Pimm (1987), in his influential book, in effect explored the nature of the mathematics register in classroom settings in English. He developed several ideas, some of which are mentioned later. Firstly, talk is important in learning mathematics in that it:

focuses attention on argument and conviction by means of explanation, as well as on the task of finding more precise and succinct expressions which may therefore be more readily worked with and verified (Pimm, 1987, p. 48).

Convincing, arguing and explaining are all important aspects of mathematics and mathematics education. The presence of discussion in a mathematics classroom is not, however, a guarantee of enhanced mathematical learning. The quality of the talk is also important: students need to 'learn how to mean like a mathematician' (Pimm, 1987, p. 203). They need, for example, to learn relevant mathematical vocabulary. This vocabulary, however, derives, often through metaphorical extension, from everyday words (e.g. difference, times, base, root), and must often be used in fairly narrow ways. The overlap between the mathematical and the everyday can be a source of confusion for students. Finally, Pimm highlighted the authoritarian nature of mathematics classroom talk. Teachers and mathematicians often use 'we', for example, to refer to an abstract community of mathematicians who provide legitimacy for the mathematical conventions introduced by the teacher (e.g. now we divide by  $x$ ).

While not all research in this area derives directly from Halliday and Pimm, their work is indicative of the kinds of issues that are taken up later. They provide descriptions of the nature of mathematical language as it is used in classrooms that make possible subsequent more discursively oriented analyses. Furthermore, Pimm, in particular, shows how mathematics, contrary to popular opinion, needs to be seen as a discursive subject (1987). A broader social perspective on language use in mathematics and mathematics education is therefore more illuminating

than a narrower formalist approach. Students need to learn to use the mathematics register, both to express their ideas and to discuss and justify them. Teachers need to find ways to support students to develop their use of the mathematics register in line with their developing mathematical thinking.

#### MAJOR AREAS OF RESEARCH

Research on the role of discourse in mathematics and mathematics education can be positioned in relation to its concern with the relationship between talk and learning. Some have primarily emphasised the social nature of mathematics classrooms (e.g. Bauersfeld, 1980). Such research has drawn on sociological perspectives on interaction, including interactional sociolinguistics and symbolic interactionism, to explore the social organisation of mathematics classroom discourse, highlighting, for example, the conventions and norms that arise. A related body of work has drawn on neo-Vygotskian socio-cultural theory to argue that, in mathematics, talk is 'almost tantamount to thinking' (Sfard, 2001, p. 13; also Lerman, 2001). Such studies have, for example, attempted to trace the processes of socialisation through which students learn to use mathematical discourse and to do mathematics. Others have been more interested in the specific nature of interaction in mathematics classrooms. This work includes studies that draw on social-semiotic perspectives to explore, for example, the nature and role of mathematical texts and of inter-textuality in mathematics education. Finally, some researchers have turned to post-structuralism to examine the processes through which mathematics, teachers and students are positioned or constructed by mathematical discourses (e.g. Brown, 2001). These different approaches are inter-related and often compatible (for an alternative characterisation, see Sierpinska, 1998). The differences between them are frequently a question of particular research interests and emphases. In the rest of this section, I discuss some of this work, with the aim of giving some sense of both its nature and range.

##### *Sociological and Socio-Cultural Perspectives*

In Germany, a rich seam of work has emerged that, following Bauersfeld's (1980) lead, draws on sociological perspectives (see Steinbring, 1998, for an overview). This work has uncovered some of the micro-discursive processes through which mathematical meaning is negotiated and understanding develops. The *conventions of mathematics* and of mathematics classroom talk emerge as a factor in students' meaning-making.

Learners of mathematics must learn how to interpret phenomena through these different conventions. It may not be clear to teachers or students whether students are struggling to understand a mathematical concept, or are struggling to see which convention is relevant (Voigt, 1998).

The nature and role of such conventions was further explored through a project involving German and US researchers (Cobb and Bauersfeld, 1995). The collaboration was based on data from a project in which the mathematics teachers sought to bring about a culture of inquiry in their classrooms—that is, a culture in which students were encouraged to seek explanations for the ideas they encountered. This work leads to a distinction between social norms and *socio-mathematical norms* (Yackel and Cobb, 1996). Social norms include general expectations or assumptions about classroom interaction, such as the norm of putting a hand up to seek permission to speak, or the expectation that students justify (or not) their solutions to mathematical problems. Socio-mathematical norms are social norms specific to mathematical activity, such as what is seen as an elegant solution or a satisfactory explanation.

The German–US collaboration also developed a detailed examination of students' *mathematical argumentation*, that is, the ways in which students put together justifications of their mathematical reasoning. Krummheuer (1995), for example, shows how some aspects of mathematics classroom argumentation are frame-independent while others are not. Stated another way, some aspects of reasoning depend on how the situation is perceived. Students may use 'everyday' reasoning to solve a problem about spending money, for example. Their teacher, using a more formal frame for the problem, could see this reasoning as 'incorrect'. On the other hand, the basic information given in the problem, for example, can be implicitly accepted from both perspectives. What frames come into play, however, depends on the local socio-mathematical norms. The teacher plays a central role in establishing and developing these norms (see, for example, contributions to Cobb and Bauersfeld, 1995). It may be in response to the authoritarian nature of mathematical discourse that students can be rather circumspect in their argumentation. In one study in the UK, for example, students were observed to use a variety of pragmatic devices to reduce the certainty of their ideas, including hedges (e.g. 'maybe'), indirectness and modality (Rowland, 2000).

Ultimately, students need to be able to use conventional mathematical discourse practices if they are to be successful. These practices include explaining and justifying as mentioned earlier, as well as defining, questioning or checking. Students can be seen to acquire and refine their use of such practices through a process of *socialisation into school*

*mathematics*. That is, through participating in mathematics and mathematical discourse, students come to speak more mathematically (Lerman, 2001; O'Connor, 1998; Sfard, 2001). Not every mathematics classroom is the same, of course, and differences in the discourses at play can lead to quite different outcomes in terms of students' learning. In classrooms where there is a discourse of exploration and problem-solving, students are likely to be more successful when tackling novel tasks than students who have been socialised into more procedural mathematical discourses (e.g. van Oers, 2001). The teacher plays a particularly important role in this socialisation process, through their influence in shaping the nature of classroom discourse (e.g. Cobb and Bauersfeld, 1995; van Oers, 2001), although it should be recognised that teachers are not the only influence. Through their interaction with each other, for example, students' ways of talking about mathematical problems, and, therefore, their ways of thinking about them, can be seen to evolve over time (Zack and Graves, 2001). Students' socialisation is, moreover, in relation to emerging norms as well as wider mathematical conventions. From this perspective, there is a reflexive relationship between the mathematics learning of individual students and the communally shared practices (including discursive practices) of a mathematics classroom (Yackel and Cobb, 1996; see also Hardman, *The Guided co-construction of Knowledge*, Volume 3; Rymes, *Language Socialization and the Linguistic Anthropology of Education*, Volume 8).

### *Social-Semiotic Perspectives*

Mathematical discourse includes the production and use of *mathematical texts*, whether in the form of published textbooks, professional mathematics research papers or students' written work. Given the highly conventional nature of mathematics, particularly written mathematics, it is perhaps surprising that there appears to be considerable variation in the mathematical discourse of published research articles (Burton and Morgan, 2000). For newer mathematicians, learning how to write such an article is rather a mysterious process, since many of the conventions are implicit (e.g. avoiding the use of 'I'), and many are flouted by more experienced mathematicians. This situation turns out to be similar to that faced by school mathematics students. The problem for students is that written mathematics can be read in many different ways. Mathematics has, for example, a high degree of *intertextuality*: it involves making links between different kinds of text, such as between tables, graphs and explanations, or between a word problem and a solution. Chapman (1995) argues that these connections are an important part of mathematical meaning; seeing how a table of data

and a graph are related is the essence of mathematics. Morgan (1998), in an investigation of how secondary school teachers assessed their students' mathematical writing in extended project reports, uncovered a range of implicit assumptions and expectations, including a sense of what an 'ideal' text should look like (e.g. contains tables, graphs and a narrative explaining the development of the project). Students' mathematical ability was constructed by teachers partly based on the details within each of these ideal elements. Chapman (2003) also analysed what makes a text more or less appropriate in mathematics. She identifies two dimensions: low–high modality and metaphor–metonymy. She argues that more mathematical texts tend to have high modality (they are more 'certain') and are more metonymical (they use symbols or labels to stand for concepts or processes). As students make progress in mathematics, they shift between high and low modality and between metaphor and metonymy, with the overall trend towards more mathematically appropriate texts. Many students, however, are likely to be unaware that this is happening. Both Morgan and Chapman argue that developing students' critical language awareness would give them greater understanding and autonomy in their use of mathematical discourse (see also Jewitt, *Multimodal Discourses across the Curriculum*, Volume 3; Valencia Giraldo, *Talk, Texts and Meaning-making in classroom contexts*, Volume 3).

### *Post-Structuralist Perspectives*

Mathematics is widely seen as being the objective truth, a somehow pure form of knowledge. This characterisation is very difficult to dislodge: surely  $2 + 2 = 4$  cannot be subjective or argued about, it just *is*. The first serious challenge to this ideology of objectivity came from Walkerdine's (1988) study of the mathematical discursive practices of young children, both at school and at home with their families. She noticed how the same words are used in different ways and for different purposes in the home and in the mathematics lesson. In mathematics, for example, 'more' contrasts with 'less' in comparisons of quantity. In the home, 'more' contrasts with 'no more' in discourses of food consumption. Walkerdine argues that truth is *produced* through networks of signification within such different discourses. For example,  $2 + 2 = 4$  stands more as an iconic exemplar of 'mathematical truth', rather than a particular instance of mathematics. Rather than being truths derived from the abstraction of experience, a stripping away of context, statements like  $2 + 2 = 4$  rely on a *suppression* of significations associated with other discourses (e.g. two hands, two legs, four limbs). Brown (2001) expands these ideas from an interpretivist, hermeneutic perspective, in which to seek objectivity in mathematics is missing the

point. Rather, each student or teacher inhabits their own evolving mathematical world, based on their interpretation of social norms, classroom situation, mathematical task and so on. Since this idea applies to all of us, the question of objectivity does not arise. Both mathematics, and our own identities as learners or teachers of mathematics, are constructed through the discourses we inhabit (see also Baxter, *Post-structuralist Analysis of Classroom Discourse*, Volume 3).

#### RECENT DEVELOPMENTS

There has been an increasing level of interest in the role of *multilingualism* (including bilingualism) in the teaching and learning of mathematics. While there has been research going back to the 1970s on this topic (see, for example, Austin and Howson, 1979), it is only more recently that discursive perspectives have been brought to bear (e.g. Adler, 2001; Barwell, 2005; Moschkovich, 2002; Setati, 2005). For Moschkovich (2002), working in the USA, characterising classroom mathematics in terms of participation in a range of discourses is a necessary part of overcoming deficit models of bilingual learners. Rather than seeing such students as having problems, such as not knowing English or needing to fill in gaps in their mathematical vocabulary, a discursive perspective turns the focus to the different discursive practices that students use. Such practices can include students' home language(s), gestures, code-switching, everyday experiences and mathematical artefacts (see also Lin, *Code-switching in the Classroom: Research Paradigms and Approaches*, Volume 10).

Setati's (2005) research in multilingual South African classrooms has highlighted how some of these different discursive resources can interact. In classrooms in her study in which English was the designated language of learning and teaching, Setati found that students and teachers would also use Setswana. Her analysis shows how use of Setswana coincided with conceptual discourse, while use of English coincided with procedural discourse. That is, in English, students and teachers rehearsed the steps involved in solving a problem, but discussed why a particular method was appropriate in Setswana. Setati goes on to link these discursive patterns to underlying cultural models, in which, for example, English is seen as the language of educational advancement and of mathematics. Thus, the use of Setswana, and of code-switching more generally, can be seen to be an important discursive resource in learning mathematics. The way Setswana is used, however, as a route into doing mathematics in English tends to reinforce the dominance of English; there is a link between classroom

language use and broader language ideologies (see Freeman field, *Identity, Community and Power in Bilingual Education*, Volume 5; Lin, *Code-switching in the Classroom: Research Paradigms and Approaches*, Volume 10; Probyn, *Policy, Practice and Power: Language Ecologies of South African Classrooms*, Volume 9).

In many mathematics classrooms in countries like the UK, however, code-switching is not available to multilingual students, since classroom business may be entirely conducted in English. In my own research (e.g. Barwell, 2005), I have explored how learners of English as an additional language (EAL) make sense of mathematics in such classrooms. My analysis of the discursive practices of such students highlights how, for example, they draw on narrative accounts of personal experience and mathematics classroom genres to make sense of mathematical tasks. I have also shown how these practices are reflexively related to language learning practices, such as negotiating the spelling of a word or the choice of verb tense.

A second important area of recent research is the comprehensive analysis by O'Halloran (2005) of the functional grammar of mathematical discourse. She divides mathematical discourse into three areas: written text, symbols and diagrams. In analysing each area, she has had to extend theoretical ideas in functional grammar, particularly in order to deal with diagrams. She then develops an account of the inter-semiotic processes through which the three areas are related in the production of mathematical meaning. She shows, for example, how there are fundamental differences in how meaning is constructed using symbols and using natural language, the former being based on relations, the latter on categories. These differences help to show why mathematical symbolism is such a powerful tool in mathematical thinking, and why talking about mathematics can sometimes seem rather difficult. O'Halloran's work is notable in that, as well as shedding light on the nature of mathematical discourse, her analysis has led to significant developments in systemic functional linguistics.

#### PROBLEMS AND DIFFICULTIES

Sierpiska (2005) suggests that a focus on discourse can result in a loss of focus on mathematics. By examining the nature and use of mathematical discourse in mathematics, we are actually looking at language, not at mathematics. This argument depends on a more fundamental, epistemological debate about the nature of mathematics itself and its relation with discourse. Can mathematics be entirely described in discursive terms? Teaching, learning and doing mathematics are clearly processes that rely on discursive interaction between people, whether through talk or text. This is not to say, however, that they *only* depend on language.

As Radford (2003) argues, discourse is part of a wider set of social practices, and derives its meaning in part from these practices. In essence, Radford is arguing that there are limits on what can be said about mathematical thinking from a discursive perspective. It may be argued that our interpretation of these wider social practices is itself mediated by discourse (perhaps following Brown, 2001). Alternatively it may be argued that discourse and social practice are the same thing, thus expanding the sense of discourse as being purely linguistic. These issues need further exploration, since they have implications for, among other things, pedagogy. If mathematics can be described discursively, that might imply that teaching and learning mathematics can also be so described. What would mathematics teaching then look like?

A current area of weakness in much work in this area is a general lack of interaction between mathematics educators and discourse specialists, such as those found in applied linguistics. All of the work referred earlier is based on readings of discursive theories of one kind or another. Frequently, however, mathematics educators discuss these theories among themselves, before applying them, sometimes superficially, in their research. In some cases, mathematics educators develop new methods of discourse analysis, despite similar tools being available elsewhere. Much of this work would be enriched by working alongside applied linguists. While there are some instances of such collaboration (e.g. Barwell, Leung, Morgan and Street, 2005), they seem to be relatively uncommon. Much of the research discussed earlier, while being interested in classroom discourse, is theoretically based on constructivist or socio-cultural learning theories, rather than on discourse theories *per se* (Sierpinska, 1998). Systemic linguistics is perhaps the most widely used theory of discourse in mathematics education. Greater inter-disciplinarity would facilitate deeper theoretical engagement with a wider range of discourse theories.

#### FUTURE DIRECTIONS

In many ways, research into discourse in mathematics and mathematics education is still developing. There have been some significant areas of work and some useful findings of relevance to teachers and educators, but there is still much to do. Recent work has begun to develop the more rigorous application of discourse theory (as opposed to learning theory) in mathematics education (e.g. Barwell, 2005; Moschkovich, 2002; O'Halloran, 2005; Setati, 2005) and to show signs of greater engagement with linguists. As this work develops, it will enrich understanding of mathematical thinking, teaching and learning. Emerging areas of focus are likely to include: the role of identity, including mathematical identity; the role of language politics in mathematics classrooms (see Setati, 2005)

and the relationship between mathematical discourses and social class, race, ethnicity and gender. Such work will also contribute to the development of discourse theory, as O'Halloran's (2005) work illustrates in the case of systemic functional linguistics.

Substantively, research will continue to extend the attention paid to multilingualism in mathematics classrooms (e.g. Barwell, Barton and Setati, 2007). The recent work on multilingualism has begun to develop more refined discursive tools to deal with the challenges of analysing interaction involving speakers of more than one language. These tools are, however, likely to have much wider application in the study of mathematics classroom discourse and classroom discourse in general.

Mathematics, of course, is not the only subject in the curriculum. There is much interesting work on discourse in science education, language and literacy education, bilingual education and in other curriculum areas (see, for example, Kelly, *Learning Science: Discursive Practices*, Volume 3). To some extent, these areas of research proceed along parallel paths, only loosely connected. Research which spanned some of these different areas would have the potential to identify more general patterns, while retaining a degree of subject specificity, and could lead to broader theoretical descriptions of the relationship between discourse and learning in schools.

Finally, there is an increasing recognition in curriculum and policy documents of the importance of language in the teaching and learning of mathematics, including the emergence of the notion of mathematical literacy as an important aspect of participation in contemporary society. Making sense of personal finance, medical information, politics or war all depend on the interpretation of a mass of mathematical information located within a range of discourses. There is room then, for more research into how people participate in such discourses, and for greater consideration of the role of mathematics curricula in preparing future citizens to participate in them.

## LEARNING SCIENCE: DISCURSIVE PRACTICES

### INTRODUCTION

Language and communication are essential elements in science learning. Learning science can be viewed as developing a repertoire of discursive practices with which to engage in the knowledge and practices of various social groups. Such groups may include classroom communities, professional science disciplines, or various citizen organizations. Through participation, learners transform these communities, knowledge, and themselves. The importance of communication to science learning can be understood in at least three ways. First, teaching and learning events are constructed through language and social processes. Studies of science learning have traditionally focused on students' conceptions and how they change over time, assessed through clinical interviews or research instruments. Increasingly, the role of discourse processes in learning events has been recognized as creating, framing, and defining opportunities for cognitive development. Second, student access to science is accomplished through engagement in the social and symbolic worlds comprising the knowledge and practices of specialized communities. Learning science consists of building means for participation and affiliation, through which understanding of ideas occurs through use. Engaging in a set of discursive practices entails, not only language use, but also a related set of values, beliefs, attitudes, and ways of being in the world. Thus, learning includes ways of being with others, the development of learner identities, and their relationships with cognitive development. Third, disciplinary knowledge is constructed, framed, communicated, and assessed through discursive practices. The tensions between linguistic structure of the final form scientific knowledge and the language of the sense making experiences of students represent a key research issue regarding science learning.

### EARLY DEVELOPMENTS

Studies of classroom science discourse processes emerged from an interest in classroom interaction, and specifically, the development of the related fields of ethnography of communication, social semiotics, and sociolinguistics (Hicks, 1995). These fields contrasted with studies of science learning which typically drew from cognitive psychology

and focused on cognitive frameworks and conceptual change, while omitting the study of language use in the learning process. Much of this changed with the publication of Lemke's (1990) *Talking Science: Language, Learning, and Values*. Lemke's social semiotic perspective on classroom discourse demonstrated the limited ways in which science was talked about in secondary science classrooms in the USA. The thematic content of science lessons was largely controlled by the teacher, with little variation from the restricted, final form of science textbooks. The sense making uses of language were absent and students were required to do little other than play the game of school science in which they provided short answers to highly directed and thematically narrow questions. While Lemke identified the importance of providing students with opportunities to combine meanings and use science discourse, the teachers' pedagogical goal of transmitting the propositional content of the products of scientific communities did not invite students into substantive discussions regarding the epistemological bases of scientific knowledge. The consequence of such pedagogy was that science remained for students a subject conceptually opaque and perceived as reserved for a cognitive elite.

Lemke's seminal work opened the field for studies that examined features of classroom discourse in more detail. These studies examined ways that science was communicated through discourse processes and considered alternatives to the highly restricted pedagogy found in the studies by Lemke. Lemke found that teachers relied heavily on the triadic dialog—a pattern of teacher initiation, student response, and teacher evaluation (IRE sequence). A series of important studies examined uses of teacher questions in more detail. For example, Carlsen (1991) drew from sociolinguistics to study the dependence of teacher discourse on subject matter knowledge. He found that in areas of subject matter knowledge strength, teachers were more likely to open up classroom conversations to student participation, vary cognitive complexity of questions posed to students, and diverge from specific, defined curriculum goals.

While initial studies often identified ways that teacher discourse shut down student participation, and thus opportunities to talk science, other studies examined pedagogical alternatives. These alternatives were often created by the researchers to examine how to develop rich environments for science learning. In one example, Roth (1996) examined an open-inquiry learning environment created through the use of engineering design in a combined fourth–fifth grade classroom. Under these conditions, the teacher posed questions without a preconceived, expected student response. The teacher was able to maintain the role as an epistemic authority without the use of the triadic dialog to control the thematic content of the conversations in highly restrictive ways. She was able to accomplish this by beginning with students' own

topics of interest and engaging in questioning sequences to discuss issues such as properties of materials and design principles, thus embedding canonical knowledge identified as salient by the teacher. In another example, teacher questioning took the form of a reflective toss (van Zee and Minstrell, 1997). In this case, the teacher was able to draw students into substantive discussions by examining the students' initial ideas, refining the proposed ideas and developing an alternative. While many initial studies examined the predominant role of teacher discourse, Gallas (1995) shifted the focus to consider how her first and second grade students posed questions. By listening to these students, Gallas identified how science talk can emerge out of the students' interests, concerns, and fledging theories. In her classrooms, the community of inquirers developed ideas by paying close attention to children's thinking and adjusting pedagogy accordingly.

### MAJOR CONTRIBUTIONS

Theories of language and science suggest that the discursive practices of school science often mislead students about the nature of language. Sutton (1996) contrasts the views of language entailed in many school science situations, and derived from a positivistic philosophy of science, with a view of language as an interpretative system. The view of language as an interpretative system focuses on the uses of discourse for sense making, exploring, and persuading, rather than uses of language for transmission of information, presumably about natural phenomena. While science textbooks often use conceptually dense, nominalized, and abstract language characteristic of some final form articulations of scientific knowledge (Halliday and Martin, 1993), these linguistic features mask the diversity of scientific discourse in professional fields. The empirical study of scientific practices identifies a range of purposes for language use, each embedded in a particular activity system (Knorr-Cetina, 1999). The complexity of the sense-making uses of language is lost in the published accounts of the events leading to a new discovery. To recover the sense making, interpretive uses of language, educators have turned to the analysis of the social bases of conceptual change, student discourse in groupwork, uses of argumentation, and heuristics for supporting science writing.

Science education researchers have had a sustained interest in how students' beliefs, values and knowledge change over time through educational processes. This focus on conceptual change has increasingly considered the role of social interaction and discourse in meaning making for students (Duschl and Hamilton, 1998). One strategy used by teachers to bridge the differences from the students' familiar ways of talking to the unfamiliar discourse of science has been the use of analogies and metaphors. Dagher's (1995) studies identified a range

of analogies used in science teaching including, compound, narrative, procedural, peripheral, and simple. While she identified the value of analogies, she cautioned about the efficacy of analogies for cognitive change. Kelly and Green (1998) argued further for a social view of conceptual change by noting the many ways that classroom life is constructed through language. They note through the construction of common ways of perceiving, acting, and evaluating, members of classrooms influence the opportunities to participate in an intellectual ecology where meanings are constructed through discursive practices. These practices include epistemic considerations, such as presenting and weighing evidence, assessing the merits of proposed ideas, and evaluating the strength of an explanation.

Cognitive, social, and sociocultural dimensions of learning science have been examined in student small groupwork. In such contexts, students are often working together to make sense of natural phenomena. These contexts present opportunities to understand their reasoning as students develop scientific understandings. Studies have documented the differing roles students take and the ways that social status influences cognitive outcomes. For example, Herrenkohl and Guerra (1998) created multiple student roles with variations in the roles taken as audience members. By assigning specific audience roles, the nature of the discourse processes was altered so that students with assigned roles as audience members initiated more engagement and challenges among the student group members than those with exclusively intellectual role assignments. This study indicated, as do others, that the discursive processes of knowledge construction are tied to, and part of, the ways that social identities, positions, roles, and relationships are negotiated among members of a group. For example, maintaining interpersonal relationships, differentiating status among peers, and varying consensus building processes have been shown to lead to differential construction and appropriation of knowledge made publicly available (Bianchini, 1999).

Learning science requires that students acquire ways of knowing and understand the reasoning behind knowledge claims. The commitment to developing respect for the reasons supporting knowledge claims has led reform in science education to focus explicitly on epistemological dimensions of learning science (Duschl and Hamilton, 1998). Educators have turned to the study of argumentation to develop pedagogy, assess students' uses of evidence, and enhance teacher education. Argumentation refers to the uses of evidence to support a knowledge claim. Pedagogical uses of argumentation have employed various means to provide students with opportunities to learn to create and critique arguments. For example, Bell and Linn (2000) sought to scaffold student knowledge integration through uses of explanation and evidence with

a computer-based argument-building tool. In this, and other studies (Sandoval, 2003), computer support for argument building served as the cognitive and epistemic goals. The uses of argument have been associated with student cognitive growth and changes in their understanding of the nature of science (Sadler, 2004). Analytic applications of argumentation analysis document the ways that discursive practices of science are appropriated by students through their own speaking and writing regarding evidence for knowledge claims (Erduran, Simon, and Osborne, 2004; Sandoval and Millwood, 2005; Takao and Kelly, 2003). Argumentation has also been used to create experiences for teachers to learn how to incorporate epistemological considerations in their teaching practices. Avraamidou and Zembal-Saul (2005) identified the need to incorporate learning experiences for teachers where priority is given to argument and explanation. That study identified how first-year teachers learned to argue in the disciplinary practices of science through experience in inquiry.

While much of the research on student learning and discursive practices has examined spoken discourse, the research on reading and writing science has contributed to understandings of how written texts support learning scientific concepts. Norris and Phillips (2003) make the case that learning science, including being knowledgeable and able to employ scientific knowledge in everyday contexts, is dependent on competence in the ability to read and write science. Studies of science reading have shown how textual materials, often in support of and supported by spoken discourse, improve students' conceptual understandings, metacognition, and science inquiry activities (Yore, Bisanz, and Hand, 2003). Support for student writing in science has included scaffolds to promote argumentation and heuristics to support reflection on practice experience. Writing supports argumentation by providing a structure for adherence to specific genre requirements, uses of extensive data sets, and reflection on crafted uses of evidence (Sandoval and Millwood, 2005; Takao and Kelly, 2003). One example of support for writing has been the development of the Science Writing Heuristic (SWH), which has two parts, one for the classroom teacher, and the other for the student writers (Wallace, Hand, and Prain, 2004). This heuristic was designed to support reflection and intersubjective reasoning among students during laboratory experiences. The use of the SWH has shown to be effective at enhancing cognition and promoting metacognition.

#### WORK IN PROGRESS

Research on the discursive practices of science learning is developing in many directions. Four of these research directions are: access and

equity to science, the practical epistemologies of everyday school science, activity theory and learning, and multiple literacies.

Access to knowledge and participation in science is deeply dependent on the ways that learning contexts are constructed with language. Discourse of school science has been shown to discriminate against students with alternative ways of talking about their worlds. Research concerned with equity and underrepresentation of minority populations continues to examine the ways that discursive practices serve to build knowledge and affiliation or limit participation and access (Brown, 2004, Lee, 2003). Discourse practices of science classrooms are often based on taken-for-granted assumptions about ways of talking science that contrast with students' ways of talking, being, and interacting in the world (Lee, 2003). Students' ways of talking about nature are tied to previous experiences, cultural assumptions, and worldviews (Lee, 1999). Other studies show how teachers incorporate students' discourse practices into science activities, and through the process of introducing ways of posing questions, finding evidence, and communicating results allow students opportunities to construct more standardized ways of talking science (Warren, Roseberry, and Conant, 1994). Gender equity has been a concern regarding science learning because of differences in interest and affiliation between female and male students. Studies of classroom interaction have identified ways that female students had fewer interactions with teachers were posed less cognitively complex questions, and had fewer opportunities to practice paradigmatic discourse (Barba and Cardinale, 1991; Kurth, Kidd, Gardner, and Smith, 2002).

Variations in discursive practices associated with ethnic background and gender pose problems regarding the fluidity with which students may be able to slot into the taken-for-granted assumptions about talking science in schools (Brown, 2006). Scientific discourse often requires not only employing specialized syntactic moves, but also involves assumptions about questioning, making ideas public, challenging the claims of others, and so forth. Discursive practices are thus related to assumptions about knowledge. The instantiation of epistemic practices in schools relies on interpretations of scientific knowledge and practices by social and symbolic mediators whose views may vary from those of both their students as well as scientists. An important development for science teaching involves the continued understanding of the ways that diverse student sociolinguistic experiences can be viewed as intellectual resources for learning (Warren, Ballenger, Ogonowski, Roseberry, and Hudicourt-Barnes, 2001), rather than a liability for speaking and acting in a prescribed manner.

Historically, much thinking about science learning has included epistemological questions about the nature of evidence, criteria for theory choice, and the structure of disciplinary knowledge. Current research

on science learning suggests that cognition can be productively conceptualized as distributed and that knowledge should be understood as accomplished in situationally specific contexts. Thus, the discursive practices that community members use to propose, justify, evaluate, and legitimize knowledge claims have become central to research programs interested in the epistemologies of everyday activity (Kelly, Chen, and Prothero, 2000). Scholars have advocated the study of students' *practical epistemologies*—i.e., what counts as knowledge claims, justification, and so forth—through examination of the discourse of authentic scientific tasks (Lidar, Lundqvist, and Ostman, 2005). This research line considers the ways that knowledge is interactionally accomplished and recognized among members of a group through participation (Roth, 2005).

Sociohistorical Activity Theory, or sociocultural theories of learning, represents an avenue for much future research in science learning. These approaches consider social epistemology, language, and participation as prominent theoretical constructs for the interpretation of potential learning events (Mortimer and Scott, 2003; Roth 2005). For example, Mortimer and Scott (2003) argue for the importance of the social plane of interpsychological phenomena as a tool for individual thinking. Their focus on classroom discourse is based on a view that meaning is constructed among people through dialogical processes. The teacher's role becomes one of introducing, framing, shaping, and evaluating dialog about natural phenomena so that students are able to engage with scientific ideas and internalize knowledge developed at the interpsychological plane. Similarly, Roth (2005) identifies the ways that as a teacher he was able to enter the microworld of his students to mediate the "collaborative construction of useful ways of seeing and talking" (p. 172). The mediation in such cases is both between the student and the world (in an experiential setting) and the student and standard language of observational categories and theoretical statements. Activity theory may provide ways of understanding student identity, participation, and affiliation commensurate with research on learning, multimedia literacies, and equity.

Science learning increasingly poses multimedia literacy demands on students. New technologies and the ever-increasing means for data and model representation transform what is required to be part of the science learning experience. These demands include interpretation of verbal discourse, paralinguistic features, such as voice quality, diagrams, mathematical symbols, and various images from computers, blackboards, and calculators (Lemke, 2000). Students are expected to be able to use various texts for multiple purposes, such as science textbooks, newspapers, pamphlets from advocacy groups, and Internet resources, among others (Wellington and Osborne, 2001). Uses of such

texts are recontextualized through engagement in discursive practices; that is, texts are publicly available resources that can be evoked, recognized, and interpreted through spoken discourse, instant messages, blogs, threaded discussions, and so forth.

### PROBLEMS AND DIFFICULTIES

Across theoretical traditions, a number of problems remain outstanding for science learning. One issue is the ways that formalism of disciplinary language of science fields, particularly as articulated in its final theoretical form, contrasts with students' everyday ways of talking about their worlds (Lee, 2003; Roth, 2005). Written science depends often on unique linguistic features, such as interlocking definitions, technical taxonomies, lexical density, and semantic discontinuity, which pose challenges to student learning (Halliday and Martin, 1993). Such discourse is the continuing consequence of various communities of knowledge producers whose goals include creating knowledge for specialized professional use. The goals of education often include communicating scientific knowledge and inculcating students with a set of beliefs and values about ways of investigating the natural world. The contrasting goals of these communities lead to differences in the purposes and uses of language. Despite such differences in purpose, the formalized language of final form science plays a predominant role in school science often leading to frustration and lack of interest among students (Brown, 2004). While it is generally acknowledged that the language of science offers a potentially powerful perspective, and that students need opportunities to make sense of their worlds from this perspective, the everyday discourses of students nevertheless need be to part of the processes leading to students' expanding repertoires.

Another problem facing the field of science learning with respect to discursive practices is methodological. The problem space for defining relevant aspects of interaction—discursive practices embodied and embedded in particular spatial and temporal contexts—is ever expanding. Continued work on the study of discursive practices of science learning further complicates what can be considered relevant to the intersubjective meanings constructed and derived from interactions. Variations across ethnicity and with multimedia literacies add orders of complexity to the research processes. Difficulties capturing relevant information are less technical and increasingly theoretical, as knowledge accrues regarding the sense making processes of human interaction. Gestures, proxemics, and prosody are all part of the interpretative field open to interlocutors and analysts alike. While the complexity of interaction poses methodological problems, the emerging modalities may create new opportunities for access to science for a

more diverse population. The inclusion of such populations in studies of science and science learning may expand and improve the discursive practices of scientific research and school learning, thus leading to new ways of understanding science learning.

The study of discursive practices also faces the problem of generating normative knowledge about educational processes. The study of discourse has tended to be highly descriptive, but within professional communities and schools, expectations for knowledge include generating specifics regarding practice. While the language of discourse analysis has been effective for understanding the micromoments of interaction, it has been less applied in the fields of teacher learning and education. Science learning requires that teachers mediate knowledge, language, and interpretations for students. This requires knowledge about how to understand language and social processes. A challenge for discourse-oriented studies of learning is to generate ways of talking with those working closely with students. One example of this is found in Mortimer and Scott (2003) who offer examples of how to consider discourse in the planning of instructional sequences, how to help teachers understand their mediational roles, and how to incorporate thinking about classroom discourse into teacher education.

#### FUTURE DIRECTIONS

The emphasis on discourse processes and discursive practices in science learning has led the field of science education research to shift its focus from individuals learning socially sanctified knowledge to the social interactions that make knowledge public, recognized, appropriated, and critiqued among participants.

Future directions regarding the discursive practices of science learning may include at least six possibilities.

First, the ways that discursive practices mediate and shape students' understanding, participation, and affiliation with disciplinary knowledge needs to be examined in the everyday life of science learning in school and nonschool settings. Studies of the lived experience of science learning document the ways that coming to participate in the genres of science requires reformulations of student identity. This research direction may contribute to understandings of the ways that students choose to affiliate to different social groups and the disproportional interest in science learning across the student population.

Second, research needs to consider the distribution of access to science across student populations and problems of equity for those excluded from science. The discursive practices of scientific fields, and their surrogates in schools, have a great influence on the ways that schooling selects students and students select school experiences.

While there has been productive work in the area of creating opportunities for excluded students, the recognition of the importance of language for learning has only increased the focus on the ways that access is achieved through discourse and social processes.

Third, research needs to examine further the relationship of language use and knowledge construction as situated practice. Emerging views of language in science understand discourse as a means for structuring and constructing ways of participating. Research can identify the ways that discursive practices are interactionally accomplished, and what gets accomplished among members of a group.

Fourth, the ways that teacher education can incorporate knowledge created through discourse studies of student learning represents a relatively unexamined area of study. Research on the discursive practices of science learning can contribute to teacher education through respecification of key constructs of learning to teach.

Fifth, the potential of cultural–historical activity theory to contribute to research and pedagogy in science settings awaits careful consideration. Anthropological and sociolinguistic perspectives focusing on the discourse of learning may be informed by learning theory, and thus contribute to the development of learning theory. Activity theory places language as a central tool for learning.

Sixth, the methodological challenges of the study of the lived experiences of science learning in multiple settings continue to pose challenges for future work. The many ways that discourse is enacted in space and time pose challenges for researchers interested in understanding how the lived experience of coming to know in science is embodied by speakers interacting with one another. Furthermore, changes in the communicative processes of contemporary science, especially the extensive use of electronic media, pose challenges for educators as standardized genres give way to more amorphous, multivocal, and high-speed ways of communicating.

## EVERYDAY FUNDS OF KNOWLEDGE AND SCHOOL DISCOURSES

### INTRODUCTION

Those who live, work, and study in schools know that schools are places where many different kinds of knowledge and ways of knowing, talking, and being (i.e., discourses) come together. The potential for competing knowledge and discourses is especially high in classrooms where students and teachers of different backgrounds and experiences come together. What's more, those who live, work, and study in schools typically recognize that certain kinds of knowledge, knowing, believing, and valuing have more power than other kinds. In particular, academic knowledge and discourses tend to have more credence inside school than do home, community, or peer group ways. The recognition that difference abounds in schools suggests the need for intensive and systematic study of the varied knowledge and discourses that youth bring to and experience in school. The intent of this chapter is to lay a foundation of research that has been generated on the funds of knowledge and of discourse documented in students' lives outside of school and to connect that work to studies of school, or academic knowledges and discourses students are expected to demonstrate in school. I use the phrase "to demonstrate" rather than "to learn" purposely, because it remains an open question as to whether students are explicitly taught academic discourses in school, or whether those who enter school with budding proficiency in those discourses—a kind of *linguistic capital* (Bourdieu and Passeron, 1990)—are groomed for development in those discourses, whereas those without linguistic capital fail to achieve.

### EARLY DEVELOPMENTS IN THEORY AND RESEARCH ON FUNDS OF KNOWLEDGE AND DISCOURSE

Two bodies of research and theory are central to this discussion. First is research that examined students' home cultures to determine whether differential levels of achievement in school might be explained by differences between the cultural practices of home and those demanded by school. Cross-cultural studies, such as the extensive project

conducted by Sylvia Scribner and Michael Cole (1981), also contributed to the focus on cultural difference by demonstrating that how students performed on certain academic tasks was more about whether they had practiced such tasks as a part of their everyday lives than it was about innate ability or about access to particular sociocultural tools. Scribner and Cole, like many other sociocultural theorists, documented that learning was a matter of engaging in certain social and cultural practices over time, with those practices producing not only knowledge, but also ways of knowing.

One articulation of the concept that people learned certain kinds of knowledge and ways of knowing outside of school as well as in school was the concept of “funds of knowledge,” first proposed by Carlos Veléz-Ibañez and Luis Moll (Moll, Veléz-Ibañez, and Greenberg, 1989; Veléz-Ibañez, 1988). The construct of funds of knowledge has been broadly taken up to mean any knowledge that children and youth construct outside of school, but the original work focused on *networks* and *funds* in which knowledge was constructed and learned as important as the knowledge itself. In short, Moll and colleagues characterize the *funds* in which knowledge is constructed, revised, maintained, and shared as *social organizations*, in which the people who are members of the fund matter to the way knowledge is constructed and communicated. It is the social nature of knowledge construction, reconstruction, and maintenance that Moll and colleagues underscore, with implications being the need for educators not only to learn about the various funds of knowledge from which youth draw, but also to make opportunities for those funds to intersect with school funds (e.g., parents and teachers working together in school classrooms to enact science curriculum). Whereas early work on cultural difference emphasized the differences in home and school practices as possible constraints on students’ school achievement, a funds of knowledge perspective emphasizes possible intersections and ways to build relationships to support student learning.

The second body of work revolves around linguistic explanations of difference between home and school by examining whether students’ school achievement was an artifact of communicative differences (e.g., Gumperz, 1977; Heath, 1983; Phillips, 1972). These early studies generated theories regarding communicative competence (Hymes, 1994), which rooted explanations for students’ lack of school success in breakdowns in culturally derived communication practices.

In line with this work, and drawing from anthropological discussions of the construct of *culture* as ways of knowing, believing, and doing (e.g., Goodenough, 1981), James Gee (1996) proposed the concept of *Discourses* to suggest that all linguistic acts—whether oral or written—were situated in cultural models, or ways of knowing, doing,

and believing. Discourses represent ways of talking, reading, and writing that are shaped by cultural models. Gee used the uppercase *D* to signal a distinction between *ways of engaging in language* and a stretch of actual language, or discourse. (In what follows, I use the lowercase discourse to refer both to stretches of language *and* to the ways that language is used in different contexts, groups, times, and relationships, with the rationale that all language is always shaped by and situated in cultural models.)

Bringing together the work on discourses and work on funds of knowledge, it could be argued that discourses are generated not only from particular group practices, but also from particular funds or social networks, making funds or networks not only funds of knowledge but also funds of discourse. In other words, people learn how to say, read, write, believe, and know certain concepts within social funds or networks. The conception of a relationship between culture and discourse refers not only to differences of ethnicity or race (i.e., the differences often evoked by the word *culture*), but also to the many other ways that people group themselves or are grouped by others. That is, discourses can also be drawn from disciplinary, peer, social class, and community relationships, among others. What's more, these relationships often intersect in points of convergence and conflict. If one examines the concept of discourses in school settings, and particularly in the upper-levels of schooling, then it can be argued that content-area classrooms represent communities that privilege both particular cultural practices and particular ways of using language—or *academic* discourses—as a means of learning and of representing what one has learned. Students in such classrooms, however, bring everyday knowledges and discourses to their academic or school learning, producing possible conflicts, as well as points of intersection for teachers and learners.

#### MAJOR CONTRIBUTIONS TO UNDERSTANDING FUNDS OF KNOWLEDGE AND SCHOOL DISCOURSES

Although several different intersecting discourses can be at work in any one classroom, at least three are particularly salient for this discussion: social or everyday discourses, disciplinary or content area discourses, and classroom or instructional/interactional discourses. These discourses represent distinct ways of knowing, doing, talking, reading, and writing, and yet they overlap and inform one another in important ways. For example, the discourses of classroom instruction are informed by what teachers and students believe about the nature of knowledge in the discipline. Similarly, the ways that students take up

classroom or disciplinary discourses are shaped by the social or everyday discourses they bring to the classroom.

### *Social/Everyday Discourses*

Perhaps the most well-known examples of social or everyday discourses come from Heath's (1983) study of the literacy practices of three communities in the North Carolina Piedmont. Heath demonstrated that these three communities each had different "ways with words" outside of school, and that these different ways had important implications for their school and social success. In the community she called "Trackton," for example, young people grew up reading and writing in groups, and learned to consider those who engaged in solitary literacy acts as somewhat unusual. The written word in Trackton was routinely supplemented by or embellished with the spoken word, and community members valued creativity, fluency, and lyricism. By contrast, members of the community labeled "Roadville" emphasized literal understanding of written text, and rewarded close readings and the following of rules in literate interactions. These different discourses for literate practice were a function of an interaction of social class, race, and geography; in short, they were mediated by the complex configuration of each group's cultural practices. More important, they were different from the discourses typically practiced or valued in the schools that served each community.

My own study (Moje et al. 2004a) on the funds of knowledge about science available to young people in their homes and communities provides a sense of the everyday ways of knowing, doing, talking, reading, and writing about science that young people bring to their classroom interactions. Indeed, funds of knowledge research related to science indicates that although youth have ample stores of knowledge about the natural world available in their everyday interactions, the discourses that they use to make sense of and communicate this knowledge are often viewed as different from those valued in science and in science classrooms (see also Lee and Fradd, 1998; Michaels and O'Connor, 1990; Warren, Ballenger, Ogonowski, Rosebery, and Hudicourt-Barnes, 2001). In addition, teachers in these studies were often unaware of, or sometimes dismissed, these funds. As a result, students' funds of knowledge about scientific phenomena are rarely articulated in deep and sustained ways to the scientific funds of knowledge and scientific discourses valued in classroom interactions. This lack of articulation of different knowledges and ways of knowing and talking about that knowledge can hinder deep conceptual learning in science because students and teachers use the same words but mean very different things (see Lemke, 1990).

*Disciplinary Discourses*

Engaging in reading, writing, and talking about disciplinary concepts is often difficult for middle-school students because the language and the ways of thinking are new to them regardless of their particular cultural, ethnic, or social class backgrounds (Hicks, 1995/1996; Hinchman and Zalewski, 1996). As Lemke (1990) has illustrated, the discourse of science represents a specialized system of language that rests heavily upon themes and concepts that are not immediately apparent to the novice science learner. Moreover, becoming a member of a scientific discourse community can be challenging for students as they encounter different *ways* of talking, reading, and writing (discourses) in their science classrooms (cf. Hicks, 1995/1996).

History reading, writing, and analysis, for example, require that students learn to think about the contexts in which texts or ideas were produced. Readers must examine texts for attribution; that is, the reader must ask such questions as, *Who wrote the text? What was the writer's background? What was the writer's perspective or standpoint?* (Wineburg, 2005). School science, by contrast, in general requires students to bring practices of prediction, observation, analysis, summarization, and presentation to their science reading, writing, and oral language practices (Lee and Fradd, 1998). In general, students are expected to apply previously learned basic language, literacy, and technology skills to the comprehension, interpretation, and application of disciplinary knowledge. This movement from everyday to disciplinary discourses is expected even of young children, as documented by Ciechanowski (2005) in a study of third-graders' use of everyday experiences and discourses as resources for learning in science and social studies. Ciechanowski analyzed a classroom teacher's routine call for students to think like scientists and to think in "social studies mode," despite their young age and the lack of explicit instruction in how to engage in those discourses.

As cross-cultural studies have illustrated, however, such skills associated with schooling practices are not necessarily valued by or practiced in the same ways by all cultural groups (e.g. Akatugba and Wallace, 1999; Heath, 1983; Hudicourt-Barnes, 2003; Michaels and O'Connor, 1990; Scribner and Cole, 1981). In *Ways with Words*, Heath examined how everyday reading and writing practices— or discourses—were aligned with and valued among school discourses. Heath's work also analyzed how even school discourses changed as students moved throughout the grades, with upper grades requiring discursive practices of interpretation, analysis, and creation that were not demanded, or even valued, in earlier grades. Children in Heath's study from Roadville, a white, working-class community whose

families practiced more literal readings of texts, found themselves challenged by work in the upper grades of their school experience when interpretation and analysis were required. This example provides a useful illustration of the ways that disciplinary discourses are linked to the instructional and interactional discourses typically valued or practiced in classrooms.

### *Instructional and Interactional Discourses*

Teachers' and students' cultural and language practices shape classroom instructional and interactional discourses to produce a unique hybrid known as school disciplinary discourse (i.e., school history discourse, school science discourse, etc.). These discourses can draw from interactional practices ranging from how one acknowledges questions posed by an adult authority figure to expected classroom participant structures (e.g., whole-class or small-group arrangements) (Cazden, 2001; Green, 1983). Instructional discourses may also include the language of instruction that revolves around how to use textbooks, where to record class notes, and when and how to answer questions, among others. A number of sociolinguists have illustrated that such practices are among the most invisible and most assumed in school learning (e.g., Gumperz, 1977). As Hymes (1994) argued, if the interactional discourses that students learn in their homes do not match those valued in school classrooms, then students may not be communicatively competent and may struggle to learn both disciplinary concepts and norms for classroom practice.

In addition to issues of differences in cultural practice that lead to the development of different discourses, many students in urban schools live in homes where standard English is not a dominant language. English language learners may have proficiency in English language, but not have proficiency in the *ways* of talking, reading, and writing necessary for classroom success, particularly in the disciplines they encounter as they move into secondary school settings (Cummins, 1984).

In most schools, multiple ethnic, peer, home, and community discourse practices meet multiple content and pedagogical discourse practices, resulting in complex interactions enacted in such classrooms. Thus, teaching and learning, especially in diverse settings, and especially at upper grade levels, where disciplinary discourses become more and more precise and texts become more and more demanding, is especially challenging. Teaching academic discourses, then, becomes more than a matter of engaging students in learning content concepts and more than teaching general reading, writing, speaking, and listening skills. Disciplinary teaching for the benefit of all students requires that teachers and curriculum developers engage students in explicit

discussions of and practice in recognizing the many different and competing discourses at work in their learning lives (cf. New London Group, 1996). Furthermore, recognition of the many different discourses at play in any classroom setting underscores the importance of working toward “third space” (Gutiérrez, Baquedano-López, Alvarez, and Chiu, 1999; Moje et al. 2004a). Gutiérrez, Baquedano-López, Alvarez, and Chiu (1999) argue that these many different discourses can be viewed as a *resource* for helping students develop stronger understandings of both academic and everyday concepts and language practices.

#### WORK IN PROGRESS

One step toward building stronger connections among students’ various funds of knowledge and the academic discourses they are expected to learn in schools lies in a dramatic rethinking of what it means to engage in disciplinary, or academic, learning. A number of theorists have argued that the content areas, or disciplines, can be viewed as spaces in which knowledge is produced or constructed, rather than as repositories of content knowledge or information (Foucault, 1972; Halliday and Martin, 1996; Luke, 2001). Even more important, knowledge production in the content areas needs to be understood as the result of human interaction. As such, knowledge production of the disciplines operates according to particular norms for everyday practice, conventions for communicating and representing knowledge and ideas, and ways of interacting, defending ideas, and challenging the deeply held ideas of others in the discipline. Disciplines, then, are no different as discourse communities than are students’ everyday home discourse communities or peer group discourse communities. They are not immutable, they are not unchangeable. And they are not simply bodies of knowledge to be handed down from expert to novice.

For example, in science, a norm of practice is that researchable problems be carefully defined and systematically and repeatedly studied before claims can be made about phenomena. Particular forms of evidence—typically empirical or observable forms that derive from experimental study—are required to provide warrant for claims. In history, by contrast, the norms of practice differ in important ways. Historians, like natural scientists, set aside researchable problems to be studied systematically, but the means of obtaining evidence and the forms that provide warrant for claims differ. The context in which a claim is situated matters tremendously to an historian (Bain, 2000). Moreover, how claims are made public differs across content areas. The types of texts produced are different and the role that various texts play in providing warrant for claims also differs. Part of learning in the content area, then, is coming to understand the norms of practice for

producing and communicating knowledge in the disciplines (Bain, 2000; Lemke, 1990; Wilson and Wineburg, 1988; Wineburg, 2003). Part of that learning also involves examining how content-area norms for practice are similar to and different from everyday norms for practice. Such learning requires understanding deeply held assumptions or themes of the discipline, as well as the ways of knowing, doing, and communicating.

The task of education, relative to these goals of learning the academic or school discourses, then, becomes one of teaching students what the privileged discourses are, when and why such discourses are useful, and how these discourses and practices came to be valued. For example, in middle-school science classrooms that several colleagues and I are currently studying, teachers emphasize the scientific practices of data representation, analysis, and interpretation, as they teach students how to write clear scientific explanations of phenomena (Moje et al. 2004b). Even as they engage in inquiry around the phenomena, these teachers help students learn the literate practices required to make scientific investigation meaningful. Together with students, for example, they have constructed criteria for producing scientific explanations, criteria that include (i) making a claim; (ii) providing multiple pieces of evidence, drawn from experimentation or the past research of others; (iii) reasoning through the evidence back to the claim; and (iv) writing the explanation in precise and accurate language that “Anyone interested in science should be able to understand.”

What is equally important to content learning, however, is providing opportunities for young people to examine how the norms of knowing, doing, and communicating are constructed. Each of these norms is not only an important aspect of “doing” the discipline, but each norm is also socially constructed. That is, the norms are constructed, practiced, and enforced by people; they are not a set of immutable rules that can be questioned or changed. Indeed, members of the different disciplines and profession often reconstruct rules, especially in their day-to-day practices. To learn deeply in a content area, young people need to have access to the way that conventions of disciplinary knowledge production and communication can be routinely or more explicitly challenged and reshaped; such knowledge gives young people the power to read critically across various texts and various disciplines. Such knowledge also gives them the power to draw from other funds of knowledge and discourse to raise challenges to what they learn in the disciplines. The more they interrogate their practices across all the funds, networks, or discourse communities they encounter in and out of school, the more they become critical readers and thinkers.

Carol Lee is actively pursuing such pedagogical and curricular developments in her research program (Lee, 2001). Lee’s construct of

*cultural modeling* situates subject areas as cultures and seeks to tease out the demands of discourse in subject areas such as English. She then looks for spaces to link students' everyday discourses and practices specifically for the purpose of enhancing academic discourse and literate development. Similarly, Ernest Morrell and colleagues (Morrell and Duncan-Andrade, 2003) have demonstrated methods for enhancing what might be thought of as traditional print literacy and discursive skills, while building critical literacy skills among adolescent learners. Gutiérrez and colleagues (Gutiérrez, 2005) continue their work in developing third spaces that provide bridges for young people from the counter-scripts of their everyday lives and funds of knowledge to the official scripts of their classrooms. Many other scholars are engaging in similar work with younger students in classrooms across the United States (Fradd, Lee, Sutman, and Saxton, 2001; Moll, 2006; Warren, Ballenger, Ogonowski, Rosebery, and Hudicourt-Barnes, 2001). Although each of these projects varies in important ways in theoretical and methodological orientations, the goals of the work are similar: To provide opportunities for children and youth to bridge, navigate, and/or reconstruct both everyday and academic discourses in ways that allow them to learn disciplinary concepts and literacy skills and practices, to achieve in school settings, and to make contributions to and changes in society.

#### PROBLEMS AND POSSIBILITIES

Although a number of the researchers named above have demonstrated that *bridging* everyday and academic knowledge and discourse do support young *children's* literacy and content learning (e.g., Gutiérrez, Baquedano-López, Alvarez, and Chiu, 1999; Heath, 1983; Hudicourt-Barnes, 2003; Lee and Fradd, 1999; Moll, Veléz-Ibañez, and Greenberg 1989; Warren, Ballenger, Ogonowski, Rosebery, and Hudicourt-Barnes, 2001), we need studies of bridging, navigating, and change-oriented third spaces constructed in *upper-level* (grades 7–12) content area classrooms to document what and how older youth learn in such classrooms. In addition, there are few studies at this point that document the *learning gains* that result from the construction of *navigational* (Elmesky, 2001; Ingalls, 2005; Lee, 2006) and *change-oriented* (Barton, 2001; Seiler, 2001; Morrell and Collatos, 2003) third spaces in advanced content literacy learning classrooms. Most of the current studies provide in-depth examinations of the processes at work in classrooms that draw from and extend students' funds of knowledge, but we need more studies in the tradition of Lee's (1993) mixed methods design that demonstrated both the learning gains in academic literacy terms and the teaching practices required to make such a third space possible.

A second issue that presents both a potential problem and possibility is related to questions of identity. A number of theorists have argued that shifts in learning both require and produce shifts in identity (Gee, 2000/2001; Lave, 1996). What then, are the implications of producing hybrid learning spaces by drawing from students' identities, cultures, and funds of knowledge and discourse? How might such work complicate the identity development of young people? How might young people resist these mergings, wishing instead to keep the multiple spaces of their lives separate? As youth engage with texts based in many different funds, they may enact hybrid identities because their identities are framed by a complex intersection of many different funds of knowledge and discourse. If youth enact hybrid, globalized identities that cross multiple discourse and national communities in their everyday lives, then the challenge of subject matter learning becomes even more complex than learning to negotiate home and school discourse communities. The challenge involves negotiating communities and identities that are always changing and shifting. And for youth in secondary school settings, the challenge is incredibly daunting, as youth are expected to negotiate five to six different discourse communities—and thus, at least as many identities—within school each day while moving from one subject matter class to another. In short, subject-matter learning has never been, and never will be, about merely learning the concepts of a target discourse community. Even our attempts to complicate subject-matter learning by acknowledging funds of knowledge do not go far enough because those funds, in the postmodern world, are increasingly complex and multiple.

#### FUTURE DIRECTIONS

Perhaps most important to future work is the realization that learning in a discipline requires people to enact particular identities, even if they do not fully take that identity on as an aspect of "self." Thus, young people in secondary school are expected to participate in the discourses of the disciplines; to incorporate those discourses with other discourses and identities they experience throughout the secondary school day; and to forge, or at least try out, new identities as they take up those discourses. What this suggests is that teachers of content areas need to provide young people with opportunities to examine the discourses they are learning in the discipline in relation to the discourses (and identity enactments) of other funds of knowledge and discourse in everyday life.

In sum, we need to reconceptualize content-area learning as a matter of learning new ways of knowing and practicing, not merely as spaces in which students are exposed to new ideas or bits of information. Part

of teaching in the content areas then becomes a matter of teaching students how the disciplines are different from one another, how acts of inquiry produce knowledge and representational forms (such as texts written in particular ways), as well as how those disciplinary differences are socially constructed.

Bain (2000) calls this the generation of an epistemically grounded curriculum and pedagogy, or one in which students come to understand that knowing how knowledge is produced is as important as having access to the knowledge itself. The focus moves away from accessing or generating texts only to obtain or produce information, toward an understanding of how texts represent ways of knowing, doing, and believing in different discourse communities. From this perspective, content teachers should also teach students to be *metadiscursive*, which means that they should not only be able to engage in many different discourse communities, but should also know how and why they are engaging, and what those engagements mean for them and others in terms of social positioning and power relations (New London Group, 1996).

Even with such a reconceptualization of the disciplines and academic discourses, the everyday realities that have historically limited the integration of students' everyday funds of knowledge and discourse with academic knowledge and discourses should not be ignored. What opportunities do teacher education and inservice professional development provide teachers to learn about the discursive basis of the content areas? How do teacher educators support teachers in supporting young people as they construct identities across different disciplines? How are teachers to work with a notion of content-area literacy as *meta-discursive practice* as they encounter probable resistance from students who have become quite comfortable with the idea that learning in the content areas is a matter of memorizing and reproducing information?

At a broader level, what school structures need to change to support teachers in supporting students as they navigate, critique, and weave together the discourses of the disciplines? The issues of the content area sub-cultures, limited opportunities for teachers to work across disciplines, the implacable structure and timing of the typical secondary school day all work to challenge a metadiscursive approach to disciplinary teaching. Indeed, a metadiscursive pedagogy calls for teachers to be able to work across disciplines, to develop courses of study that examine ideas from many different disciplinary perspectives as a way of questioning the norms of their primary discipline. Without a change in typical school structures of 50-min classes, relative isolation of teachers in single classrooms, and confinement of classes within the physical school space, a broad, metadiscursive pedagogy and curriculum will be difficult to develop.

Finally, we should not ignore the powerful ways that young people already negotiate multiple discourse communities and literacies in their lives. A number of studies illustrate that youth demonstrate remarkably metadiscursive practices in their lives out of school (Alvermann, 2001; Knobel, 1999; Leander and Lovvorn, 2006; Lewis and Fabos, 2005; Maybin, 2006; Moje, 2000). We have much to learn from young people about how we could develop a metadiscursive approach to content literacy.

Researchers need to continue to examine and make evident the different funds that youth draw from as they engage with the texts of different content areas. We need to continue to clarify how these funds mediate youths' reading and writing of all the different kinds of texts they encounter in school. We also need to experiment with classroom practices that we think bring these many different funds into play alongside the funds currently valued in many classrooms. However, the work and commitment required for the development of an integrated approach to literacy teaching and learning in the secondary content areas is enormous, requiring conceptual changes in our definitions, cultural changes in our practices, and structural changes in the enduring institutions of the secondary school and secondary teacher education. Because these constraints do not exist in some sort of hierarchical form (i.e., changes in structures lead to changes in culture or vice versa), each set of constraints needs to be addressed simultaneously, and these constraints need to be addressed by several different players of the content-area literacy puzzle, including teacher educators; school administrators; teachers; researchers; and local and national policy makers. No one group can wait for one of the other groups to take action toward change. The integration of literacy into the content areas is a complex change process that will require collaboration, communication, and a commitment to major conceptual, structural, and cultural changes.

## MULTIMODAL DISCOURSES ACROSS THE CURRICULUM

### INTRODUCTION

Multimodality approaches representation and communication as something more than language. It attends to the complex repertoire of semiotic resources and organizational means that people make meaning through—image, speech, gesture, writing, 3-dimensional forms, and so on. Strictly speaking, then multimodality refers to a field of application rather than a theory. A variety of disciplines and theoretical approaches can be used to explore different aspects of the multimodal landscape. Psychological theories can be applied to look at how people perceive different modes or to understand the impact of one mode over another on memory for example. Sociological and anthropological theories and interests could be applied to examine how communities use multimodal conventions to mark and maintain identities. The term ‘multimodality’ is, however, strongly linked with social semiotic theory and is widely used to stand for ‘multimodal social semiotics’. This is the use of multimodality in this chapter.

Multimodality is concerned with signs and starts from the position that like speech and writing, all modes consist of sets of semiotic resources—resources that people draw on and configure in specific moments and places to represent events and relations. From this perspective the modal resources a teacher or student chooses to use (or are given to use) are significant for teaching and learning. In this way, a multimodal approach rejects the traditional almost habitual conjunction of language and learning. Using a multimodal approach means looking at language as it is nestled and embedded within a wider social semiotic rather than a decision to ‘side-line’ language. Examining multimodal discourses across the classroom makes more visible the relationship between the use of semiotic resources by teachers and students and the production of curriculum knowledge, student subjectivity, and pedagogy.

### EARLY DEVELOPMENTS: A VISUAL START

Multimodality is to some extent an eclectic approach. Linguistic theories, in particular Halliday’s social semiotic theory of communication (Halliday, 1978) and developments of that theory (Hodge and Kress,

1988) provided the starting point for multimodality. A linguistic model was seen as wholly adequate for some to investigate all modes while others set out to expand and re-evaluate this realm of reference drawing on other approaches (e.g. film theory, musicology, game theory). In addition the influence of cognitive and sociocultural research on multimodality is also present, particularly Arnheim's work on visual communication and perception (1969). Many of the concerns that underpin multimodality also build on anthropological and social research (specifically the work of Barthes (1993); Bateson (1977); Foucault (1991); Goffman (1979); and Malinowski (2006) among others).

By the mid to late 1990s, a few books and papers on multimodality were starting to be published. The primary focus of this work was visual communication and the relationship between image and writing. The work of Gunther Kress and Theo van Leeuwen (1996), the New London Group (1996) and Michael O'Toole (1994) was particularly significant for multimodal research within education. This work challenged the notion that learning is primarily a linguistic accomplishment, sketched key questions for a multimodal agenda, and began to define conceptual tools for thinking about teaching and learning beyond language.

The call to understand pedagogy as multimodal was radical when it was first made. A key design element of a future pedagogy of multi-literacies was heralded as 'designs for other modes of meaning' (New London Group, 1996). In part, this call was a response to the social and cultural reshaping of the communicational landscape (related to globalization, new technologies, and new demands for work). In a sense, the conclusion that reading this 'new' multimedia, multimodal landscape for its linguistic meanings alone is not enough was inevitable. A special issue of *Linguistics and Education* on multimodality was an important publication (and one of the first) to provide tools for educational researchers wanting to undertake multimodal research (Lemke, 1998).

Attempting to understand the relationship between image and text was central to the development of research on multimodality. The redundancy of 'non-linguistic' modes was argued against and the idea that the meaning of modes is incommensurable was key. *Reading Images* (Kress and van Leeuwen, 1996) opened the door for multimodality in the way that it discusses key concepts such as composition, modality and framing. This work offers a framework to describe the semiotic resources of images and analyses how these resources can be configured to design interpersonal meaning, to present the world in specific ways, and to realize coherence. It demonstrates and generates a series of semiotic network maps showing the semiotic resources of image in play and how discourses are articulated visually through the design of these resources.

Work by Kress on literacy and young children's meaning making also helped highlight the potential of multimodality for literacy. His concern with font, style, the spatial design of the page, and the materiality of the written text positioned writing as multimodal. This work began to make connections across multimodality and New Literacy Studies—a combination that offers a distinct theoretical accent to multimodality.

#### MAJOR CONTRIBUTIONS: KEY THEMES IN THE STUDY OF MULTIMODAL DISCOURSES

From early 2000, there has been an explosion of interest in multimodality within educational research and this approach has been actively taken up educational researchers across a wide range of learning contexts. Some of the major contributions made by this work are discussed below.

##### *Mode and Semiotic Resources for Meaning*

In order for multimodality to be of use to educational research a clearer sense of how modes are used for meaning making is required. Much is known about the semiotic resources of language in the classroom and curriculum, but considerably less is understood about the semiotic potentials of gesture, sound, image and so on. A number of detailed studies on specific modes helped begin to describe these semiotic resources, material affordances, organizing principles, and cultural references. Alongside Kress and van Leeuwen's work on images (1996) other key works that contribute to an evolving 'inventory' of semiotic modal resources include Van Leeuwen's (1999) work on the materiality of the resources of sound (e.g. pitch, volume, breathing, rhythm, and so on). Martinec (2000) contributes to this with his work on movement and gesture. With a focus on writing as a multi-semiotic resource Kenner (e.g. 2004) shows how young bilingual learners use directionality, spatiality, and graphic marks to realize meaning and express identities in complex ways. The work of Kress, Jewitt, Ogborn, and Tsatsarelis (2001) and Kress et al. (2005) attempts to map how these modes interact and interplay in the classroom.

##### *Shapes of Knowledge, Pedagogy and Subjectivity*

Through detailed multimodal analysis, classroom research shows how teachers orchestrate a range of modes in the classroom. Some key studies include Kress, Jewitt, Ogborn, and Tsatsarelis (2001) in relation to school Science and school English (2005) and Mathematics

(O'Halloran, 2004). This research maps how curriculum concepts are 'filled in' by teachers' pedagogic movement between, in the case of science, abstract diagrams, embodied action, interaction with models, and canonical images to create complex multimodal narratives. At times, the complex multimodal configurations realized by teachers are designed to enable the tension between discourses, and domains of knowledge (e.g. everyday knowledge and the specialized scientific knowledge) to reside in the seams between modes: with one mode supporting one discourse and another mode realizing a quite different one. The classroom itself can also be viewed as a multimodal sign that articulates discourses of time, managerialism, ability, subject knowledge etc. through its spatial arrangements, furniture, visual displays, equipment, and artefacts. This research shows how multimodality can be applied to examine the connection between policies, the use of technologies, pedagogy and what it means to learn.

### *Multimodality and New Technologies*

The ways in which modes are newly configured and made available for teaching and learning via new technologies is also a focus of multimodal research (Kress, 2003). Burn and Parker's (2001) work on media education and digital animation explores how students design meanings across different sites of display and semiotic resources and what this means for learning and literacy. Multimodal research into new technologies and learning also explores the meaning potential of a texts structure: the semiotic facilities of linking, hypertext, and the design of hyper links (Jewitt, 2002; Lemke, 2002; van Leeuwen, 2005). These links and structures create relations and continuity or discontinuity between elements, what Lemke calls 'hyper-modality'. Another term useful to multimodality is 'resemiotization' (Iedema, 2003) which focuses on how new technologies remediate discourses via multimodal representation and communication across media. This is explored in the work of Jewitt (e.g. 2006) that brings together multimodal social semiotics with Vygotskian theories of learning to explore the relationship between representation and technology in relation to the production of curriculum knowledge, literacy, learning and pedagogy.

### *Multimodal Learning and Literacy*

Approaching the classroom as a multimodal environment demands a rethinking of learning and literacy. Multimodal research shows the complex decisions of children that are involved in the design of multimodal texts: what mode to use in order to 'best' represent and

communicate a particular meaning. Considering students in the classroom as *designers* of meaning in this way has important implications for learning such as what semiotic resources are made available in the classroom (and how modes are valued in different contexts) (Unsworth, 2002). Children's multimodal selections, adaptations, and transformations of these semiotic resources to make their own meanings are examined as one kind of evidence of learning (Jewitt and Kress, 2003; Kress, Jewitt, Ogborn, and Tsatsarelis, 2001; Kress et al. 2005). These transformations have been traced and mapped as links in the 'chain of semiosis' (Pahl, 1999; Stein, 2003). This rethinking of learning has implications for how to think about assessment.

### *Developing Theory and Method*

Alongside accounts of multimodal research, the need to develop multimodal research tools remains. Kress and van Leeuwen's book *Multimodal discourses* (2001) contributes to the general theory of multimodality in their exploration of the distinction between mode and medium and the formulation of the relationship between discourse, production, dissemination, and design. Multimodal theory has opened up the question of what constitutes a mode. The idea of mode has also been expanded in van Leeuwen's *Introducing social semiotics* (2005) to look at semiotic resources such as food, dress, everyday objects as well as image, music, gesture and writing.

Ethnographic methods have been combined with multimodality to look at semiotic literacy practices as well as texts. Stein (2003), Pahl and Rosewell, (2006) for example explore how students in South African townships express complex narratives of identities and culture through multimodal texts, highlighting the links between representational means and the production of identities. This work explores how multimodal pedagogy can reconnect linguistically disenfranchised learners—through the use of performance, semiotic artifacts, visual representation etc.

Scollon and Wong-Scollon (2004) combined multimodal semiotics and intercultural communication to explore how the physical and material characteristics of language as situated in the world give meaning to people's actions. Sigrid Norris (2004) takes up this approach to multimodal discourses and introduces several interesting concepts to the multimodal debate, one of which is the idea of *modal density* (intensity and complexity), a conceptual tool for separating out the modes as analytical units. This sets out a way of thinking about the relationships between modes in terms of a scale of low to high intensity and contributes to the theorization of the relationship across and between modes.

## WORK IN PROGRESS: DISTINCTIVE DIRECTIONS

There is substantial work in progress that looks at multimodal meaning making across a wide range of sites in pre-school and early years writing and meaning making, school English and Media education, games studies, Science education, Music, Maths, and technology-mediated learning (e.g. Bearne and Kress, 2001; Carrington and Marsh, 2005; Goodwyn, 2005). Building on this work, researchers are now looking at how the ‘choice’ and use of representational modes and media/technologies shape teaching and learning across the curriculum in different ways—choices that are made by policy makers, teachers, curriculum and software designers, and students at a national level, a local level, and in the classroom. In this way multimodal discourses analysis has begun to shift from primarily descriptive accounts to connect more explicitly with macro social, political and cultural concerns within education.

Ongoing multimodal research focuses on the development of more robust theoretical concepts and methodological tools. The need to develop practices of multimodal transcription and systematic multimodal analytical processes for working with video data is an area that is at a relatively early stage of development (e.g. Flewitt, 2006; Jewitt, 2006; Norris, 2004). The work of conceptualizing modal hierarchies and relations, and problematizing the concept of semiotic resource. Another approach in the early stages of development is an analytical framework for dealing with multimodal data in corpora (Bateman, Delin, and Henschel, 2004).

The need to rethink what it means to learn and to be literate is a thread that runs through much multimodal educational research. This raises numerous research questions in relation to learning including how representations impact on thinking and learning? What kinds of opportunities do different modes present for dialogue? How are modes valued in and out of the school? And what kind of learners do schools want to produce? It also raises questions about what literacy is and could be in a multimodal and multilingual communicational landscape. This, in turn, has led to research that sets out to ask what multimodality has to offer as a pedagogic resource and how it can be shaped as a force for change.

The need to engage with social questions (beyond the role of description) is realized in research that attempts to move from notions of critique to design. As already described, multimodality can be used to build inventories of semiotic resources and to understand how resources are used to articulate discourses across the curriculum. Multimodality can *also* contribute to the development of new ways of using semiotic resources. Focusing (through historical analysis) on how semiotic

resources come to be as they are, multimodality can ask why they are as they are. This is a powerful approach enabling people to see *how* it is a 'reality' comes to be represented and offering the potential to *imagine* it differently and to *redesign* it. Highlighting the implications for learning of how semiotic resources are used can help to bring resources into the awareness of educational practitioners, and this brings with it the potential for new ways of using and configuring—*designing*—multimodal pedagogy.

### PROBLEMS AND DIFFICULTIES

Multimodal analysis is an intensive research process both in relation to time and labor. One consequence of this is that research on multimodal discourses is generally small scale and this *can* restrict the potential of multimodality to comment beyond the specific to the general. It is perhaps important to be clear, however, that multimodality can be applied to take a detailed look at 'big' issues and questions through specific instances. Nonetheless, the scale of multimodal research can make it difficult to use findings for policy and educational strategy. The technical and theoretical developments mentioned in an earlier section, for example, the development of multimodal corpora may help to overcome this problem. The potential to combine multimodal analysis with quantitative analysis in innovative ways in the future is an alternative strategy.

A criticism sometimes made of multimodality is that it can seem rather impressionistic in its analysis. How do you know that this gesture means this or that that image means that? In part, this is an issue of the linguistic heritage of multimodality, that is, how do you get from linguistics to all modes. In part, it is the view of semiotic resources as contextual, fluid and flexible—which makes the task of building 'stable analytical inventories' of multimodal semiotic resources complex. It is perhaps useful to note that this problem exists for speech and writing. The principles for establishing the security of a meaning or a category are the same for multimodality as for linguistics (or Philosophy or Fine Art). It is resolved by linking the meanings people make (whatever the mode) to context and social function. Increasingly, multimodal research looks across a range of data (combining textual/video analysis with interviews for example) and towards participant involvement to explore analytical meanings as one response to this potential problem.

Linked with the problem above is the criticism that multimodality is a kind of linguistic imperialism that imports and imposes linguistic terms on everything. But these critics overlook the fact that much of the work on multimodality has its origins in a particular strand of linguistics: namely, the social semiotic theory of communication first

proposed by Halliday (1978). This strand of research on language and communication foregrounds meaning and the ways in which language contributes to the construction of social life. The social component of this approach to language sets it apart from narrower concerns with syntactic structures, language and mind and language universals that have long dominated the discipline. From a multimodal perspective this view of communication can be applied to all modes, to gesture and image no less and no more than to speech and writing.

Description is theoretically grounded and contributes to theory building. There is a need to actually ask questions of and through detailed description. For instance, to ask what kind of discourses are being articulated in a classroom and why, what is the social function of the representations being described. For example, to ask how the multimodal design of the English classroom shapes what school English is, what texts are included in English and how does this shape what it might mean to be a student in that classroom and so on. This analytical focus is important to show how discourses are articulated across the curriculum so that they can be made explicit, shared or challenged and re-designed. Multimodal research can be problematic if it offers an endless detailed description that fails to make clear the broad questions it seeks to answer.

The question of where the boundaries of its effective work are located is key for multimodality (as with any approach). In social semiotics, of which multimodality is a part, it is recognized that there are such limits, beyond which other approaches work much more effectively. In part, this is a question of scale. Semiotic analysis works best with small elements or with larger-level elements treated as small, namely as 'signs'. When the aims of enquiry shift to larger-level relations in process, and historically over time, it may be necessary to shift theoretical paradigms, and combine multimodality with other theoretical approaches.

#### NEW DIRECTIONS

The combination of multimodality with theories that attend to the social at a macro-level is an area for development. Multimodal theories of communication and representation emerged at a 'pivotal moment' when boundaries were fraying across the communicational landscape: modes were being recast, revalued and redesigned by the social demands on communication (the remaking of boundaries between nation states, languages, work and leisure and so on as well as the use of new technologies). Such moments and shifts have happened in the past and will happen in the future. The use and conventions of semiotic resources are established over time, and are fluid, situated,

as well as being shaped by community and culture. The work of describing modes and semiotic resources as they are used in education is therefore an ongoing and important one. To realize the full potential of multimodality research also needs to make links between *what* is happening in the classroom and *why* it is happening—to ask how the micro social interactions of the classroom inflect, reflect and connect with the concerns of macro educational and broader social policies.

The ‘change potential’ of multimodal semiotics is another aspect that may be developed more in the future. The potential for multimodal research to impact on teacher training, the design of learning, and curriculum and software design is immense. By challenging the exclusivity of the link between language and learning, multimodality opens up the need to better understand the relationship between multimodal pedagogy and learning and this raises significant questions: questions about the impact of modes of representation on learning: what does it mean for learning to have all these modes operating in the classroom? What mode is best for what? How does the move between modes impact on shapes of knowledge? What does all this mean for cognitive load and learning? What forms of communication are students being expected (often implicitly) to understand? Questions concerning what educationalists want learning to be and how a knowledge of multimodal semiotics could enable it to be redesigned: How can students best be taught the skills to make and interpret multimodal texts? A future direction for multimodality is to theorize the relationship between semiosis and learning. This is needed to find pedagogically productive ways to connect on the one hand the ways that students select, adapt, and transform information in the classroom (the resources that they bring into the classroom to learning) and on the other the expectations and demands of curriculum subjects.

The connection between student practices, curriculum, and pedagogy foregrounds the notion of assessment. There is a glaring disjuncture between multimodal pedagogy, multimodal learning, and a primarily written assessment process. This is a growing focus within multimodal research across the curriculum and a key direction for research in the future is to tackle the issue of assessment, to ask how best to assess students’ learning in a multimodal classroom.

# **Section 1**

## **Theoretical Underpinnings**

## APPLIED LINGUISTIC THEORY AND SECOND/FOREIGN LANGUAGE EDUCATION

### INTRODUCTION

Applied linguistics has been defined as “the theoretical and empirical investigation of real-world problems in which language is a central issue” (Brumfit, 1995, p. 27)—for example, problems of miscommunication in social life, institutional discourses of courtrooms, classrooms, and hospitals, language policies and testing procedures. In addition, it has been, since its inception, the foundational field of research for second language acquisition and learning. Researchers have made recommendations for language teachers based on their findings; in turn, language educators have drawn on applied linguistic research to illuminate and solve problems they encounter in their practice.

### EARLY DEVELOPMENTS

The name “applied linguistics” was given to the field when the first program of that name was founded at the University of Edinburgh in 1957, leading in the 1970s to the *Edinburgh Course in Applied Linguistics* (Allen and Corder, 1973–1977). According to Davies and Elder (2004), it was largely taken for granted in the 1960s and 1970s that applied linguistics was about language teaching and learning. The journal *Language Learning: A Journal of Applied Linguistics*, published from the University of Michigan in 1948, was the first journal in the world to carry the term “applied linguistics” in its title (Davies, 1999, p. 6). In the subsequent 50 years, the field has experienced an explosion across various disciplines, encompassing, beside language teaching, first and second language acquisition, psycho- and neurolinguistics, sociolinguistics, pragmatics, discourse and conversation analysis, text/processing/translation, computational linguistics, forensic linguistics, corpus linguistics, and language policy and planning.

Today, applied linguistics is well represented by its vibrant national and international professional organizations, for example, the International Association for Applied Linguistics (AILA) founded in 1964, the British Association of Applied Linguistics (BAAL) established in 1967, the American Association for Applied Linguistics (AAAL)

founded in 1978—and an increasing number of scholarly journals: *Applied Linguistics*, the *Journal of Applied Linguistics*, the *International Journal of Applied Linguistics*, *Modern Language Journal* among many others. It has become an exciting and capacious field of inquiry that seeks to engage with and reconceptualize various problems in the practice of language acquisition and use. This engagement is somewhat more interdisciplinary than that of other, more specialized fields that also pertain to second/foreign language (SL/FL) education, for example, second language acquisition (SLA) research, educational psychology, teaching methodology, language learning technologies, language testing research, or literacy theory (Kramsch, 2000).

The term “applied linguistic theory” refers to the theoretical insights gained from the empirical studies that are the hallmark of the field, but, given the careful distinction made by applied linguists between applied linguistics and linguistics applied (Davies, 1999, p. 12), we should not expect applied linguistic theory to be the mere application of linguistic theory to solving the problems of linguistic practice. Nor is it a unified theory that all applied linguists agree upon. First, because SL/FL education is more than the internalization of linguistic forms; it is also social, cultural, aesthetic, and political practice. Second, because as an applied field of inquiry, applied linguistics has both shaped and been shaped by the various aspects of the practice of language learning and teaching. Given the multiple facets of SL/FL *learning*, applied linguistic theory seems best suited to account for and explain the increasingly complex interaction of theory and practice in language education. However, as will be argued later, it might need to be supplemented with other theories when engaging with SL/FL language *education* in a transnational, global world of plurilingual and pluricultural encounters with varying historicities and subjectivities.

#### DEFINITIONS

##### *Second versus Foreign versus Heritage Languages*

A *second language (SL)* is a language other than the mother tongue, learned in an environment in which that language is the dominant language (e.g., English in the USA, French in France, for immigrants or minority learners), or where the language is an international language of commerce and industry (e.g., English in Korea or Hungary, German in Poland or Russia). The learning of second languages takes place in a variety of formal and informal sites: in schools, in adult classes, and at the workplace. Teaching methodologies and textbooks are published in the target country (e.g., by TESOL in the USA, the Goethe Institute in Germany) and promoted by the target country’s private, public, or

state institutions around the world. Emphasis is on the development of communicative competence and the ability to become a functioning member of a cultural, occupational, or professional community. (see Oxford, *Conditions for Second Language (L2) Learning*, Volume 4)

A *foreign language* (FL) is a language that is learned in an instructional environment or during a temporary sojourn abroad as part of general education or for professional purposes. Instruction is delivered in classrooms and in language media centers with the help of instructional technology. Some scholars make the distinction between (second) language *learning* and (foreign) language *study* or *education*. I shall return to this distinction later. Foreign language teaching guidelines and textbooks are published in the source country (e.g., Spanish is taught in the USA with American textbooks and according to the US foreign language proficiency guidelines; German is taught in France according to the Instructions Ministérielles of the Ministry of Education but also according to the Common European Framework of Reference for Language Learning, Teaching, and Evaluation). These guidelines reflect the goals and values of the source country's educational system.

A *heritage language* (HL) is a language that is learned by members of an ethnic group desirous to reconnect with the culture of their ancestors, for example, Mandarin Chinese or Cantonese, Armenian, Korean, or Spanish for 2nd or 3rd generation American youngsters. At many universities in the USA, courses are offered especially for HL learners, for example, Chinese or Spanish "for native speakers" (see Kagan and Dillon, *Issues in Heritage Language Learning in the United States*, Volume 4). HL-specific teaching methodologies and textbooks are still under development in many languages. They show a desire to validate the knowledge and experience of those who have spoken the language at home and are emotionally attached to forms of the language that are often nonstandard. They also show a tension between teaching an idealized culture of the past (as for Western Armenian or Yiddish), the present culture of a distant country of origin (as in the case of Korean or Spanish), or the present culture of the immigrant communities now in the USA, for example, the culture of Korean-Americans or Latinos. Ancestral languages are also taught in noninstitutional master-apprentice settings, for instance Native American Indians strive to revitalize the language of their tribe by eliciting speech from the elders and learning directly from native speakers through ethnographic field techniques (see Hinton, *Learning and Teaching Endangered Indigenous Languages*, Volume 4).

### *Language Learning versus Language Education*

Both language learning and language education have to do with the process of learning another language, but language learning sees the

learner as a singular individual seeking personal, economic, or professional opportunities whereas language education sees the learner as a student in an educational setting taking a foreign language as one of his/her school subjects. While language learning responds to the needs of immigrants, tourists and professionals or all ages seeking contact with speakers of languages other than their own, language education is inscribed within the schooling career of adolescents and young adults.

In terms of methodology, language learning and language education reflect the historical conditions under which they developed. Language *learning* acquired its institutional and scientific legitimacy with the rise of a multinational capitalistic economy after WWII and the growing spread of English around the world, with the concomitant emergence of applied linguistics as a scientifically recognized field of research. Applied linguistics made the learning of English as a second language (ESL) at schools and universities a legitimate academic pursuit and gave modern languages a legitimate research base (see Tarnopolsky, *Non-native Speaking Teachers of English as a Foreign Language*, Volume 4; Kagan and Dillon, *Issues in Heritage Language Learning in the United States*, Volume 4; Gunnarsson, *Professional Communication*, Volume 4). However, to this day, language learning is fighting for symbolic recognition: ESL is not seen as being at par with other subjects in the academy, and FL learning does not enjoy the same academic prestige as literature study in foreign language and literature departments. Indeed, at some institutions the first year of college FL instruction is sometimes seen as “remedial,” for example, in the case of Spanish in the western and southwestern parts of the USA.

By contrast, language *education* goes back to the days when Greek and Latin were the only languages worthy of academic study. The rise of modern languages in the second half of the nineteenth century was made possible by the rise of a mobile, internationally minded middle-class that relied on education to understand the world and its place in it.

Its academic legitimation was to be found in the then prestigious field of philology, itself made possible by the colonial practices of Western powers and their advances in the study of Sanskrit and other classical languages.

SL/FL education is inherently linked to institutional, moral, and political values that are culture-specific and are linked to the technology of the word. Unlike ESL learning that often takes place on the margins of campuses, foreign language education takes place in the center of campus, often within foreign language and literature departments. It is often seen as a means of gaining a profit of distinction on the market of symbolic exchanges. It is linked to the value of literacy and the high culture of literature and the arts. Because it enables learners

to not only master the linguistic forms of the vernacular, but to grasp the historical and cultural values of the target speech community, foreign language education can also be an aesthetic education that links taste and moral value and expands learners' notion of the good and the beautiful.

As few foreign language learners can afford to go and study abroad, FL education is often insulated from face-to-face contact with native speakers and has to compensate for the lack of an authentic cultural environment through the active use of technology. It makes full use of audio, video, and computer technology to promote distance learning for less commonly taught languages, multimedia programs for virtual cultural immersion, and telecollaboration for native–nonnative speaker exchanges across the globe (see Thorne, *Computer-mediated Communication*, Volume 4; Blake, *Distance Learning for Second and Foreign Language Teaching*, Volume 4; Kern et al., *Network-based Language Teaching*, Volume 4). But because foreign language educators are closer to academic, political, and institutional power than their colleagues in second language learning, they are often less free to experiment with new methodologies and sites of learning.

#### MAJOR CONTRIBUTIONS: APPLIED LINGUISTIC THEORY AND LANGUAGE LEARNING

Because it emerged in the second half of the twentieth century when the demand for English was growing around the globe for employment and business purposes, much of the research on language learning has focused on the learning of English as a second/foreign language. Its main research focus has been the acquisition of spoken language, pragmatic skills, conversational strategies, and the learning of the conventional written genres—for example, the academic essay, the research report, the job application, and the statement of purpose. Many aspects of ESL pedagogy have been an inspiration for developing the pedagogy of other second languages, for example, Spanish as a second language in Spain, German as a second language in Germany, and foreign language education in general (see Broeder and Martyniuk, *Language Education in Europe: The Common European Framework of Reference*, Volume 4).

The construction of an applied linguistic theory of second language learning has grown out of the empirical research findings of applied linguists studying for example the acquisition of French by Anglophone children in immersion programs in Canada (Swain and Lapkin, 1982), the acquisition of English by immigrant children in American schools (e.g., Wong-Fillmore, 1979), of German by Turkish immigrants to Germany (Pienemann, 1981), the speech act realizations in nonnative speakers' speech or interlanguage pragmatics (Kasper and Rose, 1999), sociolinguistic phenomena in situations of language hybridity

and linguistic crossing in British schools (Rampton, 1995), and the cognitive strategies used by participants in group activities mediated by language (Donato, 2000). These empirical studies have given rise to various theories of language learning, for example, psycholinguistic theory (Larsen-Freeman and Long, 1991), sociolinguistic theory (Rampton, 1995; see also McKay, *Sociolinguistics and Language Education*, Volume 4), cognitive processing theory (Skehan, 1998), pragmatic and conversational analytic theory (Kasper, 2001), socio-cultural theory (Lantolf, 2000), and their concomitant recommendations for pedagogic practice, for example, task-based, activity-based, or participation/collaboration-based pedagogies.

The changes brought about in the last 25 years by the rise of a multinational business class and the explosion of information-processing technologies have transformed English from just another foreign language into the world language of trade and industry. The case of English, more than any other foreign language, is emblematic of the close link between language teaching and the clash of national interests and international power struggles taking place at the present time in the technological, economic, and cultural spheres. These changes have created conditions favorable to the emergence of what has been called a communicative approach to language pedagogy or communicative language teaching (CLT). CLT has imposed itself on the teaching of all foreign languages around the world. It is slowly causing a backlash on the part of some language educators who question the appropriateness of applying to non-Western contexts a pedagogy that was designed within a Western context (Canagarajah, 1999; Lin, 1999).

Unlike language teaching based on philology, CLT has been based on social scientific applied linguistic research. Applied linguistic theory posits that:

1. Language is not primarily a mode of representation of some textual truth, but interpersonal communication; not historical knowledge, but information to be exchanged. The target model is not primarily the truth and accuracy of the written text, but the authenticity and trustworthiness of the native speaker. The purpose of language learning is to communicate with native and other nonnative speakers of the language in a grammatically accurate, pragmatically appropriate and discursively coherent way (Canale and Swain, 1980; Savignon, 1983).
2. The emphasis is on spoken language, the focus is on lexical knowledge and lexicalized grammar, on idiomatic phrases, pre-fabricated chunks, procedural know how, fluency in production, and the skillful management of conversation.
3. Language learning emerges from comprehensible input, interaction, participation and collaboration in authentic contexts of use

- in which meanings are expressed, interpreted and negotiated (see Oxford, *Conditions for Second Language (L2) Learning*, Volume 4).
4. It is a cognitive process of structuring and restructuring knowledge that can be facilitated by a task-based pedagogy (see Pica, *Task-based Instruction*, Volume 4).
  5. The learning and communication strategies of good language learners can and should be taught explicitly.
  6. Pair and group work in a student-centered classroom aimed at collaboratively solving real-world tasks greatly facilitates language learning.

Applied linguistics has enormously enriched the teaching and learning of SL/FL through its careful empirical investigation of the linguistic, cognitive, affective, and social processes at work in an individual's acquisition of a foreign symbolic system, and through its painstaking observations of the way actual speakers and writers, listeners and readers use language for communicative purposes. But what has it contributed to *SL/FL education*?

#### WORK IN PROGRESS: APPLIED LINGUISTIC THEORY AND SL/FL EDUCATION

CLT has had a considerable impact on SL/FL education, especially English, in countries around the world through institutional, national and international guidelines. In the USA, this impact has been informed less by applied linguistic theory, but by a proficiency-oriented methodology that is used in US government language schools (American Council for the Teaching of Foreign Languages, 1986) or by an ESL methodology that has been extended to the teaching of other languages. This methodology has generally assumed a rather harmonious and symmetrical relationship between native and nonnative speakers and a willingness to cooperate in the negotiation of meanings. It has not taken into consideration what language education also has to deal with, namely: cultural and moral conflicts, historical incompatibilities, identity politics, and the struggle for symbolic recognition. To explain these social and cultural aspects of language education, researchers have had to draw on social and cultural theories like those of Bhaskar and Habermas (Corson, 1997), Marx and Foucault (e.g., Canagarajah, 1999), Bourdieu (e.g., Lin, 1999; see also Norton, *Identity, Language Learning, and Critical Pedagogies*, Volume 6), and Butler (Ibrahim, 1999), and on the educational theories of Bakhtin and Vygotsky (e.g., Lantolf, 2000), thus creating a strand of socioculturally aware applied linguistics (Fairclough, 1992; Pennycook, 2001). It has also drawn on Halliday's functional systemic linguistics and its applications to language education. Indeed, critical applied linguistic theory has had a substantial impact on second language

literacy education in secondary schools in Australia and is slowly beginning to have an impact on foreign language education at the postsecondary level in the USA (Byrnes and Hiram, 2003; Kern, 2000).

The impact of applied linguistic theory has been felt in secondary and collegiate FL education at the beginning levels of instruction. At colleges and universities, the fact that much of language education has become de facto language learning has exacerbated the split between language studies and literary/cultural studies in foreign languages and literature departments (Byrnes and Hiram, 2003). But at the more advanced levels, the potential benefits of a socioculturally aware applied linguistics are becoming more apparent both for the undergraduates who are increasingly interested in issues of language rather than literature, and for the graduate student instructors in search of educational, rather than merely communicative, goals for their teaching.

This is where applied linguistic theory can be of use by offering theoretically validated tools of inquiry. These can enable learners to:

1. Critically approach texts, understand their textuality and the intertextualities they afford (e.g., Bazerman and Prior, 2004; Widdowson, 2004);
2. Understand the link between culture, ideology and identity, language and power (e.g., Norton and Toohey, 2004; Pennycook, 2001; Schieffelin, Woolard, and Kroskrity, 1998);
3. Understand the link between grammatical choice and authorial style (e.g., Ivanic, 1998);
4. Make connections between various symbolic systems (across languages, across modalities) and their meaning potential (e.g., Kress, 2003);
5. Appreciate the importance of genre in all its forms, including the literary;
6. Become critically aware of the relation between socialization and acquisition in SL/FL education (Kramersch, 2002).

## PROBLEMS AND DIFFICULTIES

### *Research Issues*

In the wake of geopolitical changes without precedent—the explosion of information technologies, a global market causing global migrations and increasingly plurilingual and pluricultural societies—researchers in applied linguistics are confronted with a series of issues that they didn't have to confront in the fifties or sixties. The first is: What is the link between language and culture? And what is culture: a way of life, an ideology, a discourse, a national history? To what extent does the learning of a language entail an acculturation into in a specific way of life and

specific ideological values? Even though an international language like English is not seen to belong to any particular culture, it is still linked historically to British or American imperialism, or at least to economic globalization and its neoliberal ideology. The question of culture in language education is particularly urgent for teachers of English (Pennycook, 2001), but also for FL educators (Kramsch, 1993). The difficulty in researching the issue of language and culture in a positively inclined field like applied linguistics is that there is no culture-neutral place from where to examine it and that it intersects with moral, religious and political interests, which makes objective research with universally recognized research findings a difficult enterprise.

A second research issue is: What is the link between language and social/cultural identity? What is the ultimate goal of language learning and language education: Socialization? Understanding of self? General education? Job opportunities? In the case of immigrants learning the language of the host country, it can no longer be assumed that all learners want to blend into the host society and relinquish their ethnic, social and cultural identity (see Norton, *Identity, Language Learning, and Critical Pedagogies*, Volume 6). In the case of FL education, issues of identity have not been as salient as in SL learning, because learners have been assumed to be well-established in their national and social identity, but recently questions of learner identity have been posed at the institutional level. What are educational institutions preparing language learners to be: regional community members? national citizens? global citizens? Even in countries that have national education systems, there is a great deal of debate about what kinds of citizens nation-states want to educate through their educational institutions (Kramsch, Howell, Warner, and Wellmon, 2007) Applied linguists are called upon to testify in political circles as to the value of learning languages other than the national language.

Other difficult issues in applied linguistics include: How should foreign language education be framed within plurilingual/pluricultural environments, for example, the European Union (see Broeder and Martyniuk, *Language Education in Europe: The Common European Framework of Reference*, Volume 4)? How should language learning technologies be theorized, beyond their attractive use to teach languages in authentic contexts (see Winke and Fei, *Computer-assisted Language Assessment*, Volume 4; Thorne, *Computer-mediated Communication*, Volume 4). Notions like authenticity, historicity and communication become problematic in electronic environments where the axes of time and space have been redefined. Finally: How should the outcomes of SL/FL learning and education be defined, measured and evaluated fairly and in a valid and reliable manner? To find answers to all these questions applied linguists are increasingly turning to poststructuralist, ecological theories

of language, culture and learning (see Kramersch and Steffensen, *Ecological Perspectives on Second Language Acquisition and Socialization*, Volume 8).

### *The Limits of Applied Linguistics in SL/FL Education*

The field of applied linguistics has traditionally had more to do with language learning than with language education, in part because it has been based on psycholinguistic research that has studied universals of second language acquisition rather than culture-specific modes of learning. As a respected branch of the social sciences, it has developed an authority in the field of language education because of its scientifically attested findings. But what is pedagogically valid for the teaching of English in Japan might not be appropriate for the teaching of Chinese or Arabic in the USA, for example.

Furthermore, language education includes more than just the acquisition of communicative competence. Education in FL literacy, as well as in the appreciation of social, literary, and cultural traditions, requires educators to draw on other fields than applied linguistics in its original sense. Applied linguistic theory must be supplemented by educational theory, aesthetic theory, literary theory, and even political theory to deal with all facets of FL education. The difficulty for the researcher is that FL education straddles the social and the human sciences, which have quite different research paradigms and methods of inquiry.

### *Critical Appraisal and Future Directions*

Today, globalization is presenting a challenge of unprecedented scope for SL/FL educators. What should they prepare youngsters for in a world that is increasingly diverse, changing, plurilingual and pluricultural, and where language is increasingly misused, even abused by politicians, pundits and marketing strategists alike? The notion of “textual competence” was well-suited to the *national* need for law and order in the public sphere. “Communicative competence” was appropriate for the *international* demand for smoother economic transactions and exchanges of information. But neither seems to be sufficient in a *global* world where symbolic, historical, cultural and ideological values are taking on ever greater importance. What can applied linguistics offer SL/FL education in global times?

Applied Linguistics can serve as the theoretical basis for a socially and culturally aware language education. Today, miscommunication might occur not because two interlocutors make imperfect use of the English language, but because one considers himself to be superior to the other while the other sees him as his equal (i.e., they don't share

the same symbolic reality); one comes from a country that used to be a colony of the other, or was at war with the other (i.e., they have different views of history); one might say something that evokes bad stereotypes in the mind of the other, for example, he might be heard as being condescending when he intended to be friendly, she might sound deceitful when she wanted to be tactful, he might come across as aggressive when he was trying hard to be truthful (i.e., they have different cultural values); they might mean different things even as they use the same words (i.e., their words conceal different ideologies). It is said that the more a language is used in a variety of contexts by native and nonnative speakers who have nothing in common (no common history, no common point of reference, no common worldview), the more they have to restrict themselves to the immediate task at hand. Such a view is predicated on the assumption of a common purpose for the task, but in a global world interlocutors must be ready to negotiate not only how to complete the task, but how to define the very nature and purpose of the task itself.

Nowadays, rather than communicative strategies, language learners might need much more subtle semiotic tactics, that draw on a multiplicity of perceptual clues to make and convey meaning. These tactics are especially necessary in situations where power, status and speaking rights are unequally distributed and where ideology superimposes itself on referential meanings. SL/FL learners need to understand the different historical experiences evoked by the words spoken and the different subjective resonances that the memory of these experiences elicits in the participants in cross-cultural encounters. A socially and culturally aware applied linguistic theory can show nonnative speakers not only how to make themselves understood linguistically, but how to position themselves in the world, that is, find a place for themselves historically and subjectively on the global market of symbolic exchanges.

## SOCIOLINGUISTICS AND LANGUAGE EDUCATION

### INTRODUCTION

Sociolinguistics is concerned with the relationship between language use and social variables. One of the major debates in the field of sociolinguistics is whether to take social or linguistic factors as primary in investigating this relationship. As evidence of this debate, Wardhaugh (1992) and others make a distinction between *sociolinguistics* and the *sociology of language*. Whereas sociolinguistics takes linguistic factors as primary in its investigations of language and society, the sociology of language investigates the manner in which social and political forces influence language use. Trauth and Kazzazi (1996) in the *Routledge Dictionary of Language and Linguistics* make a similar distinction, noting that sociolinguistics can have either a sociological or linguistic orientation. The dictionary, however, adds a third possibility, namely, an ethnomethodological orientation. Hence, three areas of sociolinguistic investigation are delineated:

- (a) A primarily sociologically oriented approach concerned predominantly with the norms of language use (When and for what purpose does somebody speak what kind of language or what variety with whom?) . . .
- (b) A primarily linguistically oriented approach that presumes linguistic systems to be in principle heterogeneous, though structured, when viewed within sociological parameters. . .
- (c) An ethnomethodologically oriented approach with linguistic interaction as the focal point, which studies the ways in which members of a society create social reality and rule-ordered behaviour. (p. 439)

In this chapter, sociolinguistics is viewed as composed of all three areas listed earlier. The chapter shows how all three strands have contributed to a field of inquiry that has significant implications for language education.

### EARLY DEVELOPMENTS

Many contend that early work in sociolinguistics was sociologically uninformed, concentrating primarily on an analysis of language structure (Fishman, 1968; LePage, 1997). A major exception to this

characterization occurred in 1968 with the publication of Fishman's (1968) seminal book, *Readings in the Sociology of Language*. In this collection of studies on the relationship between language and society, Fishman (1968), argued for the benefit of a greater emphasis on the social aspects of language use. He maintained that it was only natural that since society was broader than language, social structures should provide the primary focus of sociolinguistic studies. Ultimately, Fishman argued that sociologists and linguists would both gain from developing a robust interdisciplinary field. Sociologists could arrive at some reliable linguistic indicators of social class and demonstrate how the diversity inherent in language use is patterned. Linguists, on the other hand, might come to discover that what appears to be free variation in language use is in fact socially patterned.

One of Fishman's major criticisms of early fieldwork in linguistics was that it was devoid of a theoretical orientation. He questioned the value of linguistic fieldwork that provided an extensive inventory of the patterns of use of a single informant without any theoretical justification. His criticism was largely directed at early work in geographical dialectology, which tended to investigate the language use of older uneducated informants in rural areas. LePage (1997) also criticized early work in dialectology, maintaining that it tended to assume a static social structure. In his view, early dialectologists mistakenly focused on finding reasons for language change in the language use of their rural informants rather than assuming that language diversity was the base line.

The study of geographical dialectologists has a long history, beginning in the nineteenth century with historical-comparative linguistics. One of the earliest and most intensive investigations of geographical dialects in the USA was Kurath, Hanley, Bloch, and Lowman (1939–1943), whose fieldwork resulted in a comprehensive linguistic atlas of New England. More recently, a comprehensive fieldwork project of American regional dialects led by Cassidy (1985) resulted in a *Dictionary of American Regional Dialects*. In both projects, a large number of fieldworkers were employed to interview individuals of various communities and age groups to map out specific features of dialect regions.

The belief that sociolinguistics should give greater emphasis to the social aspect of language use was shared by Hymes, who argued that researchers interested in describing how language is used need to consider the context in which particular interactions take place and how this context affects the interaction. Specifically, Hymes (1972) maintained that the following four questions must be raised in analyzing language use.

1. Whether (and to what degree) something is formally *possible*;
2. Whether (and to what degree) something is *feasible* in virtue of the means of implementation available;
3. Whether (and to what degree) something is *appropriate* (adequate, happy, successful) in relation to a context in which it is used and evaluated;
4. Whether (and to what degree) something is in fact done, actually *performed*, and what its doing entails. [emphasis in original] (p. 281).

These questions have significant implications for language education since, they suggest that language education should examine standards of correctness in relation to language use and address issues of language appropriateness.

A concern with the social context of language use was also evident in the controversial work of Bernstein (1971), who examined early language socialization. Based on his research in England, he maintained that particular family structures tend to foster a closed communication system that results in the development of a *restricted code* in which there is a great deal of assumed background knowledge. On the other hand, some family structures promote an open communication system that results in an *elaborated code* where the speaker assumes that the audience needs to be supplied with necessary background knowledge. Bernstein contended that children who have access to the latter code have greater chances of success in formal educational contexts.

The work of Fishman, Hymes, Bernstein, and others, which challenged investigations that assumed a static linguistic situation, were brought about to a large extent by an interest in urban rather than rural dialectology. Linguistic communities were viewed as heterogeneous with languages and language varieties coming into regular contact. Emphasis was now placed on linguistic diversity. The new emphasis on linguistic diversity resulted in investigations of language variation, language contact, and language change.

## MAJOR CONTRIBUTIONS

### *Language Variation*

One of the major contributors to modern sociolinguists is William Labov. Labov's work provided a significant shift in how sociolinguists approached linguistic variation. His MA thesis entitled *The Social Motivation of a Sound Change*, published in Word in 1963, was based on work he did in the resort area of Martha's Vineyard. In this study, he demonstrated how linguistic variation served as a means for individuals to mark their identity as natives of the area as opposed to summer

visitors. Labov's most important contribution came from his doctoral thesis, published in 1966 and titled *The Social Stratification of English in New York City*.

In this study, Labov worked with a random sample of New Yorkers from the Lower East Side stratified into four socioeconomic classes based on occupation, income, and education. He investigated to what extent variables like *ing* vary in how they are pronounced based on an individual's socioeconomic class. Using interview data, Labov mapped the percentage of time that speakers dropped their *gs* (using "in" rather than "ing") in casual speech, careful speech, and reading style. What he found was a consistent pattern of the lower-working class using the reduced form more than the upper-middle class. However, like the upper-middle class, the lower-working class had a lower frequency in their use of the reduced form in the reading style than in the casual speech.

What was significant in Labov's study was that he drew on natural data to quantify the existence of particular linguistic variants among specific groups of individuals. He then used this information to write a variable rule that described general tendencies in the use of a particular variant like *ing*. The quantities he used were not based on individual use of a variant, but rather on the mean score for a social group. His methodology was highly innovative in that he used naturalistic speech to make generalizations regarding linguistic variation. Even more importantly, the generalizations he made from this data demonstrated the relative frequency of a particular linguistic feature rather than the mere presence or absence of this feature.

During the 1950s and 1960s, Labov's work in developing variable rules that characterize the use of a particular linguistic feature in a specific social group was applied to the Black community in the USA. In 1965, Labov with Cohen and Robins carried out a study for the US Office of Education and Welfare on the structure of English used among Black American and Puerto Rican speakers in New York City. In a later study, Labov (1969) developed a variable deletion rule to account for the deletion of the copula (e.g., the man rich) among the speech of Harlem street gangs. An interest in delineating the features of a Black English Vernacular led to many investigations in the 1960s such as the studies undertaken by Stewart (1964) and Wolfram (1969). More recently, there has been a vigorous debate over the role that African-American Vernacular English (AAVE) or Ebonics should play in the schools, with some arguing that it should be recognized and promoted in its own right as a legitimate variety of English and others arguing that the role of the school should be to replace this variety of English with Standard American English (see Rickford, 1996). There has also been continuing research on teachers' attitudes toward AAVE (see e.g., Blake & Cutler, 2003).

*Language Contact*

Another area of sociolinguistics that has been investigated in recent years is language contact and the development of pidgins and creoles. Pidgins came into being through the interaction of individuals who have minimal needs to communicate with one another and no shared language. Typically, they develop in coastal areas for trade or forced labor purposes. Because pidgins are used for limited communication between speakers, they typically have a simple vocabulary and uncomplicated morphological and syntactic structure. In general, the language of the economically and politically more powerful group provides the lexicon (the superstrate language) and the less powerful (the substrate language) the syntactic and phonological structure. Technically, a *creole* is a pidgin that has native speakers, namely children of pidgin speakers who grow up using the pidgin as their first language. Because the code is now the only language the speaker has available, the lexicon expands and the syntactic structure becomes more complex.

Rickford and McWhorter (1997) provide several reasons why theoretical linguists, sociolinguists, and educators should be interested in pidgins and creoles. First, pidgins and creoles demonstrate the manner in which sociohistorical issues such as trade and enslavement can influence language development. Second, pidgins and creoles provide important data for investigating sociolinguistic variation and change in that they illustrate the manner in which language variation is related to social class, power, and identity. Third, pidgins and creoles raise important issues in applied sociolinguistics and language planning such as the feasibility and desirability of using them as languages of instruction. Finally, investigations of pidgins and creoles often produce what Rickford and McWhorter term “fractious energy” in that creolists are consistently arguing about theories and subtheories to account for the origin and development of pidgins and creoles. (For a thorough discussion of the development of creoles and other new languages, see Mufwene, 2001.)

One of the major pedagogical issues surrounding the use of pidgins and creoles is to what extent they should be used in a classroom. In some contexts, creoles are used in initial literacy instruction under the assumption that early education is most successful if it is conducted in the child’s first language. However, there is great resistance to this option, particularly when a standardized version of the superstrate language exists in the same region, as it does, for example, in Hawaii. Often this resistance develops from negative attitudes toward the pidgin and creole rather than on any linguistic basis. In response to such negative attitudes, Hawaiian educators have been instrumental in undertaking a successful revitalization of Hawaiian creole (see also Hinton, *Learning and Teaching Endangered Indigenous Languages*, Volume 4).

An interest in language contact has also led to investigations of the language use of bilingual individuals and communities. Ferguson (1959) coined the term *diglossia* to describe the situation of a community in which most of the population is bilingual and the two codes serve different purposes. The term was originally used by Ferguson to describe a context in which two varieties of the same language are used by people of that community for different purposes. Normally one variety, termed the *high or H variety*, is acquired in an educational context and used by the community in more formal domains such as in churches or universities. The other variety, termed the *low or L variety*, is acquired in the home, and used in informal domains like the home or social center to communicate with family and friends. As examples of diglossia, Ferguson pointed to situations like the use of classical and colloquial Arabic in Egypt or the use of Standard German and Swiss German in Switzerland. Later, Fishman (1972) generalized the meaning of diglossia to include the use of two separate languages within one country in which one language is used primarily for formal purposes and the other for more informal purposes. The expansion of the meaning of the term made it applicable to countries where English is one of the official languages such as South Africa, Singapore, and India. In these countries, English often assumes the role of what Ferguson calls the high variety being used in formal contexts with the other languages of the country used in informal domains. The term has also been applied to countries like Peru where the indigenous language, Quechua, is used by many in informal contexts while Spanish serves the functions of a high variety.

Investigations have also been undertaken on the code-switching behavior of bilinguals. One of the main questions addressed in research on code switching is what leads a bilingual to shift from one language to another. In answer to this question, Blom and Gumperz (1972) posit two types of code switching. The first is *situational code switching* in which the speaker changes codes in response to a change in the situation such as a change in the setting or the speakers involved in the conversation. The second type is *metaphorical code switching* in which the shift in languages has a stylistic or textual function to mark a change in emphasis or tone. Some, like Poplack (1980) and Singh (1996), maintain that code switching is closely related to language proficiency. Singh, in fact, argues that this relationship can be summarized in the following aphorism: "A strong bilingual switches only when he wants to and a weak one when he has to" (p. 73).

One of the most comprehensive theories of code switching is that of Myers-Scotton (1993). She explains code switching in terms of a theory of rights and obligations. She proposed a markedness model of code switching, which assumes that speakers in a multilingual

context have a sense of which code is the expected code to use in a particular situation. This is termed the *unmarked* code. However, speakers can also choose to use the *marked* code. Myers-Scotton suggests several reasons why a speaker might make this choice as, for example, to increase social distance, to avoid an overt display of ethnicity, or for an aesthetic effect. In multilingual communities in which English has an official status, English is often the unmarked code in formal educational contexts. When the other languages are used in the classroom, they are often the marked choice chosen to signal such things as anger or social intimacy.

Studies in language contact have several implications for the teaching and learning of another language. Research in creoles has demonstrated that such variants are highly patterned and inherently equal to other variants of a language. However, because they have less social prestige in contexts in which a more standardized version of the language exists, students will be at a disadvantage by not learning the prestige form.

Studies on code switching have illustrated the regularity of code-switching behavior and the purposes that code switching can serve for bilinguals. Given the many contexts today where English is used as one of the additional languages within a country, more research is needed regarding how individuals make use of English in reference to the other languages they speak. Such research will be valuable in establishing classroom objectives that complement the students' use of English within their own speech community. In addition, in classrooms in multilingual contexts where the teacher shares a first language with the students, teachers need to carefully consider how they can best make use of their students' first language to further their competency in a target language.

### *Language Change and Language Standards*

One common effect of language contact is language change. In such cases, the various languages used within a multilingual context may undergo phonological, lexical, and grammatical changes as bilinguals make use of two or more languages on a regular basis. This situation is occurring in many countries today where English has an official role in the society as in India or South Africa. It is also occurring in countries where English is widely studied and used such as in many Scandinavian countries.

Many studies have been undertaken to determine the types of grammatical changes that are occurring in various multilingual contexts in which English plays a significant role (see, e.g., Kachru, 2005). Frequently, researchers begin by examining a written corpus of English

of a particular multilingual context to determine what kinds of grammatical innovations exist and how acceptable these structures are to both native speakers of English and local speakers of English. In general, when investigations of language change use a written corpus of published English, only very minor grammatical differences are found (see, e.g., Parasher, 1994).

Often the kinds of grammatical changes that occur tend to be minor differences such as variation in what is considered to be a countable noun (e.g., the standard use of *luggages* in the use of English in the Philippines and the use of *furnitures* in Nigeria) and the creation of new phrasal verbs (e.g., the use of *dismissing off* in the use of English in India and *discuss about* in Nigeria). In contexts in which such features become codified and recognized as standard within that social context there arises what Kachru (1986) has termed a *nativized variety* of English.

What is perhaps most puzzling in the development of alternate grammatical standards in the use of English is the fact that whereas lexical innovation is often accepted as part of language change, this tolerance is generally not extended to grammatical innovation. In Widdowson's (1994) view, the reason for this lack of tolerance for grammatical variation is because grammar takes on another value, namely that of expressing a social identity. Hence, when grammatical standards are challenged they challenge the security of the community and institutions that support these standards.

#### WORK IN PROGRESS

A good deal of current work in sociolinguistics falls under what was referred to in the opening of the chapter as an ethnomethodologically oriented approach to the field of sociolinguistics with linguistic interaction as the focal point. Work in linguistic interaction began as a reaction to Chomsky's (1957) focus on the language of an idealized speaker–listener in a homogeneous speech community with complete knowledge of the language. This notion was challenged by Hymes (1974) who insisted that studies on language use should strive to account for the communicative competence of a native speaker of a language. Gumperz (1982) also challenged Chomsky's notion of an idealized speaker in a homogeneous speech community arguing instead that language use in a speech community is influenced by social and cultural factors. Gumperz's studies on communication between Blacks and Whites in the USA and between Indians and British in England demonstrated how differences in language use among speech communities can cause misunderstandings leading to racial and ethnic stereotypes and inequalities in power.

The work of Rampton (1995, 1997) has taken the debate about linguistic diversity one step further. He maintains that globalization, as well as late/post modernity (a term he prefers to postmodernism), warrants a fresh look at the issues important to sociolinguistics and second language (L2) research. He contends that while current sociolinguistic research assumes that neither language nor societies are homogeneous, “when it meets diversity and variation, one of its strongest instincts is to root out what it supposes to be orderliness and uniformity beneath the surface, an orderliness laid down during early socialization” (Rampton, 1997, p. 330).

Rampton believes that the time has come for sociolinguists to challenge the notion that societies are compact and systematic entities and instead to recognize the heterogeneity and fluidity of modern states. In keeping with much of the discourse of postmodernism, he argues persuasively that sociolinguistics should give more attention to investigating issues related to fragmentation, marginality, and hybridity and recognize that “being marginal is actually a crucial experience of late modernity. Being neither on the inside nor the outside, being affiliated but not fully belonging, is said to be a normal condition . . .” (Rampton, 1997, p. 330).

## PROBLEMS AND DIFFICULTIES

### *Future Directions*

As a way of addressing Rampton’s claim that current applied linguistics research is out of touch with issues of late modernity, further research is needed that investigates linguistic diversity without preconceived ideas about native speakers and language standards. Such research should examine how particular varieties of language illustrate the fluidity of modern society. This type of research is presently underway in investigations of English as a lingua franca (ELF) negotiations, in which the speakers are neither insiders (i.e., so-called native speakers) nor outsiders in that they are users of English (see Seidlhofer, 2004, for a review of ELF research). It is exactly these kinds of interactions that exemplify the marginality of present-day interactions.

In its ongoing effort to add to existing knowledge on the relationship between sociolinguistics and language education, educational sociolinguistics will continue to face major methodological issues (e.g., gaining access to educational sites, obtaining naturally occurring data, and implementing human protocol guidelines) as well as sociopolitical issues (e.g., convincing policy makers to implement sociolinguistically sound educational programs even though they may not have popular support).

*Pedagogical Implications*

The previous discussion on language variation, language contact, and language change has several implications for second language classrooms. First, L2 pedagogy should be informed by sociolinguistic research on linguistic variation. As was demonstrated earlier, the manner in which individuals use a language will often vary based on geographical region, social class, and ethnicity. For L2 learners of any language, but particularly languages with wide geographical reach such as English and Spanish, it is important for teachers to develop materials that will raise students' awareness of such differences and to help them understand the manner in which these differences serve to indicate membership in a particular speech community.

Second, the teaching of standards should be based on sociolinguistic insights regarding language contact and language change. As was discussed previously, language contact will inevitably result in language change. Since today many individuals are using English in contact with other languages on a daily basis, their use of English is changing, and they are in the process of establishing their own standards of English grammar and pronunciation. In general, research on these emerging varieties of English indicates that the codified and accepted standard of English that exists in these communities has few differences with other standard varieties of English. The situation of multiple standards, however, is important not just for English but for many other widely used languages. Hence, it is important for L2 teachers to recognize the integrity of the varieties of the language they teach, to realize that they are important sources of personal identity and signs of the fluidity of late modernity, and to not promote negative attitudes toward such varieties.

## INDIVIDUAL DIFFERENCES IN SECOND AND FOREIGN LANGUAGE LEARNING

### INTRODUCTION

This chapter is concerned with the role that individual differences play in second (or foreign) language learning, and focusses attention on four classes of variables that have received considerable research attention over the years. One reason for limiting it to four, other than space limitations, is that these variables can be linked theoretically as well as empirically to individual differences in second language achievement. The four classes of variables include language aptitude, attitudes and motivation, language anxiety and language-learning strategies. Clearly, other variables could be added to this list, but these seem to be among the most frequently investigated and discussed in the research literature. In preparation for an earlier edition of this encyclopaedia, a computer survey was conducted of three data bases, *Linguistics and Language Behavior Abstracts*, *ERIC* and *Psyclit* to determine the research conducted on a number of different factors that have been shown to correlate with measures of second language proficiency, and these four were the most popular (see Clément and Gardner, 2001, for a summary of these results).

In the following overview, each of the four categories of variables will be considered in terms of history, and major contributions and current research. In subsequent sections, problems and difficulties and future directions will be considered in general terms since the issues involved seem to be appropriate to all the categories.

### LANGUAGE APTITUDE

#### *History*

Language aptitude is a term that has been used to identify those ability characteristics that influence how well individuals can learn a second language. Initially, research was concerned with the role that intelligence played in second language learning, but in the early 1920s, researchers became dissatisfied with the prediction attainable with measures of intelligence, and instead focussed their attention on special prognosis tests. In this period, there were a number of such tests published, and these tests made use of sample language-learning tasks,

translation tests, measures of verbal ability, and the like in order to predict achievement, with little regard for explaining why these measures did predict achievement.

### *Major Contributions and Current Research*

The modern day era began in 1959 when Carroll and Sapon published the *Modern Language Aptitude Test* (MLAT), which attempted to measure abilities that seemed to be involved in language learning. This test developed from a series of studies that investigated the factor structure of verbal ability measures hypothesized to be related to achievement in a second language. Based on this research, Carroll and Sapon (1959) proposed that achievement in a second language was influenced by four different abilities, *phonetic coding*, *grammatical sensitivity*, *rote memory* and *inductive language-learning ability*, each of which was measured in the MLAT. There have been translations and adaptations of the MLAT or parts of it into French, Hungarian, Italian and Japanese, and we have also seen the development of other measures, identified with such interesting acronyms as EMLAT, PLAB, DLAB, VORD and CANAL-FT. A recent article by Kiss and Nikolov (2005) discusses much of this research, reviews conceptual issues in the area and presents research on the development of a language aptitude test for 12-year-old Hungarian children. The general rationale underlying all of these measures is not that different from what was used in the development of the MLAT or the earlier prognosis tests, and the major focus has been on the prediction of achievement in the language.

There is now a new wave underway, where it is proposed that interest should not be on the prediction of success, but rather the identification of underlying processes, and that attention should be directed towards cognitive factors linked to specific language-learning processes or phases. For example, Skehan (1998) proposed that the concept of language aptitude should be linked directly with psycholinguistic processes involved in language learning. Using his information processing model, he distinguished between three stages, input, central processing and output. This theme has been expanded in recent research, and it is now hypothesized that different cognitive abilities might play distinct roles in different stages and settings. That is, different cognitive abilities might be implicated in formal versus informal acquisition contexts, early versus later stages of language learning and regular versus immersion language-learning contexts and so on.

Much of the theoretical underpinning of this approach is provided in an edited book by Robinson (2001) with chapters on theoretical issues associated with cognition and second language learning and their implications for instruction. In a recent review of the literature, Robinson

(2005) identifies ten basic cognitive abilities that could play different roles, depending on the stage and context of language learning, and reviews many different studies focussing on these issues. The implications of this approach and this type of research are important because it might well open the possibility of developing language-teaching techniques that are appropriate for particular cognitive abilities at different stages of language learning and different contexts.

## ATTITUDES AND MOTIVATION

### *History*

Attitudes and motivation are often treated together, which is quite meaningful given that attitudes have motivational properties and motivation has attitudinal implications. Within this general area, it is possible to distinguish between two classes of attitude variables, *educational* and *social*, and two classes of motivational variables, *general* and *task-centred*.

Social attitudes were considered by Arsenian (1945) who raised questions about the role of attitudes towards the other language group and bilingual development, by Nida (1956) who hypothesized that one individual's difficulty with learning a second language originated in his strong own-culture identification, and by Lambert (1955) who proposed that extreme levels of proficiency could be due to favourable attitudes towards the other community. Educational attitudes were reflected in studies, such as that by Jordan (1941) who developed measures of attitudes towards five school subjects, including French, and found that attitudes towards the subject matter were related to achievement.

General motivation was discussed by Marckwardt (1948) in the first article in the inaugural issue of *Language Learning*. He proposed that there were five motives for learning a second language: (a) assimilation of an ethnic minority, (b) the promotion of trade and commerce, (c) scientific and technical usefulness, (d) self-cultural development, and (e) maintenance of ethnic identity of a linguistic minority. A more educationally relevant and task-centred motivation was proposed by Dunkel (1948) who focussed on reactions to the language-learning context, emphasizing the kind and the intensity of a student's motivation.

### *Major Contributions and Current Research*

The modern day era for this research began in 1959 when Gardner and Lambert demonstrated that two factors, linguistic (language) aptitude and motivation, were related to achievement in a second language. A

series of studies followed and led in turn to the development of the socio-educational model of second language acquisition and the Attitude/Motivation Test Battery (AMTB) (see Gardner, 1985).

The socio-educational model of second language acquisition proposes that six classes of variables (language aptitude, motivation, attitudes towards the learning situation, integrativeness, language anxiety and an instrumental orientation) play roles in second language acquisition, but that motivation and language aptitude are the dominant variables. Research using the AMTB has demonstrated that attitudes, motivation and language anxiety were related to second language achievement, classroom behaviour, dropping out of language study and participation in bicultural excursion studies. It has also been shown that there are changes in these attributes as a function of bicultural excursion programmes, regular language programmes and intensive language programmes (see, e.g. Gardner, 1985).

A major assumption underlying the model is that learning another language involves adopting aspects of another language community, and thus the student's attitudes towards the target language community and other communities in general, as well as an interest in learning the language for integrative reasons will influence the individual's level of motivation. This openness to other cultures is referred to as integrativeness, and this construct distinguishes this model from more educationally based ones. Other models that incorporate integrativeness or something similar are the social context model, the intergroup model and acculturation theory (for descriptions, see Gardner, 1985).

The 'current era' began in 1991 when Crookes and Schmidt called for expanding the research horizon, making it more education-friendly. There followed a lively debate on the best way to characterize motivation that appeared in the 1994–1995 issues of the *Modern Language Journal*. One attempt to do so (Tremblay and Gardner, 1995) resulted in the conclusion that alternative ways of conceiving motivation could be incorporated into the socio-educational model of second language acquisition without any loss of generality. Current research based on this model has also demonstrated that many of the attributes assessed by the AMTB are not trait-like as claimed by some researchers, but can change over the year, and moreover, that these changes are moderated by the final grades in the course (Gardner, Masgoret, Tennant and Mihic, 2004).

Other research is more concerned with focussing on constructs closely related to general psychology and with studying features associated with motivation and its potential causes rather than with explaining differences in achievement in the language. For example,

MacIntyre, Dörnyei, Clément and Noels (1998) have proposed a model unifying constructs from many of these models. It comprises 12 variables arranged in six layers beginning with the social and individual context and culminating in communication behaviour. The ultimate goal in this model is willingness to communicate, not achievement in the language.

Dörnyei (2001) also reviews many past and current models, and proposes that more attention should be directed towards what goes on in the language classroom and in changes over time. He considers this a more educationally friendly approach to the issue of motivation and second language learning, and proposes ways for teachers to promote motivation. Some of these models also incorporate the concept of integrativeness, and Dörnyei considers that notion to be important, though in recent research he redefines it in terms of perceptions of the self and ideal self (see, e.g. Csizér and Dörnyei, 2005).

## LANGUAGE ANXIETY

### *History*

The concept of language anxiety is considered in many of the models of motivation and language learning. For example, it is viewed as one of the classes of variables in the socio-educational model of second language acquisition, and as a (negative) component of confidence in the language in the social context model. It has also been studied as a variable in its own right. Measures of audience anxiety were included in some of the earlier studies of individual differences in second language learning (e.g. Gardner and Lambert, 1959) whereas general measures such as test anxiety and manifest anxiety were the major focus in other research. In some instances, the results were equivocal, and for a time it was believed that anxiety might have both a facilitating and debilitating effect on second language acquisition. Subsequent research has indicated, however, that any effects that are obtained tend to be debilitating.

### *Major Contributions and Current Research*

A number of tests of language anxiety have been developed. Measures of French Class Anxiety and French Use Anxiety are subscales of the AMTB (Gardner, 1985). Horwitz, Horwitz and Cope (1986) developed the Foreign Language Class Anxiety scale (FLCAS), claiming that such anxiety is a composite of communication apprehension, social

evaluation and test anxiety. MacIntyre and Gardner (1994) developed three measures of French Anxiety that focussed on anxiety associated with input, processing and output, respectively. They demonstrated that anxiety aroused at any of these three stages could have an effect at that stage, and proposed that such findings had implications for any procedures concerned with reducing the effects of language anxiety. That is, input anxiety was negatively associated with performance associated with the learning of new language material, processing anxiety was negatively related to performance on language-processing tasks, and output anxiety was negatively related to language production. In addition, scores on each of the measures were highly related to measures of language classroom anxiety and language use anxiety from the AMTB, and the FLCAS.

In the social context model, Clément (1980) proposed that the antithesis of language anxiety, self-confidence with the language, developed from successful interactions with the second language and that achievement in a second language was dependent on the self-confidence that resulted. Clément and Kruidenier (1985) demonstrated that a measure of self-confidence with English (as a second language) was in fact linked directly with language anxiety. In other research, MacIntyre and Gardner (1989) found that language anxiety was relatively independent of general anxiety. Thus, it would seem that language anxiety develops from experiences in the acquisition of a second language, and once developed, this anxiety inhibits subsequent learning of the language. Horwitz, Horwitz and Cope (1986) note that language anxiety includes both negative affect that could impair learning, and beliefs and expectations about proficiency that could impair performance.

Recent research has tended to focus attention on the elements of the construct, language anxiety and its correlates more often than with the prediction of achievement. For example, Bailey, Onwuegbuzie and Daley (2000) found that students with high levels of input, processing and output anxiety tended to be older, to have high levels of academic achievement, and lowered expectations about their performance in the course, and they report that these findings were similar to another study they conducted where the FLCAS was the measure of anxiety. Other studies have investigated different forms of language anxiety, such as Foreign Language Reading Anxiety and Foreign Language Listening Anxiety. Still other studies have questioned whether language anxiety is language specific, or whether it might generalize to other languages. That is, an individual studying two languages would be expected to experience equal amounts of anxiety in both. Still other research has considered the possible link between language anxiety and perfectionism.

In short, there are many possible correlates of language anxiety that might provide an insight into its origins.

## LANGUAGE-LEARNING STRATEGIES

### *History*

Language-learning strategies can refer to techniques that researchers and teachers propose to promote successful language acquisition or to approaches and procedures that individuals use to help them learn a language. One example of the former is the keyword method (Atkinson and Raugh, 1975). These types of techniques involve specific and sometimes complex procedures that the student must learn in order to apply them properly. Examples of the latter are any number of techniques that students spontaneously report as ‘things’ they do to help them learn a language. Much of the early research focussed on the latter, studying strategies reported by successful and unsuccessful students, and making use of interviews, questionnaires or diaries to identify them (cf. Stern, 1975). Examples of the strategies identified included such diverse behaviours as willing to guess, desire to communicate, active participation, searching for meaning and so on. As can be seen, these cover a wide range of approaches.

### *Major Contributions and Current Research*

Recent research has directed attention to various techniques that are believed to be important by researchers and educators for either learning or communication. Thus, Reiss (1985) investigated seven strategies—guessing, motivation to communicate, attending to form, practising, monitoring, attending to meaning and using mnemonics, and developed multiple-choice items to measure their reported use. A test proposed by Oxford (1990) uses a slightly different procedure to assess strategies (see Oxford, *Conditions for Second Language (L2) Learning*, Volume 4). The Strategies Inventory for Language Learning (SILL) consists of 80 items for English-speaking students learning a new language, and 50 for speakers of other languages learning English, and request that students rate how frequently they make use of each item. Both versions provide scores on six different behaviours—remembering more effectively, using mental processes, compensating for missing knowledge, organizing and evaluating learning, managing emotions and learning with others. These are identified as memory, cognitive, compensation, metacognitive, affective and social strategies, respectively.

Much current research makes use of the SILL, or derivatives from it, including assessments of reading strategies and listening strategies. This research has often demonstrated substantial correlations between measures of achievement and amount of strategy use, though in some instances non-significant or negative correlations have been reported. Explanations for the inconsistencies could be that it is not the number of strategies used but the effectiveness of their use that is important, or that once a given degree of proficiency is achieved, the use of strategies decreases. In a heterogeneous class, where there are large differences in proficiency, this alone could account for non-significant or negative correlations.

Like the other topics discussed, there is also considerable interest devoted to understanding correlates of learning strategy use, as well as its relation to achievement. It is generally recognized that strategy use is a conscious process, raising the possibility that it is associated with various personality characteristics. Other research has demonstrated, furthermore, that it is related to gender, language-learning context (foreign vs. second), motivation to learn the language and language attitudes and beliefs.

#### PROBLEMS AND DIFFICULTIES

Each of these individual difference variables, language aptitude, attitudes and motivation, language anxiety and learning strategies have been shown to relate to achievement in a second language, and there has been sufficient replication of the findings in various contexts to conclude that they are somehow implicated. The few studies that fail to replicate the major findings may indicate simply that other factors such as contextual considerations, measurement operations and errors and sampling errors are operating to overshadow relationships. These studies should not be ignored, of course, because a careful analysis of the factors responsible for the discrepant results will help to clarify the conditions under which such relationships exist. Attention must be paid, however, to the careful identification and measurement of the individual difference variables involved.

One difficulty with all of this research is that it deals with individual differences, and the basic data are the correlations of these variables with achievement or any other variable of interest. We often speak of the individual difference variables as independent variables and interpret the correlation as indicating that the variable is responsible for the achievement, but because individuals are not randomly assigned to the independent variable, this is only an interpretation (cf. Clément and Gardner, 2001). Correlation does not mean causation. As a consequence any 'causal statement' is arbitrary, and arguments about what

causes what are meaningless. The important point is that the association indicates that there is an association between the two variables in the population, and the association has meaning. If someone is high in aptitude, for example, a positive association indicates that there is a heightened probability (not a certainty) that he/she will have a higher level of achievement, and moreover, if someone has a high level of achievement, she/he will probably (not certainly) have a high level of aptitude. These are known as Bayesian probabilities. Searching for what is the cause in individual difference research is fruitless, and no amount of structural equation modelling (causal modelling), multiple regression analysis or hierarchical linear modelling will change that. The basic data are associations, and any causal interpretation represents a model, not reality.

This same limitation of correlational research applies to attempts to understand the causes of aptitude, attitudes, motivation, language anxiety and learning strategies. Individual differences in these variables may relate to individual differences in other variables but this is no indication that any one variable is responsible for the other. The explanations provided are simply models of possible interpretations.

This is not meant to denigrate the value of models. A model is valuable in its ability to organize data, generate testable hypotheses and suggest potential courses of action. Modelling can be improved moreover by recourse to analytic methods. For example, structural equation modelling (causal modelling) is a technique that permits a researcher to assess how well the relationships among a set of data conform to a model in which individual difference variables are hypothesized to be causes or effects of other variables. The paths are defined by regression coefficients. This procedure does not prove that any one variable causes another. Its value is that it requires careful attention to detail in defining the underlying constructs, evaluates the quality of their measurement and definition and permits the identification of correlated errors. It is a powerful methodology, but it should not be misused or misinterpreted!

#### FUTURE DIRECTIONS

Future directions in research should be concerned with the assessment of attributes, and with identifying the major dimensions underlying the variables. Concern with assessment is required to ensure that the measures of the attributes are not confounded by other factors. Thus, there should be more research concerned with reliability and validity of assessments. Reliability should be assessed in terms of both internal consistency and stability. If internal consistency reliabilities are low, attention should be directed towards more careful analysis of the nature

of the concepts, and their relation to the items used to assess them. If test or retest reliabilities are low, it should be determined whether this is because of the difficulties with the assessment procedure or fluctuations in the attribute being assessed. Not all attributes associated with learning another language will necessarily be stable over time, given the intricacies and adjustments involved in learning another language.

Validity should be investigated from a number of perspectives. Presently, much of the research is concerned primarily with predictive and concurrent validity in that correlations are reported between measures of proficiency or related variables and the measures of the attributes of interest. More attention should be devoted, however, to construct validity. Understanding will profit from a clearer picture of the relationship between the attribute in question and other variables with which it should be related (convergent validity) as well as those with which it should not (discriminant validity).

The need for construct validity is particularly important now. There is a plethora of variables that have been hypothesized as being important for second language learning, and many of them appear to overlap to some extent. Rather than coming up with even more variants, it would seem more beneficial to investigate how they relate to, or differ from, each other. The key to scientific progress is parsimony. A valuable theory is one that can explain a phenomenon with minimum variables, that organizes existing data and that is open to empirical test.

In a related vein, more attention should be directed towards the dimensionality of the various individual difference variables involved, and their relations to each other. It is clear, for example, that the variables discussed here, language aptitude, attitudes and motivation, anxiety and language-learning strategies, are all implicated in language learning, but none of them operates in isolation. Moreover, from their description, it is clear that some of them have elements in common, and it would be beneficial to determine how the various variables relate to one another and how they operate in unison to influence individual differences in second language acquisition. Finally, the time is ripe for a meta-analysis of the roles played by the individual difference variables in acquiring a second language. Meta-analysis is a procedure that involves bringing together, in a formal manner, the findings from a number of related studies, and determining the consistency in the results. Such research should focus not only on the relationships of these variables to achievement, but also on the relationships of these variables to each other and to other variables associated with the acquisition of a second language. Such research is necessary to permit the more formal modelling that is now due.

## CONDITIONS FOR SECOND LANGUAGE (L2) LEARNING

## INTRODUCTION

This chapter compares and critiques selected theories of conditions for second language (L2) learning. These theories are important because they greatly influence L2 teaching, design of curricula and materials, and learning, either for good or ill. Specific chapter goals are to: (1) explain and critically analyze chosen theories, including non-L2 theories that have influenced L2 research, theories originating in the L2 field, and very recent L2 theories; (2) present four overarching problems; and (3) propose future directions. To be included in this chapter, a theory has to address L2 development broadly, not just one or two aspects; has to be published or in press; and has to be potentially influential across the whole field or at least among a large number of researchers and practitioners. I selected theories from various perspectives, such as teacher-centered/structured, sociocultural, cognitive-psycholinguistic, natural, whole-person-focused, and technology-based. I intentionally included some hybrid theories that combine, for example, sociocultural and cognitive-psycholinguistic elements.

*Learning conditions* are defined as factors, either internal or external, that influence learning. These conditions may be either “typical” of learners or “essential” for learning (Spolsky, 1989), although most theorists do not make this distinction clear enough. I use the term *L2 learning* to refer to the learner’s development of a language once the native language has been learned. I avoid technical distinctions between *learning* and *acquisition*. These terms no longer simplistically imply, if they ever really did, “learning  $\approx$  instructed or formal” and “acquisition  $\approx$  natural or informal;” after all, “instructed L2 acquisition” is now a common term. To avoid confusion, here the generic term *L2 learning* (or L2 development) covers an array of modes for L2 growth, which can occur in myriad locations.

## EARLY DEVELOPMENTS

Early developments concerning conditions for learning outside the L2 field have influenced theorizing among L2 specialists. These developments include the work of Gagné, Vygotsky, and experts on situated

cognition and communities of practice, such as Lave and Wenger, as well as others.

### *Gagné's Conditions*

Gagné's (1965) ideas have affected L2 learning and teaching (Brown, 2002), multimedia learning (Gagné, 1993), and general instructional design (Gagné, Briggs, and Wagner, 1992). He presents a highly teacher-centered approach meant to influence the learner's internal cognitive processes. The following four conditions summarize his much larger set of conditions.

Condition 1. *Nine external instructional events* (what the teacher does) *are associated with internal cognitive processes* (what the learner does).

Condition 2. *Five types of learning are key*: verbal information, intellectual skills, motor skills, attitudes, and cognitive strategies (variations on these in L2 strategy instruction formats include Cohen, 1998; O'Malley and Chamot, 1990; Oxford, 1990, 1996).

Condition 3. *All five learning types involve some form of noticing or attention* on the part of the learner.

Condition 4. *Each learning type has its own sequence of instructional procedures*.

Gagné's theory has helped organize many aspects of learning, teaching, instructional design, and instructional technology. His highly structured, teacher-led framework of nine learning events was particularly influenced by Skinner's behaviorist concept of sequenced learning events. The value of his work lies in the simple but profound concept that different types of learning require different instructional sequences and learning conditions, although many L2 experts reject the very rigid principles of behaviorism. Some specific limitations can be noted in the theory: (1) Gagné calls for a (verbal) context for encoding, but there is little attention to the social context; (2) he recognizes the importance of cognitive strategies, but his strategy instruction does not explicitly present metacognitive strategies, a primary basis of learner self-regulation, as a separate knowledge type; and (3) although Gagné worked with specific conditions for attitude learning, he did not explore sociocultural aspects of attitudes, motivations, and beliefs.

In sum, Gagné's work focuses on highly structured, teacher-controlled, systematic, detailed, step-by-step, "micro" processes of learning and teaching. In contrast, Vygotsky, discussed next, presents a theory centered on sociocultural understandings.

### *Vygotsky's Theory of Dialogic Learning*

Vygotsky's (1962, 1978) theory is the foundation of sociocultural psychology. His work became known in the West only in the 1960s

and beyond, although it was known in Russia as early as the 1920s. Primarily in the 1990s and thereafter L2 theorists, including Lantolf and Appel (1994) and Lantolf (2000), started paying serious attention to possible applications of Vygotsky's work to L2 learning. Vygotsky's concepts are framed below as conditions for learning.

Condition 1. *Humans inherit sociocultural artifacts and knowledge that can add to their genetic inheritance (e.g., Wells, 2000).*

Condition 2. *Emotion, sensation, perception, and all human learning, including L2 learning, are suffused with social concepts and language.*

Condition 3. *Children, as well as older learners, learn by interacting with others (social mediation) through language.*

Condition 4. *Language is the most important semiotic (symbolic) tool humans possess.*

Condition 5. *The more experienced or capable person has dialogues with the learner, and the learner internalizes and transforms the key elements of these dialogues, turning them into higher mental functions, such as planning, organizing, evaluating, analyzing, and synthesizing (Kozulin, Gindis, Ageyev, and Miller, 2003; Vygotsky, 1962).*

Condition 6. *Three stages are required for this internalization and transformation: social speech (the interpsychological plane), egocentric speech, and inner speech (the intrapsychological plane) (Vygotsky, 1962). Thus, learning starts out as "other-regulation" but, through a series of dialogues with more capable people, becomes inner speech, which can become self-regulation (see e.g., Kozulin, Gindis, Ageyev, and Miller, 2003; Vygotsky, 1962).*

Condition 7. *The zone of proximal development (ZPD) is the difference between the individual's current level and the potential level that can be reached with assistance.*

Condition 8. *As a corollary, "dynamic assessment" is essential because it measures the area of potentiality, not just the present level (Wertsch, 1985), which is usually the only level measured by what Vygotsky disparages as "static assessment."*

The theory, when applied to the L2 field, awakens L2 teachers and researchers to crucial conditions for learning an additional language. For understanding L2 learning and teaching, many of Vygotsky's concepts are fundamental: the teacher's role in dialogues, the learner's role in moving stepwise from social to inner speech, social and semiotic mediation, higher order functions, increasing self-regulation, and the role of language in concept development, for example. The ZPD-based concept of dynamic performance assessment, as yet little understood or applied by Western L2-testing specialists, could become a major advance for L2 testing. Despite some limitations, such as an explanation of how the teacher can hold a dialogue with 20 or 30 students in

a class at the appropriate level of their individually differing ZPDs, Vygotsky's work is now viewed as seminal and extremely important in the L2 field. His theory is rooted in culture, history, and personal relationships. Thus, it is a theory of "situated cognition," a precursor to later theories dealing with situated cognition in communities of practice, discussed next.

### *Situated Cognition in Communities of Practice*

Situated cognition as viewed today has at least two different meanings (1) *learning that is based (anchored, situated) in a specific, real-life, interesting, challenging problem* to be solved by learners; and (2) *learning that is situated in a community of practice*, i.e., "a group of people who share an interest in a domain of human endeavor and engage in a process of collective learning that creates bonds between them" (Wenger, 1998, p. 1). This section concerns the second meaning of situated cognition.

Lave and Wenger (1991) are authors of the term "communities of practice," which they coined while studying apprenticeship as a model for learning. We all have experience as apprentices in various communities of practice: at home, at work, in educational institutions, and so on. Situated cognition in communities of practice can be described vis-à-vis the following learning conditions.

Condition 1. *Three elements characterize a community of practice: domain, community, and shared practice, the last of which is a repertoire of knowledge, skills, beliefs, artifacts, documents, and strategies* (Wenger, 1998).

Condition 2. *Apprenticeship is not just a relationship between a student and a master but instead a set of complex social relationships. Learning by the apprentice is an integral part of generative (creative) social practice in the lived-in world* (Lave and Wenger, 1991, p. 35).

Condition 3. *A person might be an expert ("old-timer") at the center in one community of practice, while being a novice ("newcomer" or "apprentice") at the edge or periphery of other communities of practice* (Lave and Wenger, 1991).

Condition 4. *Communities of practice are dynamic, with peripherally participating members moving toward the center as experts over time and with slightly more experienced apprentices teaching newer apprentices.*

Condition 5. *The whole community learns, because learning occurs not just in an individual mind; learning also occurs collectively, in a "distributed" way* (Hanks, 1991, pp. 15–16).

Condition 6. *In communities of practice, participants are constantly constructing and altering identities through interaction* (Norton,

2001). When identities are shaped, threatened, or reshaped in communities of practice, other learner factors—values, emotions, motivation, and performance—are naturally engaged in the process. Some concepts from the theory of situated cognition in communities of practice have been applied to L2 learning. For instance, Norton (2001) provides examples of situated cognition and identity regarding participation and nonparticipation in L2 learners' "imagined [desired] communities." Much more L2 research would be valuable in this exciting and important area. However, some criticisms can also be raised regarding the basic theory. The concept of distributed/collective learning requires more specificity in diverse communities of practice. In addition, the spatial metaphor of movement from the community's periphery to the center, while useful in many instances, might seem simplistic when we consider all the different trajectories, identity conflicts, emotions, desires, skills, and knowledge emerging in an L2 community of practice simultaneously or over time.

Unlike the theories above, the next theories first arose in the L2 field.

#### MAJOR CONTRIBUTIONS WITHIN THE L2 FIELD

In this section, conditions for L2 learning are drawn from Krashen's hypotheses about L2 acquisition, Spolsky's detailed theory of L2 learning conditions, and H.D. Brown's principles of L2 learning and teaching. The numbering system for the conditions is my own.

##### *Krashen's Hypotheses*

Krashen's (1982, 1985) theory is founded on the distinction between L2 learning and acquisition. The following conditions are based on his hypotheses.

Condition 1. *L2 acquisition involves unconscious, creative communication.* L2 acquisition "... is a subconscious process identical in all important ways to the process children utilize in acquiring their first language ... " (Krashen, 1985, p. 1).

Condition 2. *Comprehensive input is required for L2 acquisition.* L2 acquisition develops only when the individual receives "comprehensible input," that is, input slightly above his or her current level of comprehension ("i+1").

Condition 3. *Affect is important.* For L2 acquisition, comprehensible input must occur in an atmosphere in which the student's "affective filter" is low, that is, a situation with as little anxiety as possible.

Condition 4. *Acquisition occurs without grammar instruction.*

Condition 5. *Acquisition involves natural order.* Acquisition of L2 grammatical structures occurs unconsciously in a natural order.

Condition 6. *Speaking must be allowed to emerge spontaneously.* Speaking production ability emerges spontaneously after learners have developed enough linguistic competence through comprehensible input. A silent period is expected.

Condition 7. *L1-L2 transfer errors occur.* When a person tries to produce the L2 beyond his or her acquisition level, he or she tends to employ L1 rules erroneously.

Condition 8. *In contrast to L2 acquisition, L2 learning is conscious and hence limited.* L2 learning is a conscious, declarative process that occurs in typical, formal classrooms.

Condition 9. *“Learned” knowledge involves the monitor.* Learned knowledge serves as an editor (monitor). To use the monitor, the individual must have sufficient time to think about and use conscious rules, must attend to form rather than meaning, and must know the rules (Krashen, 1982).

Condition 10. *Adults and children operate differently.* Acquisition is the single route possible for children to internalize the L2, just as they absorb the L1. However, adults have two possible routes: acquisition and learning (Krashen, 1985).

Krashen has had a significant effect on the L2 field over the last three decades. His theory describes a distinct classroom mode, the Natural Approach (Krashen and Terrell, 1983). However, the Natural Approach is in its own way prescriptive and narrow, exhorting teachers to provide a natural, informal setting for L2 acquisition and to abjure grammar instruction entirely. Contrary to Krashen’s view, Scarcella and Oxford (1992) note that comprehensible input is not sufficient for transforming input into usable “intake.” Moreover, Krashen provides no clear definition of “comprehensible input.” The “ $i+1$ ” formulation is a good heuristic or symbol but not a true explanation of a process. In addition, there is no special role for comprehensible output in the theory. McLaughlin (1987) challenges the theory for never adequately defining “acquisition,” “learning,” “conscious,” and “subconscious.” Krashen’s assertion that grammar study has no role is contradicted by examples of the utility of grammar study within a communicative methodology (e.g. Lightbown and Pienemann, 1993; McLaughlin, 1987). It is also questionable whether a single natural order of L2 acquisition exists given the variety of L1 backgrounds learners have, the effects of L1 on L2 development, and other factors. The theory provides no detailed explanation of how the “affective filter” develops.

Krashen attempts to revolutionize the way we look at L2 acquisition by painting a picture with broad brush strokes, while Spolsky, discussed next, is more like a calligrapher, codifying in great detail and precision the conditions of L2 learning.

*Spolsky's Conditions for L2 Learning*

Spolsky's (1989) goal is to create a general theory of L2 learning, which contains 74 conditions ("rules") for L2 learning. The book's central question is, "Who learns how much of what language under what conditions?" Spolsky (1989) asserts that the theory is based "firmly and clearly in a social context" (p. 14). "Language learning is individual but occurs in society, and while the social factors are not necessarily direct in their influence, they have strong and traceable indirect effects . . ." (p. 15). Compared with Spolsky, Norton (2001) and others give a more prominent place to sociocultural influences on L2 learning. The following paragraph briefly summarizes the conditions in Spolsky's theory.

Conditions 1–7 relate to the *nature of L2 knowledge*. The learner's L2 knowledge forms a systematic whole but is marked by variability. Analyzed L2 knowledge is recombinable and creative but can also be enriched with unanalyzed knowledge. Conditions 8–15 concern *language use*. Receptive skills (listening, reading) usually develop before productive language skills (speaking, writing) and to a higher level. Some L2 knowledge might be intuitive and implicit (rules not expressible by the learner). Learners vary in automaticity (fluency) of speaking, accuracy, and amount of control. Conditions 16–20 are focused on *testing and measurement* of L2 knowledge and skills. Knowing an L2 involves not only knowing discrete items but also controlling integrated functional skills. Conditions 22–31 and 50–56 focus on *individual learner factors*, while conditions 34–41 involve *linguistics*. *Social context* is the focus of Conditions 42–49, and conditions 57–62 concern *opportunities* for the learner to analyze the L2, recombine, embed, remember, practice, and match knowledge. Conditions for *natural learning* (63–73, odd numbers) are: communicative use, many fluent speakers, open space, and uncontrolled language but possibly modified for comprehensibility. Conditions for *formal learning* (64–74, even numbers) are: only one fluent speaker (the teacher), enclosed space, controlled language, simplified language, and much practice.

Spolsky deserves praise for this attempt to produce a comprehensive theory of conditions for L2 learning. Many areas are well represented in Spolsky's theory, e.g., multiple types of language knowledge, specific linguistic foundations, formal versus informal learning, and language use. However, considering the theory's massiveness, criticisms are bound to emerge. For example, in the context of world languages, many experts (see Davies, 2003; Singh, 1998) question whether learners outside of a certain geographic range have ever encountered "native speaker language," and those researchers ask whether a typical

“native speaker” can be said to exist. The theory lacks well-developed conditions for L2 learner autonomy/self-regulation. Finally, social and cultural aspects, while mentioned, are not adequately developed in the theory.

In comparison to Spolsky’s long list of L2 learning conditions, the theory of H.D. Brown (2001) is intentionally simpler. Obviously, the purposes differ.

### *Brown’s Theory*

Brown’s (2001) theory reflects a “whole-person” approach, not just a psycholinguistic approach. He presents 12 principles of language learning and teaching, which can be considered conditions, as I show below. According to Brown, L2 learning requires the following:

Condition 1. *Efficient L2 learning involves timely movement from control of a few language forms to automatic processing* of a relatively unlimited number of language forms. L2 teaching should not focus just on isolated items but should also give learners authentic, meaningful practice opportunities leading to automaticity.

Condition 2. Meaningful learning is by definition relevant to learners’ goals and interests.

Condition 3. *Learners’ actions are driven by anticipation of reward*, so teachers must understand learners’ motivations and purposes, and learners must be aware of the beneficial aims of the course.

Condition 4. *The most powerful rewards are intrinsic*, that is, internal to the learner, even without external rewards. Teacher praise and constructive feedback can be reinforcing, but intrinsic motivation is more powerful.

Condition 5. *L2 mastery depends largely on use of learning strategies*. Although the methods employed by the teacher are important, learning strategies are equally important.

Condition 6. *As one learns an L2, one develops a second identity or language ego*. Teachers should show sensitivity and support to learners who might feel inhibited or defenseless in the classroom.

Condition 7. Self-confidence influences L2 development. A self-confident learner can accomplish the task regardless of language ego.

Condition 8. *L2 learners must take risks for long-term retention*. To encourage risk-taking, teachers create an appropriate, encouraging classroom atmosphere and ensure that L2 tasks are at the right difficulty level.

Condition 9. L2 learning and culture learning are connected. L2 teaching involves teaching customs, values, and ways of thinking and feeling. Teachers should be sensitive to students’ culturally related L2 learning preferences.

Condition 10. *The L1 influences L2 learning*, either facilitating or interfering, depending on the closeness between the two languages and other factors.

Condition 11. *The learner's interlanguage is systematic or quasi-systematic*. Knowledge of how the interlanguage operates influences the feedback teachers give students.

Condition 12. *Learners need to develop communicative competence*, so the L2 classroom must be authentically communicative and relate to learners' future needs. It must attend to use and usage and to both fluency and accuracy.

This theory encapsulates currently predominant, research-based beliefs concerning a necessary balance between form and meaning and between accuracy and fluency. One of the strongest aspects of the theory is the inclusion of multiple affective or cognitive-affective factors, such as anticipation of reward, intrinsic motivation, language ego, self-confidence, and risk-taking. Some linguistic factors are also cited (L1 influences on L2 and interlanguage), as well as certain cognitive factors (learning strategies and the movement to automatic processing). The link between culture and language is made clear, as is the importance of meaningful learning and communicative competence. Brown is awake to the social aspects of learning, as seen in the emphasis on interaction and the role of culture, but his theory unfortunately does not explicitly provide depth about socioculturally mediated learning or communities of practice. He cites the importance of the learning environment, but a setting that seems encouraging and nonthreatening for one learner might not seem so for another. How the classroom atmosphere is experienced at a given time depends on the individual learner's personality, general anxiety level, and other factors.

Recent contributions are shown next in areas of conditions for instructed L2 acquisition and conditions for technology-related L2 learning.

#### WORK IN PROGRESS

This section presents recent work on conditions for L2 learning, first without an emphasis on technology and then with technology. I review theories by Ellis (2005) and Zhao and Lai (2007).

##### *Ellis' Model of Instructed L2 Acquisition*

In this primarily psycholinguistic theory, Ellis (1999) uses the term "instructed L2 acquisition" for a specific purpose. For him, acquisition is indicated when an item or feature is truly internalized and entered into the learner's interlanguage for communicative use. Ellis (2005)

offers ten principles of instructed L2 acquisition that are expressed below as learning conditions. *L2 instruction needs to . . .*

Condition 1. . . . *ensure that learners develop both a rich repertoire of formulaic expressions and a rule-based competence.*

Condition 2. . . . *ensure that learners focus mainly on meaning.* Meaning includes both semantic meaning (L2 as a subject of study) and pragmatic meaning (L2 as a tool for communication).

Condition 3. . . . *ensure that learners also focus on form.* This can occur through either an intensive emphasis on specific forms or an incidental, extensive attention to larger numbers of forms.

Condition 4. . . . *be predominantly directed at developing implicit knowledge of the L2 while not neglecting explicit knowledge.* Implicit knowledge underlies fluency and explicit knowledge underlying accuracy.

Condition 5. . . . *take into account learners' "built-in" syllabus.* Order of acquisition is approximately the same for natural and instructed L2 learners, so any instruction must be compatible with natural processes.

Condition 6. . . . *provide extensive L2 input.* Input can occur in natural or instructed acquisition. This means using the L2 extensively in the classroom and having many outside opportunities for L2 input, including extensive reading.

Condition 7. . . . *provide opportunity for L2 output.* Interaction encourages acquisition when a communication problem occurs, students must negotiate meaning, and adequate scaffolding is present.

Condition 8. . . . *emphasize that the opportunity to interact in the L2 is central to developing proficiency.* Students must have a reason to attend to language, have opportunities to express personal meanings, be engaged in tasks beyond their current proficiency level, and interact in a large range of contexts.

Condition 9. . . . *take into account learners' individual differences.* These include, e.g., motivation and learner strategies. Strategy instruction should include both analytical and experiential modes.

Condition 10. . . . *assess both free and controlled L2 production.*

In this list of research-based conditions for effective instructed L2 acquisition, Ellis underscores the importance of implicit L2 knowledge while still giving explicit knowledge a role. He promotes a focus on meaning while not forgetting form or the learner's "built-in syllabus." He accurately emphasizes the crucial nature of interaction, which is related to multiple opportunities for input and output practice in varying contexts. He notes that strategy instruction is not only part of the teacher's role but should also occur in more than one modality

to meet the needs of diverse learners. One drawback is that this list contains nothing about key sociocultural factors, such as social mediation, identity, power struggles, or values. Nothing is stated about the effects of the nature of the classroom environment or other sociocultural environments on L2 learning.

The theory discussed next is about conditions for learning the L2 with technology. As would be hoped, there is some overlap with Ellis' concepts of instructed L2 acquisition.

### *Zhao and Lai's Theory of Technology-Enhanced Instructional Conditions*

Zhao and Lai's (2007) theory contains four instructional conditions, which relate to L2 instruction regardless of whether it is enriched by technology or not. However, they cite research showing that technology-enhanced L2 instruction is often better able to fulfill the four conditions. Technologies mentioned by the authors range from ordinary TVs, audiotapes, videos, and mobile phones to the most sophisticated computerized hardware and software, even artificial intelligence.

Condition 1. *Learners need high quality input.* Technologies offer authentic input of various types: comprehensible, simplified, and enhanced.

Condition 2. *Learners need ample opportunities to practice.* Technology provides practice via computer-mediated communication, mobile phones, and human-computer interaction.

Condition 3. *Learners need high quality feedback.* Technology contributes to feedback vis-à-vis error-tracking, speech recognition, adaptive feedback, and learner control of feedback (a form of self-regulation or autonomy).

Condition 4. *Learners need individualized content.* Technology allows greater customization and individualization.

The theory by Zhao and Lai is elegant in its simplicity and rich in its research foundation, based on studies with and without technology-enhanced instruction. It helpfully includes both the psycholinguistic perspective and the sociocultural approach, although the former is emphasized. There is little to criticize, but more could be added, for instance, regarding certain sociocultural factors. Though the theory mentions learner strategies in relation to individual differences, strategies could also be discussed in regard to their powerful role in communicative practice. It would be useful for the theory to explain in further detail how individualization can work, especially in the context of students' needing to meet learning standards at multiple educational levels (national, state, and local).

## PROBLEMS AND DIFFICULTIES

Several problems and difficulties exist, including lack of understanding of the intellectual roots (cultural, historical, and personal) of many theories, lack of clarity of purposes, the sheer number of theories, and inconsistency in addressing some basic theoretical necessities.

Issue 1. *Theories of conditions for learning are often accepted (or rejected) at face value, i.e., superficially and without an exploration of their cultural, historical, and personal roots.* Each of the theories reflects cultural belief system(s), historical factors, and personal experiences. However, those who encounter these theories do not necessarily know or think about the cultural, historical, and personal underpinnings—the “intellectual history” of each theory, so to speak. No matter how objective a learning theory might seem, no learning theory is culture-free, ahistorical, or lacking in a personal imprint. It is unfortunate that researchers, teachers, and others do not always recognize or seek the background of a given theory. Such knowledge might help potential users understand why a given theorist frames the theory in particular ways, especially with regard to assumptions about purpose(s) for learning, role of the teacher, role of the learner, teacher–learner relationships, appropriate tasks, nature of input and feedback, implicit/explicit knowledge, emphasis on content or language, and learning environment.

Issue 2. *These theories have a mixture of purposes, which are not always made clear.* Perhaps there should be greater clarity in several of the theories regarding just what the theories hope to explain. Many theories contain a combination of conditions/principles of teaching, learning, and linguistic factors. Are they learning and teaching theories? Strictly learning theories? Linguistic theories?

Issue 3. *There is a plethora of theories.* More than 20 years ago, Long (1983) noted that the field of L2 acquisition or learning already possessed more than 60 different theories. These theories covered areas such as acculturation, affective variables, variation, and discourse. Theories tend to proliferate rather than consolidate, so there are likely more theories now than then. Few attempts have been made pull these theories into a full-scale, testable, comprehensive theory, although Spolsky certainly tries his best.

Issue 4. *Some key issues of theory-building have not been consistently addressed.* In the field of L2 development, many attempts at delineating conditions, hypotheses, conclusions, or principles have been made without regard to some important fundamentals of theory-development. Gregg (1999, applying the work of Cummins, 1983) points out two problems inherent in trying to understand L2 learning or acquisition: logical and developmental. The *logical*

*problem* involves explaining the nature of human competence to develop an L2. This problem requires a *property theory* of the system's components and their interrelationships. The *developmental problem* involves explaining processes whereby development occurs over time, calling for a *transition theory* of cause-and-effect. I classify the first problem-and-theory set as "static" (or synchronic/single-time) and the second as "dynamic" (or diachronic/across time). Both general types of theory, property and transition, are necessary for understanding L2 development. However, most theories tend to be only one or another—property or transition—or else include a somewhat unsatisfying or slightly unorganized mix of both. Theorists should explain whether they are presenting property theories, transition theories, or some combination and should indicate how they are doing this.

### FUTURE DIRECTIONS

New options for research and theory concerning L2 learning conditions can be associated with specific themes. One burgeoning theme is conditions for facing an L2 learning crisis and moving beyond it effectively (Oxford, Meng, Zhou, Sung, and Jain, 2007). My recent research has uncovered dozens of L2 learning crises associated with repeated failure in L2 classrooms; loss of L2 self-worth or self-efficacy when learners face dismissive, controlling, punitive, indifferent, power-hungry, or discriminatory L2 teachers or sarcastic and unwelcoming peers; and interrupted schooling and trauma among immigrants and refugees learning an L2. This work incorporates concepts from self-determination (e.g., Ryan and Deci, 2000), autonomy and strategies (Benson, 2006; Little, 1994; Oxford, in press), competence (Ryan and Deci, 2000), motivation and demotivation (Dörnyei, 2001; Oxford, 2003), sociocultural identity (Norton, 2000, 2001), trauma (Bracken, 2005), and resiliency (Masten, 2006). The factors of crisis, trauma, and resiliency expand our understanding of conditions for L2 learning.

A second theme involves emotions. MacIntyre (2002) complains that the only emotion L2 researchers have studied in depth anxiety. However, new L2-related work appears to be dramatically expanding the study of emotion, especially as related to identity. Recent contributions are by Pavlenko (2006) and Pavlenko and Blackledge (2004), who discuss emotions and identity not as merely individual, personal features but instead in sociocultural terms within multilingual settings. Future research along this line can be explicitly associated with socio-cultural issues of symbolic and actual power, "native-speakerism," the role of nonnative speakers in teaching and learning an L2, language prestige and discrimination, and post-colonialism in general.

A third theme comprises conditions for technology-enhanced learning. Technology can lead L2 learning out of the classroom and into almost any venue. The significant array of technologies presented by Zhao and Lai (2007), as well as found in CALL theories (Egbert, Chao, and Hanson-Smith, 1999; Pennington, 1996), offers new ways of thinking about conditions for L2 learning. It would be extremely interesting to find out more about the linguistic, cultural, cognitive, and affective aspects of L2 learning that can be facilitated via technology.

A fourth theme, hardly touched upon at all in the theories in this chapter, involves characteristics of the teacher. The teacher is not a faceless, nameless machine any more than is the learner. It is almost unbelievable that theories of conditions of L2 learning do not address features of teachers who facilitate L2 learning in particular types of contexts and varied geographic regions around the world. Some useful research exists on (a) L2 teacher beliefs and behaviors, often as related to L2 student beliefs and behaviors (e.g., Kalaja and Barcelos, 2003; Oxford, 2001), and (b) teacher characteristics outside of the L2 field (Brophy, 2002).

Much theoretical research and practical work needs to be done in the ongoing and important area of conditions for L2 learning. This area affects millions of learners throughout the world, as well as their teachers, families, and others. This chapter stands as a formal call for widespread, coordinated efforts to uncover conditions for L2 learning in varied sociocultural settings. Interdisciplinary efforts are very valuable, especially when researchers and theorists from diverse schools of thought work closely in teams. Such creative efforts will benefit everyone, particularly L2 learners and teachers.

## **Section 2**

### **Current Approaches to Second and Foreign Language Education**

## CONTENT-BASED INSTRUCTION

### INTRODUCTION

Content-based instruction (CBI) is an umbrella term referring to instructional approaches that make a dual, though not necessarily equal, commitment to language and content-learning objectives. CBI has been translated into practice in diverse ways in response to student needs at primary, secondary, tertiary, and adult education levels, in foreign, second, and multiple language contexts. Unlike other language instruction approaches that define primary content in terms of grammatical structures, communicative language functions, or language skills, in CBI, content refers to the use of nonlanguage subject matter that is closely aligned with traditional school subjects, themes of interest to students, or vocational and occupational areas. Most content-based settings have strong academic orientations, emphasizing the linguistic, cognitive, and metacognitive skills as well as subject matter that students need to succeed in future educational endeavors. In highly diversified linguistic contexts, CBI can be used to promote plurilingualism as a social and political necessity (Wolff, 2002). Despite differences in emphases, what most content-based approaches share is the assumption that content and language create a symbiotic relationship; that is, the learning of content contributes to the learning of language and a mastery of language gives learners easier access to content (Stoller, 2004).

### EARLY DEVELOPMENTS

Integrated language and content instruction, historically restricted to upper social classes, now reaches across social strata and educational levels. The more widespread use of CBI is partially a response to increased global communication, the need for competencies in languages of wider communication, efforts to maintain and revive minority languages (Cenoz and Genesse, 1998), attempts to preserve linguistic and cultural diversity (Wolff, 2002), and changes in student demographics.

CBI has been implemented in various ways, revealing different degrees of emphasis placed on language and content. These varied configurations lie on a continuum, bounded by content-driven curricula at one end and language-driven curricula at the other (Met, 1998). In immersion programs, at the content-driven end of the continuum, school

subject matter is taught primarily through the medium of the target language. The term immersion, oftentimes referred to as the prototypical content-based approach, was adopted in the 1960s to refer to Canadian programs in which children were taught traditional school subjects in their second language (Swain and Lapkin, 1982; see also Genesee and Lindholm-Leary, *Dual Language Education in Canada and the USA*, Volume 5). Since that time, the Canadian immersion model has been adapted worldwide to include full immersion, partial immersion, late immersion, and delayed immersion (Johnson and Swain, 1997).

At the other end of the continuum are theme-based courses and language programs with stronger commitments to language-learning objectives. Theme-based courses are typically designed around themes that provide the content for language-learning activities; in language programs with a weak content focus, subject matter is integrated into individual lessons as a means for assisting students in developing their language abilities.

In between the two end points on the continuum are other content-based prototypes. Two models in particular grant more equal weighting to content and language objectives. In sheltered instruction (Echevarria and Graves, 2007), nonnative speakers of the target language are deliberately separated from native speakers for the purpose of “sheltered” content instruction, characterized by the use of comprehensible language, the contextualization of subject matter, visual aids, modified texts and assignments, and explicit attention to students’ linguistic needs. In adjunct or linked courses, students are concurrently enrolled in a language class and a content class, the former designed to assist students with the content-learning demands of the latter.

A major source of early support for CBI, in its various forms, stemmed from second language acquisition research, in particular studies on the role of comprehensible input, output, and explicit attention to relevant and contextually appropriate language forms. Further support was provided by sociocultural approaches to second language acquisition that demonstrated that the Vygotskian-based concepts of negotiation in the Zone of Proximal Development, private speech, and student appropriation of learning tasks are important components in language learning and readily compatible with CBI. Moreover, the idea that students need Cognitive Academic Language Proficiency (CALP) to succeed in academic second language-learning contexts provided an additional impetus for CBI (see Cummins, 2000).

Research in educational and cognitive psychology also provided compelling support for CBI. Of particular relevance was research on cognitive processes of learning, depth of processing, discourse comprehension processing, optimal experiences, expertise, motivation, attribution, and learner interest. Additional support for CBI stemmed from

classroom training studies on cooperative learning, metacognitive and learning strategy instruction, and extensive reading, all readily incorporated within CBI. The outcomes of actual CBI programs in foreign and second language settings (Brinton, Snow, and Wesche, 1989; Krueger and Ryan, 1993) offered support for CBI as well (see Grabe and Stoller, 1997, for a review of this early support).

### MAJOR CONTRIBUTIONS

In the 1980s, applied linguists exhibited substantial interest in instructional approaches that combined language and content-learning objectives. Mohan (1986) characterized academic discourse in terms of knowledge structures typical of school subject matter: description, sequence, choice, classification, principles, and evaluation. He proposed a model of integrated instruction that explicitly taught knowledge structures and corresponding graphic representations to assist students in mastery of content and academic discourse. Crandall (1987) showcased ways in which teachers could integrate instruction to help limited English-proficient students master mathematics, science, and social studies while at the same time learning academic English. Enright and McCloskey's (1988) Integrated Language Teaching Model emphasized the integration of language and subject matter learning, language skills, as well as home and school language and learning experiences. Brinton, Snow, and Wesche (1989) provided an oft-quoted rationale for CBI at postsecondary levels and showcased models of sheltered, adjunct, and theme-based approaches to CBI. Concurrent with these publications was the emergence of the Cognitive Academic Language Learning Approach (CALLA) (Chamot and O'Malley, 1987), an alternative to sheltered instruction that is noted for its three-way commitment to academic content, academic language skills, and strategy training.

Since the 1980s, numerous adaptations of integrated instruction prototypes have emerged. Some North American initiatives include the Language-Content-Task (LCT) framework (Short, 2002), which emphasizes the importance of and interactions among knowledge of the target language (L), the content area (C), and the tasks (T) required to succeed in academic settings. The six T's framework (Stoller and Grabe, 1997) endorses the use of themes, topics, texts, tasks, threads, and transitions as design criteria for more coherent content-based curricula. Sustained CBI and sustained content language teaching (Murphy and Stoller, 2001; Pally, 2000) promote the exploration of a single-carrier topic in the language classroom, with a complementary focus on language learning. The Content-based Language Teaching Through Technology initiative, launched by the University of Minnesota's Center for Advanced Research on Language Acquisition, assists foreign

language teachers, in kindergarten to tertiary level classes, in creating curricula that utilize technology to support CBI (<http://carla.acad.umn.edu/COBALTT.html>).

Models for foreign language education in North American contexts include content-enriched Foreign Language in the Elementary School (FLES) programs, in which content matter from other classes (e.g., math, science, geography) is integrated into foreign language classes; the foreign language serves as reinforcement for subject matter classes and the content serves as a stimulus for contextualized language learning. In tertiary level Foreign Language Across the Curriculum (FLAC) and Languages Across the Curriculum (LAC or LxC), institutions extend the reach of foreign languages by providing students with opportunities to use foreign languages in areas of academic interest (Krueger and Ryan, 1993; Stryker and Leaver, 1997). In FLAC programs, foreign languages are taught through the content of academic disciplines (e.g., history, social sciences, engineering) and the learning of various disciplines is augmented with foreign language content resources. Foreign Language Immersion Programs (FLIP) provide university level foreign language and content-area majors the opportunity to enroll in a full set of language and content courses taught in the target language. The Monterey Model (Jourdenais and Springer, 2005) integrates advanced foreign language study into programs such as International Business and International Policy Studies, thereby making a dual commitment to content and language learning.

In Europe, Content and Language Integrated Learning (CLIL) has been formalized in response to the European Union's plurilingual education agenda, its commitment to the preservation of linguistic and cultural diversity, and its recognition of the political and economic necessity to increase multilingualism (Grenfell, 2002; see also Coyle, *CLIL—A Pedagogical Approach from the European Perspective*, Volume 4; Marsh, *Language Awareness and CLIL*, Volume 6). CLIL is typically adopted in contexts in which an additional language (i.e., not the most widely used language of the setting) is used for the teaching and learning of subject matter other than the language itself (Marsh and Langé, 1999), with the goal of "European competence" (Wolff, 2002). CLIL, sometimes referred to as Modern Languages Across the Curriculum (MLAC), has been translated into diverse configurations, within and across countries, reflected by differences in curricula, targeted content areas, designated languages, selection of students, methodology, materials, assessment, and teacher development. Despite these differences, five overarching dimensions are combined, though in different ways and to different degrees, in CLIL classrooms (Marsh, Maljers, and Hartiala, 2001); they include cultural, environmental (focused on internationalization and European Union integration),

language, content, and learning (focused on learning strategies and learner motivation) dimensions. Related to CLIL are the European Network for Content and Language Integrated Classrooms (EuroCLIC) ([www.euroclil.net](http://www.euroclil.net)), which promotes the exchange of information, experience, and materials among those involved in integrated instruction, and Translanguage in Europe-CLIL (TIE-CLIL) ([www.tieclil.org](http://www.tieclil.org)), a multinational effort to write CLIL teacher-education materials.

Other notable contributions to CBI focus more directly on the language of the content areas. The conceptual framework proposed by Snow, Met, and Genesee (1989) introduced the important notions of *content-obligatory language* and *content-compatible language*, the former referring to the specific language required for students to master and communicate about a particular content area and the latter referring to academic language that can be taught within the context of a given content area but that is not required for content mastery. Equally notable is the work of Short (1994), who focused on the characteristics of disciplinary language, specifically social studies and history, and the demands they place on target language learners. Short's work has resulted in teacher guidelines for integrated language and content instruction, with an emphasis on scaffolding, graphic organizers, and language and content-teacher collaboration. Short's work as well as others at the Center for Applied Linguistics in Washington, DC ([www.cal.org](http://www.cal.org)) has contributed greatly to an understanding of the intricacies of the language of different disciplines, the tasks commonly associated with those disciplines, and the challenges faced by teachers and students in content-based classrooms.

In addition to examining the language of the disciplines, attention has been paid to the practices of content teachers. As an example, Project Learning English for Academic Purposes (LEAP; Snow, 1997) has focused on strategies that can be used by university faculty to make their content instruction more accessible to language minority students, while maintaining the academic rigor of their courses. Emphasis has been placed on instructional enhancements to improve lectures, make textbooks accessible, scaffold instruction, prepare students for exams, and involve students actively in learning.

#### WORK IN PROGRESS

Approaches to CBI continue to evolve internationally, in locations as distinct as Australia, Europe, Israel and the Middle East, Japan, North America, South Africa, Turkey, and West Africa (e.g., Fruhauf, Coyle, and Christ, 1996; Grenfell, 2002; Jourdenais and Springer, 2005; Kaufman and Crandall, 2005; Snow and Brinton, 1997; Wilkinson, 2004). While many programs have designated English as the language

of instruction, other languages are also the target of CBI, including Chinese, Dari and Pashto, French, German, Japanese, and Spanish. CBI is being adapted in these diverse settings for students at beginning, intermediate, and advanced proficiency levels. In an effort to meet the needs of such diverse student populations and educational settings, CBI professionals report efforts at collaborating across the disciplines, experimenting with problem and project-based learning, and refining mainstreaming efforts (Mohan, Leung, and Davison, 2001). Furthermore, CBI educators are working diligently to promote student autonomy, use technology to enhance content and language learning, and integrate new approaches into CBI that assist students' academic language development, grasp of content, and ability to engage in meaningful interactions.

Professionals interested in CBI are also exploring the relevance of empirically supported Concept-Oriented Reading Instruction (CORI) and Collaborative Strategic Reading (CSR) for their classrooms (see Stoller, 2004). CORI emphasizes thematic instruction, students' personal engagement with themes, wide reading and information gathering across multiple information sources, reading strategy instruction to assist with comprehension, and project work; it has been used and researched extensively in first language settings. CSR is an instructional framework that combines cooperative learning principles and reading comprehension strategy instruction to promote content learning, language mastery, and reading comprehension.

Current research on the effectiveness of integrated content and language learning has confirmed earlier findings and has provided new insights on CBI. Continuing a long-standing tradition, numerous Canadian studies focus on integrated content and language instruction at primary, secondary, and tertiary levels (Wesche, 2001). Researchers in Canada continue to explore the effects of (a) immersion models, (b) the proportion of instructional time in the target language and the mother tongue, and (c) the language of assessment. Of particular interest are findings that suggest that immersion programs have proven largely successful at helping learners develop fluency and comprehension of a second language, but are unsuccessful in assisting students in developing the accuracy of their native-speaking counterparts (see Swain, 2000). Ethnographic studies of secondary social studies classes have determined that students not only need to be able to succeed in a variety of speaking, reading, and writing tasks, but they also need (a) knowledge of popular culture, mass media, and newsworthy events, (b) skills to express critical perspectives on social issues, and (c) confidence. Other studies have examined the effectiveness of the adjunct model at university levels; results have revealed that students can make measurable gains in oral fluency and accuracy as a result of paired

classes, building upon earlier studies that demonstrated the effectiveness of linking content and language-support courses.

Research on teacher and learner-modified interactions, form-focused intervention, and form-focused instruction has led to recommendations that content-based teachers modify their responses to student contributions made during classroom discussions in ways that generate more input, feedback, and modified student output (Pica, 2002). The empirically validated Sheltered Instruction Observation Protocol model (SIOP) provides school personnel (including teachers and teacher supervisors) with an instrument for observing and quantifying teachers' implementation of quality sheltered instruction (Echevarria, Vogt, and Short, 2004). Essentially, the SIOP model operationalizes sheltered instruction by offering teachers a model for lesson planning and implementation.

### PROBLEMS AND DIFFICULTIES

The integration of content and language-learning objectives presents challenges for policy makers, program planners, curriculum designers, teachers, materials writers, teacher educators, teacher supervisors, test writers, and learners. A perennial problem is linked to the paucity of content materials in target languages and the time-consuming nature of creating suitable materials (Fruhauf, Coyle, and Christ, 1996). When faced with selecting from among available materials, CBI teachers struggle with determining levels of sufficient challenge to ensure student motivation and engagement and finding a good match with student ages, cognitive levels, and curricular expectations. Practitioners often report the difficulties associated with (a) the selection and sequencing of language items dictated by content sources rather than predetermined language syllabi and (b) the alignment of content with language structures and functions that emerge from the subject matter.

Another formidable obstacle in some settings concerns the institutionalization of CBI in light of available resources and the needs of faculty and students. In some centralized educational systems, securing official approval of a CBI approach has proven to be problematic. In most content-based settings, preoccupations about funding, beyond start-up costs, are pervasive.

Another commonly cited set of challenges concerns CBI teacher recruitment, qualifications (including target language proficiency), certification, training, and assessment. In some settings, debates center around the use of subject or language specialists in CBI. At times, what plague efforts to advance CBI are (a) the lack of expertise among language teachers in content areas and discipline-specific pedagogy and (b) the lack of experience among content teachers in addressing

learners' language needs. At the most foundational levels, language instructors need assistance in handling unfamiliar subject matter and content-area instructors need training in handling language issues (Perez-Vidal, 1999), yet all teachers involved in integrated instruction would benefit from training that prepares them for the language *and* content-learning demands of their classrooms (Esbcoar Urmeneta and Perez-Vidal, 2004). Little research or curriculum development, from within the disciplines, guides teachers in accommodating language learners as they strive to master content knowledge and improve their language skills (Kaufman and Crandall, 2005).

That teachers are not fully prepared for content-based classrooms has caught the attention of the international Teachers of English to Speakers of Other Languages (TESOL) association. TESOL has developed standards for teacher education, specifying the need for teacher candidates to have a grasp of linguistics, language acquisition, language pedagogy, content knowledge, and the specialized pedagogy of respective disciplines (<http://www.tesol.org>). For these TESOL standards to have a widespread effect, they must be endorsed by teacher-training institutions and supported by modifications in teacher-training curricula. What complicates matters is the fact that discipline-specific discourses, and the tasks commonly associated with them, limit the value of generic teacher training.

Attitudes toward CBI represent another challenge. In CLIL settings, as an example, many teachers view the simple adoption of CLIL as innovative; instead of striving to implement innovative teaching practices to achieve CLIL aims, these teachers typically turn to conventional teaching practices meant for more traditional classrooms (Wolff, 2002). In other settings, language teachers' knowledge and skills are perceived to have lower status than subject area teachers' knowledge and skills. In such settings, pedagogical approaches perceived as highly effective among language professionals (e.g., scaffolding, making form–function links, noticing gaps in input, providing opportunities for negotiation) are perceived as less important than the content teachers' pedagogical practices. The undermining of the language teachers' contributions to language and content teacher partnerships marginalizes not only the language teacher but also the students who are supposed to benefit from the language teachers' contributions (Creese, 2002). The attitudes of some learners and their parents regarding the use of CBI undercut the efforts of language and content teachers in some settings.

Assessment represents another formidable challenge for CBI practitioners. Because it is difficult to isolate language learning from content learning in the assessment process, teachers struggle to determine whether students' inability to demonstrate knowledge is because of

language barriers or a lack of understanding of content material (Gottlieb, 1999; Short, 1993). Dissatisfaction with current assessment practices has led to a call to move beyond standardized tests and toward more systematic assessment that monitors students' academic progress, language learning, and content learning. Moreover, there is a call for more systematic assessment of CBI program effectiveness in addition to educational and public policies and their influence on students' content and language learning (see Byrnes, *Assessing Content and Language*, Volume 7).

#### FUTURE DIRECTIONS

As CBI does not lend itself to a fixed method, the future is likely to bring with it a proliferation of content-based models customized for different instructional settings. Expansions into vocational sectors will likely require considerable adaptations. Case studies, anecdotal accounts, and research on adaptations of current models are likely to contribute to an understanding of the intricacies of the approach and its various configurations in a wide range of contexts. Qualitative and quantitative investigations of numerous aspects of CBI are sorely needed. Particularly fruitful would be research on (a) the selection, sequencing, and weighting of content and language in different CBI models; (b) the relationships among input, output, and feedback to ensure improved student mastery of content and language; (c) student engagement with information gathering, compiling, and reporting and the language demands at each point of the process; (d) strategy training and its influence on student learning; (e) the contextualization of grammar instruction; and (f) the relationship between tasks and texts. Equally valuable would be research on factors critical for academic success and specific career outcomes and on processes involved in, and interactions among, acquiring literacy competence, subject matter learning, and target language learning. Furthermore, investigations into how to sustain student motivation and engagement, by combining learner choice, autonomy, and challenge, could offer insights into more effective CBI frameworks.

The need for systematic research on assessment in CBI has been pointed out by many practitioners as critical (Gottlieb, 1999; Short, 1993). In the past, more emphasis has been placed on the design and implementation of CBI than on the assessment of content and language learning. Teachers, students, and the school systems in which they find themselves would benefit greatly from more attention to assessment of content and language learning for formative and summative purposes.

As in other areas of language teaching, CBI is likely to be influenced by computer technology, particularly in the areas of corpus linguistics

and computer-assisted language learning (see Granger, *Learner Corpora in Foreign Language Education*, Volume 4). Corpus linguists have the capability to analyze large corpora of authentic texts from different disciplines and genres; their findings have the potential for contributing valuable insights into discipline-specific language that can assist CBI teachers, curriculum designers, and materials writers. As corpus linguistics tools become more accessible, teachers and students themselves may develop the skills to analyze language and content resources, thereby contributing to their autonomy as teachers and learners. Innovations in computer-assisted language learning are likely to find a place in content-based classrooms as well.

Technology may contribute to CBI in other ways. CBI teachers are likely to bring in more interesting combinations of content resources, including the Internet, media, and other forms of content. These varied content resources, accompanied by stimulating tasks, will lead to interesting synthesis activities, thereby obliging students to use critical thinking abilities that are transferable to other learning situations.

Finally, as CBI, in its various configurations, takes on more predominant roles in educational settings, increased attention should be paid to pre and in-service teacher preparation. Opportunities for dual certification and specializations in CBI will prepare a new generation of teachers to enter the work force well-prepared for the challenges of CBI. Partnerships between teacher-training institutions and schools, between researchers and teachers, and across disciplines are likely to result in better prepared, more enthusiastic teachers, and more abundant classroom resources, the end result being students who learn subject matter and language more effectively.

## TASK-BASED INSTRUCTION

### INTRODUCTION

Task-based instruction is characterized by activities that engage language learners in meaningful, goal-oriented communication to solve problems, complete projects, and reach decisions. Tasks have been used for a broad range of instructional purposes, serving, for example, as units of course syllabi, activities for structure or function practice, and language focusing enhancements to content-based curricula. Although the language used to carry out a task need not be prespecified, a task can be designed so that attaining its goal depends on linguistic and communicative precision, or requires the use of specific grammatical forms (e.g., Ellis, 2003; Loschky and Bley-Vroman, 1993). The communication strategies and learning processes that emerge during task goal attainment are consistent with those advanced in second language acquisition (SLA) theory and found in SLA research. Demands on the learners' attention, comprehension, and production as they carry out a task that can lead them to test L2 hypotheses, obtain feedback on their comprehensibility, draw inferences about L2 rules and features, and produce more accurate and developmentally advanced output.

### EARLY DEVELOPMENTS

Early developments in task-based instruction reflect principles and practices of communicative language teaching, many of which remain in effect to date. A role for tasks was implicit in communicative language teaching from its inception, revealed, for example, by Allwright (1979), who described ways in which instructional activities could promote development of language for authentic use rather than knowledge of language as an unapplied system. Most of the field of language education looks to Prabhu's work in Bangalore, India in the 1980s as the first large-scale project to use tasks as the foundation for instruction within a communicative curriculum (Beretta and Davies, 1985; Prabhu, 1987). Prabhu advanced the idea that task participation could facilitate L2 structure learning without a need to focus on structures themselves, as the need for task completion and goal attainment would create

linguistic demands and stimulate learning processes. He distinguished three task formats: an opinion gap format that invited exchange of preferences and attitudes on a topic or theme; an information gap format that required transfer and exchange of information for project completion; and a reasoning gap format that supported the application of information toward problem solving and decision making. A task could be characterized by a single format or an integration of two or three. For example, students could be asked to share opinions about travel destinations and exchange information about them, then locate departure times on a schedule and use them for trip decisions and plans.

Much of the early work on task-based instruction focused on defining tasks and explaining how they differed from other classroom activities. Although numerous definitions were advanced, tasks came to be characterized by objectives and outcomes that reflected authentic experiences of everyday life, and required use of language consistent with communicative practices outside the classroom context. Many noted scholars looked to tasks to develop student textbooks (e.g., Willis and Willis, 1987) and design learning activities (e.g., Brumfit and Johnson, 1979; Nunan, 1989).

A great deal of attention was given to ways to organize tasks into a course syllabus, as debate centered on the value of a procedural versus a process syllabus. The former, espoused by Johnson (1982) and Prabhu (1987), consisted of problems and activities that were largely teacher designed and directed, and free of explicit language features. It was believed that language-learning processes would be stimulated as students worked to meet task objectives such as deciding on ways to facilitate package shipments, planning itineraries from schedules, or constructing a floor plan from a house description. Alternatively, the more language focused, process syllabus (e.g., Breen, 1987; Candlin, 1987) encouraged the use of language-focused tasks, as long as they were warranted by learners' needs and wishes, and thus also included a role for learner contributions to syllabus and task design. Later, Long and Crookes (1992) would argue for a task-based syllabus that reflected principles of authenticity. Classroom tasks were based on a thorough analysis of learner needs, and corresponded to real world tasks that reflected those needs.

Tasks were introduced to the research context by Long (1981), to address questions on input and interaction in SLA. Many of the research tasks were adaptations of those found in language textbooks, and used in language classrooms. Throughout the 1980s, versions of tasks originally developed for instructional purposes thus came to serve as reliable instruments for gathering data on questions regarding instructional interventions, input adjustments, feedback strategies, and learning processes (reviewed in Pica, Kanagy, and Falodun, 1993).

## MAJOR CONTRIBUTIONS

Task-based instruction has generated broad interest among educators and researchers, as its central construct, the task, has been used successfully in classroom and research contexts. Numerous single-author texts and edited volumes are available on task-based instruction. Most of them tend to emphasize task design, implementation, and research (e.g., Bygate, Skehan, and Swain, 2001; Crookes and Gass, 1993; Ellis, 2003; Nunan, 1989). Broader phenomena involving task-based curricula and pedagogical practices have also been addressed (e.g., Willis, 1996). Each of these volumes contains numerous extracts and samples of tasks from student textbooks and materials that can be easily accessed, purchased, and used by teachers in their classrooms. The vitality and versatility of the task as an instructional tool, a research instrument, and a learning activity become especially evident when tasks are viewed with respect to the psycholinguistic, sociocultural, and pedagogic processes that are believed to contribute to successful L2 learning.

Long has been at the forefront of efforts to develop tasks that promote psycholinguistic processes of SLA. For Long and others, the most effective tasks promote incidental learning of L2 form, by making message communication the principal activity needed for attaining task objectives. Such tasks are convergent and closed-ended, as they require participants to transfer or exchange uniquely held pieces of information to reach a single, incontrovertible outcome. The demand for comprehensibility of the information and completion of the task sets up conditions for participants to draw each other's attention to their linguistic and communicative shortcomings and needs, and engage in what Long calls "focus on form" (Long, 1991). A large and growing number of researchers have developed tasks that incorporate Long's design features, often extending them toward more specific form focus, and have tracked their accomplishments in empirical studies. A useful resource for these studies is Doughty and Williams (1998).

Long has emphasized ways in which tasks can draw learners' attention to language form incidentally, as the need arises during task implementation. Other psycholinguistically oriented researchers have developed tasks that draw learners' attention to specific linguistic forms more directly by requiring their use to attain task completion. Loschky and Bley-Vroman (1993), for example, suggest that the most helpful tasks for SLA are those in which L2 forms are "task essential," in that the tasks cannot be accomplished unless participants focus on a specific form. They offer the example of a comparison task, whose completion requires the use of *-er* and *more* comparison forms. Most tasks fall short of this ideal, however, and are more likely to provide contexts

for forms that Loschky and Bley-Vroman consider “useful” for their completion. An interview task, for example, could establish contexts for questions, and its implementation would thereby assist the learner’s development of question formation. Questions would be a useful choice, but would not be “essential,” since imperatives or statements of request could be used in their place. Interest in the role of form-focused tasks in L2 learning has led to the development of tasks for use in classroom and research contexts (e.g., Ellis, 2003; Pica, Kang, and Sauro, in press).

Psycholinguistically motivated research has also shown how learners’ familiarity with task-related information frees their attention to achieve production accuracy (Skehan and Foster, 1997). Allowances for task planning and task repetition have been shown to make a difference in the complexity and comprehensibility of learners’ use of language, as the increased allotment of time invites their attention to both language form and meaning (e.g., Bygate, 2001; Skehan 2003). Nunan (1989) and Ellis (2003) review these and other factors as they seek procedures for adjusting tasks for learners’ developmental levels. Examples of adjustments include decreasing or increasing the number of items or steps in the task, the amount of time allowed for its completion, and the extent of linguistic elaboration needed to reach its outcome. These adjustments make it possible for the same task to be used in a classroom of learners who present different developmental levels. Beginners might be given the task with its first few steps completed, and allowed to complete it over the course of two time periods. Advanced learners might be asked to go through all of the steps and might be given one period to do the task, with a follow-up task immediately thereafter. At the individual learner level, an increase in task reporting time could permit a dysfluent student to speak more slowly and precisely, or a student struggling with grammatical endings or sentence connectors to take notes and troubleshoot difficult items.

The selection and design of tasks that promote sociocultural processes is an area of growing interest and importance in the study of SLA. Although psycholinguistically grounded tasks are designed to be implemented through social interaction, this is done to promote processes of attention and cognition for L2 learning. Socioculturally oriented tasks are designed to promote collaborative interaction through which learners can support and guide each other’s L2 learning. The most productive work has been carried out by Swain and Lapkin (2001), who have designed and adapted tasks in ways that provide a basis for the process of “scaffolding,” whereby learners can support each other when confronted with task components that they cannot accomplish on their own. As such, this initial guidance provides support that that the assisted learner can apply to future experiences. One

of the most reliable tasks for stimulating sociocultural processes for L2 learning is the dictogloss (see again, Swain and Lapkin, 2001). Initially, learners are on their own, as they take notes while listening to a teacher-delivered text. During the remainder of the task, they work in pairs or small groups to coconstruct the text from their notes, and later present their versions to their classmates. Swain and Lapkin have studied the strategies learners use to support each other's L2 learning throughout their text coconstruction. Especially affected are areas of vocabulary, as learners supply and define new words and their meanings.

Finally, many tasks draw on classroom processes. Willis (1996) and Willis and Willis (1987), for example, provide a step-by-step procedure for carrying out tasks as part of the classroom curriculum. The first phase consists of topic-oriented, input-rich pretask activities, during which small groups of students get ready for their main task, with teacher's support. This is followed by a planning phase in which the groups carry out the task as well as draft and practice a report on their task work. In the third phase, the learners share their report with their classmates. Through each step, the teacher plays a major role as a reactor, who supplies forms to the students as needed, as well as a selector of L2 forms and features that require further study.

Samuda (2001) has developed a classroom program that uses tasks to guide learners through an input stage, an operation stage, and stage of consolidation and reflection. In so doing, she distinguishes tasks that engage learners in constructing knowledge and building awareness of new forms from those that push them to draw on their language resources to retrieve, activate, and use emerging forms. Samuda also looks to the teacher to provide language assistance and to create task conditions for students' 'need to mean' and to be able to respond to this need with form suppliance. In the final phase of Samuda's program, learners report on their work, often in a poster format, so that they can consolidate their learning and reflect on the language they have learned.

#### WORK IN PROGRESS

Task-based instruction continues to grow in interest as its central construct, the task, is both an object and an instrument of teaching and research. This is particularly evident in three ongoing projects. Task-based instruction has been a crucial part of the long-standing debate over the effectiveness of direct and indirect instructional approaches in meeting learners' linguistic needs. Ellis and his colleagues at the University of Auckland Institute of Language Teaching and Learning are addressing theoretical and pedagogical questions on this topic, and developing form-focused tasks to do so. As Ellis (2002) explains and summarizes, research has revealed that direct instruction on

specific forms is, in the short run, more likely to lead to L2 grammar learning than communicative experiences designed to gain the learner's attention to L2 form on an implicit or incidental basis. However, questions remain as to the scope, durability, and spontaneity of the linguistic knowledge acquired through direct approaches. It is argued that direct approaches are effective when forms are simple and criteria for their learning are kept to explicit knowledge and discrete point testing. For difficult and complex forms to be internalized and used automatically, however, implicit and inferential learning, albeit much slower, is required.

Ellis and his colleagues are looking at ways to make difficult forms accessible to learners through direct instruction, as well as to help them build implicit knowledge through task-based experiences. Among their instructional tools are focused tasks, which they have designed to direct the learner's attention to forms that are either necessary or useful for task implementation and goal attainment. The tasks also allow for the interface of explicit and implicit knowledge, through either practical application and use of forms that have been taught initially through direct instruction, or approached through problem solving, comprehension of enhanced input, metalinguistic discussion, and other consciousness-raising experiences. As Ellis and his colleagues compare the roles and contributions of focused and unfocused tasks, and other interventions in the learning of L2 forms, their project holds much promise for future task development and for answers to the explicit-implicit learning debate.

On the language classroom front, Pica and a team of co-researchers, teachers, administrators, and graduate students at the University of Pennsylvania have been working on a project which aims to enhance text-based content curricula with tasks that turn meaning-focused texts into form-focused tasks. The project addresses concerns about the missed opportunities for language learning observed in content-based thematic, sheltered, and specific purpose language classrooms, at elementary, secondary, tertiary, and community levels. Analysis of the discourse characteristics of the discussions and homework reviews, as the predominant activities in these classrooms, has revealed fluent, but linguistically inaccurate student production, with greater attention given to the meaning of their contributions than to their linguistic encodings (e.g., Pica, 2005).

Project members are working together to design form-focused information gap tasks that assist L2 learning and teaching, serve as tools for data collection on these processes, and maintain classroom authenticity and interest to allow for long-term usage and longitudinal study. The tasks are closed-ended and precision-oriented, and require the exchange of uniquely held information.

Working in pairs, learners carry out three types of information gap tasks, *Spot the Difference*, *Jigsaw*, and *Grammar Communication*, and do so during regular class meetings. They first read passages on familiar topics, whose sentences contain linguistic forms that are low in salience, difficult to master, and developmentally appropriate. Each pair is then given a version of the passage to read again. One phrase in each sentence of each version is encoded either with the same low salience form that appeared in the original passage or with a slightly different, but nonetheless grammatical, form. For example, one version might contain “a table” while the other had “the table.”

In the *Spot the Difference* tasks, pair members specify the form differences as they compare each sentence of their passage versions. In the *Jigsaw* tasks, they first reorder scrambled sentences of their versions and then specify the form differences. In the *Grammar Communication* tasks, they fill in blank lines in each sentence, by choosing among four differently encoded forms, including the form that appeared in the original passage.

Across all three types of tasks, the learners identify, recall, and compare forms, their functions, and meanings through text reading, form selection, decision making, and text reconstruction. Publications from the project thus far show how to develop form-focused tasks from any content curriculum that uses content-focused texts. They also present data on the ways in which learners' participation in the tasks works to facilitate their learning of L2 forms that are difficult to acquire through communication and content alone, and on the ways in which the tasks themselves operate simultaneously as an instructional activity and a research tool (e.g., Pica, 2005; Pica, Kang, and Sauro, in press).

Researchers at the National Foreign Language Center at the University of Maryland are engaged in basic and applied research on the design of task-based instructional programs for advanced learners. Their current emphasis is on critical languages such as Korean, Chinese, and Arabic. This large-scale, long-term project builds on its predecessor at the National Foreign Language Center, University of Hawaii. Its aim is to produce a task-based program that is consistent with principles of SLA theory and supported by research. The program has developed task-based instructional materials and instruments for assessing learner needs and learning outcomes and carrying out program evaluations. Task-based syllabi and task modules have been organized according to principles of grading and sequencing. Classroom approaches have been designed to promote enhancement of spoken and written input and provision of form-focused feedback. Data collection, which remains ongoing, has thus far revealed advances in L2 proficiency among students who have participated in various dimensions of the program. As majority of students are native speakers

of English, this project allows for the study of task-based learning of a foreign language. Applications of its findings address important areas of need in task-based learning and instruction from both research and practice perspectives.

### PROBLEMS AND DIFFICULTIES

One of the foremost criticisms of task-based instruction has been that its approach to task specification and selection fails to account for sequences and processes of language learning. This standard has not been used to judge other instructional approaches, perhaps because their ordered arrangement of linguistic structures, functions, and notions, gives the appearance that they reflect levels of language learning. Even though it has been widely accepted and well documented that SLA is a multidimensional process that does not follow a stagewise path, and occurs most efficiently in meaningful contexts, rich in comprehensible input, with opportunities for feedback, and production of modified output, skepticism remains about task-based instruction. There is an expectation that courses that are task based or even task enhanced should be able to organize their units of instruction according to principles of linguistics or L2 learning (Bruton, 2002).

Another concern lies in the area of assessment. This is an area where the label, "task," is applied to measures of L2 proficiency that are essentially communicative activities rather than tasks in the sense identified earlier. As such, narratives, interviews, even problem-solving discussions, used in proficiency testing are not tasks in the sense of being connected to a goal or outcome outside of language. To meet this criterion, a proficiency task might ask a language teacher to narrate a story to a classroom of youngsters; or to interview for an actual position in the workplace; or to solve a problem related to the teaching profession. Such objectives for L2 use are currently lacking in task-based assessments. However, much promise can be seen in assessments that engage L2 learners in problem-solving, goal-oriented interaction and information exchange that reflect their own needs and purposes.

A much discussed challenge has been to develop tasks that are consistent with learners' communicative needs and goals, and at the same time, draw their attention to complex or low-salience features easily overlooked in the course of task completion. Most tasks to date promote interaction and create opportunities for form focus, but do so unpredictably, without attention to specific forms. Form-focused and text-based tasks, as described in the project overviews earlier, are aiming to accomplish this end. To study interaction and SLA, they have adapted classroom tasks to study the impact of interventions, for example, recasts, metalinguistic correction, and other feedback moves.

Unfortunately, most of the tasks used in research have been implemented under controlled conditions rather than authentic classroom settings. Some studies have gathered data by implementing tasks in authentic classrooms, but as an extracurricular activity, added on to the regular classroom agenda. Such researcher-dominated practices have given rise to concerns as to their classroom authenticity and application, as the learners who provided the data are first and foremost subjects in a study, and only secondarily students in a classroom. An important need in the field of educational linguistics is for tasks that have authenticity for students and teachers and meet reliability and validity requirements for research. As noted earlier, current works in progress are attempting to address this need.

Whereas considerable strides have been made in the design of tasks for language learning, the development of instructional approaches for task implementation has been wanting. Ironically, a field that began with a large-scale, classroom-centered project (Prabhu, 1987) has over the years narrowed its focus on the development of a theoretically grounded battery of task types for laboratory-like use. Fortunately the practical, classroom implementation is of concern to the newer projects in progress and principled, task-based methods may be forthcoming.

#### FUTURE DIRECTIONS

Task-based instruction will continue to be of great interest throughout the field of educational linguistics, as it is one of the few instructional approaches that has had both a theoretical and an empirical grounding since its inception. The task, which has shown itself to be versatile and robust as a theoretical construct, a pedagogical unit, and a research tool, will continue to find a home in these areas. Questions about the role of tasks in classroom learning and practice provide a challenging research agenda: Can tasks shown to facilitate individual students' grammatical needs in controlled contexts be used to assist groups of students in the language classroom? Can language teachers extend language-learning tasks to address their students' content needs as well? Can programs be developed, designed, and evaluated with tasks as their central unit? Affirmative answers to these questions will promote follow-up questions about application and process.

Other fields will enrich these questions as well. As technology continues to grow in importance language education, teachers will be asked to develop language-learning experiences that involve students as media users, not only consumers. As Warschauer and Healey (1998) emphasize, task-based projects will be needed to integrate learners across networked environments as well as to integrate the skills of reading, writing, speaking, and listening in this effort. In order for such

an integrated approach to be effective, teachers will be called on to develop tasks whereby students can learn to use computers and other technological instruments as tools for their L2 learning and use.

As the responsibilities given to professional educators expand and evolve, teachers are being called on to broaden the scope of their work, and to be teachers of language as well as teachers of language learners. They find themselves responsible for meeting the subject content needs of their students, and their linguistic and communicative needs as well. World wide, teachers are confronted with the responsibility to teach classes of students who must acquire knowledge and skills in science, technology, business, and telecommunication, and do so through a language of which they know very little, or nothing at all. Translating their target needs into learning tasks is a major, but necessary effort in this area. Such tasks create a further demand for tests and assessments that reflect target performance in content applications and skill usage. The scale of this work is likely to increase as schools continue to move language learners into sheltered and regular classrooms, as university language courses adopt content-based curricula, and as theme-based and specific purpose classes increase in scope and popularity.

Debate will continue as to whether instruction should assist the purposes of communication, and therefore emphasize functions, notions, and their structural and lexical correlates, or orchestrate the processes of communication, and therefore develop language-rich experiences and arrange different student groupings. From the time of its inception, task-based instruction has been oriented toward the latter, but has never lost sight of the former. This has been evident in the use of needs and task analyses and the ever-present reliance upon the responsive and flexible teacher to draw students' attention to their linguistic and communicative needs. The movement toward focused tasks and needs-specified curricula, described in the previous section, portends further developments in this area.

Now that task design has become a central concern of SLA research, as tasks have come to serve as instruments for instructional treatment and contexts for data collection on theoretical questions, the influence of tasks and task development is likely to be felt beyond the classroom. Projects in progress reveal that teachers and researchers from diverse academic interests, cultural backgrounds, and professional persuasions are working together to develop tasks, and more importantly, they are working together to make a difference to the students whose needs and interests they serve.

PROFESSIONAL COMMUNICATION

INTRODUCTION

Language for special or specific purposes (LSP) was earlier the main term used for research on communication in professional settings. The history of this field reveals an early theoretical interest in the description of various *sublanguages*, which are assumed to exist within the general language system in response to specific professional needs. Early studies were concerned with the written products e.g. with specific terminology, text types and registers. Over time, however, there has been a growing interest in the communicative processes involved, and in their psychological and sociological dimensions, with a theoretical shift towards sociolinguistics, social constructivism, ethnography, conversation analysis and critical linguistics. Studies have dealt with spoken as well as written discourse and with the complex and diversified interplay between these media. The term *professional discourse* or *professional communication* is preferred to delineate this wider field.

The early LSP traditions developed mainly within foreign language departments, with their orientation towards analysis of the language system. Practical problems relating to translation, standardization of terminology and design of technical and commercial documents were dealt with. This connection between the study of foreign languages and professional communication still exists, though the problems focused on have shifted somewhat. The earlier interest in language differences has made way for an interest in problems relating to language-in-context, and a sociological approach has been used both for macro analysis of organization structure and for micro analysis of workplace interaction. This has meant a gradual acknowledgement of the complexity and multimodality of interaction at work and a broadened methodological frame. In a gradually more globalized professional world, we also find that the cross-cultural dimension, in all its social complexity, is becoming more and more central.

## EARLY DEVELOPMENTS

The use of language for special purposes is of ancient origin, stemming from the human need to moderate language to suit different types of activities. The systematic study of LSP and the establishment of LSP as a field of academic inquiry, however, has a much shorter history. The oldest branch is concerned with the study of terminology. In the early years of this century, German engineers elaborated lists of terms used within different fields, and the theoretical work of Eugen Wüster in the 1930s laid the foundations for international collaboration to standardize terminology (cf. Wüster, 1970).

It is not as easy, however, to determine when the study of texts for specific purposes began. We can find individual studies on business, legal and scientific languages, for example, quite early on. The 1960s, of course, saw an increase in such work, as with other types of linguistic research. Interest in readability and document design also emerged in the 1960s, leading to the creation of 'document design centres'. As regards the LSP field in a more organized form, we have to go to the 1970s to find its starting-point. In the late 1970s, various activities were in progress, which seem to indicate that LSP had become established as a field of its own. The first European symposium on LSP was held in 1977, the LSP journal *Fachsprache* was launched in 1979 and the journal *English for Specific Purposes* in 1981.

The early history of the LSP field is to a large extent connected with European scholars and European thinking. The study of language for specific purposes was undertaken in a language-based functionalist theoretical framework. The emphasis was on general characteristics at different levels (lexicon, syntax, style) of different sublanguages, such as the medical, economic, legal and technical sublanguages. The relevant knowledge base was fundamental to this differentiation into *sublanguages*, while functional aspects underlay a differentiation into *text types*.

Traditional, mainstream LSP research could thus be described as language-based and product-oriented, with the aim of describing and classifying different types of languages for specific purposes and different types of texts. From early on, translation of economic, technical and other professional texts was a key area of interest to LSP scholars, and special attention has been devoted to the linguistic basis for the translation of documents. In parallel with this Germanistic European LSP tradition, an Anglo-American tradition developed, following a largely different course. The ESP (English for Specific Purposes) field developed in the US and in Britain in English language departments, with their strong orientation towards literature and a more global and text-based analysis of different genres. It evolved within academic

communities concerned with educational problems relating to teaching students how to write different types of English texts in a socially acceptable and also a competitive way. The study of ESP therefore came to be combined with an interest in rhetoric, the art of persuasion, and in sociology, the art of socializing and conforming. This tradition, spread through a web of 'writing across the curriculum' courses in the English-speaking countries, focused on text patterns—argumentative and persuasive patterns—and the actual writing process, rather than on language structure and variation. The social dimension was also central. Writing was analysed as taking place within a *discourse community*, a sociorhetorical concept relating to the use of written texts for specialist professional purposes. There is a clear connection between the concepts of *discourse community* and *sublanguage*; those using a particular sublanguage for specific purposes are thus assumed to form a discourse community. Studies have been directed not only towards the *genre*, but also towards the individual writers and their relationship to the discourse community. The interest in the linguistic structure of various sublanguages was replaced by a wider interest in communication in professional settings and in research on both text and talk.

### MAJOR CONTRIBUTIONS

The following discussion of major contributions will be arranged around different professional settings.

#### *The Economic–Technical Setting*

The 1970s and 1980s were the decades of the *plain language movement*. The idea was to formulate strategies and rules for writers that would improve documents of different kinds. Perhaps the most widespread and enduring result of this movement was what were called 'readability formulae'. Based on a mechanistic view of reading and comprehension, formulae were developed, which could measure the difficulty—readability—of texts. Most of them were based on word and sentence length. The theoretical basis for these formulae is very weak, but they owe their popularity to their simplicity.

This movement, however, is much more than just readability formulae, and some work has been done under this umbrella, which is of a good theoretical standard. Basing their studies on psycholinguistics and cognitive psychology, Linda Flower and John Hayes managed to give their document design work a theoretical orientation. They conducted experiments with readers and writers, and came to develop their famous writing model (Hayes and Flower, 1980).

'Instructional science' was also used as a basis for document design work, for example in Europe. Instructional research focuses on the development of procedures for optimizing learning in specific situations. Its aim is to establish rules that specify the most effective way of attaining knowledge or mastering skills. Another field that has contributed to document design work is that of 'human factors'. Here, methods and techniques are developed for the application of experimental procedures in real-life situations.

The plain language movement has not ceased to exist, although its focus has shifted. Studies are oriented towards text linguistics and rhetoric with the goal of improving instructions, guidelines and technical reports, finding adequate strategies for the drafting of sales promotion letters and job applications, and also popularizing difficult documents. The development of *The Journal of Business Communication*, the first number of which appeared already in 1963, reflect this change, as does the newly merged journal *Information Design Journal+Document Design*. A good example of its broad application is also Shuy (1998), where a number of tools for communicating more clearly in government and business settings are given.

### *Legal and Bureaucratic Settings*

Much work of interest has been carried out within legal and bureaucratic settings. The more purely descriptive work done on the characteristics of legislative language in terms of vocabulary, syntax and textual patterns (Mellinkoff, 1963; Kurzon, 1986; Bhatia, 1987) can be seen as forming the foundation for the more process-oriented studies. Other work had a sociological foundation, analysing the functions of laws and other legal texts (Danet, 1980).

One legal problem area relates to the asymmetries in reading comprehension between lay people and professionals. Being undertaken with the aim of facilitating reading and comprehension for the ordinary man or woman, these studies have come to clearly reflect the theoretical situation within psycholinguistics. In the 1960s legislative texts were analysed and assessed in relation to their readability, which involved a mechanical way of analysing documents at a surface level. An analysis of jury instructions by Charrow and Charrow (1979) represented a step forward. Their ideas for reform derived from a number of linguistic factors, but they were not based on any theory of text comprehension or on a very searching analysis of the societal function of the texts.

Other studies have had a more theoretical foundation. On the basis of a critique of previous research, Gunnarsson (1984) rejected the concern with lexis or syntax, which went no further than memorization or ability

to paraphrase, and developed a theory of functional comprehensibility focusing on perspective and function orientation (implications for action). The reading of laws and text comprehension is here viewed in a societal framework.

Difficulties due to asymmetries have also interested scholars of spoken legal discourse. Courtroom proceedings and police encounters, have been analysed by linguists, sociologists and ethnographers. Studies have focused on different types of content and argumentative features, in order to reveal how utterances are part of a prior and anticipated context. Cross-examination, question–answer patterns, topic progression and recycling, argumentative structure and story patterns have been analysed (Atkinson and Drew, 1979; Drew, 1992). Other studies have focused on the understanding and interpretation of utterances. Within a sociolinguistic theoretical framework, experiments have been carried out with different versions of utterances, in order to test powerful and powerless speech, gender differences etc. in style, self-presentation and tone of voice, (Adelswärd, Aronsson, Jönsson, and Linell, 1987; Conley and O’Barr, 1998; O’Barr, 1982).

Important work has also been done on the pre-trial phase, which is police interrogation. Cicourel (1968) analysed the part played by police questioning in the long bureaucratic judicial process. In this pioneering work, he studied the social construction of ‘cases’, particularly the formation and transformation of the images of young delinquents as the cases pass through the legal system (police, social workers, probation officers, prosecutors, courts). Lynch (1982) studied argumentation in pre-trial versus trial situations, and Jönsson (1988) the interplay between police interrogation and the written police report. Other studies have examined the role and effectiveness of legal interpretation. As well in police interrogations as in the court room, interpreters play essential roles for the process (Berk-Seligson, 1990, 2000).

### *The Medical–Social Setting*

Medical discourse has also been studied from a variety of angles. The problems that arise between doctors and patients have been seen to a large extent as interactional, and it has been assumed that it is possible to do something about them. The asymmetries between doctor and patient have been analysed in various ways. Mishler (1984) talked about the two different voices in doctor–patient interaction, the voice of medicine and the voice of the lifeworld, which represent different ways of conceptualizing and understanding patients’ problems. The different perspectives in medical interaction have been the concern of Cicourel, one of the founders of doctor–patient research. By means of conversational

analysis of extracts from doctor–patient encounters, he was able to reveal important sources of miscommunication (Cicourel, 1981).

Among the different medical specialities, psychiatric treatment has been of particular interest to linguists. A well-known example is Labov and Fanshel's work on therapeutic discourse (1977). Analyses have also focused on neurotic and psychotic language, interaction with aphasia and dementia sufferers, and talk to and about old people. In Sarangi and Roberts (1999), several important analyses of discourse in medical settings are presented and placed in their theoretical and methodological framework. The new journal *Communication and Medicine* also shows the broad interest in this area of applied linguistics.

### *Science and the Academic Setting*

Writing at the college and university level and the different academic genres of writing have attracted the attention of many researchers. Much research has been steered by the practical need to improve the teaching of writing in the college classroom. The so called 'Freshman Writing Program' in the US, which involves all college students, has thus led to a large number of studies on genres and on the writing process. Many of these focus on the learner's adjustment to the academic discourse community from a sociological angle (e.g. Berkenkotter and Huckin, 1995; Swales, 1990), while other studies stress the negotiative character of writing in a truly Bakhtinian sense (e.g. Flower, 1994).

Academic genres have also been studied from a cross-cultural angle, with the aim of revealing differences and improving L2 writing. The contrastive rhetoric tradition, which has been influenced by the pioneering work of Kaplan in the 1960s, has led to many important studies on differences between the writing of scholars with different language backgrounds (e.g. Connor, 1996; Kaplan, 1966; Mauranen, 1993; Melander, Swales and Fredrickson, 1997).

Additionally, the Australian school, using a systemic functional approach, has been steered by the practical need to elaborate tools to use in the teaching of text writing at different levels (Halliday and Martin, 1993).

The complexity of the construction of knowledge and the historical development of scientific discourse has interested other scholars. In a pioneering study, Bazerman (1988) analysed the rise of modern forms of scientific communication, focusing on the historical emergence of the experimental article. The sociohistorical development of academic genres has also been studied using the technique of textlinguistics (Gunnarsson, 1998).

In Hyland (2003) a complex methodological framework is used to describe social interaction in academic writing, including praise and

criticism, citation and intertextuality, power and authority and the construction of expertise. Ethnographic methodology is used by Swales (1998) for the study of the textography in academic settings.

### WORK IN PROGRESS

The studies, which will be discussed, under this heading all relate to discourse in organizations, institutions or workplaces. With a theoretical orientation towards sociology and organization/network theory, social constructivism, critical linguistics, ethnography and conversation analysis, these studies try to grasp and understand problem areas relating to the complexity and diversity of communication in the professions (see Bazerman and Paradis, 1991; Gunnarsson, Linell and Nordberg, 1997). The aim is not mainly to describe differences relating to the various professions but to find macro and micro structures in professional discourse as such. In many ways these studies can be seen as pointing towards the future.

The relationship between organizational structure and culture, hierarchy and writing activities have earlier been elucidated in a variety of studies, using methods ranging from pure survey to ethnographic observation. What characterizes the work in progress in this area, however, is its close connection to sociolinguistics and to work on organizations within sociology.

Gunnarsson (2004) gives an account of research related to different types of organizations. In one study, the writing activities of a local government office were analysed in relation to its internal structure—hierarchies, clusters, role patterns—as well as to the external networks to which the actors/writers belong. Within this workplace, complexity was found to be related to the roles played by the writer, the network structure and also the intertwining of spoken and written discourse. Complexity was also found central within larger organizations, which were the focus of a contrastive study. Banks and structural engineering companies were studied in three countries: Germany, UK and Sweden. Based on interview data and analyses of texts, the relationship between discourse, organizations and national cultures were explored. The organizational ideas and communicative policies of each enterprise are found to matter for the structure of discourse at the same time as national cultural patterns can be distinguished.

Sarangi and Roberts (1999, pp. 1–57) give a valuable theoretical perspective on the dynamics of institutional and interactional orders in work-related discourse, which are likely to form a background for future studies on institutional discourse. Another methodology to describe the orders and disorders of discourse is found in Wodak (1997), which focuses on the complexity due to the institutional structure in a medical

setting, an out-patients' clinic at an Austrian hospital. The actual discourse between the medical actors—doctor, nurse, patient and relatives—is analysed in relation to a macro description of the institution as a working organization, comprising an analysis of roles, routines and events. The research team found a clear relationship between the setting, the physical and mental state of the professionals and the actual conversation. The doctors' behaviour towards the patients, for instance the length of the conversation, the tone and the degree of mutual understanding, varies with the degree of stress and tension caused by the events occurring. The Wodak study was carried out within the critical discourse analysis paradigm, and it has also found a direct application in that the research team have based courses for doctors on their results.

Micro-analysis of workplace interaction is another expanding research area, and also here a broad range of methodologies have been used for the analysis of talk at work: conversation analysis, critical discourse analysis, politeness theory and interactional sociolinguistics. The sociological approach is a common denominator for these studies, which aim at a description of the various *communities of practice* within professional life (Barton and Tusting, 2005). Holmes and Stubbe (2003) analyse power and politeness in the workplace. A particular focus in workplace studies has been on interaction involving immigrants with other mother tongue than the dominant language at work (Clyne, 1994).

Encounters in working life have also been focused on from the perspective of the complexity of the social and cultural dimensions involved. Considerable practical interest attaches to intercultural negotiations, and many studies have focused on negotiations between individuals from different cultures and with different mother tongues. Firth (1995) includes studies of negotiations in intraorganizational encounters, in commodity trading, and in professional-lay interactions. Negotiations are studied in the varied settings of the doctor's office, the welfare bureau, the travel agency, the consumer helpline, government, the university and business. Professional communication in international settings is also dealt with in Pan, Scollon and Scollon (2002), where the focus is on the communicative activities of telephone calls, resumés (or CV), presentations and meetings.

A current theme within studies of professional discourse is related to the communicative practices within transnational companies. In Gunnarsson (2004), a study on the multilingual practices of a transnational company with its head office in Sweden is also discussed. The term *parallel writing* is used to describe the practices established within the Electrolux group. This term relates to text writing in different languages based on a common raw material, which is sent out from the head office in Stockholm. The selling offices throughout the world receive this raw material, from which they can choose ideas and parts

for the writing of customer brochures in their respective language and for their respective group of customers. The role of translating is thus minimized and mainly reserved for official documents like annual reports. For the designing of courses for translators, results like this are indeed of great relevance.

In a globalized business world, many companies are forced to use English lingua franca, ELF, as their corporate language. Currently there are a great number of studies focusing on this practice. Nickersen (1998) analysed ELF in email writing within an international company in the Netherlands, and Kankaanranta (2005) analyses the use of ELF in email correspondence between Finns and Swedes. In addition, these studies are of great relevance for the teaching of language for specific purposes in the future.

Another subarea where there is much work in progress relates to the complexity due to new technology. Since the 1990s an increased number of studies have focused on the use of fax, e-mail and other computer-mediated genres for business purposes (Bargiela-Chiappini and Nickersen, 1999), and the multimodal character of discourse is explored in a variety of professional interactions (Le Vine and Scollon, 2004; Norris and Jones, 2005). Meetings and negotiations by means of video technique have been recorded and analysed as have interaction in call centres.

## PROBLEMS AND DIFFICULTIES

The first problem that should be considered is one touched on earlier. It relates to the historical disciplinary divide between studies of written discourse and work on spoken discourse. Studies of non-verbal communication and new technology, too, are often departmentally separated from studies of other types of discourse, as they are carried out in communication and technology departments, rather than in language and sociology departments. It should be said, however, that this problem can be solved, and that many steps have already been taken to bridge the gap, including conferences and joint volumes, and multiplex studies of real-life communication.

The second major problem in this field is the complexity of professional life and the variation from one environment to another. It is not always possible to generalize from one workplace to another, and even less from one culture to another. In addition, continuous—and often very rapid—changes take place in the various organizations and institutions, which means that painstaking studies, taking years to complete, are sometimes obsolete before they are finished and made known to the public.

A third and related problem has to do with establishing the right research contacts. It is not always easy for the researcher to gain access

to the authentic workplace situation he or she wishes to observe. Many situations are too sensitive, which means that the presence of an outsider could ruin the outcome. Much of what happens in the business world is cloaked in strict secrecy, and many professionals are afraid to reveal their strategies to outsiders and, of course, to competitors.

A fourth problem concerns the acceptance of one's results, on the one hand among fellow researchers and on the other among practitioners. The researcher studying communication in the professions has to balance between two worlds—the academic and the practical—a task that is most certainly very complicated. Most of the studies presented in this chapter are accepted as solid research. It is probably safe to say, however, that most of this work is little known among the practitioners concerned.

The dissemination of research results to practitioners and to teachers of communication in the professions is, of course, of vital importance. Much teaching of LSP and professional communication, for example in foreign languages, lack unnecessarily a solid theoretical foundation. The transfer of knowledge from studies on professional communication to the actual teaching of business Spanish, legal German, etc. does not always take place. Although far from impossible, it has to be said that bridging this gap is sometimes quite problematic.

Last but not least, I would like to focus on the problems arising from the dominance of the rich parts of the world and their special languages in relation to research and teaching. Though important work was done as early as the 1970s on the development of course materials and textbooks specifically for use on English for science and technology courses in the developing countries, the rich world bias still prevails in the great flood of books that have spread around the globe. It is also to be regretted that, here as elsewhere, we know so little about studies on the smaller and less known special languages, in particular those used in the developing world.

#### FUTURE DIRECTIONS

To grasp the complexity and diversity of authentic situations in the professional world, theoretical and methodological integration must—and is likely to—take place within the field of professional discourse and communication. Such studies will need to adopt a holistic approach, that is, to include all kinds of communication—written, spoken and new technology. Analysis of the interplay between written and spoken discourse is already under way, but much more needs to be done in order to grasp what is really happening. A few studies have dealt with new technology—e-mail, fax, telephone and video conferences etc.—but future research will have to explore these types of communication

in greater detail. In particular, it will be necessary to analyse the new roles of and the interplay between traditional discourse types and this new technology in a changing professional world. What medium is used for what purpose, by whom and in what situation?

The use and function of different languages in the professions is another area that has been touched upon, but in which a lot more needs to be done. In a more and more internationally oriented professional world, language choice is a complex issue. In a multilingual professional community, the different languages are likely to serve different functions and also to have differing prestige. Translation issues are of course always central, but what is of growing importance in a rapid international interchange of information and ideas is the parallel production of discourse (spoken as well as written) in different languages.

In order to grasp the complexity of real life, it will be necessary to use a multiplex methodology, drawing on the traditional quantitative as well as qualitative traditions. It will also be necessary to analyse the practices in professional settings in different parts of the world, that is to study medical communication in China, Korea and Brazil, and the use of different languages and different language mixes for professional purposes.

## CLIL—A PEDAGOGICAL APPROACH FROM THE EUROPEAN PERSPECTIVE

### INTRODUCTION

The advent of CLIL as an acronym for Content and Language Integrated Learning (CLIL/EMILE: Enseignement d'une Matière par l'Intégration d'une Langue Etrangère) in the mid-1990s brought to the fore significant developments in a trans-European movement focussing on integrating foreign language and subject/thematic content in a wide range of learning and teaching contexts. According to Marsh (2002, p. 15) CLIL/EMILE is an umbrella term which refers to 'any dual-focussed educational context in which an additional language, thus not usually the first foreign language of the learners involved, is used as a medium in the teaching and learning of non-language content'. This broad definition serves to differentiate CLIL from bilingual or immersion education and a host of alternatives and variations such as content-based language teaching, English for Special Purposes, plurilingual education, in two distinct ways: it is based on an integrated approach, where both language and content are conceptualised on a continuum without an implied preference for either; it has its roots in European contexts where socio-linguistic and political settings are very rich and diverse. CLIL relates to any language, age and stage—not only in the compulsory education sector but also inclusive of kindergarten, vocational and professional learning. It encapsulates lifelong learning.

After a historical overview of the developments of CLIL, the increasing momentum of CLIL is then described alongside new challenges and problems to be solved which provide a steer for future directions.

### EARLY DEVELOPMENTS

Although Europe has a history of 'variegated' forms of bilingual education dating back over several millennia (Glyn-Lewis, 1976), until recently, these developments were perceived as

*special, marginal, remedial, compensatory, peripheral, experimental or exotic. As such, alternative bilingual forms of education have simply got on with their business outside*

*the mainstream of consciousness, accumulating experience and expertise which have failed to reach out to the relevant research public or academic spheres* (Baetens-Beardsmore 1993, p. 1)

In the 1970s and beyond, while major initiatives in Canadian Immersion programmes were attracting worldwide attention, not least because of extensive and integrated pedagogical research evidence, pioneering work in European 'bilingual education' was struggling for a more cohesive and coordinated identity. Linguistic complexity across Europe and trans-national socio-political developments, within for example the European Union and Eastern European countries, were spawning different ideologies in attempts to build on, rationalise or dominate linguistic and cultural diversity. During this period, many different models of bilingual education were developing across Europe (Artigal, 1991; Coste, 1994; Wolff, 1997) involving:

*the maintenance and expansion of a threatened linguistic patrimony as in Wales, the revival and expansion of smaller regional languages as in Catalonia and the Basque country, the accommodation of cross-border minorities as in Schleswig, the promotion of neighbouring languages across national frontiers as in the German model, the provision of high-level multilingual proficiency as in Luxembourg and the European Schools, and the integration of immigrant populations into mainstream society.* (Baetens-Beardsmore 1993, p. 3)

Little emphasis was placed on collaboration to develop CLIL pedagogies. Theoretical principles underpinning CLIL classroom practice tended to rely heavily on second language acquisition theory (Coyle, 2005).

In the 1990s, the European Commission was instrumental in promoting a re-conceptualisation of these diverse models into the European phenomenon of CLIL—an evolution which has taken over 10 years and is continuing. In terms of European Language Policy, it was clear that the vision and rhetoric concerning complex language issues had to be addressed through promoting the learning of foreign languages especially in the compulsory education sector. In 1993, for example, the Council of Europe within their programme of Language Learning for European Citizenship organised pan-European Workshop 12A *Bilingual Education in Secondary Schools: Learning and Teaching non-language subjects through a Foreign Language*. This brought together key players in the bilingual field ranging from policy makers and theoreticians to teachers and learners to 'provide a survey of current models, materials and practices' and 'initiate a multi-faceted programme of international co-operation in the field of bilingual learning'

(Report on Workshop 12A, p5). This was followed in 1996 by Workshop 12B which set about making recommendations for the coordination of developments in bilingual education across Europe so that more teachers, learners and curricular programmes might benefit from offering learning opportunities, other than formal language lessons, in a foreign language. During this period, bilingual education was attaching itself to European language policy, seen by some as a possible response to the so-called failure of communicative approaches in language learning to motivate and produce a highly skilled plurilingual, pluricultural workforce.

Defining bilingual education remained a major issue for debate: the plethora of models with differing priorities, needs, aims and outcomes were united in the 1995 Commission of the European Communities White Paper *Teaching and Learning: Towards the Learning Society*, which argued strongly that all European citizens should be able to communicate in three languages—the local and/or national language and two other European languages. The greatest challenge then in the 1990s, was to create a channel for shared understandings and an acknowledgement that the diversity of European models demanded the revisioning of bilingual education according to national and regional contexts. The term CLIL was therefore adopted to indicate a

*generic umbrella term encompassing a wide range of initiatives, in which learning of second/foreign languages and other subjects, has a joint curricular role in education. Usage of this term allows us to consider the myriad variations. . .without imposing restrictions which might fail to take account of school or region-specific implementation characteristics. . .*

*It does not give emphasis to either language teaching or learning, or to content teaching and learning, but sees both as integral parts of the whole. (Marsh 2002, p. 59)*

#### MAJOR CONTRIBUTIONS: EXPANSION OF CLIL ACROSS EUROPE

CLIL is dual-focused encompassing both subject or thematic and language development although, depending on the context and variables within, there may be a predominance of one over the other but never to exclusion. However, it is the interpretation of the *integration* of content and language in CLIL which has major implications for and impact on the development of CLIL pedagogies. According to Nikula (1997) countries have very many ways of realising CLIL due to specific socio-cultural settings and educational policies. There is no single blueprint that can be applied in the same way in different countries.

*At the global level European communities both individually and collectively have had to address the complex specificities of linguistic and cultural diversity. CLIL is central to this diversity whilst remaining constant in its drive to integrate both subject and language learning. Integration is a powerful pedagogic tool which aims to safeguard the subject being taught whilst promoting language as a medium for learning as well as an objective of the learning process itself (Coyle 2002a, p. 27)*

### *Diverse CLIL Models*

The 2006 Eurydice Survey, *Content and Language Integrated Learning (CLIL) at School in Europe*, which takes stock of CLIL provision and organisation in 30 European countries, concludes that while the acronym CLIL is used in research, different countries use different terminology which reflects the emphasis given to either the subject-based component or the language of CLIL. Grin (2005) notes that there are 216 types of CLIL programmes based on variables such as compulsory status, intensity, starting age, starting linguistic level and duration. Clegg (2003, p. 89) differentiates between language-led CLIL which ‘imports parts of subjects ... [and] highlights language development’ and subject-led projects which ‘may well exclude language teachers and explicit language teaching’. He goes on to identify 14 criteria for profiling CLIL including ownership, objectives and the degree of explicit language and/or subject teaching, before pointing out that ‘we need to examine CLIL projects according to these criteria before we can make judgements on them’ (2003, p. 109).

*CLIL models are by no means uniform. They are elaborated at a local level to respond to local conditions and desires. Indeed the characteristics of CLIL developments in Europe show a great variety of solutions ... it is the combination of the choices in respect to the variables that produce a particular CLIL model as well as also defining its effectiveness vis à vis the overall aims. (Coonan 2003, p. 27)*

According to the CLIL Compendium (Marsh and Maljers, 2001) different European models can be categorised according to where the CLIL programme is placed on a monolingual, bilingual or multilingual continuum. Inherent in positioning CLIL along this continuum are different societal and contextual variables such as language choice, age of learners, level of competence etc. The same study also identified five fundamental dimensions which determine the very nature of any CLIL: culture, environment, language, content and learning. These dimensions impact directly on CLIL programmes across Europe,

renowned for their diversity: from sections européennes using different languages in over 2,000 upper secondary schools in France, to primary school learners using English in Austria; from ‘European Schools’ to vocational and professional institutions; from pre-school youngsters in Finland learning through Swedish to thousands of secondary school students in Germany using English or French to learn mainstream curriculum subjects; from over 4,000 students in the Netherlands learning through English in all sectors of their schooling to primary school learners using Estonian and English in Estonia, Bulgaria, Hungary, Italy ... and so on. In effect, diverse models involve more than 30 European nations including those programmes targeting heritage languages and plurilingual contexts as in Wales, Catalonia, Luxembourg, Italy, Switzerland, Belgium (data from Marsh, 2002).

### *In Search of Pedagogical Coherence*

Unlike the general consensus among practitioners and researchers alike around communicative approaches to teaching foreign languages in the 1980s, there is a lack of cohesion around CLIL pedagogies. Pedagogy is embedded in a conception of the learning process and the desired social and cultural learning outcomes of CLIL. There is neither one CLIL approach nor one theory of CLIL. Instead, different models and their constituent dimensions have contributed to the emergence of a range of methods, materials and curriculum organisation which are often reactive to educational settings in different countries. Cummins (2000) remarked that in the early Canadian immersion programmes many of the classrooms tended to be highly teacher-centred or ‘transmission-oriented’. In similar vein, two general observations about European CLIL in the last two decades might be considered:

1. CLIL pedagogies have been highly influenced by language acquisition theories which favour language teaching perspectives. Since in European contexts English is the predominant CLIL language, this has reinforced a range of approaches which ‘guides language processing, supports language production, teaches language learning through use’ (Kelly, 2005) and sometimes resembles English for Special Purposes, TESOL or content-based language instruction. While all of these have a significant contribution to make, it seems that subject matter pedagogies are being systematically overlooked.
2. Transmission-oriented approaches in CLIL teaching have encouraged teachers to focus on content delivery and address potential tensions of time constraints and promises that progress in the subject matter would not lag behind similar courses taught in the mother tongue (InterTalk video, 1998). The more advanced the

students' level of foreign language, the less attention it seemed needed to be paid to linguistic development. Learner interaction in the foreign language has tended to be avoided with a marked preference for writing tasks instead (Eurydice, 2006).

In 1999, a publication by CILT (Centre for Information on Language Teaching and Research, London) entitled *Learning Through a Foreign Language: Models, Methods and Outcomes* (Masih, 1999) explored different approaches to learning and teaching CLIL and marked a milestone in promoting CLIL models and pedagogies. It crucially demonstrated that whilst different models were giving rise to different practices that fundamental theoretical underpinnings were starting to emerge.

#### WORK IN PROGRESS: EVOLVING CLIL PEDAGOGIES

In 1986, Mohan proposed that subject matter, thinking and language should form the basis of effective language-medium teaching whatever the model. Swain (1991 in Mohan, Leung, and Davidson, 2000) supports this view '*good content teaching ... the integration of language, subject area knowledge, and thinking skills requires systematic monitoring and planning*'. Coyle (1999) argues that classroom practice must be built on theoretical principles which take account of the integration of content and foreign language learning to ensure that the linguistic level of the learners does not determine or reduce the cognitive processing of individual learners.

More recently there has been a shift to integrate not only language and content but to integrate learning theory (content and cognition) and language learning theory (communication and culture). The teaching team at the CIEP (Centro Integrado de Educação Primária) Vila Olímpica school in Barcelona (2003) provides a very clear explanation of how this works in practice:

*Language functions as a tool that enables and fosters the knowledge structuring process. Language helps us to organize what knowledge we have and to introduce in such knowledge the new acquisitions we regularly interiorize. It can be said then that as we teach and students learn the different contents of each area, we are also teaching and students are also learning the language items that belong to each area. It also works the other way: insofar as we teach and students learn language they learn the contents of curricular areas. This is precisely the way in which we consider language as a transverse axis for the work on each and every one of the school curriculum areas. (Ramirez and Serra, 2003)*

In addition, since ‘intercultural’ understanding is promoted in trans-European contexts, Wolff (2002) advocates that CLIL, which brings together elements of citizenship, plurilingual and pluricultural understanding, transcends national borders and linguistic barriers.

### *The 4Cs Framework*

Working towards a cohesive conceptual tool, and influenced by the early work of Mohan and his *Knowledge Framework* (1986), Coyle (1999) developed the 4Cs Framework (Figure 1). This Framework differs from the standards-based world languages education strategy *Standards for Foreign Language Learning in the 21st Century* (1999) published by ACTFL (American Council on the Teaching of Foreign Languages), which focuses on the language curriculum. Although some interesting links can be made (e.g. communication, cultures and connections), there is a difference in emphasis since the starting point is language education. The 4Cs framework for CLIL starts with content (such as subject matter, themes, cross-curricular approaches) and focuses on the interrelationship between content (subject matter), communication (language), cognition (thinking) and culture (awareness of self and ‘otherness’) to build on the synergies of integrating learning (content and cognition) and language learning (communication and cultures). It unites learning theories, language learning theories and intercultural understanding:

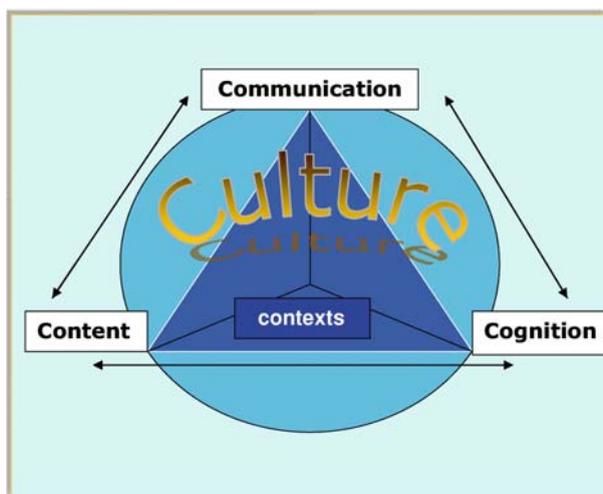

Figure 1 The 4Cs framework for CLIL (Coyle, 2005).

1. Subject matter is not only about acquiring knowledge and skills, it is about the learner constructing his/her own knowledge and developing skills (Lantolf, 2000; Vygotsky, 1978);
2. Acquiring subject knowledge, skills and understanding is related to learning and thinking (cognition). To enable the learner to construct an understanding of the subject matter, the linguistic demands of its content must be analysed and made accessible (Met, 1998);
3. Thinking processes (cognition) need to be analysed for their linguistic demands (Bloom, 1984; McGuinness, 1999);
4. Language needs to be learned in context, learning through the language, reconstructing the subject themes and their related cognitive processes e.g. language intake/output (Krashen, 1985; Swain, 2000);
5. Interaction in the learning context is fundamental to learning. This has implications when the learning context operates through L2 (Pica, 1991; van Lier, 1996);
6. The relationship between cultures and languages is complex. Intercultural awareness and learning is fundamental to CLIL (Byram, Nicols, and Stevens, 2001).

The 4Cs Framework holds that it is through progression in knowledge, skills and understanding of the subject matter, engagement in associated cognitive processing, interaction in a communicative context, developing appropriate language knowledge and skills as well as acquiring a deepening intercultural awareness through the positioning of self and ‘otherness’, that effective CLIL takes place whatever the model. From this perspective, CLIL involves learning to use language appropriately whilst using language to learn effectively. The 4Cs Framework is a tool for mapping out CLIL activities and for maximising potential in any model, at any level and any age.

### *Pedagogical Implications of CLIL*

As case studies from different CLIL contexts accrue, so too does an effective evidence base. Research shows that CLIL can for example:

- Raise learner linguistic competence and confidence;
- Raise teacher and learner expectations;
- Develop risk-taking and problem-solving skills in the learners;
- Increase vocabulary learning skills and grammatical awareness;
- Motivate and encourage student independence;
- Take students beyond ‘reductive’ foreign language topics;
- Improve L1 literacy;
- Encourage linguistic spontaneity (talk) if students are enabled to learn through the language rather than in the language;
- Develop study skills, concentration—learning how to learn through the foreign language is fundamental to CLIL;

- Generate positive attitudes and address gender issues in motivation;
- Embed cultural awareness and intercultural understanding into the curriculum. (Coyle, 2002b; Wolff, 1997)

Yet it is not CLIL *per se* which leads to spontaneous language use, learner talk and questioning, collaborative learning, grammatical understanding, improved study skills, positive attitudes and increased motivation, neither too the development of subject knowledge, skills and understanding. It could be argued that all the above are on the agenda for effective language learning and that CLIL concerns itself with appropriate pedagogic practice which is fit-for-purpose. In similar vein, it is an accepted maxim that bilingual education is not about becoming bilingual but about ‘getting’ education.

More recent opinion advocates that quality CLIL is dependent on understanding and operationalising approaches which will not be found solely in the traditional repertoires of either language or subject teachers. Gajo and Serra’s work (2000) explores the positive effects of ‘co-presence’ on learning that is where the subject teacher and the language teacher bring together different expertise and skills and through collaboration are able to reflect, discuss and evaluate the learning from two complementary perspectives ‘*un regard nouveau sur les frontières disciplinaires*’. De Bot (2002) similarly acknowledges that ‘teaching a subject in a foreign language is not the same as integrating language and content, and many schools are still to make that transition’. He calls for language and subject teachers to work together more in order to formulate ‘new didactics’.

The evolution of CLIL pedagogies whilst heavily influenced by immersion and language learning theories (SLA) and appropriately so, now looks set to build on the inclusion of learning theory and intercultural understanding in order to find its own identity in serving different European contexts.

#### PROBLEMS AND DIFFICULTIES IN CLIL PRACTICES

It could be argued that the flexibility of CLIL is both its strength and weakness in terms of sharing appropriate classroom practice. The question remains concerning the feasibility of achieving pedagogical coherence to bind together and maximise the potential of such diversity.

##### *The Subject-Language Divide*

Although pedagogic tools (e.g. 4Cs Framework) can be adapted to support any CLIL model, other issues come into play. There remain tensions between the ‘subject experts’ and ‘language experts’—since it

only in few cases where these are the same person. Subject teachers are concerned that their subject might be 'diluted' by non-specialists whereas language teachers express concern about the quality of the linguistic environment when led by non-linguists. The fundamental issue remains concerning who should deliver the CLIL curriculum with important implications for both in-service and pre-service teacher training.

CLIL remains 'hybrid' straddling both subject teaching cultures and language cultures. While CLIL may lend itself to co-operative learning (Slavin, 1995) and indeed such classroom approaches might be common in some L1 science lessons and history lessons and so on, collaborative learning in language teaching contexts remains relatively uncharted territory. The Thinking Skills Movement (Leat, 1998) has a strong base in the humanities and sciences whereas in language classrooms, developing learner thinking skills has played a minor role. From a language teaching perspective CLIL might be seen as evolving from communicative language practice rooted in the 1970s and 80s, with an emphasis on developing four skills, communicative strategies and grammatical awareness. Subject classroom practice on the other hand has tended to concentrate on cognitive development, knowledge transfer and 'progression' of learner understanding. Wolff (1998) argues that discovery learning, using learning strategies and techniques, hypothesis-building and testing in subject learning could be applied to CLIL environments with potent transfer to language learning. But problems remain if subject teaching . . . .

*is highly conventional and teachers tend to transfer their subject teaching methodology into the content subject language classroom – the natural explorative potential inherent in the teaching/learning process is thus neglected.* (Wolff, 1998, p. 32)

### *CLIL Language Issues*

The most common CLIL language across Europe is English. It might be perceived that CLIL is encouraging the further expansion of English across Europe at the expense of other languages. Moreover, teaching English as a foreign or second language has a well-documented, widely disseminated practical and theoretical base. It has strong 'pedagogical identity' which in some instances is being transferred rather than being adapted to CLIL settings. Meanwhile, languages other than English continue to fight for CLIL recognition although language choice is dependent on a complex range of socio-political factors.

Within the CLIL classroom, the use of L1 and L2 including the choice of language, the place and role of monolingual or bilingual

interactions and the importance of code switching and ‘translanguaging’ by the learners is being researched (Williams, 2000).

### *Learning Cultures*

Different countries and regions have their own cultural approaches to learning and education in general which differ significantly according to societal values and beliefs. In the CLIL setting for example, importing materials or textbooks from the target language country does not necessarily respond to the needs of learners and teachers in CLIL classes. Neither does material exchange from mother tongue use to CLIL use automatically address the absence of ready-made effective CLIL materials.

### *Defining Good CLIL and Effective Teaching*

Effective CLIL practice is determined by pedagogical values shared or owned by key players. If, for example, CLIL teachers are not trained to integrate language and subject learning rigorously, then potential value may be lost. Gajo and Serra (2002) for example advocate that research in linguistics and in pedagogy should provide more instruments to develop teaching methods focussing on cognitive skills and on subject content *supporting constructivist and interactionist procedures of teaching and learning* (2002, p. 95). Effective classroom interaction and the construction of knowledge are dependent on pedagogical beliefs and approaches (Bruner, 1999). Although there is a wide research base on what makes a good language learner (e.g. Naimen, Frohlich, Stern, and Todesco, 1978), this has not been replicated for CLIL.

## FUTURE DIRECTIONS

Recent studies (Coyle, 2005) have shown that as CLIL extends its research base beyond the field of second language acquisition to embrace wider learning and intercultural perspectives, then reconceptualising the function of language within CLIL may illuminate alternative pedagogies. Coyle advocates a triptych approach by analysing the language of, for and through learning in CLIL classrooms. Language of learning embraces the language needed to access and understand the subject matter lexis. Language for learning explores the role of meta-cognitive skills, grammatical skills and language needed to operate successfully in a CLIL setting. Language through learning addresses cognitive processes which underpin the use of language to learn including articulation, thinking skills and scaffolded learning. Learning in and through a foreign language, can provide rich opportunities

for extending knowledge, skills and understanding especially connecting quality learning and thinking with linguistic and intercultural competences.

Exploring the role played by language in CLIL may allay fears that CLIL is only for highly skilled learners. In fact, in accordance with the Bullock Report (all teachers are teachers of language, 1975) there is evidence to suggest that CLIL can support the development of literacy in L1 (Nuffield, 2000) and therefore should become an entitlement for all learners.

There remain many challenges for CLIL in the next decade: developing quality assurance mechanisms, robust assessment and evaluation procedures, materials development and professional development/teacher education. However, as CLIL research expands and the evidence-base increases, so too does the confidence in evolving CLIL pedagogical identity.

Perhaps the greatest challenge focuses on sharing successful practice across diverse setting to arrive at guiding principles for CLIL. Weaving the threads of research findings in diverse but related fields such as motivation, constructivist learning, interaction and the development of oral skills, scaffolding, reading skills, code switching, input-intake-output, learner autonomy, pupil voice and so on—might appear to be an overwhelming task. However, as more institutions across Europe develop CLIL, effective classroom practice and the theories that inform it take on greater significance. According to van Lier (1996, p. 69)—‘such awareness-raising work, which turns the classroom from a field of activity into a field of inquiry, can promote deep and lasting changes in educational practice’.

A clear message thus far in the development of CLIL pedagogies is that CLIL is contextually bound and models are diverse. Rather than this being seen as a limitation it could instead be welcomed as a conduit for propelling CLIL learning communities towards constructing their own CLIL theories of practice shared and owned by the community (Lave and Wenger, 1991). In this way CLIL pedagogies will be developed through classroom praxis and professional collaboration to formulate ‘new didactics needed for [a] real integration’ (de Bot, 2002) ... shared within communities between communities and for communities (Holmes, 2001):

*To attain its maximum potential it must be integrated into an educational philosophy that goes beyond ... Applied Linguistics. Students must have opportunities to communicate powerfully in the target language if they are going to integrate their language and cognitive development with their growing personal identities. (Cummins, 2000)*

CLIL—‘a rapidly developing, high profile and continuously controversial educational approach’ (Marsh, Marsland, and Maljers, 1999), ‘a growth industry in educational linguistics’ (Baetens-Beardsmore,

1999)—is set to contribute to the European 2010 targets for ‘making European education and training systems world class’.

*Das eigentliche pädagogische Potenzial des bilingualen Sachfachunterrichts liegt deshalb nicht nur in der Förderung des fremdsprachlichen Lernens, sondern vor allem auch in der Veränderung unserer verkrusteten schulischen Strukturen.* (Wolff 2002, p. 46)

“Thus, the actual pedagogic potential of teaching subjects bilingually doesn’t only lie in the acquisition of foreign languages but—above all—in changing our encrusted educational structures.”

## SECOND LANGUAGE LEARNING IN A STUDY ABROAD CONTEXT

### INTRODUCTION

Within the last decade or so, the topic of language learning in a study abroad (SA) context has become a recognized subfield of research in second language acquisition (SLA). In part, this is related to a more general interest in context of learning as a variable in SLA research. Three general questions have motivated this research: (i) Is there empirical documentation for the long held beliefs that students who study abroad achieve greater L2 language skills than those who do not? (ii) What are the *specific* differences in the language of students who have studied abroad as compared to those whose learning has been limited to the language-learning classroom at home (AH)? (iii) What aspects of the SA context contribute to language gain abroad?

In 1995, Freed (1995a) first enumerated a detailed list of theoretical and practical questions on this topic. Efforts to respond to them by various scholars have provided the basis for a wide range of studies, all of which have sharpened our insight into the nature of gains made by SA students as well as into various aspects of the actual learning environment. These studies have documented many assumptions about the linguistic benefits to be accrued from a SA experience. At the same time, they have offered some disquieting findings about the nature of the SA environment and the impact it may, or may not, have on L2 learning. This chapter summarizes the history of work done to date, discusses work in progress, outlines related problems and sets forth directions for the future.

### EARLY DEVELOPMENTS

A series of sporadic studies that explored the language-learning experiences of SA students were conducted between the mid 1960s and the early 1990s when the first major study of this type was completed. With few exceptions, the early projects used test scores exclusively to measure the linguistic gains made by students who studied abroad. Carroll's (1967) pioneering study of the language proficiency foreign language majors demonstrated for the first time that time spent abroad was one

of the major predictors of overall language proficiency. In subsequent years, a number of smaller studies, conducted in England, measured gains in speaking, listening and reading by British students who spent over a year working or studying in France or Germany. The scholars who summarized these studies reported test scores gains, which appeared to support the linguistic advantages of residence abroad (Willis, Doble, Sankarayya and Smithers, 1977).

Several small case studies (Möhle, 1984; Möhle and Raupach, 1983; Raupach, 1984) were among the first to focus on the acquisition of *fluency* by SA students, in this case French students studying in Germany and German students in France. Their results pointed to gains in global fluency for the exchange students. This fluency was manifested by increasing the rate of speech and/or decreasing the length of time between utterances, and by learning appropriate fillers, modifiers, formulae and compensation strategies. Their work was also the first to suggest that SA students do not appear to acquire improved grammatical skills as a result of time abroad. DeKeyser (1991) compared the language skills of a group of American students who spent a semester in Spain with an AH. He found that despite gains in fluency and vocabulary for the SA students, there were no significant differences with respect to improvements in grammar and oral proficiency. His findings emphasized the importance of individual differences in SA experiences, a theme which remained prominent in the SA literature.

In 1988, Dyson assessed the listening and speaking skills of 229 British students who spent a year studying in France, Germany, or Spain. The pre- to posttest scores indicated growth in both areas, particularly among the weaker students. Unfortunately, the lack of comparative data with students who had not been abroad, made it impossible to compare improvement in linguistic competence with any that might have resulted from an extra year of study spent at home.

The 1980s witnessed a number of studies in the USA which used the ACTFL/ILR oral proficiency interview (OPI) as a criterion measure for analyzing changes in oral proficiency for students who had been abroad. Among these, Viguez (1984) analyzed the language growth of a small group of students who studied in Spain, finding that they made substantial progress on the OPI. Liskin-Gasparro (1984), one of the first to use a control group of students who had not been abroad, found similar support for SA with higher OPI ratings for those who had been abroad. Similarly, Magnan (1986), again using the OPI, demonstrated that SA students of French made superior gains. Milleret (1990) followed a small group of students of Portuguese, using the Portuguese Speaking Test, demonstrating that students who participated in a 6-week summer program in Brazil made major gains on the OPI rating scale.

These studies supported assumptions regarding the general linguistic advantages that may be derived from an academic stay abroad. Although they contributed preliminary knowledge to the understanding of the benefits of SA, they were limited by the fact that many were of short duration, most lacked control groups and all relied exclusively on test scores to measure linguistic skills. These studies were unable to reveal specific qualitative changes in students' language proficiency nor were they able to capture distinctions in actual L2 usage among SA students. Nonetheless, this work stimulated interest in the topic and laid the groundwork for research which followed.

### MAJOR CONTRIBUTIONS

Beginning in the early 1990s several innovative projects expanded the focus, scope and promise of research on the linguistic impact of SA. The first of these was a multiyear study which combined quantitative and qualitative evaluation instruments to evaluate the learning of Russian in a SA setting (Brecht and Davidson, 1991; Brecht and Robinson, 1993; Brecht, Davidson and Ginsberg, 1990, 1993). The quantitative portions of this project supported the belief that SA experience promoted greater skills in speaking Russian, as measured by the OPI, than that offered by a 4-year AH program. From a qualitative perspective, their work introduced the first studies that relied upon student diaries and journals to provide students' own perceptions and descriptions of their actual field experiences.

Freed's (1995b) publication of the *Linguistic Impact of Study Abroad* presented the first multilinguistic group of studies that addressed different aspects of the SA experience. Most importantly, these studies addressed specific qualitative differences in the language use of SA versus non-SA students, as well as innovative work on communicative and sociolinguistic gains made while abroad. Among these studies was Regan's demonstration of the improved sociolinguistic competence, in French for advanced SA students in France. Regan also identified a lack of improvement in French grammar, a finding that has now been replicated in several later studies. Additional studies included Siegal's compelling description of the pragmatic conflict (between contemporary female American norms of behavior and expectations for native-like Japanese sociolinguistic behavior) encountered by advanced female students of Japanese studying in Japan; Lafford's report of the enriched communicative abilities (a broader repertoire of communicative strategies for initiating, maintaining, expanding and terminating communicative situations) for American L2 students who studied in Mexico and Spain, and Freed's analysis (1995c) of the improved fluency in French (more abundant and faster speech with fewer clusters of dysfluent

hesitations) for SA students. Polanyi, Miller and Ginsberg, and Brecht and Robinson, each working with students studying in Russia, provided evidence of the contrasting experiences and the interpretations (“folklinguistic theories”) students had of their own experiences, as well as the impact these experiences, both in and out-of-the classroom, had on their ultimate linguistic performance.

Coleman’s (1998) comprehensive review of SA research within the European context provided insight into the slightly different perspective on inter-European exchanges. Much of the reviewed research (based on [sometimes unreliable] self-assessment scores and/or discrete point tests), echoes American initiatives in their desire to measure linguistic gain as a result of these exchanges. European research has also placed a greater emphasis on assessing changes in intercultural competence as well as “attitudes, strategies and behaviors” which emanate from time spent living in another culture.

Wilkinson (1998) and Pellegrino’s (1998) work has brought considerable depth to the understanding of the SA language learning content, using both ethnographic and descriptive research, to garner insights into the actual nature of the so-called immersion setting, the diversity of encounter situations students confront and the description of the social relationships they form. Unexpected findings emerged from this work, identifying the unexpectedly limited linguistic (and social) nature of many homestay experiences, along with data which revealed that student’s interactions with native speakers are often less frequent and less intense than was once believed.

A multidimensional study of the acquisition of Spanish in a SA context and in the AH university language learning classroom, investigated gains in oral proficiency, fluency, communication strategies, vocabulary, grammatical control, pronunciation and the relationships between these gains and several related variables (cognitive readiness, time-on-task) for a group of university level students (Collentine, 2004; Collentine and Freed, 2004; Diaz-Campos, 2004; Freed, Segalowitz, and Dewey, 2004; Lafford, 2004; Lazar, 2004, Segalowitz and Freed, 2004). Each segment of this multipart project addressed a different aspect of L2 language use.

Collentine’s analysis of 17 measures of grammatical development yielded negative results with respect to superior gains for SA students. In fact, gains made by AH students on a number of discrete aspects of grammatical performance (e.g., accuracy in the use of prepositions, object-pronouns, use of the present and past tense, etc.) were greater than for the SA students. However, the SA students demonstrated significantly greater skills in narrative discourse than did the AH students. The SA students were better at concatenating subordinate clauses and using words that were informationally rich (nouns, attributive

adjectives and multisyllabic words). Segalowitz and Freed's study of the acquisition of fluency (measured by hesitation and temporal phenomena) confirmed prior studies suggesting the benefits of the SA context for helping students acquire increased fluidity and smoothness in their speech. A unique aspect of this study was the effort to relate cognitive processing abilities to oral fluency. The authors demonstrated that speed of visual word recognition (lexical access) and efficiency of visual word recognition (automaticity) correlated significantly with oral fluency in terms of mean run speech runs with no filled pauses. Most importantly, evidence of complex relationships involving some of the cognitive variables emerged as a significant aspect of the L2 learning experience. For example, students who made the greatest gains in oral proficiency began the semester with significantly faster and cognitively more efficient L2-specific word recognition abilities, which suggests a cognitive threshold for L2 learning readiness. Lafford's study of communication strategies elucidated another aspect of improved oral performance by SA students. Her analysis of 26 distinct techniques used by students to deal with communication gaps or breakdowns demonstrated that at the end of the semester the SA students used significantly fewer communication strategies (e.g., strategies requiring self-repair, accuracy checks on the learner's own speech, and restructuring) than did the AH group. Finally, from a statistician's perspective, with respect to the relationship of SLA and context of learning, Lazar's penetrating discussion of causal inference tools and their related assumptions highlights the need for caution by all SLA researchers in attributing causal relationships to findings based on correlational analyses alone.

The early work and contributions described above have provided the field with a well-documented perspective of the types of specific gains students in a SA context might make as compared to their counterparts at home. We can state with confidence that the SA experience promote gains in oral fluency, resulting in speech that has fewer dysfluent (individual and clustered) hesitations than that of their AH peers. Their speech is more abundant and delivered at a faster rate; they are likely to develop increased skills in narration and to utilize more semantically dense lexical items. In addition, SA students acquire a range of more native-like sociolinguistic skills and they decrease the number of communication strategies they need to call upon when interacting with native speakers. At the same time, there is ample evidence to conclude that, *as a rule*, the SA context does not promote superior gains in syntactic development nor in the *quantity* of lexical items per se.

Beyond specific descriptions as to the manner in which the speech of SA students may differ from that of students who have not studied abroad, this work has also provided emerging insights into unexpected

and complex relationships between language gain and cognitive and social variables in the SA context. For example, research suggests a cognitive threshold for L2 learning readiness, demonstrated by the fact that students who made the greatest gains in oral proficiency began the semester with significantly faster and cognitively more efficient L2-specific word recognition abilities. Equally important in understanding the SA context are the results of projects that have demonstrated that time-on-task (based on the reported number of out-of-class hours students spent per week in extracurricular activities) are not, *in and of themselves*, solely responsible for superior gains in oral proficiency and fluency by SA students. Thus, while increased interaction in the homestay setting indicated that the more students took advantage of exchanges in this setting, the less they had to rely on communication strategies to handle information gaps, it has also demonstrated that gains in speed of attention control (how fast learners shifted focus of attention) correlated *negatively* with the reported amount of contact with homestay families. Moreover, diary and journal reports have enriched our understanding of the value of student perceptions of the *quality* and not merely the *quantity* of their interactions with native speakers at home and in the larger speech community. These unanticipated findings support the ethnographic studies that uncovered a sometimes-surprising paucity of linguistically rich interaction in the homestay setting. Ample evidence now provides documentation that conversation in the homestay context may often be limited to brief and formulaic exchanges, which are less linguistically rich, challenging and motivating than was once assumed.

#### WORK IN PROGRESS

Research on the topic of language learning in the SA context has been enriched by the work of a number of scholars, working alone or in small groups, who have identified new directions and themes to be explored in expanding efforts to better grasp the complexities and results of SA experiences. Prominent among these is the on-going and pioneering project organized by Paige and his colleagues (2002) which promotes strategy learning for SA students. Their efforts have focused on introducing SA students to a wide range of individually utilized strategies (in reading, writing, speaking, listening), to help them maximize the potential linguistic benefits of their time abroad. In addition to materials, for instructor and student use prior to and during SA, this team is currently exploring the influence strategy use appears to have on linguistic gain while abroad.

Although the term “immersion” is typically reserved as a term to describe SA experiences, a small number of recent studies in French,

Spanish and Japanese have compared results of time spent in intensive domestic immersion programs as contrasted with immersion in the native speech community of the SA context. Dewey (2004), Freed Segalowitz, and Dewey (2004), and Liskin-Gasparro (1998), investigating respectively students of Japanese, French or Spanish, completed studies confirming superior gains by students in the intensive domestic immersion context.

Stimulated by the prior research on the nature of the SA context, the quantity and quality of interactions that students encounter, both in and out of the classroom, as well as long standing beliefs about the importance of the home stay experience, several recent and/or on-going studies are enriching our understanding with respect to these aspects of the SA experience. O'Donnell's (2004) analysis of the relationship between students' positive and negative perceptions of the homestay setting, as well as their attitudes toward their more general experiences in the SA context (all expressed in diaries and personal interviews) has yielded ambiguous results with respect to the influence that student perceptions have on the development of L2 fluency. Despite the lack of robust findings which would further elucidate the importance of student attitudes, this work has enhanced our understanding of the deeply held perceptions that students maintain about their experiences as well as the fact that time-on-task as a quantitative measure cannot account for language gain.

Two topics, one surprisingly the other more or less expected, have been traditionally neglected within the domain of research on SA. The first, the development of phonological accuracy, has been the subject of several recent studies (Díaz-Campos, 2004; Simões, 1996; Stevens, 2001) that have examined the acquisition of pronunciation (phonology, intonation, prosody). The findings were markedly inconsistent in terms of the advantages for pronunciation for study abroad, stressing once again the need to consider a range of individual differences when exploring linguistic development during SA. The second of these topics, the development of literacy skills, in reading and/or writing while abroad, first explored by Huebner (1995) and Kline (1998) are currently the focus of on-going work. Dewey (2004) continues to examine vocabulary development, processes and comprehension in reading for students who have studied in Japan while Freed, so, and Lazar (2003) have initiated work in native speaker perceptions of the written fluency of students who have studied in France. In both instances, there appears to be a lack of support for SA as a determining factor in the development of increased reading ability as quantitatively measured. However, some of this recent work continues to find support for the development of greater confidence in reading as well as an expression of interest and involvement in the social world of literacy.

The publication in 2006 of a second major volume (DuFon and Churchill, 2006) on the topic of L2 learning in the SA context underscores the growing interest in the field at the same time that it reflects newly emerging themes of interest and diverse methodological approaches. Exemplary of these trends are studies that investigate the development of pragmatic competence during SA, explorations of interaction and socialization in a homestay setting, as well as studies that deal with individual differences in SA.

#### PROBLEMS AND DIFFICULTIES

Several of the major problems in conducting research of this type have been alluded to above. The most obvious of these has been the utilization of discrete point or even global tests of holistic languages use, many with built-in ceiling effects, and all of which preclude the identification of specific differences in the gains made by students in one context as compared to the other. As the field has evolved, we have witnessed the development and utilization of different types of assessment methods, some of which permit researchers to identify specific qualitative differences in the language developed by SA students compared to those who remain at home. The need remains, however, to develop more refined measurement procedures that permit us to distinguish gains made by lower level students from those made by advanced students and to specify precisely what linguistic benefits are accorded by time spent abroad. Although more recent studies have analyzed speech corpora based on actual student output, even these corpora have been based on interviews and have not necessarily captured students' natural and spontaneous linguistic performance. The difficulty in gathering data of this type pose a complex problem for future research.

Methods of data collection problems are coupled with access to a sufficiently varied population. To date, the vast majority of research has focused on beginning and intermediate students and the results have consistently pointed to greater growth by less proficient learners. However, we can safely assume that some strides made by advanced learners are in those areas where classroom based learning has the least to offer. Consequently the more subtle and nuanced gains (e.g., in pragmatics and sociocultural fluency) made by advanced level learners are yet to be uncovered. Here again we are confronted by both difficulties in gathering data which characterize the linguistic environment of the learners as well as in identifying the nature of the gains made.

Equally important in efforts to understand the linguistic impact of a SA experience is the need to adequately describe and characterize the nature of input that students receive. To date, no study has been comprehensive enough to gather a robust quantity of data that permits

either a functional or syntactic comparison of learner input (including features such as grammar, vocabulary, discourse, sociolinguistic usage and the like) with the language produced by students in the SA context. The financial and operational demands of organizing such a project are one of the major challenges before us.

Not unrelated to the problem posed by the need to relate native speaker input to student output, is the delicate issue of the interaction that transpires in the homestay environment. Coupled with the challenge of collecting sufficient data is the sensitivity of this privileged setting and the cultural obstacles by potential invasion of the home environment. Research to date, based primarily on qualitative case studies of student diaries, journals and occasional interviews, has led to counter intuitive findings that suggest that the home stay setting is frequently devoid of precisely the abundant linguistic experience that it was once assumed to provide. While the descriptive accuracy of these studies is not to be questioned, the difficult challenge is to be able to bolster such studies with larger empirical studies that provide detailed evidence of the precise nature of the linguistic input in wide variety of homestay settings.

Finally, statistical interpretation of research findings remains a complex and sometimes contentious issue in all aspects of SLA research. Comparative studies, those based on identifying differences between gains made in one learning context contrasted with another, are particularly sensitive to assumptions that may be made about the impact of contextual differences. In the case of comparisons between SA and at home learning (or SA, at home and domestic immersion learning contexts), which strive to answer questions of causality, difficult problems of interpretation are posed for the researcher. The combination of observational and experimental data and statistical measures of correlation are seductive in their suggestions of cause and effect. However tempting it may be to look for causation in the manipulation of contexts such conclusions are dangerous to make. The issue and the problem, as presented by Lazar (2004), is in encouraging SLA scholars to develop methods of causal inference rather than relying primarily on more standard analyses.

#### FUTURE DIRECTIONS

In many respects, the problematic issues outlined above point to directions for the research agenda of the future. Fifteen or so years ago, the challenge was to document anecdotal beliefs about the power of SA experiences to transform learners into accomplished speakers of a second language. Today we are aware of some of the limitations of the SA context, sensitive to some of the myths long associated with the notion

of “immersion in the native speech community,” as well as knowledgeable about the nature of some of the specific gains made by those who participate in SA programs. That said, important challenges are still before us.

We need first to expand the range of languages that are studied. The vast majority of research has been based on Romance Languages with a small number of studies in Japanese and Russian. It is incumbent upon us to include more typologically different languages. It is equally important to diversify the type of students who form the basis of our research populations. We must strive to include more students of different racial backgrounds in our studies as well as those with different types and different amounts of pre SA experience.

Quantitative data will continue to be important in future research as we attempt to understand the specific nature of linguistic input in the SA context. However, in addition to attempting to describe this aspect of the learning puzzle, research of the future must expand its focus qualitative approaches to research that will provide insight into the nature of interactions that students encounter in different contexts of learning and in different settings within those contexts. Further, we will need to devise methods of collecting valid and reliable data (oral and written) that is not predicated on the use of a semi/structured interview with its own inherent limitations.

In conclusion, research of the future must of necessity incorporate both cognitive and social perspectives as an integral part of its research design. Therefore, we must consider the nature of the learner’s language learning readiness in terms of underlying processes that support L2 learning. As Segalowitz and Freed (2004, p. 19) have suggested, “We need to ask in what ways the learner is prepared for the special challenges presented by a specific learning context. We must also consider how the individual qualities a student brings to a learning environment change as a function of the experiences afforded by that learning environment.” While it can now be assumed that a direct relationship will not be established between linguistic input, context of learning, time-on-task and linguistic gain, research directions of the future must answer the question as to the precise and complex ways in which these variables interact. Sensitivity to this broad range of issues will ultimately provide a more fully developed picture of the contribution of SA experiences to the SLA.

### **International Perspectives on Second and Foreign Language Learning**

## FOREIGN LANGUAGE LEARNING IN K-12 CLASSROOMS IN THE UNITED STATES

### INTRODUCTION

Not since the post-Sputnik era has so much attention been given to the learning of languages other than English. The tragic events of September 11, combined with a globalized economy, and increasing linguistic and cultural diversity within communities across America have created a need for language competence that will ensure national security, a thriving economy, and a cohesive society.

The US has no language policy, nor a language education policy. Despite sporadic and unsuccessful attempts to mandate English as the official language of the US, and despite state-level referenda that have abolished bilingual education in a few states, there has been little effort at the national or state levels to shape which languages are taught in K-12 schools, which learners are allowed to study foreign languages,<sup>1</sup> how long they continue their study, and what the goals of such study should be.

Despite the lack of formal policy, a new landscape prevails. In June 2004, the Department of Defense hosted a national conference on language and language education, focused on how the US might better align the supply of Americans with language competence with the growing demand. The resulting White Paper called for national leadership to undertake a number of urgently needed actions:

- Implement policies, programs, and legislation that build the national language and cultural understanding capability
- Engage Federal, state, and local agencies and the private sector in solutions
- Develop language and cultural competency across public and private sectors
- Develop language skills in a wide range of critical languages
- Strengthen our education system, programs, and tools in foreign languages and cultures
- Integrate language training into career fields and increase the number of language professionals, especially in the less commonly taught languages (p. ii)

---

<sup>1</sup> This chapter will use the term ‘foreign language’ to refer to languages other than English taught in schools.

Shortly thereafter, in January 2005, the American Council on the Teaching of Foreign Languages (ACTFL) convened a policy summit of business leaders, government officials, and academics to begin to formulate a language education policy and to identify action steps to be taken by each constituency. Throughout the fall and winter of 2005–2006, the media have been filled with reports of growing interest in the teaching and learning of Arabic and Chinese. This interest, no doubt, is in response to the ever greater prominence in global politics of speakers of these languages and their culture, as well as their significant roles in the global economy. In January 2006, President Bush announced the National Security Language Initiative (NSLI), aimed at promoting security and national prosperity, in part through expanding foreign language learning. The surging momentum for teaching and learning languages comes at a fortuitous moment in the evolution of language education in the USA, building on recent innovations and successes.

#### EARLY DEVELOPMENTS

##### *Language Education in the Post-Sputnik Era*

September 11 has provided an impetus for defense-related needs for Americans to know the languages of the world, just as Sputnik provided in an earlier era. Subsequent to the launch of Sputnik, interest in languages was tied to national defense, the Cold War, and the related competition with the former Soviet Union, with the federal government playing a significant role in shaping language education policy. Substantial federal funding under the 1957 National Defense Education Act (NDEA) provided important support for the expansion of language offerings and increased enrollments at the elementary, secondary, and postsecondary levels, particularly for study of languages that were in the national interest; extensive funding for improving teacher knowledge and skills to produce a cadre of well-prepared teachers aware of current best practices (at that time, practices associated with the audio-lingual method); and the development of new materials aligned with prevailing theories of learning, primarily Skinnerian Behaviorism (Curtain and Dahlberg, 2004; Liskin-Gasparro, 1984; Omaggio-Hadley, 2001).

NDEA led to enthusiasm among schools and districts in offering languages in the elementary grades, which in turn led to numerous new programs taught face-to-face or through television. Language laboratories, thought to provide the kind of practice suggested by Skinner's Operant Conditioning were being installed in secondary schools. The primary methodology favored by language educators was the audio-lingual method in which language was seen as a habit to be formed

through a variety of drills designed according to notions of stimulus-response (Omaggio-Hadley, 2001).

A number of factors resulted in declining interest in language education. Early language learning programs did not produce better results by high school than those of students who delayed starting language learning until later. Lack of age-appropriate curriculum, ineffective and inappropriate instructional methodologies, and insufficient age-appropriate materials, along with a critical shortage of teachers prepared to work with young learners, all contributed to a lack of evidence supporting the efficacy of starting language study early (Curtain and Dahlberg, 2004). Similarly, language laboratories—among early powerful technology tools—were not found to enhance student achievement (Kelly, 1976). Again, a number of factors contributed to these findings, including inadequate training for teachers on how to use this technology and how it might best be integrated into their instructional programs.

*Language Education Policy Today: Who Decides Who Studies a Foreign Language and for How Long?*

Historically, language education policy is in the purview of the states, as is education in general. Most states determine whether foreign languages are required for high school graduation or not (almost none have such a requirement) and whether language study is acknowledged through special “merit” diplomas (many states award such recognition) (for an overview of language education policy in US elementary and secondary schools see Brown, 1994; Met, 1994). Since the mid-1980s a number of states have mandated that foreign language learning be required of all students during the elementary grades, with different states determining different age spans. For example, in Oklahoma K-3 all students must be provided with language “awareness,” while students in grades 4–8 are expected to attain Novice High proficiency on the ACTFL scale upon completion of grade 8; in Wyoming, effective 2003, every K-2 student must have the opportunity to learn a language; and in New Jersey, as of 1996, all public schools are required to provide foreign language instruction to students in grades K-8. In contrast, although there is legislation requiring foreign languages be taught in all Arizona and North Carolina elementary schools, the law is not accompanied by state funding, and numerous school districts have terminated their programs. As of 1997, nine states had established requirements for elementary school foreign language instruction for some or all students (Lewelling and Rennie, 1997).

In the absence of state requirements, decisions about language offerings and requirements are in the hands of local school boards. Traditionally, most school districts offered foreign languages to students at

the high school level and often only to the college bound. More recently, there has been an increase in the percentage of students attending middle schools studying foreign languages. In 2000<sup>2</sup>, 15% of students in grades 7–8 were enrolled in a foreign language course, as compared with 12% in 1994<sup>3</sup> (Draper and Hicks, 1994, 2002), as well as a broadening of the student population studying languages. As noted above, an increase in the number of elementary school aged children beginning foreign language learning early is also assumed to be increasing the numbers of secondary language learners, particularly in areas where the elementary mandate has applied to all students, not a select few. All told, approximately 34% of US public school students were enrolled in a foreign language course in the fall of 2000 (Draper and Hicks, 2002).

### MAJOR CONTRIBUTIONS

The current interest in promoting learning languages other than English in the US comes as a welcome departure from the apathy and disdain for language learning that has prevailed for decades. Based on their own personal experiences—beginning language learning late in their academic career, finding pedagogical approaches limited in their effectiveness, and relative successes in the job market despite lacking proficiency in any language besides English—many Americans believe that language learning is unsuccessful in our schools, and not an essential for career advancement. As has been described, global changes have begun to change that view (for a fuller discussion, see Met, 2001).

Optimism for the future rests not only on the positive policy climate, but also on a series of initiatives taken within the foreign language field that are more likely than ever to contribute to K-12 learners becoming competent in additional languages. Born of the national standards movement of the mid-1990s, and supported by federal funds, a consortium of professional associations produced both generic and language-specific content standards for what all students should know and be able to do upon exiting high school: *Standards for Foreign Language Learning*. The five goals of the national standards and the eleven standards subsumed under them are shown in [Table 1](#).

The standards are a natural outgrowth of the “proficiency movement” emphasizing what students can do with language, rather than

---

<sup>2</sup> Data collected in 2000 by ACTFL, and reported in 2002, are the most recent available on nationwide enrollments.

<sup>3</sup> These data are approximate. Some students in grades 7 and 8 attend schools housing grades 7–12, and those enrollment data are reported separately. Further, when state level enrollment data were not available, statistical extrapolations were used to estimate enrollments.

Table 1 Standards for foreign language learning

|   |   |
|---|---|
| <p>Communication</p> <p><i>Communicate in Languages Other Than English</i></p>                          | <p>Standard 1.1: Students engage in conversations, provide and obtain information, express feelings and emotions, and exchange opinions.</p> <p>Standard 1.2: Students understand and interpret written and spoken language on a variety of topics.</p> <p>Standard 1.3: Students present information, concepts, and ideas to an audience of listeners or readers on a variety of topics.</p> |
| <p>Cultures</p> <p><i>Gain Knowledge and Understanding of Other Cultures</i></p>                        | <p>Standard 2.1: Students demonstrate an understanding of the relationship between the practices and perspectives of the culture studied.</p> <p>Standard 2.2: Students demonstrate an understanding of the relationship between the products and perspectives of the culture studied.</p>  |
| <p>Connections</p> <p><i>Connect with Other Disciplines and Acquire Information</i></p>                 | <p>Standard 3.1: Students reinforce and further their knowledge of other disciplines through the foreign language.</p> <p>Standard 3.2: Students acquire information and recognize the distinctive viewpoints that are only available through the foreign language and its cultures.</p>  |
| <p>Comparisons</p> <p><i>Develop Insight into the Nature of Language and Culture</i></p>                | <p>Standard 4.1: Students demonstrate understanding of the nature of language through comparisons of the language studied and their own.</p> <p>Standard 4.2: Students demonstrate understanding of the concept of culture through comparisons of the cultures studied and their own.</p>   |
| <p>Communities</p> <p><i>Participate in Multilingual Communities at Home &amp; Around the World</i></p> | <p>Standard 5.1: Students use the language both within and beyond the school setting.</p> <p>Standard 5.2: Students show evidence of becoming life-long learners by using the language for personal enjoyment and enrichment.</p>   |

Source: Standards for Foreign Language Learning: Preparing for the Twenty-First Century.

what they know about it. The communication goal describes communicative performance in three modes: interpretive communication (listening and reading for meaning when there is no opportunity for direct negotiation of meaning with the speaker or writer); presentational communication (speaking or writing without possibility of negotiation of meaning); and interpersonal communication (oral or written interactions that permit speaker/listener or reader/writer to negotiate meaning).

Goal 2 of the national standards—Cultures—states that students are expected to learn about the products and practices of other cultures and understand how these relate to cultural perspectives—the values, attitudes, beliefs, and world views of the people who speak the language. Products may be anything from great works of literature and the arts to everyday products such as home furnishings or skateboards. Practices may be traditional festivals and holidays, customs, or everyday patterns such as mealtimes or dating patterns among teens. Most importantly, products and practices are to be tied to the underlying cultural belief systems that determine why people do what they do. Even when perspectives may not be known to the learner (or even to culture bearers themselves) there is an understanding that there are underlying cultural reasons for products and practices.

The three remaining goals of the national standards apply the Communication and Cultures standards to other aspects of language use. Goal 3—Connections—states that students use their new language to connect with subject matter found in other parts of the school curriculum or to use their new language to acquire new information or insights into the target culture—perhaps even accessing information that might not otherwise be accessible to them through English. Goal 4—Comparisons—aims at an outcome language educators have long believed an important part of learning another language: insights into one's own language and culture. Goal 5—Communities—asks students to use their language skills to connect with the world outside the schoolroom, either in the local community or abroad, whether directly through face-to-face interaction or indirectly through access to print and electronic communications (for a more detailed description of each of the goals and related standards see Phillips and Terry, 1996).

In a deliberate and focused effort at coherence, new standards for teachers have been developed and are aligned with standards for student learning. That is, programs of teacher preparation, as well as the performance of novice and accomplished teachers, are all expected to ensure that what happens in classrooms allows students to attain the outcomes described in the national standards. The National Council for Accreditation of Teacher Education (NCATE) standards, revised in 2002, apply to teacher preparation programs seeking accreditation;

the Interstate New Teacher Assessment and Support Consortium (INTASC, 2002) standards describe what novice teachers should know and be able to do, while the National Board for Professional Teaching Standards (NBPTS, 2003) standards describe the competencies of accomplished teachers.

To further ensure congruence of content standards with student performance, a new set of guidelines—the ACTFL K-12 Performance Guidelines—were developed to describe how well students at given points in their language career can communicate (Swender and Duncan, 1998). These guidelines provide an understanding of how to map the new standards onto the older Oral Proficiency Guidelines, that were first developed in the 1980's and were based on an yet another set of guidelines produced by a consortium of US government agencies—Intergovernmental Language Roundtable (ILR) (Liskin-Gasparro, 1984). The ILR scale was and still is widely used by the US government to describe language proficiency using the educated native speaker as the point of comparison. The new K-12 guidelines describe what students within the K-12 setting might be expected to achieve, and how well they might perform, as a result of standards-based instruction.

Within a decade of their release, the national standards for students as well as those for teachers and teacher preparation have received widespread acceptance in the K-12 language education community. State standards and curriculum frameworks have been produced that align with the national standards. Since states, not the federal government, regulate education, national standards are voluntary. State standards may serve as frameworks, guidelines, or mandates, depending on state law and practice. At the local level, district curricula and professional development are helping to bring standards into the classroom.

## WORK IN PROGRESS

### *New Approaches to Assessment*

Traditional approaches to assessment measured what students knew about language, but rarely asked for evidence that students could use their knowledge into communicative performance. Tests were largely paper and pencil, and often tested discrete components of language, such as vocabulary and grammar. With the advent of the ACTFL oral proficiency guidelines and the move toward communicative language teaching came the recognition that discrete point testing and paper/pencil measures could not realistically capture students' ability to use language to communicate. The ACTFL oral proficiency interview (OPI) was developed to assess performance on the ACTFL rating scale, with resulting extensive training provided to ensure inter-rater reliability.

Interest in performance assessments went beyond the ACTFL oral proficiency interview (OPI). Classroom teachers considered the ACTFL OPI a valuable tool, but an impractical approach for assessing their own students. The OPI requires extensive (and costly) training, so that many classroom teachers were simply unable to become certified testers. The time required to administer the OPI is not feasible for teachers with 150 or more students to be tested several times a semester or year. Further, most schools require teachers to submit grades within a short time after administering final examinations, contributing to the impracticality of the OPI for end-of-course testing in secondary schools. In 2005, ACTFL received funding from the US Department of Education to develop a blueprint for assessing language proficiency, to create a framework that would be appropriate for a standards-based national language test, and to develop a prototype for such a test.

A variety of approaches to performance assessment suitable for classroom use have evolved. ACTFL took the lead in developing Integrated Performance Assessments (IPA) that model how classroom teachers might integrate assessment with instruction and focus on performance, rather than discrete point knowledge. The IPA is comprised of three tasks—Interpretive, Interpersonal and Presentational—integrated around a particular theme or content area and reflecting how language is actually used in the real world or the classroom. The three tasks are integrated so that “each task provides the information and elicits the linguistic interaction that is necessary for students to complete the subsequent task” (ACTFL, 2006).

Given the challenges of assessing the proficiency of large numbers of students, researchers turned to technology as a means of efficiently determining the ability of students to communicate in a foreign language. Beginning in 1999, the Center for Advanced Second Language Studies (CASLS) embarked on a project to develop the Standards-based Measurement of Proficiency (STAMP), online assessments of spoken and written language that align with the ACTFL Performance Guidelines and with national standards. At the time of this writing, those assessments have been developed in seven languages: Chinese, French, German, Hebrew, Japanese, Spanish, and Turkish.

Another interesting approach to assessment is being developed and piloted by a consortium of states, patterned after the European Language Portfolio (see also Broeder and Martyniuk, *Language Education in Europe: The Common European Framework of Reference, Volume 4*). *Linguafolio*, its US counterpart, is a document consisting of three parts: a language passport that describes students experiences and abilities with languages, including formal diplomas or certificates; a language biography in which students record their language learning history and reflect on their goals and experiences, and a dossier, in which students

selectively place evidence of their language skills and achievements (Linguafolio, 2005).

Throughout the education field, assessment has come to play a central role. In order to ensure that what students learn (curriculum) and how it is taught (instruction) are well aligned, educators have begun to plan curriculum and instruction using “backwards design,” based principally on the work of Wiggins and McTighe, *Understanding by Design* (1998). Backwards design begins with an analysis of goals and objectives, describing what students would do to demonstrate their learning. This demonstration is the core of the assessment, thus beginning the planning process with a detailed, clear understanding of acceptable evidence of student learning, followed by a gap analysis to determine the gap between current levels of student knowledge/performance and the desired level. Strategies for enabling students to gain the knowledge and skills required to meet expectation and provide the expected evidence of learning (instruction) are then aligned with best practices in the discipline. Using assessment to drive curriculum and instruction decision-making is gaining interest on the part of foreign language leaders.

### *New Approaches to Instruction*

A variety of approaches to the integration of content and language learning have blossomed over the last two decades (Christian and Rhodes, 1997; Curtain and Dahlberg, 2004; Met, 1998). Elementary school foreign language curricula reinforce and enrich other content areas of the curriculum; in middle schools, thematic units integrate language with other content; at the postsecondary level, Foreign Language Across the Curriculum models vary across institutions, but share the commonality of using languages other than English as a medium for content learning.

Continued interest in integrated approaches is evidenced by the growth of immersion programs, and in particular, dual language programs (Christian, Montone, Lindholm and Carranza, 1997; Lindholm-Leary, 2001). Also called two-way immersion, these programs bring together speakers of English with speakers of the target language in an immersion program. While program models vary, with some devoting 90% of the school day to the non-English and with others dividing the day between the two languages 50–50%, the primary characteristic of these innovative programs is that students are learning language from one another as well as from the teacher (Christian, Montone, Lindholm and Carranza, 1997; Lindholm-Leary, 2001). Spanish-English dual language programs are the most common, but programs in Chinese, Japanese, Korean, and Navajo have also been

established. Immersion programs—whether foreign language immersion or two-way immersion—are recognized as providing high levels of language competence in both English and the non-English language while ensuring that students meet expectations for academic performance (Day and Shapson, 1996; Genesee, 1987; Lindholm-Leary, 2001; Swain and Lapkin, 1991).

Technology as a primary instructional delivery system is still in its infancy, although expanding rapidly. At the elementary school level, there have been a number of video programs produced that develop rudimentary language skills. In the late 1990s Georgia Public Television produced SALSA, one of the most widely used of these programs. SALSA is sometimes used by a regular classroom teacher who may or may not have received professional development on supporting the video series with in-class activities; in some schools, the video is supplemented with face-to-face instruction provided by a certified language professional or trained paraprofessional. Initial data suggests that students are making clear progress in the development of listening comprehension skills through its use, particularly in schools where video instruction is complemented by face-to-face instruction from a trained foreign language professional (National K-12 Foreign Language Resource Center, 2004).

Distance learning as the primary mode of instructional delivery has been an option at the secondary school level for over a decade. Interaction with the on-screen teacher or with conversation partners via telephone is included in many of these programs. Distance learning (which provides interactivity) and distributed learning (technology-delivered instruction without interactivity) are under development as many states (e.g., Kentucky) and local school districts (e.g., Fairfax County, VA) work to develop Virtual High School course offerings in foreign languages.

### *Building Infrastructure*

The continued successful expansion of language learning in the US depends on high-quality instruction and on well-articulated programs.

In response to a dramatic increase in demand for learning Chinese in K-12, the Asia Society convened leaders in the language education and Chinese teaching field to determine what would be required to increase current enrollments in Chinese by 5%. Their report highlights the critical need for infrastructure development, particularly for expanding the pool of highly qualified teachers and for instructional materials (Stewart and Wang, 2005). Although this report deals specifically with the expansion of Chinese language instruction, many of the findings would apply equally well to other languages that are also receiving new attention, such as Arabic.

Well-articulated programs allow students to make continuous progress in their language learning, from year to year and from school to school. Unfortunately, for many students, changing teachers or changing schools often means revisiting the same material previously taught. Some students report taking first-year language courses in the elementary grades, again in secondary school, and yet again in college. In order to demonstrate how articulation might be addressed, the National Security Education Program, a federal program, funded the first K-16 pipeline in the USA. This pipeline provides K-12 Portland (OR) Public Schools students who have been studying Chinese the opportunity to continue seamlessly with their language development at the University of Oregon. The key to success is anticipated to be a well-thought out linkage between the school and university based on shared agreements on standards accompanied by yearly assessment of student performance. Federal funding for replication of the K-16 pipeline at other sites is anticipated in coming years.

#### PROBLEMS AND FUTURE DIRECTIONS

Although great progress has been made in reshaping policy and practices in K-12 language education, much work is still in progress.

Bringing the standards into classrooms requires vigorous continued efforts. The national *Standards for Foreign Language Learning*, and some state standards, are voluntary. As a result, in those K-12 settings where there is a lack of professional development, or a poor understanding of how standards are more powerful than previous (or previously nonexistent) expectations, or where there is a lack of funding to revise existing curricula and related materials, change will come very slowly.

Further, standards for student learning are only useful if students are enrolled in foreign language courses. Despite the upsurge in enrollments, most students do not begin language learning before grade 9 (approximately age 14) (Draper and Hicks, 2002). Opportunities to develop meaningful levels of language proficiency are limited in the elementary and middle grades (K-8). The majority of elementary school programs are limited in contact time and resulting objectives. Most classes meet for 60 minutes or less per week; many programs aim only for language and culture exposure and appreciation (Branaman and Rhodes, 1999). In the middle grades (anywhere from grades 4–8 depending on school configuration), approximately one-fourth of course offerings are ‘exploratory’: short-term courses that seek to give students a general idea of languages and language learning, rather than a start along the path to proficiency (Branaman and Rhodes, 1999).

As the landscape shifts, and language education becomes a priority, it is likely to exacerbate an existing teacher shortage. In some parts of

the USA, and particularly since enrollments in Spanish have jumped to almost 70% of the total foreign language enrollment, it is difficult to find Spanish teachers. As interest in languages less commonly taught gain momentum, the teacher shortage will be even more severe. There are already reports that the growing interest in learning Chinese is not accompanied by sufficient teachers to provide instruction. Further, for many of the less commonly taught languages, there are few institutions that prepare teachers of those languages and choices among materials for instruction are highly limited, and often outdated. Although forms of distance and distributed learning might be an effective way to address these shortages, there is still some resistance to the notion of technology as a primary delivery mode of teaching. Developing new distance and distributed learning programs requires significant amounts of funding, funding that has not yet been widely available within education.

### *Future Directions*

The changing landscape of language education policy reported in this chapter has been spurred in large part by issues of national security. On the one hand, there are concerns about our ability to promote peace, to understand the motivations of those who wish harm to the USA, and to interpret the intelligence that our government gathers. Clearly, these rest on language skills and cultural understanding. On the other hand, our national security also rests upon our ability to maintain a strong presence in the global economy. To do that, current and future generations of Americans will need to be able to communicate effectively across linguistic and cultural boundaries, or be left behind those who can. Although these needs are legitimate and important, and have energized language educators, it is also helpful to look back at other times in our history when languages were important for their instrumental value—whether for political or economic reasons—and be cognizant of the subsequent trajectory of support for foreign language learning.

As languages become a more integral part of American students' educations, it would be promising if the value of knowing other languages were acknowledged for its contribution to a well-rounded general education, for the academic and/or cognitive benefits it may provide, or simply, for the personal enjoyment that can derive from direct access to the people of other cultures, their arts, and their lives.

ISSUES IN HERITAGE LANGUAGE LEARNING  
IN THE UNITED STATES

INTRODUCTION AND DEFINITION

In the language acquisition field, new pedagogical theories, methodologies, and assessment protocols appear periodically. However, no new area of research and development in language teaching has emerged as an independent field since Teaching English as a Second language (TESL). Heritage language learning has recently become such a new field of inquiry.

The term *heritage languages* is Canadian in origin; it was coined when the “Ontario Heritage Languages Programs” (Cummins, 2005, p. 585) were launched in 1977. The term entered the US vernacular in the late 1990s. As yet there is no single, universally accepted definition of the terms heritage speaker or heritage learner. For example, Spanish courses for what we would label “heritage speakers” are typically labeled “Spanish for Native Speakers.” By contrast, a recent advertisement for advanced proficiency training in English is aimed at “heritage speakers” who are, in fact, native speakers, individuals who have completed their undergraduate education in their country of origin.

Several definitions of heritage languages and speakers have been proposed by researchers in the USA. The best known definition belongs to Valdés (2000) who describes heritage learners as “individuals raised in homes where a language other than English is spoken and who are to some degree bilingual in English and the heritage language.” Polinsky [Brinton, Kagan, and Bauckus (in press)] defines heritage language as the “language which was first for an individual with respect to the order of acquisition but has not been completely acquired because of the switch to another dominant language.” Fishman (2001, p. 81) identifies a heritage language by its “particular family relevance to the learners,” and Van Deusen-Scholl (2003) refers to learners who “have been raised with a strong cultural connection to a particular language through family interaction” as learners “with a heritage motivation” (p. 222). For the purpose of discussing heritage language education, a description that emphasizes the dichotomy between foreign language acquisition that “is usually begun in a classroom setting” and heritage language acquisition that “begins in the

home” (UCLA Steering Committee, 2001, p. 8) can serve as a working definition. Collectively these definitions affirm the need for multidimensional approaches to teaching heritage learners.

Fishman (2001, p. 81) identifies three groups of heritage speakers: speakers of colonial, indigenous, and immigrant languages. The heritage language field has arisen in the United States as a consequence of the language profession’s recognition that heritage learners of immigrant languages now constitute a major demographic group for a large number of K-16 language programs. Over 28 million Americans identify Spanish as their home language (2000 US Census) and overall, 12% of Americans speak a language other than English in the home. [Table 1](#) lists ten languages other than English and Spanish most frequently spoken at home in the USA.

When heritage speakers pursue formal study of their heritage language, they present a challenge to language educators who are trained to teach foreign language learners, that is students without previous knowledge of the target language. Since the events of September 11, 2001 heritage students’ knowledge has become increasingly valued in the USA as the federal government has become mindful of the need for competent speakers of foreign languages, especially languages considered vital for national security.

Table 1 Ten most frequently spoken languages in the USA (excluding English and Spanish)

| Rank | Language   | N Speakers |
|------|------------|------------|
| 1    | Chinese    | 2,022,143  |
| 2    | French     | 1,643,838  |
| 3    | German     | 1,382,613  |
| 4    | Tagalog    | 1,224,241  |
| 5    | Vietnamese | 1,009,627  |
| 6    | Italian    | 1,008,370  |
| 7    | Korean     | 894,063    |
| 8    | Russian    | 706,242    |
| 9    | Polish     | 667,414    |
| 10   | Arabic     | 614,582    |

## EARLY DEVELOPMENTS

Scholarly interest in heritage language preservation can be traced back to the mid-1960s and early 1970s. Joshua Fishman's publications laid the foundation for what became known as a field of heritage language education, most notably his seminal work on the sociology of language, *Language Loyalty in the United States* (1966). Guadalupe Valdés has been involved in efforts to maintain and preserve heritage languages among minority populations since the mid-1970s. While much of her work has focused on the teaching of Spanish to Hispanophone students in the USA (she is the co-author of the first textbook for heritage speakers of Spanish, *Español Escrito* (2003), first published in 1978 and now in its fifth edition), Valdés prepared the groundwork for research and instruction in other heritage languages.

In the late 1990s interest in English–Spanish bilingualism broadened to include an effort to embrace and preserve all languages spoken in the USA. Russell Campbell (Campbell and Peyton, 1998) and Richard Brecht (Brecht and Ingold 1998; Brecht and Rivers, 2000) were among early advocates of providing instruction designed for heritage speakers. Even before national security became an issue of concern, Brecht and Ingold (1998) advocated drawing on the capabilities of heritage speakers to strengthen linguistic readiness, pointing out that foreign language instruction on the college level seldom results in the proficiency needed for professional-level work.

The first national conference dedicated to heritage language teaching, “Heritage Languages in America,” was convened in 1999 (Center for Applied Linguistics, 1999). Selected papers from the conference were published as “Heritage Languages in America: Preserving a National Resource” (Peyton, Ranard, and McGinnis, 2001). The conference focused on the need to create heritage programs in K-16 and in communities and demonstrated that the nascent heritage language field was in need both of foundational research and a research agenda. The research agenda was proposed in the UCLA Steering Committee Heritage Language Research Priorities Conference Report (2001). The report advocates multidisciplinary research with a focus on the heritage speaker; the family and the community; language specific issues; educational policies; programmatic priorities, and assessment.

The second national conference on heritage languages was held in 2002 (Center for Applied Linguistics, 2002). This conference's goals were to develop public awareness of the economic, personal, and social benefits of proficiency in heritage languages and promote the inclusion of heritage language issues in the national dialogue; to shape a national heritage language policy and share information on best practices; to

develop collaboration among all constituent groups; and to devise a plan for moving from rhetoric to action.

#### MAJOR CONTRIBUTIONS

Several volumes dedicated to heritage education have been published since 2000. *Teaching Heritage Language Learners: Voices from the Classroom* (John Webb and Barbara Miller, 2000) resulted from the project “*Collaborative Teacher Education Program: A Model for Second Language Instruction for Inner City Schools*,” sponsored by the American Council on the Teaching of Foreign Languages (ACTFL) and Hunter College, NY, and designed to prepare teachers of Spanish, Haitian Créole, and French to work with heritage language learners.

Selected papers from the 1999 heritage language conference were published as *Heritage Languages in America: Preserving a National Resource* (Peyton, Ranard, and McGinnis, 2001), with contributions focused on establishing the field in the USA.

*Mi Lengua: Spanish as a Heritage Language in the United States* (2003) (Ana Roca and Cecilia Colombi, editors) examines theoretical issues involved in teaching Spanish to Spanish heritage learners and reports on classroom research studies at all levels of instruction. Although the volume’s focus is on Spanish, its offerings, which include an abundance of practical suggestions for heritage language educators, also apply to other heritage languages.

*Heritage Language Education: A New Field Emerging* (Brinton, Kagan, and Bauckus, in press) is a multidisciplinary collection of articles that positions heritage speaker education at the intersection of language policy, linguistics and applied linguistics, psychology and pedagogical practice. In addition to theoretical findings, this collection presents a range of case studies in such less commonly taught languages as Japanese, Russian, and Korean.

The online *Heritage Language Journal* (HLJ), the first and so far the only serial publication in the heritage field, is a joint project of the UCLA Center for World Languages and the UC Consortium for Language Learning and Teaching and has been publishing since 2003.

A special volume of the *International Journal of Bilingual Education and Bilingualism* (2005), based on a 2001 US–Australian conference, is dedicated to heritage/community language education. The conference discussed themes of community and identity; policy, language ecology, and teacher education; program and curriculum; and assessment (p. 102). A 2005 issue of the *Modern Language Journal* devoted its *Perspectives* section to heritage education in recognition of heritage learners who are now “foregrounded in professional discussions” (Byrnes, 2005, p. 582).

In recent years the teaching and preservation of heritage languages has become an increasingly popular topic at national conferences on language acquisition and teaching, including the American Association for Applied Linguistics, the Modern Language Association, the American Council on the Teaching of Foreign Languages, and language-specific conferences, which routinely have panels dedicated to heritage language research and practice.

Virtually all studies suggest that an understanding of heritage language learning and teaching requires attention to an array of issues including proficiency, identity, curriculum and assessment, ties with heritage communities, and questions of policy. Hornberger (2003) locates heritage speakers' proficiency on a continuum of bilingualism that suggests the difficulty of a single instructional approach. Learners may, for example, demonstrate high-level competence in speaking and listening while having no functional literacy skills. Moreover, because of the home-based nature of their language acquisition, even heritage speakers with high proficiency in speaking and listening generally lack the skills shaped by formal education that would allow them to function in an academic or professional setting. Heritage speakers also may display traits of nonstandard or émigré language and dialectic features, and their language may be marked by code switching, English borrowings and calques, all features that require tailored instruction if heritage speakers are to acquire standard professional level language skills.

Valdés (2001) classifies speakers of immigrant languages according to the time of arrival and their contact with the language. She proposes four categories of bilinguals, from incipient bilinguals of the first generation to English dominant bilinguals of the fourth generation (pp. 42–43). Basing her findings on Spanish speakers, Valdés finds that “by the fourth generation, most individuals of immigrant background will have become monolingual English speakers” (p. 43).

Studies of Russian heritage speakers by Kagan and Dillon (2001) and Kagan (2005) have identified four groups of Russian speakers based on the correlation between their education and their degree of competency in the language. Students in *Group 1* either graduated or nearly graduated from high school in a Russian-speaking country and are the closest to native speakers. *Group 2* students attended school in a Russian-speaking country for about 8 years. They have lexical and stylistic lacunae in academic or formal language. *Group 3* emigrated after starting elementary school. Their formal education has been primarily if not completely in English. *Group 4* students emigrated at a pre-school age or were born outside of the home country. These students, who are generation 1.5 or second generation, are typically already English dominant. While each language group has

its own characteristics, grouping students according to their level of education in the language, including in community schools, is beneficial for placement and curricular design.

Table 2 Comparison of heritage language and traditional language learners

| Knowledge and competencies | Typical heritage language learners  | Traditional foreign language learners  |
|----------------------------|---|--|
| Phonology                  | Pronunciation, stress, and intonation are close to native speaker level; may be dialect   | Have acquired most of the phonological system of a standard dialect; pronunciation is accented                     |
| Grammar                    | Use much of the grammatical system appropriately, not familiar with the rules   | Familiar with grammatical rules, but cannot use them fluently nor comprehend them fully in real-life communication |
| Vocabulary                 | Have acquired extensive vocabulary, but range is limited to home, community, and religious institutions; a large number of "borrowings" from the majority language are noted        | Vocabulary is extremely limited, but consistent with the prestige dialect  |
| Sociolinguistic rules      | Control registers relating to verbal interactions with family and community members; competence is limited by range of social interactions  | Have very limited knowledge and control of sociolinguistic rules except for those appropriate to the classroom     |
| Literacy skills            | Have not developed literacy skills beyond elementary levels. However, are capable of developing such skills quickly, can learn to process lengthy texts early on acquiring literacy | Have a good to very good foundation for development of literacy  |

For the purposes of designing courses for heritage-language learners the most important factor is understanding not only how heritage speakers differ from native speakers, but also the factors that distinguish differences between heritage and foreign language learners. [Table 2](#) offers a comparison of the abilities of heritage speakers with no schooling in the language and foreign language learners, based on the features identified in Campbell and Rosenthal (2000, pp. 169–170).

Because of heritage learners' prior and extensive exposure to language, approaches that take their global knowledge into account are considered to be most beneficial. Such approaches have been termed "macro-approaches" by Kagan and Dillon (2001). A macro-approach can be otherwise described as a global or top-down approach that builds on learners' initial abilities in speaking and listening. A micro-approach, by contrast, builds competency from the bottom up, by isolating the elements of the language and gradually increasing in complexity. Instructional needs of heritage learners can be best met by "macro-approaches" to curricular and material development, as illustrated in [Table 3](#).

Approaches that can be characterized as macro include discourse-based, content-based, genre-based, task-based, and experiential.

#### WORK IN PROGRESS

Valdés (2000) has argued repeatedly and convincingly that "the pedagogies and practices currently used for teaching heritage languages are essentially atheoretical" (p. 389). She has pointed out that in the case of heritage language courses, "classroom practices, effective as they may superficially appear, are not based on coherent theories about, for example, how second dialects are acquired, how proficiency in high-level registers is developed, how bilinguals are able to expand the range of a non-dominant language, and how skills (e.g., reading and writing abilities) transfer across languages" (pp. 389–390). Every issue relevant to the heritage language awaits foundational research. The most pressing issues include policy formulation and implementation, curriculum and materials development, the adaptation of foreign language methodology to heritage language teaching, placement, and assessment.

#### *Policy*

Fishman (1978, ix) wrote that "the 'unity' of mankind must be built upon a recognition and acceptance of mankind's diversity" that includes "societal multilingualism." We have come a long way since 1978 in recognizing the value of bi- or multilingualism in the form

Table 3 Pedagogical needs: nonheritage versus heritage learners

| Teaching domains             | Non-heritage learners  | Heritage learners  |
|------------------------------|--|--|
| Pronunciation and intonation | Instruction throughout course of study   | Typically none   |
| Vocabulary                   | Full range   | Age appropriate/<br>literary/academic/<br>formal   |
| Grammar                      | Micro-approach (e.g. case by case)   | Macro-approach (i.e., by concept)  |
| Reading                      | Small texts, gradually and slowly increasing in volume and complexity  | Fairly large and complex texts almost from the very beginning  |
| Writing                      | Sentence level, gradually advancing to paragraph level. The writing even at high levels of proficiency rarely approaches native ability. | High degree of internal grammar allows expansive writing assignments at early stages of instruction. Macro-approach to writing: concentrate on the content and gradually improve spelling, grammar, and stylistics |
| Speaking                     | Micro-approach: initially restricted to dialog, gradually progressing to monologue and discussion  | Macro-approach: emphasis on monologue and discussion   |
| Listening                    | Micro-approach: short simple texts, gradually increasing in volume and complexity  | Macro-approach: full range of native language input, that is movies, documentaries, lectures   |
| Culture                      | Micro-approach: initially isolated cultural items  | Macro-approach: full range of native language input, audio, visual, and print  |

of heritage language competence in the United States, but an understanding of linguistic, psycholinguistic and sociolinguistic factors that is crucial for developing “a coherent heritage language education policy” (UCLA Steering Committee, 2001, p. 11) remains inadequate. “There has been, in recent years, increased interest and support to help linguistically diverse students acquire speaking, reading, and writing abilities in their home languages” (Wiley 2005, p. 208). There is still, however, no policy that would facilitate transforming the United States into a “language competent American society” (Tucker, 1991, p. 78).

### *Curriculum and Materials Development*

There is as yet no standard approach to teaching heritage languages. Some approaches have been suggested by various researchers and practitioners, but sufficient data have not been gathered to determine their efficacy. Among the commonly discussed issues are the applicability of foreign language methodology to heritage language curricular design, tracking heritage learners, and teaching them in mixed classes.

At the end of each chapter of *Mi Lengua: Spanish as a Heritage Language* (Roca and Colombi, 2003), the editors include a practical section titled “Pedagogical Implications for the Teaching of Spanish as a Heritage Language in the U.S.” Volume contributors propose the use of “challenging academic material (p. 141), providing students with “extensive experience in Spanish in all modes, registers, and a variety of dialects” (p. 192); and the value of “the content-based and genre-based approaches” (p. 230). In the same volume (Lynch, 2003, p. 37) recommends a discourse-based approach, suggesting that “HL pedagogy should emphasize grammatical and lexical development through discourse-level activities. Discrete-level activities, transformation exercises, grammar paradigms, metalinguistic rules, and long vocabulary lists will likely hinder HL learners more than help them.”

Researchers and practitioners alike debate the alternatives of teaching heritage learners in mixed classes or of tracking them (Pino and Pino, 2000). When heritage learners are tracked, separate instruction generally is limited to the first 1 or 2 years of instruction. The rationale is that after one or two years heritage learners can be taught together with foreign language learners. Experience indicates that this practice is deficient and that the needs of heritage learners remain different from the needs of foreign language learners. Kagan and Dillon’s matrix for heritage learner education includes a multi-year sequence together with components such as proper placement, time on task, and programmatic rigor; specific instructional materials; an uninterrupted, comprehensive curriculum; instructors trained in heritage language acquisition; consideration of the home/community native speaker environment, and

a metalinguistic framework that raises awareness of importance of grammatical accuracy and register (2003, p. 100).

### PROBLEMS AND DIFFICULTIES

The principal needs in the heritage language field include the development of the aforementioned theoretical base, curricular models, and instructional materials. In addition, research and observation have shown that heritage speakers require placement and assessment protocols and education abroad programs designed expressly for them.

#### *Placement and Assessment*

A current topic in the area of placement and assessment is the application of the Oral Proficiency Interviews (OPIs) and the ACTFL (1999) Guidelines to evaluate the oral proficiency of heritage learners. Objections to using the guidelines are largely based on the observation that because they have acquired their language in a naturalistic environment, heritage learners' competencies substantially differ from the competencies of traditional foreign language speakers for whom the ACTFL Guidelines were designed. Valdés argues that since the Guidelines compare students against the standard of the educated native speaker, and do not take native nonstandard varieties into account, they may not accurately measure the oral competency of speakers of these nonstandard varieties (Valdés, 1989). However, Kagan and Friedman (2004) found that the OPI can be an effective placement instrument for learners of Russian, since most heritage students come from families who were educated in a uniform educational system in the former Soviet Union. More research is necessary to determine whether the OPI and the ACTFL Guidelines could be revised to incorporate heritage learners of all languages.

Placement and assessment of heritage learners is complicated by attitudes that these students may encounter in the educational system. Terence Wiley, who is known for his work on the importance of language use in the community in making curricular decisions, is concerned that if "the school stigmatizes the varieties of home and community language, it may undercut the motivation to learn at school" (2005, p. 597). Addressing similar concerns, Valdés (2000) stresses that knowing which dialects are spoken in émigré communities, and how those dialects are regarded within the communities and by monolingual native speakers in the target country, is important, since effective heritage instruction is designed to "expand the bilingual range" (Valdés, 2000, p. 388), that is to build on existing knowledge rather than stigmatize it.

*Study Abroad for Heritage Learners*

Study abroad experiences and resulting gains for foreign language students have been the focus of several important research studies (Brecht, Davidson, and Ginsberg, 1993; Cohen, Paige, Kappler, Demmessie, Weaver, Chi, and Lessegard, 2003). As yet, however, no studies have examined in-country experience of heritage learners who are participating in study abroad programs in increasing numbers. Current understanding indicates two key areas of concern: (1) programs have not yet identified or adapted to heritage learners' instructional needs, and (2) successful articulation between home institutions and study abroad requires more information about how to prepare heritage students for study abroad.

## FUTURE DIRECTIONS

Future directions for the heritage field remain largely the same ones that have been identified at the seminal meetings and conferences held when the field was first emerging. It has been nearly 10 years since the Brecht and Ingold (1998) call for a national effort to supply what is absent in the field of heritage education, including the study of heritage communities, development of the principles of effective program design, curricula, materials, and the establishment of an infrastructure that will promote the sharing of knowledge and resources to provide appropriate heritage language instruction.

An understanding of the cultural, historical, and linguistic contexts that define heritage speakers must be at the center of continuing work in the heritage language field. For example, factors such as an immigrant community's density, relationship to the home country, rate of continuing immigration, average level of education, and the extent of commercial activity conducted in the immigrant language, may be anticipated to influence the character of language retention and language shift (UCLA Steering Committee, 2001) and thus must be central concerns of future development. Not enough is known about why some language groups are more likely to retain their languages, or retain them longer, than others. Similarly, insufficient research has been done on the conditions under which language shift occurs and whether these conditions are identical for each group. Cummins determined that in the Canadian population "there is massive attrition of students' heritage language competence over the course of schooling." (Cummins, 2005, p. 585). This loss of an enormously valuable resource, a factor in the United States as well, can be stemmed only through research-based curricular, pedagogical, and policy interventions.

Some studies dedicated to a specific language have begun to appear, such as a study of Chinese heritage schools by Wang (1996) or Korean

children's biliteracy by Shin (2005). Studies such as these are vitally needed in other languages as well in order to develop broad-scale understanding of the language-specific issues that should underpin curricular and programmatic development and design.

Recent research in sociology indicates that immigrants of the late twentieth and early twenty-first centuries no longer sense a contradiction between "an ethnic identity and an American identity" (Zhou, 2004, p. 153). This new sense of identity among heritage students needs to be explored to determine what role it might play in motivating them to study their heritage languages. As witnessed by recent submissions to the *Heritage Language Journal*, language educators are beginning to research the connection between motivation and identity. A large-scale cross-language research project could make a significant contribution to heritage language education.

The research agenda articulated by the UCLA Steering Committee Heritage Language Research Priorities Conference Report (2001) is still valid; every component of that comprehensive menu awaits contributions. The conference called for a multidisciplinary approach "to explore the diverse aspects of heritage language maintenance and development." It stated that researchers "from other fields, including economists, scientists and social scientists would . . . have important roles in measuring the effects of heritage language learning on the individual, the family, the community, and the nation." Such a large-scale multidisciplinary effort is fundamental to the maturation of the heritage field, redounding to the benefit of millions of heritage language learners in the USA, who need a comprehensive education in their first but no longer dominant language if they are to become truly bilingual, biliterate, and bicultural.

The funding of a new National Heritage Language Resource Center (Department of Education # P229A060008) in 2006 affirms the importance of the field. The Center at UCLA is dedicated to the development of research and the production of instructional materials pertaining to heritage language education.

LEARNING AND TEACHING ENDANGERED  
INDIGENOUS LANGUAGES

INTRODUCTION

Most of the languages of the world are spoken by small numbers of people. Nettle and Romaine (2000), calculating from data on the *Ethnologue*, state that 90% of the languages of the world are spoken by only 10% of the people respectively. These are usually indigenous and minority languages in nations that do not support them, and over the last several hundred years their speakers have been under increasing pressure from the forces of industrialization and globalization to shift to a majority language. Typically, education, jobs, mass media, and literary materials are in the majority language, making it difficult for anyone who does not command the majority language to thrive. And in learning the majority language, the minority language is often abandoned. Thus we have a worldful of endangered languages—languages going out of use, no longer being learned at home by children, languages that seem to be disappearing from the face of the earth.

However, the small languages of the world still have great value to their speakers and to the descendants of speakers. The language may symbolize and even embody traditional values, religion and culture, rich oral literature, history, and a sense of rooted identity (Fishman, 1985). The wish for partial or full autonomy of indigenous groups trapped in a nation established by conquest or colonization also adds to the symbolic value of the languages. Therefore in much of the world we see the decline of indigenous minority languages accompanied by the counterforce of grass roots attempts to reverse language shift through the education of children and adults who have not learned their language at home. These efforts are followed with interest and support by many people outside the indigenous communities as well, since there is a growing sense that language diversity, and the knowledge systems that accompany the languages, are important to posterity in general. These languages are the carriers of unique environmental understanding, philosophies, and great oral literatures whose loss should be mourned by all. Thus the survival and revitalization of indigenous languages is supported by occasional reports in the press, by linguists lending their expertise, by foundations interested in indigenous welfare, and sometimes even by governments willing to shift

away from the older language eradication policies to support indigenous language survival.

#### EARLY DEVELOPMENTS

The USA is one of the countries where indigenous languages are the most deeply endangered. According to the *Ethnologue* (Gordon, 2005), there are 72 American Indian languages known to be extinct. Of 146 living American Indian languages, 67 have only a handful of elderly speakers; and only 20 languages have a sizable number of families where children are still learning the language at home (Krauss, 1992). Even those 20 languages are on the cusp of “tipping” to English as the primary language of communication (Dorian, 1986). This decline of indigenous languages is the result of a 500-year history of contact and discrimination. Starting from the first European settlers, there was a long period of conquest, warfare and massacre through the nineteenth century. The twentieth century saw a period of forced assimilation through boarding schools, where use of indigenous languages was a punishable offence. Finally in current times, work, school, television, and sheer force of numbers of English speakers is making the indigenous languages disappear faster than ever. While in some families decisions were made to abandon the heritage language in order to ensure that their children learned English, in most cases the shift is more unconscious than that. Marriages between people who speak different languages often crowd out the indigenous language. Even when two parents speak the same heritage language, they are often puzzled as to why their children fail to learn their language, not fully realizing that English is being used in the household more than the ancestral tongue. School is still a major factor in language shift: children starting school often begin using English at home, and the bilingual parents accommodate. This often means that the younger siblings are exposed to the heritage language much less than the older siblings, and may never learn to speak it at all. Incomplete language learning also plays a role in shift, as older relatives begin to criticize young people for not speaking correctly, thus making the young speakers decide to avoid criticism by abandoning the language altogether. The end result of all these factors is often precipitous: for example, Navajo, which has the most speakers of any American Indian language in the USA, is experiencing a very rapid decline. The Navajo community of Fort Defiance is a case in point: whereas in 1971 95% of the children in Fort Defiance were arriving at Kindergarten speaking Navajo, 15 years later less than a third of the children had even passive knowledge of Navajo (Arviso and Holm, 2001). Recent reports say that throughout the reservation in the last few years, less than 5% of the

children are coming to school knowing Navajo (Ted Fernald, personal communication).

## MAJOR CONTRIBUTIONS

### *Bilingual Education*

From the 1960s on, American Indians have tried to combat language loss with increasing energy. The first wave of resistance to language loss was through bilingual education, set up by the federal government (mainly with immigrants in mind) in 1968 through the Bilingual Education Act, and mandated by the Lau Remedies of 1975. Many American Indian communities established bilingual education programs in their schools, which resulted in a blossoming of new orthographies, reading materials and written genres for languages that had never before had a tradition of literacy. It also brought back the indigenous languages into the same educational system that had once forbade and reviled them, and in the process gave children and their parents a new sense that their languages were respectable.

However, bilingual education did not reverse language shift. Families continued to shift away from the use of their languages at home, and bilingual education was not designed to teach the language well to children who were not already fluent. The government was ambivalent about the value of bilingual education and always treated it as transitional; and with change of administrations, it became a politicized issue. Government funding and training for bilingual education was spotty, never sufficient. The current administration's views of bilingual education were made clear when a few years ago the Office of Bilingual Education was renamed the "Office of English Language Acquisition." Over the decades, bilingual education has declined in American Indian communities; even many of the best programs have lost their funding by now, in large part because many communities who once had children dominant in the indigenous language coming to school, no longer have a viable population of child speakers. This is not to say that no American Indian bilingual education exists any more; there are still excellent programs in some Native American communities—e.g., there are Navajo bilingual education programs ongoing at Leupp, Fort Defiance, and elsewhere, though with increasing emphasis on actually teaching Navajo to the children (Fillerup, 2002). But the impetus for language survival in most communities has shifted to other means.

## WORK IN PROGRESS

*Immersion Schools*

Some of the larger communities have successfully implemented a much more intensive kind of program: immersion schooling, where most or all instruction takes place in the indigenous languages. The oldest of these is the Akwesasne Freedom School of the Mohawks. The largest and most successful is the Punana Leo system of schools in Hawai'i (Warner, 2001; Wilson and Kamana, 2001); and the Ojibwes, the Blackfeet, Navajos, and others have all worked to develop such schools. The results are very promising—children emerge from the school system both well-educated and fluent in their heritage tongues. For example, Hawai'i now has a young generation of thousands of fluent speakers as a result of their large and successful system of Hawaiian-medium schools going all the way from preschool through high school (plus Hawaiian Studies majors at the University of Hawaii campuses which have excellent Hawaiian language instruction). We have yet to see if the younger generation will carry the language back to their homes when they marry and have children, but there is a great deal of hope that this will happen for a sizable number of people.

Immersion schooling is a tremendously exciting strategy for language survival, but it is also very difficult to implement, demanding great financial and human resources and an ability to battle against the bureaucratic and political hurdles that block the process. Such government policies as “No child left behind”, and state initiatives such as Arizona's proposition 203 that have outlawed teaching in any language except English, are pitted against tribal efforts to run their own schooling according to their own needs and goals. Smaller groups have very little in the way of the resources needed to run immersion schools. In California, for example, most of the languages are so moribund that there are only a few elderly speakers, way past retirement age, and none of whom have anything like a teaching credential. There is a missing generation or two of speakers—those generations who are of professional age or parenting age, who would, if they knew the heritage language, be able to transmit it to the children. Furthermore, many of the tribes are so small that there may not be a critical mass of children to teach. In many cases there is not even a physical community—kids are scattered in different public schools. In a state like Hawai'i where there is only one indigenous language, funding and educational and political assistance can be focused on it (for example, Hawaiian is now one of the two official languages of the state). In a place like California, where there are 50 liv-

ing indigenous languages, state and university assistance is scattered, funding is scarce, and with so few people who could possibly teach in an immersion school, burnout is a major issue. While a few immersion classes have sprouted in California, most of them have been small and short-lived.

*The Master-Apprentice Language Learning Program*

How, then, can any headway be made in reversing language shift in a place like California? This question was asked in 1992 at a gathering of California Indians at what has now become a biennial language revitalization conference attended by 250 or more Native Californians. At that first conference, a committee was formed, called the Advocates for Indigenous California Language Survival (AICLS), now a nonprofit organization with an all-native board (and this author as a consulting member). AICLS has developed a number of programs to enhance and support language survival. The most successful and best known of these programs is the Master-Apprentice Language Learning Program (MAP). The goal of MAP is to build new speakers in the missing generations described above, through informal immersion techniques in natural settings. The Master-Apprentice model focuses on the development of communicative competence; it borrows from various other models such as total physical response (see Asher, 1993) and situational learning (Holm, Silentman and Wallace, 2003) and also teaches the apprentice to utilize monolingual elicitation techniques as developed by linguistic fieldworkers (e.g., see Makkai, 1986; Everett, 2001).

Teams consisting of a speaker of a California language and a member of the community who wishes to learn the language apply to AICLS, who provides them with training, mentoring, and a small stipend. They are trained at weekend workshops (which they attend twice a year) in how to leave English behind and speak only in the target language, using gestures, actions, pictures, and props to make themselves understood. Since even the speakers of these moribund languages have generally lost the habit of using their language long ago in real communicative situations, one of the major tasks is to help them regain the habits of communicating in their native tongue. This task falls primarily to the apprentice. At the weekend workshops one of the first things the apprentice is assigned to learn is how to ask basic questions in the target language. The apprentice learns to ask such things as “What is this/that?,” “What are you (am I, is s/he) doing?,” and “How do you say \_\_ in our language?” Apprentices also learn reminders like “Please speak to me in our language,” or “Please say that in our

language,” and helpful phrases for beginning learners like “Say that again.”

People without training in language teaching tend to think that one teaches word lists first, and that it is necessary to write the words down. We try to discourage writing, especially because most California languages do not have standardized writing systems and people tend to use a “folk orthography” that they themselves cannot decipher later. Furthermore, the point of the Master-Apprentice program is to help people become conversationally proficient, and it is very clear that conversational proficiency only comes through oral and aural practice. We remind people of how children learn their first language, and try to get the teams to behave in some ways like parents and children in the first-language learning situation. We encourage the introduction of vocabulary in full sentences and in communicative contexts where the meaning of the word is made clear not through translation but through visual and contextual cues. At training sessions we emphasize sequences where a word might be introduced in sentential contexts (e.g., “This is my nose. That’s your nose.” (with appropriate gestures), and reinforced through commands: “Touch your nose,” and questions: “Is that your nose?,” etc.

We teach the teams to work together in real-life situations—drinking coffee together, making and eating meals, going on drives, looking at family picture albums, etc. We tell the master that s/he can get the apprentice to do housework, chop wood, cook a meal, wash laundry, paint the house, or whatever—so long as communication in the target language is taking place during it. Washing laundry, for example, can teach words for clothing and colors, along with commands to do the various associated tasks. The teams may also be involved in traditional activities such as making regalia or baskets, which become very natural situations in which communication in the target language can take place.

Activities that are less usual in adult daily life are also encouraged. We sometimes develop kits for the teams that include games, puppets, and children’s books without words, for the teams to play with together to vary their language-learning activities. There is also a published manual that can guide the teams through the language transmission process (Hinton, Vera, and Steele, 2002). The manual begins with a debunking of myths about language learning, gives an overview of the philosophy and method, describes a typical session and gives a sample sequence for beginning teams, talks about ways to develop vocabulary, grammar and connected speech, and how to overcome problems and plateaus in language learning. Since it is expected that the apprentice, possibly with the master, will go on to teach the language to others, there are also chapters on how to develop a language pro-

grams in one's community, and how to apply the Master-Apprentice principles to the classroom.

After the first training session, the teams go to their respective home communities and begin work. They are paid a small stipend for every 40 hours the team puts in together. The apprentice must keep a log of the sessions and what activities they did together, and send it in to the AICLS administrator before the checks are cut. Each team is also assigned a mentor, usually a member of the board or a graduate student in the UC Berkeley Linguistics Department, who calls them twice a month and sees how things are going, and helps the team solve problems they are coming up against. The mentor also suggests new activities and exercises the team can do. At least once a year, the mentor visits the team at their home site and observes them in their sessions. Quarterly reports about team progress are sent to AICLS by the mentors.

At every training, the apprentices' knowledge of the language is assessed by a set of simple tests. First the team is asked to converse together about any topic for a few minutes; and then the apprentice is given a complex picture of some sort—usually a painting with a California or Native American theme—and asked to talk about it. The assessors do not themselves generally know the language, and what is primarily listened for is the degree of fluency that is being exhibited by the apprentice—how long they can talk, whether they are using connected speech or just simple vocabulary items, whether they have to stop and search for words frequently, or can speak fluidly and confidently. After the first training, teams are challenged in various ways at subsequent workshops: apprentices are asked to give short talks in their language (longer talks as time goes on), or tell stories; teams are asked to prepare skits or puppet shows during the workshop; and activities are assigned such as picking a topic out of a hat that the apprentice must then develop a 2-minute talk on.

The Master-Apprentice program has gained popularity around the country: AICLS has done trainings in such places as Oklahoma, Washington, Alaska, British Columbia, and Ontario, and given invited presentations at indigenous conferences around North America and as far away as Japan and Finland. In California, AICLS has trained at least 70 teams since 1992, in at least 25 different languages. Not all teams are successful in transmitting conversational proficiency to the learner; much depends on the ability of master and apprentice to spend sufficient time together (10–20 hours per week), and to have faith in and be willing to employ the principles of immersion. But if those two requirements are fulfilled, after a 3-year program together the apprentice generally emerges with a high degree of conversational proficiency.

The apprentice is generally of professional or child-bearing age, and is selected in large part on their demonstrated commitment not only to learn the language but also to transmit it to others—either to their own relatives, or through the teaching of classes. In some communities the Master-Apprentice model is being used specifically to train teachers for school language programs (whether these are immersion programs or the less-ambitious language classes in an otherwise English-medium school). In California, apprentices are trained to use some of the same techniques for teaching that they use for learning—use no English, focus on real-life communicative situations rather than on isolated word-lists; make sure there is lots of repetition and review, but in different contexts so that students are not bored and are learning new language at the same time; use entertaining games and activities in the teaching process. Some of the apprentices have become skilled language teachers, and many are teaching their languages now to classes or to their own children.

## PROBLEMS AND DIFFICULTIES

### *Language Change*

There are two major ways in which any language revitalization program produces major changes in the language. One is in the development of new vocabulary, and the other is in the changes resulting from second-language learning in an environment where another language—in our case, English—is dominant.

The Master-Apprentice model is usually employed in a situation where even the speakers have not used the language for everyday communication for many years. Daily life nowadays is filled with objects and events that have never been talked about before in the endangered indigenous language. Teams can go to a grocery store or look at a city street and see a multitude of things for which no words exist in the target language. If English is not going to be used, strategies for developing new vocabulary must be used. Of course, borrowing English vocabulary is a possibility, but since English is the encroaching language that language revitalization programs are defending against, there is a strong desire to develop native vocabulary instead. For scientific vocabulary, the Hawaiians have chosen to borrow “international scientific vocabulary” and to “Hawaiianize” the pronunciation, rather than making completely new words (Wilson and Kamana, 2001). While in large programs such as the Hawaiian immersion schools it is essential to have a centralized authority to ratify new vocabulary (since otherwise each classroom would end up with different words for the same things!), in the small Master-Apprentice programs, a given

team may be the only people using the language, and find themselves having to develop vocabulary on their own. This is often a very entertaining activity which can bring a lot of humor into the situation, and by learning from the speaker traditional means of developing vocabulary through such processes as descriptive phrases and metaphors, the learner becomes well-educated in aspects of the grammar and semantics of the target language.

Second-language learning in adulthood and for anyone beyond the “critical age” will rarely result in speakers that can speak identically to a native speaker. The learners are likely to speak with an accent, and will probably exhibit a good deal of calquing and grammatical influence from English. Furthermore, it takes a very committed and skilled person to become truly fluent in an endangered language, since it is virtually never heard outside of the learning environment itself. Thus the learner’s language may be relatively limited and pidginized. Unlike the case with world languages, the learners of endangered languages represent the only hope for future survival and transmission of the language, meaning that whatever the learner knows is what will be passed on. If the learner’s language has an accent or different grammatical structuring from the last native speakers, it is the learner’s form of the language that will be transmitted. Thus going through the bottleneck of second-language learning is likely to result in major changes for the endangered languages. This fact is problematic for people trying to save their languages, and there is a good deal of debate over how much value there is in an imperfect language competency. At one extreme are some elders who stultify younger people by saying “If you can’t speak our language right, don’t speak it at all!” On the other side of the debate are some of the second-language learners who value communication in their heritage language over preservation of older grammatical systems (e.g., Terry Supahan, Karuk) who say “I’m interested in communication, not in preservation” (Hinton, 2001). We must not think that language revitalization will save all of a language in its full traditional form. Languages always change, of course; but endangered languages are changing in particular, extreme ways. While extreme change is probably inevitable, it is important for second-language learners of endangered languages to understand that so long as there are speakers or linguistic records to learn from, they have a lifetime project—language change is inevitable, but we can hope that learners will learn genres of speech, idioms, manners of speaking, and grammatical systems that are full and rich and not merely calques of English.

## FUTURE DIRECTIONS

When might we say that language revitalization is “successful”? We could look to Hebrew as an extreme example of success: a whole nation now uses Hebrew as its language of daily communication, whereas for close to 2000 years it survived only in written form and as a language of religious study. Most endangered languages cannot hope for that kind of final outcome (though who knows what might happen 2000 years from now?). For the indigenous languages of the USA, Hawaiian is the only one that has a status that is in some way analogous to Hebrew—it was the national language of independent Hawai’i until its forcible annexation to the USA; it is the only indigenous language of the state, and is now an official language of the state; and people of all races have some sense of identity with the language, so that many nonnative people wish to learn it. Due to the effective school programs, Hawaiian is already a language of daily communication among many people, and it is likely that this will increase. However, English will probably never lose dominance in Hawai’i.

Unlike Hawaiian, most endangered languages belong to very small minority populations and are endemic to small locales, so the thought of such languages becoming the language of a modern nation is not feasible. “Success” must be measured in other terms. We must look for smaller, stepwise goals. Daryl Baldwin, who learned his language (Miami) proficiently from written records (since there were no native speakers left at all) and is a leader of language revitalization in his community, thinks in terms of a 50-year plan. For now, language camps and usage at home by a small group of advocates represents the first major success. But Baldwin says that not much more can happen for language growth until social and geographic development occurs. The tribe needs to develop a bigger land base and economic base, to which members can then be attracted to live, at which point possibly an immersion school can be developed (Daryl Baldwin, personal communication). Smaller tribes, many of them not even federally recognized, may not even have the options that Baldwin foresees. Nor are all tribes interested in language revitalization—often it is only certain individuals who have the passion to learn their language. In these cases, it might be language learning itself that is the only criterion for success. If a person learns his language well, a goal has been met successfully. Each person and each community may see successes such as these as being part of a longer-term set of goals for language revitalization, but as a whole, they cannot see where the next generations will take the process—they can only say “this language will not die on my watch.”

## COMMUNITY LANGUAGE LEARNING IN AUSTRALIA

### INTRODUCTION

The term ‘community languages’ was coined in the mid-1970s to denote languages other than English used in the Australian community. This is to stress that these are not really foreign languages. The term does not usually include indigenous languages as their communities wish to emphasize their uniqueness and special status. Within education, community languages are often subsumed under ‘languages other than English (LOTE)’ which is a key learning area in most parts of Australia.

School education is under the jurisdiction of the six states and two territories, all of whom have different language-in-education policies. There are three types of institutions which give instruction in community languages to school-aged children:

1. primary and secondary day schools,
2. Schools of Languages which are part of the state education department in some states and offer instruction on Saturdays in languages not available to the student at their regular school and
3. after-hours ethnic community schools.

We can distinguish between state schools, Catholic schools and independent schools. The latter are largely affiliated with Protestant denominations but there are also some run by other Christian and non-Christian religious and parent education bodies. Some such schools have links with a particular language to the teaching of which they give special weight—Arabic in Islamic, Coptic and Maronite schools, Hebrew in Jewish schools, Modern Greek in Greek Orthodox schools and to some extent German in Lutheran schools. Non-government schools charge fees. The student ratio in state to non-government schools is about 2 to 1, but less at the higher levels and this varies between states. Most of the languages taught in universities and adult education programs are spoken in the community.

## EARLY DEVELOPMENTS

Bilingual education was not uncommon in some of the British colonies that predated the federated nation of Australia (1901)—mostly German-English primary schools in rural areas settled by Germans but also a few German-English secondary schools in urban areas, some French-English girls' secondary schools in Melbourne and in the mid-19th century some Gaelic-English primary schools. Originally intended for children from the respective language background, some attracted pupils from English-speaking backgrounds and in the case of the French schools, they were in the majority (Clyne, 2005, p. 2). Bilingual schools fell victim to the homogenization tendencies of the education acts of the 1870s and 80s or to wartime legislation outlawing instruction through the medium of community languages (1916). Restrictions on bilingual education continued until well after World War II, by which time Australia had embarked on a large-scale immigration scheme bringing unskilled labour from Europe. The expectation was that immigrants would acquire English and rapidly abandon their first language (for a detailed discussion see Kipp, *The Language Ecology of Australia's Community Languages*, Volume 9).

After-hours ethnic community schools have existed in Australia since 1857. This model has been adopted by immigrant communities ever since. The peripheral nature of the schools was affirmed by the fact that for a long time they did not receive funding from Australian governments and many of the teachers were untrained, used outdated methods and lacked understanding of the Australian school system to which the pupils were becoming or had become acculturated. As most of the classes run on Saturdays, they compete against sporting and other extracurricular activities, making them difficult for or unpopular among the pupils.

In the 1950s and 1960s, LOTEs were generally not taught in primary schools and the main 'foreign language' taught in secondary schools was French, not the language of a large immigrant group. Where a community language was offered, usually German but sometimes Russian or Italian, such programs were clearly intended for those without a home background in the language, and there were subtle means of discriminating against such students in the matriculation examinations in some languages (Clyne, 2005, pp. 118–119).

By the mid-1960s, some interest began to be shown in offering 'migrant languages' in the normal school curriculum as a resource for language maintenance purposes and to promote balanced bilingualism, as can be gauged from a discussion in the modern language teachers' journal *Babel* (Clyne, 1964; McCormick, 1964). Some states were soon to extend the range of languages taught in government schools. This

had already happened in many non-government schools. In 1972, the new Victorian Universities and Schools Examinations Board liberalized the conditions for a language to be a matriculation subject. (Similar developments took place in South Australia and New South Wales). German, Italian and Dutch, which were significant community languages, had been introduced much earlier as 'foreign languages', to be joined more recently by Modern Greek. Now the introduction of Lithuanian and Latvian paved the way for a large number of community languages to become examination subjects.

The range of languages available at universities was generally wider than that available in secondary schools. French and German were taught in virtually all universities. Some institutions offered Italian, Greek, Indonesian and Russian and to a lesser extent Dutch, Swedish, Chinese and Japanese. Asian languages were not spoken much in Australia at the time due to racially based immigration restrictions. Languages were taught as intellectual exercises for cultural enrichment (Pauwels, 2007).

However, 1972 was to mark the beginning of a new era—with the election of a reformist Labour government, the rapid change from assimilation to multiculturalism as the dominant policy and the dismantling of the White Australia policy, which had already been weakened by the previous government. This would have profound effects on language-in-education policy and its delivery.

#### MAJOR CONTRIBUTIONS

The above changes had been promoted by national and international political factors but also by the demands of ethnic communities and the critique of academics. Smolicz (1971), for instance, argued that the Australian school was acting as an assimilation agency. Rado (1977) and others argued for bilingual education, which was introduced in a number of state schools in Adelaide, Melbourne and Sydney in the mid-1970s. She produced bilingual materials in English and a range of community languages. This enabled children to learn together, whether in English, their first languages or bilingually. Migrant education conferences and lobbies in a number of state capital cities, which received considerable input from academics in relevant fields, produced sets of demands which included the teaching of community languages in primary and secondary schools. Ethnic schools started to receive funding from Australian federal and state governments. Descriptive studies of Greek, German and Japanese ethnic schools were undertaken, e.g. Tsounis (1974), Monheit (1975) and later Miyoshi (1994) respectively.

From the mid-1970s, a coalition of language interest groups including linguists, language teachers and ethnic communities and their organiza-

tions began to lobby for a national policy on languages. Ozolins (1993) shows how the mobilization of professional language organizations and ethnic communities on issues of language policy set the stage for a greater push for community language teaching.

An important milestone was the federal government's decision to commission a parliamentary committee with an inquiry into the need for a national languages policy. A contemporary account of needs, resources and policy development is Clyne (1982). It is based on the demographic analysis of community language use in the 1976 Census and the developments of the 1970s and up to 1982. The parliamentary committee, on the basis of submissions and public hearings, set the guiding principles of a national languages policy, including the maintenance and development of LOTES (both indigenous and community languages). Some states, especially South Australia and Victoria, were already working towards this and were starting to introduce LOTES into primary schools. As there was a simultaneous devolution of decision making to local school communities, many schools opted for community languages of significance in the local community. Italian, the most widely used community language, was the favourite, especially since the community had decided to direct its ethnic school funding in most states to Italian programs in Catholic and state schools, taught by teachers provided by the community. Bettoni (1985) projected learners of Italian background in Australia as trilinguals, between Italian, dialect and English.

There were also a considerable number of Greek programs, and German received a boost from the fact that it was, among other things, perceived to be a community language. Several other community languages, including Turkish and 'Serbo-Croatian' were introduced in a smaller number of schools, in districts where they had substantial numbers of speakers. New South Wales and Victoria began allocating supernumerary teachers to some community language programs. The early programs sometimes had model building character—the Greek and Macedonian bilingual programs at Lalor North Primary School and the German immersion program at Bayswater South Primary School (Fernandez, 1996), situated in areas of Melbourne where these languages were regularly spoken, were examples of this, as was the Italian-English bilingual program in Norwood, Adelaide (Rubichi, 1985). Innovative school programs were sometimes accompanied by research, for instance a study of the German language development of German-speaking background children participating in the Bayswater South program (Imberger, 1986). There was also an expansion of programs in community languages in state secondary schools. The federal government had already funded new university programs in Modern Greek and several Slavic languages in the late 1970s.

The National Policy on Languages (Lo Bianco, 1987) established the complementarity of English and the other languages used in Australia and provided social justice, cultural and economic arguments for multilingualism in Australia. It secured federal funding for innovations in language maintenance as well as second language acquisition programs in all states and territories and established a multi-centre National Languages Institute, which was based on areas of research strength in applied linguistics at universities. Among collaborative projects was a series on nine languages of wider teaching which, among other things, considered the community use of the language and issues in the teaching of the language in schools and universities. The languages were Arabic, Chinese, French, German, Indonesian/Malay, Italian, Japanese, Modern Greek and Spanish and a volume on each was published.

One of the research projects in the Institute was on 'background speakers' (Clyne, Fernandez, Chen and Summo-O'Connell, 1997). It includes a study of the language of first to third generation bilinguals in German, Italian and Chinese programs and works towards a taxonomy of children with a background in a language they are studying. There are also recommendations for teaching such pupils and for curriculum development. Rubino (2004) examines approaches to catering for background and non-background post-secondary learners of Italian in first year university. She emphasizes flexibility in both curriculum and assessment in order to provide learning opportunities that maximize the potential of all students.

These and other issues were taken up in a collaborative project between the University of Melbourne and the Victorian state and Catholic school systems on the role of secondary schools in the maintenance and sharing of community languages. It involved responses to student diversity in four schools, one of each teaching Arabic, Chinese (Mandarin), Greek and Spanish (Clyne, Rossi Hunt, Isaakidis and Liem, 2004). The above-mentioned taxonomy of 'background speakers' is refined in this study, models are discussed and developed to cater for student diversity, as are ways of utilizing community resources in the language for maintenance and acquisition purposes. This project also generated a study of the learning of a community language, Greek or Spanish, as a third language (Clyne, Isaakidis and Rossi Hunt, 2004). It showed that the L3 learners, because of their bilingualism, believed they had a better understanding of how language works than the L2 learners. The L3 learners were constantly comparing their languages and using one as a resource to learn another. In addition, learning a third language both attitudinally supported their home language maintenance and gave them a more general interest in languages.

In an increasing emphasis on languages for trade, and consequently a de-emphasizing of sociocultural issues, the subsequent Australian

Language and Literacy Policy (Dawkins, 1991) prioritized 14 languages, some of which did have significant communities in Australia, from which each state could choose eight priority languages for special federal funding. All eight states and territories included Italian and Mandarin among their priority languages, six Modern Greek, four Vietnamese and three Spanish. This slightly reduced what teaching was taking place of other community languages such as Macedonian, Turkish and Maltese in mainstream schools. The Rudd report, *Asian Languages and Australia's Economic Future* (1994), led to a large-scale concentration on four Asian languages and cultures—Chinese (Mandarin), Indonesian, Japanese and Korean—in a well-funded program which lasted for ten years. The teaching of Vietnamese, Filipino and Hindi, community languages of Asian origin, was not boosted by this and the expansion of Korean was not successful. Moreover, the presence of communities and schoolchildren using Mandarin, Korean, Indonesian and Japanese was not taken into account.

In an important overview of Australian language policy, Lo Bianco (2001) shows how governments since the early 1990s have distanced community involvement from policy, preferring a 'managed' top-down policy, marginalizing and disrupting professional networks of language advocates and the interests of community language groups. (See also Scarino and Papademetre, 2001; also Lo Bianco, *Language Policy and Education in Australia*, Volume 1)

Bradshaw and Truckenbrodt (2003) investigated attitudes to the teaching of Greek among stakeholders (teachers, parents, students, management) at a Melbourne Greek independent day school. They demonstrated diversity of opinions between the Greek consular staff, the school staff and parents on Greek linguistic norms, the status of students (L1 or L2), teaching methods, student motivation—concealed by an overall commitment to the teaching of Greek.

Papers from an American-Australian symposium on 'heritage/community language education' (*International Journal of Bilingual Education and Bilingualism*, 8, 2 & 3, 2005) examine research priorities and make recommendations on developing, implementing and evaluating programs. Helen Borland reports on a case study of action-oriented research to raise the awareness and use of Maltese among second and third generation people of Maltese-background. Richard Baldauf examines language-in-education planning relating to ethnic schools. Catherine Elder considers the role of tests in evaluating the effectiveness of community languages in mainstream Australian schools (see also Kagan and Dillon, *Issues in Heritage Language Learning in the United States*, Volume 4).

Debski and his associates (Debski, 2004; Fitzgerald and Debski, 2006) have investigated how electronic communication is redefining

community language maintenance and learning. His study shows how Polish emigrants create their own websites and participate in online events involving people in their country of origin, and how such opportunities may generate the sense of increased participation in, and a feeling of greater influence on, social and cultural events in the former homeland.

#### WORK IN PROGRESS

Much of the research in progress is attempting to find ways of improving community language learning at all levels. Robert Debski is collaborating with Polish after hours community schools in the incorporation of new technologies into teaching models. This activity will enable them to develop a 'Participation Pedagogy' for language learning, drawing on project-oriented learning and emphasizing identity development. Young bilinguals tend to use their community language exclusively to older people and therefore lack peer group register and specialist registers in the language. This is changing because of the widespread use of the internet (and email), linking immigrants and their descendants with their countries of origin and with speakers of the language in other immigrant countries. Building on recent studies, Debski (see above) is researching the implications of new technologies to 'enable participation' in the community language and culture.

Margaret Gearon is coordinating a project which investigates the development of literacy and intercultural understanding in ethnic school students, focusing on Russian and Vietnamese programs. The study also seeks information from parents to indicate how, when and with whom they assist their children to maintain their background language, become literate in it and develop an understanding of key cultural elements.

Among other things, this reflects the changing role of ethnic schools, which under their umbrella organization Community Languages Australia have become a national lobby group for community language learning, the instigator of national conferences, and a partner of research institutes to promote and apply local applied linguistic research. Opportunities for teacher professional development funded by governments and provided by university staff are widely taken up. Ethnic schoolteachers are now generally qualified and often teach in regular schools during the week. Schools of languages similarly lobby for community languages and collaborate with universities on research.

Anne Pauwels is conducting a survey on innovative language programs in Australian universities, including collaborations on community languages. A team headed by Colin Nettelbeck is investigating

'beginners language courses' in universities, including ones taken by students with a limited home background in the language.

Catherine Elder is continuing her research on the testing of a population with diverse backgrounds and needs in the language they are studying. Her forthcoming monograph will give particular emphasis to assessment in school and university contexts, and will examine the challenges posed by the presence of minority group learners in the school population for the valid assessment of language ability. The monograph consists of a number of case studies, one of which examines the manner in which the Australian education system has dealt with the assessment of languages such as Chinese, Italian and Greek, which are studied by a range of background and non-background learners.

On the basis of interviews with teachers, students and other stakeholders, Yvette Slaughter is exploring the impact of exclusionary language planning in Australia, which has prioritized four Asian languages—Chinese, Japanese, Indonesian and Korean. This policy and its implementation disregard the needs and motivations of community language learners. It has devalued and impeded the practice and development of numerous Asian community languages in Australia such as Vietnamese, the most widely spoken community language in the 0–14-year age group. It ignores the needs and aspirations of some students who are motivated not just to maintain a language, but to develop complex identities, based on pan-Asian interests explored through local and global multilingual and multicultural interaction. It also ignores the complex reality of teaching languages, which are widely spoken by communities in Australia to students with and without a background in a language.

## PROBLEMS AND DIFFICULTIES

This section outlines five main problems and difficulties with the teaching and learning of community languages in Australia.

### *Grading*

Australia's linguistic diversity can be supported and strengthened by motivating those with a background in a language to develop it to the fullest and by utilizing community resources in a language. Because the assessment at the end of secondary school has gatekeeper function for entry to coveted courses of study, especially at prestigious universities, an elaborate system of score adjustment has been developed to balance out perceived inequalities between subjects. Certain language subjects have been targeted because it is perceived by some that parti-

cular students have an ‘unfair advantage’ and thus complete beginners are discouraged from taking up the language. In recent years, various discriminatory classification schemes have been devised to counter the perceived advantage, but they often demotivate either language maintenance or students benefiting from further study of the language. The schemes do not take into sufficient account that there are many different types and degrees of background in the language (e.g. receiving instruction in it in the country of origin for a differential period, speaking the language, understanding it, using a distantly related dialect) and that maintaining and developing the language to a high level is an achievement warranting credit (Clyne, 2005, pp. 110–134; Clyne Fernandez, Chen, and Summo-O’Connell, 1997; Elder, 2005). Much of the issue concerns Asian languages, especially Chinese. This is a complex matter because of the difficulty of learning characters and the fact that many of the ‘Chinese’ speakers in Australia use a variety such as Cantonese, which is mutually unintelligible with the target language, Mandarin. Also the shift to English from Cantonese or Mandarin between the first and second generations is usually substantial (Clyne, 2005, p. 72).

#### *National Co-operative System*

Several states have pooled assessment resources for a number of years, making it possible for 45 languages to be accredited for the examination at the end of secondary school. Recently languages with less than 15 candidates for three consecutive years have been suspended. Five languages were affected in this way in 2006. This development is out of keeping with the multicultural principle that all languages are equally worthwhile.

#### *Closure of University Programs*

Due to declining public funding, universities are unable to maintain some language programs that were previously cross-subsidized within the institution. Consequently some languages (Dutch, Khmer, Maltese, Polish, Slovenian, Turkish) are no longer taught at any Australian university or at any university in a particular state (Thai or Serbian/Croatian in Victoria, Vietnamese in South Australia; see also Pauwels, 2007). This is having an indirect impact on schools as universities have hitherto provided language teachers with advanced language skills (Clyne, 2005, p. 117). Baldauf (1995) and colleagues (e.g. Mühlhäusler, 1995, working with an ecological model) conducted research on the need for and offerings of low candidature languages in universities (many of

which are community languages). They include a national plan for university low candidature language programs, with incentives for their continuation, shared responsibility, the promotion of technologically based teaching, and the use of community resources.

### *Status of Languages*

Despite being a 'key learning area', languages tend to be regarded as less important than other curriculum areas. This is characteristic of the monolingual mindset which is so dominant in Australian society (Clyne, 2005), although there is some variation between states.

### *Demography and Delivery*

In a comparison of languages spoken at home and languages taken at school, Clyne, Fernandez and Grey (2004) show that the offerings of school language programs are not keeping up with Australia's language demography. This, too, varies from state to state. Apart from Italian, significant community languages are not taught widely in regular schools. This applies particularly to Vietnamese, Arabic and Greek and also to Spanish despite its international status.

Cantonese has large numbers of speakers, although Mandarin is the school language of choice for many from Cantonese-speaking backgrounds (hence its absence from public examinations and near-absence from university programs—Pauwels, 2007). Japanese and French gain their large numbers of school students for reasons other than communities of speakers in Australia. Diglossia in Arabic and the pluricentric nature of the language as well as affective factors have detracted from the teaching and learning of Arabic as a second language.

## FUTURE DIRECTIONS

Though multiculturalism in Australia is a fact of life, the future of community language learning depends on societal attitudes in Australia. The National Statement for Languages Education in Australian Schools, and the accompanying National Plan issued by the Ministerial Council on Education, Employment, Training and Youth Affairs (MCEETYA) sets out a commitment to 'quality languages education for all students, in all schools, in all parts of the country' (MCEETYA, p. 6). The initial four year Plan (2005–2008) focuses on six nationally agreed inter-dependent strategic areas, including teaching and learning, teacher supply and retention, and advocacy and promotion of languages learning. Funding has been made available for eight national

projects targeting these areas, with the aim of supporting and promoting languages education on a national scale.

However, prestige planning (Baldauf, 2004) requires a reversal of the dominant monolingual mindset, which is starting to redefine 'real Australianness' again in terms of xenophobia and anti-intellectualism. This mindset could lead to a sidelining of the teaching of all but the top six or so languages away from mainstream schools into ethnic schools and, in some states, schools of languages, though with official financial support. With continuing economic neo-liberalism driving the university curricula, the presence of community languages there may decrease further.

For some languages, discriminatory practices against those with a home background will have a demotivating effect on language maintenance (see above). Recognizing and dismantling the culture which propagates the notion of 'unfair advantage' is a major challenge for the future. A further challenge will be to ensure that students with and without a background in the community language they are studying at school will be supported to fully develop their language skills. Elder (1997) shows that, in Chinese, Italian and Greek, 'background speakers' are stronger on listening than on reading skills while 'non-background speakers' are better at strategic competence, such as gaining meaning from context. The advantage some 'background speakers' may have in oral skills may be far outweighed in the final years of schooling by their relatively underdeveloped literacy skills. Clyne (2005, p. 133) mentions that non-background speakers with a structural orientation often notice points that 'background speakers' take for granted and that the latter are often penalized for using non-standard forms which those without a home background would not know. Some steps towards curriculum approaches which cater for a range of backgrounds and prior experience with a language have been described in Clyne, Fernandez, Chen, and Summo-O'Connell (1997), Clyne, Rossi Hunt, Isaakidis, and Liem (2004), and in Rubino (2004). However, explicit recognition of the needs of various types of learners, together with appropriate materials development, remains severely underdeveloped.

The internet will provide exciting new opportunities and support for more effective community language learning. It could facilitate collaborative learning of low candidature language programs at both secondary and tertiary levels.

Future directions in community language learning will depend on positive attitudes and policies that recognize the value of Australia's multilingualism for the individual, the ethnic communities themselves and for the nation.

## SECOND AND FOREIGN LANGUAGE LEARNING IN SOUTH AFRICA

### INTRODUCTION

It must be pointed out at the outset that in South Africa (SA) the terms foreign and second language are highly contested, particularly when used with reference to black learners of English. This article reviews pedagogical issues in second/foreign language learning in South Africa against the background of the sociopolitical changes, especially the end of apartheid, that have taken place in the country since 1994. More specifically, the article seeks to determine to what extent these changes have affected foreign/second learning in schools and universities in the country. The first section of this article reviews early developments in second/foreign language learning in South Africa. The second section discusses major contributions to second/foreign language in the country, with a focus on South Africa's past and current language-in-education policies. The third section looks at work in progress, especially the Curriculum 2005 and outcomes-based education (OBE), which has been designed to replace the educational system South Africa inherited from apartheid. This is followed by a brief look at some of the problems and difficulties that second/foreign language learners face in South Africa and the strategies that language teachers use to address these difficulties. The last section examines future directions that second/foreign language learning might take in the country's effort to provide equitable education to all.

### EARLY DEVELOPMENTS IN SECOND/FOREIGN LANGUAGE LEARNING IN SA

South Africa is known to the rest of the world mostly because of its now defunct, divide-and-rule apartheid system, on the basis of which the country was ruled from 1948 to 1994 and whose legacy continues to haunt the country's educational system. In order to better appreciate the discussion of issues in second and foreign language learning in the post-apartheid state, one must understand South Africa's colonial history against which the issues themselves have evolved. This history is discussed in the next section. The present section reviews early developments in second/foreign language in South Africa. South

African schools at all levels including primary, secondary and tertiary institutions fall into two language-based categories, much as they were during the apartheid era: There are the English-medium schools on the one hand, and the Afrikaans-medium schools on the other. In regard to the English-medium schools, in the apartheid era non-English speaking background students were required to learn English as a second language (L2). However, and as already pointed out, in South Africa the distinction between “English as a first (L1) and/or second (L2) language” has been called into question. For instance, Young (1988, p. 8) associates terms such as L1 and L2 with apartheid and argues that they should be discarded because they imply that Blacks are not able to assimilate western language and culture. Policy makers have voiced a similar view, i.e., that the term second language implies a “deficit view of language competence” (African National Congress (ANC), 1992, p. 2) and that “the aim of a fully bilingual education system is rather to achieve a single level of language proficiency by the end of compulsory schooling” (Barkhuizen and Gough, 1996, p. 459). In 1993, a Core Syllabus Committee for English was set up to look into this issue. The Committee noted that the use of the terms English as a first- and/or second language is complicated by the fact that most second language learners, even those in rural areas for whom English can be described as a foreign language, use English as their medium of instruction. Therefore, the Committee proposed that:

... these terms [English-first and English-Second Language] be replaced with the term *English*. Nevertheless, the principle of equity demands some acceptable and brief way of acknowledging the verifiable differences ... between mother-tongue and non-mother-tongue learners of English. For this purpose then, it is proposed that a growing international practice of referring to all learners for whom English is not their mother-tongue as *bilingual* learners of English, be adopted (Murray and van der Mescht, 1996, p. 258).

Since then, there seems to be a trend (as yet to be documented) for everyone in English-medium schools, irrespective of home language, invariably to learn English as L1 and Afrikaans or an African language as L2. In Afrikaans-medium schools, everyone learns Afrikaans as L1 and at least one other language, in practice most commonly English, as L2. Unlike in English-medium schools, in Afrikaans-medium schools there seems to be no need to distinguish between Afrikaans as L1 and/or as L2 since these schools are attended mostly by native speakers of Afrikaans.

In predominantly black schools, especially those located in rural areas, African languages continue to be used as the medium of instruction for the first 4 years of primary school, much as they were in the

apartheid era. However, recent trends in language education suggest that, in these schools, even where no qualified English teachers are available, English is increasingly being used, in whatever form, as the medium of instruction from grade one onwards. A number of questions arise as a result: If the distinction between English as L1 and/or L2 is not maintained, how does one prevent the emergence of a society in which, as Peirce (1992, p. 6) warns, power is concentrated in a minority of speakers of standard English? Should the country reintroduce first language (or mother tongue) education despite its close association with apartheid, or should it promote English-medium education despite its elitist nature and the high failure- and dropout-rates, especially among black learners. Future language-in-education policies must address these issues if attempts to implement multilingualism in education in South Africa are to succeed.

### MAJOR CONTRIBUTIONS

As pointed out earlier, issues in second/foreign language in South Africa cannot be discussed in a vacuum, for they are interwoven with the country's sociopolitical history and with its language-in-education policies in particular. This section offers a brief review of these policies and their colonial history. The colonial history of South Africa indicates that the country was first colonized by the Dutch, who ruled South Africa from 1652–1795. During the century and a half of the Dutch occupation of the country only knowledge of Dutch, hence Dutchification, served as a catalyst for access to education and employment in the civil service. The Dutchification of South Africa or what was then called the Cape colony came to an end in 1795 when the territory fell under British control. With the territory now in their hands, the British authorities introduced the policy of Anglicization, which sought to replace Dutch with English in all spheres of public life including the educational system (Davenport, 1991, p. 40). Like Dutchification, Anglicization required knowledge of English for access to education and to whatever resources were available in the colony. As the language of power and official language in the colony, English had to be learnt as a second/foreign language by all including the Africans and the Dutch. The policy of Anglicization lasted until 1948 when the Dutch, who by now identified themselves as Afrikaners, took the reign of the government. They, in turn, replaced Anglicization with Afrikanerization, a policy that saw the Afrikaans language, an offspring of Dutch, increase its power dramatically and take center stage in the administration of the state:

... All government-controlled institutions, the state administration, the radio and television, the education sector, the

defense force and semi-state institutions gradually [became] almost wholly Afrikaans. The [white] Afrikaans-population was in total control (Webb and Kriel, 2000, p. 22)

Knowledge of Afrikaans became a requirement for entry into the civil service, much as was that of Dutch and English in the eras of Dutchification and Anglicization, respectively. In an effort to further “Afrikanerize” the South African society, in 1953 the apartheid government adopted a controversial language policy commonly known as the Bantu Education Act. Briefly, the policy sought (a) to promote Afrikaans and reduce the influence of English in black schools; (b) to impose in these schools the use of both Afrikaans and English on an equal basis as media of instruction; and to extend mother tongue education in African languages from grade 4 to grade 8 (e.g., Cluver, 1992; Kamwangamalu, 1997, p. 237. For an elaborate discussion of other motives of the Bantu Education Act, see Kamwangamalu, 2001, pp. 390–395). This legislation had serious implications for languages of learning and teaching in black schools. In line with this policy of Bantu Education, black children had to receive education through three languages, Afrikaans, English, and the mother tongue; while for their white, colored (people of mixed race), and Indian counterparts education was dispensed exclusively in Afrikaans or in English, depending on whether one was Afrikaans- or English-speaking. The black pupils resisted mother tongue education, as promoted by the Bantu Education Act, because they recognized it for what it was: one of the strategies used by the apartheid government to deny the Blacks access to English and hence to higher education and thus restrict their social and economic mobility (Kamwangamalu, 1997, p. 243). The black pupils’ resistance to the Bantu Education Act, and the apartheid government’s determination to impose it, led to the bloody Soweto uprising of 16 June 1976, in which several pupils lost their lives (Alexander, 1989). The aftermath of the Soweto uprisings saw Afrikaans emerge, in the minds of black South Africans, as the language of oppression, and English as the language of advancement and of liberation against apartheid. As for the indigenous African languages, they became identified as inferior and unsuitable for use in the educational system. In other words, the Soweto uprisings reinforced black people’s hatred towards Afrikaans; they boosted the status of an already powerful language, English, over both Afrikaans and African languages in black schools and in black communities at large; and led the black South Africans to equate education in their own languages with inferior education. It is against this background that one must understand issues in second/foreign language learning and the development of the new language policy, to which I turn below, in the post-apartheid state.

*The New Language Policy*

When apartheid ended in 1994 and against the background of past language policies, the new government wasted no time in introducing a new language policy. The policy gives official recognition to eleven languages including English and Afrikaans, previously the only two official languages of the state, and nine African languages, among them Ndebele, Pedi, Sotho, Swati, Tsonga, Tswana, Xhosa, Zulu, and Venda. The key objective of the new language policy has been, understandably, to redress the imbalances of the past by promoting the use of previously marginalized languages, i.e. the indigenous African languages, in higher domains such as the media, education, the government and administration, etc. In 1997, the Minister of Education announced a language-in-education policy whose objectives are listed as follows:

1. to promote additive multilingualism, that is, to maintain home language(s) while providing access to and the effective acquisition of additional language(s);
2. to promote and develop all the official languages;
3. to counter disadvantages resulting from different kinds of mismatches between home languages and languages of learning and teaching;
4. to develop programs for the redress of previously disadvantaged languages. (Department of Education, *Government Gazette* no. 18546, December 19, 1997.)

One of the main objectives of the new multilingual language policy has been to promote the status of the nine official African languages against the backdrop of past discriminatory language policies. Accordingly, the new Constitution states that "... recognizing the historically diminished use and status of the indigenous languages of our people, the state must take practical and positive measures to elevate the status and advance the use of these languages" (The Constitution, 1996, Chapter 1, section 6 (2)). The Constitution also makes provision for the establishment of a Pan South African Language Board (PANSALB) with the responsibility to, *inter alia*: "... promote and create conditions for the development and use of these (African) and other languages" (The Constitution, 1996, Chapter 1, section 6 (5a)).

The question that needs to be raised at this juncture and which is at the core of this paper is this: To what extent have the recent political changes in South Africa, especially the country's new language-in-education policy, affected second/foreign language learning schools and universities? Recent studies (Kamwangamalu, 2000; Webb, 2002) indicate that not much has changed in terms of language practice in education. In other words, the status quo prevails: English and Afrikaans remain the chief media of learning in English-medium and

Afrikaans-medium schools respectively, much as they were in the apartheid era. If anything has changed at all in terms of the language practices, it is that English has gained more territory and political clout than Afrikaans in virtually all of the country's institutions including education. English has become the only language in which the majority of South African parents want their children educated: English is the language of business, commerce and international trade; it is the language of education, government and administration, international communication, diplomacy, science and technology; and it is seen not only as the language of power, prestige and status but also as an open sesame (Samuels, 1995) by means of which one can acquire unlimited vertical social mobility. It is therefore not surprising that except for historically Afrikaans-medium schools, the majority of schools in South Africa are English-medium. The demand for English-medium education, and not for education through the medium of other official languages, has to be understood against the background of the socio-economic power and international status of English on the one hand; and of the legacy of the Bantu Education Act on the other. Besides, in South Africa there seems to be no demand for multilingual skills for sociocultural, academic, and administrative purposes. Consequently, as Verhoef (1998) remarks, for African pupils there is no alternative to English-medium education. In a study of language attitudes in black schools in the North West Province, Verhoef (1998) found that constitutional demands for multilingualism are at odds with black pupils' demand for English as the sole language of learning and teaching. The demand for English is exacerbated by the fact that the pupils are only too well aware of the power of English to ask for education in any other language, and of the fact that their own languages have no economic cachet either locally or internationally. In the following section I discuss the new pedagogical framework, namely OBE, that South Africa has adopted to redress past inequities in education.

#### WORK IN PROGRESS: OUTCOMES-BASED CURRICULUM 2005

In order to provide equitable education to all South African learners, in 1998 the Minister of Education introduced a new national curriculum, dubbed Curriculum 2005, that is to gradually replace the curriculum the country has inherited from the apartheid-based education system. The new curriculum was initially scheduled to be implemented in grades 1–9 by the year 2005, hence the name “Curriculum 2005.” However, due to the difficulties it has encountered in its efforts to implement the OBE system (see below), the Department of Education has decided not to implement the plan by 2005 but to aim at a later

date. It is now projected that the revised curriculum will be implemented by 2008. The rationale for introducing the new curriculum is that, under the previous system, learners of different racial groups did not get the same quality education. Curriculum 2005 is based on the concept of OBE.

According to Spady (1995), who is regarded as the founder of OBE, outcomes are what learners can actually do with what they know and have learned; that is, the tangible application of what has been learned. An OBE is a learner-centered, results-orientated approach to education premised on the expectation that all learners can learn and succeed (*Government Gazette* no. 19640, 23 December 1998). One of the key characteristics of OBE is the acknowledgement of, and support for, the learners' use of their primary languages for acquiring knowledge, whether or not such languages are the formal languages of the school for learning and teaching. Other characteristic features of the OBE system include the following: Learning is considered an interactive process occurring between the teachers (educators) and the learners, with the latter playing a central role in the learning process, and the former serving as facilitators. The focus of learning is on what learners should know and do – the outcomes. A strong emphasis is put on co-operative learning, especially group work on common tasks or activities. The learner's progress is determined on the basis of continuous assessment, rather than on year-end examinations or on the accumulation of a series of traditional test results (Gultig, Lubisi, Parker, and Wedekind, 1998).

Since its announcement in 1997 and its subsequent launch in 1998, Curriculum 2005 has received a mixed reaction from the stakeholders. To my knowledge, and except for a lone 3-day conference on OBE organized by the Western Cape Department of Education in December 1999, there has been very little academic debate on OBE in South Africa (e.g. Gultig, Lubisi, Parker, and Wedekind, 1998). The argument for or against OBE has been aired mostly in the local newspapers. The opponents of OBE, among them a mix of journalists, members of opposition political parties and right-wingers, have said that OBE is a "... very dangerous experiment in social engineering" (*Sunday Times*, 22 June 1997). According to its critics, OBE has been a disaster in the first world countries where it has been implemented, including the USA, New Zealand, Australia, and the United Kingdom. The critics see it:

... as a system aimed at producing 'confident illiterates', a system which refutes the need for competition and its essential element: individual excellence. It is based on the group and seeks not so much to endow children with skills as to make them feel good and to raise their self-esteem (*Sunday Times*, June 1, 1997).

In contrast, the proponents of OBE, including the current ruling party (The African National Congress) and their associates, refer to the achievements of the OBE system in the very same first world countries where, according to the critics, OBE has been a failure. For instance, in a newspaper article, van der Horst and McDonald (1997) remark that:

... having studied the instructional systems of some states in the United States, Australia, South America, the United Kingdom (including the Scottish system), various European countries as well as Singapore and Japan, it became clear to us that outcomes-based education has a place and function in South Africa at this time (Sunday Times, June 22, 1997).

The proponents of OBE argue that those who oppose OBE have "... allegiance to the elitist, inequitable and fragmented status quo which protects their privileges while condemning millions to a life of poverty, illiteracy and ignorance" (Sunday Times, June 15, 1997). The latest input on Curriculum 2005 is that it will be streamlined according to the recommendations of a group of academics who reviewed it recently at the request of the Minister of Education (Sunday Times, August 20, 2000). As far as language is concerned, 70% of classroom time will now be allocated to language teaching/learning (and mathematics) in Grades 1 to 3 and 50% from Grade 4 onwards.

It must be pointed out that, in spite of the goals of OBE-Curriculum 2005, in South Africa there is a strong drive for English-medium education in OBE classrooms. It is not a coincidence that as a result of the demise of apartheid, and with it school segregation, the country has witnessed an influx of black students from the township schools to formerly white or Indian schools in their quest to be educated only through the medium of English. Recent newspaper reports bear testimony to this state of affairs. One report, titled "Township pupils go elsewhere," says that "schools in townships north of the city of Durban ... have experienced dwindling student enrolments in recent years [due] to the lack of qualified teachers and the absence of adequate facilities" (Daily News, 22 August 2002, p. 2). As a result, the report adds, the majority of advantaged schools in former white and Indian areas have witnessed an increased enrolment of African pupils. Another report, titled "Students shun African languages" (Sunday Times, 4 March 2001), indicates that enrolment in African languages at universities around the country has been declining by half each year since 1996. According to UNISA (the University of South Africa), the only institution that offers courses in all official African languages, the number of undergraduate students registered for these courses has dropped from 25,000 in 1997 to 3,000 in 2001. The number of postgraduate

students has also decreased, from 511 to 53 in the same period (1997–2001). Other tertiary institutions have confirmed an annual decline of 50%. However, how do learners from previously disadvantaged communities cope in English-medium classes? The next section is devoted to this issue, with a focus on the obstacles that learners face in their effort to learn English, and the teaching methods that teachers use in an attempt to overcome these obstacles.

### PROBLEMS AND DIFFICULTIES

Learners of English as a second language or foreign language in South Africa face many problems in their quest to be educated through the medium of English only. Webb (2002, pp. 56–57) summarizes some of these problems as follows with reference to English second language learners at the University of Pretoria, a historically Afrikaans-medium University that now also offers courses in English to accommodate black students' demand for English-medium education:

1. An inadequate language proficiency (grammatical, textual, functional and sociolinguistic) in the Language of Learning/Teaching (LoL/T) among both many students and members of staff.
2. Linguistic alienation: second-language students, aware of their inadequate English language proficiency, could experience a serious degree of linguistic alienation, which possibly significantly restricts their participation in classroom interaction, so essential to educational development.
3. The use of learning materials which have not been designed to address the language problems faced by students.
4. Inadequate guidance to students about handling language matters (including advice on the selection of an appropriate LoL/T and an academic working language), which can guide students not to select an LoL/T they do not know well enough, thus performing below their potential, even to the extent of failing their courses.

Although Webb's study focuses on students at the University of Pretoria, the problems it highlights are arguably experienced by other South African universities as well. It is no coincidence that virtually all South African universities run programs that seek to help students improve their proficiency in English. The types of language problems that such programs are intended to address can be illustrated with the following passage, which was produced in June 2000 by a first-year student at the University of Pretoria in response to a formal examination on "The Verbal Communication Process" (Webb, 2002, p. 49)

*The first four components are fundamental content of the communication process because together they form the norms.*

*Out of these norms one make disions out of Linguistic means, text constructing and Genre and that then forms the text. . . . The situational context refers to Locality, where the verbal communication proses takes place. . . . The situation also determines the Roles of the descoursed partisipants The use of language and linguistic forms. Also languagevariets. . . . The tone and register of the text for example formal, informal ect. And also how the resefer will interpret the speakers communicative intent. . . . The situasion context places people in positions and they entisipate the next phase.*

Webb (2002, p. 49) remarks further that similar examples can be found in the formal written work of students registered for a course-work masters program in Applied Linguistics (despite being language teachers, and in possession of primary degrees), for example:

*English has more knowledge than all other languages is high but the Tswana are a bit medium not more than english. Zulu is the highest in knowledge is spoken by many South Africans.*

While universities have programs in place that seek to remedy the language problems evident in the above passages, teachers in the township schools in particular address these problems by using teaching strategies such as translation, codeswitching, and peer-tutoring. Translation from English into the learners' mother tongue does indeed benefit the learners since the mother tongue is the language best known to the learners. The problem with translation is that teachers do not use it in assessing the students. Instead, all assessment activities are carried out through the medium of the official medium of instruction, English, a language in which learners are not proficient. Codeswitching has been shown to fulfil pedagogical functions in an ESL classroom, such as classroom management, emphasis, reinforce understanding of what is taught, etc. (e.g. Moodley, 2003). However, like translation, codeswitching is not allowed in examination and test papers either, nor does it enhance English proficiency. Peer tutoring, also known as peer-teaching involves grouping together students who share the same native language, Zulu, but different levels of English proficiency so that the more proficient students can tutor the less proficient ones. In using peer tutoring the teacher subcontracts, as it were, some of his prerogatives to pairs or small groups of students headed by what Sionis (1990) has termed "surrogate teachers." It is not clear to what extent these methods have helped teachers improve learners' proficiency in English. What is evident, though, is that there is a mismatch between schools' language policy, which requires that teachers teach in English, and the teaching strategies that teachers use in the classroom, as highlighted earlier.

## FUTURE DIRECTIONS

Let me reiterate that because of past language-in-education policies, especially the Bantu Education Act, the majority of South Africa's black youth do not have the language skills they need to do well at school. According to the 1991 census figures, 49% of the black youth between 15 and 24 years of age do not speak, read, or write English (van Zyl Slabbert Malan, Marais, Oliver, and Riordan, 1994, p. 109). A recent report by the then Minister of Education, Professor Kader Asmal, indicates that 12 million South Africans are illiterate and that about 20 million others, mostly schoolchildren, are not fluent readers in any language (The Sunday Times, 16 April 2000). In the latest survey on literacy, the Pan South African Language Board (PANSALB) reports that about 50% of non-English-speaking South Africans (read mostly black South Africans) do not understand statements or speeches made in English by government officials (The Star, 8 September 2000). What then should be done to remedy this situation? I argue that the answer to this question lies in the implementation, as yet to materialize, of the new language-in-education policy. A commitment to linguistic pluralism (Cobarrubias, 1983) and thus to linguistic democracy means that the use of the mother tongue in education (and other higher domains) is, as many linguists have pointed out, a fundamental human right (e.g. Phillipson, 1992; Skutnabb-Kangas, 1988; Tollefson, 1991). Therefore, there is an urgent need for South Africa to take a hard look into its language-in-education policies, with a view to revitalizing mother tongue education as a means through which to empower the masses. Revalorizing the indigenous does not mean, and this is an important point, saying farewell to English and Afrikaans. Rather, it means bringing these two languages to equality with indigenous languages as required in the constitution. It entails, as Webb 1995, p. 103 correctly points out, "making the indigenous languages desirable and effective [tools] for educational development, economic opportunity, political participation, social mobility, and cultural practice." Whether or not the indigenous African languages are developed to function alongside English and Afrikaans as the medium of instruction, English will continue to be the language of choice in education for most learners and their parents. Given the difficulties that learners are currently encountering due to their lack of proficiency in English, they should not be allowed to register for courses in their subject areas until they become proficient in the language. For this purpose, current English (remedial) programs should be restructured and turned into intensive programs that extend over at least a full semester. Such programs would allow the students enough time to develop the skills they need to be able to perform to their full potential in English as L2-classrooms.

## SECOND AND FOREIGN LANGUAGE EDUCATION IN CANADA

### INTRODUCTION

Canada, a vast country comprised of ten provinces and three territories, has a linguistically and culturally diverse population. Officially a bilingual country (English and French), in a recent consensus (Statistics Canada, 2001), 59% of the population reported English as their mother tongue, 23% French, and 18% a mother tongue other than English or French, about 1% of whom are aboriginal people.

Constitutionally, education is the responsibility of the provinces and territories, and each one has distinct policies and curricula. There is some communication across jurisdictions, through structures such as the Council of Ministers of Education, but there is no direct federal government connection to education in schools. There is, however, a sharing of expenditure for some aspects of public education (health and other welfare programs) between the provinces and the federal government and this includes federal funding to support *official* minority language vitality and development (i.e., English or French in a provincial, or regional, context where one of the other official languages dominates). In view of such diverse sociopolitical and economic factors, second and foreign language education has developed variously across geopolitical contexts and language program types. The following identifies some of the more significant trends and initiatives that have been undertaken.

### EARLY DEVELOPMENTS

Before the arrival of Europeans, Aboriginal peoples populated Canada. Since the sixteenth century, immigrants have been arriving from Northern and Western Europe, and increasingly from all over the world. European Canada was French until 1763, when it was ceded to Britain after the 7 Years War. Since the earliest days, struggles between Francophones and Anglophones for separate identities, including religious and linguistic rights, have been central threads throughout the country's social and political history.

Canada was created legally (Constitution Act, 1867) through the merger of four British Colonies. There was minimal constitutional provision

for language. Arguably, the concept of official languages as a symbol of Canadian identity came most forcibly to the fore from the 1960s to the present. In the 1960s, Francophones in Quebec took steps to gain more control, during a period of rapid social change known as the “quiet revolution.” As a response to a perceived crisis in national identity, in 1963, the federal government established, the Royal Commission on Bilingualism and Biculturalism out of which resulted the Official Languages Act of 1969. This act gave French and English equal status as Canada’s official languages and created the position of Commissioner of Official Languages to oversee the implementation of the Act. In 1970–1971 the Government of Canada created programs known as the Official Languages in Education (OLE) program that put in place a funding system of subsidies to expand opportunities for minority Francophones and improve the teaching of French and English as a second language in provinces where the other official language is dominant. In 1982, a new constitution, and associated Charter of Rights and Freedoms, strengthened official language rights and promoted bilingualism. With respect to education, children of families with an official minority language background (e.g., French in British Columbia and English in Quebec) now had a right to schooling in their home language. In keeping with these official policies of bilingualism, since English is the dominant language in about three-quarters of the country, French is the official second language taught in the majority of schools. Likewise, English is the official second language taught in French language-dominant provinces and French-speaking regions within provinces. Foreign languages are also taught to a relatively small percentage of students. Traditionally, these were mainly European languages (most commonly Spanish, German, Italian) but increasingly other languages (e.g., Mandarin, Japanese, Korean, and Punjabi in British Columbia) are formally accredited courses. Provinces vary in the age at which foreign languages are offered in the schools, the foreign languages offered (this also varies considerably within provinces across schools and communities), and the mandated grades, where a foreign language course is no longer a requirement toward graduation.

The portrait of Canada’s linguistic and cultural landscape is, however, more complex than the *official languages* policies might suggest. Approximately 20% of the population speaks a language other than English or French in their families and local communities. Moreover, Canada has an active immigration policy with more than 200,000 immigrants arriving annually, 50% speaking a language other than French or English. Because the education of children is a provincial responsibility, no federal funding is available for language programs for children who enter school speaking a *nonofficial* language if they are educated in the dominant official language of their province

of residence. This leads to a curious anomaly wherein, for example, a school in Vancouver may receive federal funding to educate, in French, a student who enters school speaking a *nonofficial* language, but federal funds are not available to teach that same student in English, the medium of instruction in most schools in British Columbia. Provincial funding is available for English as a Second Language (ESL) programs, however, there is no coherent national profile of ESL policies, programs, and provisions across geopolitical contexts. An initial analysis suggests considerable variation across provinces with respect to: funding amounts per pupil per year, definition of ESL students, policies, time caps in ESL programs, presence of ESL curriculum, service delivery models, ESL teacher certification requirements, and credits for ESL courses. Canadian federal policy does promote the recognition of the value of languages other than English and French, as expressed in the Canadian Multiculturalism Act (1990), but funding for related programs is limited and generally directed to promoting tolerance, nondiscrimination, and cross-cultural awareness, rather than heritage language learning. Smaller linguistic groups have not fared as well, then, with respect to nationally coordinated efforts and provisions for second- or dual-language education programs. Provinces also vary considerably in the extent to which they support maintenance of heritage languages in schools. In the approximately 50% of the provinces where they exist, heritage language programs are generally added on at the end of the school day or offered on Saturday mornings. For a powerful critique of the problematic consequences of lack of a coherent policy, for heritage language teaching in schools, together with an argument for the potential benefit of such a policy, for foreign language teaching in schools, see Cummins (2005). (For related reviews, see Cumming 2006; for a review of policy and education with respect to First Nations languages, see Burnaby, *Language Policy and Education in Canada*, Volume 1).

#### MAJOR CONTRIBUTIONS

Canada is renowned for its innovative and widespread use of various language and content approaches to second language pedagogy, immersion education being the most prominent of these. This review does not touch upon the extensive research that has been done on immersion (see for review, Genesee and Lindholm-Leary, *Dual Language Education in Canada and the USA*, Volume 5). Rather, it provides an overview of the contributions that have been made in two other important aspects of second and foreign language education in Canada, aspects that impact on a high percentage of the school-age population; these are: (1) integrated language and content programs

for English Language Learner (ELL) students who are receiving their education through the medium of English and (2) Core French Programs.

The origins and growth of French Immersion, since its beginnings in a Montreal suburb in the mid-1960s, is well-documented. Systematic content-based approaches for ESL programs appeared about two decades later. In the first half of the 1980s, Canada received a steady flow of ELL students in schools. Influenced by Cummins' (1981) theory of social and academic language proficiency, a number of ESL teachers began to experiment with content-based language instruction in their classes. In this context, Mohan published his seminal book *Language and Content* (1986) and the British Columbia Ministry of Education published *An Integrated Language and Content Resource Book* (Early, Thew, and Wakefield, 1986) for use with teachers throughout the B.C. school system; both were based on Mohan's heuristic, "A Knowledge Framework." Working within a Systemic Functional Linguistics (SFL) perspective, this is a view of language as discourse in the context of social practice; it looks explicitly at the role of language and discourse within social practice in order to design tasks that intentionally address the language and subject matter requirements of both. Unlike immersion approaches of that period, this perspective explicitly and intentionally considered students' language needs and encouraged critical meta-discourses about language and subject matter knowledge. Research revealed that knowledge structures serve as a useful construct to consider transfer across: academic content-area discourses, modes of meaning making, and different languages, and to engage ELL students in critical meta-language discourses (see for review Mohan, Leung, and Davison, 2001).

Relatedly, in immersion programs, explicit attention to students' language needs through a "focus on form" (Swain, 1988) has also become an increasingly common focus of research (see Lyster, 2004, for a recent overview). As well, in the context of ESL instruction in Francophone communities, Lightbown and Spada have conducted an ongoing series of studies of "focus on form" on language learning outcomes (see Lightbown, 2000). Thus, various approaches to instructional language development by researchers working across different languages, theoretical perspectives, contexts, and program types have been an aspect within content-based instruction, where major Canadian contributions have been made (see Wesche, 2001, for more detailed examples).

Returning specifically to ESL content-based research, Duff (2004) conducted a two-year ethnographic study in a Vancouver high school with a high concentration of students from Asian backgrounds. Her work is revealing in illustrating the discourse and cultural challenges for ELL students in mainstream social studies classes. Toohey,

Waterstone, and Julé (2000), drawing on sociocultural theorists, examined classroom activities engaged in by more or less proficient speakers of English and how their interpersonal relationships are implicated in their speech activities. Findings revealed that certain kinds of adult participation might hinder or enhance opportunities for young ELL student's participation in learning. Roessingh and colleagues (see Roessingh, 2004, for review) have conducted a number of studies to report on their experiences of building an effective ESL program that focused primarily on results. Kouritzin (2004) conducted a year-long comparative study of four low-incidence (i.e., a small percentage of population) ESL schools in two provinces, with reputations for success. Her work revealed that school-wide programs and attitudes more than specific pedagogical practices correlated with school success. Recent work in Canada regarding identity construction, social contexts, and relations of power (e.g., Cummins, 2000; Heller, 1999; Norton, 2000; Schechter and Cummins, 2003) has also made major contributions (see Norton, *Identity, Language Learning, and Critical Pedagogies*, Volume 6).

Although immersion and content-based language programs have been prominent in research in second language education in Canada, 90% of English-speaking students are enrolled in Core French programs and these have gradually become more of a focus of research (for more detailed examples and extended literature reviews see Canadian Patents for French, 2000–2005; Lapkin, 1998; Lapkin and Turnbull, 1999).

Core French is French as a second language program, taught in periods that vary from 20 to 50 minutes per day, the object of which is to teach students basic conversation skills, language knowledge, and an appreciation of French culture in Canada and beyond (Turnbull, cited in the CPF report, 2004). Interest in variations on this program, particularly Intensive (Core) French formats, has grown significantly in recent years. This is due to the growing reports that students are frequently discouraged by their lack of progress in what has come to be known as the “drip feed” method of 20 minutes per day of French, together with high attrition rates, where students leave Core French programs, nationwide, at the earliest possible opportunity (MacFarlane, 2003). As an alternative format, intensive French increases the number of instructional hours in the second language. This varies from 450 hours in *le bain linguistique* in Ottawa, where the focus is on listening and speaking, rather than all four skills, to other Intensive French Language programs, for example a pilot program in Newfoundland and Labrador, where the amount varied between 180 and 360 instructional hours. A number of research and evaluations studies of these programs have been conducted and the results to date with respect to L2 outcomes are impressive. In addition, Intensive

French Language programs have also been found to have a positive effect on students' attitudes toward the L2 and increase students' confidence in their ability to communicate in French (see Germain and Nettan, 2004). Although these results are promising many questions remain concerning the nature of the program itself, for example use of L1, the role of time, of pedagogy used, of teachers' language competency, and whether or not the initial gains and positive attitudes are maintained on students' return to traditional Core French. In addition to the two areas mentioned earlier, see also Chappelle (2005), for a review of Canadian contributions to computer-assisted language learning.

#### WORK IN PROGRESS

Most of the developments reported in the preceding section on content-based ESL and Core French are currently being advanced.

Although linguistic and cultural diversity have long been characteristic of Canadian society, current work is being undertaken in rapidly changing times, wherein, the extent of local diversity and global connectedness is unprecedented. These "new times" are leading researchers to address how literacies and pedagogies in multilingual, multiethnic urban schools might be reconceptualized to consider the extent to which Canadian schools have taken into account and built on the multilingual competencies that students bring to school as resource. A large-scale Canada-wide project, entitled *From Literacy to Multiliteracies: Designing Learning Environments for Knowledge Generation within the New Economy* (Early, Cummins, and Willinsky, 2002), a Social Sciences and Humanities Research Council of Canada (SSHRC), funded, collaborative research alliance, is one example of such work. On the basis of case studies of multiliterate pedagogies carried out collaboratively by teachers and university-based researchers, the project is attempting to articulate the choices that school systems face with respect to *what forms of literacy* to teach and what *pedagogical options* are most appropriate for teaching different forms of literacy in diverse contexts. One question addressed by this project of particular relevance to this review is: How can we teach for cross-language and cultural transfer and literacy engagement when there are multiple languages represented in the classroom, none of which the teachers may know? A related question asks, how might technology help us realize such diversity as a resource for all? Various approaches have been implemented including: the creation of multimodal dual language texts; sister-class projects; the use of e-lective, a computer assisted, text-based ESL/EFL learning system; the use of the students' home languages in cross-modal and cross-language transfer to facilitate content and L2 language learning; and the design of multimodal pedagogical

activities and spaces that afforded ELL students opportunities and skills to access knowledge from multiple perspectives and to forge their own links between the discourses of school and family and community life (see [www.multiliteracies.ca](http://www.multiliteracies.ca)). One emerging factor from the Canadian Multiliteracies Project is teachers' reports that issues around assessment and accountability can constrain their innovative efforts. A complementary study (Early, Overgaard, and Willinsky, 2006) is investigating the viability of internet-based, teacher-authored accounts as an alternative accountability procedure in conveying to stakeholders students' multiliterate accomplishments and achievements and engaging them in democratic conversations around what we value in the development of literate citizens (for details on work in progress, see [www.multiliteracies.ca](http://www.multiliteracies.ca)).

Similarly, Mohan and colleagues are conducting ongoing work within a SFL perspective to investigate ELL students' development of academic discourses, particularly science discourse, for academic achievement. For example, Mohan and Slater (2005) provide a detailed account of how a teacher and her 6 to 7-year-old students were able to build up a simple theory of magnetism using scientific register, linking technical terms to their practical experience.

Reeder, Early, Kendrick, and Shapiro (2003) in an SSHRC-funded study, are investigating the effectiveness of a prototype-automated speech recognition software from Project Listen, Carnegie Mellon University, to improve ELL students' literacy development. The software is an automated Reading Tutor that displays stories on a computer screen, listens to children read aloud, and provides corrective feedback. An initial quasi-experimental study in Vancouver, of students from five language groups, showed gains by the Reading Tutor group matched gains by the human tutoring group on most reading measures, and interviews showed favorable affect impact by the Reading Tutor. Analysis is continuing. In Toronto, a 12-week study (Cunningham and Geva, 2005) involved 104 ESL students in grades 4–6 at 8 schools. The study compared three treatments: the Reading Tutor; Kurzweil 3,000, which reads aloud to the student and provides vocabulary support; and regular ESL classroom instruction. Analysis of data from the first 39 students shows promising trends for the Reading Tutor. Analysis is continuing.

With respect to official second language education in Canada, in the spring of 2003, the federal government released a comprehensive new plan for official languages, entitled: *The Next Act: New Momentum for Canada's Linguistic Duality* (2003), which articulated as the main objective, the doubling of the proportion of graduates from Canadian high schools with a functional knowledge of their second official language by 2013 (see <http://www.ocol-clo.gc.ca/symposium/documents/>

[lapkin/lapkin\\_e.html](#) for a research perspective, including work in progress, on how to rise to the challenge). Also, as a follow-up to the plan, Rehorick (2004) coordinated an expert team charged with outlining concrete steps to make the goals attainable. Based on document analysis and interviews, the team identified five priority areas outlined in *The Next Act*: improve Core French and Core English programs; increase the number of qualified teachers; give new life to French Immersion; offer bilingual graduates the opportunity to put their bilingual skills to use and improve bursary and monitor programs, and developed a set of recommendations with respect to each of the priority areas. Notably, recommendation 51, is to establish a Second Official Language Research Agency of Canada to support and oversee the research that accompanies all the initiatives to be funded by Plan 2013. This agency would amongst other functions identify key areas of research and act as a clearinghouse for information regarding the development of official second languages. In addition, Annual Reports by the Canadian Association of Second Language Teachers (CASLT [www.caslt.org](#)), including reports of commissioned position papers and new research underway, provide important reviews of work in progress regarding *official* second language education initiatives. The State of French Second Language Education Reports produced annually for the past 6 years by the Canadian Parents for French ([www.cpf.ca](#)), also provide up-to-date information annually on research and innovations taking place in immersion and Core French in each Canadian province.

## PROBLEMS AND DIFFICULTIES

Second and foreign language education in Canada, while leading edge in many respects, is not without its problems. Four of these are addressed in this section: a shortage in trained FSL and ESL teachers; high attrition rates from Core French; disturbing trends in the drop out and/or disappearance rates of ELL students in high-school examinable subjects; and the marginalization of heritage language programs.

With respect to FSL, the Canadian Parents for French conducted a large-scale study in 2002 and concluded that "... shortages of Core French and French Immersion teachers were currently wide-spread" (p. 58). Follow-up studies have been conducted in 2003 and 2004, and though these studies note gains in supply and demand ratios, "... expectations about the availability of FSL teachers over the next five years remains pessimistic" (p. 59) ([www.cpf.ca](#)). The concerns regarding trained ESL teacher shortages are undocumented yet likely more far reaching. In school districts across Canada, the majority of ELL students receives their education in mainstream classrooms and

is withdrawn for additional English language support by a resource teacher. Personal communications with ESL professionals in major urban centers across the country suggest that ELL students more and more are being served in classrooms where the focus is on system-wide literacy and numeracy standards. To the extent that specialized resources are available to ELL students, The British Columbia Teachers Federation notes this disturbing trend:

The BCTF strongly supports the roles of specialist ESL, Language Assistance and Special Education teachers in an inclusionary education system. We do not endorse combining roles . . . . But roles are being combined and our members need support in those roles. (BCTF Teaching to Diversity Website)

The subsuming of ELL students' needs to broadband pedagogical concerns about mainstream literacy standards or about learning difficulties is not unique to B.C. Faculties of Education training programs and school systems' decisions regarding the organization of teachers and their work, including the kinds of professional conversations they have opportunities to engage in, more explicitly need to address students' need for teachers with pedagogical expertise in ESL.

A second problem area is the high attrition rates from Core French programs nationwide. MacFarlane (2003) reports that many students over the past decade have dropped out of French at the first opportunity, often at the end of grade 9 in most provinces, when it is no longer obligatory. As reported earlier, initiatives and research programs to reverse this trend, including addressing FSL teacher shortages, are currently being put in place.

Concerning ELL students receiving their education in the medium of English, several tracking studies conducted in Canada all conclude that, high-school graduation remains an elusive goal for a disturbingly high percentage young people. Gunderson (2006) provides a comprehensive literature review of tracking studies and has undertaken the most long-term and comprehensive of these. From an analysis of a sample of 5,000 ELL students drawn from data collected on 25,000 immigrant students who were enrolled in the Vancouver public schools between 1991 and 2001, and compared with a random sample of Canadian-born students, the investigation revealed important findings related to immigrants' academic achievement. Four provincially examinable subjects (English, Social, Studies, Science, and Math) were used as indicators of success. There were statistically significant differences across both grades and academic subjects. Most notably grades dipped in grade 11 and students fared better in math and science than in the humanities. There were also differences across ethnolinguistic groups, for example, Mandarin speakers consistently outperformed Canadian-born students,

Cantonese speakers also fared relatively well except in Grade 12 humanities. Spanish- and Vietnamese-speaking students did not fare nearly as well in the sample. A further disturbing finding is that the number of immigrant students enrolled in examinable courses (needed for graduation) decreased significantly from grade 8 to grade 12. The overall decrease was 60% of the population, but it varied dramatically from school to school, from 35% to nearly 100%. These results have a high correlation with socioeconomic status. Gunderson's findings are in line with similar studies, conducted in British Columbia, Alberta, and Ontario (see Gunderson, 2006, for a review). Addressing the educational needs of immigrant students to achieve their full potential remains a critical challenge, as well as an opportunity, for Canadian education systems nationally, particularly as immigration numbers are projected to increase over the next decade.

As has been pointed out earlier in this review and by others, notably Cummins (2005, p. 585), currently, "... the teaching of heritage languages is marginalized with respect to funding provisions, number of students involved and number of students who participate." Similarly, within mainstream classrooms, as discussed in the previous section, *de facto* "English Only" policies are in operation, resulting, not only in missed opportunities for students' development of academic knowledge, but also in the attrition of students' heritage language competence over the course of their schooling. Concurrently, foreign language teaching, too commonly, results in high attrition rates and limited success. As Cummins (2005) points out, we are faced with a bizarre situation, in which fluent speakers of foreign languages are turned into monolingual English speakers, while simultaneously, schools struggle, with limited success, to transform monolingual English students into foreign language speakers. These are current problems in language education that demand redress.

#### FUTURE DIRECTIONS

With respect to official language programs, the 2013 plan mentioned earlier, and follow-up responses for implementation are positive moves in setting future directions and committing the necessary resources to meet the stated goals.

Regarding second language education for nonofficial language minority groups, schools, school districts, Ministries of Education, and national bodies such as the Council of Ministers, in partnership with universities and community organizations, need to consider the extent to which Canadian schools (and teacher development programs) have incorporated into their policies, curricula, and instruction the full implications of the linguistic diversity that exists in Canadian classrooms.

Currently, though “multiculturalism” is endorsed in our schools, very few educational systems have generated policies and pedagogies that bring into the classroom the heritage languages and cultures of the students. Available educational achievement data presents a complex picture of our limited success with “English Only” schooling. Future directions in second and foreign language education in Canada must consider ways that the full range of linguistic and cultural competencies that students bring to school can have greater instructional relevance, not only for individual student’s well being, but also for the collective Canadian good.

## LANGUAGE EDUCATION IN EUROPE: THE COMMON EUROPEAN FRAMEWORK OF REFERENCE

### INTRODUCTION

A large number of different languages are learned in Europe. Europeans often speak languages other than their mother tongue at home or in the street. Language learning not only occurs at school. Therefore, it is important to have insight into the way in which people learn languages within a European context. Moreover, it is important to know what levels of language skills are achieved when people learn languages in formal as well as in informal contexts. This contribution provides an overview of the Common European Framework of Reference for Languages (CEFR) that has been proposed by the Council of Europe. In addition, the focus is on the European Language Portfolio and the Manual for relating language examinations to the CEFR.

### EARLY DEVELOPMENTS

The Council of Europe (based in Strasbourg, France) was founded in 1949. Today it serves 800 million people in 46 European member states subscribing to the principles of human rights, democracy and the rule of law. The main aim of the Council of Europe (CoE) is to achieve a greater unity between its members on a variety of social, political and legal domains. A specific aim is to promote and develop a European cultural identity, with special emphasis on education. The programs initiated in the area of modern languages are co-coordinated by two units of the CoE:

- The *Language Policy Division* ([www.coe.int/lang](http://www.coe.int/lang) and [www.coe.int/portfolio](http://www.coe.int/portfolio)) in Strasbourg (France) focuses on instruments and initiatives for the development and analysis of language education policies for the member states.
- The *European Centre for Modern Languages* ([www.ecml.at](http://www.ecml.at)) in Graz (Austria) was established in 1995 and deals with the implementation of language policies and the promotion of innovative approaches. Its strategic objectives include the practice of modern language learning and teaching and the training of multipliers.

The Council of Europe has been active in the area of language education for almost 50 years now (see CoE, 2005a for a historic overview).

*Early Initiatives: Threshold Level/Niveau-Seuil*

The first major CoE Project in Modern Languages (1963–1972) promoted international co-operation on audio–visual methods and the development of applied linguistics. In the 1970s, the feasibility of a unit-credit scheme for language learning in adult education was explored. A notional-functional model for specifying objectives was elaborated and exemplified in a *Threshold Level* for English (Van Ek, 1975) and a *Niveau-Seuil* for French (Coste, Courtillon and Ferenczi, 1981). The model specified in operational terms the knowledge and skills a language learner should have, and what a learner should be able to *do* when using the language independently. The basic model was adapted for over 30 other languages. It has been extremely influential and applied in a series of projects covering all sectors of education. Throughout the 1980s guiding principles in the notional-functional models provided the basis for a reform of national curricula, for better language teaching methods (textbooks, multimedia courses) and for forms of assessment. School interaction networks (Bergentoft, 1987) with teacher trainers as key agents played a major role in sharing expertise and experiences between member states and in bringing innovation to classroom materials and methods (cf. CoE 2005a).

*Language Learning for European Citizenship*

In the dynamic 1990s, some countries from Central and Eastern Europe joined a common Europe. In order to get a grip on the new language (learning) situation, the Modern Language Project on *Language Learning for European Citizenship* was carried out between 1989 and 1996 (CoE, 1996). The results and the recommendations of a concluding conference in 1997 in Strasbourg led to Recommendation No. R (98) 6 of the Committee of Ministers Concerning Modern Languages. It emphasised intercultural communication and plurilingualism as key policy goals and set out concrete measures for each educational sector in Europe. Two instruments were developed as an outcome of the project:

- A *Common European Framework of Reference* introducing a new Descriptive Scheme for language education and a system of Common Reference Levels. This language scale can be used to compare language skills and certificates. For example, pupils who studied French in a high school in Poland can, when applying for an apprenticeship in France, give a potential employer a good idea of what such a diploma in French means.
- A *European Language Portfolio*: a comprehensive document that not only covers formal certificates but can also document other language experiences, such as growing up in a multilingual home situation.

## MAJOR CONTRIBUTIONS

*Common European Framework of Reference for Languages: Learning, Teaching and Assessment*

The CEFR was officially published in 2001 (CoE, 2001), the European Year of Languages ([www.coe.int/edl](http://www.coe.int/edl)). It quickly turned out to be one of the most influential publications of the last decade in the field of language learning, teaching and especially language testing in Europe and elsewhere. The aim of the construction of the CEFR was to promote transparency and coherence for the three areas in a comprehensive way. It consists of two parts:

- The *Descriptive Scheme* is a tool for reflecting on what is involved not only in language use, but also in language learning and teaching. Parameters in the Descriptive scheme include: skills, competences, strategies, activities, domains and conditions and constraints that determine language use;
- The *Common Reference Level system* consist of scales of illustrative descriptors that provide global and detailed specifications of language proficiency levels for the different parameters of the Descriptive Scheme. The core of the Common Reference Level scales is a compendium of ‘can-do’ descriptors of language proficiency outcomes.

Through the CEFR learners, teachers, examiners, administrators, policy makers, educational institutions are stimulated to refer their efforts to a common European framework. The scales of illustrative descriptors can be used in the support of self-directed language learning (e.g. raising self-awareness of own language skills and strategic actions to be taken by the learner). The CEFR might also be used in the planning of language-learning programs (e.g. for establishing interfaces between different sectors of education, for developing curriculum guidelines and textbooks or for teacher training). In order to facilitate cooperation between educational institutions in Europe and to provide a basis for the mutual recognition of language qualifications, the CEFR can be used in the planning of content syllabus of examinations and the specification of assessment criteria. It is also meant to be used in policy making as a means of ensuring coherence and transparency through the different sectors or stages in language education. Many European countries have taken advantage of the appearance of the Framework to stimulate curriculum and examination reforms in different educational sectors.

**The Descriptive Scheme of the CEFR**

The CEFR adopts an action-oriented approach towards language use, embracing language learning. The Descriptive Scheme focuses on the

actions performed by persons who as individuals and as social agents develop a range of *general* and *communicative language competences*.

*General competences* of a language user/learner comprise four sub-categories:

- *Declarative knowledge* ('savoir') resulting from experience (i.e. empirical knowledge) or formal learning (i.e. academic knowledge);
- *Skills and know-how* ('savoir-faire'), implying the ability to carry out tasks and apply procedures;
- *Existential competence* ('savoir être') comprising individual characteristics, personality traits and attitudes towards oneself and others engaged in social interaction;
- *Ability to learn* ('savoir apprendre') is the ability to engage in new experiences and to integrate new knowledge into existing knowledge.

*Communicative language competences* of a user/learner involve knowledge, skills and know-how for each of the following three components:

- *Linguistic competence* deals with formal characteristics of a language such as the phonology, the morphology, the lexicon and the syntax;
- *Sociolinguistic competence* concerns the socio-cultural conditions of language use such as e.g. politeness rules or social group repertoires;
- *Pragmatic competence* covers the functional use of language, for example the use in specific scenarios of how to act in a restaurant or how to participate in a job interview.

On the basis of general and communicative language competences the language user/learner applies skills and strategies that are suitable to perform tasks in the following oral/written language activities:

- *Reception*
- *Production*
- *Interaction*
- *Mediation* (i.e. summarizing, paraphrasing, interpreting or translating)

The contextualization of these language activities in specific domains implies activating language processes of producing and receiving spoken/written discourse (so-called texts). The language activities happen within domains of language use such as:

- *Public domain*
- *Personal domain*
- *Educational domain*
- *Occupational domain*

Performing language activities the language user/learner needs to activate those strategies that seem most appropriate for carrying out the tasks to be accomplished in the pertinent domain. Ultimately the

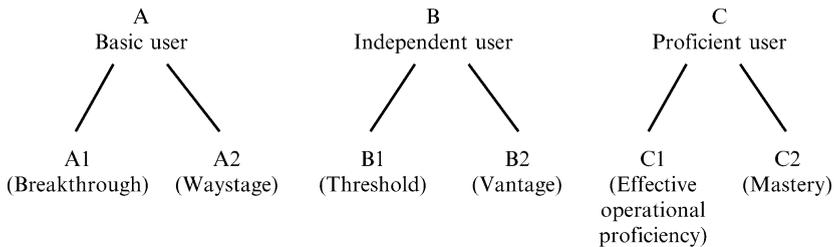

(self-)monitoring of the process of language use and language-learning results in the reinforcement or modifications of competences.

### Common Reference Levels of Language Proficiency

With a view to enhancing the usability of the CEFR a simple and global distinction is made into three main user levels:

- The *proficient user* has hardly any or no strains in the use of the target language—no consideration needs to be taken into account that it is not his/her native tongue;
- The *independent user* can handle the daily language practice, is mostly able to interact without too much effort and generally is able to follow a normal speech tempo—some consideration needs to be taken into account that it is not his/her native tongue;
- The *basic user* has the most elementary expressions, however in communication is dependent of the willingness on the interlocutor to adapt to the attained level—interlocutors assistance is necessary.

A ‘hypertext’ branching approach (see below) was proposed to define finer levels and categories to suit local needs and yet still relate back to a common system. It was determined that six levels would be adequate to show progression in different sectors, while allowing for reasonably consistent distinctions to be made.

The six ascending proficiency levels are couched in terms of ‘can-do’ statements which resulted from a project of the Swiss National Science Research Council which took place between 1993 and 1996 (North, 2000). The starting point of the project was a detailed analysis of 41 scales of language proficiency from the internationally available sources. Those ‘can-do’ descriptors were selected which would fit into the different parameters of the Descriptive Scheme. They were then scaled through a combination of intuitive, qualitative and quantitative methods. In the intuitive phase, this material was edited, new descriptors were formulated, and the set discussed by experts. Next, a variety of qualitative methods were used to check that teachers could relate to the descriptive categories selected, and that descriptors actually described the categories they were intended to describe. Finally, the best descriptors were scaled using quantitative methods (Rasch model).

And as a result the Descriptive Scheme of the CEFR could be enriched with two illustrative Reference Scales with varying degrees of specificity:

- A global scale for the Common Reference Levels.
- A self-assessment grid.

**Table 1** specifies the global scale for the Common Reference Levels. The Common Reference Levels were elaborated further through ‘can-do’ descriptors for understanding, speaking and writing, that is, for each of the following six language activities in the Descriptive Scheme:

- Listening
- Reading
- Spoken Interaction
- Written Interaction
- Spoken Production
- Written Production

Cross-tabulating these six language activities with the six proficiency levels results in a self-assessment grid with general descriptors of outcomes (see [Appendix 1](#)). For example, the general descriptor for listening comprehension on *Breakthrough Level* (or level A1) is formulated as follows:

*I can recognize familiar words and very basic phrases concerning myself, my family, and my immediate concrete surroundings, when people speak slowly and clearly.*

Below is an example of the general descriptor used for reading comprehension on *Mastery Level* (or level C2):

*I can read with ease virtually all forms of the written language, including abstract, structurally or linguistically complex texts such as manuals, specialized articles, and literary works.*

With the aid of general descriptors such as these, anyone, the teacher, the curriculum developer, but also the employer, the personnel officer, or the policy maker can easily attain information on an individual’s language proficiency. In terms of European and international affairs, this assessment of language proficiency levels may have great relevance.

The global Reference Scales are elaborated further through specific descriptors that provide detailed information and insight. Some examples of specific descriptors for listening comprehension skill of the *basic breakthrough* language user/learner (or level A1) are the following:

*I can understand simple directions for how to get from X to Y, on foot or by public transport.*

*I can understand numbers, prices, and times.*

The detailed specification of the Descriptive Scheme through the illustrative Reference Scales take the form of a descriptor bank that can be added to, updated and edited to meet present and future needs. Since 2001 the CEFR with its Descriptive Scheme and the Common Reference Levels have been translated into 25 languages (as of February 2006).

Table 1 Common reference levels: Global scale

|                  |    |   |
|------------------|----|---|
| Proficient user  | C2 | Can understand with ease virtually everything heard or read. Can summarise information from different spoken and written sources, reconstructing arguments and accounts in a coherent presentation. Can express him/herself spontaneously, very fluently and precisely, differentiating finer shades of meaning even in more complex situations.  |
|                  | C1 | Can understand a wide range of demanding, longer texts, and recognise implicit meaning. Can express him/herself fluently and spontaneously without much obvious searching for expressions. Can use language flexibly and effectively for social, academic and professional purposes. Can produce clear, well-structured, detailed text on complex subjects, showing controlled use of organisational patterns, connectors and cohesive devices.                                       |
| Independent user | B2 | Can understand the main ideas of complex text on both concrete and abstract topics, including technical discussions in his/her field of specialisation. Can interact with a degree of fluency and spontaneity that makes regular interaction with native speakers quite possible without strain for either party. Can produce clear, detailed text on a wide range of subjects and explain a viewpoint on a topical issue giving the advantages and disadvantages of various options. |
|                  | B1 | Can understand the main points of clear standard input on familiar matters regularly encountered in work, school, leisure, etc. Can deal with most situations likely to arise whilst travelling in an area where the language is spoken. Can produce simple connected text on topics, which are familiar, or of personal interest. Can describe experiences and events, dreams, hopes and ambitions and briefly give reasons and explanations for opinions and plans.                 |
| Basic user       | A2 | Can understand sentences and frequently used expressions related to areas of most immediate relevance (e.g. very basic personal and family information, shopping, local geography, employment). Can communicate in simple and routine tasks requiring a simple and direct exchange of information on familiar and routine matters. Can describe in simple terms aspects of his/her background, immediate environment and matters in areas of immediate need.                          |
|                  | A1 | Can understand and use familiar everyday expressions and very basic phrases aimed at the satisfaction of needs of a concrete type. Can introduce him/herself and others and can ask and answer questions about personal details such as where he/she lives, people he/she knows and things he/she has. Can interact in a simple way provided the other person talks slowly and clearly and is prepared to help.   |

Further language versions are in preparation. More detailed information on general and specific descriptors can be found in the studies of North and Schneider (1998) and North (2000).

### *A Language Portfolio for Europe*

The most successful implementation of the approach proposed in the CEFR is the European Language Portfolio (henceforth ELP)—the second instrument developed by the Council of Europe (CoE, 2000). It is a document, in which those who are learning or have learned a language—whether at school or outside school—can record and reflect on their plurilingual and pluricultural experiences. It was developed and piloted by the Language Policy Division of the Council of Europe, Strasbourg, from 1998 until 2000 (Schärer, 2000). In 2000 the Standing Conference of the Ministers of Education of the Council of Europe adopted a Resolution recommending the implementation and widespread use of the ELP. It was launched on a pan-European level during the European Year of Languages (2001) as a tool to support the development of plurilingualism and pluriculturalism—the two fundamental ideas underlying the CoE language education approach. These two concepts are based on the observation that individual language learners/users may develop their linguistic and cultural ability in a range of languages and cultures, with a very diversified levels of proficiency (a ‘profile’) for the different skills within that repertoire. The ELP is a tool with which the CoE is attempting to stress the value of each new linguistic and cultural experience thus striving to preserve a linguistically and culturally diversified Europe—an ideal of ‘plurilingual and pluricultural people living in a multilingual and multicultural Europe’. In the interest of the quality and credibility of the ELP the education committee of the Council of Europe has adopted *Principles and Guidelines* (CoE, 2004a). With respect to form and content, it is recommended that each version of the ELP includes the following three components:

- *Language Passport*: This section is a regularly updated summary description of the linguistic and intercultural experiences of the owner, it provides ‘an overview of the individual’s proficiency in different languages at a given point in time; the overview is defined in terms of skills and the common reference levels in the Common European Framework’ (CoE, 2004a, p. 5);
- *Language Biography*: the second section of the ELP ‘facilitates the learner’s involvement in planning, reflecting upon and assessing his or her learning process and progress’ (CoE, 2004a, p. 7). It contains goal-setting and self-assessment checklists expanding on the ‘can-do’ descriptors in the CEFR;
